Ballot Results: Affirmative: 12

8-36 Log #729 NEC-P08 **Final Action: Accept**
(352.13)

Submitter: Robert Kelleher, Paramount Electrical Services
Comment on Proposal No: 8-64
Recommendation: Continue to Reject .
Substantiation: Continue to Reject. The addition of these NECA Fine Print Notes, serves no benefit to the user of the National Electrical Code. These are not standards, they are a compilation of generic information and do not serve as information to the user. These must be purchased through NECA. This FPN as written is nothing more than free advertisement for generic, readily available information which must be purchased by the code user. A total of seventeen new Fine Print Notes were proposed to reference NECA standards. Sixteen were unanimously rejected. Inclusion of this Fine Print Note is in direct conflict with 90.1(C). The TCC should intervene to prohibit these types of Fine Print Notes. CMP 8 should continue to reject this FPN. Failure to do so will mean adding Fine Print Notes for IEC, EEI, IBEW, IAEI, ACC, NETA, NEI, SEIA, AISI, API, ASHE, AHAM, ICEAI, NYBFU and dozens of others when they decide to develop income through generic standards development. If this type of Fine Print Note is placed anywhere in the NEC an Annex should be included with coupons for the code user. If the NEC is to be used for advertisement purposes, coupons should be included.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the comment to continue to reject the proposal and reiterates its substantiation for that rejection as stated in the ROP: "As 90.1(C) states: This Code is not intended as a design specification or instruction manual for untrained persons." The panel does not necessarily agree with all points of the submitter's substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-37 Log #855 NEC-P08 **Final Action: Accept**
(352.13)

Submitter: John P. Masarick, Independent Electrical Contractors Inc.
Comment on Proposal No: 8-64
Recommendation: The panel is encouraged to continue to Reject Proposal 8-64.
Substantiation: The reasons to continue to Reject the Proposal are as follows:

1. The trend by the CMPs over the last several code cycles has been to limit the use of FPNs.
2. There is also a correlation issue. There is a conflict between those panels that accepted the proposal and those that rejected the proposal.
3. These standards are also covered by a Fine Print Note in 110.12.
4. The FPN should not be accepted because numerous standards and installation manuals exist and to only mention one does not adequately inform the public about accepted industry practices. The NEC is not intended to be an instruction manual for untrained persons. If the FPNs are allowed to reference these standards, then they should list all applicable standards.
5. Since the referenced installation standards are intentionally general to cover different models of equipment, approval of the FPN may lead many to believe these standards can be used instead of listed or labeled manufacturer's instructions which would be in violation of 110.3(B).
6. If the CMP would like to include the reference, it should be placed in the Annex with the other references.

Panel Meeting Action: Accept
Panel Statement: The panel accepts the comment to continue to reject the proposal and reiterates its substantiation for that rejection as stated in the ROP: "As 90.1(C) states: This Code is not intended as a design specification or instruction manual for untrained persons." The panel does not necessarily agree with all points of the submitter's substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-38 Log #785 NEC-P08 **Final Action: Accept**
(352.30(C))

Submitter: David G. Humphrey, Midlothian, VA
Comment on Proposal No: 8-65
Recommendation: Revise text to read as follows:

Where oversized, concentric or eccentric knockouts are not encountered, Type RNC shall be permitted to be unsupported where the raceway is not more than ~~900 mm (3 ft)~~ 450 mm (18 in.) and remains in unbroken lengths (without coupling). Such raceways shall terminate in an outlet box, device box, cabinet, or other termination at each end of the raceway.

Substantiation: The existing text does not address issues that could have a direct negative impact on the durability of the installation. The affects of weight and vibration of the raceway, especially with larger raceway sizes, may cause loosening at the raceway termination points. Movement as described could additionally result in a weakening of the joined rings of concentric and eccentric knockouts and where on the raceway fitting in contact with the enclosure to which it is connected. Reducing the length to 450 mm (18 in.) would half the weight of the raceway in the current text, and still provide ample room to install normal supporting and securing hardware for longer lengths. Prohibiting unsupported raceways where oversized, concentric, or eccentric knockouts are encountered would serve to maintain the integrity of the equipment installation.

In summation, the proposed revised text would meet the submitter's intent and address system durability issues.

Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

GRIFFITH, M.: Panel action on this Comment should have been to "Reject" rather than to "Accept" for the following reasons:
1. The new language suggesting an 18 in. limit completely changes the intent of the original proposal which was to clarify a widespread practice in industry that is already implied to be acceptable by existing code language and for which there is no evidence to change.
2. The spacing of 18 in. is new material that has not had public review and is not substantiated.
3. The limitation to installations "where oversized...knockouts are not encountered" has not been substantiated. In addition, concerns about knockouts can be addressed by any of several installation methods representing good workmanship that result in adequate support.
Panel action on the original Proposal 8-65 should continue to apply.

8-39 Log #967 NEC-P08 **Final Action: Accept in Principle**
(352.30(C))

Submitter: Mark C. Ode, Underwriters Laboratories Inc.
Comment on Proposal No: 8-65
Recommendation: Add an introduction to the new (C) provided in the proposal to read as follows:
352.30 Securing and Supporting
RNC shall be installed as a complete system as provided in 300.18 and shall be fastened so that movement from thermal expansion or contraction is permitted. RNC shall be securely fastened and supported in accordance with 352.30(A) and (B) or permitted to be unsupported in accordance with 344.30(C).

[(A) and (B) are unchanged in this comment and the proposal.]

(C) Unsupported raceways. Type PVC conduit RNC shall be permitted to be unsupported where the raceway is not more than 900 mm (3 ft) in length and remains in unbroken lengths (without coupling). Such raceway shall terminate in an outlet box, junction box, device box, cabinet, or other termination at each end of the raceway.
Substantiation: This added new subsection (C) needs an introduction in the main text to comply with the NEC Style Manual. .....
Panel Meeting Action: Accept in Principle
Change the NEC reference from 344.30(C) to 352.30(C).
Panel Statement: Editorial correction of cross-reference.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-40 Log #1397 NEC-P08 **Final Action: Accept in Principle in Part (352.30(C))**

Submitter: James M. Imlah, City of Hillsboro
Comment on Proposal No: 8-65
Recommendation: Revise text to read as follows:

(c) Unsupported raceways: Type RNC shall be permitted to be unsupported where the raceways is not more than 600 mm (2 ft) ~~900 mm (3 ft)~~ in length and remains in unbroken lengths (without coupling). Such raceway shall terminate, where oversized, eccentric or concentric knockout are not encountered in an outlet box, junction box, device box, cabinet, or other termination at each end of the raceway.

Substantiation: This allowance should only be allowed for 24" nipples or less in length. Many times RNC nipples, as described in Table 9 Note 4, are installed for the intent of allowing additional conductor conduit fill. By following the 24" length of this note for nipples provides consistency for short sections of raceway being installed and meet submitters intent. Additionally, support shall be installed if oversized, eccentric, or concentric knockouts are encountered due to vibration or loose oversized knockouts causing possible additional strain on energized conductors.
Panel Meeting Action: Accept in Principle in Part
Panel Statement: The panel action on Comment 8-38 satisfies the eccentric or concentric issue of the submitter; however, the panel rejects the recommendation to increase the unsupported length to 2 feet.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

GRIFFITH, M.: Panel action should have been to "Reject" this Comment. There is no substantiation for the limit(s) imposed by the submitter's suggested revision. See also my Explanation of Negative Vote on Comment 8-38.

8-41 Log #1923 NEC-P08 **Final Action: Reject**
(352.30(C) (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 8-65
Recommendation: Reject the proposal.
Substantiation: The concept of a special support rule for short lengths of raceway run between enclosures of various sorts is without technical substantiation, and at variance from routine trade practice. No such requirement has ever been in the NEC. Raceways generally require support within 3 ft of terminations, and when the entire length is just that long, then no additional support is ever required. In effect, the locknuts and bushings or connectors and locknuts at each end are supports. This is not a new concept for the NEC: CMP 7 just added the wording "(wiring method) fittings shall be permitted as a means of cable support" in a number of cable articles. If this and its companion proposals remain accepted, the various tubular rigid raceways will be expected to grow clamps where they will look rather strange, such as in the middle of a 90° sweep if it has a coupling and a 3-in. extension to make a required distance. This proposal is without precedent, and addresses a nonexistent problem.
Panel Meeting Action: Reject
Panel Statement: Section 352.30(A) specifically states, "Each Type PVC shall be securely fastened within 900 mm (3 ft) of each outlet box, junction box, device box, cabinet, conduit body, or other conduit termination." There is no special support rule, just the already existing securely fastened rule. See also panel action on Comment 8-38.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

GRIFFITH, M.: Panel action should have been "Accept in Principle" for this Comment. The submitter's substantiation is correct except for his (likely unintended) reference to "support" instead of "secured in place" as identified in the panel statement. See also my Explanation of Negative Vote on Comment 8-38.

8-42 Log #445 NEC-P08 **Final Action: Reject**
(352.100)

Submitter: Steven Tollefson, Cantex Inc.
Comment on Proposal No: 8-68
Recommendation: CANTEX requests that Code-Making Panel 8 Reject the proposed revision as initially Accepted in Principle in Part by deleting the additional two sentences placed at the beginning of the section. The section should remain as originally phrased prior to the proposed revision, as follows:

352.100 Construction. ~~RNC shall be made of rigid (nonplasticized) polyvinyl chloride (PVC) or reinforced thermosetting resin (RTRC). The material shall be homogenous without the use of foaming agents.~~ RNC and fittings shall be composed of suitable nonmetallic material that is resistant to moisture and chemical atmospheres. For use above ground, it shall also be flame retardant, resistant to impact and crushing, resistant to distortions from heat under conditions likely to be encountered in service and resistant to low temperature and sunlight effects. For use underground, the material shall be acceptably resistant to moisture and corrosive agents and shall be of sufficient strength to withstand abuse, such as by impact and crushing, in handling and during installation. Where intended for direct burial, without encasement in concrete, the material shall also be capable of withstanding continued loading that is likely to be encountered after installation.

Alternatively, the panel should refrain from taking any action with regard to the proposal until after Underwriters Laboratories Inc. ("UL") has completed its testing of CANTEX's Schedule 40 Forte-Duct® product line.
Substantiation: The proposed revision fundamentally alters the existing standard by requiring that PVC conduit "material shall be homogenous without the use of foaming agents." By specifically excluding the use of "foaming agents" in RNC, the proposed revision under consideration by the Panel would effectively suppress alternative cellular-core technology that has proven to be a safe and efficient alternative to solid-core RNC.

As a manufacturer of its own line of highly successful cellular-core RNC products marketed under the trade name Fote-Duct®, CANTEX is a market leader in cellular-core technology. As demonstrated by the success of CANTEX's own products, cellular-core RNC is more economical, lighter in weight and equally as safe as solid-core RNC made of PVC and reinforced thermosetting resin ("RTRC").

Based upon its expertise in cellular-core technology, as well as independent testing conducted by Underwriters Laboratories Inc. ("UL") and other testing organizations, CANTEX respectfully submits that the proposed revision to NEC 352.100 is scientifically unfounded and otherwise unjustified as a matter of public policy. CANTEX has carefully reviewed the proposed revision, its supporting text, and the twelve (12) specified technical concerns about cellular-core RNC that accompany the proposed revision. As detailed in the supporting material submitted along with this comment, the twelve (12) points raised in support of the proposed revision are largely inaccurate, incomplete or otherwise scientifically unsubstantiated.

In short, Code-Making Panel 8 should Reject Mr. Kendall's proposed revision to 352.100. In the absence of any legitimate scientific justification, the proposed revision is blatantly anticompetitive. If adopted, the proposed revision would place CANTEX and other manufacturers of cellular-core RNC at a competitive disadvantage to the makers of traditional solid-core PVC products. As a result, the proposed revision would stifle the continued development of emerging cellular-core technology to the detriment of the market and the credibility of NFPA.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 8-45a.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:

GRIFFITH, M.: The submitter is encouraged and reminded to consider using the TIA process should further test results become available to support a broader application of the cellular-core product than allowed by 352.100 as stipulated in Panel Comment 8-45a.

8-43 Log #1394 NEC-P08 **Final Action: Reject**
(352.100)

Submitter: David R Carpenter, Florence, AL
Comment on Proposal No: 8-68
Recommendation: This proposal and change of construction requirements should not be accepted in the code. It should be removed from the proposal.

Revise 352.100 to read as follows:

352.100 Construction. ~~RNC shall be made of rigid (nonplasticized) polyvinyl chloride (PVC) or reinforced thermosetting resin (RTRC). The material shall be homogenous without the use of foaming agents.~~
Substantiation: The proposed language "homogenous without the use of foaming agents" is anticompetitive. This language removes cellular-core RNC from acceptance in the Code. Cellular-core has a 10+ year history of use with no reports of shock or safety hazards. The submitter's proposal has no technical data to prove any hazard can or will exist with cellular-core RNC.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 8-45a.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-44 Log #1396 NEC-P08 **Final Action: Reject**
(352.100)

Submitter: David R Carpenter, Florence, AL
Comment on Proposal No: 8-68
Recommendation: This proposal and change of construction requirements should not be accepted in the code. It should be removed from the proposal.

Revise 352.100 to read as follows:

352.100 Construction. ~~RNC shall be made of rigid (nonplasticized) polyvinyl chloride (PVC) or reinforced thermosetting resin (RTRC). The material shall be homogenous without the use of foaming agents.~~
Substantiation: This additional wording clearly prohibits the use of cellular-core type conduit without any scientific data to provide it is a safety hazard. Cellular-core conduit has not been a hazard to the electrical industry, even with

foaming agents. The foam in this conduit is a closed cell technology design. It is not open cell such as foam in a cooler or cushion. The proposal would have a significant impact on competition without data to prove the product is a safety hazard. No safety hazard has been established and it has already passed all but one UL 651 standard test. The product has already passed the first phase of the remaining test and final results on that test are expected in the near future. Cellular-core conduit has already been accepted in specifications of utilities for the past ten years without a shock or fire hazard being reported. As an inspector and engineer, I am concerned any time I see the code being used as a competition tool without adequate substantiation. Product with the best quality and safe application should stand on its own merit. I respectfully ask this Panel to consider removing the change and additional language of this proposal based on the grounds of no scientific data to substantiate the proposal and its good safety record.

8-45 Log #2157 NEC-P08 **Final Action: Reject**
(352.100)

Submitter: David H. Kendall, Carlon
Comment on Proposal No: 8-68
Recommendation: This Proposal should continue to be Accepted in Principle in Part.
Substantiation: It is not Panel 8's position that this product is inherently unsuitable for Listing. Rather, as stated in the substantiation that accompanied Proposal 8-68, this product "is obviously different from any other conduit previously listed under UL 651" and that while it "may have its place as a Listable conduit, it should not be considered equivalent to currently Listed PVC conduits."

All types of conduit, either currently or previously covered under Article 352, Rigid Nonmetallic Conduit (PVC, HDPE, and RTRC) were introduced to the NEC through the use of data developed by an independent third-party, NRTL test facility. However, this was not the course of action chosen for the cellular-core PVC product.

It is Panel 8's decision whether or not new conduit types are acceptable for use in electrical installations, and listing agencies and manufacturers should not attempt to circumvent that responsibility. If it is determined that this product is safe, it should be accepted by the NEC and it should be done so on the basis of a thorough analysis of the product and its features and the application of an appropriate set of product safety requirements. Additionally, based upon the precedent that has been set for HDPE in the 2005 NEC, which appears likely to be followed for RTRC in the 2008 NEC, this product should be covered by a separate article.

The process followed by the manufacturer and the listing agency represents an effort on their part to write Code without Panel 8's input. This would permit the use of a product of undetermined suitability while providing a manufacturer with an unfair and unwarranted advantage over the manufacturers that do follow the correct procedures.

8-48 Log #1380 NEC-P08 **Final Action: Reject**
(355.10)

Submitter: William Wagner, Certification Solutions
Comment on Proposal No: 8-79
Recommendation: This Proposal should be revised and accepted as follows:

355.10 Uses Permitted. The use of RTRC shall be permitted in accordance with 352.10(A) through ~~(H)~~ (J).

(A) Concealed. RTRC shall be permitted in walls, floors, and ceilings.

(B) Corrosive Influences. RTRC shall be permitted in locations subject to severe corrosive influences as covered in 300.6 and where subject to chemicals for which the materials are specifically approved.

(C) Cinders. RTRC shall be permitted in cinder fill.

(D) Wet Locations. RTRC shall be permitted in portions of dairies, laundries, canneries, or other wet locations and in locations where walls are frequently washed, the entire conduit system including boxes and fittings used therewith shall be installed and equipped so as to prevent water from entering the conduit. All supports, bolts, straps, screws, and so forth, shall be corrosion-resistant materials or be protected against corrosion by approved corrosion-resistant materials.

(E) Dry and Damp Locations. RTRC shall be permitted for use in dry and damp locations not prohibited by 355.12.

(F) Exposed. RTRC shall be permitted for exposed work where not subject to physical damage if identified for such use.

(G) Underground Installations. For underground installations, see 300.5 and 300.50.

FPN: Refer to Article 352 for Rigid Polyvinyl Chloride Conduit: Type PVC and Article 353 for High Density Polyethylene Conduit: Type HDPE.

(H) Support of Conduit Bodies. RTRC shall be permitted to support nonmetallic conduit bodies not larger than the largest trade size of an entering raceway. These conduit bodies shall not support luminaires (Fixtures) or other equipment and shall not contain devices other than splicing devices as permitted by 110.14(B) and 314.16(C)(2).

(I) Ducts, Plenums and Other Air-Handling Spaces. Phenolic RTRC shall be permitted for use in ducts, plenums, and other air-handling spaces as covered in 300.22 if listed as having adequate fire-resistant and low smoke-producing characteristics.

(J) Riser. Phenolic RTRC shall be permitted for use in riser applications if listed as having fire-resistant characteristics capable of preventing the carrying of fire from floor to floor.

Substantiation: This proposal was presented as a companion proposal to 3-92 (NEC 300.22). It was rejected due to insufficient technical substantiation. However, technical substantiation has now been developed to demonstrate the ability of these products to be safely used in these applications and is being presented to CMP-3 in support of revised proposal 3-92, CMP-8 in support of revised proposals 8-79 and 8-80, and CMP-15 in support of revised proposal 15-112.

CMP-8 was, of course, correct in its statement that "individual raceway articles do not need to duplicate acceptable systems" provided that they have been included in 300.22. However, the proposed revision to include phenolic RTRC in 300.22 represents such a significant departure from the types of raceway that have been previously accepted in these applications, that it is believed to warrant a corresponding reference in 355.10 of the NEC as well.

The position of Underwriters Laboratories in relation to flame spread and smoke developed values for materials used in plenums was put forth in UL's Mr. Randy Laymon's letter dated December 15, 2004.

As a result of my initial proposal, and this UL position paper, FRE Composites (2005) Inc. undertook testing with Underwriters Laboratories of phenolic RTRC products to both UL 2024 plenum and riser tests, and the ASTM E84 flame spread and smoke developed tests. As can be seen from the UL test data and reports, phenolic RTRC products, in a variety of trade sizes, were able to complete each of these testing programs with flame and smoke ratings significantly below the criteria established for products to be used in both plenum and riser applications.

The performance of these products, as demonstrated, is summarized as follows:

Test	Maximum Permitted Value	Maximum Test Value
Plenum (UL 2024) Flame	5.0 ft	2.0 ft
Plenum (UL 2024) Smoke Peak	0.50	0.10
Plenum (UL 2024) Smoke Avg.	0.15	0.02
Riser (UL 2024) Flame	12.0 ft	4.0 ft
Riser (UL 2024) Temperature	850.0˚F	371˚F
ASTM E84 Flame Spread Index (FSI)	25	5
ASTM E84 Smoke Developed Index (SDI)	50	0

Therefore, in consideration of the data generated by an independent, NRTL accredited test laboratory, and in conjunction with UL's stated position on this issue, these conduit products have conclusively demonstrated their ability to perform acceptably in both plenum and riser applications and I recommend their inclusion in NEC 355.10 in accordance with the revised proposal. It should be noted that this proposal has been slightly modified from its original version in order to delete the FPN indicating suggested acceptance criteria for these products. The development of appropriate flame and smoke criteria, along with the product's listing requirements is best left to the determination of the listing organization. However, regardless of which of the established flame and smoke criteria the listing organization chooses, phenolic RTRC has demonstrated its ability to perform safely.

Additionally, a reference to "phenolic" RTRC conduit has been added in order to limit this proposal to only that conduit type which was evaluated as part of the technical substantiation provided with this comment.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: Individual raceway articles do not need to duplicate acceptable systems. Only Code- Making Panel 3 can determine which wiring methods are acceptable for use in ducts, plenums, and other air-handling spaces [300.22(A) through (D)]. It would be inappropriate for Panel 8 to indicate redundant information pertaining to 300.22, since this might confuse the user. Even if Panel 3 accepts this as an acceptable use, the references in 355.10 and 355.12 are unnecessary.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Abstain: 1

Explanation of Abstention:

HUMPHREY, D.: The vote by this party was to abstain. As per the request of the Technical Correlating Committee at the meeting on proposals, and because of the ongoing revision of NFPA 90A, the opportunity to resolve technical issues relating to RTRC in plenums for the 2008 NEC and revision of NFPA 90A could not be completed.

8-49 Log #1381 NEC-P08 **Final Action: Reject**
(355.12)

Submitter: William Wagner, Certification Solutions

Comment on Proposal No: 8-80

Recommendation: This Proposal should be revised and accepted as follows:

355.12 Uses Not Permitted. RTRC shall not be used under the following conditions.

(A) Hazardous (Classified) Locations.

(1) In hazardous (classified) locations, except as permitted in 503.10(A), 504.20, 514.8 Exception No. 2, and 515.8

(2) In Class I, Division 2 locations, except as permitted in 501.10(B)(3)

(B) Support of Luminaires (Fixtures). For the support of Luminaires (fixtures) or other equipment not described in 355.10(H).

(C) Physical Damage. Where subject to physical damage unless identified for such use.

(D) Ambient Temperatures. Where subject to ambient temperatures in excess of 110°C (230°F) unless listed otherwise.

(E) Insulation Temperature Limitations. For conductors or cables operating at a temperature higher than the RTRC listed operating temperature rating.

Exception: Conductors or cables rated at a temperature higher than the RTRC listed temperature rating shall be permitted to be installed in RTRC, provided they are not operated at a temperature higher than the RTRC listed temperature rating.

(F) Theaters and Similar Locations. In theaters and similar locations, except as provided in 518.4 and 520.5.

(G) Ducts, Plenums and Other Air-Handling Spaces. RTRC shall not be used in ducts, plenums, and other air-handling spaces as covered in 300.22, unless constructed of phenolic and listed as having adequate fire-resistant and low smoke-producing characteristics.

(H) Riser. RTRC shall not be used in riser applications unless constructed of phenolic and listed as having fire-resistant characteristics capable of preventing the carrying of fire from floor to floor.

Substantiation: This proposal was presented as a companion proposal to 3-92 (NEC 300.22). It was rejected due to insufficient technical substantiation. However, technical substantiation has now been developed to demonstrate the ability of these products to be safely used in these applications and is being presented to CMP-3 in support of revised proposal 3-92, CMP-8 in support of revised proposals 8-79 and 8-80, and CMP-15 in support of revised proposal 15-112.

CMP-8 was, of course, correct in its statement that "individual raceway articles do not need to duplicate acceptable systems" provided that they have been included in 300.22. However, the proposed revision to include phenolic RTRC in 300.22 represents such a significant departure from the types of raceway that have been previously accepted in these applications, that it is believed to warrant a corresponding reference in 355.12 of the NEC as well.

The position of Underwriters Laboratories in relation to flame spread and smoke developed values for materials used in plenums was put forth in UL's Mr. Randy Laymon's letter dated December 15, 2004.

As a result of my initial proposal, and this UL position paper, FRE Composites (2005) Inc. undertook testing with Underwriters Laboratories of phenolic RTRC products to both UL 2024 plenum and riser tests, and the ASTM E84 flame spread and smoke developed tests. As can be seen from the UL test data and reports, phenolic RTRC products, in a variety of trade sizes, were able to complete each of these testing programs with flame and smoke ratings significantly below the criteria established for products to be used in both plenum and riser applications.

The performance of these products, as demonstrated, is summarized as follows:

Test	Maximum Permitted Value	Maximum Test Value
Plenum (UL 2024) Flame	5.0 ft	2.0 ft
Plenum (UL 2024) Smoke Peak	0.50	0.10
Plenum (UL 2024) Smoke Avg.	0.15	0.02
Riser (UL 2024) Flame	12.0 ft	4.0 ft
Riser (UL 2024) Temperature	850.0˚F	371˚F
ASTM E84 Flame Spread Index (FSI)	25	5
ASTM E84 Smoke Developed Index (SDI)	50	0

Therefore, in consideration of the data generated by an independent, NRTL accredited test laboratory, and in conjunction with UL's stated position on this issue, these conduit products have conclusively demonstrated their ability to perform acceptably in both plenum and riser applications and I recommend their inclusion in NEC 355.12 in accordance with the revised proposal. It should be noted that this proposal has been slightly modified from its original version in order to delete the FPN indicating suggested acceptance criteria for these products. The development of appropriate flame and smoke criteria, along with the product's listing requirements is best left to the determination of the listing organization. However, regardless of which of the established flame and smoke criteria the listing organization chooses, phenolic RTRC has demonstrated its ability to perform safely.

Additionally, a reference to "phenolic" RTRC conduit has been added in order to limit this proposal to only that conduit type which was evaluated as part of the technical substantiation provided with this comment.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

HUMPHREY, D.: See my explanation of abstaining vote on Comment 8-49.

8-49b Log #CC800 NEC-P08 **Final Action: Accept**
(355.30)

Submitter: Code-Making Panel 8,

Comment on Proposal No: 8-78

Recommendation: Revise text of 355.30 to read as follows:

355.30 Securing and Supporting

RTRC shall be installed as a complete system in accordance with 300.18 and shall be securely fastened in place and supported in accordance with 355.30(A) and (B) or permitted to be unsupported in accordance with 355.30(C).

(A) Securely Fastened. RTRC shall be securely fastened within 900 mm (3 ft) of each outlet box, junction box, device box, conduit body, or other conduit termination. Conduit listed for securing at other than 900 mm (3 ft) shall be permitted to be installed in accordance with the listing.

(B) Supports. RTRC shall be supported as required in Table 355.30. Conduit listed for support at spacing other than as shown in Table 355.30 shall be permitted to be installed in accordance with the listing. Horizontal runs of RTRC supported by openings through framing members at intervals not exceeding those in Table 355.30 and securely fastened within 900 mm (3 ft) of termination points shall be permitted.

(C) Unsupported Raceways. Where oversized, concentric or eccentric knockouts are not encountered, Type RTRC shall be permitted to be unsupported where the raceway is not more than 450 mm (18 in.) and remains in unbroken lengths (without coupling). Such raceways shall terminate in an outlet box, device box, cabinet, or other termination at each end of the raceway.

Substantiation: This comment correlates with the panel actions on Comments 8-7, 8-8, 8-20, 8-21, 8-38, 8-39, 8-57, and 8-58 for Type RTRC.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

GRIFFITH, M.: The panel text for 355.30(C) should be revised to read as follows:

(C) Unsupported raceways. ~~Where oversized, concentric or eccentric knockouts are not encountered,~~ Type RTRC shall be permitted to be unsupported where the raceway is not more than ~~450 mm (18 in.)~~ 900 mm (3 ft.) and remains in unbroken lengths (without coupling). Such raceways...at each end of the raceway.

Panel accepted the text in this comment in order to correlate with similar text in accepted comments for the other raceway articles. The text regarding knockouts and the 18 in. length limit should not apply as explained in my Explanation of Negative Votes on Comments 8-7, 8-20, 8-38, and 8-57.

ARTICLE 356 — LIQUIDTIGHT FLEXIBLE NONMETALLIC CONDUIT: TYPE LFNC

8-50 Log #727 NEC-P08 **Final Action: Accept**
(356.13)

Submitter: Robert Kelleher, Paramount Electrical Services

Comment on Proposal No: 8-85

Recommendation: Continue to Reject .

Substantiation: Continue to Reject. The addition of these NECA Fine Print Notes, serves no benefit to the user of the National Electrical Code. These are not standards, they are a compilation of generic information and do not serve as information to the user. These must be purchased through NECA. This FPN as written is nothing more than free advertisement for generic, readily available information which must be purchased by the code user. A total of seventeen new Fine Print Notes were proposed to reference NECA standards. Sixteen were unanimously rejected. Inclusion of this Fine Print Note is in direct conflict with 90.1(C). The TCC should intervene to prohibit these types of Fine Print Notes. CMP 8 should continue to reject this FPN. Failure to do so will mean adding Fine Print Notes for IEC, EEI, IBEW, IAEI, ACC, NETA, NEI, SEIA, AISI, API, ASHE, AHAM, ICEAI, NYBFU and dozens of others when they decide to develop income through generic standards development. If this type of Fine Print Note is placed anywhere in the NEC an Annex should be included with coupons for the code user. If the NEC is to be used for advertisement purposes, coupons should be included.

Panel Meeting Action: Accept

Panel Statement: The panel accepts the comment to continue to reject the proposal and reiterates its substantiation for that rejection as stated in the ROP: "As 90.1(C) states: This Code is not intended as a design specification or instruction manual for untrained persons." The panel does not necessarily agree with all points of the submitter's substantiation.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

8-51 Log #857 NEC-P08 **Final Action: Accept**
(356.13 (New))

Submitter: John P. Masarick, Independent Electrical Contractors Inc.

Comment on Proposal No: 8-85

Recommendation: The panel is encouraged to continue to Reject Proposal 8-85.

Substantiation: The reasons to continue to Reject the Proposal are as follows:

1. The trend by the CMPs over the last several code cycles has been to limit the use of FPNs.
2. There is also a correlation issue. There is a conflict between those panels that accepted the proposal and those that rejected the proposal.
3. These standards are also covered by a Fine Print Note in 110.12.
4. The FPN should not be accepted because numerous standards and installation manuals exist and to only mention one does not adequately inform the public about accepted industry practices. The NEC is not intended to be an instruction manual for untrained persons. If the FPNs are allowed to reference these standards, then they should list all applicable standards.
5. Since the referenced installation standards are intentionally general to cover different models of equipment, approval of the FPN may lead many to believe these standards can be used instead of listed or labeled manufacturer's instructions which would be in violation of 110.3(B).
6. If the CMP would like to include the reference, it should be placed in the Annex with the other references.

Panel Meeting Action: Accept

Panel Statement: The panel accepts the comment to continue to reject the proposal and reiterates its substantiation for that rejection as stated in the ROP: "As 90.1(C) states: This Code is not intended as a design specification or instruction manual for untrained persons." The panel does not necessarily agree with all points of the submitter's substantiation.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

ARTICLE 358 — ELECTRICAL METALLIC TUBING: TYPE EMT

8-52 Log #2204 NEC-P08 **Final Action: Reject**
(358.10, FPN)

Submitter: William A. Wolfe, Steel Tube Institute of North America

Comment on Proposal No: 8-94

Recommendation: Revise the text as follows and accept this comment;

FPN: The galvanizing on steel (ferrous) EMT provides supplementary corrosion protection. When steel EMT is in direct contact with the earth or is installed in concrete, supplementary corrosion protection may be required. When aluminum (non-ferrous) EMT is in direct contact with the earth or is installed in concrete, supplementary corrosion protection is required.

Substantiation: Proposal 8-94 was a companion proposal to proposal 8-15 on Rigid Metal Conduit. The Panel accepted proposal 8-15 which added a Fine Print Note to differentiate between the corrosion protection required for steel rigid conduit versus aluminum rigid conduit. There has been confusion in the field as to when supplementary corrosion protection is required for these two different metals.

The Panel did **not** accept the addition of the FPN in this proposal. Article 358 covers aluminum and steel electrical metallic tubing. The Panel stated that there was mandatory language in the FPN and that there was a reference to 300.6. The revised text addresses those issues by removing the mandatory language and the reference to 300.6. With these changes, the Panel should be able to accept this proposal and make their action on this proposal consistent with their action on Proposal 8-15. The FPN provides useful guidance and reflects the listing requirements in the UL Electrical Construction Equipment Directory.

Panel Meeting Action: Reject

Panel Statement: The panel still maintains that the reference to 300.6 in the FPN gives the installer the proper reference to determine corrosion protection requirements.

It is not acceptable per the NEC Style Manual for fine print notes (FPNs) to state "Mandatory Text". The last sentence in the proposed text indicates that supplementary corrosion protection "is required."

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

8-53 Log #1784 NEC-P08 **Final Action: Reject**
(358.10(B))

Submitter: Joseph A. Hertel, Safety and Buildings
Comment on Proposal No: 8-95
Recommendation: Revise 358.10(B) to say:
(B) Electrical metallic tubing shall not be used in direct contact with earth, in concrete slabs or floors poured on earth, or in exterior concrete walls below grade.
Substantiation: The CMP rejected the proposal and should reconsider in the comments. The panel indicates that EMT is suitable where corrosion protection is provided in accordance with 358.10(B). 358.10(B) says "where protected by corrosion protection and judged suitable for the condition." What is a suitable corrosion protection that will allow EMT to survive below grade or embedded in concrete on grade? Is the galvanized coating from the manufacturer the corrosion protection envisioned by the CMP or is it something they should specify?
Panel Meeting Action: Reject
Panel Statement: The authority having jurisdiction will determine the suitability of a corrosion protection method.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-57 Log #784 NEC-P08 **Final Action: Accept**
(358.30(C))

Submitter: David G. Humphrey, Midlothian, VA
Comment on Proposal No: 8-104
Recommendation: Revise text to read as follows:
Where oversized, concentric or eccentric knockouts are not encountered, Type EMT shall be permitted to be unsupported where the raceway is not more than ~~900 mm (3 ft)~~ 450 mm (18 in.) and remains in unbroken lengths (without coupling). Such raceways shall terminate in an outlet box, device box, cabinet, or other termination at each end of the raceway.
Substantiation: The existing text does not address issues that could have a direct negative impact on the durability of the installation. The affects of weight and vibration of the raceway, especially with larger raceway sizes, may cause loosening at the raceway termination points. This loosening would certainly impose an impediment to the raceways ability to safely carry the maximum fault current likely to be imposed on the raceway. Reducing the length to 450 mm (18 in.) would half the weight of the raceway in the current text, and still provide ample room to install normal supporting and securing hardware for longer lengths. Prohibiting unsupported raceways where oversized, concentric, or eccentric knockouts are encountered would serve to maintain the integrity of the equipment grounding function of the raceway.
In summation, the proposed revised text would meet the submitter's intent and address system durability issues.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
GRIFFITH, M.: Panel action on this Comment should have been to "Reject" rather than to "Accept" for the following reasons:
1. The new language suggesting an 18 in. limit completely changes the intent of the original proposal which was to clarify a widespread practice in industry that is already implied to be acceptable by existing code language and for which there is no evidence to change.

2. The spacing of 18 in. is new material that has not had public review and is not substantiated.
3. The limitation to installations "where oversized...knockouts are not encountered" has not been substantiated. In addition, concerns about knockouts can be addressed by any of several installation methods representing good workmanship that result in adequate support.
Panel action on the original Proposal 8-104 should continue to apply.

8-58 Log #968 NEC-P08 **Final Action: Accept**
(358.30(C))

Submitter: Mark C. Ode, Underwriters Laboratories Inc.
Comment on Proposal No: 8-104
Recommendation: Revise as follows:
358.30 Securing and Supporting
EMT shall be installed as a complete system in accordance with 300.18 and shall be securely fastened in place and supported in accordance with 358.30(A) and (B) or permitted to be unsupported in accordance with 358.30(C).
(C) Unsupported raceways. Type EMT shall be permitted to be unsupported where the raceway is not more than 900 mm (3 ft) in length and remains in unbroken lengths (without coupling). Such raceway shall terminate in an outlet box, junction box, device box, cabinet, or other termination at each end of the raceway.
Substantiation: This added new subsection (C) needs an introduction in the main text to comply with the NEC Style Manual.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-59 Log #1398 NEC-P08 **Final Action: Accept in Principle in Part**
(358.30(C))

Submitter: James M. Imlah, City of Hillsboro
Comment on Proposal No: 8-104
Recommendation: Revise text to read as follows:
(c) Unsupported raceways: Type EMT shall be permitted to be unsupported where the raceways is not more than 600 mm (2 ft) ~~900 mm (3 ft)~~ in length and remains in unbroken lengths (without coupling). Such raceway shall terminate, where oversized, eccentric or concentric knockout are not encountered in an outlet box, junction box, device box, cabinet, or other termination at each end of the raceway.
Substantiation: This allowance should only be allowed for 24" nipples or less in length. Many times EMT nipples, as described in Table 9 Note 4, are installed for the intent of allowing additional conductor conduit fill. By following the 24" length of this note for nipples provides consistency for short sections of raceway being installed and meet submitters intent. Additionally, support shall be installed if oversized, eccentric, or concentric knockouts are encountered to maintain assured grounding and bonding continuity due to vibration or loose oversized knockouts.
Panel Meeting Action: Accept in Principle in Part
Panel Statement: The panel action on Comment 8-57 satisfies the eccentric or concentric issue of the submitter; however, the panel rejects the recommendation to increase the unsupported length to 2 feet.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
GRIFFITH, M.: Panel action should have been to "Reject" this comment. There is no substantiation for the limit(s) imposed by the submitter's suggested revision. See also my Explanation of Negative Vote on Comment 8-57.

8-60 Log #1925 NEC-P08 **Final Action: Reject**
(358.30(C) (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Pro
posal No: 8-104
Recommendation: Reject the proposal.
Substantiation: The concept of a special support rule for short lengths of raceway run between enclosures of various sorts is without technical substantiation, and at variance from routine trade practice. No such requirement has ever been in the NEC. Raceways generally require support within 3 ft of terminations, and when the entire length is just that long, then no additional support is ever required. In effect, the locknuts and bushings or connectors and locknuts at each end are supports. This is not a new concept for the NEC: CMP 7 just added the wording "{wiring method} fittings shall be permitted as a means of cable support" in a number of cable articles. If this and its companion proposals remain accepted, the various tubular rigid raceways will be expected to grow clamps where they will look rather strange, such as in the middle of a 90° sweep if it has a coupling and a 3-in. extension to make a required distance. This proposal is without precedent, and addresses a nonexistent problem.
Panel Meeting Action: Reject
Panel Statement:
Section358.30(A) specifically states, "Each Type EMT shall be securely fastened within 900 mm (3 ft) of each outlet box, junction box, device box, cabinet, conduit body, or other conduit termination." There is no special support rule, just the already existing securely fastened rule. See also the panel action on Comment 8-57.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
GRIFFITH, M.: Panel action should have been "Accept in Principle" for this comment. The submitter's substantiation is correct except for his (likely unintended) reference to "support" instead of "secured in place" as identified in the Panel statement. See also my Explanation of Negative Vote on Comment 8-57.

8-63 Log #2353 NEC-P08 **Final Action: Accept**
(368.6)

Submitter: Alan Manche, Square D Company
Comment on Proposal No: 8-129
Recommendation: Continue to Reject the Proposal.
Substantiation: There has been no substantiation presented that a safety issue exists that would warrant a listing requirement on busway.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
DABE, J.: The original submitter of ROP 8-129 is correct in stating that the AHJ does not have the means to determine the safety of the design and manufacture of busways. The panel should reconsider the fact that many panels including this one have required listing for far less hazaradous and complex items.
WALBRECHT, G.: The submitter's substantiation in Proposal 8-129 is correct. The authority having jurisdiction will not have the means available to determine the safety of the design, manufacture, and installation of a busway. Busways and their associated fittings, as with any wiring method, should be evaluated and listed by a nationally recognized third party certification organization. Field fabrication and modification of factory-produced components can also be hazardous and should be properly examined and evaluated by a nationally recognized testing organization.

8-64 Log #1926 NEC-P08 **Final Action: Reject**
(368.10)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 8-131
Recommendation: Accept the proposal.
Substantiation: The panel statement did not rebut the assertion in the substantiation that the use of "exposed" and "concealed" in the NEC text did not accord with the Article 100 definitions. This should be corrected. In addition, it is not true that the view terminology is not used in the NEC. It is used in 610.31(4) because on large cranes an insight disconnect rule is impracticable due to the 50-ft parameter in the "insight" definition. To get around this, CMP 12 uses the "in view" construction. Another comparable construction occurs in 450.13(A), where "in the open" is used because the key issue is being capable of observation as opposed to being within view and capable of being reached quickly. Defined terms in the NEC should be used accordingly.
Panel Meeting Action: Reject
Panel Statement: The terms "Exposed" and "Concealed" are commonly used and understood throughout the National Electrical Code. "In View" and "Out of View" may have been more appropriate for other sections of the National Electrical Code, but in this case Panel 8 believes that those terms would only deviate from the commonly used terms without the appropriate substantiation to make the revision.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
WALBRECHT, G.: UL agrees with the panel that "in view" and "out of view" should not be adopted for this section. However, we agree with the submitter that the terms "exposed" and "concealed" are being used improperly in this section and instead suggest replacing "Exposed" with "Where Visible" and "Concealed" with "Behind Access Panels" as the subsection titles for 368.10(A) and (B) respectively. This more closely describes that text of the requirements.

8-65 Log #723 NEC-P08 **Final Action: Accept**
(368.13)

Submitter: Robert Kelleher, Paramount Electrical Services
Comment on Proposal No: 8-135
Recommendation: Continue to Reject .
Substantiation: Continue to Reject. The addition of these NECA Fine Print Notes, serves no benefit to the user of the National Electrical Code. These are not standards, they are a compilation of generic information and do not serve as information to the user. These must be purchased through NECA. This FPN as written is nothing more than free advertisement for generic, readily available information which must be purchased by the code user. A total of seventeen new Fine Print Notes were proposed to reference NECA standards. Sixteen were unanimously rejected. Inclusion of this Fine Print Note is in direct conflict with 90.1(C). The TCC should intervene to prohibit these types of Fine Print Notes. CMP 8 should continue to reject this FPN. Failure to do so will mean adding Fine Print Notes for IEC, EEI, IBEW, IAEI, ACC, NETA, NEI, SEIA, AISI, API, ASHE, AHAM, ICEAI, NYBFU and dozens of others when they decide to develop income through generic standards development. If this type of Fine Print Note is placed anywhere in the NEC an Annex should be included with coupons for the code user. If the NEC is to be used for advertisement purposes, coupons should be included.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the comment to continue to reject the proposal and reiterates its substantiation for that rejection as stated in the ROP: "As 90.1(C) states: This Code is not intended as a design specification or instruction manual for untrained persons." The panel does not necessarily agree with all points of the submitter's substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-66 Log #860 NEC-P08 **Final Action: Accept**
(368.13 (New))

Submitter: John P. Masarick, Independent Electrical Contractors Inc.
Comment on Proposal No: 8-135
Recommendation: The panel is encouraged to continue to Reject Proposal 8-135.
Substantiation: The reasons to continue to Reject the Proposal are as follows:
1. The trend by the CMPs over the last several code cycles has been to limit the use of FPNs.
2. There is also a correlation issue. There is a conflict between those panels that accepted the proposal and those that rejected the proposal.
3. These standards are also covered by a Fine Print Note in 110.12.
4. The FPN should not be accepted because numerous standards and installation manuals exist and to only mention one does not adequately inform the public about accepted industry practices. The NEC is not intended to be an instruction manual for untrained persons. If the FPNs are allowed to reference these standards, then they should list all applicable standards.
5. Since the referenced installation standards are intentionally general to cover different models of equipment, approval of the FPN may lead many to believe these standards can be used instead of listed or labeled manufacturer's instructions which would be in violation of 110.3(B).
6. If the CMP would like to include the reference, it should be placed in the Annex with the other references.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the comment to continue to reject the proposal and reiterates its substantiation for that rejection as stated in the ROP: "As 90.1(C) states: This Code is not intended as a design specification or instruction manual for untrained persons." The panel does not necessarily agree with all points of the submitter's substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-67 Log #1382 NEC-P08 **Final Action: Accept**
(368.56(A))

Submitter: William Wagner, Certification Solutions
Comment on Proposal No: 8-136
Recommendation: This Proposal should be Accepted as revised:
368.56(A) General. Branches from busways shall be permitted to use any of the following wiring methods:
(1) Type AC armored cable
(2) Type MC metal-clad cable
(3) Type MI mineral-insulated, metal-sheathed cable
(4) Type IMC intermediate metal conduit
(5) Type RMC rigid metal conduit
(6) Type FMC flexible metal conduit
(7) Type LFMC liquidtight flexible metal conduit
(8) Type PVC ~~RNC~~ rigid ~~nonmetallic~~ polyvinyl chloride conduit
(9) Type RTRC reinforced thermosetting resin conduit
~~(9)~~ (10) Type LFNC liquidtight flexible nonmetallic conduit
~~(10)~~ (11) Type EMT electrical metallic tubing
~~(11)~~ (12) Type ENT electrical nonmetallic tubing
~~(12)~~ (13) Busways
~~(13)~~ (14) Strut-type channel raceway
~~(14)~~ (15) Surface metal raceways~~s~~
~~(15)~~ (16) Surface nonmetallic raceways~~s~~
Where a separate equipment grounding conductor is used, connection of the equipment grounding conductor to the busway shall comply with 250.8 and 250.12.
Substantiation: While it is true that Proposals 8-53 and 8-78 refer to RNC in the definition of PVC conduit and RTRC, this proposed revision is still necessary. With the acceptance of 8-53 and 8-78, Type RNC will cease to exist, replaced by Type PVC and Type RTRC. Accordingly, the use of the designation "Type" RNC would be incorrect. Therefore, it is necessary to revise 368.56(A) as shown above both for correctness of terminology and consistency with the references to other conduit types.

This proposal has been revised to remove the reference to HDPE, as the submitter agrees with the panel statement that HDPE is not permitted to be used as a branch from a busway.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 374 — CELLULAR METAL FLOOR RACEWAY

8-68 Log #1752 NEC-P08 **Final Action: Hold**
(374.17)

Submitter: John Michlovic, H.H. Robertson Floor Systems
Comment on Proposal No: 8-148
Recommendation: Revise text to read as follows:
Ampacity of conductors. The ampacity adjustment factors in ~~310.15(B)(2)~~ Table 374.17 shall apply to conductors installed in cellular metal floor raceways.
Substantiation: ROP 8-148 (Log #1057) seeks an exception to 374.17 so as to eliminate the perceived need to use "loop wiring" and "violate 374.7" in relation to multiple outlets on the same circuit. In lieu of adopting an isolated exception to address the proponent's particular concern, this Comment suggests that NFPA amend 374.17 more comprehensively to establish an ampacity reduction table specifically applicable to cellular metal floor raceways.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Hold
Panel Statement: The comment introduces a concept that has not had public review in accordance with 4.4.6.2.2 of the Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 376 — METAL WIREWAYS

8-69 Log #49 NEC-P08 **Final Action: Accept**
(376.6)

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 8-151
Recommendation: It was the action of the Technical Correlating Committee that the panel reconsider the proposal as it is unclear what "one of a kind" means and that further consideration be given to the comments expressed in the voting. This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: See panel action on Comment 8-71.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-70 Log #696 NEC-P08 **Final Action: Reject**
(376.6)

TCC Action: The Technical Correlating Committee understands that the panel agrees with the substantiation provided by the submitter of Comment 8-71 and their action to Accept.
Submitter: Jamie McNamara, Hastings, MN
Comment on Proposal No: 8-151
Recommendation: The panel should continue to accept this proposal in principle and have the exception read:
"Exception: Custom made, and field-fabricated wireways and fittings shall not be required to be listed."
Substantiation: The TCC concerns of the term "one of a kind" being unclear is warranted and the term has been removed from the proposed exception.
The close vote and the comments of the panel members make it clear that this is a very important and divided issue and there is merit in all the comments expressed. Installers and inspectors do not have the ability in the field to determine the suitability of a raceway (metal wireways) as to its condition of use. Metal wireways and associated fittings should be listed to provide for a minimum standard of safety that all standard metal wireways and associated fittings should meet.
Panel Meeting Action: Reject
Panel Statement: See panel action on Comment 8-71.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
DABE, J.: The panel should have accepted this comment. Custom made or Field Fabricated wireways may be used under the exception, however, a listed product used whenever possible for standardized construction is the preferred method.
WALBRECHT, G.: The authority having jurisdiction will not have the means available to determine the safety of the design, manufacture, and installation of a metal wireway. Wireways and their associated fittings, as with any wiring method, should be evaluated and listed by a nationally recognized third party certification organization. Field fabrication and modification of factory-produced components can also be hazardous and should be properly examined and evaluated by a nationally recognized testing organization.

8-71 Log #1832 NEC-P08 **Final Action: Accept**
(376.6)

Submitter: Michael Walls, American Chemistry Council
Comment on Proposal No: 8-151
Recommendation: Reject this Proposal.
Substantiation: In the Explanation of Negative all of the commenters state the same concern. Metal Wireways are more often field fabricated than purchased components made into an assembly. There are not enough options made by the manufacturers to fit the needs of the field. Customizing of listed metal wireway components would void the listing. This is an impractical requirement. No technical substantiation has been provided that there is a problem with the current installations. If custom made or field fabricated metal wireways are acceptable, per the Exception, then why require any of them be listed.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
DABE, J.: The panel should have rejected this comment and accepted comment 8-70, which would have allowed "Custom made or Field Fabricated wireways" when needed.
WALBRECHT, G.: See my explanation of negative and substantiation on Comment 8-70.

8-72 Log #906 NEC-P08 **Final Action: Hold**
(376.10)

Submitter: Nicholas P. Ludlam, FM Approvals
Comment on Proposal No: 8-157a
Recommendation: Revise as follows:
376.10 Uses Permitted. The use of metal wireways shall be permitted in the following:
(1) For exposed work.
(2) In concealed spaces as permitted in 376.10(4).
(3) In hazardous (classified) locations as permitted by 501.10(B) for Class I, Division 2 locations; 502.10(B) for Class II, Division 2 locations ~~and~~ 504.20, 505.15(A) and 506.15(A) for intrinsically safe wiring; 505.15(C) for Class I Zone 2 locations; and 506.15(C) for Zone 22. Where installed in wet locations, wireways shall be listed for the purpose.
(4) As extensions to pass transversely through walls if the length passing through the wall is unbroken. Access to the conductors shall be maintained on both sides of the wall.
Substantiation: Articles 505 and 506 include additional hazardous classified locations which are not addressed by this wiring technique.
Panel Meeting Action: Hold
Panel Statement: The comment introduces a concept that has not had public review in accordance with 4.4.6.2.2 of the Regulations Governing Committee Projects. The recommendation is for a revision to 376.10, yet Proposal 8-157a is on 376.100.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-73 Log #969 NEC-P08 **Final Action: Accept**
(376.80)

Submitter: Mark C. Ode, Underwriters Laboratories Inc.
Comment on Proposal No: 8-157
Recommendation: Revise as follows:
376.22 Number of Conductors and Ampacity. The number of conductors and their ampacity shall comply with (A) and (B).
(A) Cross-Sectional Areas of Wireway. The sum of the cross-sectional areas of all contained conductors at any cross section of a wireway shall not exceed 20 percent of the interior cross-sectional area of the wireway.
(B) Adjustment Factors. The adjustment factors in 310.15(B)(2)(a) shall be applied only where the number of current-carrying conductors, including neutral conductors classified as current-carrying under the provisions of 310.15(B)(4), exceeds 30. Conductors for signaling circuits or controller conductors between a motor and its starter and used only for starting duty shall not be considered as current-carrying conductors.
Substantiation: Added titles to the subsections to comply with the NEC Style Manual.

Panel Meeting Action: Accept
Panel Statement: Panel 8 recognizes that the submitter meant to indicate 376.22 instead of 376.80. Panel 8 accepts the proposed titles to 376.22(A) and (B).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-74 Log #50 NEC-P08 **Final Action: Accept**
(376.100 (new))

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 8-157a
Recommendation: The Technical Correlating Committee directs that the panel add Titles to (A) and (B). This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: Panel 8 recognizes that the TCC meant to indicate Proposal 8-157, not 8-157a, since titles are incorporated in 376.100. Panel 8 accepted Comment 8-73 to add titles to 376.22(A) and (B).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 382 — NONMETALLIC EXTENSIONS

7-55 Log #947 NEC-P07 **Final Action: Reject**
(382)

Submitter: Samuel R. LaDart, City of Memphis / Rep. IBEW Local 474
Comment on Proposal No: 7-98
Recommendation: The panel should have rejected this proposal.
Substantiation: This is a safety issue. This wiring method is subject to physical damage under any and all sets of circumstances. We feel as though it could contribute to unnecessary shock hazards, as well as fire-damage.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 7-56.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 11 Negative: 3
Explanation of Negative:

ADAMS, M.: This wiring method is subject to physical damage.

FAHRENTHOLD, C.: Proposal 7-98 has written concealable nonmetallic extension into Article 382. These concealable nonmetallic extensions can be installed on walls and ceilings without mechanical protection. This is contrary to 300.4 which states that: "where subject to physical damage, conductors shall be protected." Nowhere in 300.4 does it provide for an exception if the wiring has a "level of shock protection equivalent to a GFCI."

Proposal 7-98 has put in the requirement that the concealed nonmetallic extension have a level of shock protection equivalent to a GFCI. This will protect the person who drives a nail through the wiring of the nonmetallic extension, but there is no provision for repairing the wiring. The only solution is to install more wiring over the existing wiring or remove the old wiring and install new. This can be an expensive undertaking for the person that did not know that the wiring was concealed behind the paint, texture, etc. when they drove the nail into the wall.

The concealable nonmetallic extensions should not be added to the code unless there are provisions for the wiring to be protected from physical damage.

LADART, S.: We disagree with the panel action. This is a safety issue. Proposal 7-98 introduces a new wiring method: "Concealable nonmetallic extensions". Although we encourage and promote the development of innovative wiring methods, the "concealable flat wire nonmetallic extension method" is unacceptable. Proposal 7-98 suggests revising the text of Article 382, which governs nonmetallic extensions to include a new method of extending a branch circuit, (the concealable nonmetallic extension method).

The opening sentence of the NEC, (90.1), clearly states that the intended purpose of the NEC is the practical safeguarding of persons and property from hazards arising from the use of electricity.

AC flatwire is a fragile wiring method, with thin flat conductors, separated by thin layers of insulating material. The wiring method is designed to be surface mounted on a dwelling or office wall using adhesives, and then painted for "CONCEALMENT". The system is designed to utilize an inherent safety system that is built within.

Good judgment has prevailed. Everyone with whom we have discussed this wiring method has quickly asked: Since I cannot see the "concealed wiring", how can I avoid penetrating it with a nail, screw, or some other foreign object? The answer is quite clear. You cannot protect this wiring method from physical damage. The proposal suggest that there is no need to protect the wiring method from physical damage. We disagree for a number of reasons. AC Flatwire is nonrepairable, and it must be stripped from the wall in the inevitable event of failure. We feel that; in all likelihood of failure, this will become an economical disadvantage to the consumer. Our foremost concern is product safety. The panel accepted this proposal on a "fact finding study", and not on the merits of "product approval" by a testing lab. The substantiation for this proposal suggests that no protection from physical damage is necessary because the circuit for the nonmetallic extension is designed with "inherent" protection to protect against shock hazards.

Would you or your loved ones feel safe while driving a nail into an energized 120 volt circuit under any set of circumstances that could possible exist? Circuits containing "inherent" safety devices are vital in preventing shock hazards associated with approved wiring methods. We fee, however, that the "inherent" design of an electrical circuit is placed within the circuit to augment the safety of an acceptable wiring method, and not for the purpose of attempting to" make safe" the design of an unsafe circuit.

Make no mistake about it. We have been opposed to this wiring method for extending a branch circuit from the very beginning. The safety of an electrical circuit is a product of design and conditions of use. This product cannot be designed for its intended application, and meet the safety standards as set forth in 90.1.

In the name of safety, we have an obligation to recommend the rejection of this proposal.

7-56 Log #2231 NEC-P07 **Final Action: Accept**
(382.6)

Submitter: Richard Temblador, Southwire Company
Comment on Proposal No: 7-98
Recommendation: Revise text to read as follows:

382.6 Listing Requirements. Concealable nonmetallic extensions and associated fittings and devices shall be listed. The starting/source tap device for the extension shall contain and provide the following protection for all load-side extensions and devices:

(1) Supplementary over-current protection
(2) Level of protection equivalent to a Class A GFCI
(3) Level of protection equivalent to a portable GFCI
(4) Line and load-side miswire protection
(5) Provide protection from the effects of arc faults

Substantiation: The revised wording provides additional protection against possible arcing and miswired circuits. The UL Fact Finding Study supporting these additions is available at NFPA headquarters. The study showed that all shock and fire hazards were mitigated with the exception of arcing. The proposed revision requires arc fault protection to be added to the listing requirements. Line and Load-Side Miswire Protection addition improves the overall performance of all the integral safety functionality by insuring the system will not energize if either the line or load-side of the CNE is miswired.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept
Panel Statement: The Panel accepts the Fact Finding Report and resulting requirements to add arc fault and miswire protection.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:

LADART, S.: We disagree with the panel action. Supplementary overcurrent protection and active safety devices are always a welcomed addition to augment the safety of an acceptable wiring method, and not to attempt to "make safe" an unacceptable wiring method. Concealable nonmetallic extensions are an unacceptable wiring method, and the employment of active safety devices to protect the dangerous circuit is as ridiculous as the placement of "seat belts" on motorcycles. Proposal 7-98 should be rejected.

7-57 Log #1081 NEC-P07 **Final Action: Accept in Principle**
(382.6(4))

Submitter: David Shapiro, Safety First Electrical Contracting Consulting & Safety Education
Comment on Proposal No: 7-98
Recommendation: Add new text as follows:

382.6(4) Level of protection equivalent to that of a combination-type AFCI.

Substantiation: I share the grave concerns expressed by those who disagree with acceptance of this wiring method. I have observed for decades the frequency with which end-users damage even wiring methods that are quite visible, such as surface-run cable or surface raceway. It is rare that I can identify a location with confidence as one that is unlikely to subject a surface wiring method to mechanical damage. Mr. Stewart's point about its concealment is very troubling, too. While this method should enjoy protection equivalent to that of LDCI cords, AFCIs strength is that they protect against cables that are damaged in just such ways as this seems likely to experience.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 7-56.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:

LADART, S.: We disagree with the panel action. Supplementary overcurrent protection and active safety devices are always a welcomed addition to augment the safety of an acceptable wiring method, and not to attempt

to "make safe" an unacceptable wiring method. Concealable nonmetallic extensions are an unacceptable wiring method, and the employment of active safety devices to protect the dangerous circuit is as ridiculous as the placement of "seat belts" on motorcycles.

Comment on Affirmative:

STEWART, H.: The additional proposed protection mitigates the requirement of physical protection of concealable non-metallic extensions.

7-57a Log #CC700 NEC-P07 **Final Action: Accept**
(382.12(5))

Submitter: Code-Making Panel 7,
Comment on Proposal No: 7-99
Recommendation: Reject Proposal 7-99 and do not add new 382.12(5).
Substantiation: The listing for the products addresses the permitted use of the product under the provisions of Article 382. Acceptance of the recommendation of Proposal 7-99 would have precluded the intended use of nonmetallic extensions.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-58 Log #925 NEC-P07 **Final Action: Reject**
(382.12(5) (New))

Submitter: Samuel R. LaDart, City of Memphis / Rep. IBEW Local 474
Comment on Proposal No: 7-99
Recommendation: We agree with the panel action to accept this proposal. See my Affirmative Comment on Vote on this Proposal.
Substantiation: Non metallic extensions should never be installed where subject to physical damage.
Panel Meeting Action: Reject
Panel Statement: The listing for the products addresses the proper use of the product under the provisions of this Article.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 11 Negative: 3
Explanation of Negative:

ADAMS, M.: This wiring method is subject to physical damage. No electrical installation should be installed where physical damage is so easily anticipated.

FAHRENTHOLD, C.: Proposal 7-99 to add the requirement that the concealable nonmetallic extensions should not be permitted to be installed "where subject to physical damage" is consistent with the code. This requirement correlates with 300.4 which states that: "where subject to physical damage, conductors shall be protected." No where in 300.4 does it provide for an exception if the wiring has a "level of shock protection equivalent to a GFCI" which is the only requirement for the concealable nonmetallic extension that is part of Proposal 7-98.

The concealable nonmetallic extension should have as a requirement that they be protected from physical damage.

LADART, S.: We disagree with the panel action. The panel action on Proposal 7-99 at the proposal stage added a new 382.12(5) that provided: Nonmetallic extensions cannot be located where subject to physical damage. Comment 7-58 is an affirmative comment for the panel action taken at the proposal stage.

Comment 7-58 was initially accepted at the comment stage, and later revisited and rejected because it was obvious that some of the panel members wanted the new "concealable Flatwire method" of extending a branch circuit to be exempt from having to be protected from physical damage.

Comment on Affirmative:

DALY, J.: See my explanation of affirmative vote on Comment 7-59.

7-59 Log #1413 NEC-P07 **Final Action: Reject**
(382.12(5) (New))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 7-99
Recommendation: NEMA agrees with the panel action.
Substantiation: NEMA submits this comment to correct incorrect statements by the submitter and by Mr. Brown who submitted an affirmative comment. Statements were made that EMT (Electrical Metallic Tubing) is not permitted where subject to physical damage. Article 358 covers EMT and allows the use of EMT where not subject to severe physical damage. Since code users read the ROP for educational purposes in addition to keeping current on actions on code proposals, it is important to correct misstatements when they occur.
Panel Meeting Action: Reject
Panel Statement: The listing for the products addresses the proper use of the product under the provisions of this Article.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 2
Explanation of Negative:

ADAMS, M.: This wiring method is subject to physical damage. No electrical installation should be installed where physical damage is so easily anticipated.

LADART, S.: We disagree with the panel action. The panel action on Proposal 7-99 at the proposal stage added a new 382.12(5) that provided: Nonmetallic extensions cannot be located where subject to physical damage. Comment 7-59 is an affirmative comment for the panel action taken at the proposal stage. The panel rejected it at the comment stage.

Comment on Affirmative:

DALY, J.: NEMA votes in agreement with the panel action to reject Comments 7-58 and 7-59 and understands that the panel actions to reject these two comments and accept Comment 7-57a will result in the rejection of Proposal 7-99 and the text will remain as shown in the 2005 Code.

While NEMA agrees with the panel action to reject Comment 7-59 and Proposal 7-99, NEMA agrees with the substantiation in comment 7-59 that wanted to clarify the submitter's substantiation and the affirmative comment. Comment 7-59 was submitted to correct incorrect statements by the submitter and by Mr. Brown who submitted an affirmative comment. Statements were made that EMT (Electrical Metallic Tubing) is not permitted where subject to physical damage. Article 358 covers EMT and allows the use of EMT where not subject to severe physical damage. Since code users read the ROP and the ROC for educational purposes in addition to keeping current on actions on code proposals,it is important to correct misstatements when they occur.

(383 (New))

Submitter: Samuel R. LaDart, City of Memphis / Rep. IBEW Local 474
Comment on Proposal No: 7-101
Recommendation: We disagree with the panel action to accept this proposal.
Substantiation: This is a safety issue. The proposed wiring method is too fragile to be exposed to physical damage, and should not be allowed in the code.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 7-56.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 2
Explanation of Negative:

ADAMS, M.: This wiring method is subject to physical damage. No electrical installation should be installed where physical damage is so easily anticipated.

LADART, S.: We disagree with the panel action. Proposal 7-101 provides for a new article that covers the use, installation, and construction specifications for Concealable Nonmetallic Extensions.

Although we encourage and promote the development of new wiring methods, the Concealable Nonmetallic Extension method is unacceptable.

AC Flatwire is a fragile wiring method, with thin flat conductors, separated by thin layers of insulating material. The wiring method is designed to be surface mounted on a dwelling or office wall using adhesives, and then painted for "concelment". The system is designed to utilize an inherent safety system that is built within.

Good judgment has prevailed. Everyone with whom we have discussed this wiring method has quickly asked: Since I cannot see the "concealed wiring", how can I avoid penetrating it with a nail, screw, or some other foreign object? The answer is quite clear. You cannot protect this wiring method from physical damage. The proposal suggest that there is no need to protect the wiring method from physical damage. We disagree for a number of reasons. AC Flatwire is nonrepairable, and it must be stripped from the wall in the inevitable event of failure. We feel that; in all likelihood of failure, this will become an economical disadvantage to the consumer. Our foremost concern is product safety. The panel accepted this proposal on a "fact finding study", and not on the merits of "product approval" by a testing lab. The substantiation for this proposal suggests that no protection from physical damage is necessary because the circuit for the nonmetallic extension is designed with "inherent" protection to protect against shock hazards.

Would you or your loved ones feel safe while driving a nail into an energized 120 volt circuit under any set of circumstances that could possible exist?

Circuits containing "inherent" safety devices are vital in preventing shock hazards associated with approved wiring methods. We feel, however, that the "inherent" design of an electrical circuit is placed within the circuit to augment the safety of an acceptable wiring method, and not for the purpose of attemting to "make safe" the design of an unsafe circuit.

Make no mistake about it. We have been opposed to this wiring method for extending a branch circuit from the very beginning. The safety of an electrical circuit is a product of design and conditions of use. This product cannot be designed for its intended application, and meet the safety standards as set forth in 90.1.

In the name of safety, we have an obligation to recommend the rejection of this proposal.

ARTICLE 384 — STRUT-TYPE CHANNEL RACEWAY

8-75 Log #344 NEC-P08 **Final Action: Accept**
(384.22)

Submitter: Brian Dolan, IBEW/NECA Technical Institute
Comment on Proposal No: 8-170
Recommendation: Revise text to read:
Shall not exceed the percentage fill using Table 384.22 and applicable ~~Outside Diameter (OD) Dimensions~~ Cross-Sectional Area of specific types and sizes of wire given in the tables in Chapter 9.
Substantiation: The above change would facilitate greater efficiency in the application of the code section, and reduce confusion. Greater efficiency because the user is not asked to calculate the area of a conductor from its diameter, when the area is shown in the adjacent column. Less confusion because the user is not left to wonder if they are misinterpreting the code section, thinking there must be a reason why they are told to use the conductor diameter as a starting point, instead of the conductor cross-sectional area. This change would also eliminate the need for the user to recall and apply the formula for the area of a circle.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 388 — SURFACE NONMETALLIC RACEWAYS

8-76 Log #1928 NEC-P08 **Final Action: Accept**
(388.56)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 8-176
Recommendation: Accept the proposal in principle. Instead of deleting the word “removable”, replace it with “capable of being opened in place” placed immediately after the word “cover”. Instead of deleting the third sentence of the rule, retain it, but change “removable” to “capable of being opened in place” with those new words following the word “covers”.
Substantiation: Deleting the cover rules may end up distorting the meaning of this section. This comment addresses the submitter’s concern that a hinged cover of some sort that could not be removed might not qualify. The new wording in this comment provides access where it is required, while sidestepping the cover access provisions. It is unclear whether the provision as it emerged from the proposal period would have assured access and boxes where expected.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 392 — CABLE TRAYS

8-77 Log #1473 NEC-P08 **Final Action: Hold**
(392)

Submitter: Richard E. Loyd, Sun Lakes, AZ, James Imlah
Comment on Proposal No: 8-180
Recommendation: Revise Article 392 as follows:

ARTICLE 392 Cable Trays ~~-~~ Systems

I. General

392.1 Scope. This article covers cable tray systems, including ladder, ventilated trough, ventilated channel, solid bottom, and other similar structures.

FPN: For further information on cable trays, see ANSI/NEMA–VE 1-1998,Metal Cable Tray Systems; NEMA–VE 2-1996, Metal Cable Tray Installation Guidelines; and NEMA–FG-1998, Nonmetallic Cable Tray Systems.

392.2 Definition.
Cable Tray System. A unit or assembly of units or sections and associated fittings forming a structural system used to securely fasten or support cables and raceways.
FPN. Cable trays are not raceways they are mechanical support systems. See definition of raceway in Article 100.

ll. Installation

392.~~3~~ 10 Uses Permitted.
Complete System. Cable trays shall be installed as a complete system. ~~Cable trays and their associated fittings shall be identified for the intended use.~~
(A) Cable tray shall be permitted to be used as a support system for service conductors, feeders, branch circuits, communications circuits, control circuits, and signaling circuits.

(B) Cable tray installations shall not be limited to industrial establishments.

(C) Where exposed to direct rays of the sun, insulated conductors and jacketed cables shall be identified as being sunlight resistant.

(D) Cable tray systems shall be permitted to have mechanically discontinuous segments between cable tray runs or between cable tray runs and equipment. The system shall provide for the support of the cables in accordance with their corresponding articles.

(E Where cable trays support individual conductors and where the conductors pass from one cable tray to another, or from a cable tray to raceway(s) or from a cable tray to equipment where the conductors are terminated, the distance between cable trays or between the cable tray and the raceway(s) or the equipment shall not exceed 1.8 m (6 ft). The conductors shall be secured to the cable tray(s) at the transition, and they shall be protected, by guarding or by location, from physical damage.

(F) In all ~~L~~ locations ~~(A) Wiring Methods. T~~he wiring methods in Table 392.~~3~~10~~(A)~~ (F) shall be permitted to be installed in cable tray systems under the conditions described in their respective articles and sections.

Table 392.~~3~~10~~(A)(6)~~ (F) Wiring Methods

Wiring Method	Article Section
Armored cable	320
Communication raceways	800
Electrical metallic tubing	358
Electrical nonmetallic tubing	362
Fire alarm cables	760
Flexible metal conduit	348
Flexible metallic tubing	360
Instrumentation tray cable	727
Intermediate metal conduit	342
Liquidtight flexible metal conduit	350
Liquidtight flexible nonmetallic conduit	356
Metal-clad cable	330
Mineral-insulated, metal-sheathed cable	332
Multiconductor service-entrance cable	338
Multiconductor underground feeder and branch-circuit cable	340
Multipurpose and communications cables	800
Nonmetallic-sheathed cable	334
Power and control tray cable	336
Power-limited tray cable	725.61(C) and 725.82(E)
Optical fiber cables	770
Optical fiber raceways	770
Rigid metal conduit	344
Rigid nonmetallic conduit	352

Other factory-assembled, multiconductor control, signal, or power cables that are specifically approved for installation in cable trays.

~~B)~~ (G) In Industrial Establishments Only. The wiring methods in Table 392.~~3~~(A) 10 (F) shall be permitted to be used in any industrial establishment under the conditions described in their respective articles. In industrial establishments only, where conditions of maintenance and supervision ensure that only qualified persons service the installed cable tray system any of the cables in 392.~~3~~ 10(G) (1) ~~(B)(1)~~ and (G) (4) ~~(B)(2)~~ shall be permitted to be installed in ladder, ventilated trough, solid bottom, or ventilated channel cable trays.

~~(1) Single Conductors. Single-conductor cables shall be permitted to be installed in accordance with (B)(1)(a) through (B)(1)(c).~~
~~(a)~~ (1) Single-conductor cable shall be 1/0 AWG or larger and shall be of a type listed and marked on the surface for use in cable trays. Where 1/0 AWG through 4/0 AWG single-conductor cables are installed in ladder cable tray, the maximum allowable rung spacing for the ladder cable tray shall be 225 mm (9 in.).

~~(b)~~ (2) Welding cables shall comply with the provisions of Article 630, Part IV.

~~(c)~~ (3) Single conductors used as equipment grounding conductors shall be insulated, covered, or bare, and they shall be 4 AWG or larger.

~~(2)~~ ~~(d)~~ (4) Medium Voltage. Single- and multiconductor medium voltage cables shall be Type MV cable. Single conductors shall be installed in accordance with 392.~~3~~(B)(1)10~~(5)(a).~~(G)(1)

~~(C)~~ (H) Equipment Grounding Conductors. Metallic cable trays shall be permitted to be used as equipment grounding conductors where continuous maintenance and supervision ensure that qualified persons service the installed cable tray system and the cable tray complies with provisions of 392.~~7~~ 60.

~~(D)~~ (I) Hazardous (Classified) Locations. Cable trays in hazardous (classified) locations shall contain only the cable types permitted in 501.10, 502.10, 503.10, 504.20, and 505.15.

~~(E)~~ (J) Nonmetallic Cable Tray. In addition to the uses permitted elsewhere in 392.~~3~~ (10), nonmetallic cable tray shall be permitted in corrosive areas and in areas requiring voltage isolation.

~~392.6 (E)~~ (K) Multiconductor Cables Rated 600 Volts or Less. Multiconductor cables rated 600 volts or less shall be permitted to be installed in the same cable tray.

~~392.6(F)~~ (L)Cables Rated Over 600 Volts. Cables rated over 600 volts and those rated 600 volts or less installed in the same cable tray shall comply with either of the following:

(1 The cables rated over 600 volts are Type MC.

(2) The cables rated over 600 volts are separated from the cables rated 600 volts or less by a solid fixed barrier of a material compatible with the cable tray.

~~392.6(G)~~ (M)Through Partitions and Walls. Cable trays shall be permitted to extend transversely through partitions and walls or vertically through platforms and floors in wet or dry locations where the installations, complete with installed cables, are made in accordance with the requirements of 300.21.

~~392.6(H)~~ (N) Exposed and Accessible. Cable trays shall be exposed and accessible except as permitted by 392.~~6(G)~~ 10(~~13~~) (M).

~~392.6(I)~~ (O) Adequate Access. Sufficient space shall be provided and maintained about cable trays to permit adequate access for installing and maintaining the cables.

392.~~←~~12 Uses Not Permitted.

Cable tray systems shall not be used in hoistways or where subject to severe physical damage. Cable tray systems shall not be used in ducts, plenums, and other air-handling spaces, except as permitted in 300.22, to support wiring methods recognized for use in such spaces.

~~392.6(B)~~ 392.22 Conductors and Multiconductor Cables Completed Before Installation. Each run of cable tray shall be completed before the installation of cables.

~~392.8(D)~~ (A) Connected in Parallel.

(1) Where single conductor cables comprising each phase, neutral; or grounded conductor of an alternating-current circuit are connected in parallel as permitted in 310.4, the conductors shall be installed in groups consisting of not more than one conductor per phase, neutral, or grounded conductor to prevent current imbalance in the paralleled conductors due to inductive reactance.

(2) Single conductors shall be securely bound in circuit groups to prevent excessive movement due to fault-current magnetic forces unless single conductors are cabled together, such as triplexed assemblies.

~~392.8(E)~~ (B) Single Conductors. Where any of the single conductors installed in ladder or ventilated trough cable trays are 1/0 through 4/0 AWG, all single conductors shall be installed in a single layer. Conductors that are bound together to comprise each circuit group shall be permitted to be installed in other than a single layer.

~~392.9~~ (C) Number of Multiconductor Cables, Rated 2000 Volts or Less, in Cable Trays.

The number of multiconductor cables, rated 2000 volts or less, permitted in a single cable tray shall not exceed the requirements of this section. The conductor sizes herein apply to both aluminum and copper conductors.

(~~A~~) (1) Any Mixture of Cables. Where ladder or ventilated trough cable trays contain multiconductor power or lighting cables, or any mixture of multiconductor power, lighting, control, and signal cables, the maximum number of cables shall conform to the following:

~~(1)~~ (a) Where all of the cables are 4/0 AWG or larger, the sum of the diameters of all cables shall not exceed the cable tray width, and the cables shall be installed in a single layer.

~~(2)~~ (b) Where all of the cables are smaller than 4/0 AWG, the sum of the cross-sectional areas of all cables shall not exceed the maximum allowable cable fill area in Column 1 of Table 392.~~9~~ 22 (C) for the appropriate cable tray width.

~~(3)~~ (c) Where 4/0 AWG or larger cables are installed in the same cable tray with cables smaller than 4/0 AWG, the sum of the cross-sectional areas of all cables smaller than 4/0 AWG shall not exceed the maximum allowable fill area resulting from the calculation in Column 2 of Table 392.9 22 (C) for the appropriate cable tray width. The 4/0 AWG and larger cables shall be installed in a single layer, and no other cables shall be placed on them.

Table 392.22(C) Allowable Cable Fill Area for Multiconductor Cables in Ladder, Ventilated Trough, or Solid Bottom Cable Trays for Cables Rated 2000 Volts or Less

Maximum Allowable Fill Area for Multiconductor Cables									
		Ladder or Ventilated Trough Cable Trays, 392.22~~9(A~~(C) (1)				Solid Bottom Cable Trays, 392.22~~9(C~~)22(C) (3)			
Inside Width of Cable Tray		Column 1 Applicable for 392.~~9(A~~22(C) (1)~~(2)~~ (b) Only		Column 2[a] Applicable for 392.~~9(A~~22 (C) (1) ~~(3)~~ (c) Only		Column 3 Applicable for 392.~~9(C)(2)~~ 22 (C) (2) (b)Only		Column 4a Applicable for 392.~~9 (C)(3)~~ 22 (c) Only	
mm	in.	mm2	in.2	mm2	in.2	mm2	in.2	mm2	in.2
150	6.0	4,500	7.0	4,500 – (30 Sd)[b]	7– (1.2 Sd)[b]	3,500	5.5	3,500–(25 Sd[b])	5.5–Sd[b]
225	9.0	6,800	10.5	6,800 – (30 Sd)	10.5– (1.2 Sd)	5,100	8.0	5,100–(25 Sd)	8.0–Sd
300	12.0	9,000	14.0	9,000 – (30 Sd)	14– (1.2 Sd)	7,100	11.0	7,100–(25 Sd)	11.0–Sd
450	18.0	13,500	21.0	13,500 – (30 Sd)	21– (1.2 Sd)	10,600	16.5	10,600–(25 Sd)	16.5–Sd
600	24.0	18,000	28.0	18,000 – (30 Sd)	28– (1.2 Sd)	14,200	22.0	14,200–(25 Sd)	22.0–Sd
750	30.0	22,500	35.0	22,500 – (30 Sd)	35– (1.2 Sd)	17,700	27.5	17,700–(25 Sd)	27.5–Sd
900	36.0	27,000	42.0	27,000 – (30 Sd)	42– (1.2 Sd)	21,300	33.0	21,300–(25 Sd)	33.0–Sd

[a] The maximum allowable fill areas in Columns 2 and 4 shall be calculated. For example, the maximum allowable fill in mm2 for a 150-mm wide cable tray in Column 2 shall be 4500 minus (30 multiplied by Sd) [the maximum allowable fill, in square inches, for a 6-in. wide cable tray in Column 2 shall be 7 minus (1.2 multiplied by Sd)].

[b]The term Sd in Columns 2 and 4 is equal to the sum of the diameters, in mm, of all cables 107.2 mm (in inches, of all 4/0 AWG) and larger multiconductor cables in the same cable tray with smaller cables.

(B) (2) Multiconductor Control and/or Signal Cables Only.

(a) Where a ladder or ventilated trough cable tray having a usable inside depth of 150 mm (6 in.) or less contains multiconductor control and/or signal cables only, the sum of the cross-sectional areas of all cables at any cross section shall not exceed 50 percent of the interior cross-sectional area of the cable tray.

(b) A depth of 150 mm (6 in.) shall be used to calculate the allowable interior cross-sectional area of any cable tray that has a usable inside depth of more than 150 mm (6 in.).

(C) (3) Solid Bottom Cable Trays Containing Any Mixture. Where solid bottom cable trays contain multiconductor power or lighting cables, or any mixture of multiconductor power, lighting, control, and signal cables, the maximum number of cables shall conform to the following:

(1) (a) where all of the cables are 4/0 AWG or larger, the sum of the diameters of all cables shall not exceed 90 percent of the cable tray width, and the cables shall be installed in a single layer.

(2) (b) Where all of the cables are smaller than 4/0 AWG, the sum of the cross-sectional areas of all cables shall not exceed the maximum allowable cable fill area in Column 3 of Table 392.9 22 (C)for the appropriate cable tray width.

(3) (c) Where 4/0 AWG or larger cables are installed in the same cable tray with cables smaller than 4/0 AWG, the sum of the cross-sectional areas of all cables smaller than 4/0 AWG shall not exceed the maximum allowable fill area resulting from the computation in Column 4 of Table 392.9 22 (C) for the appropriate cable tray width. The 4/0 AWG and larger cables shall be installed in a single layer, and no other cables shall be placed on them.

(D) (4) Solid Bottom Cable Tray — Multiconductor Control and/or Signal Cables Only.

(a) Where a solid bottom cable tray having a usable inside depth of 150 mm (6 in.) or less contains multiconductor control and/or signal cables only, the sum of the cross-sectional areas of all cables at any cross section shall not exceed 40 percent of the interior cross-sectional area of the cable tray.

(b) A depth of 150 mm (6 in.) shall be used to calculate the allowable interior cross-sectional area of any cable tray that has a usable inside depth of more than 150 mm (6 in.).

(E) (5) Ventilated Channel Cable Trays. Where ventilated channel cable trays contain multiconductor cables of any type, the following shall apply:

(1) (a) Where only one multiconductor cable is installed, the cross-sectional area shall not exceed the value specified in Column 1 of Table 392.9(E).22 (C) (5)

(2) (b) Where more than one multiconductor cable is installed, the sum of the cross-sectional area of all cables shall not exceed the value specified in Column 2 of Table 392.9(E).22 (C) (5)

Table 392.9(E) 392.22(C)(5) Allowable Cable Fill Area for Multiconductor Cables in Ventilated Channel Cable Trays for Cables Rated 2000 Volts or Less

Inside Width of Cable Tray		Maximum Allowable Fill Area for Multiconductor Cables			
		Column 1 One Cable		Column 2 More Than One Cable	
mm	in.	mm2	in.2	mm2	in.2
75	3	1500	2.3	850	1.3
100	4	2900	4.5	1600	2.5
150	6	4500	7.0	2450	3.8

(F) (6) Solid Channel Cable Trays. Where solid channel cable trays contain multiconductor cables of any type, the following shall apply:

(1) (a) Where only one multiconductor cable is installed, the cross-sectional area of the cable shall not exceed the value specified in Column 1 of Table 392.9(F) 22 (C) (6).

(2) (b) Where more than one multiconductor cable is installed, the sum of the cross-sectional area of all cable shall not exceed the value specified in Column 2 of Table 392.9(F) 22 (C) (6).

Table 392.9(F)392.22(C)(6) Allowable Cable Fill Area for Multiconductor Cables in Solid Channel Cable Trays for Cables Rated 2000 Volts or Less

Inside Width of Cable Tray		Column 1 One Cable		Column 2 More Than One Cable	
mm	in.	mm2	in.2	mm2	in.2
50	2	850	1.3	500	0.8
75	3	1300	2.0	700	1.1
100	4	2400	3.7	1400	2.1
150	6	3600	5.5	2100	3.2

392.10 392.22 (D) Number of Single-Conductor Cables, Rated 2000 Volts or Less, in Cable Trays.

The number of single-conductor cables, rated 2000 volts or less, permitted in a single cable tray section shall not exceed the requirements of this section. The single conductors, or conductor assemblies, shall be evenly distributed across the cable tray. The conductor sizes herein apply to both aluminum and copper conductors.

(A) (1) Ladder or Ventilated Trough Cable Trays. Where ladder or ventilated trough cable trays contain single-conductor cables, the maximum number of single conductors shall conform to the following:

(1) (a) Where all of the cables are 1000 kcmil or larger, the sum of the diameters of all single conductor cables shall not exceed cable tray width, and the cables shall be installed in a single layer. Conductors that are bound together to comprise each circuit group shall be permitted to be installed in other than a single layer.

(2) (b) Where all of the cables are from 250 kcmil up to 1000 kcmil, the sum of the cross-sectional areas of all single-conductor cables shall not exceed the maximum allowable cable fill area in Column 1 of Table 392.10(A) 22(D) for the appropriate cable tray width.

(3) (c) Where 1000 kcmil or larger single-conductor cables are installed in the same cable tray with single-conductor cables smaller than 1000 kcmil, the sum of the cross-sectional areas of all cables smaller than 1000 kcmil shall not exceed the maximum allowable fill area resulting from the computation in Column 2 of Table 392.10(A) 392.22(D) for the appropriate cable tray width.

(4) d Where any of the single conductor cables are 1/0 through 4/0 AWG, the sum of the diameters of all single conductor cables shall not exceed the cable tray width.

(B) (2) Ventilated Channel Cable Trays. Where 50 mm (2 in.), 75 mm (3 in.), 100 mm (4 in.), or 150 mm (6 in.) wide ventilated channel cable trays contain single-conductor cables, the sum of the diameters of all single conductors shall not exceed the inside width of the channel.

392.12 (E) Number of Type MV and Type MC Cables (2001 Volts or Over) in Cable Trays.

The number of cables rated 2001 volts or over permitted in a single cable tray shall not exceed the requirements of this section.

(1) The sum of the diameters of single-conductor and multiconductor cables shall not exceed the cable tray width, and the cables shall be installed in a single layer.

(2) Where single conductor cables are triplexed, quadruplexed, or bound together in circuit groups, the sum of the diameters of the single conductors shall not exceed the cable tray width, and these groups shall be installed in single layer arrangement.

Table 392.10(A) 392.22 (D) Allowable Cable Fill Area for Single-Conductor Cables in Ladder or Ventilated Trough Cable Trays for Cables Rated 2000 Volts or Less

Inside Width of Cable Tray		Maximum Allowable Fill Area for Single-Conductor Cables in Ladder or Ventilated Trough Cable Trays			
		Column 1 Applicable for 392.10(A)(2) 22 (D) (1) (b) Only		Column 2a Applicable for 392.10(A)(3) 392.22 (D) (1) (c) Only	
mm	in.	mm2	in.2	mm2	in.2
150	6	4,200	6.5	4,200 – (28 Sd)[b]	6.5 – (1.1 Sd)[b]
225	9	6,100	9.5	6,100 – (28 Sd)	9.5 – (1.1 Sd)
300	12	8,400	13.0	8,400 – (28 Sd)	13.0 – (1.1 Sd)
450	18	12,600	19.5	12,600 – (28 Sd)	19.5 – (1.1 Sd)
600	24	16,800	26.0	16,800 – (28 Sd)	26.0 – (1.1 Sd)
750	30	21,000	32.5	21,000 – (28 Sd)	32.5 – (1.1 Sd)
900	36	25,200	39.0	25,200 – (28 Sd)	39.0 – (1.1 Sd)

[a]The maximum allowable fill areas in Column 2 shall be calculated. For example, the maximum allowable fill, in mm2, for a 150 mm wide cable tray in Column 2 shall be 4200 minus (28 multiplied by Sd) [the maximum allowable fill, in square inches, for a 6-in. wide cable tray in Column 2 shall be 6.5 minus (1.1 multiplied by Sd)].

[b]The term Sd in Column 2 is equal to the sum of the diameters, in mm, of all cables 507 mm2 (in inches, of all 1000 kcmil) and larger single-conductor cables in the same ladder or ventilated trough cable tray with small cables.

~~392.6(A)~~ 392.24 Field Bends or Modifications ~~How Made.~~ Field bends or modifications shall be so made that the electrical continuity of the cable tray system and support for the cables is maintained.

~~392.5(B)~~ 392.28 Smooth Edges. Cable trays shall not have sharp edges, burrs, or projections that could damage the insulation or jackets of the wiring.

~~392.6(C)~~ 392.30 Supports.
A. Cable Supports
(1)Supports shall be provided to prevent stress on cables where they enter raceways or other enclosures from cable tray systems.
~~392.8 (B)~~(2) (B) ~~Fastened Securely.~~ In other than horizontal runs, the cables shall be fastened securely to transverse members of the cable trays.
~~(A)~~ (B) Cable trays shall be supported at intervals in accordance with the installation instructions.
~~(B)~~ (C) ~~392.6(J)~~ Raceways, Cables, Boxes, and Conduit Bodies Supported from Cable Tray Systems.
(1) In industrial facilities where conditions of maintenance and supervision ensure that only qualified persons service the installation and where the cable tray systems are designed and installed to support the load, such systems shall be permitted to support raceways and cables, and boxes and conduit bodies covered in 314.1.
~~(a)~~ (2) For raceways terminating at the tray, a listed cable tray clamp or adapter shall be used to securely fasten the raceway to the cable tray system. Additional supporting and securing of the raceway shall be in accordance with the requirements of the appropriate raceway article.
~~(b)~~ (3) For raceways or cables running parallel to and attached to the bottom or side of a cable tray system, fastening and supporting shall be in accordance with the requirements of the appropriate raceway or cable article.
~~(c)~~ (4) For boxes and conduit bodies attached to the bottom or side of a cable tray system, fastening and supporting shall be in accordance with the requirements of 314.23.

~~392.5 (E) & 392.3~~ 392.40 ~~(D) Boxes and~~ Fittings and Covers.

~~392.5(E)~~ 392.40(A) Fittings.
(1) Cable trays shall include fittings or other suitable means for changes in direction and elevation of runs.
~~392.3~~ (2) Cable trays and associated fittings shall be identified for the intended use.

~~392.6(D)~~(B) Covers. In portions of runs where additional protection is required, covers or enclosures providing the required protection shall be of a material that is compatible with the cable tray.

~~392.8(C)~~ 392.46 Bushed Conduit and Tubing. A box shall not be required where cables or conductors are installed in bushed conduit and tubing used for support or for protection against physical damage.

~~392.8(A)~~ 392.56 Cable Splices. Cable splices made and insulated by approved methods shall be permitted to be located within a cable tray, provided they are accessible and do not project above the side rails.

392.60 Grounding and Bonding.

~~392.7~~ 392.60 (A) Grounding
(A) Metallic Cable Trays. Metallic cable trays that support electrical conductors shall be grounded as required for conductor enclosures in accordance with 250.96.
(~~B~~ 1) Steel or Aluminum Cable Tray Systems. Steel or aluminum cable tray systems shall be permitted to be used as equipment grounding conductors, provided that all the following requirements are met:
~~(1)~~ a The cable tray sections and fittings shall be identified for grounding purposs.
~~(2)~~ b The minimum cross-sectional area of cable trays shall conform to the requirements in Table 392.~~7(B).~~60 (A)
~~(3)~~ c All cable tray sections and fittings shall be legibly and durably marked to show the cross-sectional area of metal in channel cable trays, or cable trays of one-piece construction, and the total cross-sectional area of both side rails for ladder or trough cable trays.
~~(4)~~ d Cable tray sections, fittings, and connected raceways shall be bonded in accordance with 250.96, using bolted mechanical connectors or bonding jumpers sized and installed in accordance with 250.102.

1600	—	—	967.5	1.50
2000	—	—	1290	2.00[b]

[a]Total cross-sectional area of both side rails for ladder or trough cable trays; or the minimum cross-sectional area of metal in channel cable trays or cable trays of one-piece construction.
[b]Steel cable trays shall not be used as equipment grounding conductors for circuits with ground-fault protection above 600 amperes. Aluminum cable trays shall not be used as equipment grounding conductors for circuits with ground-fault protection above 2000 amperes.

~~292.6(A)~~ 392.60(B) Bonding. A bonding jumper sized in accordance with 250.102 shall connect the two sections of cable tray, or the cable tray and the raceway or equipment. Bonding shall be in accordance with 250.96.

~~392.11~~ 392. 80 Ampacity of Cables, Rated 2000 Volts or Less, in Cable Trays.
(A) Multiconductor Cables. The allowable ampacity of multiconductor cables, nominally rated 2000 volts or less, installed according to the requirements of 392.9 shall be as given in Table 310.16 and Table 310.18, subject to the provisions of (1), (2), (3), and 310.15(A)(2).
(1) The derating factors of 310.15(B)(2)(a) shall apply only to multiconductor cables with more than three current-carrying conductors. Derating shall be limited to the number of current-carrying conductors in the cable and not to the number of conductors in the cable tray.
(2) Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, not over 95 percent of the allowable ampacities of Table 310.16 and Table 310.18 shall be permitted for multiconductor cables.
(3) Where multiconductor cables are installed in a single layer in uncovered trays, with a maintained spacing of not less than one cable diameter between cables, the ampacity shall not exceed the allowable ambient temperature-corrected ampacities of multiconductor cables, with not more than three insulated conductors rated 0 through 2000 volts in free air, in accordance with 310.15(C).
FPN: See Table B.310.3.
(B) Single-Conductor Cables. The allowable ampacity of single-conductor cables shall be as permitted by 310.15(A)(2). The derating factors of 310.15(B)(2)(a) shall not apply to the ampacity of cables in cable trays. The ampacity of single-conductor cables, or single conductors cabled together (triplexed, quadruplexed, etc.), nominally rated 2000 volts or less, shall comply with the following:
(1) Where installed according to the requirements of 392.10, the ampacities for 600 kcmil and larger single-conductor cables in uncovered cable trays shall not exceed 75 percent of the allowable ampacities in Table 310.17 and Table 310.19. Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 600 kcmil and larger cables shall not exceed 70 percent of the allowable ampacities in Table 310.17 and Table 310.19.
(2) Where installed according to the requirements of 392.10, the ampacities for 1/0 AWG through 500 kcmil single-conductor cables in uncovered cable trays shall not exceed 65 percent of the allowable ampacities in Table 310.17 and Table 310.19. Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 1/0 AWG through 500 kcmil cables shall not exceed 60 percent of the allowable ampacities in Table 310.17 and Table 310.19.
(3) Where single conductors are installed in a single layer in uncovered cable trays, with a maintained space of not less than one cable diameter between

individual conductors, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities in Table 310.17 and Table 310.19.

Exception to (B)(3): For solid bottom cable trays the ampacity of single conductor cables shall be determined by 310.15(C).

(4) Where single conductors are installed in a triangular or square configuration in uncovered cable trays, with a maintained free airspace of not less than 2.15 times one conductor diameter (2.15 × O.D.) of the largest conductor contained within the configuration and adjacent conductor configurations or cables, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities of two or three single insulated conductors rated 0 through 2000 volts supported on a messenger in accordance with 310.15(B).

FPN: See Table 310.20.

~~392.13~~ ~~392.64~~(C) Ampacity of Type MV and Type MC Cables (2001 Volts or Over) in Cable Trays.

The ampacity of cables rated 2001 volts, nominal, or over, installed according to ~~392.12~~ 392.22(E) shall not exceed the requirements of this section.

(A) Multiconductor Cables (2001 Volts or Over). The allowable ampacity of multiconductor cables shall be as given in Table 310.75 and Table 310.76, subject to the following provisions:

(1) Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, not more than 95 percent of the allowable ampacities of Table 310.75 and Table 310.76 shall be permitted for multiconductor cables.

(2) Where multiconductor cables are installed in a single layer in uncovered cable trays, with maintained spacing of not less than one cable diameter between cables, the ampacity shall not exceed the allowable ampacities of Table 310.71 and Table 310.72.

(B) Single-Conductor Cables (2001 Volts or Over). The ampacity of single-conductor cables, or single conductors cabled together (triplexed, quadruplexed, etc.), shall comply with the following:

(1) The ampacities for 1/0 AWG and larger single-conductor cables in uncovered cable trays shall not exceed 75 percent of the allowable ampacities in Table 310.69 and Table 310.70. Where the cable trays are covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 1/0 AWG and larger single-conductor cables shall not exceed 70 percent of the allowable ampacities in Table 310.69 and Table 310.70.

(2) Where single-conductor cables are installed in a single layer in uncovered cable trays, with a maintained space of not less than one cable diameter between individual conductors, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities in Table 310.69 and Table 310.70.

(3) Where single conductors are installed in a triangular or square configuration in uncovered cable trays, with a maintained free air space of not less than 2.15 times the diameter (2.15 × O.D.) of the largest conductor contained within the configuration and adjacent conductor configurations or cables, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities in

III Construction Specifications

~~392.5 Construction Specifications~~.

~~392.5~~ 392.100 Construction

(A) Strength and Rigidity. Cable trays shall have suitable strength and rigidity to provide adequate support for all contained wiring.

~~392.5 (D)~~ (B) Side Rails. Cable trays shall have side rails or equivalent structural members.

~~392.5(C)~~ 392.110 Corrosion Protection. Cable tray systems shall be corrosion resistant. If made of ferrous material, the system shall be protected from corrosion as required by 300.6.

~~392.5(F)~~ 392.116 Nonmetallic Cable Tray. Nonmetallic cable trays shall be made of flame-retardant material.

Revised Article 392 would show as follows:

ARTICLE 392 Cable Tray Systems

I. General

392.1 Scope. This article covers cable tray systems, including ladder, ventilated trough, ventilated channel, solid bottom, and other similar structures.

FPN: For further information on cable trays, see ANSI/NEMA–VE 1-1998,Metal Cable Tray Systems; NEMA–VE 2-1996, Metal Cable Tray Installation Guidelines; and NEMA–FG-1998, Nonmetallic Cable Tray Systems.

392.2 Definition.

Cable Tray System. A unit or assembly of units or sections and associated fittings forming a structural system used to securely fasten or support cables and raceways.

FPN. Cable trays are not raceways they are mechanical support systems. See definition of raceway in Article 100.

ll. Installation

392.10 Uses Permitted.

Complete System. Cable trays shall be installed as a complete system.

(A) Cable tray shall be permitted to be used as a support system for service conductors, feeders, branch circuits, communications circuits, control circuits, and signaling circuits.

(B) Cable tray installations shall not be limited to industrial establishments.

(C) Where exposed to direct rays of the sun, insulated conductors and jacketed cables shall be identified as being sunlight resistant.

(D) Cable tray systems shall be permitted to have mechanically discontinuous segments between cable tray runs or between cable tray runs and equipment. The system shall provide for the support of the cables in accordance with their corresponding articles.

(E) Where cable trays support individual conductors and where the conductors pass from one cable tray to another, or from a cable tray to raceway(s) or from a cable tray to equipment where the conductors are terminated, the distance between cable trays or between the cable tray and the raceway(s) or the equipment shall not exceed 1.8 m (6 ft). The conductors shall be secured to the cable tray(s) at the transition, and they shall be protected, by guarding or by location, from physical damage.

(F) In all locations the wiring methods in Table 392.10 (F) shall be permitted to be installed in cable tray systems under the conditions described in their respective articles and sections.

Table 392.10-(F) Wiring Methods

Wiring Method	Article Section
Armored cable	320
Communication raceways	800
Electrical metallic tubing	358
Electrical nonmetallic tubing	362
Fire alarm cables	760
Flexible metal conduit	348
Flexible metallic tubing	360
Instrumentation tray cable	727
Intermediate metal conduit	342
Liquidtight flexible metal conduit	350
Liquidtight flexible nonmetallic conduit	356
Metal-clad cable	330
Mineral-insulated, metal-sheathed cable	332
Multiconductor service-entrance cable	338
Multiconductor underground feeder and branch-circuit cable	340
Multipurpose and communications cables	800
Nonmetallic-sheathed cable	334
Power and control tray cable	336
Power-limited tray cable	725.61(C) and 725.82(E)
Optical fiber cables	770
Optical fiber raceways	770
Rigid metal conduit	344
Rigid nonmetallic conduit	352

Other factory-assembled, multiconductor control, signal, or power cables that are specifically approved for installation in cable trays.

(G) In Industrial Establishments Only. The wiring methods in Table 392.10 (F) shall be permitted to be used in any industrial establishment under the conditions described in their respective articles. In industrial establishments only, where conditions of maintenance and supervision ensure that only qualified persons service the installed cable tray system any of the cables in 392.10(G) (1) and (G) (4) shall be permitted to be installed in ladder, ventilated trough, solid bottom, or ventilated channel cable trays.

(1) Single-conductor cable shall be 1/0 AWG or larger and shall be of a type listed and marked on the surface for use in cable trays. Where 1/0 AWG through 4/0 AWG single-conductor cables are installed in ladder cable tray, the maximum allowable rung spacing for the ladder cable tray shall be 225 mm (9 in.).

(2) Welding cables shall comply with the provisions of Article 630, Part IV.

(3)Single conductors used as equipment grounding conductors shall be insulated, covered, or bare, and they shall be 4 AWG or larger.

(4) Medium Voltage. Single- and multiconductor medium voltage cables shall be Type MV cable. Single conductors shall be installed in accordance with 392.10(G) (1)

(H) Equipment Grounding Conductors. Metallic cable trays shall be permitted to be used as equipment grounding conductors where continuous maintenance and supervision ensure that qualified persons service the installed cable tray system and the cable tray complies with provisions of 392.60.

(I) Hazardous (Classified) Locations. Cable trays in hazardous (classified) locations shall contain only the cable types permitted in 501.10, 502.10, 503.10, 504.20, and 505.15.

(J) Nonmetallic Cable Tray. In addition to the uses permitted elsewhere in 392.10, nonmetallic cable tray shall be permitted in corrosive areas and in areas requiring voltage isolation.

(K) Multiconductor Cables Rated 600 Volts or Less. Multiconductor cables rated 600 volts or less shall be permitted to be installed in the same cable tray.

(L)Cables Rated Over 600 Volts. Cables rated over 600 volts and those rated 600 volts or less installed in the same cable tray shall comply with either of the following:

(1) The cables rated over 600 volts are Type MC.

(2) The cables rated over 600 volts are separated from the cables rated 600 volts or less by a solid fixed barrier of a material compatible with the cable tray.

(M)Through Partitions and Walls. Cable trays shall be permitted to extend transversely through partitions and walls or vertically through platforms and floors in wet or dry locations where the installations, complete with installed cables, are made in accordance with the requirements of 300.21.

(N) Exposed and Accessible. Cable trays shall be exposed and accessible except as permitted by 392.10 (M).

(O) Adequate Access. Sufficient space shall be provided and maintained about cable trays to permit adequate access for installing and maintaining the cables.

392.12 Uses Not Permitted.

Cable tray systems shall not be used in hoistways or where subject to severe physical damage. Cable tray systems shall not be used in ducts, plenums, and other air-handling spaces, except as permitted in 300.22, to support wiring methods recognized for use in such spaces.

392.22 Conductors and Multiconductor Cables Completed Before Installation.

Each run of cable tray shall be completed before the installation of cables.

(A) Connected in Parallel.

(1) Where single conductor cables comprising each phase, neutral; or grounded conductor of an alternating-current circuit are connected in parallel as permitted in 310.4, the conductors shall be installed in groups consisting of not more than one conductor per phase, neutral, or grounded conductor to prevent current imbalance in the paralleled conductors due to inductive reactance.

(2) Single conductors shall be securely bound in circuit groups to prevent excessive movement due to fault-current magnetic forces unless single conductors are cabled together, such as triplexed assemblies.

(B) Single Conductors. Where any of the single conductors installed in ladder or ventilated trough cable trays are 1/0 through 4/0 AWG, all single conductors shall be installed in a single layer. Conductors that are bound together to comprise each circuit group shall be permitted to be installed in other than a single layer.

(C) Number of Multiconductor Cables, Rated 2000 Volts or Less, in Cable Trays.

The number of multiconductor cables, rated 2000 volts or less, permitted in a single cable tray shall not exceed the requirements of this section. The conductor sizes herein apply to both aluminum and copper conductors.

(1) Any Mixture of Cables. Where ladder or ventilated trough cable trays contain multiconductor power or lighting cables, or any mixture of multiconductor power, lighting, control, and signal cables, the maximum number of cables shall conform to the following:

(a) Where all of the cables are 4/0 AWG or larger, the sum of the diameters of all cables shall not exceed the cable tray width, and the cables shall be installed in a single layer.

(b) Where all of the cables are smaller than 4/0 AWG, the sum of the cross-sectional areas of all cables shall not exceed the maximum allowable cable fill area in Column 1 of Table 392.22 (C) for the appropriate cable tray width.

(c) Where 4/0 AWG or larger cables are installed in the same cable tray with cables smaller than 4/0 AWG, the sum of the cross-sectional areas of all cables smaller than 4/0 AWG shall not exceed the maximum allowable fill area resulting from the calculation in Column 2 of Table 392.22 (C) for the appropriate cable tray width. The 4/0 AWG and larger cables shall be installed in a single layer, and no other cables shall be placed on them.

(2) Multiconductor Control and/or Signal Cables Only.

(a) Where a ladder or ventilated trough cable tray having a usable inside depth of 150 mm (6 in.) or less contains multiconductor control and/or signal cables only, the sum of the cross-sectional areas of all cables at any cross section shall not exceed 50 percent of the interior cross-sectional area of the cable tray.

(b) A depth of 150 mm (6 in.) shall be used to calculate the allowable interior cross-sectional area of any cable tray that has a usable inside depth of more than 150 mm (6 in.).

Table 392.22(C) Allowable Cable Fill Area for Multiconductor Cables in Ladder, Ventilated Trough, or Solid Bottom Cable Trays for Cables Rated 2000 Volts or Less

Maximum Allowable Fill Area for Multiconductor Cables									
		Ladder or Ventilated Trough Cable Trays, 392.22 (C) (1)				Solid Bottom Cable Trays, 392.22 (C) (3)			
Inside Width of Cable Tray		Column 1 Applicable for 392.22 (C) (1) (b) Only		Column 2[a] Applicable for 392.22 (C) (1) (c) Only		Column 3 Applicable for 392. 22 (C) (2) (b)Only		Column 4a Applicable for 392. 22 (C) (2) (c) Only	
mm	in.	mm2	in.2	mm2	in.2	mm2	in.2	mm2	in.2
150	6.0	4,500	7.0	4,500 – (30 Sd)[b]	7– (1.2 Sd)[b]	3,500	5.5	3,500–(25 Sd[b])	5.5–Sd[b]
225	9.0	6,800	10.5	6,800 – (30 Sd)	10.5– (1.2 Sd)	5,100	8.0	5,100–(25 Sd)	8.0–Sd
300	12.0	9,000	14.0	9,000 – (30 Sd)	14– (1.2 Sd)	7,100	11.0	7,100–(25 Sd)	11.0–Sd
450	18.0	13,500	21.0	13,500 – (30 Sd)	21– (1.2 Sd)	10,600	16.5	10,600–(25 Sd)	16.5–Sd
600	24.0	18,000	28.0	18,000 – (30 Sd)	28– (1.2 Sd)	14,200	22.0	14,200–(25 Sd)	22.0–Sd
750	30.0	22,500	35.0	22,500 – (30 Sd)	35– (1.2 Sd)	17,700	27.5	17,700–(25 Sd)	27.5–Sd
900	36.0	27,000	42.0	27,000 – (30 Sd)	42– (1.2 Sd)	21,300	33.0	21,300–(25 Sd)	33.0–Sd

[a] The maximum allowable fill areas in Columns 2 and 4 shall be calculated. For example, the maximum allowable fill in mm2 for a 150-mm wide cable tray in Column 2 shall be 4500 minus (30 multiplied by Sd) [the maximum allowable fill, in square inches, for a 6-in. wide cable tray in Column 2 shall be 7 minus (1.2 multiplied by Sd)].

[b]The term Sd in Columns 2 and 4 is equal to the sum of the diameters, in mm, of all cables 107.2 mm (in inches, of all 4/0 AWG) and larger multiconductor cables in the same cable tray with smaller cables.

(3) Solid Bottom Cable Trays Containing Any Mixture. Where solid bottom cable trays contain multiconductor power or lighting cables, or any mixture of multiconductor power, lighting, control, and signal cables, the maximum number of cables shall conform to the following:

(a) where all of the cables are 4/0 AWG or larger, the sum of the diameters of all cables shall not exceed 90 percent of the cable tray width, and the cables shall be installed in a single layer.

(b) Where all of the cables are smaller than 4/0 AWG, the sum of the cross-sectional areas of all cables shall not exceed the maximum allowable cable fill area in Column 3 of Table 392.22 (C)for the appropriate cable tray width.

(c) Where 4/0 AWG or larger cables are installed in the same cable tray with cables smaller than 4/0 AWG, the sum of the cross-sectional areas of all cables smaller than 4/0 AWG shall not exceed the maximum allowable fill area resulting from the computation in Column 4 of Table 392.22 (C) for the appropriate cable tray width. The 4/0 AWG and larger cables shall be installed in a single layer, and no other cables shall be placed on them.

(4) Solid Bottom Cable Tray — Multiconductor Control and/or Signal Cables Only.

(a) Where a solid bottom cable tray having a usable inside depth of 150 mm (6 in.) or less contains multiconductor control and/or signal cables only, the sum of the cross-sectional areas of all cables at any cross section shall not exceed 40 percent of the interior cross-sectional area of the cable tray.

(b) A depth of 150 mm (6 in.) shall be used to calculate the allowable interior cross-sectional area of any cable tray that has a usable inside depth of more than 150 mm (6 in.).

(5) Ventilated Channel Cable Trays. Where ventilated channel cable trays contain multiconductor cables of any type, the following shall apply:

(a) Where only one multiconductor cable is installed, the cross-sectional area shall not exceed the value specified in Column 1 of Table 392.22 (C) (5)

(b) Where more than one multiconductor cable is installed, the sum of the cross-sectional area of all cables shall not exceed the value specified in Column 2 of Table 392.22 (C) (5)

Table 392.22(C)(5) Allowable Cable Fill Area for Multiconductor Cables in Ventilated Channel Cable Trays for Cables Rated 2000 Volts or Less

		Maximum Allowable Fill Area for Multiconductor Cables			
Inside Width of Cable Tray		Column 1 One Cable		Column 2 More Than One Cable	
mm	in.	mm2	in.2	mm2	in.2
75	3	1500	2.3	850	1.3
100	4	2900	4.5	1600	2.5
150	6	4500	7.0	2450	3.8

(6) Solid Channel Cable Trays. Where solid channel cable trays contain multiconductor cables of any type, the following shall apply:

(a) Where only one multiconductor cable is installed, the cross-sectional area of the cable shall not exceed the value specified in Column 1 of Table 392.22 (C) (6).

(b) Where more than one multiconductor cable is installed, the sum of the cross-sectional area of all cable shall not exceed the value specified in Column 2 of Table 392.22 (C) (6).

Table 392.22(C) (6) Allowable Cable Fill Area for Multiconductor Cables in Solid Channel Cable Trays for Cables Rated 2000 Volts or Less

Inside Width of Cable Tray		Column 1 One Cable		Column 2 More Than One Cable	
mm	in.	mm2	in.2	mm2	in.2
50	2	850	1.3	500	0.8
75	3	1300	2.0	700	1.1
100	4	2400	3.7	1400	2.1
150	6	3600	5.5	2100	3.2

(D) Number of Single-Conductor Cables, Rated 2000 Volts or Less, in Cable Trays.

The number of single-conductor cables, rated 2000 volts or less, permitted in a single cable tray section shall not exceed the requirements of this section. The single conductors, or conductor assemblies, shall be evenly distributed across the cable tray. The conductor sizes herein apply to both aluminum and copper conductors.

(1) Ladder or Ventilated Trough Cable Trays. Where ladder or ventilated trough cable trays contain single-conductor cables, the maximum number of single conductors shall conform to the following:

(a) Where all of the cables are 1000 kcmil or larger, the sum of the diameters of all single conductor cables shall not exceed cable tray width, and the cables shall be installed in a single layer. Conductors that are bound together to comprise each circuit group shall be permitted to be installed in other than a single layer.

(b) Where all of the cables are from 250 kcmil up to 1000 kcmil, the sum of the cross-sectional areas of all single-conductor cables shall not exceed the maximum allowable cable fill area in Column 1 of Table 392.22(D) for the appropriate cable tray width.

(c) Where 1000 kcmil or larger single-conductor cables are installed in the same cable tray with single-conductor cables smaller than 1000 kcmil, the sum of the cross-sectional areas of all cables smaller than 1000 kcmil shall not exceed the maximum allowable fill area resulting from the computation in Column 2 of Table 392.22(D) for the appropriate cable tray width.

(d) Where any of the single conductor cables are 1/0 through 4/0 AWG, the sum of the diameters of all single conductor cables shall not exceed the cable tray width.

(2) Ventilated Channel Cable Trays. Where 50 mm (2 in.), 75 mm (3 in.), 100 mm (4 in.), or 150 mm (6 in.) wide ventilated channel cable trays contain single-conductor cables, the sum of the diameters of all single conductors shall not exceed the inside width of the channel.

Table 392.22(D) Allowable Cable Fill Area for Single-Conductor Cables in Ladder or Ventilated Trough Cable Trays for Cables Rated 2000 Volts or Less

		Maximum Allowable Fill Area for Single-Conductor Cables in Ladder or Ventilated Trough Cable Trays			
Inside Width of Cable Tray		Column 1 Applicable for 392.22 (D) (1) (b) Only		Column 1 Applicable for 392.22 (D) (1) (b) Only	Column 2a Applicable for 392.22 (D) (1) (c) Only
mm	in.	mm2	in.2	mm2	in.2
150	6	4,200	6.5	4,200 – (28 Sd)[b]	6.5 – (1.1 Sd)[b]
225	9	6,100	9.5	6,100 – (28 Sd)	9.5 – (1.1 Sd)
300	12	8,400	13.0	8,400 – (28 Sd)	13.0 – (1.1 Sd)
450	18	12,600	19.5	12,600 – (28 Sd)	19.5 – (1.1 Sd)
600	24	16,800	26.0	16,800 – (28 Sd)	26.0 – (1.1 Sd)
750	30	21,000	32.5	21,000 – (28 Sd)	32.5 – (1.1 Sd)
900	36	25,200	39.0	25,200 – (28 Sd)	39.0 – (1.1 Sd)

[a]The maximum allowable fill areas in Column 2 shall be calculated. For example, the maximum allowable fill, in mm2, for a 150 mm wide cable tray in Column 2 shall be 4200 minus (28 multiplied by Sd) [the maximum allowable fill, in square inches, for a 6-in. wide cable tray in Column 2 shall be 6.5 minus (1.1 multiplied by Sd)].

[b]The term Sd in Column 2 is equal to the sum of the diameters, in mm, of all cables 507 mm2 (in inches, of all 1000 kcmil) and larger single-conductor cables in the same ladder or ventilated trough cable tray with small cables.

(E) Number of Type MV and Type MC Cables (2001 Volts or Over) in Cable Trays.

The number of cables rated 2001 volts or over permitted in a single cable tray shall not exceed the requirements of this section.

(1) The sum of the diameters of single-conductor and multiconductor cables shall not exceed the cable tray width, and the cables shall be installed in a single layer.

(2) Where single conductor cables are triplexed, quadruplexed, or bound together in circuit groups, the sum of the diameters of the single conductors shall not exceed the cable tray width, and these groups shall be installed in single layer arrangement.

392.24 Field Bends or Modifications. Field bends or modifications shall be so made that the electrical continuity of the cable tray system and support for the cables is maintained.

392.28 Smooth Edges. Cable trays shall not have sharp edges, burrs, or projections that could damage the insulation or jackets of the wiring.

392.30 Supports.

A. Cable Supports

(1)Supports shall be provided to prevent stress on cables where they enter raceways or other enclosures from cable tray systems.

(2) In other than horizontal runs, the cables shall be fastened securely to transverse members of the cable trays.

(B) Cable trays shall be supported at intervals in accordance with the installation instructions.

(C) Raceways, Cables, Boxes, and Conduit Bodies Supported from Cable Tray Systems.

(1) In industrial facilities where conditions of maintenance and supervision ensure that only qualified persons service the installation and where the cable tray systems are designed and installed to support the load, such systems shall

be permitted to support raceways and cables, and boxes and conduit bodies covered in 314.1.

(2) For raceways terminating at the tray, a listed cable tray clamp or adapter shall be used to securely fasten the raceway to the cable tray system. Additional supporting and securing of the raceway shall be in accordance with the requirements of the appropriate raceway article.

(3) For raceways or cables running parallel to and attached to the bottom or side of a cable tray system, fastening and supporting shall be in accordance with the requirements of the appropriate raceway or cable article.

(4) For boxes and conduit bodies attached to the bottom or side of a cable tray system, fastening and supporting shall be in accordance with the requirements of 314.23.

392.40 Fittings and Covers.

(A) Fittings.

(1) Cable trays shall include fittings or other suitable means for changes in direction and elevation of runs.

(2) Cable trays and associated fittings shall be identified for the intended use.

(B) Covers. In portions of runs where additional protection is required, covers or enclosures providing the required protection shall be of a material that is compatible with the cable tray.

-392.46 Bushed Conduit and Tubing. A box shall not be required where cables or conductors are installed in bushed conduit and tubing used for support or for protection against physical damage.

-392.56 Cable Splices. Cable splices made and insulated by approved methods shall be permitted to be located within a cable tray, provided they are accessible and do not project above the side rails.

392.60 Grounding and Bonding.

(A) Grounding

(1) Metallic Cable Trays. Metallic cable trays that support electrical conductors shall be grounded as required for conductor enclosures in accordance with 250.96.

(2) Steel or Aluminum Cable Tray Systems. Steel or aluminum cable tray systems shall be permitted to be used as equipment grounding conductors, provided that all the following requirements are met:

(a) The cable tray sections and fittings shall be identified for grounding purposes.

(b) The minimum cross-sectional area of cable trays shall conform to the requirements in Table 392.60 (A)

(c) All cable tray sections and fittings shall be legibly and durably marked to show the cross-sectional area of metal in channel cable trays, or cable trays of one-piece construction, and the total cross-sectional area of both side rails for ladder or trough cable trays.

(d)Cable tray sections, fittings, and connected raceways shall be bonded in accordance with 250.96, using bolted mechanical connectors or bonding jumpers sized and installed in accordance with 250.102.

(B) Bonding. A bonding jumper sized in accordance with 250.102 shall connect the two sections of cable tray, or the cable tray and the raceway or equipment. Bonding shall be in accordance with 250.96.

392.80 Ampacity of Cables, Rated 2000 Volts or Less, in Cable Trays.

(A) Multiconductor Cables. The allowable ampacity of multiconductor cables, nominally rated 2000 volts or less, installed according to the requirements of 392.9 shall be as given in Table 310.16 and Table 310.18, subject to the provisions of (1), (2), (3), and 310.15(A)(2).

(1) The derating factors of 310.15(B)(2)(a) shall apply only to multiconductor cables with more than three current-carrying conductors. Derating shall be limited to the number of current-carrying conductors in the cable and not to the number of conductors in the cable tray.

(2) Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, not over 95 percent of the allowable ampacities of Table 310.16 and Table 310.18 shall be permitted for multiconductor cables.

(3) Where multiconductor cables are installed in a single layer in uncovered trays, with a maintained spacing of not less than one cable diameter between cables, the ampacity shall not exceed the allowable ambient temperature-corrected ampacities of multiconductor cables, with not more than three insulated conductors rated 0 through 2000 volts in free air, in accordance with 310.15(C).

FPN: See Table B.310.3.

(B) Single-Conductor Cables. The allowable ampacity of single-conductor cables shall be as permitted by 310.15(A)(2). The derating factors of 310.15(B)(2)(a) shall not apply to the ampacity of cables in cable trays. The ampacity of single-conductor cables, or single conductors cabled together (triplexed, quadruplexed, etc.), nominally rated 2000 volts or less, shall comply with the following:

(1) Where installed according to the requirements of 392.10, the ampacities for 600 kcmil and larger single-conductor cables in uncovered cable trays shall not exceed 75 percent of the allowable ampacities in Table 310.17 and Table 310.19. Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 600 kcmil and larger cables shall not exceed 70 percent of the allowable ampacities in Table 310.17 and Table 310.19.

(2) Where installed according to the requirements of 392.10, the ampacities for 1/0 AWG through 500 kcmil single-conductor cables in uncovered cable trays shall not exceed 65 percent of the allowable ampacities in Table 310.17 and Table 310.19. Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 1/0 AWG through 500 kcmil cables shall not exceed 60 percent of the allowable ampacities in Table 310.17 and Table 310.19.

Table 392.60(A) Metal Area Requirements for Cable Trays Used as Equipment Grounding Conductor

Maximum Fuse Ampere Rating, Circuit Breaker Ampere Trip Setting, or Circuit Breaker Protective Relay Ampere Trip Setting for Ground-Fault Protection of Any Cable Circuit in the Cable Tray System	Minimum Cross-Sectional Area of Metal[a]			
	Steel Cable Trays		Aluminum Cable Trays	
	mm2	in.2	mm2	in.2
60	129	0.20	129	0.20
100	258	0.40	129	0.20
200	451.5	0.70	129	0.20
400	645	1.00	258	0.40
600	967.5	1.50[b]	258	0.40
1000	—	—	387	0.60
1200	—	—	645	1.00
1600	—	—	967.5	1.50
2000	—	—	1290	2.00[b]

[a]Total cross-sectional area of both side rails for ladder or trough cable trays; or the minimum cross-sectional area of metal in channel cable trays or cable trays of one-piece construction.

[b]Steel cable trays shall not be used as equipment grounding conductors for circuits with ground-fault protection above 600 amperes. Aluminum cable trays shall not be used as equipment grounding conductors for circuits with ground-fault protection above 2000 amperes.

(3) Where single conductors are installed in a single layer in uncovered cable trays, with a maintained space of not less than one cable diameter between individual conductors, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities in Table 310.17 and Table 310.19. Exception to (B)(3): For solid bottom cable trays the ampacity of single conductor cables shall be determined by 310.15(C).

(4) Where single conductors are installed in a triangular or square configuration in uncovered cable trays, with a maintained free airspace of not less than 2.15 times one conductor diameter (2.15 × O.D.) of the largest conductor contained within the configuration and adjacent conductor configurations or cables, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities of two or three single insulated conductors rated 0 through 2000 volts supported on a messenger in accordance with 310.15(B).

FPN: See Table 310.20.

(C) Ampacity of Type MV and Type MC Cables (2001 Volts or Over) in Cable Trays. The ampacity of cables rated 2001 volts, nominal, or over, installed according to 392.22(E) shall not exceed the requirements of this section.

(1) Multiconductor Cables (2001 Volts or Over). The allowable ampacity of multiconductor cables shall be as given in Table 310.75 and Table 310.76, subject to the following provisions:

(a) Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, not more than 95 percent of the allowable ampacities of Table 310.75 and Table 310.76 shall be permitted for multiconductor cables.

(b) Where multiconductor cables are installed in a single layer inuncovered cable trays, with maintained spacing of not less than one cable diameter between cables, the ampacity shall not exceed the allowable ampacities of Table 310.71 and Table 310.72.

(2) Single-Conductor Cables (2001 Volts or Over). The ampacity of single-conductor cables, or single conductors cabled together (triplexed, quadruplexed, etc.), shall comply with the following:

(a) The ampacities for 1/0 AWG and larger single-conductor cables in uncovered cable trays shall not exceed 75 percent of the allowable ampacities in Table 310.69 and Table 310.70. Where the cable trays are covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 1/0 AWG and larger single-conductor cables shall not exceed 70 percent of the allowable ampacities in Table 310.69 and Table 310.70.

(b) Where single-conductor cables are installed in a single layer in uncovered cable trays, with a maintained space of not less than one cable diameter between individual conductors, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities in Table 310.69 and Table 310.70.

(c) Where single conductors are installed in a triangular or square configuration in uncovered cable trays, with a maintained free air space of not less than 2.15 times the diameter (2.15 × O.D.) of the largest conductor contained within the configuration and adjacent conductor configurations or cables, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities in

III Construction Specifications

392.100 Construction

(A) Strength and Rigidity. Cable trays shall have suitable strength and rigidity to provide adequate support for all contained wiring.

(B) Side Rails. Cable trays shall have side rails or equivalent structural members.

392.110 Corrosion Protection. Cable tray systems shall be corrosion resistant. If made of ferrous material, the system shall be protected from corrosion as required by 300.6.

392.116 Nonmetallic Cable Tray. Nonmetallic cable trays shall be made of flame-retardant material.

Substantiation: As per the TCC to clarify the panel action, Article 392 was reorganized to more closely follow the suggested numbering system established in the NFPA style manual.

This rewrite was completed to format it as closely as possible to the common numbering system.

- Title: add "systems" to clarify this article cover cable tray systems.
- Add Part l General
- 392.2 Definition added new FPN added for clarity definition.
- Add Part ll Installation
- 392.6 "Installation" was no longer needed so it was deleted.
- 392.3 renumbered to "392.10 and revised to style manual. The first sentence from 392.6(A) was added. "Complete System. Cable trays shall be installed as a complete system."
- Old "392.3 renumbered to 392.10 Uses Permitted" will change the numbering system from the normal 1, 2, 3… to A, B, C… to match the style manual. Additionally, the list style shown in the style manual does not provide for sublists within a section and the following changes:
- Old 392.3 (A) renumbered to 392.10 (A)
- Old 392.3 (A) renumbered to 392.10 (B)
- Old 392.3 (A) renumbered to 392.10 (C).
- Old 392.6 (A) renumbered to 392.10 (D)
- Old 392.6 (A) renumbered to 392.10 (E)
- Old 392.3 (A) renumbered to 392.10 (F) and changed table reference to Table 392.3(6) (A) to read Table 392.10 (F). The was an editorial change for adding "In all locations the" and removing "(A) Wiring Methods"
- Old Table 392.3 (A) (6) renumbered to Table 392.10 (F)
- Old 392.3 (B) renumbered to 392.10 (G) "In Industrial Establishments Only"
- Old 392.3 (B), first sentence table reference renumbered to 392.10 (F).
- Old 392.3 (B) second sentence to read "any of the cables in 392.10 (G) (1) to (G) (4)"
- Old 392.3 (B) (1) removed the sentence "(1) Single Conductors. Single-conductor cables shall be permitted to be installed in accordance with (B) (1) (a) through (B) (1) (c) as not needed sub heading.-
- Old 392.3 (B) (1) (A renumbered to 392.10 (G) (1)
- Old 392.3 (B) (1) (B) renumbered to 392.10 (G) (2)
- Old 392.3 (B) (1) (C) renumbered to 392.10 (G) (3)
- Old 392.3 (B) (2) (d) renumbered to 392.10 (G) (4) and changed reference in article of 392.3 (B) (1) to 392.10 (G) (1)
- Old 392.3 (C) renumbered to 392.10 (H) and the grounding reference is changed from 392.7 to 392.60
- Old 392.3 (D) renumbered to 392.10 (I)
- Old 392.3 (E) renumbered to 392.10 (J)
- Old 392.6 (E) renumbered to 392.10 (K).
- Old 392.6 (F) renumbered to 392.10 (L)
- Old 392.6 (G) renumbered to 392.10 (M)
- Old 392.6 (H) renumbered to 392.10 (N) and change the reference within (N) identified as 392.6(G) renumbered to 392.10 (M)
- Old 392.6 (I) renumbered to 392.10 (O)
- Old 392.4 renumbered to 392.12.
- Old 392.6 "Installation" renumbered to 392.22 with a title of "Conductors and Cables" by adding the word "Multiconductor" that is referenced in the section due to the rewrite and numbering sequence. Change title to read "392.22 Conductors and Multiconductor Cables."
- Old 392.8 (D) renumbered to 392.22 (A) and the contents within this article subdivided as two separate conditions to read:

"Where single conductor cables comprising each phase, neutral; or grounded conductor of an alternating-current circuit are connected in parallel as permitted in 310.4, the conductors shall be installed in groups consisting of not more than one conductor per phase, neutral, or grounded conductor to prevent current imbalance in the paralleled conductors due to inductive reactance."

"Single conductors shall be securely bound in circuit groups to prevent excessive movement due to fault-current magnetic forces unless single conductors are cabled together, such as triplexed assemblies.

- Old 392.8 (E) renumbered to 392.22 (B).
- Old 392.9(A) (1) renumbered to 392.22 (C) (1) (a)
- Old 392.9 that was renumbered to 392.22 (C) with subsection (1) (b) to change the existing reference of Column 1 of Table 392.9 changed to Column 1 of Table 392.22 (C).
- Old 392.9 that was renumbered to 392.22 (C) with subsection (1) (c) to change the existing reference of Column 2 of Table 392.9 changed to Column 2 of Table 392.22 (C).
- Old Table 392.9 that was renumbered to Table 392.22 (C) to change the following table references with the table to read as follows:

Ladder or Ventilated Trough Cable Trays 392.9 (A) renumbered to 392.22 (C) (1)

Solid Bottom Cable Trays 392.9 (A) renumbered to 392.22 (C) (3)

Column 1 Application for 392.9 (A) (2) renumbered to 392.22 (C) (1) (b) Only

Column 2 Application for 392.9 (A) (3) renumbered to 392.22 (C) (1) (c) Only

Column 3 Application for 392.9 (C) (2) renumbered to 392.22 (C) (2) (b) Only

Column 4 Application for 392.9 (C) (3) renumbered to 392.22 (C) (2) (c) Only

- Old 392.9 (B) changed the section content now numbered 392.22 (C) (2) into parts (a) and (b) to follow previous article format and will read as follows: Where a ladder or ventilated trough cable tray having a usable inside depth of 150 mm (6 in.) or less contains multiconductor control and/or signal cables only, the sum of the cross-sectional areas of all cables at any cross section shall not exceed 50 percent of the interior cross-sectional area of the cable tray. A depth of 150 mm (6 in.) shall be used to calculate the allowable interior cross-sectional area of any cable tray that has a usable inside depth of more than 150 mm (6 in.).
- Old 392.9 (C) renumbered to 392.22 (C) (3)
- Old 392.9 (C) (1) renumbered to 392.22 (C) (3) (a)
- Old 392.9 (C) (2) renumbered to 392.22 (C) (3) (b) to update reference Table to new title of Table 392.22 (C).
- Old 392.9 (C) (3) renumbered to 392.22 (C) (3) (c) to update reference Table to new title of Table 392.22 (C).
- Old 392.9 (D) renumbered to 392.22 (C) (4)
- Old 392.9 (D) changed the section content now numbered 392.22 (C) (4) into parts (a) and (b) to follow previous article format and will read as follows:

Where a solid bottom cable tray having a usable inside depth of 150 mm (6 in.) or less contains multiconductor control and/or signal cables only, the sum of the cross-sectional areas of all cables at any cross section shall not exceed 40 percent of the interior cross-sectional area of the cable tray.
A depth of 150 mm (6 in.) shall be used to calculate the allowable interior cross-sectional area of any cable tray that has a usable inside depth of more than 150 mm (6 in.).
- Old 392.9 (E) (1) renumbered to 392.22 (C) (5) (a) table reference changed to read "Column 1 of Table 392.22 (C) (5)."
- Old 392.9 (E) (2) renumbered to 392.22 (C) (5) (b) table reference changed to read "Column 2 of Table 392.22 (C) (5)."
- Old Table 392.9 (E) renumbered to Table 392.22 (C) (5)
- Old 392.9 (F) renumbered to 392.22 (C) (6)
- Old 392.9 (F) (1) renumbered to 392.22 (C) (6) (a) and table reference changed to read "Column 1 of Table 392.22 (C) (6)."
- Old 392.9 (F) (2) changed to 392.22 (C) (6) (b) and table reference changed to read "Column 2 of Table 392.22 (C) (6)."
- Old Table 392.9 (F) is renumbered to Table 392.22 (C) (6)
- Old 392.10 renumbered to 392.22 (D)
- Old 392.10 (A) renumbered to 392.22 (D) (1)
- Old 392.10 (A) (1) renumbered to 392.22 (D) (1) (a)
- Old 392.10 (A) (2) renumbered to 392.22 (D) (1) (b) for table reference to now read Column 1 of Table 392.22 (D)
- Old 392.10 (A) (3) renumbered to 392.22 (D) (1) (c) for table reference to now read Column 2 of Table 392.22 (D)
- Old 392.10 (A) (4) renumbered to 392.22 (D) (1) (d)
- Old 392.10 (B) renumbered to 392.22 (D) (2)
- Old Table 392.10 (A) renumbered to Table 392.22 (D)
- Old Table 392.10 (A) column heading reference renumbered to "Column 1 Applicable for 392.22 (D) (1) (b) Only"
- Old Table 392.10 (A) column heading reference to "Column 2a Applicable for 392.22 (D) (1) (c) Only"
- Old 392.12 renumbered to 392.22 (E)
- Old 392.12 renumbered to 392.22 (E) changed the section content into parts (1) and (2) to follow previous article format style and will read as follows:

The sum of the diameters of single-conductor and multiconductor cables shall not exceed the cable tray width, and the cables shall be installed in a single layer.
Where single conductor cables are triplexed, quadruplexed, or bound together in circuit groups, the sum of the diameters of the single conductors shall not exceed the cable tray width, and these groups shall be installed in single layer arrangement.
- The old 392.6 (A) has relocated this sentence to this newly number section as follows:

392.24 Field Bends or Modifications. Field bends or modifications shall be so made that the electrical continuity of the cable tray system and support for the cables is maintained. Words "Field" and "or Modifications" were editorial changes to provide clarity for job specific installation requirements.
- The old 392.5 (B) has relocated this sentence to the newly numbered section as follows:

392.28 Smooth Edges. Cable trays shall not have sharp edges, burrs, or projections that could damage the insulation or jackets of the wiring.
- The old 392.6 (C) has been renumbered to "392.30" "Supports."
- The old 392.6 has been renumbered to 392.30 "(A) Cable Supports" for multiple support requirements that will be identified as separate requirements.
- The old 392.6 (C) renumbered as 392.39 (A) (1) as one of the requirements for cable supports as follows:

Supports shall be provided to prevent stress on cables where they enter raceways or other enclosures from cable tray systems.
- The old 392.8 (A) second sentence has been relocated to 392.30 (A) (2) to read:

In other than horizontal runs, the cables shall be fastened securely to transverse members of the cable trays. This relocation better fulfills the requirements for cable supports. The old title "Securely Fastened" has been removed from the 392.8 (B) when this was relocated.
- Old 392.6 (A) second sentence is renumbered as 392.30 (B).
- Old 392.6 (J) is renumbered as 392.30 (C) with a title "(C) Raceways, Cables, Boxes, and Conduit Bodies Supported from Cable Tray Systems.
- Old 392.6 (J) now identified as 392.30 (C) was changed to a number format numbered 1 to 4 as separate requirements by the following numbering sequence:

In industrial facilities where conditions of maintenance and supervision ensure that only qualified persons service the installation and where the cable tray systems are designed and installed to support the load, such systems shall be permitted to support raceways and cables, and boxes and conduit bodies covered in 314.1

For raceways terminating at the tray, a listed cable tray clamp or adapter shall be used to securely fasten the raceway to the cable tray system. Additional supporting and securing of the raceway shall be in accordance with the requirements of the appropriate raceway article.

For raceways or cables running parallel to and attached to the bottom or side of a cable tray system, fastening and supporting shall be in accordance with the requirements of the appropriate raceway or cable article.

For boxes and conduit bodies attached to the bottom or side of a cable tray system, fastening and supporting shall be in accordance with the requirements of 314.23.
- From the old 392.5 (E) and 392.3 (D) renumbered to a new heading and number to read as follows:"392.40 Fitting and Covers."
- Old 392.5 (E) renumbered and an identification sub (A) 392.40 (A) "Fittings."

From the old 392.5 (E) and a new designation:
Cable trays shall include fittings or other suitable means for changes in direction and elevation of runs.
- From the old 392.3 to have a new (2) for the statement relocated as follows:

Cable trays and associated fittings shall be identified for the intended use.
This change was to correlate with the fitting and covers title line.
- Old 392.6 (D) renumbered to 392.40 and new designation sub (B) titled "Covers."
- Old 392.8 (C) renumbered as 392.46 "Bushed Conduit and Tubing"
- Old 392.8(A) renumbered as 392.56 "Cable Splices."
- From the old 392.7 Grounding has been renumbered to 392.60 to more closely follow the NEC numbering sequence. Additionally, the title has been changed to "Grounding and Bonding" for the title to more accurately describe the content of the article

A new sub-heading "392.60 (A) Grounding" to separate the requirements from bonding.
- Old 392.7 (A) is renumbered 392.60 (A) (1) "Metallic Cable Trays"
- Old 392.7 (B) is renumbered 392.60 (A) (2) "Steel or Aluminum Cable Tray Systems."
- Old 392.7 (B) (1) is renumbered 392.60 (A) (2) (a)
- Old 392.7 (B) (2) is renumbered 392.60 (A) (2) (b) the table reference to Table 392.7 (B) renumbered to Table 392.60 (A)
- Old 392.7 (B) (3) is renumbered 392.60 (A) (2) (c)
- Old 392.7 (B) (4) is renumbered 392.60 (A) (2) (d)
- Old Table 392.7 (B) is renumbered 392.60 (A)
- From the old 392.6 (A) has been re-identified as a sub designation "392.60 (B) Bonding" for the title to more accurately description of the article
- Old 392.11 renumbered to 392.80
- Old 392.13 renumbered to 392.80 (C) "Ampacity of Type MV and Type MC Cables (2001 Volts or Over) in Cable Trays" as a sub title under ampacity
- The old 392.13 first sentence code reference should be renumbered from 392.12 to 392.22 (E)
- Old 392.13 renumbered as 392.80 (C) (1)
- Old 392.13 (A) renumbered as 392.80 (C) (1)
- Old 392.13 (A) (1) renumbered as 392.80 (C) (1) (a)
- Old 392.13 (A) (2) renumbered as 392.80 (C) (1) (b)
- Old 392.13 (B) renumbered as 392.80 (C) (2)
- Old 392.13 (B) (1) renumbered as 392.80 (C) (2) (a)
- Old 392.13 (B) (2) renumbered as 392.80 (C) (2) (b)
- Old 392.13 (B) (3) renumbered as 392.80 (C) (2) (c)
- Add Part "III Construction Specifications"
- Change the old 392.5 to 392.100 and title as "Construction" to follow the titles and location assigned to other articles.
- Old 392.5 (A) is renumbered as 392.100 (A)
- Old 392.5 (D) is renumbered as 392.100 (B)
- Old 392.5 (C) is renumbered as 392.110
- Old 392.5 (F) is renumbered as 392.116

Panel Meeting Action: Hold
Panel Statement: The panel believes that Comment 8-77 introduces material that has not had public review in accordance with 4.4.6.2.2 of the Regulations Governing Committee Projects. In taking this action, the panel wishes to also place Proposal 8-180 on hold for reconsideration in the next revision cycle.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-78 Log #1833 NEC-P08 **Final Action: Hold**
(392)

Submitter: Michael Walls, American Chemistry Council
Comment on Proposal No: 8-180
Recommendation:
ARTICLE 392 Cable Trays

GENERAL

392.1 Scope
This article covers cable tray systems, including ladder, ventilated trough, ventilated channel, solid bottom, and other similar structures.
Cable trays are mechanical support systems. Cable trays are not raceways. See the definition of raceway in Article 100.

FPN: For further information on cable trays, see ANSI/NEMA–VE 1-1998, Metal Cable Tray Systems; NEMA–VE 2-1996, Metal Cable Tray Installation Guidelines; and NEMA–FG-1998, Nonmetallic Cable Tray Systems.

392.2 Definition
Cable Tray System. A unit or assembly of units or sections and associated fittings forming a structural system used to securely fasten or support cables and raceways.

INSTALLATION

392.3**10** Uses Permitted

Cable tray shall be permitted to be used as a support system for service conductors, feeders, branch circuits, communications circuits, control circuits, and signaling circuits.

(1) Cable tray installations shall not be limited to industrial establishments.

(2) Where exposed to direct rays of the sun, insulated conductors and jacketed cables shall be identified as being sunlight resistant.

(3) Cable trays and their associated fittings shall be identified for the intended use.

(A) Wiring Methods The wiring methods in Table 392.310(A) shall be permitted to be installed in cable tray systems under the conditions described in their respective articles and sections.

Table 392.3**10**(A) Wiring Methods

Wiring Method	Article Section
Armored cable	320
Communication raceways	800
Electrical metallic tubing	358
Electrical nonmetallic tubing	362
Fire alarm cables	760
Flexible metal conduit	348
Flexible metallic tubing	360
Instrumentation tray cable	727
Intermediate metal conduit	342
Liquidtight flexible metal conduit	350
Liquidtight flexible nonmetallic conduit	356
Metal-clad cable	330
Mineral-insulated, metal-sheathed cable	332
Multiconductor service-entrance cable	338
Multiconductor underground feeder and branch-circuit cable	340
Multipurpose and communications cables	800
Nonmetallic-sheathed cable	334
Power and control tray cable	336
Power-limited tray cable	725.61(C) and 725.82(E)
Optical fiber cables	770
Optical fiber raceways	770
Other factory-assembled, multiconductor control, signal, or power cables that are specifically approved for installation in cable trays	
Rigid metal conduit	344
Rigid nonmetallic conduit	352

(B) In Industrial Establishments The wiring methods in Table 392.3**10**(A) shall be permitted to be used in any industrial establishment under the conditions described in their respective articles. In industrial establishments only, where conditions of maintenance and supervision ensure that only qualified persons service the installed cable tray system, any of the cables in 392.3**10**(B)(1) and (B)(2) shall be permitted to be installed in ladder, ventilated trough, solid bottom, or ventilated channel cable trays.

(1) Single Conductors Single-conductor cables shall be permitted to be installed in accordance with (B)(1)(a) through (B)(1)(c).

(a) Single-conductor cable shall be 1/0 AWG or larger and shall be of a type listed and marked on the surface for use in cable trays. Where 1/0 AWG through 4/0 AWG single-conductor cables are installed in ladder cable tray, the maximum allowable rung spacing for the ladder cable tray shall be 225 mm (9 in.).

(b) Welding cables shall comply with the provisions of Article 630, Part IV. Cable trays used to support welding cables are required to be dedicated for welding cable installation. See 630.42 for installation details.

(c) Single conductors used as equipment grounding conductors shall be insulated, covered, or bare, and they shall be 4 AWG or larger.

(2) Medium Voltage Single- and multiconductor medium voltage cables shall be Type MV cable. Single conductors shall be installed in accordance with 392.3**10**(B)(1).

(C) Equipment Grounding Conductors Metallic cable trays shall be permitted to be used as equipment grounding conductors where continuous maintenance and supervision ensure that qualified persons service the installed cable tray system and the cable tray complies with provisions of 392.7**60**.

(D) Hazardous (Classified) Locations Cable trays in hazardous (classified) locations shall contain only the cable types permitted in 501.10, 502.10, 503.10, 504.20, and 505.15.

(E) Nonmetallic Cable Tray In addition to the uses permitted elsewhere in 392.3**10**, nonmetallic cable tray shall be permitted in corrosive areas and in areas requiring voltage isolation.

392.4**12** Uses Not Permitted

(1) Cable tray systems shall not be used in hoistways or where subject to severe physical damage.

(2) Cable tray systems shall not be used in ducts, plenums, and other air-handling spaces, except as permitted in 300.22, to support wiring methods recognized for use in such spaces.

392.9 **22 Cable Tray Conductor Fill (A)** Number of Multiconductor Cables, Rated 2000 Volts or Less, in Cable Trays

The number of multiconductor cables, rated 2000 volts or less, permitted in a single cable tray shall not exceed the requirements of this section. The conductor sizes herein apply to both aluminum and copper conductors.

~~(A)~~ **(1)** Any Mixture of Cables Where ladder or ventilated trough cable trays contain multiconductor power or lighting cables, or any mixture of multiconductor power, lighting, control, and signal cables, the maximum number of cables shall conform to the following:

~~(1)~~ **(a)** Where all of the cables are 4/0 AWG or larger, the sum of the diameters of all cables shall not exceed the cable tray width, and the cables shall be installed in a single layer.

~~(2)~~ **(b)** Where all of the cables are smaller than 4/0 AWG, the sum of the cross-sectional areas of all cables shall not exceed the maximum allowable cable fill area in Column 1 of Table 392.9 **22** for the appropriate cable tray width.

~~(3)~~ **(c)** Where 4/0 AWG or larger cables are installed in the same cable tray with cables smaller than 4/0 AWG, the sum of the cross-sectional areas of all cables smaller than 4/0 AWG shall not exceed the maximum allowable fill area resulting from the computation in Column 4 of Table 392.9**22** for the appropriate cable tray width. The 4/0 AWG and larger cables shall be installed in a single layer, and no other cables shall be placed on them.

~~(B)~~ **(4)** Solid Bottom Cable Tray — Multiconductor Control and/or Signal Cables Only.

(a) Where a solid bottom cable tray having a usable inside depth of 150 mm (6 in.) or less contains multiconductor control and/or signal cables only, the sum of the cross-sectional areas of all cables at any cross section shall not exceed 40 percent of the interior cross-sectional area of the cable tray.

(b) A depth of 150 mm (6 in.) shall be used to calculate the allowable interior cross-sectional area of any cable tray that has a usable inside depth of more than 150 mm (6 in.).

~~(E)~~ **(5)** Ventilated Channel Cable Trays Where ventilated channel cable trays contain multiconductor cables of any type, the following shall apply:

~~(1)~~ **(a)** Where only one multiconductor cable is installed, the cross-sectional area shall not exceed the value specified in Column 1 of Table 392.9 **22**(E).

~~(2)~~

(b) Where more than one multiconductor cable is installed, the sum of the cross-sectional area of all cables shall not exceed the value specified in Column 2 of Table 392.9 **22**(E).

Table 392.9 **(22)**(E) Allowable Cable Fill Area for Multiconductor Cables in Ventilated Channel Cable Trays for Cables Rated 2000 Volts or Less

~~(F)~~ **(6)** Solid Channel Cable Trays Where solid channel cable trays contain multiconductor cables of any type, the following shall apply:

~~(1)~~ **(a)** Where only one multiconductor cable is installed, the cross-sectional area of the cable shall not exceed the value specified in Column 1 of Table 392.9 **22**(F).

~~(2)~~ **(b)** Where more than one multiconductor cable is installed, the sum of the cross-sectional area of all cable shall not exceed the value specified in Column 2 of Table 392.9 ~~22~~(F).

~~392.10~~ **(B)** Number of Single-Conductor Cables, Rated 2000 Volts or Less, in Cable Trays

The number of single-conductor cables, rated 2000 volts or less, permitted in a single cable tray section shall not exceed the requirements of this section. The single conductors, or conductor assemblies, shall be evenly distributed across the cable tray. The conductor sizes herein apply to both aluminum and copper conductors.

~~(A)~~ **(1)** Ladder or Ventilated Trough Cable Trays Where ladder or ventilated trough cable trays contain single-conductor cables, the maximum number of single conductors shall conform to the following:

~~(1)~~ **(a)** Where all of the cables are 1000 kcmil or larger, the sum of the diameters of all single conductor cables shall not exceed cable tray width, and the cables shall be installed in a single layer. Conductors that are bound together to comprise each circuit group shall be permitted to be installed in other than a single layer.

~~(2)~~ **(b)** Where all of the cables are from 250 kcmil up to 1000 kcmil, the sum of the cross-sectional areas of all single-conductor cables shall not exceed the maximum allowable cable fill area in Column 1 of Table 392.~~10(A)~~ **22(G)** for the appropriate cable tray width.

~~(3)~~ **(c)** Where 1000 kcmil or larger single-conductor cables are installed in the same cable tray with single-conductor cables smaller than 1000 kcmil, the sum of the cross-sectional areas of all cables smaller than 1000 kcmil shall not exceed the maximum allowable fill area resulting from the computation in Column 2 of Table 392.~~10(A)~~ **22(G)** for the appropriate cable tray width.

~~(4)~~**(d)**Where any of the single conductor cables are 1/0 through 4/0 AWG, the sum of the diameters of all single conductor cables shall not exceed the cable tray width.

~~(B)~~ **(2)**Ventilated Channel Cable Trays Where 50 mm (2 in.), 75 mm (3 in.), 100 mm (4 in.), or 150 mm (6 in.) wide ventilated channel cable trays contain single-conductor cables, the sum of the diameters of all single conductors shall not exceed the inside width of the channel.

(C) Number of Combination of Multiconductor Cables and Single Conductor Cables in the same Cable Tray.

392.6**24**Installation

(A) Complete System Cable trays shall be installed as a complete system.

(1) Field bends or modifications shall be so made that the electrical continuity of the cable tray system and support for the cables is maintained.

(2) Cable tray systems shall be permitted to have mechanically discontinuous segments between cable tray runs or between cable tray runs and equipment.

(3) The system shall provide for the support of the cables in accordance with their corresponding articles.

(4) Where cable trays support individual conductors and where the conductors pass from one cable tray to another, or from a cable tray to raceway(s) or from a cable tray to equipment where the conductors are terminated, the distance between cable trays or between the cable tray and the raceway(s) or the equipment shall not exceed 1.8 m (6 ft).

(a) The conductors shall be secured to the cable tray(s) at the transition, and they shall be protected, by guarding or by location, from physical damage.

(b)A bonding jumper sized in accordance with 250.102 shall connect the two sections of cable tray, or the cable tray and the raceway or equipment. Bonding shall be in accordance with 250.96.

(B) Completed Before Installation. Each run of cable tray shall be completed before the installation of cables.

(C) Supports. Supports shall be provided to prevent stress on cables where they enter raceways or other enclosures from cable tray systems.
Cable trays shall be supported at intervals in accordance with the installation instructions.

(D) Covers. In portions of runs where additional protection is required, covers or enclosures providing the required protection shall be of a material that is compatible with the cable tray.

(E) Multiconductor Cables Rated 600 Volts or Less. Multiconductor cables rated 600 volts or less shall be permitted to be installed in the same cable tray.

(F) Cables Rated Over 600 Volts. Cables rated over 600 volts and those rated 600 volts or less installed in the same cable tray shall comply with either of the following:

(1) The cables rated over 600 volts are Type MC.

(2) The cables rated over 600 volts are separated from the cables rated 600 volts or less by a solid fixed barrier of a material compatible with the cable tray.

(G) Through Partitions and Walls Cable trays shall be permitted to extend transversely through partitions and walls or vertically through platforms and floors in wet or dry locations where the installations, complete with installed cables, are made in accordance with the requirements of 300.21.

(H) Exposed and Accessible Cable trays shall be exposed and accessible except as permitted by 392.6 **(24)**(G).

I) Adequate Access. Sufficient space shall be provided and maintained about cable trays to permit adequate access for installing and maintaining the cables.

(J) Raceways, Cables, Boxes, and Conduit Bodies Supported from Cable Tray Systems.

(1) In industrial facilities where conditions of maintenance and supervision ensure that only qualified persons service the installation and where the cable tray systems are designed and installed to support the load, such systems shall be permitted to support raceways and cables, and boxes and conduit bodies covered in 314.1.

(2) For raceways terminating at the tray, a listed cable tray clamp or adapter shall be used to securely fasten the raceway to the cable tray system.

(3) Additional supporting and securing of the raceway shall be in accordance with the requirements of the appropriate raceway article.

~~(B)~~ **392.30** Fastened Securely. In other than horizontal runs, the cables shall be fastened securely to transverse members of the cable trays.

392.8 **56**Cable Installation

(A) Cable Splices Cable splices made and insulated by approved methods shall be permitted to be located within a cable tray, provided they are accessible and do not project above the side rails.

~~(C)~~ **(B)**Bushed Conduit and Tubing A box shall not be required where cables or conductors are installed in bushed conduit and tubing used for support or for protection against physical damage.

~~(D)~~ **(C)**Connected in Parallel

(1) Where single conductor cables comprising each phase, neutral, or grounded conductor of an alternating-current circuit are connected in parallel as permitted in 310.4, the conductors shall be installed in groups consisting of not more than one conductor per phase, neutral, or grounded conductor to prevent current imbalance in the paralleled conductors due to inductive reactance.

(2) Single conductors shall be securely bound in circuit groups to prevent excessive movement due to fault-current magnetic forces unless single conductors are cabled together, such as triplexed assemblies.

~~(E)~~ **(D)**Single Conductors

(1) Where any of the single conductors installed in ladder or ventilated trough cable trays are 1/0 through 4/0 AWG, all single conductors shall be installed in a single layer.

(2) Conductors that are bound together to comprise each circuit group shall be permitted to be installed in other than a single layer.

392.7 **60**Grounding

(A) Metallic Cable Trays.

(1) Metallic cable trays that support electrical conductors shall be grounded as required for conductor enclosures in accordance with 250.96.

(2) Section 392.7**(60)**(A), together with 250.96, requires all cable tray systems that support electrical conductors (whether mechanically continuous or with isolated segments) to be electrically continuous and effectively bonded and grounded. This requirement applies whether or not the cable tray is used as an equipment grounding conductor.

(B) Steel or Aluminum Cable Tray Systems Steel or aluminum cable tray systems shall be permitted to be used as equipment grounding conductors, provided that all the following requirements are met:

(1) The cable tray sections and fittings shall be identified for grounding purposes.

(2) The minimum cross-sectional area of cable trays shall conform to the requirements in Table 392.7 **60**(B).

(3) All cable tray sections and fittings shall be legibly and durably marked to show the cross-sectional area of metal in channel cable trays, or cable trays of one-piece construction, and the total cross-sectional area of both side rails for ladder or trough cable trays.

(4) Cable tray sections, fittings, and connected raceways shall be bonded in accordance with 250.96, using bolted mechanical connectors or bonding jumpers sized and installed in accordance with 250.102.

392.11 **80**Ampacity of Cables, Rated 2000 Volts or Less, in Cable Trays

(A) Multiconductor Cables The allowable ampacity of multiconductor cables, nominally rated 2000 volts or less, installed according to the requirements of 392.9 **22(A)**shall be as given in Tables 310.16 and 310.18, subject to the provisions of (1), (2), (3), and 310.15(A)(2).

(1) The derating factors of 310.15(B)(2)(a) shall apply only to multiconductor cables with more than three current-carrying conductors. Derating shall be limited to the number of current-carrying conductors in the cable and not to the number of conductors in the cable tray.

(2) Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, not over 95 percent of the allowable ampacities of Tables 310.16 and 310.18 shall be permitted for multiconductor cables.

(3) Where multiconductor cables are installed in a single layer in uncovered trays, with a maintained spacing of not less than one cable diameter between cables, the ampacity shall not exceed the allowable ambient temperature-corrected ampacities of multiconductor cables, with not more than three insulated conductors rated 0 through 2000 volts in free air, in accordance with 310.15(C).
FPN:See Table B.310.3.

(B) Single-Conductor Cables The allowable ampacity of single-conductor cables shall be as permitted by 310.15(A)(2). The derating factors of 310.15(B)(2)(a) shall not apply to the ampacity of cables in cable trays. The ampacity of single-conductor cables, or single conductors cabled together (triplexed, quadruplexed, etc.), nominally rated 2000 volts or less, shall comply with the following:

(1) Where installed according to the requirements of 392.10**22 (B)**, the ampacities for 600 kcmil and larger single-conductor cables in uncovered cable trays shall not exceed 75 percent of the allowable ampacities in Tables 310.17 and 310.19. Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 600 kcmil and larger cables shall not exceed 70 percent of the allowable ampacities in Tables 310.17 and 310.19.

(2) Where installed according to the requirements of 392.103, the ampacities for 1/0 AWG through 500 kcmil single-conductor cables in uncovered cable trays shall not exceed 65 percent of the allowable ampacities in Tables 310.17 and 310.19.Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 1/0 AWG through 500 kcmil cables shall not exceed 60 percent of the allowable ampacities in Tables 310.17 and 310.19.

(3) Where single conductors are installed in a single layer in uncovered cable trays, with a maintained space of not less than one cable diameter between individual conductors, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities in Tables 310.17 and 310.19.
Exception to (B)(3): For solid bottom cable trays the ampacity of single conductor cables shall be determined by 310.15(C).

(4) Where single conductors are installed in a triangular or square configuration in uncovered cable trays, with a maintained free airspace of not less than 2.15 times one conductor diameter (2.15 × O.D.) of the largest conductor contained within the configuration and adjacent conductor configurations or cables, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities of two or three single insulated conductors rated 0 through 2000 volts supported on a messenger in accordance with 310.15(B).
FPN:See Table 310.20.

392.~~12~~ **90 2001Volts or More**
(A) Number of Type MV and Type MC Cables (2001 Volts or Over) in Cable Trays
(1) The number of cables rated 2001 volts or over permitted in a single cable tray shall not exceed the requirements of this section.
(2) The sum of the diameters of single-conductor and multiconductor cables shall not exceed the cable tray width, and the cables shall be installed in a single layer.
(3) Where single conductor cables are triplexed, quadruplexed, or bound together in circuit groups, the sum of the diameters of the single conductors shall not exceed the cable tray width, and these groups shall be installed in single layer arrangement.
392.13 **(B)**Ampacity of Type MV and Type MC Cables (2001 Volts or Over) in Cable Trays
(1) The ampacity of cables, rated 2001 volts, nominal, or over, installed according to 392.~~12~~ **90** shall not exceed the requirements of this section.
~~(A)~~ **(a)**Multiconductor Cables (2001 Volts or Over) The allowable ampacity of multiconductor cables shall be as given in Tables 310.75 and 310.76, subject to the following provisions:
~~(1)~~**(2)**Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, not more than 95 percent of the allowable ampacities of Tables 310.75 and 310.76 shall be permitted for multiconductor cables.
~~(2)~~**(3)**Where multiconductor cables are installed in a single layer in uncovered cable trays, with maintained spacing of not less than one cable diameter between cables, the ampacity shall not exceed the allowable ampacities of Tables 310.71 and 310.72.
~~(B)~~ **(C)**Single-Conductor Cables (2001 Volts or Over) The ampacity of single-conductor cables, or single conductors cabled together (triplexed, quadruplexed, etc.), shall comply with the following:
(1) The ampacities for 1/0 AWG and larger single-conductor cables in uncovered cable trays shall not exceed 75 percent of the allowable ampacities in Tables 310.69 and 310.70.
(2) Where the cable trays are covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 1/0 AWG and larger single-conductor cables shall not exceed 70 percent of the allowable ampacities in Tables 310.69 and 310.70.
~~(2)~~**(3)**Where single-conductor cables are installed in a single layer in uncovered cable trays, with a maintained space of not less than one cable diameter between individual conductors, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities in Tables 310.69 and 310.70.
~~(3)~~**(4)**Where single conductors are installed in a triangular or square configuration in uncovered cable trays, with a maintained free air space of not less than 2.15 times the diameter (2.15 × O.D.) of the largest conductor contained within the configuration and adjacent conductor configurations or cables, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities in Tables 310.67 and 310.68.

392.~~5~~ **100** Construction Specifications.
(A) Strength and Rigidity Cable trays shall have suitable strength and rigidity to provide adequate support for all contained wiring.
(B) Smooth Edges Cable trays shall not have sharp edges, burrs, or projections that could damage the insulation or jackets of the wiring.
(C) Corrosion Protection Cable tray systems shall be corrosion resistant. If made of ferrous material, the system shall be protected from corrosion as required by 300.6.
(D) Side Rails Cable trays shall have side rails or equivalent structural members.
(E) Fittings Cable trays shall include fittings or other suitable means for changes in direction and elevation of runs.
(F) Nonmetallic Cable Tray Nonmetallic cable trays shall be made of flame-retardant material.
Substantiation: The Panel action was to "Accept in Principle", but the only actions stated seem to be three items. One understanding from the CMP-8 meeting was that a number of formatting changes without content changes were in fact made. The attached contains what these changes were and therefore better explains why the action taken was to "Accept in Principle" rather than to just "Accept".
Panel Meeting Action: Hold
Panel Statement: See panel action and statement on Comment 8-77.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-79 Log #51 NEC-P08 **Final Action: Accept**
(392.3 and 392.4)

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 8-180
Recommendation: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal in the reorganization of Article 392. This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: See panel action and statement on Comment 8-77.
Number Eligible to Vote: 12

8-81 Log #234 NEC-P08 **Final Action: Accept**
(Table 392.3(A))

Submitter: Stanley Kaufman, CableSafe Inc.
Comment on Proposal No: 8-181
Recommendation: Accept this proposal.
Substantiation: The listing of multipurpose cables ended on July 1, 2003. This proposal is one of a series of proposals I submitted to complete the elimination of multipurpose cables from the code. The process of eliminating them began in the 2005 Code. Removal of multipurpose cables will not cause any inconvenience for users because all multipurpose cables were also listed as communications cables.
See CMP 16 action on proposals 16-175, 176, 181, 182 and CMP-3 action on proposal 3-169.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-82 Log #235 NEC-P08 **Final Action: Accept**
(Table 392.3(A))

Submitter: Stanley Kaufman, CableSafe Inc.
Comment on Proposal No: 8-182
Recommendation: Accept proposal 8-182 in principle by revising the columns "Wiring Method" and "Article" as shown below.

Table 392.3(A) Wiring Methods

Wiring Method	Article
Armored cable	320
CATV cables	820
CATV raceways	820
Class 2 & 3 cables	725
Communications cables	800
Communications raceways	800
Electrical metallic tubing	358

Submitter: Code-Making Panel 16,
Comment on Proposal No: 8-181
Recommendation: Reconsider and accept the proposal.
Substantiation: Listing of multipurpose cables ended on July 1, 2003. CMP-16 accepted Proposals 16-175, -176, -181 and -182 and CMP-3 accepted Proposal 3-169 to remove references to multipurpose cable. CMP-16 rejected Proposals 16-220 and 16-221 which would have deleted the listing requirements for multipurpose cables because of a Standards Council directiive dealing with NFPA 90A issues. Other than the listing requirements that CMP-16 could not delete, the reference in Table 392.3(A) is the only remaining reference to multipurpose cables in the 2008 NEC. Elimination of references to multipurpose cables began in the 2005 NEC. Removal of a reference to multipurpose cables does not create any problem for users of the code since all multipurpose cables were also listed as communication cables.

This comment was balloted through CMP-16 with the following ballot results:

15 Eligible to Vote
12 Affirmative
1 Negative
2 Not Returned (R. Gubisch and R. Hughes)

Mr. H. Ohde voted negatively stating: "CMP-16 rejected Proposals 16-220 and 16-221 because of a Standards Council directive. Since multipurpose (CMP) cable is still listed in 800.179(G), technically the reference to multipurpose cables should remain in Table 392.3(A) until the standard Council decision is resolved."

Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Comment 8-81.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-85 Log #707 NEC-P08 **Final Action: Accept (392.7(A))**

Submitter: Robert Crain, Cablofil
Comment on Proposal No: 8-108
Recommendation: The Panel should accept in principle and modify the existing 392.7(A) as follows:

Metallic cable trays that support electrical conductors shall be grounded as required for conductor enclosures in accordance with 250.96 and Part IV of Article 250.

Substantiation: The proposed revision in 392.7(A) requires the cabletray to be connected to a grounded enclosure rather than simply being grounded. The intent of this section appears to be to ensure the cabletray is grounded as required for conductor enclosures. There are other means for grounding the cabletray rather than connecting it to a grounded enclosure. No substantiation has been provided to require changing the means of grounding cabletray by connection only to grounded enclosure. Enclosures usually occur at the end of a cable tray run. Cable tray is allowed to be mechanically discontinuous as long as it is electrically continuous, and provides cable support per appropriate cable type code section. Those trays are often grounded to building steel via hold down hardware or jumpers. They are often grounded to telecommunication grounding bus as well.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-86 Log #2158 NEC-P08 **Final Action: Accept in Principle (392.8(A))**

Submitter: David H. Kendall, Carlon
Comment on Proposal No: 8-192a
Recommendation: Proposal 8-192a should be an "Accept in Principle" and revise the text for 392.8(A) to read as follows:

(A) Cable Splices. Cable splices made and insulated by approved methods shall be permitted to be located within a cable tray, provided they are accessible. Splices that are subjected to physical damage shall not project above the side rails.

Substantiation: The current text accepted by Panel 8 indicates that the only time a splice is permitted is when it is exposed to physical damage. The proposed rewording in this comment attempts to state that splices are allowed in a cable tray. When the splice is subject to physical damage, then the splice cannot project above the side rails of the cable tray.
Panel Meeting Action: Accept in Principle
Revise the text for 392.8(A) to read as follows:

(A) Cable Splices. Cable splices made and insulated by approved methods shall be permitted to be located within a cable tray, provided they are accessible. Splices shall be permitted to project above the side rails where not subject to physical damage.

Panel Statement: The revised wording meets the intent of the submitter.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 396 — MESSENGER SUPPORTED WIRING

7-61 Log #47 NEC-P07 **Final Action: Accept (396.12(B))**

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 7-105
Recommendation: The Technical Correlating Committee directs that further consideration be given to the comments expressed in the voting. This action will be considered by the panel as a public comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the direction of the TCC. See panel action and statement on Comment 7-62.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-62 Log #285 NEC-P07 **Final Action: Accept**
(396.12(B))

Submitter: Code-Making Panel 5,
Comment on Proposal No: 7-105
Recommendation: CMP-5 recommends that CMP-7 reject this proposal.
Substantiation: This proposal adds grounding requirements for the messenger cable that do not correlate with the grounding requirements in other parts of the code as has been pointed out by the negative vote comments. Context indicates that 396.12 has to do with the physical uses of the messenger cable. The submitter's substantiation does not specifically address the physical use of the messenger cable. A more appropriate place to address grounding requirements for messenger cables is 396.60. Please refer to CMP-5's comment on Proposal 7-106.

This comment has been balloted through CMP-5 with the following results:
15 Eligible to Vote
13 Affirmative
1 Negative
1 Not Returned (W. Helfrich)

Mr. D. Brender voted negatively stating: "Vote on Panel 5 and Task Group recommendation is negative. Recommendation: Revise the proposed new 396.12(B) as follows: "The messenger shall not be used as a continuous current-carrying conductor such as a neutral unless otherwise permitted in this code."

Substantiation: The NEC generally requires conductors to be insulated. See 310.2(A). This should include where neutral conductors are installed as feeders or branch circuits. 230.22 Exception Permits the grounded conductor of multiconductor cable installed for services to be bare. However, this section does not apply to feeders or branch circuits. CMP-5 disagrees that 225.4 allows current-carrying conductors to be bare or covered. The exception simply states that other sections in the NEC might allow such an installation. While it is normal practice for the electrical utilities to install service drops using bare neutral conductors, these service drops are not covered by the code given the exclusion provided in 90.2(B)(5)."

Mr. D. Hammel voted affirmatively stating: "Accept the proposal in principle and create a new section for the use of the messenger as a current-carrying conductor as follows:

"396.XX Use of Messenger as current-carrying Conductor. The messenger shall only be used as a grounded conductor as provided in 396.XX(A) or (B).

(A) Grounded Service Conductor. The messenger shall only be used as a grounded service conductor as provided in 230.22 exception.

(B) Grounded Feeder Conductor. The messenger shall only be used as a grounded conductor in accordance with 250.32(B)(2)."

Note: If the CMP-5 action on Proposal 5-119 continues to hold through the 2008 NEC development process, the reference to 250.32(B)(2) should be changed to reference 250.32(B)(1) Exception.

CMP-5 agrees with the concepts introduced in this proposal that restricts messengers from generally being used as current-carrying conductors. By inserting the words "unless used as a grounded conductor in accordance with 250.32(B)(2") places a restriction on this use while at the same time allows existing installations to continue this use because the installation met previous requirements in the NEC. The actions taken by CMP-5 on Proposal 5-119 will place further restrictions on this use to only existing installations where the conditions of the exception (former 250.32(B)(2) have been met. CMP-5 recommends that CMP-7 adjusts the accept action to accept in principle on this proposal and add the text suggested for consistent correlation with the CMP-5 actions on Proposal 5-119. This action should meet the intent of the submitter while continuing to recognize the allowance for messengers to carry current under restrictive existing installations only."
Panel Meeting Action: Accept

The panel accepts the comment and rejects Proposal 7-105. This panel action will delete 396.12(B) as accepted by the panel action on Proposal 7-105, and shown in the ROP, and return 396.12 to the text shown in the 2005 Code.
Panel Statement: The panel considered the recommendations to reject Proposal 7-105 submitted in CMP5 Comment 7-62, CMP4 Comment 7-63 and CMP19 Comment 7-64 and the substantiations and recommendations provided in those comments.

The CMP5 action to accept in principle Proposal 5-119 changed 250.32(B)(2) into an Exception to 250.32(B)(1).

Acceptance of Proposal 7-105 would introduce a conflict with the accept in principle action on Proposals 5-21 and 5-36 to add a definition of "neutral conductor" in Article 100. The Article 100 definition, as modified in Proposal 5-36, states "Neutral Conductor. The conductor connected to the neutral point of a system that is intended to carry current under normal conditions." Proposal 7-105 recommends the addition of 396.12(B) to read "(B) The messenger shall not be used as a continuous current carrying conductor such as a neutral conductor."

Acceptance of Proposal 7-105 would also introduce a conflict with 310.15(B)(4).
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-63 Log #297 NEC-P07 **Final Action: Accept**
(396.12(B))

Submitter: Code-Making Panel 4,
Comment on Proposal No: 7-105
Recommendation: The following is the **Final Action** of a task group appointed to review Proposal 7-105. CMP-4 recommends rejecting the proposal.
Substantiation: CMP-4 has rejected Proposal 4-6 to delete permission to use a bare or covered conductor as a grounded circuit conductor. A bare messenger wire is used as the grounded conductor throughout the country for overhead utility company service drops without any problems and is permitted by 230.41, Exception for service entrance conductors. Overhead branch circuits and feeders are permitted to be installed in an outside application where the wires are distributed using overhead poles similar to utility company distribution of service conductors. Section 225.4 only requires installation or covering on branch circuit or feeder cables installed using overhead poles where within 10 ft of any building or structure (structures other than supporting poles or towers). If phase conductors can be uninsulated from pole to pole, it would stand to reason that the grounded conductor could be uninsulated.

No evidence is offered that any of the incidents cited by the submitter is or has been corrected by the application of insulated neutrals; no evidence is offered that "Zipse's Law" has credence or is accepted by any recognized authority; and no evidence is offered that using the messenger as a current carrying conductor is a hazard.

This comment was balloted through CMP-4 with the following results:
10 Eligible to Vote
10 Affirmative

Ballot Results: Affirmative: 14

7-64 Log #306 NEC-P07 **Final Action: Accept**
(396.12(B))

Submitter: Code-Making Panel 19,
Comment on Proposal No: 7-105
Recommendation: The following is the **Final Action** of a task group appointed to review Proposal 7-105. CMP-19 recommends rejecting this proposal.
Substantiation: CMP-5, not Article 396, should determine grounding requirements including stipulations for the grounded conductor. Based on Proposal 5-119, CMP-5 did not accept the concept of deleting 250.32(B)(2) from the NEC because there are instances where this method of grounding is warranted. They did retain and incorporate the text of 250.32(B)(2) into an exception to the main rule in 250.32(B)(1). CMP-19 agrees with these changes, but points out that they apply to branch circuits and feeders, not services. Proposal 7-105 makes no distinction. Additionally, this new language poses unnecessary restrictions in instances where repairs are needed such as if an entire cable comes down and needs to be replaced.

This comment was balloted through CMP-19 with the following balloting results:
14 Eligible to Vote
12 Affirmative
2 Not Returned (W. Bowman and R. Carlson)

Mr. M. Ewing voted affirmatively stating: "Applying Proposal 7-105 to NEC 396.2(1), (2) and (3) makes sense because these messengers are not intended to carry current and 396.60 requires these messengers to be grounded as equipment. I see a conflict with 230.41 Exception, thus, in addition to Panel 5's input, Panels 4 and 7 need to work together to determine the use of the 396.2(4) bare multiplex cable messenger (which is a bare conductor wrapped around a steel support messenger as an assembly) for service conductors. Beware that the proposal does not prohibit the use of a bare grounded circuit conductor permitted by 230.41 Exception, rather it prohibits the use of the present type combined messenger/conductor from being used as a grounded circuit conductor (a quadruplex cable could be made to have 2-insulated and 2-bare for 3-current carrying conductors or a triplex cable with a bare conductor and a separate bare messenger which defeat the proposal's intent."
Panel Meeting Action: Accept
Panel Statement: See panel action and statement on Comment 7-62.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-65 Log #964 NEC-P07 **Final Action: Reject**
(396.12(B))

Submitter: Mark C. Ode, Underwriters Laboratories Inc.
Comment on Proposal No: 7-105
Recommendation: Revise as follows:
396.12 Uses Not Permitted. ~~(A)~~ Messenger supported wiring shall not be used under the following cond
itions:
(1) In hoistways ~~or~~
(2) where subject to physical damage
~~(B)~~ (3)where the messenger ~~shall not be~~ is used as a continuous current carrying conductor, such as a neutral conductor.
Substantiation: This proposed change follows the format in other wiring method articles and more closely follows the NEC Style Manual.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 7-62.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-66 Log #1173 NEC-P07 **Final Action: Accept**
(396.12(B))

Submitter: Neil F. LaBrake, Jr., National Grid / Rep. Edison Electric Insitute-Electric Light & Power Group
Comment on Proposal No: 7-105
Recommendation: Reject Proposal 7-105.
Substantiation: The submitter's intent is to prohibit the use of the messenger from ever being a current carrying conductor. Sections 250.32(B)(1) and 250.32(B)(2) in the 2005 NEC clearly set forth the rules for when this conductor can be a grounding conductor and when it can be a grounded conductor. Acceptance of this proposal would negate these applicable requirements when this wiring method is used. Article 396 should be used to determine the use, installation, and construction specifications for messenger supported wiring. Article 250 should be used to determine the grounding requirements. No evidence is offered that any of the incidents cited by the submitter is, or has been corrected by the application of insulated neutrals. No evidence is offered that using the messenger as a current carrying conductor is a hazard.
Panel Meeting Action: Accept
Panel Statement: See panel action and statement on Comment 7-62.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-67 Log #1515 NEC-P07 **Final Action: Reject**
(396.12(B))

Submitter: James Daly, Upper Saddle River, NJ
Comment on Proposal No: 7-105
Recommendation: The Panel Action should be to Accept in Principle and instead of adding 396.12(B), revise 396.30 to read as follows.
396.30 Messenger.
(A) Support. The messenger shall be supported at dead ends and at intermediate locations so as to eliminate tension on the conductors. The conductors shall not be permitted to come into contact with the messenger supports or any structural members, walls, or pipes.
(B) Neutral Conductor. Where the messenger is used as a neutral conductor, it shall comply with the requirements of 225.4, 250.184(A), 250.184(B)(7), and 250.186(B).
(C) Equipment Grounding Conductor. Where the messenger is used as an equipment grounding conductor, it shall comply with the requirements of 250.32(B), 250.118, 250.184(B)(8), and 250.186(D).
Substantiation: Requirements already exist in the Code for neutral conductors and equipment grounding conductors. It is not necessary nor appropriate to introduce additional requirements in Article 396 that may conflict with other requirements in the Code that address the concerns of the submitter of the Proposal.
CMP7 has the responsibility to define the construction and installation requirements for Messenger Supported Wiring. CMP5 has adequately defined the specific requirements when the messenger is used as a neutral conductor or an equipment grounding conductor.
Expansion of 396.30 will locate all the requirements related to the application and use of the messenger within one section.
The change in the title of 396.30 was made to be consistent with the new text added into the section. The two sentences in (A) are unchanged from the 2005 Code.

Submitter: Code-Making Panel 5,
Comment on Proposal No: 7-106
Recommendation: It is recommended that CMP-7 continue to accept this proposal.
Substantiation: If the CMP-5 action on Proposal 5-119 continues to hold through the 2008 NEC development process, the reference to 250.32(B)(2) should be changed to reference 250.32(B)(1) Exception.
This comment was balloted through CMP-5 with the following balloting results:
15 Eligible to Vote
13 Affirmative
1 Negative
1 Not Returned (W. Helfrich)
Mr. D. Brender voted negatively stating: "Vote on Panel 5 Task Group recommendation is negative.
Recommendation: Reject the proposal.
Substantiation: CMP-5 intends that the practice of grounding the neutral at buildings or structures supplied by a feeder or branch circuit be allowed only where done as provided in editions of the NEC preceding the A2008. As a result, the additional sentence accepted in Proposal 7-106 should not be added."
Mr. D. Hammel voted affirmatively stating: "It is recommended that CMP-7 reject the suggested changes to this section but accept the proposal in principle and refer to the CMP-7 action and statement on Proposal 7-105.
CMP-5 agrees with the concepts introduced in this proposal that restricts messengers from generally being used as current-carrying conductors but feels that the restrictive text more appropriately belongs in a separate section. By inserting the words "only be used as a grounded conductor in accordance with 250.32(B)(2)", it places a restriction on this use while at the same time allows existing installations to continue this use because the installation met previous requirements in the NEC. The actions taken by CMP-5 on Proposal 5-119 will place further restrictions on this use to only existing installations where the conditions of the exception (former 250.32(B)(2) have been met. CMP-5 recommends that CMP-7 adjust the accept action to accept in principle on this proposal and refer to the panel action and statement on Proposal 7-105. This action should meet the intent of the submitter while continuing to recognize

the allowance for messengers to carry current under restrictive existing installations only as currently allowed in 250.32(B)(2)."
Panel Meeting Action: Accept in Principle
The panel accepts in principle the comment by accepting in principle Proposal 7-106.
Panel Statement: The panel agrees with the substantiation to change the reference to 250.32(B)(1) Exception; see panel action on Comment 7-76.

7-71 Log #298 NEC-P07 **Final Action: Accept in Principle**
(396.60)

Submitter: Code-Making Panel 4,
Comment on Proposal No: 7-106
Recommendation: The following is the **Final Action** of a task group appointed to review Proposal 7-106. CMP-4 recommends rejecting this proposal.
Substantiation: CMP-4 has rejected Proposal 4-6 to delete permission to use a bare or covered conductor as a grounded circuit conductor. A bare messenger wire is used as the grounded conductor throughout the country for overhead utility company service drops without any problems and is permitted by 230.41, Exception for service entrance conductors. Overhead branch circuits and feeders are permitted to be installed in an outside application where the wires are distributed using overhead poles similar to utility company distribution of service conductors. Section 225.4 only requires insulation or covering on branch circuit or feeder cables installed using overhead poles where within 10 ft of any building or structure (structures other than supporting poles or towers). If phase conductors can be uninsulated from pole to pole it would stand to reason that the grounded conductor could be uninsulated or covered. Service-entrance cable (SE) is an example of a cable where the grounded conductor is only covered, not insulated in accordance 388.10(B)(2) and (B)(4). Section 338.100, last paragraph, permits service entrance (SE) or USE to be constructed with one conductor (the grounded conductor) uninsulated. Accepting this proposal as written, would affect the permission with 338.10(B)(2) and (B)(4).granted for exterior installations of SE cables in not only 225.4, but also in 338.10.

This comment was balloted through CMP-4 with the following results:
10 Eligible to Vote
9 Affirmative
1 Negative

Mr. J. Young voted negatively stating: "CMP-7 has responsibility for this issue."

Mr. J. Rogers voted affirmatively stating: "I am voting in the affirmative on this comment, however, I do believe that the submitter is correct in his concern that the use of messenger cables as grounded circuit conductors has to be further defined. The exception to 225.4 allows this type of an installation for an outside branch circuit or feeder, but there is no defining language as to where and how. It is my belief that the onus is on CMP-4 to clarify this in the next code cycle and that clarification will be dependent upon some of the actions taken by CMP-5 in this code cycle. I do not believe that the 10 ft restriction for energized conductors is intended to apply to grounded or grounding conductors. To reference type SE cable in the Panel statement, could tend to create further confusion as Article 338 would only allow type SE cables to be used in this fashion when they are supported by a messenger cable, thus bringing the uninsulated messenger cable back into the picture."
Panel Meeting Action: Accept in Principle
Panel Statement: The panel did not accept the recommended sentence in Proposal 7-106 but did include in 396.30 references to the applicable sections in the Code when the messenger is used as a neutral conductor or an equipment grounding conductor.
See panel action on Comment 7-76.

7-76 Log #1517 NEC-P07 **Final Action: Accept**
(396.60)

Submitter: James Daly, Upper Saddle River, NJ
Comment on Proposal No: 7-106
Recommendation: The Panel Action should be to Accept in Principle and instead of adding an additional sentence to 396.60, revise 396.30 to read as follows.
396.30 Messenger.
(A) Support. The messenger shall be supported at dead ends and at intermediate locations so as to eliminate tension on the conductors. The conductors shall not be permitted to come into contact with the messenger supports or any structural members, walls, or pipes.
(B) Neutral Conductor. Where the messenger is used as a neutral conductor, it shall comply with the requirements of 225.4, 250.184(A), 250.184(B)(7), and 250.186(B).
(C) Equipment Grounding Conductor. Where the messenger is used as an equipment grounding conductor, it shall comply with the requirements of 250.32(B), 250.118, 250.184(B)(8) and 250.186(D).
Substantiation: Requirements in addition to the section referenced in the Proposal already exist in the Code for neutral conductors and equipment grounding conductors. Expansion of 396.30 will locate all the requirements related to the application and use of the messenger within one section.
CMP7 has the responsibility to define the construction and installation requirements for Messenger Supported Wiring. CMP5 has adequately defined the specific requirements when the messenger is used as a neutral conductor or an equipment grounding conductor.
The change in the title of 396.30 was made to be consistent with the new text added into the section. The two sentences in (A) are unchanged from the 2005 Code.
This Comment has been correlated with my comment on Proposal 7-105.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-77 Log #1929 NEC-P07 **Final Action: Accept in Principle**
(396.60)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 7-106
Recommendation: Accept the proposal. Even if the CMP 5 action in 250.32 stands, there will still be a use for this provision.
Substantiation: CMP 7 should not interfere in CMP 5 policy decisions regarding the use of a regrounded neutral messenger. This procedure has been used for over a century, and it is an essential part of most overhead utility distributions in North America and elsewhere. It can be used safely.Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
See action taken by panel on Comment 7-76.
Panel Statement: Other Sections within the Code already specify the requirements for a neutral conductor or an equipment grounding conductor and it is not necessary to include additional requirements in Article 396 for a messenger used for either of these functions. The recommended text refers the user to the applicable sections of the Code when the messenger is used either as a neutral conductor or an equipment grounding conductor.
See action taken taken by panel on Comment 7-76.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 400 — FLEXIBLE CORDS AND CABLES

6-68 Log #1877 NEC-P06 **Final Action: Accept**
(400.5(B))

Submitter: Mike Holt, Mike Holt Enterprises, Inc.
Comment on Proposal No: 6-77
Recommendation: Continue to accept the proposal, with the following change:
Make the following change in 400.5(B) fourth paragraph:
On a 4-wire, 3-phase, wye circuit where the ~~major portion~~ more than 50% of the load consists of nonlinear loads, there are harmonic currents present in the neutral conductor and the neutral conductor shall be considered to be a current-carrying conductor.
Substantiation: Using a prescriptive number instead of phrase that might be vague to some people would be much preferred to many code users.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-69 Log #417 NEC-P06 **Final Action: Reject**
(400.8(1)(4))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 6-84
Recommendation: Accept proposal revised:
(1) As a substitute for the ~~fixed~~ wiring ~~of a structure~~ methods covered in Chapters 2 and 3. (4) Where attached to buildings or structures ~~surfaces~~ except as permitted in this code.
Substantiation: Fixed wiring is not defined; it may be interpreted as wiring methods covered in Chapters 2 and 3, or "permanent wiring", although 555.13(A)(2)(1) permits power cables as permanent wiring. The phrase "as permitted in this code" is used in other sections. Structures which are not deemed buildings should be included, such as poles, posts, Fences etc.
Panel Meeting Action: Reject
Panel Statement: The original panel statement on Proposal 6-84 addresses the definition of "Fixed Wiring." The changes recommended in the comment are already addressed in 400.8 Exception to (4).
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-70 Log #1930 NEC-P06 **Final Action: Reject**
(400.8(4) Exception)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 6-86
Recommendation: Accept the proposal.
Substantiation: The panel statement is not responsive, because it does not provide a technical reason for rejection that is capable of rebuttal. In fact, the statement is incorrect grammatically, in that it refers to "uses" (plural), in an instance where only a single use is allowed (bus drop cable). A traditional use to be sure, but only one. The substantiation presented with the proposal merits a more serious review of past practice.
Panel Meeting Action: Reject
Panel Statement: The panel disagrees with attaching the cord to the structure other than as permitted by other articles in the Code. The Code already requires strain relief for the cord.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-71 Log #1931 NEC-P06 **Final Action: Reject**
(400.14)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 6-88
Recommendation: Accept the proposal.
Substantiation: The panel statement overlooks the substantiation that puts this restriction in Article 400 to begin with, namely, that cord ampacities anticipated operation in unconfined spaces. In fact, if the panel statement were correct,we would establish that the inclusion of this limitation was based on entirely erroneous information since the assigned ampacities already anticipated a diminished air circulation. Not true, of course.
The real reason to revisit this proposal has to do with practical utility. When wiring systems break down, they usually do so where conductors are spliced. This proposal tries to reduce the number of splices in an electrical system. When cord is used at the outer end of control or other circuits to accommodate frequent repositioning, it can be brought back intact to control terminals in an industrial control panel, or it can enter a box for a transition to building wire. Normally avoiding the splices is the better design choice.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms the panel action and statement on Proposal 6-88.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

ARTICLE 404 — SWITCHES

9-43 Log #2267 NEC-P09 **Final Action: Reject**
(404)

Submitter: Mathew Tarring, Bana Corporation
Comment on Proposal No: 9-82
Recommendation: Revise to read:
Connection points, such as screws on sides of snap switches shall be adequately protected from accidental or inadvertant contact. When installed in areas where they may come in contact with unqualified people or persons.
Substantiation: Although a system is not complete without switch covers, during the life of a system, it is inevitable that said covers will be damaged, removed, or discarded at some point. At that time, leaving a safety risk for any unqualified persons. Throughout the code book there are multiple provisions set forth to protect the end user and/or unqualified persons from safety risks

for the life of the system. I feel adding this text will help take yet another step forward towards an even safer installation. I would also like to site 406.4(F) to further express the need to continue a trend of safety.
Panel Meeting Action: Reject
Panel Statement: The Proposal is not properly submitted since it does not identify a specific location in the NEC. The cover plate is required to complete the enclosure and provides an effective level of protection from accidental or inadvertent contact of energized contact points. If the cover plate is removed the circuit is to be de-energized.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-2 Log #60 NEC-P17 **Final Action: Accept**
(404.2(C))

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 9-85
Recommendation: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 17 for Action in Article 422. This action will be considered by Code-Making Panel 17 as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the responsibility for Proposal 9-85 but rejects its recommendation. See panel action and statement on Comment 17-3.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9
Ballot Not Returned: 1 Gill, C.

17-3 Log #904 NEC-P17 **Final Action: Reject**
(404.2(C) (New))

Submitter: John McCamish, Amboy, WA
Comment on Proposal No: 9-85
Recommendation: Add a new subsection (C) to read:
(C) Off indication. A switch with a marked off position shall disconnect all ungrounded conductors to the load it controls.
Substantiation: The submitter provides adequate substantiation and description of an unsafe installation practice that is currently legal. Although the panel statement states that this is a maintenance issue-requiring field marking, Panel 9 covers installation practices. This is an allowable practice due to a loophole in the NEC and needs to be corrected. Marking only allows the installer to continue to violate safe installation practices.
The term "OFF" is clear and should be applied in its intended context.
Panel Meeting Action: Reject
Panel Statement: Requirements already exist in 422.34.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9
Ballot Not Returned: 1 Gill, C.

17-4 Log #1441 NEC-P17 **Final Action: Reject**
(404.2(C))

Submitter: Lawrence Cross, Local Union #98 IBEW
Comment on Proposal No: 9-85
Recommendation: None given.
Substantiation: I agree with Mr. Belisle, R. This is a very unsafe practice. An off position with a switch should be deenergized.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 17-3.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9
Ballot Not Returned: 1 Gill, C.

9-44 Log #793 NEC-P09 **Final Action: Reject**
(404.2(C) (New))

TCC Action: Based on the Technical Correlating Committee action on Comment 9-47, the Technical Correlating Committee directs that Comment 9-44 be reported as "Reject".
Submitter: Ian McDonald, Underwriters Laboratories Inc.
Comment on Proposal No: 9-84
Recommendation: Add a new subparagraph 404.2(C) and exception to read as follows:
404.2 Switch Connections.
(C) Switches Controlling Lighting Loads. Where switches control lighting loads supplied by a grounded general purpose branch circuit, a grounded circuit conductor shall be provided at the switch location.
Exception: Grounded conductors shall not be required in installations where it is possible to install conductors into the device boxes without damaging the building structure or building finish.
Substantiation: Acknowledging the ever-increasing use of these devices which need a return path for inboard control circuitry, a step in the right direction would be to add language that limits the new requirement to only those installations where it is impractical to add the grounded conductor at a future date. The reality of such an exception is that, in most installations where a cable wiring method is used, the grounded conductor will be required. This would include the majority of residential applications where the homeowner, unaware of the safety issues related to current flow on the equipment grounding conductor, would have a grounded conductor available at all switch locations which control lighting loads. The exception would have the opposite affect in most commercial applications where raceways are employed and trained electrical workers appreciate the needed for a grounded conductor. It is in these applications, due to the presence of a raceway, that the installer has the ability to install the required conductor without damage to the building structure or building finish.
It is important to note that, since the ROP Meeting, proposals to revise the applicable product standards have been unsuccessful. The original substantiation for Proposal 9-83 cited that the UL Standard for Nonindustrial Photoelectric Switches for Lighting Control, ANSI/UL 773A was being revised to require a grounded conductor termination for control current; however, in the recirculation process of the Standards Technical Panel (STP), this decision was reversed and the proposal was rejected. This decision was due in part to a concern from the manufacturers that the Code does not suggest a need for this wiring method at the switch box. Based on the action of this STP, it was determined that similar proposals to other standards would be unsuccessful. As such, an opportunity now exists, for placing language in the Code, which would provide the installer with the means to correctly terminate these devices with a proper return path for the monitoring current.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 9-47.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 9 Negative: 2
Explanation of Negative:
BREITKREUTZ, B.: This comment should be rejected because it would add a spare conductor for future use.
MCCULLOUGH, R.: See my explanation of negative vote on Comment 9-47.

9-45 Log #819 NEC-P09 **Final Action: Reject**
(404.2(C))

Submitter: Rod Belisle, NECA-IBEW Electrical Training Center
Comment on Proposal No: 9-84
Recommendation: Accepted in principle with the following addition to clarify the scope of the proposal.
Add: <u>In dwelling locations,</u> switches controlling lighting loads supplied by a grounded general purpose branch circuit…
Substantiation: This proposal created a great deal of discussion and concern for the CMP. The proposal has merit and should be required by the NEC in cable wiring methods, where the addition of a grounded conductor is not feasible or practical. The submitter's proposal is all-inclusive and probably not necessary for commercial and industrial applications, as wiring methods would typically permit the addition of a grounded conductor to those specific modified locations.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 9-47, which meets the intent of the submitter.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

9-46 Log #1240 NEC-P09 **Final Action: Reject**
(404.2(C) (New))

Submitter: Rhett Roe, JATC #26 IBEW/NECA
Comment on Proposal No: 9-84
Recommendation: Add new text as follows:
404.2 Switch Connections.
(A) Three-Way and Four-Way Switches. Three-way and four-way switches shall be wired so that all switching is done only in the ungrounded circuit conductor. Where in metal raceways or metal-armored cables, wiring between switches and outlets shall be in accordance with 300.20(A).
Exception: Switch loops<u>, three-way and four-way,</u> shall not require a grounded conductor.
<u>(B) Grounded Conductors.</u>
<u>(1) Disconnecting</u> Grounded Conductors. Switches or circuit breakers shall not disconnect the grounded conductor of a circuit.
Exception: A switch or circuit breaker shall be permitted to disconnect a grounded circuit conductor where all circuit conductors are disconnected simultaneously, or where the device is arranged so that the grounded conductor cannot be disconnected until all the ungrounded conductors of the circuit have been disconnected.
<u>(2) Providing Grounded Conductors. A grounded conductor shall be provided in all device boxes to permit connection of switches with a grounded conductor termination.</u>

Substantiation: Although the Code panel feels it is the responsibility of the installer to provide the grounded conductor during construction and the manufacturers of products needing additional grounded conductors to provide appropriate, clearly visible warnings and instructions on their packaging and installation instructions. This proposal should be revisited and recommended to be accepted in order to eliminate that any installation problems before and after construction to avoid possible connection to the equipment grounding conductor.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 9-47, which meets the intent of the submitter.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

9-47 Log #1415 NEC-P09 **Final Action:** Reject
(404.2(C))

TCC Action: The Technical Correlating Committee directs that this comment be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.
Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 9-84
Recommendation: Accept in Principle and revise the proposed text as follows:
404.2 Switch Connections.
(C) Switches Controlling Lighting Loads. Where switches control lighting loads supplied by a grounded general purpose branch circuit, a grounded circuit conductor shall be provided at the switch location.
Exception: A grounded conductor shall not be required in installations where the wiring method permits the installation of additional conductors without causing damage to the building structure or building finish.
Substantiation: NEMA agrees with the comments of panel members that the original proposal may have been too broad in requiring a grounded conductor in all installations. The rewording of the proposal in this comment is intended to require the grounded conductor in an initial installation only where it is impractical to later install a grounded conductor. For example, a conduit system would permit pulling a grounded conductor into the box after the initial installation whereas a cable wiring method covered by a a finished surface, such as NM cable used in a dwelling, may be difficult to retrofit with an additional conductor.
The intent of this proposal is to provide an installation for lighting control products that will not require the use of the grounding conductor for low-level standby current. If this requirement is adopted, the design of these products will be allowed to migrate from using the grounding conductor to using the grounded conductor for the standby current. Without a code requirement it is unlikely that the present wiring installation practices will change and designers of these products will be forced to continue to rely on the grounding conductor.
Occupancy sensors are permitted by UL 773A to have a current of up to 0.5 mA on the grounding conductor. This is allowed because the operation of an occupancy sensor requires a low level standby current. The standard permits this current on the grounding conductor because in a typical installation there is no grounded circuit conductor in the switch box which can be used as the return conductor for the standby current. There was a recent proposal to revised UL 773A to delete the section that allows 0.5 mA on the grounding conductor. The UL 773A Standards Technical Panel rejected this change to the standard. Consequently, UL 773A continues to permit 0.5 mA on the grounding conductor.
Products that have ground leakage are not uncommon. There are more than 200 UL standards that permit leakage current to ground. Acceptance of this requirement will help to eliminate the need for leakage current on the grounding conductor in lighting control devices and other similar products. The design of these products will eventually change to use the grounded conductor for standby current if the code is changed to ensure that the grounded conductor is available or could be easily installed at the switch location.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 6 Negative: 5
Explanation of Negative:
BREITKREUTZ, B.: This comment should be rejected because it would add a spare conductor for future use.
HARTWELL, F.: The comment should have been rejected. Although the concept of limiting the requirement to instances where a grounded conductor can be easily installed at later date is a substantial improvement over the original proposal, the exact wording of the exception is just not ready for prime time. Electricians routinely fish new cables into existing openings to address desired changes, and the more skilled among them very often do so without damaging the wall. What level of skill, then, should the AHJ assume while pondering a potential citation? Any time the wiring method uses a cabled wiring method? That would probably be excessive because it would clearly be improper to cite an instance where a wall wired with Type MC cable, but finished on only one side, failed to include a grounded conductor in a switch box. What then about the common commercial applications where the walls are only finished as far up as the suspended ceiling? Any electrician, almost regardless of skill, could replace a two-wire with a three-wire cable in that case. How would that be assessed by an AHJ? What about a box fed with a raceway wiring method, but fully loaded in terms of volume? Some form of extension would be required to contain the additional conductor, which the owner would probably resist in terms of appearance, but no damage to the wall would be required to complete the installation.
Good code is never necessarily code with which one is in technical agreement. It is code that will be consistently applied and understood. This wording does not meet that test. It also does not respond to the presentation at the panel meeting that demonstrated a (to this member) surprising correlation between occupancy type and difficulty in applying the objectives of this comment, with good compliance in residential occupancies and very poor compliance in commercial occupancies. This deserves further study over the next code making cycle.
MCCULLOUGH, R.: This comment should be rejected. Writing code rules based on endless "what if" scenarios is not logical. Trying to come up with rules that cover every possible thing that may be done later is going to result in a book too large to carry and installations too expensive for anybody to afford. the proposed language and the exception would seem to unnecessarily burden the residential and small commercial markets where the buildings are typically wired using cable methods. These installations would more than likely require a grounded conductor be included as part of the original installation at every switch location. It is just not reasonable to assume that an occupancy sensor will replace every switch that controls lighting outlets. Since this is not a retroactive rule, it would be more reasonable to assume that design professionals would include the sensors on their plans taking into account those locations where the may actually be installed and then the grounded conductor would be included as part of the original installation. This way you wouldn't have to run the grounded conductor to the switch(es) that controls your under cabinet lights, the eyeball spots over your fireplace, the light in your crawl space, the keyless in your furnace room, or lighting accenting wall pictures or other room decor.
The panel's statement in rejecting (correctly) Proposal 9-84 is still valid and more attention should be paid by the manufacturers to the suggestion for clear warnings and instructions on these types of devices. There was much discussion at both the ROP and ROC meetings about UL 773A which allows 0.5mA on the grounding conductor and proposed changes to that standard. These proposed changes were rejected in part we were told, because the NEC didn't require the grounded conductor at the switch. In my opinion the code doesn't have to change to require the grounded conductor because 250.6 doesn't allow for normal operating current to be imposed on the equipment grounding conductor now. Installers and the standards writers need to be aware of 250.6 and take the proper steps to ensure compliance. UL 773A should be changed to delete the allowance for the "standby current" on the grounding conductor, thus, bringing the installation into compliance with the existing rules of the code. This would force the manufacturers of the devices to mark them in such a way so as to make it crystal clear to the installers that they have to make provisions for a connection to the grounded conductor of the circuit. 0.5mA doesn't sound like much, but, think of the cumulative effect in a large building with perhaps hundreds of switch locations and there is considerable current flowing on the equipment ground system. In summary, this is clearly a design issue and the code should not be imposing requirements that may never be utilized.
SENGUPTA, S.: This provision of a grounded circuit as a spare in a switch, controlling lighting loads, will be interpreted as the only code requirement for any future modification. It may be a good idea for a specific purpose and should not be a code requirement which covers a whole range of safety issues.
It is recognized that this grounded circuit conductor will be used in the future to facilitate a special switching arrangement like a dimmer, sensor, ceiling fan switch or other programmable switch. This conductor is not required for the present switching and will only be required for provision of a circuit for current path for the future switch modification. So, this spare grounded circuit conductor, required by 2008 NEC, is for convenience of a fast track introduction of a future controlling switch. The future switch may be a safe product, but its installation as a replacement of an existing switch may create a safety hazard, violating other requirements of the NEC.
All modifications to any existing installations must take total safety into consideration following all code requirements. This 2008 NEC requirement of a grounded conductor in a switch may give a notion that there are no other code requirements to comply for modification of a switch.
YOUNG, R.: See the Comment on Negative Vote from IEEE (Mr. S. Sengupta).
Comment on Affirmative:
RUPP, B.: The intent of this proposal is to provide an installation for lighting control products that will not require the use of the grounding conductor for low-level standby current. If this requirement is adopted the design of these products will be allowed to migrate from using the grounding conductor to using the grounded conductor for the standby current. Without a code requirement it is unlikely that the present wiring installation practices will change and designers of these products will be forced to continue to rely on the grounding conductor. Acceptance of this requirement will help to eliminate the need for leakage current on the grounding conductor in lighting control devices and other similar products The design of these products will eventually change to use the grounded conductor for standby current, if, the code is changed to ensure that the grounded conductor is available or cold be easily installed at the switch location.

9-48 Log #917 NEC-P09 **Final Action: Reject**
(404.8(B))

Submitter: Richard Shackelford, NEO Products LLC
Comment on Proposal No: 9-91
Recommendation: Revise as follows:
Voltage Between Adjacent Devices. A snap switch shall not be grouped or ganged in enclosures with other snap switches, receptacles, or similar devices unless they are arranged so that the voltage between adjacent devices does not exceed 300 volts, or unless they are installed in enclosures equipped with identified, securely installed barriers or other means listed for the purpose between adjacent devices.
Substantiation: In the response, it was stated that if the devices were individually insulated, the insulation could be left off after a repair was made. Partitions could also be left out after a repair because all partitions sold now are removable. The advantage to an approved insulator on each device is if one device is replaced and left unprotected the other device insulator will still provide the separation. Another situation that occurs during building renovations is when lighting systems are changed from 120 volts to 277 volts using the existing conduits and boxes, the boxes are not always designed for partitions but an individual approved insulator would solve the problem. There have been numerous complaints from electricians (since the code required the grounding of switches) that the bare ground wire of romex is causing short circuiting. To use some approved means to insulate the devices would also solve this problem.
An insulating band is currently going through the UL approval process.
This insulator has received raving reviews from twelve electrical inspectors, four chief inspectors, and three fire chiefs.
Letters of approval are available upon request.
Panel Meeting Action: Reject
Panel Statement: The barriers that are the focus of this section are independent of the switch. The barrier needs to be part of the enclosure and stay with the enclosure, and not with the device.

9-51 Log #2101 NEC-P09 **Final Action: Reject**
(404.9(B))

Submitter: Brent Kidman, Cheetah usa Corp., Dale C. Gledhill
Comment on Proposal No: 9-18
Recommendation: Wording below is from the 2008 draft. Because of changes to identification that switch shall be connected to an equipment grounding conductor, the additional wording telling how to do that is not needed, so it is being proposed to be removed. In addition, where there is no likelihood of shock, the exception should include those situations.
(B) Grounding. Snap switches, including dimmer and similar control switches, shall be connected to an equipment grounding conductor and shall provide a means to connect metal faceplates to the equipment grounding conductor, whether or not a metal faceplate is installed. ~~Snap switches shall be considered to be par to fan effective ground fault current path if either of the following conditions is met:~~ [ROP 9-18]
~~(1) The switch is mounted with metal screws to a metal box or metal cover that is a connected to an equipment grounding conductor or to a nonmetallic box with integral means for connecting to an equipment grounding conductor. [ROP 9-96]~~
~~(2) An equipment grounding conductor or equipment bonding jumper is connected to an equipment grounding termination of the snap switch.~~
Exception to (B): Where no means exits within the snap switch enclosure for connecting to the equipment grounding conductor or where the wiring method does not include or provide an equipment grounding conductor, a snap switch without a connection to an equipment grounding conductor shall be permitted for replacement purposes or where there is no possibility of exposure of dead metal parts or no provision for installation of a metal faceplate only. A snap switch wired under the provisions of this exception and located within reach of earth, grade, conducting floors, or other conducting surfaces shall be provided with a faceplate of nonconducting, noncombustible material or shall be protected by a ground-fault circuit interrupter.
Substantiation: Since the wording has been revised to indicate connection to the equipment grounding conductor, the additional wording previously there to describe effective grounding is not needed. In addition where the switch and faceplate combination are such that no dead metal is available (plastic switch and faceplate combination) there is no reason for the grounding conductor to be provided on the switch.
Panel Meeting Action: Reject
Panel Statement: The comment would eliminate necessary provisions that cover the characteristics of an acceptable equipment grounding return path with respect to snap switch yokes and metal faceplates. Those requirements exist in part because the exchange of a nonmetallic faceplate for a metallic one will not, as a general rule, be supervised by qualified persons. There is no need for the additional wording in "Exception to (B)" since the existing requirement allows a plastic switch and cover plate to be installed.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

9-52 Log #820 NEC-P09 **Final Action: Reject**
(404.9(B)(1))

Submitter: Rod Belisle, NECA-IBEW Electrical Training Center
Comment on Proposal No: 9-95
Recommendation: "Accept" to read as follows:
Revise 404.9(B)(1) as follows:
The switch is mounted with metal screws to a surface-mounted metal box with at least one of the insulating washers removed or to a nonmetallic box with integral means for grounding devices.
Substantiation: The requirements in 404.9(B) state that a switch shall be "effectively grounded".
The definition of effectively grounded in Article 100, states that it shall be sufficiently low impedance and have sufficient current carrying capacity to prevent the buildup of voltages that may result…
It is not accurate to state that a switch mounted on a non-conductive surface, secured to a metal box that is recessed _", therefore not touching the switch, meets the requirements of "Effectively grounded".
The CMP substantiated it's vote by stating that the requirement is not the same as the requirement for receptacles, but the terminology used in 404.9(B) does not differentiate for the code user.
The use of the term "effectively grounded" needs to mean the same thing as used throughout the NEC, as it is described in Article 100.
Panel Meeting Action: Reject
Panel Statement: The proposed requirement is the same as 250.146(A) for receptacles and as such is excessive for snap switches that do not form an element in the extension of a circuit beyond the fixed wiring of a building or structure. This has been the consistent position of CMP 9 on this point for at least 70 years, and there has not been adequate technical substantiation presented to justify this change.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

9-53 Log #903 NEC-P09 **Final Action: Reject**
(404.9(B)(1))

Submitter: John McCamish, Amboy, WA
Comment on Proposal No: 9-96
Recommendation: This proposal should be rejected.
Substantiation: The proposed action and statement by the panel allows for switches mounted in raised industrial covers to be grounded via the cover, therefore, exposing the electrician to a shock hazard when mounting screws become loose, the cover is removed to service the device, take test measurements, or other activities OSHA would allow while the circuit is in the energized state.

Installation of a bonding jumper from the box to the device is a small request in exchange for a safe installation. The CMP needs to be reminded of the purpose of the NEC as described in 90.1.
Panel Meeting Action: Reject
Panel Statement: Refer to the panel statement on Comment 9-52. In addition, safe work on the energized terminals of a snap switch must involve other work procedures beyond the continuity of the equipment grounding return path in this instance. In fact, if there were a fault in the switch, and the enclosure and device were wired in accordance with the 2005 NEC, the circuit would have opened long before the electrician went to work on the box.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:

BELISLE, R.: The panel should have accepted the comment and rejected the original proposal. Allowing switches mounted in raised industrial covers to be grounded by the cover mounting screws is a poor practice and certainly does not provide a safe installation or working environment. Too often cover screws become loosened in working environments, exposing both the general public and the electrician to a potential shock hazard due to the inadequate grounding. As the panel stated, we cannot rely on the equipment grounding return path to provide a safe work environment if it does not exist. This could easily be resolved through the addition of an equipment grounding conductor installed to ground the device.

9-54 Log #1199 NEC-P09 **Final Action: Reject**
(404.9(B)(1))

Submitter: Richard A. Holub, Middletown, DE
Comment on Proposal No: 9-96
Recommendation: Retain the existing wording in this section and Reject the Proposal.
Substantiation: I share the opinion of the lone negative vote on this subject. While I don't advocate working on snap switches live, I do agree that grounding a snap switch through the cover presents an additional hazard if the cover becomes loose or when the cover is removed for maintenance access to the snap switch (you have to remove the cover to verify absence of voltage). We should not change the existing language - it was put there for a reason. The panel's justification that this puts snap switches in the same category as receptacles ignores one important difference between snap switches and receptacles: when an electrician needs to work on a receptacle, they can verify absence of voltage prior to removing the cover...when working on a snap switch, they cannot. We should not rely on the mounting screws in the cover for the ground path. A separate bonding jumper should still be required.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 9-53.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:

BELISLE, R.: See my explanation of negative vote on Comment 9-53.

9-55 Log #1834 NEC-P09 **Final Action: Reject**
(404.9(B)(1))

Submitter: Michael Walls, American Chemistry Council
Comment on Proposal No: 9-96
Recommendation: This proposal should have been rejected.
Substantiation: The proposal as accepted in principal and reworded by the panel would allow for switches in raised industrial covers to be grounded via the cover. Therefore if the cover is removed, the electrician could be exposed to a shock hazard if the switch body has become energized and is no longer grounded.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 9-53.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:

BELISLE, R.: See my explanation of negative vote on Comment 9-53.

ARTICLE 406 — RECEPTACLES, CORD CONNECTORS, AND ATTACHMENT PLUGS (CAPS)

18-1 Log #1266 NEC-P18 **Final Action: Accept**
(406, 410, 600 and 605)

Submitter: Neil F. LaBrake, Jr., Syracuse, NY
Comment on Proposal No: 18-8
Recommendation: Continue to accept the TCC Grounding and Bonding Task Group proposal 18-8 as modified and revised by the actions of CMP-18.
Substantiation: The CMP-18 revisions to the proposal have been made for clarity and continue to be consistent with the Grounding and Bonding Task Group's original initiatives.

This Comment was developed by a Task Group assigned by the NEC Technical Correlating Committee to address actions that were other than "accept" taken by Code-Making Panels on proposals from the TCC to resolve 2005 NEC Proposal 5-1 and Comment 5-1. Members of the Task Group on Grounding and Bonding for this Comment included: C. Douglas White; Michael Johnston; Jeffrey Boksiner; Daleep Mohla; Phil Simmons; Christopher Hutchings; James Carroll; Alan Rebeck; Richard Loyd; Paul Dobrowsky; and Neil F. LaBrake, Jr.

18-2 Log #1274 NEC-P18 **Final Action: Reject**
(406.2 (New))

Submitter: Bob Boutin, BE Safe Consultants, Inc.
Comment on Proposal No: 18-11
Recommendation: Add new text to read as follows:

All 125-volt single phase receptacles shall have Overload Fault Circuit Interrupter Protection for Personnel.
Substantiation: My proposal was rejected for improper style, lack of substantiation and lack of independent testing on various topics. The revised wording above should address improper style, but does introduce a new term "Overload Fault Circuit Interrupter" that has also been proposed to CMP-2 (Proposals 2-154 and 2-155). With regards to independent testing, one company that makes a product that has been listed by CSA (Certificate #1818336) has provided me with a test report from ETL/Intertek. This report - as well as the CSA listing - addresses the product's ability to perform under conditions outlined by both CMP 18 and Nationally Recognized Testing Labs (NRTLs) that are applicable to electrical outlets and supplemental testing for Overload Fault Circuit Protection features.

On the front page of the NFPA website there is a new report taken from the NFPA Journal titled "U.S. Fire Loss for 2005". In this article concern was shown that "with home fire deaths still accounting for 3,030 fire deaths or 82 percent of all civilian deaths, fire safety initiatives targeted at the home remain the key to any reductions in the overall fire death toll". The fourth (of five) major strategy to address this issue stated that "additional ways must be sought to make home products more fire safe." The fifth strategy is to address "the special fire safety needs of high-risk groups, e.g., the young, older adults, and the poor." This new technology would be a major step in the right direction to achieve these objectives set forth by the NFPA, by making homes safer and saving lives.

Note: Supporting material is available for review at NFPA Headquarters.

18-3 Log #1355 NEC-P18 **Final Action: Reject**
(406.2 (New))

Submitter: Gary S. Santoro, Town of Wethersfield / Rep. New England Association of Fire Marshals
Comment on Proposal No: 18-11
Recommendation: Add new text to read as follows:

All 125-volt single-phase 15- and 20-ampere receptacles shall have Overload Fault Circuit Interrupter and Power Fault Circuit Interrupter protection.
Substantiation: 2D2C, Inc., a US company, has developed several technologies to prevent the ignition of fires from excess heat due to electrical faults. These fire prevention technologies have been implemented in the form of circuit interrupters. The interrupters disconnect loads before adequate heat can be generated to ignite a fire. These interrupters supplement the preventative protection already provided by circuit breakers, by Arc Fault Circuit Interrupters, and by Ground Fault Circuit Interrupters. They fill the fire-cause gaps that remain after implementation of these protective devices - they are complimentary and not redundant technologies that should be implemented in all residential wiring systems to prevent fires.

I personally learned about the technology at the NFPA Exposition in Orlando in June 2006. I received a demonstration of the technology as implemented in the SafePlug brand of electrical safety outlets. The technology works. And from my experience as a Fire Marshal, it will save lives by preventing a large number of fires. You can view an overview of the products at their website: www.safeplug.com. I am sure company representatives would travel to the NFPA review meeting to demonstrate the product. The contact that demonstrated the product to me and gave me NFPA sanctioned technical talk of the technology at the NFPA Expo was Steve Montgomery.

These primary causes of fires from electrical faults are outlined in three primary reference documents used in the fire investigation industry. These documents include the following:

- "Guide to Fire and Explosion Investigations", NFPA 921
- "Kirk's Fire Investigation, 6th Edition", John DeHaan, Prentice Hall, 2007, Chapter 10 "Electrical Causes of Fire" by Chris Korinek, P.E.
- "Fire Ignition", Dr. Vyto Babrauskas, Fire Science Publishers, 2003

These documents all suggest that the top electrical causes of heat to ignite flammables consist of the following:

1. High current flowing through high resistance connections
2. Excess voltage across electrical device loads, and
3. Excess current flowing through electrical device loads

2D2C, Inc. has designed Fault Circuit Interrupters to remove the load after detecting these conditions. The heat source disappears if no current flows. Thus, although the Interrupter approach does not fix the wiring or load device problem, it prevents the calamity of ignition from the fault. Below is a simple description of what the two types of interrupters accomplish to prevent fires:

- Power Fault Circuit Interrupter (PFCI): Removes a load if it detects excess current flowing through a high resistance connection in the circuit OR if it detects excess AC Line utilization voltage across the device load
- Overload Fault Circuit Interrupter (OFCI): Removes a load if it detects excess current flowing into the load using a fast-trip, variable threshold, resettable breaker. The trip level matches the electrical load ampacity through RightPlug communication.

NOTE: PFCI and OFCI will prevent fires that presently occur in the presence of circuit breaker, AFCI and GFCI protection. The PFCI and OFCI protection is needed in a structural wiring system - protection does not presently exist for these faults. PFCI will prevent the super-heating of loose wire junctions inside wire nuts and screw connections that cause fires. PFCI will also protect against voltages up to 200-220 VAC across 120 VAC rated electrical devices caused by "floating neutral" conditions. OFCI will prevent against excess-current heating in the small wires (18, 20, 22, 24 gauge) inside electrical devices caused by poor maintenance, damage, abuse, improper designs, and poor quality manufacturing. OFCI also limits current through each 120 VAC outlet to a cumulative maximum of 15 amps or (as rated for the outlet type) to prevent distribution wiring from overheating due to overloads allowed by improper size fuse or circuit breaker replacement (presently the company has not completed the designs for a 20A outlets - only 15A versions exist at the time of this writing).

Additionally, 2D2C, Inc. has invented complimentary shock safety technology to the Ground Fault Circuit Interrupter (GFCI). The GFCI prevents electrocutions from line-to-ground leakage paths. The Shock Fault Circuit Interrupter (SFCI) prevents shocks through the normal line-to-line paths. To accomplish this, the SFCI keeps electricity off at unused receptacles and only delivers electricity to tagged electrical plugs.

Please approve proposals 18-11, 18-12, and 18-13. Make this technology part of the 2008 Code. If the PFCI and OFCI technology had been installed in homes in our community where I serve as Fire Marshal, a number of fires would never have started. Please help me to save lives by requiring the use of PFCI and OFCI in the electrical outlets in residential wiring systems.

(406.2 (New))

Submitter: Steve Montgomery, OFI Inc.

Comment on Proposal No: 18-13

Recommendation: Add new text to read as follows:

All 125-volt single phase receptacles shall have Overload Fault Circuit Interrupter protection.

Substantiation: Thank you for considering the Overload Fault Circuit Interrupter (OFCI) located in an electrical outlet for fire protection of structures. In these comments, I have tried to respond to your concerns as stated:

1) The submitter's use of the term "should not" could be interpreted as not being mandatory language and may not satisfy the submitter's original intent.

2) Over the past several code cycles, much of the same incident data has been used to support AFCI proposals indicating that the incidents are the result of arcing faults on the interior wiring. The last code cycle, this data was used to support a thermally protected receptacle indicating that the incidents resulted from overheated receptacle contacts or terminals. Now the claim is that the incidents are resulting from electrical overload of connected utilization

3) This appears to be a proposal that would recommend a "theoretical" product. CMP 18 is not aware of any such product on the market. Nor is CMP 18 aware of any standards or fact finding report covering such a product. Before considering a proposal such as this, CMP 18 would look for information from a standard or fact finding report dealing with performance characteristics such as (but not limited to) the following:

- Endurance
- Capacity to withstand overload and short circuit
- Ability to operate in normal and abnormal temperature ranges
- Ability to withstand surges
- Ability to withstand under-voltages
- Ability to withstand moisture/corrosive atmosphere

My comments are as follows:

1) Change the wording in Proposal 18-11 and 18-12 to match the Proposal 18-13 as follows:

"All receptacles shall incorporate Overload Fault Circuit Interrupter protection."

2) I cannot accurately state what percentage of electrically-ignited fires would have been prevented by the use of OFCI. It is impossible for anyone without the forensic evidence to accurately analyze the fire examples listed in Proposal 18-13. However, the OFCI covers many of the previous gaps in electrical fire protection.

As I am sure you know, the surveys that the NFPA conducts are mostly based upon Fire Marshal Reports. I am a member of the International Fire Marshals Association (IFMA) and have spoken to a number of Fire Marshals about the level of detail regarding their investigations. In addition to the fact that only about a third of the big fires leave enough evidence to trace back to the cause, very few of them have time or the forensic tools to dive in really deep to identify the specific cause. It is often an accomplishment for anyone to determine that an electrical fault, versus another ignition source, generated the fire, let alone what type of electrical fault caused it. The insurance company fire investigator gets more detail on cause, since they must try to indict one or more product manufacturers to assign the insurance payout burden away from the insurance company. But the product liability defense forensic expert, hired to prove the product manufacturer to be innocent, is the one with the best knowledge. He understands electricity very well, replicates ignition situations in his/her lab, and even X-rays burned electrical components (appliances, circuit breakers, etc.) to identify internal states to prove cause. Only these electrical forensic experts know the detailed fire cause facts, but rarely can they share them since the evidence is associated with a court case or simply held as confidential by the electrical appliance or device manufacturer.

To identify how many of electrically ignited fires would be prevented by OFCI, we interviewed several of these expert forensic electrical fire investigators including the following persons:

- Dr. Vyto Babrauskas, Fire Science and Technology, 9000 300th Place SE, Issaquah, WA 98027, fire researcher, forensic investigator, expert witness, author of the book "Ignition Handbook," ISBM 0-9728111-3-3.
- Chris Korinek, P.E., Synergy Technologies LLC, N144 W6466 Pioneer Road, Cedarburg, WI 53012, expert witness, electrical forensic investigator, author, contributor to Chapter 10 "Electrical Causes of Fire" of "Kirk's Fire Investigation" 5th and 6th editions, by John DeHaan, ISBN 0-13-171922-X.
- Jim Finneran, ElectroTek Consultants Inc., 18925 SR 1, Spencerville, IN 46788, fire researcher, electrical forensic investigator, expert witness, co-author of "Fire Findings."
- John S. Robison, Robison Consulting LLC, PO Box 680854, Prattville, AL 36068-0854, electrical forensic investigator, expert witness, ex Fire Marshal.

The general consensus is that the three primary electrical causes of fires consist of the following in order of prevalence:

1. High current flowing through high resistance connections
2. Excess voltage across electrical device loads, and
3. Excess current flowing through electrical device loads

None of these experts wanted to commit to percentages of specific electrical fire cause. All of them feel that high current through a high resistance connection is the most common electrical ignition source. Most estimated high resistance connections as causing 50 to 80 percent of all electrically induced fires. Most suggested that floating neutral problems (excess voltage across loads) are the next biggest cause of fires. Third, would be excess current draw through extension cords, lamps, appliances, electronics and other loads. The cause of excess current in a load device represents reduced impedance. Some causes of reduced load impedance include the following:

- Improper device use (e.g., oversized light bulbs)
- Poor product manufacturing quality (flaws)
- Poor product design
- Insulation breakdown and leakage through carbonization (age and fatigue)
- Locked motor rotors (worn bearings, dirt)

Other electrical fire causes, such as induction, are extremely rare. The experts' general opinion is that arcing from line to ground is usually a result of a fire, not the cause of a fire.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: Nothing in the NEC prohibits installation of such a listed device. The commenter submitted two significant reports. One was a Fact Finding Report demonstrating that the device in question performs the functions claimed by the manufacturer. The other was a CSA certification

report that demonstrates that the device is suitable for certification as a receptacle or plug, but making no certification as an OFCI. What continues to be missing is information clearly defining the problem, justifying that the magnitude of the problem is sufficient to warrant addressing by this Code, and demonstrating that the performance characteristics of this device are the appropriate and necessary performance characteristics.

Ballot Results: Affirmative: 12

18-5 Log #1621 NEC-P18 **Final Action: Reject**
(406.2 (New))

Submitter: Scott Tegler, City of Woodstock / Rep. Fire Department City of Woodstock
Comment on Proposal No: 18-13
Recommendation: All 125-volt single-phase 15- and 20-ampere receptacles shall have Overload Fault Circuit Interrupter and Power Fault Circuit Interrupter protection.
Substantiation: I do not have the information that you request to make a decision on this proposal. Nevertheless, since I proposed this code change, I am responding to your request for comments.

1. My proposal did comply with NFPA Regulations Governing Committee Projects and the NEC Manual of Style. I used the word “shall” and not “should”.

2. As a Fire Chief, I cannot provide an absolute analysis of fire data. Most of the NFPA data is collected from Fire Marshals and Fire Prevention Officers, not fire investigators, and few fire departments have forensic equipment or the resources to perform these detailed analyses.

Additionally, the number of fires that occur each year in each fire department jurisdiction is statistically inadequate, even if the analysis granularity and accuracy existed. Nevertheless, NFPA 921 provides guidelines for electrical fire cause and the book “Ignition Handbook” by Vytenis Babrauskas provides excellent detail on electrical fire cause. Circuit breakers, GFCIs, AFCIs, and resettable fuses on strip outlets all provide good protection. However, the protection coverage map leaves gaps and Overload and Power Fault Circuit Interrupters fill many of these gaps. These new technologies are not comprehensive, but they address several of the primary fault causes including:

Current overloads
Voltage overloads
Inadequate voltage
High resistance connections

They do not cover arcing (improvements continue to be made on AFCIs though) nor induction (written about, but extremely rare as a fire cause). The other protection you mentioned, of sensing heat rise inside an outlet caused by poor wire connections at the outlet or inside the electrical box makes sense too. However it would miss high resistance connections in junction boxes or inside the electrical panel, whereas Power Fault Circuit Interrupters do cover these locations also. All these technologies are mutually supportive in preventing fires. No solution should by positioned as “absolute” or “all-encompassing.”

3. A product implementation of Overload and Power Fault Circuit Interrupter exists today. It is not a “theoretical” product; it is real and I have witnessed its functionality. It interrupts current and overload faults before they can damage insulation (long term fire cause) or ignite flammables (short term fire cause). I first became aware of these product solutions in May 2005 at the Ontario Fire Chief Association meeting. 2D2C, Inc. has a product line called SafePlug electrical safety outlets that implement these products. I do not know if other companies are making the product. Their research and development facility is located in Waterloo, Ontario, Canada and their corporate headquarters are in Gurnee Illinois. The leader of the Canadian operation is Steve Montgomery. He would be better prepared to provide the evidence of product performance characteristics and reliability than I would. I have requested that he provide this evidence directly to you.

Based upon my experience as Fire Chief, I truly believe that this Overload and Power Fault Circuit Interrupter technology implemented either in new structure or retrofitted into existing structure electrical outlets would reduce the number of fires. Please require them in the 2008 NEC.

(406.2 (New))

Submitter: Greg Baker, 2D2C, Inc.
Comment on Proposal No: 18-13
Recommendation: Add new text to read as follows:

All 125-volt phase receptacles shall incorporate Overload Fault Circuit Interrupter Protection for Personnel.

Substantiation: I am the president of 2D2C, Inc. My company has developed products that implement Overload Fault Circuit Interrupter technology that would satisfy Proposals 18-11, 12, and 13 (as well as 2-154 and 2-155). These products are, and will be commercially available regardless of your actions for the 2008 NEC.

One of our products was listed by CSA in late 2005. We have sold some of this product without any marketing push. Our other OFCI product was recently listed. Now that we know that our high quality products exceed industry accepted safety standards, in addition to internal quality tests, we will commercially launch both products in the first quarter of 2007. While we strongly believe that this technology should be part of the NEC, our products do not need a change to the NEC to be used. Therefore, we will get the products into the marketplace to prevent fires and save lives.

We have established manufacturing capabilities to support the significant demand that we expect for these products. We have included in our manufacturing plans, contingencies for additional production capacity if you choose to include this technology in the 2008 NEC. We are working with several companies that will provide additional sources of products utilizing OFCI technology through both licensing and brand labeling agreements.

18-7 Log #2238 NEC-P18 **Final Action: Reject**
(406.2 (New))

Submitter: John S. Robison, Robison Consulting, LLC
Comment on Proposal No: 18-11
Recommendation: Add text to read as follows:

All 125-volt single phase receptacles shall have Overload Fault Circuit Interrupter protection.

Substantiation: I sincerely request that you accept the proposed technology described in Proposals 2-154 and 2-155. A company called 2D2C, Inc. (www.2d2c.com) has developed a simple approach to protecting against incorrect sizing of light bulbs to fixtures. The technology is called Overload Fault Circuit Interrupter (OFCI). I witnessed this technology in operation at an NFPA Expo, evaluated it and found that it works as described. Based upon my expertise, OFCI would eliminate most fires caused by improperly sized light bulbs if it was installed. From my experience, the only way to ensure that this OFCI technology prevents these fires, is to require its usage. If it is optional, it will not get used and these fires will continue.

Simply stated, OFCI is effectively a resettable fast-trip breaker located in the outlet or in a light fixture. The light fixture version of OFCI has a fixed trip-current level that matches the light fixture rating. If the wrong size light bulb is installed in the fixture, the OFCI disconnects electricity to the bulb and will toggle power to the light with a very low duty cycle until it detects a current draw below its trip threshold and then resets itself.

The OFCI electrical outlet version has 14 different trip-current levels and automatically matches its trip level to the device rating plugged into each receptacle independently. Outlet OFCI reads this trip level from RightPlug safety encoding inside the plug (www.RightPlug.com). The RightPlug encoding embeds a wireless memory stick inside the plug that contains information about the appliance such as its maximum current draw and power rating. Therefore, a 60 Watt, 120V lamp will have a RightPlug hold current of 0.5 Amp. When the plug is inserted in the OFCI outlet, the RightPlug reader inside the outlet reads the appliance rating and sets it trip level accordingly. If a 100 Watt light bulb is inserted in the fixture, the OFCI outlet will disconnect electricity after a few seconds to give instant feedback to the operator that an oversized light bulb has been inserted in the light fixture. On the OFCI outlet, the breaker is reset by removing the plug and reinserting it in the socket. If the correct sized bulb has been installed, the OFCI outlet will turn on power to the outlet and operate the same as any standard outlet. If an oversized bulb remains in the fixture, the OFCI outlet will trip again and disconnect electricity to the lamp cord. A red indicator light flashes adjacent to the overloaded receptacle to ease troubleshooting.

I presently act as an expert investigator for fire cause and am a retired fire marshal. As such, I have personal experience with identifying the cause of thousands of fires. On several occasions, the use of light bulbs of a higher rating than the fixture in which they were used has resulted in fires. The NFPA 101 Life Safety Code requires apartment building owners to provide annual information to tenants regarding safety procedures in the event of fire or the sounding of a fire alarm. I believe a portion of that information should include the proper use of correct wattage bulbs in light fixtures. Unfortunately, this safety practice does not normally occur nor is it practical to regulate. OFCI is a practical solution to this fire cause.

Some examples of fires that OFCI would have prevented include the following:

A fatal apartment house fire where 100 watt bulbs were routinely installed in both interior and exterior fixtures, although the fixtures carry warnings regarding the use of bulbs in excess of 60 watts.

Several interior lamp fires where bulbs in excess of 60 watts were used overheating combustible shades.

Warnings regarding this improper practice of over-sizing bulbs in fixtures and lamps are displayed on websites of nationally recognized safety organizations, however, the practice continues and fires do likewise.

18-8 Log #396 NEC-P18 **Final Action: Reject**
(406.3(G) (New))

Submitter: Earl W. Roberts, Reptec
Comment on Proposal No: 18-15
Recommendation: Add new section 406.3(G), "Receptacle Testing", as follows:
"Receptacle outlet circuit testers designed for use in 15A and 20A, 125V, 2P3W receptacles shall display a lighted warning signal when the equipment grounding contacts are energized at 90 volts or more."
Substantiation: The Panel has agreed that a serious shock hazard can exist under the conditions specified in the proposal. The submitter is familiar with eight electrocutions that resulted from the very conditions described.
90.1(A) of the NEC states that the purpose of the code is the practical safeguarding of persons and property from hazards arising from the use of electricity. Note that there is no limitation concerning devices "not permanently connected".
The Panel rejected the proposal, stating - "The Panel disagrees that requirements for usage of a device not permanently connected to the premises wiring system belong in the NEC." The submitter is encouraged to work with the UL 1436 STP.
This is a "chicken-egg" situation. We know that if a requirement is included into the NEC, since the NEC becomes an American National Standard, that the UL standard must not be in conflict, in order for it to become an American National Standard.
The NEC is full of examples where requirements are included for devices not permanently connected to the premises wiring. Several NECs ago, we were involved in the requirements for hair dryers in 422.41. At that time, we located about 100 other examples. I have provided a list that includes several articles, with many examples, should suffice to make the point.
The wide-spread usage of 3-wire receptacles to replace 2-wire receptacles, protected by GFCIs and properly labeled, have greatly increased the likelihood of equipment grounding contacts of these receptacles becoming energized. Plugging in any tool or appliance with a 3-wire cord causes a serious shock hazard. The existing listed testers will not detect this shock condition.
The Panel is urged to address this serious safety issue, and not to push it off to another organization beyond their control to resolve.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: CMP 18 continues to reject this proposal and comment as the receptacle testers referenced do not fall within the scope of the NEC. The NEC does contain provisions for the proper use of cord wiring, the proper polarization of cord-caps, and the proper identification of the grounded-circuit conductor within a cord. Article 422 on appliances addresses the circuit requirements to an appliance and not the wiring of the appliance. Section 410.42 addresses the grounding and polarization of portable lamps but does not address usage. A receptacle tester is not a device similar in usage to a portable luminaire or an appliance which is cord-connected and left in-place for an extended period of time. Receptacle testers are used intermittently to verify safe wiring and operation of receptacles. The appropriate standard for the safe construction and operation for receptacle testers is ANSI/UL 1436, Standard for Outlet Circuit Testers and Similar Indicating Devices.

18-9 Log #1423 NEC-P18 **Final Action: Accept**
(406.4(D) Exception No. 2)

TCC Action: The Technical Correlating Committee notes that in addition to the Fact-Finding Report referred to in the substantiation of this comment the Taymac Corporation has submitted additional substantiation in support of retaining 406.4(D), Exception No. 2, including a further Fact-Finding Report. See Comment 18-10.
Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 18-19
Recommendation: The panel should Accept this Proposal.
Substantiation: This exception creates a direct conflict with other parts of the NEC and nationally recognized standards and can create an unsafe condition by allowing a wall plate to:
1. Prevent full engagement of a plug into a receptacle.
2. Prevent the seating of the wall plate against the wall.
3. Circumvent the basic design, installation and safety standards for plugs and receptacles.

ANSI/UL Standard 514D is the ANSI standard for Coverplates (Wallplates, Faceplates).
Section 4.1 requires:
● A cover plate or outlet box hood that is used with a receptacle shall not hinder the complete seating of an attachment plug of the type intended for use with the receptacle.
● A cover plate shall have dimensions that comply with ANSI/NEMA WD6 for features intended to accommodate a flush-mounted receptacle.

ANSI/NEMA WD6 contains the dimensional requirements to accommodate these important safety functions:
● The minimum height of the receptacle boss is specified to allow wall plates to be designed so that the duplex bosses are flush or protrude from the installed wall plate and "...not preclude the flush seating of a plug into a receptacle". The minimum blade length of the plug is specified, not the depth of the receptacle contacts. Receptacles are designed to work with a minimum blade length with the plug fully seated against the receptacle face.
● The maximum height of the receptacle boss is not specified, thus the holes specified for the bosses in the wall plate allow it to slip over the bosses and seat against the wall surface safely completing the electrical enclosure.

The NEC has installation requirements that support both of these safety objectives.
● NEC 406.4(D) requires "After installation, receptacle faces shall be flush with or project from faceplates of insulating material and shall project a minimum of 0.4 mm (0.015 in.) from metal faceplates".
● Article 406.5 requires "Receptacles faceplates shall be installed so as to completely cover the opening and seat against the mounting surface".

Clearly there has been a comprehensive and collaborative set of codes and standards requirements that recognize these relationships and work together to establish a safe environment.
NEC 406.5 Exception No. 1 recognizes this important relationship.
● It permits "Listed kits or assemblies encompassing receptacles and nonmetallic faceplates that cover the receptacle face, where the plate cannot be installed on any other receptacle...".
● This is a very reasonable exception. It permits a specific receptacle and faceplate to be tested, evaluated and listed for the purpose.
● It also acknowledges the fact that it is not possible to determine if the face plate will function safely with the billions of other receptacles installed, produced or being designed and, thus, requires it to be non-interchangeable.

NEC 406.5 Exception No. 2 overlooks this important relationship.
It universally permits "Listed nonmetallic faceplates that cover the receptacle face to a maximum thickness of 1 mm (.040 in.)...".
● This exception in effect arbitrarily reduces the plug engagement on any receptacle where it is installed.
● This would be the same as the NFPA allowing an exception for all plug blades to be 1 mm (.040 in.) shorter than the minimum length published in the ANSI standards.

There are several safety issues involved:
● The typical duplex receptacle is designed to mount to an outlet box installed in a wall and the electrical enclosure is completed by the installation of a faceplate. To do this, it must seat on the surface of the wall. A faceplate as described in Exception No. 2 that covers the receptacle face must also seat on the receptacle face. It will only seat against the wall if its dimensions match the receptacle face height exactly. There are millions of receptacles being produced and installed that have a face height significantly higher than the minimum specified in ANSI/NEMA WD6. If the plate is designed to the minimum face height dimension, then it will not seat against the wall with these receptacles. This is a direct violation of NEC 406.5 cited previously and creates a potential safety hazard by permitting access to live parts in the outlet box.
● If the plate is designed to be greater than the minimum face height dimension, in order to seat against the wall, then it may not seat against the face of the receptacle creating a gap between the plate and receptacle face precluding the full insertion of a plug even further. This can create an arcing condition and potential for fire with any receptacle where the contacts are deeply recessed. The billions of installed receptacles have widely varying contact recesses as they are designed to work with a minimum length of plug blade.
● Even if the receptacle and the plate are perfectly matched, the installation must also be perfect. If the receptacle is slightly raised, it will lift the plate off the wall. If the receptacle is slightly recessed it will result in a gap between the plate and receptacle resulting in far more than a.040 in. obstruction.
● By its very nature this type of plate can be used to cover an improperly recessed receptacle or be used to cover an old worn and broken receptacle. The finished installation will look perfect while actually concealing the hazard.

The TayMac code panel presentation cites a fact-finding to justify the exception. The test program is seriously flawed, as it does not follow the standard test protocols in the appropriate ANSI/UL standards. However, even if corrected it would still be irrelevant as it cannot test or anticipate the wide variety of receptacle designs and installation conditions that can create the safety issues cited above. It can only demonstrate, at best, that it can work where it can work. There are many receptacle designs where the plate will not work safely because the plate will not seat on the wall or the plug engagement is significantly compromised.
This is a dimensional compatibility issue, not just a performance issue. Clearly, Exception No. 1 was intended to address this issue by allowing a Nationally Recognized Testing Laboratory (NRTL) to evaluate and list nonmetallic faceplates that cover the receptacle face for use with specific receptacles and cannot be installed on non-tested receptacles. This in effect acknowledges that it is not possible to test or evaluate the face plate with the billions of other receptacles already installed, being produced or being designed.

Exception No. 2 is dimensionally incompatible with the current and future receptacle infrastructure and can create a hazardous condition. Therefore, the proposal to delete Exception No. 2 should be accepted.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
OWENS, T.: I continue to support the current language contained within 406.4(D) Exception No. 2. Persuasive arguments for and against this issue were submitted during both the proposal and comment stages. The panel narrowly supported removal of this exception. I firmly believe that it is a case of "throwing out the baby with the bath water."
The proponents of removing the exception provided some examples of where the cover plate could cover up unsafe receptacles or improperly installed receptacles. The issue addressed from this side really is a case of an installation that is in violation of other sections of the NEC by the receptacle not being maintained in a serviceable condition or not installed with the plaster ears against the wall surface. This is similar to stating that a surface-mounted fluorescent luminaire should not be allowed because the box was not installed in a code complaint manner. The correction action is to require proper installation of the receptacle and not preclude the installation of the plate.
The only operative issue that was presented concerns the ability of a receptacle to make proper contact with the blades of a cord cap. The single receptacle that was used in the demonstration is no longer produced in the same configuration according to a representative of the manufacturer. The proponents of retaining the exception provide testing results that indicated one manufacturer's plate and certain receptacles complied with the blade retention requirements of the appropriate ANSI/UL Standard 514D. Thus, stating that 406.4(D) Exception No. 2 is inherently dangerous is really a disingenuous argument. In fact, one nationally recognized testing agency has listed this manufacturer's plate.
Another issue raised is that 406.4(D) Exception No. 2 violates language contained in ANSI/UL 514D and ANSI/NEMA Standard WD6. This is not an issue new to the NEC process. The revision cycle of the NEC does not always correspond to the revision cycles of UL or NEMA standards. Allowance is always made for other standards to catch up. For example, take the proposed new requirement for weather-resistance receptacles in damp and wet locations. At the time the original proposal was made the current standards did not have requirements covering weather-resistant type receptacles. During this comment stage, statements were made that the standards are in the process of being revised and new listed devices should be available upon code implementation. Finally, both standards do allow cover plates that cover a receptacle specifically in the floor mounted receptacles.
In conclusion, I did not see any presentation that an otherwise code complaint installation is denigrated by 406.4(D) Exception No. 2 or that existing standards could be modified to allow these coverplates under specified conditions and with appropriate installation instructions and restrictions.
PIERCE, J.: I recommend a reject on the proposal to remove Exception No. 2 from this Article. Let the certification labs decide by controlled evaluations/ tests whether an additional 1.0 mm insulating material between the receptacle face and plug is the same or better than a standard wall plate. Intertek did that evaluation and confirmed the same or better test results per standard UL498. The demonstration in the meeting was very convincing, but was it an accurate representation of a test in UL498? (Note the Masque wallplate was held against the old receptacle by finger pressure only and secured with a screw as intended).

18-10 Log #1607 NEC-P18 **Final Action: Reject**
(406.4(D) Exception No. 2)

Submitter: Robert W. Miller, Taymac, Inc.
Comment on Proposal No: 18-19
Recommendation: Continue to reject the proposal.
Substantiation: The substantiation for the proposal provides no evidence of field problems, although products meeting the provisions of the exception have been sold for over ten years, with millions of installations. Additional substantiation requested by some members of CMP-18 to retain the current wording is contained in the report provided.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The panel does not support this proposal based upon the dimensional compatibility issue of assuring that a cover plate when used with any receptacle will not produce a safety hazard. Panel members rely on technical facts and not on the basis of the number of unreported field problems or a series of tests that do not encompass the entire range of available products to justify continued acceptance. It is clearly evident that ANSI/NEMA WD6 standard contains the critical dimensional requirements to assure the safe usage of a receptacle and an attachment plug regardless of whom and where each is individually produced. The ANSI/UL 514D Standard, which states that a cover plate or outlet box hood that is used with a receptacle shall not hinder the complete seating of an attachment plug of the type, intended for use with the receptacle. The submitter has not demonstrated that the unimpeded plug insertion has been addressed as well as assured compliance with 406.5 regarding the seating of the faceplate against the wall surface. The panel urges the submitter to continue to address this issue through the ANSI Standard process for Cover Plates for Flush-Mount Wiring Devices, the ANSI/UL 514D.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
OWENS, T.: See my explanation of negative vote on Comment 18-9.
Comment on Affirmative:
PIERCE, J.: See my Explanation of Negative Vote on Comment 18-9.

18-11 Log #328 NEC-P18 **Final Action: Reject**
(406.4(D)(1))

Submitter: Bruce King, Black & Veatch
Comment on Proposal No: 18-19a
Recommendation: (1) 2-pole, 3-wire, and 3-pole, 4-wire grounding, blade type receptacles shall have the ground pin oriented on the top for vertical installations, and to the left hand side for horizontal installations.
Substantiation: IEEE standard 602-1996 Section 4.2.2 specifcally address' ground prong orientation to be on top for vertical alignment, or on left when on horizontal installation. FDA has issued warnings attributing ground prong installation being on bottom as the cause of hospital bed fires. As a minimum, NFPA should include an FPN to this section taking a position that gives preference to the top or left position. Through use of an FPN, other orientations could still be allowed when based on either equipment manufacturer recommendations, or equipment installed location. This issue is a true safety concern, not a design preference, and needs to be addressed.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Comment 18-15.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
BER, M.: This comment is a result of the perennial proposal to require the ground prong up in a receptacle installation. The only substantiation that has ever been presented to the panel is the "what if" defense. What if a receptacle had a metallic cover plate? What if the cover plate screw fell out? What if when the screw fell out there was a cord plugged into the receptacle? What if the cover plate fell down and contacted both grounded and ungrounded prongs at the same time? What if the switch controlling this receptacle was on? What if the resulting short tripped the breaker? Fin, Cased closed! Then there is the other scenario where: What if the cord cap was not all the way into the receptacle? What if some very thin conductive object fell between the cord cap and the cover plate? What if this object contacted the ungrounded and the grounded or the grounding prongs at the same time? What if the resulting short tripped the breaker? Fine, case closed. Too many "what ifs" to make this a code requirement, and not enough logic or gravity to make it a sure thing that upside down mounting would have a different result. But, if someone feels that they can save the world by installing receptacles upside down then let them proceed, there is nothing in current code language that would prohibit this.

18-12 Log #2147 NEC-P18 **Final Action: Reject**
(406.4(E))

Submitter: Brandon Lott, Gephart
Comment on Proposal No: 18-20
Recommendation: While technical substantiation is lacking, common sense should prevail. Gravity will hold any currents in the receptacle when not in use. It would make sense that a cover i.e., whether proof hinged cover is installed to protect the receptacle when not in use.
Substantiation: None given.
Panel Meeting Action: Reject
Panel Statement: In accordance with Sections 4.4.5(c) and 4.4.5(d) of the Regulations Governing Committee Projects this comment is rejected because the submitter has not provided specific code text to be added and has also not provided technical substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-13 Log #216 NEC-P18 **Final Action: Accept**
(406.4(G) (New))

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 18-24
Recommendation: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Add a new 406.4(G) to read:

Voltage between Adjacent Devices. A receptacle shall not be grouped or ganged in enclosures with other receptacles, snap switches, or similar devices, unless they are arranged so that the voltage between adjacent devices does not exceed 300 volts, or unless they are installed in enclosures equipped with identified, securely installed barriers between adjacent devices.

Panel Statement: The panel concludes that the hazard addressed by 404.8(B) for switches and other devices is also present for receptacles and other devices. Section 404.8(B) states: "Voltage Between Adjacent Devices. A snap switch shall not be grouped or ganged in enclosures with other snap switches, receptacles, or similar devices, unless they are arranged so that the voltage between adjacent devices does not exceed 300 volts, or unless they are installed in enclosures equipped with identified, securely installed barriers between adjacent devices." Therefore, a receptacle installed in a box with an adjacent switch where the voltage between devices exceeds 300 would require a barrier. The new section will require barriers where two receptacles are installed.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

18-14 Log #581 NEC-P18 **Final Action: Accept in Principle (406.4(G))**

Submitter: Russell LeBlanc, Peterson School of Engineering

Comment on Proposal No: 18-24

Recommendation: This proposal should be accepted.

It's a simple, logical extension of existing requirements for similar devices. Being proactive may prevent incidents in the first place. Why wait for an incident and then be reactive.

Substantiation: Sometimes logic and common sense is an appropriate reason for making changes instead of waiting for something bad to happen and then reacting to the incident. I urge the panel members to use forward thinking in this matter.

Panel Meeting Action: Accept in Principle

Panel Statement: See the panel action and statement on Comment 18-13.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

18-15 Log #2149 NEC-P18 **Final Action: Reject**
(406.4(G), FPN (New))

Submitter: Charles Browning, Travis Tech

Comment on Proposal No: 18-21

Recommendation: A Fine Print Note should be added to give direction during installation as follows:

Receptacle orientation should be considered when installing receptacles for fixed or stationary equipment with the receptacle position best suited for the cord being installed.

Substantiation: None given.

Panel Meeting Action: Reject

Panel Statement: The panel is unable to accept a fine print note for a section that is non-existent. The proposed fine print note is informational concerning receptacle orientation when mounted in a vertical surface. There is not a current section that addresses this issue.

The panel reiterates that receptacle orientation is a recommended practice by many organizations but has not received sufficient technical documentation that a correctly installed receptacle and cord cap connection presents an inherently unsafe situation.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

18-15a Log #1299 NEC-P18 **Final Action: Reject**
(406.8(A))

Submitter: Robert D. Detter, Phoenix, AZ

Comment on Proposal No: 18-28

Recommendation: Revise the 2nd sentence to read as follows:

The receptacle shall be a listed ~~weather resistant~~ sunlight resistant type if subject to solar exposure.

Substantiation: It should not be required to be weather-resistant since it is required to be protected by a weatherproof coverplate. It may or may not be subject to the effects of solar exposure depending on its location and the type of weatherproof cover installed.

Panel Meeting Action: Reject

Panel Statement: The panel rejects this comment as it presents new wording that is significantly different from the concept of the referenced proposal. The panel did not take a "Hold" action on this comment, in accordance with Section 4.4.6.2.2 of the Regulations Governing Committee Projects, because the submitter did not provide sufficient technical substantiation to support this comment being automatically resubmitted to CMP 18 as a proposal in the next NEC revision cycle.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

18-16 Log #1424 NEC-P18 **Final Action: Accept in Principle (406.8(A))**

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Comment on Proposal No: 18-28

Recommendation: The Proposal should be Accepted in Principle with the proposed text revised to read as follows and with the addition of a new Figure and FPN. This comment is a companion to the NEMA comments on Proposals 18-33 and 18-35.

15- and 20-amperes, 125- and 250-volt receptacles conforming to the configurations shown in Figure 406.8(B) shall be Listed weather-resistant type. ~~The listed weather resistant requirement shall become effective on January 1, 2011.~~

FPN: Complete details of the configurations can be found in ANSI/NEMA WD6, National Electrical Manufacturers Association Standard for Dimensions of Attachment Plugs and Receptacles.

[Reference Note for panel information only — the FPN and Figure are similar in format to 552.44(C)(2)].

Substantiation: NEMA supports the intent of the proposals to require listed weather resistant receptacles in damp and wet locations. However, this requirement should be limited to 15 and 20 ampere, 125 and 250 volt straight blade receptacle configurations. These are the receptacles that were covered by NEMA/UL field study cited in the substantiation for the proposals. In reviewing available field data, the NEMA wiring device manufacturers have concluded that it is predominately 15 and 20 ampere straight blade receptacles that are affected by the conditions described in the substantiation. This is most likely due to the use and installation practices commonly associated with these receptacles. Requiring 15 and 20 amp straight blade receptacles to be the Listed weather resistant type will ensure that the receptacles subject to the conditions described in the proposal substantiations will be of sufficiently robust design to withstand these conditions. Requiring all receptacles to be Listed weather resistant type would include many receptacles not typically subject to the same conditions as the 15 and 20 amp straight blade receptacles. These other types of receptacles would include devices such as pin and sleeve, high ampere locking devices and other similar categories of receptacle. NEMA wiring device manufacturers have been unable to identify any information that indicates an adverse impact on these receptacles used in damp and wet locations similar to the effect on 15 and 20 amp straight blade receptacles.

NEMA is currently working with UL to develop requirements for Listed weather resistant receptacles that will be included in UL 498. This will ensure availability of Listed weather resistant receptacles prior to the adoption of the 2008 NEC. NEMA recommends deleting the January 1, 2011 effective date from this proposal.

Panel Meeting Action: Accept in Principle

Revise the last paragraph of 406.8(A) to read:

A receptacle shall be considered to be in a location protected from the weather where located under roofed open porches, canopies, marquees, and the like, and will not be subjected to a beating rain or water runoff. All nonlocking 15- and 20- ampere, 125- and 250-volt receptacles ~~The receptacle~~ shall be a listed weather-resistant type. ~~This listed weather-resistant requirement shall become effective on January 1, 2011.~~

FPN: The types of receptacles covered by this requirement are identified as 5-15, 5-20, 6-15, and 6-20 in ANSI/NEMA WD 6-2002, National Electrical Manufacturers Association Standard for Dimensions of Attachment Plugs and Receptacles.

Panel Statement: The panel accepts in the principle the restriction on listing 15- and 20- ampere 125- and 250-volt receptacles. The panel has revised the recommended fine print note to identify the product standard and configuration types which makes inclusion of the recommended figure unnecessary.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

18-17 Log #2321 NEC-P18 **Final Action: Reject**
(406.8(A))

Submitter: Jim Pauley, Square D Company

Comment on Proposal No: 18-28

Recommendation: Reject this Proposal.

Substantiation: There are no listed weather resistant receptacles. In fact, there are not even any requirements for a listed weather resistant receptacle. Why would the code panel agree to such a requirement when they have no idea if the claimed situation will be addressed by the ultimate requirements. In fact, the proposal doesn't even outline the problems in enough detail.

We have code requirements for the installation of boxes and covers that are to handle the situation described. If the receptacle is performing poorly, then the receptacle manufacturers should improve their product designs to accommodate the intended installations. It's clear that the receptacle manufacturers know that their product will be installed in these environments (since the code has requirements for certain installations to have outdoor receptacles), so they should have already taken this into account into their designs.

In addition, the requirement will end up applying to situations that are not impacted by some of the stated issues. One example is receptacles in Power Outlets. These receptacles are typically behind metal covers that can be closed with the cord in place. Why is a UV resistant receptacle needed.

Lastly, it is somewhat ridiculous to attempt to have two different receptacles. Contractors and inspectors will be faced with continual problems in trying to sort out the right receptacle for indoor versus outdoor. Receptacle applications such as this are universal. If the receptacle needs to be improved, then the receptacle manufacturers need to make the improvements - not complicate the code.

Panel Meeting Action: Reject

Panel Statement: The substantiation provided with Comment 18-16 indicates that these receptacles will be available prior to the effective date shown in Proposal 18-28.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

18-18 Log #1426 NEC-P18 **Final Action: Accept in Principle (406.8(B)(1))**

20-A, 125-V, 2-pole, 3-wire, grounding type

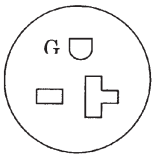
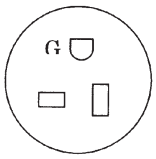
15-A, 250-V, 2-pole, 3-wire, grounding type



20-A, 250-V, 2-pole, 3-wire, grounding type



20-A, 250-V, 2-pole, 3-wire, grounding type

FIGURE 406.8(B) Receptacle Configurations.

[Reference Note for panel information — the FPN and Figure are similar in format to Section 552.44(C)(2)]

Substantiation: NEMA supports the intent of the proposals to require listed weather resistant receptacles in wet locations. However, this requirement should be limited to 15 and 20 ampere, 125 and 250 volt straight blade receptacle configurations. These are the receptacles that were covered by NEMA/UL field study cited in the substantiation for the proposals. In reviewing available field data, the NEMA wiring device manufacturers have concluded that it is predominantly 15 and 20 ampere straight blade receptacles that are affected by the conditions described in the substantiation. This is most likely due to the use and installation practices commonly associated with these receptacles. Requiring 15 and 20 amp straight blade receptacles to be the Listed weather resistant type will ensure that the receptacles subject to the conditions described in the proposal substantiations will be of sufficiently robust design to withstand these conditions. Requiring all 15 and 20 ampere, 125 and 250 volt receptacles to be Listed weather resistant type would include locking type receptacles of these ratings. NEMA wiring device manufacturers have been unable to identify any field reports that indicate that the locking receptacles are experiencing the same adverse affects that occur with the 15 and 20 amp straight blade receptacles installed in wet locations.

NEMA is currently working with UL to develop requirements for Listed weather resistant receptacles that will be included in UL 498. This will ensure availability of Listed weather resistant receptacles prior to the adoption of the 2008 NEC. NEMA recommends deleting the January 1, 2011 effective date from this proposal.

Panel Meeting Action: Accept in Principle

Revise the recommended text to read:

(B) Wet Locations.

(1) 15- and 20-Ampere Receptacles in a Wet Location. All 15- and 20-ampere, 125- and ~~through~~ 250-volt receptacles installed in a wet location shall have an enclosure that is weatherproof whether or not the attachment plug cap is inserted. All 15- and 20-ampere, 125- and 250-volt nonlocking receptacles shall be listed weather-resistant type. ~~This listed weather-resistant requirement shall become effective on January 1, 2011.~~

FPN: The types of receptacles covered by this requirement are identified as 5-15, 5-20, 6-15, and 6-20 in ANSI/NEMA WD 6-2002, National Electrical Manufacturers Association Standard for Dimensions of Attachment Plugs and Receptacles.

Insert the exception added by the panel action on Proposal 18-34 following the new fine print note.

Panel Statement: The panel revised the recommended text “through” to “and” as a result of their action on Comment 18-19 and 18-20. The panel has also revised the text and added a fine print note to clarify that only nonlocking receptacles are required to be listed and identified as weather-resistant type. The substantiation provided with this comment indicates that these receptacles will be available prior to the effective date shown in Proposal 18-28.

18-22 Log #1425 NEC-P18 **Final Action: Reject**
(406.8(B)(1) Exception (New))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 18-34
Recommendation: NEMA agrees in Principle with the exception to not require an "in-use" cover under certain conditions, but does not agree with the reference to high-pressure spray washing. We recommend changing the exception as follows:

[406.8(B)(1) Exception (New)]

Exception: 15- and 20-ampere, 125- through 250-volt receptacles installed in a wet location and subject to ~~routine high-pressure spray washing~~ wash down or similar procedures where cord openings of an in-use cover would allow water entry shall be permitted to have an enclosure that is weatherproof when the attachment plug is removed.

Substantiation: Covers that are weatherproof only with the plug removed have not been tested for high-pressure spray washing. This exception would provide a weatherproof enclosure only with plug removed similar to 406.8(B)(2)(b), other receptacles attended while in use. There are covers and devices listed that can provide higher levels of protection as needed.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided sufficient technical substantiation to support the expansion of the applications covered in the exception.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:

CARPENTER, F.: NEMA believes that in applications where a receptacle is subjected to routine wash-down it is better to use a cover that is weatherproof when the attachment plug is removed than to use a cover that is designed for leaving the attachment plug connected. However, the current wording implies that these covers have been tested for "high-pressure washing". Since these covers have not been tested for this application, we object to this phrase being used in the code.

WELLS, J.: To state, as the substantiation did, that the product is not tested for "high pressure spray" is, I believe, sufficient technical justification calling to our attention that we are requiring something that is not technically valid.
Comment on Affirmative:

WRIGHT, R.: I concur with the panel action to reject this proposal based on the fact that the proposed text is too broad. I do feel the commenter has a good point on expanding the requirements.

18-23 Log #1427 NEC-P18 **Final Action: Accept**
(406.8(B)(2))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 18-35
Recommendation: This Proposal should be Rejected. This comment is a companion to the NEMA comments on Proposals 18-28 and 18-33.

~~The receptacles shall be Listed weather-resistant type. The listed weather-resistant requirement shall become effective on January 1, 2011.~~

Substantiation: NEMA supports the intent of the proposals to require listed weather resistant receptacles in wet locations. However, this requirement should be limited to 15 and 20 ampere, 125 and 250 volt straight blade receptacle configurations. These are the receptacles that were covered by the NEMA/UL field study cited in the substantiation for the proposals. In reviewing available field data, the NEMA wiring device manufacturers have concluded that it is predominantly 15 and 20 ampere straight blade receptacles that are affected by the conditions described in the substantiation. This is most likely due to the use and installation practices commonly associated with these receptacles. Requiring 15 and 20 amp straight blade receptacles to be the Listed weather resistant type will ensure that the receptacles subject to the conditions described in the proposal substantiations will be of sufficiently robust design to withstand these conditions. Requiring all receptacles to be Listed weather resistant type would include many receptacles not typically subject to the same conditions as the 15 and 20 amp straight blade receptacles. These other types of receptacles would include devices such as pin and sleeve, high ampere locking devices and other similar categories of receptacle. NEMA wiring device manufacturers have been unable to identify any information that indicates an adverse impact on these receptacles use din damp and wet locations similar to the effect on 15 and 20 amp straight blade receptacles.

Ballot Results: Affirmative: 12

18-24 Log #2323 NEC-P18 **Final Action: Accept**
(406.8(B)(2))

Submitter: Jim Pauley, Square D Company
Comment on Proposal No: 18-35
Recommendation: Reject the Proposal.
Substantiation: There are no listed weather resistant receptacles. In fact, there are not even any requirements for a listed weather resistant receptacle. Why would the code panel agree to such a requirement when they have no idea if the claimed situation will be addressed by the ultimate requirements? In fact, the proposal doesn't even outline the problems in enough detail.

We have code requirements for the installation of boxes and covers that are to handle the situation described. If the receptacle is performing poorly, then the receptacle manufacturers should improve their product designs to accommodate the intended installations. It's clear that the receptacle manufacturers know that their product will be installed in these environments (since the code has requirements for certain installations to have outdoor receptacles), so they should have already taken this into account into their designs.

In addition, the requirement will end up applying to situations that are not impacted by some of the stated issues. One example is receptacles in Power Outlets. These receptacles are typically behind metal covers that can be closed with the cord in place. Why is a UV resistant receptacle needed?

Lastly, it is somewhat ridiculous to attempt to have two different receptacles. Contractors and inspectors will be faced with continual problems in trying to sort out the right receptacle for indoor versus outdoor. Receptacle applications such as this are universal. If the receptacle needs to be improved, then the receptacle manufacturers need to make the improvements - not complicate the code.

Panel Meeting Action: Accept
Panel Statement: The panel does not agree with the substantiation provided by the submitter. See the panel action on Comment 18-23 which limits the application of the weather-resistant receptacles to 15- and 20- ampere, 125 volt and 250 volt nonlocking types.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-25 Log #395 NEC-P18 **Final Action: Reject**
(406.9(F))

Submitter: Earl W. Roberts, Reptec
Comment on Proposal No: 18-39
Recommendation: Accept the proposal revised as follows:

(F) A listed device included as an integral part of a plug, cord set, or power supply cord that disconnects automatically and simultaneously all three conductors - the line conductor, the grounded circuit conductor, and the equipment grounding conductor, shall be permitted, when a voltage to ground of 90v or more exists on the equipment grounding conductor, where all of the following conditions exist:

1) The plug configuration is 15 or 20 amp, 125 volt, 2P3W.

2) A listed 15 or 20 amp, 125 volt GFCI is installed in the power supply cord, either integral with the plug, or within one foot of the plug.

3) The device provides labeling and a clear signal by a light or other means that the equipment grounding conductor has been interrupted.

Substantiation: Mr. Silverman is proposing a reasonable solution to a serious safety problem not addressed in the present NEC. The disconnection of all three conductors automatically when the equipment grounding conductor is energized at line voltage is no different functionally from pulling a plug out of a receptacle.

The proposal provides a solution to a shock condition that a GFCI does not protect against. The energized equipment grounding conductor bypasses the GFCI function entirely.

The substantiation submitted with my Comment on Proposal 18-15 is applicable here also. Rather than repeat the information, there is certainly substantial evidence that the solution to this issue belongs in the NEC. It is ironic that the Panel has recommended sending the proposal to Panel 5 “for action”, while taking the position that requirements for usage of a device not permanently connected to the premises wiring system do not belong in the NEC.

Panel Meeting Action: Reject

Ballot Results: Affirmative: 12

18-26 Log #579 NEC-P18 **Final Action: Reject**
(406.9(F))

Submitter: Arthur Silverman, General Wire Spring Company
Comment on Proposal No: 18-39
Recommendation: Accept the proposal revised as follows:

(F) A listed device included as an integral part of a plug, cord set, or power supply cord that disconnects automatically and simultaneously all three conductors - the line conductor, the grounded circuit conductor, and the equipment grounding conductor, shall be permitted, when a voltage to ground of 90v or more exists on the equipment grounding conductor, where all of the following conditions exist:

1. The plug configuration is 15 or 20 amp, 125 volt, 2P3W.

2. A listed 15 or 20 amp, 125 volt GFCI is installed in the power supply cord, either integral with the plug, or within one foot of the plug.

3. The device provides labeling and a clear signal by a light or other means that the equipment grounding conductor has been interrupted.

Substantiation: There have been six electrocutions of operators on our machines in the past years. These machines had GFCIs as standard equipment. These electrocutions were not caused by the machine or plumbing snake coming in contact with an outside source of electricity. They were not caused by an electrical short on the machine that the GFCI did not sense. They were caused by faulty wiring at the receptacle or extension cord that allowed current to pass into the machine through the ground wire.

I am not saying that the electrical grounding on our machines does not protect the operator in the event that the machine or plumbing snake comes in contact with an alternate electrical source (it allows the alternate source of electricity to follow the path of least resistance to a harmless ground).

Our device will protect any electrical piece of equipment using a 3-wire cord on all three wires, not two out of three. In the event that the device is plugged into a receptacle with no ground, or a “hot” ground, all three lines are disconnected electrically and a warning light comes on. This is, in effect, the same as pulling the plug with a bonus of a warning light.

We are having difficult getting our device manufactured because it is not listed. We are having difficulty getting it listed because it doesn’t appear to conform to the electrical code.

Early Jewish writing states: “To save on one life is as if you have saved the world.” I am not going to comment on this. I will say that your decision to approve this device will put it on all of our equipment and should put it on all 3-wire electrical equipment. This will save lives.

The author agrees with the substantiation for Comment on Proposal 18-15 submitted by Earl W. Roberts. Rather than repeat the information here, there is certainly substantial evidence that the solution to the issue belongs in the NEC. It is ironic that the panel has recommended sending the proposal to Panel 5 “for action”, while taking the position that requirements for usage of a device not permanently connected to the premises wiring system do not belong in the NEC.

Panel Meeting Action: Reject
Panel Statement: The panel reiterates that the proposed device is intended for inclusion within the cord for a specific type of equipment and as such is part of the equipment listing process. The panel also reviewed the conditions presented in the original proposal as the justification for requiring this device. The issue presented is not with the equipment but the premises wiring system to which the equipment is connected. It is apparent that prior testing of the circuit for proper wiring with a listed circuit tester would alert the user to the unsafe condition. This proposed device would not correct the problem but bypass the safety problem.

The directions to the TCC that the original proposal be forwarded to CMP 5 for comment is required by the proposal’s recommendation to disconnect the equipment grounding conductor to a piece of equipment. This would pose a violation of the requirements within Article 250 which is under the purview of CMP 5.

(406.11)

Submitter: Stanley J. Folz, Morse Electric, Inc.
Comment on Proposal No: 18-40
Recommendation: Delete the text proposed in the ROP.
Substantiation: I have to agree with the negative Panel comment by Mr. Wall. As a point of information to the TCC I had tamperproof receptacles quoted today (5/16/2006). A residential grade is not available so I was quoted specification grade. 15 and 20 ampere P&S tamperproof receptacles were $15.00 and $17.00, respectively. I know a residential model of this device coupled with mass production will be more economical. However, until such a device exists I think the CMP should put this proposal on HOLD until the next Code cycle.

Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Comment 18-56.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:

BER, M.: Although presented to the panel as a safety issue this is not a safety issue, it is not an economical issue, it is a responsibility issue and it is not good code. This blanket requirement to install tamper resistant receptacles in all dwelling unit locations is a blatant example of creeping socialism and rampant big-brotherism. It is time for us as a nation to accept our responsibilities and protect our own children. It should not be the position of the NFPA, the government, or the local police to force our responsibilities upon us. If our kids are uninformed enough to stick something in a receptacle and not learn the first time then it is our responsibility as parents to buy some covers. If the kid is smart enough and has enough manual dexterity to be able to defeat the covers then it is time to start his college fund. But requiring the installation of all new receptacles to be tamper resistant is not necessary or prudent. What is the next step? Childproof barriers along all streets and roads? Surgically installed water wings?

Whenever we are presented with any subject that concerns “the children” the ability to keep eyes dry and analyze data rationally immediately leaves the room. This inability to make intelligent decisions has been enhanced in this instance with dubious data presented with introductory terms like, probability sample” and “estimated”. As soon as we are presented with this type of undata, without any technical substantiation, it is time for all good men and women to look for underlying reasons. Compound this with photos presented to the panel of severely burned children that have no connection to the discussion. A child that chews on an extension cord has no relationship to an unsupervised kid with a hair pin in his hand that is allowed to be in a location with receptacles.

It is ridiculous and ludicrous that grown people should spend as much time, effort, and money on a subject that is best left to the individual parent. All that it takes is a short trip o the local home improvement store to see an entire section that is devoted to child protection, including many items not electrically related such as drawer hardware and cabinet latches. Not only are there the common plastic receptacle covers, there are complete covers that provide protection with and without cord caps installed. Also, there are receptacle covers with the sliding protection that a tamper resistant receptacle would provide. And all of these inexpensive devices can be easily installed by the homeowner. If the parents feel that these could be defeated by their budding Phi Bata Kappa, then an electrician could be hired to install some tamper resistant receptacles. But to saddle the entire country with and mandate that all new dwelling units would be required to have tamper resistant receptacles is severe overkill and without justification.

On the concern for the elderly being able to use these tamper resistant receptacles I did not think that this was a true issue until I tried to insert a cord

cap into the sample that was available during the panel meeting. At over 250 pounds I have always felt I was pretty strong, but I cold not push the cord into the sample provided I am truly concerned as to how my 115 pound, 86 year old mother would be able to handle plugging in her oxygen pump!

BOYNTON, C.: I am voting against the panel and recommending to delete section 406.11. Tamper proof receptacles will be difficult for some people to use, not just due to the force, but because the blades have to be precisely aligned and perpendicular to the receptacle for the shutters to move. Any shaking by the hand or unsteady movement of the hand will result in extreme frustration in trying to insert the plug. I do not know of any data or studies that have proven this will not be an issue.

Deleting this proposal does not preclude the use of tamper proof receptacles if persons choose to do so. However, it allows persons who do not need them to not be forced to do so. Some of the examples seen in the burn presentation show children that have burns where the child chewed on the cord. This is not applicable unless "chew proof cords" are also mandated. As it stands, other options such as the caps can prevent children from inserting objects in the receptacle. The code is not a product standard. In addition, some of the objects that are inserted in the receptacle, which the presentation listed as "not perceived as dangerous by parents", such as knives, pins, screws, nails, etc., to me are perceived as dangerous in the hands of a child regardless of a receptacle being involved or not.

Submitter: Alan H. Nadon, City of Elkhart, IN
Comment on Proposal No: 18-40
Recommendation: The panel should reject this proposal.
Substantiation: This is a design consideration and should not be mandated by the Code. Not just tamper resistant receptacles but, other products and design considerations are available at this time that will achieve the goal proposed by the submitter. The NFPA Electrical Safety Sheet recommends plastic safety covers as a product that would achieve this goal. The placement of receptacles at an elevation that would reduce the probability of an infant or small child from reaching a receptacle is a permitted design change that would achieve this goal. The latter would achieve the goal with no additional expense, and cause no additional problems for elderly persons or adults with physical impediments.

Comment on Proposal No: 18-40
Recommendation: The panel should reject this proposal.
Substantiation: The proposal is too broad as submitted. There is no allowance made for receptacles located above the level a small child could reach nor is there consideration for receptacles located behind large appliances, stoves, refrigerators, washing machines, etc.
To the best of my knowledge there are no GFCI recepticals designed as tamper proof.

In my experience I have seen these types of receptacles defeated through mis-use usually from being painted locking them in the open position and more troublesome in the closed position which leads occupants to use extension cords.

Well intentioned as this proposal may be the panel should reject it.

Comment on Proposal No: 18-40
Recommendation: Delete the following text:
~~406.11 Tamper Resistant Receptacles in Dwelling Units. In all areas specified in 210.52, all 125-volt, 15 and 20 ampere receptacles shall be listed tamper-resistant receptacles.~~
Substantiation: This proposal is based on children inserting an object into a receptacle. The statistics suggest that the incidents are very rarely fatal, but will result in electric shocks and mild to severe burns.

Although the implementation of this proposal would minimize the potential of the insertion of objects into a receptacle, there still exists a remote possibility that the shutters of this receptacle could be compromised. Note, the panel is additionally concerned about the possible increased insertion force required for the aging population.

My suggestion is not to add this text, but to modify 210.8(A) by installing GFCI protection to all rooms in a dwelling unit. This would eliminate any hazard associated with objects being inserted into any receptacle, not just minimize the potential.

Submitter: Robert A. Jones, IEC Texas Gulf Coast
Comment on Proposal No: 18-40
Recommendation: This proposal should be Rejected.
Substantiation: The current requirements contained in UL 498 for tamper resistant receptacles only investigates single pole insertion of a test probe with a force of 8 ounces (1N) in an attempt to simulate someone (a child) to bypass the tamper resistant mechanism. A standard does not exist for the insertion force necessary to insert a two or three prong plug into a tamper resistant receptacle. The requirement for tamper resistant receptacles to be installed in dwelling units could have a serious affect on the safety of elderly or impaired people. These people may not have the strength to fully insert a plug into these types of receptacles. If the plug prongs are not fully engaged, then the exposed parts could lead to shock or fire hazards. This could be a very serious problem since the population of America is aging and more new dwelling units

are being built as assisted living and independent living housing in retirement communities. A study should be made and a standard developed for the insertion force necessary for these tamper resistant receptacles before the code requires they be installed in dwelling units.

(406.11)

Submitter: Gilbert L. Thompson, MEIA Codes and Standards
Comment on Proposal No: 18-40
Recommendation: The Panel should reconsider their action and reject the new proposal and delete all of the proposed new wording that would add a new Section 406.11. This is a manufactures' recommendation to make a drastic change to existing wiring devices without evaluating the problems that could be generated or the cost to the industry and public. There is no time table in the proposal to accommodate existing stocks. What happens to contractors, supply houses and discount stores with supplies on hand? Many jurisdictions have not adopted the new code and are still using other editions. Have GFCI and special outlets been designed for this new requirement? What happens to replacements and existing installations?
Substantiation: Our inspectors associations agree with the negative comments of Mr. Wall. There are many communities that cater to assisted living and elder care residents and the only children in the units are the ones that visit. Tamper-resistant receptacles or covers for specific locations where children are located have already been addressed in Section 517.18(C) for pediatric care.

Also, many health care facilities that threat mental patients require these type receptacles in psychiatric wards. Parents and concerned parties already have alternate means (special covers, plastic inserts, etc.) to protect their children. An example of good sense are dangerous chemicals stored in kitchen cabinets and a simple lock for the cabinet doors keeps the children out. It still should be a choice for safety-minded people as to how to protect their children.

18-41 Log #1297 NEC-P18 **Final Action: Reject**
(406.11)

Submitter: Steven Roncourt, Roncourt Enterprises Inc / Rep. Electrical Contractors Business Associates
Comment on Proposal No: 18-40
Recommendation: This proposal should be rejected.
Substantiation: Please consider the information below before making a decision concerning this proposal.

There are major concerns about the insertion force required that would affect the elderly and the physically impaired as well as many people with physical ailments that would be limited by the strength in their hands.

According to the submitter, there would only be an additional cost of approximately 0.50 per receptacle. In speaking to suppliers in the area the estimated cost could range from $5.00 to $13.00 at today's rates. This was based on calls made to get pricing for this product to 3 suppliers in the NH area. If using NEMA's information concerning average receptacles in a house of 75, this could cost an average anywhere from $750.00 to $2,000.00 depending on the size of the house, and would place an undo burden on anyone purchasing a new home who can easily and very inexpensively install safety caps. We are not sure if this justifies the additional expense for all of those people that do not have children within the age group that was referenced.

There is not enough true raw data to support any possible issues that a standard receptacle creates an additional hazard as opposed to a tamper resistant one. There is just an estimate based on sample counts. Even though what is shown is very informative it is not an actual count of the incidents, which we feel should be taken into consideration before making any decision on this proposal.

This will create possible conflicts with concerns to AFCI & GFCI outlets in the future. Not all conditions allow for circuit breakers to be installed, and if so, again at additional cost to the homeowner compared to receptacles. Presently, there is no such device available on the market to allow us to meet these requirements that would be set forth in this proposal or anything to show that this would have a dramatic affect with concerns to this issue.

The submitter's data is based on sample counts and historical estimates and clearly states "The results of these incidents are rarely fatal". This proposal should require additional research with proven facts and product development that would allow for this to become a possible option to homeowners in the future. The panel should also require the break down to show in which years these incidents occurred. It is our feeling that since 1991 the public awareness on the child safety issue with receptacles has dramatically increased. These statistics do not reflect that. They are, however, reflected within the fatality estimated reports which show that there has not been a fatality since 1998 through 2001, and only four in total.

We agree that any fatality is of grave concern and not acceptable. But as we are sure the panel knows you are unable to protect everyone in every situation from every danger. Some of this responsibility must remain on the parents or person responsible for the 2 year old child who is left unattended long enough to insert a foreign object into an outlet.

Even based on the information supplied by the submitter there were no deaths from 1998 through 2001. For almost 3 years there were no fatalities from what we believe was public awareness. And, we also believe that this trend has continued over the last 5 years, as more and more of our members see the plastic protective caps installed on outlets in a dwelling during routine service calls.

As far as safety caps go we are sure that some of the older ones may be removed with a little more ease then the newer ones. Anything over time will start to show signs of wear and tear, which includes the tensile strength of a tamper resistant outlet. Our experience is that we need to use a screwdriver to get them out and it takes quite a bit to get them out.

So instead of a homeowner being able to go out on their own, and get new safety caps if they are loosing there retention strength, they now have to call an electrician to replace the entire outlet for what is surely to be up to 5 times the cost. This does not seem to make a lot of sense. They are more likely to replace an inexpensive safety cap on their own, long before they will call an electrician and spend almost $75-$90 on a service call with a new receptacle. Which then create a long lasting safety hazard because more than likely as long as the outlet works they won't replace it. This is just human nature.

As an organization made up of Electrical Contractors and Associate members consisting of many suppliers within the area, we hope that you will take the time to consider these issues before making a decision. We thank you for your time in hearing our comments and look forward to working with you in the future.

(406.11)

Submitter: Larry W. Burns, Burns Electric, Inc.
Comment on Proposal No: 18-40
Recommendation: This proposal should be rejected.
Substantiation: Why start this requirement with dwelling units? The report given to Panel 18 states 71% of the injuries were in the home, but it did not state the extent of the injuries. The four fatalities stated in the report did not identify the occupancy where the fatality occurred. I would think the best place for this requirement would be for daycare centers, preschools, and elementary schools. The caregivers and teachers at these facilities are more overburdened with supervising children than a parent within their own home.

Submitter: Bill Sherrill, Selo Industrial
Comment on Proposal No: 18-40
Recommendation: This proposal should be rejected.
Substantiation: If NEMA is so concerned with protecting children from electrical shock or burns why not make the requirement for all occupancies? I guess the 696 children that will be injured in occupancies other than dwellings are of no concern to NEMA. A Code requirement is not needed. All NEMA has to do is quit manufacturing non-tamper resistant receptacles. I think their motive is more profit driven than protecting children. Obviously there is more profit in selling tamper resistant receptacles than non-tamper resistant.

18-47 Log #1429 NEC-P18 **Final Action: Accept**
(406.11)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 18-40
Recommendation: The panel should continue to Accept this Proposal.
Substantiation: Tamper resistant receptacles will significantly reduce the number of injuries to children that result from children inserting foreign objects into a receptacle. Tamper resistant receptacles are readily available from the major receptacle manufacturers. Tamper resistant receptacles are also available as GFCI receptacles. Tamper resistant receptacles are listed to UL 498. UL 498 has a section that contains specific requirements for tamper resistant receptacles that ensure that a foreign object cannot be inserted into the receptacle and contact a live part.

The panel expressed concern with the amount of force necessary to insert a plug into a tamper resistant receptacle. NEMA wiring device manufacturers conducted tests to compare the insertion forces required to insert a plug into a standard receptacle and into a tamper resistant receptacle. A NEMA 5-15P, 15 amps, 125 volt plug was used. The plug was mounted in a force measuring gauge as shown in the photograph. The receptacle was mounted to allow lateral movement to prevent binding of the plug upon initial insertion. The values for insertion forces with and without the tamper resistant mechanism were recorded.

The typical insertion forces observed could be characterized as follows: When the plug blades are initially inserted into a tamper resistant receptacle, a small force of approximately 1 - 1.5 lb is required to overcome the initial resistance of the tamper resistant mechanism. This is followed by a drop in force as the plug blades have opened the tamper resistant mechanism and are passing through. As insertion continues, at the point where the blades reach and become engaged with the receptacle contacts the force increases. This is where the maximum force is observed.

The typical insertion force varied from 10 - 20 lb, depending on the design of the receptacle. There was no appreciable difference in insertion force between tamper resistant receptacles and receptacles without the tamper resistant mechanism. The overriding forces required to open the receptacle contacts are far greater than the force exerted by the tamper resistant mechanism.

The negative vote on this proposal mentioned several issues that merit comment. It was indicated that many homes do not have small children. While this may be correct at any point in time, houses are sold, kids visit grandparents and neighbors. Controlling where children are and aren't isn't possible, but providing a safer environment for them is...for under $40 per house.

The negative vote also indicated there is no evidence that kids can't defeat these receptacles. While the manufacturers would not claim that defeating them is impossible, they are, after all called tamper "resistant" not "proof", the UL standard is quite thorough in testing the unintended insertion of objects. Further, for over 20 years, these products have been used in the pediatric area of hospitals with no report of injuries.

The negative comment further stated that this requirement will require GFCI receptacles to be "tamper resistant". This is correct and such GFCIs have been on the market for over a year.

The negative comment stated that it was not demonstrated that AFCIs and GFCIs are not effective in preventing such incidents. First, AFCIs are not intended to protect against such incidents. They are intended to prevent arcing initiated fires, not burns to the finger. While GFCIs can provide some level of protection, they are only required on a limited number of circuits and only protect against some of the circumstances associated with such incidents.

Finally, the negative comment indicated that each dwelling owner should be given the choice. Since most new home construction is speculative, prospective owners are not even known at the time the electrical installation is made. More importantly, considering the cost per home and the number of incidents a clear mandate to add these proven safety products is justified.

See my Proposal 18-40 (Log #1944) that was Accepted, along with the Explanation of Affirmative and Negative Comments on Vote for that proposal.
Panel Meeting Action: Accept
Panel Statement: The panel agrees with the substantiation provided with this comment. The documentation provided with the proposal is very thorough and comprehensive. The substantiation clearly addresses the concerns raised in the comments included with the voting during the ROP process. An identified safety hazard will be mitigated with the installation of tamper- resistant receptacles.
The panel recognizes that not all receptacles listed within 210.52 are subject to child access. Yet, the overall material cost should outweigh the mind set of providing two different type of receptacles to the electricians in hopes that they would not accidentally install a standard receptacle in a location requiring the tamper-resistant type. This type of mistake could cost as much to correct, as would the amount of the savings.

The panel disagrees with the conclusions reached by most of the remaining submitters of comments to 406.11. Tamper-resistant receptacle costs cited in the substantiation provided with several comments are based on today's limited demand and does not take into account the reduction that an increased demand with corresponding increase in supply. This would be similar to the difference in cost of GFCI receptacles today over when they first were required. Pediatric areas already require listed tamper-resistant receptacles.
Finally, GFCI's and AFCI's are not intended to prevent the type of burn incidences resulting from inserting conductive foreign objects into a receptacle. GFCI's provide protection from electrocution resulting from low level ground faults and AFCIs provide protection against fires resulting from arcing type faults.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 3
Explanation of Negative:
BER, M.: See my explanation of negative vote on Comment 18-27.
BOYNTON, C.: See my explanation of negative vote on Comment 18-27.
TODD, S.: I am voting negative on Comment 18-47. EEI agrees that there is sufficient substantiation that using tamper resistant receptacles in areas accessible to unattended small children is safer than standard receptacles in that same area. However, there is no justification presented for a requirement for these receptacles where they are not accessible to children. Tamper resistant

receptacles furthermore should not be required in homes that do not contain small children. The commenter requested the Panel continue to accept Proposal 18-40. Proposal 18-40 requires all 125-volt, 15- and 20-ampere receptacles in areas specified by 210.52 be listed tamper resistant receptacles even though not all of the area will be accessible to small children (ages 9 months to 5 years) which are the people the substantiation states that these devices are to protect. This all-encompassing change puts an unnecessary burden on the end use customer for those installations of receptacles inaccessible to small children such as for refrigerators or for wall receptacles above countertops. Furthermore, tamper resistant receptacles or faceplates with tamper resistant features are not available at the $0.50 premium as discussed in the substantiation. Although EEI supports the safe installation of premises wiring in the Code and the concept proposed in the original proposal and this comment, EEI cannot accept this change without having the specific facts to broadly apply this requirement throughout the entire dwelling's premises wiring.

Comment on Affirmative:

PIERCE, J.: I continue to recommend an affirmative vote on this proposal to add tamper resistant receptacles to this Article. Some have said the increased cost and intrusion into our homes is not worth it. I disagree. This is an improved design with obvious benefits. These points against the proposal are always used and we as Committee members should rise above those tired reasons to vote reject.

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 18-40
Recommendation: Reject the proposal.
Substantiation: There are a host of practical problems in this proposal, as well, as major issues of significant principle regarding the function of the NEC. The practical issues concern whether the new receptacle designs will be adult proof, and on what range of receptacles the features will be available. For example, my house is wired throughout with 5362 series industrial grade 20-amp duplex receptacles that cost on the order of $15 each. Would it be possible to achieve that level of quality in the future if this proposal goes forward? I rather doubt it, because the receptacle manufacturers will probably make the business decision that they will only make child-resistant receptacles in the residential and commercial grades of receptacle. Unless CMP 18 imposes the rule as a construction specification for all such receptacles, I would look forward to a decreased quality expectation regarding receptacle performance.

The more serious issue, however, concerns the extent to which The National Electrical Code is expected to act in loco parentis. I have raised four children, and part of the process of having a toddler is kid-proofing the house. Receptacle inserts go in all the unused receptacle slots, latch retainers go into the under-sink cabinets, etc. Then, when they get a little older, the inserts come out. Is it really necessary to impose a rule with practical problems that only has significant value during a very small fraction of the life cycle of a house or apartment? My house was built in 1868, and as near as I can figure from deed and probate records, toddlers only were in residence for about 10 percent of that history.

The debate over receptacle placements on kitchen island may be relevant here. CMP 2 was going to require, in effect, tombstone receptacle outlets on flat islands because a receptacle on the side of the island would be an attraction for a toddler, who might pull a hot appliance off the counter and get scalded. In the end, I was successful in convincing CMP 2 that the parent was the appropriate arbiter of when it was appropriate to use a receptacle on the side of an island, and not the code making panel. The same is true with toddler access to receptacles.

This proposal is one of several from NEMA this cycle that increase the value added to electrical products in mature markets, and as such are grounds for skepticism. This proposal does not comply with 90.1(B).

Submitter: Noel Williams, Herriman, UT
Comment on Proposal No: 18-40
Recommendation: This Proposal should be Rejected.
Substantiation: There is no legitimate reason that every receptacle should be suitable for use around small children. Many are not installed where they would be accessible to small children - kitchen countertops, behind refrigerators and other dedicated spaces for appliances. Many products are available that preclude insertion, and people can easily obtain these items if they need them. This proposal is dramatic over-reaching in solving a problem that does not exist in the majority of dwelling units. Furthermore, the panel statement and comments on affirmative indicate that additional information should have been provided or obtained before a decision was made. This submitter agrees with the comment on negative by Mr. Wall.

~~406.11 Tamper Resistant Receptacles in Dwelling Units. In all areas specified in 210.52, all 125-volt, 15- and 20-ampere receptacles shall be listed tamper resistant receptacles.~~
Substantiation: The proposal appears to be unconvincingly substantiated. (unreadable) the acceptance of this proposal appears to provide a safer installation. It is a design specification rather than a minimum standard, for example, GFCI protection on luminaires and exhaust fans for tub/showers could be safer. However, proposals have been rejected for several code cycles. Secondly, the proposal only references 125-volt, 15- and 20-ampere receptacles. Alternately the proposed text would apply to receptacles which are not readily accessible. The proposal should be rejected as this previously accepted by Panel 18 during the proposal process. Lastly, I do not believe the industry manufacturers tamper resistant multi outlet assemblies.

Substantiation: The report submitted to Code Panel 18 was dated 2002 and based on data collected years before. Since that time, arc fault protection requirements have been implemented in dwelling unit bedrooms. We have been told that arc fault protection is the answer to most injuries and fires in dwelling units. If the insertion of a conductive item in a receptacle causes a burn, then surely an arc will be present. The signature of this arc would be very different from that of an actual load and the arc fault protective device would operate and the circuit would be turned off. Why require another form of protection?

Comment on Proposal No: 18-40
Recommendation: Proposal 18-40 (Log #1944) should be rejected.
Substantiation: 1. There are major concerns about the insertion force required that would affect the elderly and the physically impaired as well as many people with physical ailments that would limit the strength in their hands.
2. According to the submitter, there would only be an additional cost of.50 per receptacle. According to suppliers in the area, the cost could range from $5.00 to $13.00. This would place an undue burden on anyone purchasing a new home who can easily and very inexpensively install safety caps.
3. There is not enough data to support any possible issues that a standard receptacle creates an additional hazard as opposed to a tamper resistant one.
4. This will create possible conflict with concerns to AFCI and GFCI outlets in the future. Not all conditions allow for circuit breakers to be installed, and if so, again at additional cost to the homeowner.
5. The submitter's data is based on sample counts and historical estimates and clearly states: "The results of these incidents are rarely fatal." This proposal should require additional research with proven facts and product development that would allow for this to become a possible option to homeowners in the future.
Panel Meeting Action: Reject
Panel Statement: The Panel has reviewed all comments and concludes that requiring tamper-resistant receptacles will effectively reduce child burns and electrocution. Specific responses to comments are as follows.
(1) Test data presented to the panel indicates insertion and withdrawal forces will not be a problem for the aged or physically challenged. Insertion forces necessary to open the shutter at 20-25% those necessary to insert a plug into a receptacle and once the shutters are cleared no additional force is required to engage the plug into the receptacle contacts.
(2) The safety justification is compelling. CPSC and CHIRPP use highly sophisticated statistical models that allow accurate estimates of the total universe. The fact that CPSC data was remarkable similar to a totally different study in Canada corroborates both sets of data.
(3) The plastic safety caps mentioned in some substantiations have been available during the entire time of the hospital emergency room data collection in both the US and Canada and did not mitigate thousands of burn incidents each year.
(4) The UL/ANSI standard has requirements and tests that attempt to defeat the shutters. UL fully tests with a probe to try to manipulate opening. Similar products have been in use for over 20 years in pediatric areas with no evidence of them being defeated. Shutters are commonly used in European electrical receptacle devices.
(5) The NEMA cost estimate was based on the cost adder for residential type tamper resistant receptacles produced in the volumes this requirement would result in. Cost estimates based on hospital
or specification grade products are based on today's market size and do not provide a valid comparison.
(6) The panel considered limiting the requirements. The hazard exists on vanity and kitchen countertops on which children are placed and which have easily accessed receptacles. Given the very few receptacles that would, under all circumstances, not be accessible and the modest cost of the receptacles, it was decided that a clear, unambiguous requirement would be easier to follow and enforce.
(7) Neither AFCI nor GFCI eliminate the faults that result in the child burns. Neither product is intended to protect against the type of burn incidents on which this requirement is based.

18-57 Log #2354 NEC-P18 **Final Action: Accept**
(406.11)

Submitter: Ken Brewer, Tampa Area JATC / Rep. IBEW 915
Comment on Proposal No: 18-40
Recommendation: Continue to Accept this Proposal.
Substantiation: The minimal cost increase associated with the proposed requirement is far outweighed by the benefit of protecting small children. With their inquisitive nature, small children learn through exploration and don't have the ability to recognize the inherent danger of a receptacle that is conveniently at their level as they crawl about. The proposed requirement would lessen the chances that a child would come into contact with an electrical source.
The requirement should not be optional for each individual dwelling owner, and would only lead to confusion and inconsistency. Dwellings are typically occupied by a succession of owner-occupants over time, and allowing the initial owner to decide against the protections offered by the requirement leaves the possibility open that small children inhabiting the dwelling at some point in time will be exposed to danger. Just as required seat belts in motor vehicles have saved many lives, the requirement of tamper resistant receptacles will help to ensure the safety of our children. Accordingly, the proposed requirement should apply not only to new home construction, but to new work in existing homes as well.
Panel Meeting Action: Accept

18-58 Log #2115 NEC-P18 **Final Action: Reject**
(406.11 Exception (New))

Submitter: Matthew Hoffman, Dover, NH
Comment on Proposal No: 18-40
Recommendation: Add an Exception to read as follows:
This article will not apply to elderly housing, hospitals or other types of core facilities.
Substantiation: By adding this exception it will help prevent situations where elderly or disabled persons may have trouble using tamper resistant receptacles, due to the excessive force needed to insert a plug into this type of receptacle.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Comment 18-56.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
BOYNTON, C.: I am voting with the panel to reject this exception for the simple reason that I am rejecting 406.11 being in the code in the first place. See my explanation of negative vote on Comments 18-27 through 18-57.

ARTICLE 408 — SWITCHBOARDS AND PANELBOARDS

9-56 Log #61 NEC-P09 **Final Action: Accept**
(408.4)

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 9-101
Recommendation: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal with respect to the Panel Action on Proposal 9-105. This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
The final text incorporates the actions on both Proposals 9-101 and 9-105. The resulting text is as follows:
Every circuit and circuit modification shall be legibly identified as to its clear, evident, and specific purpose or use. The identification shall include sufficient detail to allow each circuit to be distinguished from all others. Spare positions that contain unused overcurrent devices or switches shall be described accordingly. The identification shall be included in a circuit directory that is located on the face or inside of the panel door in the case of a panelboard, and located at each switch on a switchboard. No circuit shall be described in a manner that depends on transient conditions of occupancy.

9-58 Log #643 NEC-P09 **Final Action: Reject**
(408.4)

Submitter: Mark Shapiro, Farmington Hills, MI
Comment on Proposal No: 9-105
Recommendation: Reject the proposed new last sentence:
~~No circuit shall be described in a manner that depends on transient conditions of occupancy.~~
Substantiation: Is this new requirement really necessary? Labeling a circuit, "copying machine" or "so-and-so's bedroom" does have the disadvantage of describing a potential transient condition in the life of a building. But, it has the important advantage of communicating.
I am afraid that under the guise of making things clearer, we will wind up marking them murkier. (Otherwise known as, The Law of Unintended Consequences.)
Panel Meeting Action: Reject
Panel Statement: The intent of the panel is to be clear and use a method that will be valid over an extended period of time.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

9-59 Log #1048 NEC-P09 **Final Action: Accept in Principle**
(408.4)

Submitter: Robin Johnson, Buchanan, VA
Comment on Proposal No: 9-101
Recommendation: Revise text to read as follows:
Every circuit and circuit modification shall be legibly identified as to its clear, evident, and specific purpose or use. The identification shall include sufficient detail to allow each circuit to be distinguished from all others. Spare positions that contain unused overcurrent devices or switches shall be described accordingly. The identification shall be included in a circuit directory that is located on the face or inside of the panel door in the case of a panelboard, and located at each switch on a switchboard.
Substantiation: This proposal should be accepted as written marking on switchboards panelboards is a major concern for building owners and operators the term "and located at each switch on a switchboard" is a good practice when the panel directories have been lost or not updated.
Panel Meeting Action: Accept in Principle
Panel Statement: The comment text appears to be a verbatim transcription of the final panel action on Proposal 9-101, but does not include the action on Proposal 9-105. Refer to the action on Comment 9-56 for the complete text.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

9-60 Log #722 NEC-P09 **Final Action: Accept**
(408.6)

TCC Action: The Technical Correlating Committee does not agree with the request of the submitter, as accepted by the panel, to globally prohibit these types of Fine Print Notes and that each panel should continue to act on the merits of such proposals, if any, within its purview.
Submitter: Robert Kelleher, Paramount Electrical Services
Comment on Proposal No: 9-106
Recommendation: Continue to Reject .
Substantiation: Continue to Reject. The addition of these NECA Fine Print Notes, serves no benefit to the user of the National Electrical Code. These are not standards, they are a compilation of generic information and do not serve as information to the user. These must be purchased through NECA. This FPN as written is nothing more than free advertisement for generic, readily available information which must be purchased by the code user. A total of seventeen new Fine Print Notes were proposed to reference NECA standards. Sixteen were unanimously rejected. Inclusion of this Fine Print Note is in direct conflict with 90.1(C). The TCC should intervene to prohibit these types of Fine Print Notes. CMP 9 should continue to reject this FPN. Failure to do so will mean adding Fine Print Notes for IEC, EEI, IBEW, IAEI, ACC, NETA, NEI, SEIA, AISI, API, ASHE, AHAM,I CEAI, NYBFU and dozens of others when they decide to develop income through generic standards development. If this type of Fine Print Note is placed anywhere in the NEC an Annex should be included with coupons for the code user. If the NEC is to be used for advertisement purposes, coupons should be included.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

9-61 Log #861 NEC-P09 **Final Action: Accept**
(408.6)

TCC Action: The Technical Correlating Committee does not agree with the recommendation of the submitter to move all such Fine Print notes into an Annex as recommended in the substantiation. Each panel should continue to act on the merits of such proposals.
Location of all references in an Annex does not enhance usability.
Submitter: John P. Masarick, Independent Electrical Contractors Inc.
Comment on Proposal No: 9-106
Recommendation: The panel is encouraged to continue to Reject Proposal 9-106.
Substantiation: The reasons to continue to Reject the Proposal are as follows:
1. The trend by the CMPs over the last several code cycles has been to limit the use of FPNs.
2. There is also a correlation issue. There is a conflict between those panels that accepted the proposal and those that rejected the proposal.
3. These standards are also covered by a Fine Print Note in 110.12.
4. The FPN should not be accepted because numerous standards and installation manuals exist and to only mention one does not adequately inform the public about accepted industry practices. The NEC is not intended to be an instruction manual for untrained persons. If the FPNs are allowed to reference these standards, then they should list all applicable standards.
5. Since the referenced installation standards are intentionally general to cover different models of equipment, approval of the FPN may lead many to believe these standards can be used instead of listed or labeled manufacturer's instructions which would be in violation of 110.3(B).
6. If the CMP would like to include the reference, it should be placed in the Annex with the other references.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

(Note: The sequence no. 9-62 was not used.)

9-63 Log #265 NEC-P09 **Final Action: Accept**
(408.24)

Submitter: Stanley J. Folz, Morse Electric, Inc.
Comment on Proposal No: 9-109
Recommendation: Text to remain as presented in the ROP.
Substantiation: I agree with the action of the CMP. This proposal is an excellent answer to a problem that has plagued installations for years.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

9-64 Log #1883 NEC-P09 **Final Action: Accept in Principle**
(408.30)

Submitter: Mike Holt, Mike Holt Enterprises, Inc.
Comment on Proposal No: 9-114
Recommendation: Continue to accept the proposal with the following change:
Replace the word "and" with the word "or", as indicated in proposal number 4-47.
Substantiation: Refer to panel 4's remarks on proposal 4-47, which are accurate.
Panel Meeting Action: Accept in Principle
In addition to the change submitted in the comment, add the words "as applicable" after "Article 220."
Panel Statement: Not all of the itemized parts of Article 220 will apply in any given case.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

9-65 Log #1506 NEC-P09 **Final Action: Accept in Principle (408.34)**

Submitter: Jeffrey Boksiner, Telcordia Technologies, Inc.
Comment on Proposal No: 9-116
Recommendation: If action to delete 408.34 is not accepted, then use the term "neutral conductor" as originally proposed.
Substantiation: This comment was developed by the Technical Correlating Committee (TCC) Task Group (TG) on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6). The TCC directed that the action on this proposal be sent to the TG for review and comment.

The TG takes no position on proposal 9-117, however, the TG concludes that if proposal 9-117 is not accepted then the words "neutral conductor" are preferable to "neutral busbar or equivalent connection provisions." This provides consistency with other articles. Also, the connection is essentially made to the neutral conductor even though it may through a terminal, busbar or other arrangement.
Panel Meeting Action: Accept in Principle

Panel Statement: The underlying text to which this comment refers is being deleted. Refer to the panel action and statement on Comment 9-70.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

9-66 Log #970 NEC-P09 **Final Action: Accept in Principle (408.36)**

Submitter: Mark C. Ode, Underwriters Laboratories Inc.
Comment on Proposal No: 9-117
Recommendation: Correct the second sentence in Exception No. 1 by inserting a hyphen in "multipole" and replace the word "disconnectable" with "capable of being disconnected by a..." to read as follows:
408.36 Overcurrent Protection.
In addition to the requirements of 408.30, a panelboard shall be protected by an overcurrent protective device having a rating not greater than that of the panelboard. This overcurrent protective device shall be located within or at any point on the supply side of the panelboard.
Exception No. 1: Individual protection shall not be required for a panelboard used as service equipment and containing not more than six overcurrent devices. For the purposes of this exception, the term "overcurrent device" means a single or a multi-pole circuit breaker, or a single fuse or set of fuses, operable or ~~disconnectable~~ capable of being disconnected by a by a single motion of the hand and that supplies a single load.

Exception No. 2: Individual protection shall not be required for a panelboard individually protected on its supply side by not more than two main circuit breakers or two sets of fuses having a combined rating not greater than that of the panelboard. A panelboard wired under this exception shall not contain more than 42 overcurrent devices. For the purposes of this exception, a 2-pole or a 3- pole circuit breaker shall be considered as two or three overcurrent devices, respectively.

Exception No. 3: For existing panelboards, individual protection shall not be required for a panelboard used as service equipment for an individual residential occupancy.
Substantiation: A hyphen has been added to "multipole" and "disconnectable" has been replaced with "capable of being disconnected by a" since multipole and disconnectable are not actually words.
Panel Meeting Action: Accept in Principle

Take no action under this comment.
Panel Statement: The underlying text to which this comment refers is being deleted. Refer to the panel action and statement on Comment 9-70.

Ballot Results: Affirmative: 11

9-67 Log #1428 NEC-P09 **Final Action: Accept in Principle (408.36)**

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 9-117
Recommendation: Proposal 9-117 should continue to be Accept in Principle, but the Exceptions need revisions. 408.36 should be revised as follows:

408.36 Overcurrent Protection. In addition to the requirements of 408.30, a panelboard shall be protected by an overcurrent protective device having a rating not greater than that of the panelboard. This overcurrent protective device shall be located within or at any point on the supply side of the panelboard.

Exception No. 1: Individual protection shall not be required for a panelboard used as service equipment ~~and containing not more than six overcurrent devices. For the purposes of this exception, the term "overcurrent device" means a single or a multipole circuit breaker, or a single fuse or set of fuses, operable or disconnectable by a single motion of the hand and that supplies a single load.~~ with multiple disconnecting means in accordance with 230.71. Each single-pole circuit breaker or single-pole fused switch within the disconnecting means shall be rated greater than 30 amperes. In panelboards protected by three or more main circuit breakers or sets of fuses, the circuit breakers or sets of fuses shall not feed a second bus structure within the same panelboard assembly.

Exception No. 2: Individual protection shall not be required for a panelboard ~~individually~~ protected on its supply side by ~~not more than~~ two main circuit breakers or two sets of fuses having a combined rating not greater than that of the panelboard. A panelboard constructed or wired under this exception shall not contain more than 42 overcurrent devices. For the purposes of ~~this exception~~ determining the maximum of 42 overcurrent devices, a 2-pole or a 3-pole circuit breaker shall be considered as two or three overcurrent devices, respectively.

~~Exception No. 3: For existing panelboards, individual protection shall not be required for a panelboard used as service equipment for an individual residential occupancy.~~
Substantiation: The text of the main rule is acceptable as worded in the Panel Action.

Exception No. 1. The first sentence of the proposed exception should return to wording similar to the original Exception to 408.36(B), in order to regain proper tie to the requirements of 230.71. This gives the proper rules for the disconnects and removes the need to attempt clarification of overcurrent protection requirements. (These are Service Equipment panelboards, in which the overcurrent protection is achieved through rules for loading.)

Eliminating the lighting and appliance panelboard rules has inadvertently resulted in permitting service disconnects to be rated 30 ampere or less in a multiple-disconnect service panelboard. Exception No. 1 as written in the ROP would permit, for example, a service of (6) – 20A single pole circuits (disconnects) without a main. The rules in 408.34 presently prohibit that, and there has been no substantiation presented to convey the impact of permitting multiple single pole devices serving loads. Therefore, the second sentence of this comment suggests that a device must be rated greater than 30A in this application – to more closely align it with the present rules and reduce the impact from this change.

The requirement at the end of Exception No. 1 that requires each overcurrent device to serve a "single load" is unclear, at best. This would seem to prohibit the overcurrent devices being used in a six-disconnect application to feed other panelboards. We believe the intent was to disallow feeding other bus splits within the panelboard. The proposed new third sentence addresses that more clearly.

Exception No. 2. Deleting the words "individually" and "not more than" makes the wording of this exception better fit with the rest of the revised section. Adding the words "constructed or" acknowledges the fact that panelboards normally will be built in this manner – not wired into the configuration. Changes to the last sentence are to make the "definition" for overcurrent devices apply only to the maximum count. As written, the definition would also apply to mains, in the first sentence, resulting in a single 2-pole main being the most that is permitted.

Exception No. 3. This exception is no longer necessary. It was added to the NEC a number of years ago to help clarify changes to the rules that previously permitted split-bus service panelboards having more than two mains. It has outlived its purpose.
Panel Meeting Action: Accept in Principle

Refer to the panel action and statement on Comment 9-70.
Panel Statement: The actions and panel statement on Comment 9-70 address the concerns raised in this comment.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

9-68 Log #1622 NEC-P09 **Final Action: Accept in Principle in Part (408.36)**

Submitter: Phil Simmons, Olympia, WA
Comment on Proposal No: 9-120
Recommendation: It appears the second page of the proposal was sent to the Panel since the proposal as printed in the ROP is not complete. A complete Proposal with substantiation was not submitted. I apologize to the Panel that it did not have this material available for consideration, and thus, made the statement regarding Substantiation, "None provided."

I have provided a copy of the complete Proposal.

Change 408.36 in the 2008 NEC ROP Draft to read as follows:

408.36 Overcurrent Protection. In addition to the requirements of 408.30, a panelboard shall be protected by an overcurrent protective device having

a rating not greater than that of the panelboard. This overcurrent protective device shall be located within or at any point on the supply side of the panelboard.

Exception No. 1: Individual protection shall not be required for a panelboard used as service equipment and containing not more than six overcurrent devices. For the purposes of this exception, the term "overcurrent device" means a single or a multipole circuit breaker, or a single fuse or set of fuses in a switch, that can be opened ~~operable or disconnectable~~ by a single operation ~~motion of the hand and that supplies a single load~~.

Exception No. 2: Individual protection shall not be required for a panelboard individually protected on its supply side by not more than two main circuit breakers or two sets of fuses having a combined rating not greater than that of the panelboard. A panelboard wired under this exception shall not contain more than 42 overcurrent devices. For the purposes of this exception, a 2-pole or a 3-pole circuit breaker shall be considered as two or three overcurrent devices, respectively.

Exception No. 3: For existing panelboards, individual protection shall not be required for a panelboard used as service equipment for an individual residential occupancy.

(A) Snap Switches Rated at 30 Amperes or Less. (No change.)

(B) Supplied Through a Transformer. (Retain existing text in main rule.)

Exception No. 1: A panelboard supplied by the secondary side of a transformer shall be considered as protected by the overcurrent protection provided on the primary side of the transformer where that protection is in accordance with 240.21(C)(1.

Exception No. 2: A panelboard containing not more than six overcurrent devices that is supplied by conductors complying with 240.21(C)(2) shall not be required to have individual overcurrent protection on the supply side.

Exception No. 3: A panelboard containing not more than six overcurrent devices installed to comply with Note 2 to Table 450.3(A) or Note 2 to Table 450.3(B) shall not be required to have individual overcurrent protection on the supply side.

For the purposes of 408.36(B) Exception No. 2 and 3, the term "overcurrent device" means a single or a multipole circuit breaker, or a single fuse or set of fuses in a switch, that can be opened by a single operation.

(C) Delta Breakers. (No change.)

(D) Back-Fed Devices. (No change.)

Substantiation: This Comment is intended to correlate the requirements of permissions of other sections on panelboards that are supplied by certain tap rules or through transformers as presently provided in the Code.

Substantiation for proposed Exception No. 2: The rule for 10-ft secondary conductors in 240.21(C)(2) permits the conductors to terminate in a "device" so long as the conductors have an ampacity not less than the rating of the "device." In this case, the conductors on the secondary of the transformer are not required to terminate directly in an overcurrent device. Since CMP-9 has primary jurisdiction for overcurrent protection rules for the panelboard, adding the exception to recognize the provisions in 240.21(C)(2) will make the Code more "user-friendly". Also, overcurrent protection for the panelboard is assured by the requirement in 408.30 that the panelboard be suitable for the calculated load.

Substantiation for proposed Exception No. 3: Note 2 to Tables 450.3(A) and 450.3(B) recognize up to six disconnecting means to be suitable for the overcurrent protection for transformers. Since the rule in 408.36 deals with overcurrent protection of panelboards, the rules need to be correlated. If it is acceptable to have up to six disconnects in one panelboard serve as the overcurrent protection for a service, why not for the secondary of transformers? Also, overcurrent protection for the panelboard is assured by the requirement in 408.30 that the panelboard be suitable for the calculated load. CMP-9 has long equated being suitable for the calculated load as overcurrent protection for power panelboards.

These proposed exceptions do not introduce a new concept as the provisions for overcurrent protection of secondary conductors in 240.21(C)(2) and the Notes to Tables 450.3 have been in the Code for some time. Correlating language needs to be here in 408.36 to help the Code be "user friendly."

Changes are proposed to improve the existing sentence in Exception No. 1 to 408.36 both technically and grammatically. A single fuse or set of fuses need to be in a switch to be openable. The phrase "motion of the hand" begs improvement as one then asks, "What kind of a motion of the hand?" Finally, these overcurrent devices may supply a single load or many loads such as a multioutlet lighting or receptacle branch circuit or a feeder to a panelboard that has several branch circuit overcurrent devices.

Since the language relating to six operations for disconnecting means relates to more than just service equipment, it needs to be located where it clearly relates to the entire section.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle in Part

Accept the principle of the suggested changes in Exception No. 1 regarding disconnection through the reference to 230.71. Reject the proposed additional exceptions covering panelboards supplied from transformers.

Panel Statement: The intent of the revisions in 408.36 have been accomplished through the action on Comment 9-70, because the text now points to 230.71 instead of imperfectly restating those rules in this location.

The changes with respect to correlating the 240.21(C) rules with this section have not been previously considered because the second page of the proposal as submitted did not come to the panel and did not have public review. However, CMP 9 notes that wiring what used to be a power panelboard without individual protection to a transformer secondary would not be permitted under the revisions being made in this cycle, because all such panels will be required to have individual protection for the first time. The only permitted arrangement for making such will be when the same effect is achieved through the winding arrangements in the transformer, as covered in what will be 408.36(B).

9-70 Log #2268 NEC-P09 **Final Action: Accept in Principle**
(408.36)

Submitter: James Wiseman, Schneider Electric / Square D

Comment on Proposal No: 9-117

Recommendation: Proposal 9-117 should continue to be Accepted in Principle, but the Exceptions need revisions. 408.36 should be revised as follows:

408.36 Overcurrent Protection. In addition to the requirements of 408.30, a panelboard shall be protected by an overcurrent protective device having a rating not greater than that of the panelboard. This overcurrent protective device shall be located within or at any point on the supply side of the panelboard.

Exception No. 1: Individual protection shall not be required for a panelboard used as service equipment with multiple disconnecting means in accordance with 230.71. ~~and containing not more than six overcurrent devices. For the purposes of this exception, the term "overcurrent device" means a single or a multipole circuit breaker, or a single fuse or set of fuses, operable or disconnectable by a single motion of the hand and that supplies a single load.~~ Each circuit breaker or fused switch that is a part of the disconnecting means, and which protects a circuit having a grounded conductor, shall be rated greater than 30 amperes. In panelboards protected by three or more main circuit breakers or sets of fuses, the circuit breakers or sets of fuses shall not feed a second bus structure within the same panelboard assembly.

Exception No. 2: Individual protection shall not be required for a panelboard ~~individually~~ protected on its supply side by ~~not more than~~ two main circuit breakers or two sets of fuses having a combined rating not greater than that of the panelboard. A panelboard constructed or wired under this exception shall not contain more than 42 overcurrent devices. For the purposes of ~~this exception~~ determining the maximum of 42 overcurrent devices, a 2-pole or a 3- pole circuit breaker shall be considered as two or three overcurrent devices, respectively.

~~Exception No. 3: For existing panelboards, individual protection shall not be required for a panelboard used as service equipment for an individual residential occupancy.~~

Substantiation: The text of the main rule is acceptable as worded in the Panel Action.

Exception No. 1 - The first sentence of the proposed exception should return to wording similar to the original Exception to 408.36(B), in order to regain proper tie to the requirements of 230.71. This gives the proper rules for the disconnects and removes the need to attempt clarification of overcurrent protection requirements. (These are Service Equipment panelboards, in which the overcurrent protection is achieved through rules for loading,)

Eliminating the lighting and appliance panelboard rules has inadvertently resulted in permitting service disconnects to be rated 30 ampere or less in a multiple-disconnect service panelboard. Exception 1 as written in the ROP would permit, for example, a service of (6) – 20A single pole circuit breakers

(disconnects) without a main. The rules in 408.34 presently prohibit that, and there has been no substantiation presented to convey the impact of permitting multiple 30A or less devices serving loads. Therefore, the second sentence of this comment suggests that a device must be rated greater than 30A in this application – to more closely align it with the present rules and reduce the impact from this change.

The requirement at the end of Exception 1 that requires each overcurrent device to serve a "single load" is unclear, at best. This would seem to prohibit the overcurrent devices being used in a six-disconnect application to feed other panelboards. We believe the intent was to disallow feeding other bus splits within the panelboard. The proposed new third sentence addresses that more clearly.

Exception No. 2 - Deleting the words "individually" and "not more than" makes the wording of this exception better fit with the rest of the revised Section. Adding the words "constructed or" acknowledges the fact that panelboards normally will be built in this manner – not wired into the configuration. Changes to the last sentence are to make the "definition" for overcurrent devices apply only to the maximum count. As written, the definition would also apply to mains, in the first sentence, resulting in a single 2-pole main being the most that is permitted.

Exception No. 3 - This exception is no longer necessary. It was added to the NEC a number of years ago, to help clarify changes to the rules that previously permitted split-bus service panelboards having more than two mains. It has outlived its purpose.

Panel Meeting Action: Accept in Principle

Delete the second sentence of exception 1 in Comment 9-70. Exception 3 is to be retained. The final language is to read as follows:

408.36 Overcurrent Protection. In addition to the requirements of 408.30, a panelboard shall be protected by an overcurrent protective device having a rating not greater than that of the panelboard. This overcurrent protective device shall be located within or at any point on the supply side of the panelboard.

Exception No. 1: Individual protection shall not be required for a panelboard used as service equipment with multiple disconnecting means in accordance with 230.71. In panelboards protected by three or more main circuit breakers or sets of fuses, the circuit breakers or sets of fuses shall not supply a second bus structure within the same panelboard assembly.

Exception No. 2: Individual protection shall not be required for a panelboard protected on its supply side by two main circuit breakers or two sets of fuses having a combined rating not greater than that of the panelboard. A panelboard constructed or wired under this exception shall not contain more than 42 overcurrent devices. For the purposes of determining the maximum of 42 overcurrent devices, a 2-pole or a 3- pole circuit breaker shall be considered as two or three overcurrent devices, respectively.

Exception No. 3. For existing panelboards, individual protection shall not be required for a panelboard used as service equipment for an individual residential occupancy.

Panel Statement: The changes retain concepts from the 2005 NEC that were not addressed in either the original proposal or the panel action at the ROP meeting. The comment introduced new material because there was also no indication of intent to remove Exception No. 3 that could have been considered for public comment.

CMP 9 has broadened the present 408.36(B) Exception (Exception No. 1 in the new language) to apply to all panels in these limited service applications where greater inspectional supervision is normally expected. This action appropriately follows from the policy decision to remove the distinction between lighting and appliance branch circuit panelboards and power panelboards.

Ballot Results: Affirmative: 11

9-71 Log #701 NEC-P09 **Final Action: Accept in Principle**
(408.36 Exception No. 1)

Submitter: Michael J. Johnston, Plano, TX

Comment on Proposal No: 9-117

Recommendation: Revise as follows:

Exception No. 1: Individual protection shall not be required for a panelboard used as service equipment that contains not more than six circuit breakers or six disconnects in accordance with 230.71.

Substantiation: The exception, as proposed introduces the concept of motions of the hand, which may lead to varying differences in application in the field. The exception should refer to the equipment and characteristics of the equipment or installation rather than how many moves of the hand it takes to operate a service disconnect or multiple service disconnects grouped together in the same enclosure.

Panel Meeting Action: Accept in Principle

Refer to the panel action and statement on Proposal 9-70, which address the submitter's concern.

Panel Statement: CMP 9 takes this opportunity to note that 230.71(B) specifically refers to motions of the hand.

(408.36(B))

Submitter: Mark C. Ode, Underwriters Laboratories Inc.

Comment on Proposal No: 9-121

Recommendation: Change the last sentence "…..and the neutral conductor~~,~~ ~~that~~ with the voltage being less that the nominal voltage between the ungrounded conductors."

408.36(B) Power Panelboard Protection. In addition to the requirements of 408.30, a power panelboard with supply conductors that include a neutral conductor, and having more than 10 percent of its overcurrent devices protecting branch circuits rated 30 amperes or less, shall be protected by an overcurrent protective device having a rating not greater than that of the panelboard. This overcurrent protective device shall be located within or at any point on the supply side of the panelboard. To qualify for this classification, the panelboard shall be supplied by no fewer than two ungrounded conductors that have an equal nominal voltage between them and the neutral conductor~~, that~~ with the voltage being less that the nominal voltage between the ungrounded conductors.

Substantiation: This change provides corrected text for the added final sentence.

Panel Meeting Action: Accept in Principle

Make no changes other than those incorporated in the panel action on Proposal 9-70.

Panel Statement: The comment addresses a provision that is being removed through the acceptance of Proposal 9-117 and Comment 9-70.

(408.36(B))

Submitter: Jeffrey Boksiner, Telcordia Technologies, Inc.

Comment on Proposal No: 9-121

Recommendation: If action to delete text that uses the term "neutral" is not accepted then use the wording accepted by the Panel.

Substantiation: This comment was developed by the Technical Correlating Committee (TCC) Task Group (TG) on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6). The TCC directed that the action on this proposal be sent to the TG for review and comment.

The TG takes no position on proposal 9-117, however TG concurs with the proposed wording if CMP 9 chooses to retain 408.36(B).

Panel Meeting Action: Accept in Principle

Make no changes other than those incorporated in the panel action on Proposal 9-70.

Panel Statement: The comment addresses a provision that is being removed through the acceptance of Proposal 9-117 and Comment 9-70.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

11-1 Log #2325 NEC-P11 **Final Action: Accept**
(409.104(B))

Submitter: David Fisher, Rockwell Automation

Comment on Proposal No: 11-8

Recommendation: Revise text to read as follows:

409.104 Wiring Space in Industrial Control Panels.

(B) Wire Bending Space. ~~Wire bending space for the main supply terminals shall be in accordance with the requirements in 312.6.~~ Wire bending space within industrial control panels for ~~other~~ field wiring terminals shall be in accordance with the requirements in 430.10(B). ~~The gutter space shall comply with 312.8.~~

Substantiation: The proposal should have been accepted in principle for the following reasons:

1. 312.6 offers two wire bending options with a number of exceptions. The options necessitate the knowledge of where the field connected conductors will enter the enclosure. This is seldom known at the time of the placement of the components in an industrial control panel unless it is field assembled at the installation site. A panel assembler remote from the installation could comply with the requirements of 312.6 by placing the components in a panel suitable for conductor entry at 90º to the component terminals, effectively allowing

only about one half the space required for a "straight in" entry that might be needed at the installation. Such a misapplication can't happen with the wire bending space according to Table 430.10(B) since its spacing requirements account for the worst case installation. Further, the panel statement indicating that 312.6 provides "increased wire bending space for supply terminals" seems to imply an advantage, but that would only be true if there was evidence that the spacings required in Table 430.10(B) did not provide adequate wire bending space for supply terminals. The spacings shown in Table 430.10(B) have been unchanged for years and have been applied for all types of field connected terminals and there was no proposal to change them during this code cycle.

2. The existing text in the second sentence "for other terminals" is ambiguous as to whether these "terminals" are for field connection or those that are interconnected with other components in the panel during its assembly and wiring. The changing to the revised text "for field wiring terminals" mitigates this problem.

3. The last sentence should have been eliminated from 409.104(B), as proposed, since the gutter requirements in 312.8 are essentially part of the 409.104(A) existing text.

Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-2 Log #2320 NEC-P11 **Final Action: Accept in Part**
(409.106)

Submitter: Jay Tamblingson, Rockwell Automation
Comment on Proposal No: 11-9
Recommendation: Revise text to read as follows:
409.106 Spacings. Spacings between live bare metal parts in feeder circuits shall not be less than specified in Table 430.97.

Exception: Spacings ~~The distance~~ shall be permitted to be less than those ~~that~~ specified in Table 430.97 at circuit breakers and switches and as otherwise permitted in listed ~~components installed in~~ industrial control panels.
Substantiation: The UL508A Industrial Control Panel standard provides requirements for minimum spacing of components in feeder circuits. The present wording of the exception in proposal 11-9 could potentially conflict with those requirements in that it could permit use of listed components in feeder circuits with smaller spacings than those required of UL508A, as well as prevent use of components in feeder circuits that would be otherwise be acceptable. The changes submitted would help ensure consistency of permitted spacings within field built and listed industrial control panels. In addition, the term "The distance" in the exception should be revised to "Spacings" to align with the requirement text.
Panel Meeting Action: Accept in Part

Change 409.106 to read as follows:

409.106 Spacings. Spacings between live bare metal parts in feeder circuits shall not be less than specified in Table 430.97.

Exception: Spacings shall be permitted to be less than those specified in Table 430.97 at circuit breakers and switches and in listed components installed in industrial control panels.
Panel Statement: The panel accepts the change in terminology from "distance" to "spacing" and from "that" to "those".

The panel rejects the second part of the submitter's exception. The panel's intent is to allow for "listed parts" installed in industrial control panels to be permitted a smaller spacing if that particular part was listed with a smaller spacing due to its particular construction. The spacing requirements in UL 508A are consistent with the spacing requirements in Table 430.97.

(410.2)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 18-48
Recommendation: Reject the proposal, at least for the next cycle.
Substantiation: This provision has been in the NEC since the 1940s, and it would seem that more care should be taken before removing it. Early on, there was a rule about separating these lamps from combustible surfaces, and then the rules simply pointed to Article 710. CMP 18 should more carefully substantiate whether there are any practical instances of this equipment still in use. It is harmless in its present form, so there is no downside risk to retaining it for now.
Panel Meeting Action: Reject
Panel Statement: The commentor has not submitted any data to substantiate his belief that there may still be practical installations of this equipment in use. Without such data, holding this proposal until the next code cycle serves no purpose. As stated in the substantiation to Proposal 18-48, Article 490 makes no mention of arc lamps used on constant current systems; therefore, the reference in 410.2 is not valid and is not needed.

Explanation of Negative:
OWENS, T.: I think the appropriate action on this comment is accept. CMP-18 should have accepted the kudos for a job well-done and moved on. The effort spent on pointing out that no justification for the congratulations was provided is not time well-spent by the panel.

18-65 Log #2188 NEC-P18 **Final Action: Accept in Principle**
(410.6, 410.27(B) & (C), 410.30(C), and 410.30(C)(1)(2)(c))

Submitter: Frederick L. Carpenter, Lithonia Lighting
Comment on Proposal No: 18-40a
Recommendation: Change the proposed text to read as follows:
410.xx Listing Required. All luminaires~~,~~ and lampholders~~, and lighting assemblies~~ shall be listed.
Additionally, the text of 410.27(B), 410.27(C), 410.30(C)(1), and 410.30(C)(1)(2)(c) should be modified by adding the word "listed" back into the sections as shown below:
410.27(B) Size Unless part of listed decorative lighting assemblies, pendant conductors shall not be smaller than 14 AWG for mogul-base or medium-base screw-shell lampholders or smaller than 18 AWG for intermediate or candelabra-base lampholders.
410.27(C) Twisted or Cabled Pendant conductors longer than 900 mm (3 ft) shall be twisted together where not cabled in a listed ~~lighting~~ assembly.
410.30(C)(1) Cord-Connected Installation. A listed ~~lighting~~ assembly shall be permitted to be cord connected if the following conditions apply:
410.30(C)(1)(2)(c) Is terminated in a grounding-type attachment plug cap or busway plug, or is a part of a listed ~~lighting~~ assembly incorporating a manufactured wiring system connector in accordance with 604.6(C), or has a luminaire (fixture) assembly with a strain relief and canopy.
Substantiation: The term "lighting assemblies" is undefined, vague, and likely to lead to a variety of interpretations from different authorities having jurisdiction. Will optional parts that are normally shipped separately from a luminaire be considered to be lighting assemblies which must carry a listing mark? (For instance, visors or vandal guards). Are poles lighting assemblies? To address this problem, the term "lighting assemblies" should be removed from this proposed general listing requirement, and the requirement for listing should be added back into the appropriate specific sections that previously referenced "listed assemblies".
Panel Meeting Action: Accept in Principle
Accept the recommendation as submitted with the following revision to 410.30(C)(1).
(1) Cord-Connected Installation. A luminaire or a listed assembly shall be permitted to be cord connected if the following conditions apply: (remainder of 410.30(C)(1) to remain as is in the 2005 NEC)
Panel Statement: The panel accepts the recommendation with the addition of the words "luminaire or" to 410.30(C)(1) to restore the text to that of the 2005 NEC. The panel notes that "fixture" will be removed throughout the NEC based on the TCC direction.

Ballot Results: Affirmative: 13

18-66 Log #1407 NEC-P18 **Final Action: Accept in Principle**
(410.8(B)(3) (New))

Submitter: Lee Ward, Ardee Lighting Inc.
Comment on Proposal No: 18-56
Recommendation: This Proposal should be Accepted.
410.8 Luminaries (Fixtures) in Clothes Closets.
(B) Luminaire (Fixture) Types Permitted. Listed luminaries (fixture) of the following types shall be permitted to be installed in a closet:
(1) A surface-mounted or recessed incandescent luminaire (fixture) with a completely enclosed lamp.
(2) A surface-mounted or recessed fluorescent luminaire (fixture).
(3) A listed surface-mounted or wall-mounted clothes rod luminaire installed in accordance with the manufacturer's installation instructions.
Substantiation: This luminaire or fixture is intended to supply supplemental low voltage or fluorescent lighting to areas of the closet that cannot be reached by conventional fixtures.
The panel statement in the Report on Proposal 18-56 mentioned that "There currently are no tests in the luminaire standard, ANSI/UL 1598, that determine the suitability of a luminaire for use in a clothes closet". Panel Rejected the Proposal.
Since receiving the ROP, an independent test lab tested the clothes rod luminaire in an IC test box built to simulate a worse case situation in the storage area of a clothes closet. All external surfaces are less than 90°C which is a requirement in UL 1598. These tests were witnessed by UL. We feel that the clothes rod luminaire listed Type IC should be permitted for use in the storage area of a clothes closet.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
Revise 410.8 by adding the following:
410.8(B)(3) Surface mounted fluorescent or LED luminaires identified as suitable for installation within the storage area.
410.8(D)(5) Surface mounted fluorescent or LED luminaires shall be permitted to be installed within the storage space where identified for this use.
Panel Statement: The panel action allows for the use of listed luminaires that can be installed within the storage area of a clothes closet.

410.18 Exposed Luminaire (Fixture) Parts.
(B) Made of Insulating Material Luminaires (fixtures) directly wired or attached to outlets supplied by a wiring method that does not provide a ready means for grounding shall be made of insulating material and shall have no exposed conductive parts.
~~Exception No. 2: Where no equipment grounding conductor exists at the outlet, replacement luminaires (fixtures) that are GFCI protected shall not be required to be connected to an equipment grounding conductor.~~
Substantiation: This was added to the 2005 NEC and as noted in NEC handbooks and Code update presentation as similar protection as provided for receptacles. This is not the same, receptacles are installed in the wall were no live parts are exposed to the general public, but a Luminarie could have ground fault by means of a nicked wire in the fixture box and because there is no grounding conductor the fixture could become energized and sit there waiting for the first person to come along and touch the fixture and have to receive a shock in order to trip the GFCI protecting the fixture. Also, the person could be on an aluminum ladder and receive this shock and jump also introducing a fall hazard. Yes, I know this provides a least some protection, but I believe it should be installed according to the main text or Exception No. 1, but not allow Exception 2.
Panel Meeting Action: Reject
Panel Statement: In accordance with 4-4.6 of the Regulations Governing Committee Projects, the panel is to consider and act on all comments that are directly related to the substantive content of the Report on Proposals. Since there were no proposals on Section 410.18(B) Exception No. 2, the panel is rejecting this comment. Proposal 18-41 was simply a reorganization of Article 410 and did not address any technical issues.
The panel rejects the substantiation for deleting Exception No. 2 to 410.18(B). In response to this substantiation, a luminaire installed to a box without an equipment grounding conductor is not any different than a luminaire plugged into a receptacle without an equipment grounding conductor. Both cases require GFCI protection and provide the same level of protection.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-70 Log #1977 NEC-P18 **Final Action: Reject**
(410.30(C)(1)(2)(c))

Submitter: Noel Williams, Herriman, UT
Comment on Proposal No: 18-78
Recommendation: This Proposal should have been Rejected.
Substantiation: While the proposal may address the prohibition of running a cord through a hole in a ceiling by installing it in a raceway, it does not address other potential conflicts and will still be seen as a code violation by many AHJs. For example, 400.8 also prohibits the cord being above the suspended or dropped ceiling and from being used as a substitute for fixed wiring. In addition, it prohibits the installation of cord in a raceway. Admittedly, this proposal would overcome that prohibition by specifically permitting it. However, other aspects of the installation are not addressed by the proposal: (1) The wording implies that the raceway is for attachment to an outlet box above the ceiling, but that is not clear. (2) If the cord is to emerge from the raceway, how is this transition made, and how is the cord protected? A better solution would be to devise a box that could be installed over the grid member, or to use a flexible raceway or cable for the connection, so that the provisions of 400.8 do not have to be violated.
Panel Meeting Action: Reject
Panel Statement: See panel action on Comment 18-77. Proposal 18-78 requires that the raceway be attached to an outlet box above the ceiling. The cord would emerge from the raceway into the outlet box and be totally enclosed and protected.

Ballot Results: Affirmative: 13

18-71 Log #2185 NEC-P18 **Final Action: Accept**
(410.31)

Submitter: Frederick L. Carpenter, Lithonia Lighting
Comment on Proposal No: 18-40a
Recommendation: Return the text of 410.31 to the text in the 2005 NEC by adding the word “listed” as shown below:
410.31 Luminaires as Raceways. Luminaires shall not be used as a raceway for circuit conductors unless listed and marked for use as a raceway.
Substantiation: The use of the word “listed” in 410.31 is necessary to indicate that the products being discussed need to be listed for a specific requirement, in addition to the general requirements for listed luminaires. The word “listed” needs to remain in this section to clearly identify that listing as a raceway is required. When the panel removed the word “listed” from this section because they added a general requirement for listing luminaires elsewhere in the article, the intent of this section lost clarity.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-72 Log #2186 NEC-P18 **Final Action: Accept**
(410.32)

Submitter: Frederick L. Carpenter, Lithonia Lighting
Comment on Proposal No: 18-40a
Recommendation: Return the text of 410.32 to the text in the 2005 NEC by adding the word “listed” as shown below:
410.32 Wiring Supplying Luminaires Connected Together. Luminaires designed for end-to-end connection to form a continuous assembly, or luminaires connected together by recognized wiring methods, shall be permitted to contain the conductors of a 2-wire branch circuit, or one multiwire branch circuit, supplying the connected luminaires and need not be listed ~~marked~~ as a raceway. One additional 2-wire branch circuit separately supplying one or more of the connected luminaires shall also be perm
itted.
Substantiation: The use of the word “listed” in 410.32 is necessary to indicate that the products being discussed need to be listed for a specific requirement, in addition to the general requirements for listed luminaires. The word “listed” needs to remain in this section to clearly identify that listing as a raceway is required. When the panel removed the word “listed” from this section because they added a general requirement for listing luminaires elsewhere in the article, the intent of this section lost clarity.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-73 Log #440 NEC-P18 **Final Action: Reject**
(410.33)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 18-79
Recommendation: Revise panel action:
Feeder and branch circuit conductors within 75 mm (3 in.) of a ballast shall have a temperature rating not lower than marked on the ballast or luminaire (fixture) and not lower than 90°C (194°F) unless supplying a ballast or luminaire (fixture) listed and marked for a ~~different~~ lower temperature.
Substantiation: Definition of luminaire indicates it is a complete unit (singular) that may contain a ballast. Where the ballast is remote the luminaire may have a temperature marking lower than 90°C. Literal wording does not permit a feeder or branch circuit which does NOT supply a luminaire with lower temperature rating requirements to be less than 90°C and permits a lower than 90°C rating if the marking is for a HIGHER (different) than 90°C rating.
Panel Meeting Action: Reject
Panel Statement: The temperature limit on the enclosure of a listed Class P ballast is 90 C. Some ballast manufacturers mark electronic ballasts with a maximum temperature limit that is less than 90C for warranty purposes. This is a ballast manufacturer declared value and is not related to the testing performed for safety certification.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-74 Log #2187 NEC-P18 **Final Action: Reject**
(410.35)

Submitter: Frederick L. Carpenter, Lithonia Lighting
Comment on Proposal No: 18-79a
Recommendation: Proposal 18-79a should be Rejected and the text should be returned to the text of 410.35 of the 2005 NEC if Proposal 18-40a is Rejected.
Substantiation: The substantiation for eliminating the minimum letter height of this marking because the visibility requirements are already addressed in the listing standard is only valid if all luminaires are required to be listed. Currently, the codes does not require listing of all luminaires. If Proposal 18-40a becomes accepted throughout the code revision process, then this Proposal (18-79a) would be acceptable. However, if Proposal 18-40a is rejected, Proposal 18-79a should be rejected by the panel and the text should revert to the text of 410.35 in the 2005 NEC.
Panel Meeting Action: Reject
Panel Statement: The action taken by the panel on Comment 18-65 addresses the commentor’s concerns with Proposal 18-40a. Therefore, since Proposal 18-40a is being accepted, the concerns raised in this comment have been addressed.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-75 Log #1124 NEC-P18 **Final Action: Reject**
(410.35(A))

Submitter: Andre R. Cartal, Princeton Borough Building Dept.
Comment on Proposal No: 18-80
Recommendation: Please reconsider this proposal.
Substantiation: This proposal is concerned with branch circuit wiring in old homes. Evidently, the Panel feels that a luminaire that requires conductor insulation to be rated for a potential temperature of 194 degrees Fahrenheit is OK - Just read the label.
Panel Meeting Action: Reject
Panel Statement: The panel understands that the NEC applies to new installations versus existing older wiring. However, the panel does not agree that markings on luminaires are ineffective. The only way to insure proper installation of a luminaire is through the markings and installation instructions. The panel will not create specialized language to assuage those installers who refuse to follow the directions provided by manufacturers.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-76 Log #1125 NEC-P18 **Final Action: Reject**
(410.36)

Submitter: Andre R. Cartal, Princeton Borough Building Dept.
Comment on Proposal No: 18-82
Recommendation: See comment for Proposal 18-80.
Substantiation: The Panel claims that "substantial changes have been made to the safety standards over the past 60 years" BUT WE STILL SEE THE LABEL RESTRICTING THE BRANCH CIRCUIT CONDUCTORS TO 75/90C! The Panel comments on new wiring but THE CONCERN IS WITH THE 60 YEAR OLD WIRING.
Panel Meeting Action: Reject
Panel Statement: The panel understands that many existing wiring installations contain the older 60° C rated conductors. It also understands that most new luminaires are marked for 75°/90° C conductors only. The installer of a new luminaire on an older wiring installation must make provisions to upgrade the connections or the wiring to meet the new luminaire marking. Again, the panel will not create specialized language to assuage those installers who refuse to follow the directions provided by manufacturers.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

(410.62(C)(2)(c))

Submitter: Michael Lenherr, Pendant Systems
Comment on Proposal No: 18-78
Recommendation: Delete the following text:
~~having a maximum 152 mm (6 in.) long section of raceway for attachment to an outlet box above a suspended ceiling.~~
Substantiation: There clearly exists alternatives to produce the inline look of the feed end side suspension on the T-bar of the indirect fluorescent lighting systems in today's lighting market place. I have provided product information from Pendant Systems, Fnelite and Lite Control showing code compliant installations within the workings of 400.8. The typical wiring system that we have seen in the past is the use of a 1/2 in. offset nipple with a bushing on the front of the canopy into a 1900 box mounted sideways on to suspended ceiling grid attached to a IDS type clip. (see photo). This type of installation does not provide strain relief at the canopy location as with the canopy over the junction box at the ceiling level and relies on the contractor to us a UL knot in the 1900 box above the ceiling. It would also be easier for the AHJ to verify cord strain relief at the canopy level as there is the possibility that these fixture may be height adjusted at a later time as the cable suspension systems utilized today are adjustable. Exempting Article 400 for this use would most likely lead to an abuse of cord connected devices through a drop ceiling which is not the intent here.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: Examples presented by the commentor would be supported by the proposal. Two of the examples have integrally formed raceways that allow for passage of a flexible cord above the ceiling line.

The proposal requires strain relief. A knot tied in the flexible cord bearing against a smooth surface is considered a suitable strain relief means by the product standard. One of the examples that the commentor presented relies on a knot tied in the cord for stain relief. Since the outlet box is accessible, the strain relief means can be inspected. If there is a height adjustment, a knot can be tied in the cord to accommodate the change. The box shown in the photograph, identified by the commentor as a "1900" box, illustrates a knot tied in individual conductors rather than in a flexible cord, this is not a suitable strain relief means.

From the material the commentor presented regarding the junction box for drop ceiling applications, the method used to bond the ceiling grid member to ground is not clear. Since the ceiling grid member is typically an accessible dead metal part with a portion passing through an electrical enclosure, the panel reminds the commentor that it should be bonded to ground.

The proposed language does not exempt Article 400 but rather permits a specific construction as allowed by 400.8.

(410.73)

Submitter: Colette Keslin, Juno Lighting Group, Inc., Fishers Facility / Rep. NEMA
Comment on Proposal No: 18-90b
Recommendation: On behalf of Juno Lighting Group, Inc., Fishers Facility, I would like to express our support of Proposal 18-90b, based on the fact that all reported incidents involve linear fluorescents, highly due to the ease of ballast access. There are no reported incidents to our knowledge, involving compact fluorescent luminaires, thus we deem it unnecessary to include CFLs in the requirement for ballast disconnects.
Substantiation: See previous comment.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-79 Log #2091 NEC-P18 **Final Action: Accept in Principle**
(410.73(G))

Submitter: Frederick L. Carpenter, Lithonia Lighting
Comment on Proposal No: 18-90b
Recommendation: Change the word "assorted" in the first sentence to "associated". Also, in the first sentence, change the words "double ended" to "double-ended" and the word "ballast" to "ballast(s)". In the second sentence, change the word "disconnect" to "disconnecting means". Section 410.73(G) would read as follows:

(G) Disconnecting Means. In indoor locations, other than dwellings and ~~assorted~~ associated accessory structures, fluorescent luminaires that utilize ~~double ended~~ double-ended lamps and contain ballast(s) that can be services in place shall have a disconnecting means either internal or external to each luminaire. When connected to multiwire branch circuits, the disconnecting means shall simultaneously break all the supply conductors of the ballast, including the grounded conductor. The line side terminals of the disconnecting means shall be guarded. The disconnecting means shall be located so as to be accessible to qualified persons before servicing or maintaining the ballast. Where the disconnecting means is external to the luminaire, it shall be a single device, located in sight of the luminaire.

Existing five exceptions to remain as written in the 2005 NEC.
Substantiation: The word "associated" was inadvertently changed to "assorted" by the panel. The words "double ended" should be change to "double-ended", and the word "ballast" should be changed to "ballast(s)" to remain consistent with the previous code language and to clarify that a luminaire may contain more than one ballast. In the second sentence, the word "disconnect" should be changed to "disconnecting means" to use a term that is defined in Article 100 and to remain consistent with the rest of the section.

The panel should continue to limit the scope of this section to fluorescent luminaires that utilize double-ended lamps and contain ballasts that can be serviced in place, since the anecdotal incidents that have been reported to the panel, and the data collected by the Electrical Safety Authority in Ontario, Canada, indicate that the shock incidents are limited to individuals working on this subset of products while not following the appropriate safety precautions and regulations.
Panel Meeting Action: Accept in Principle
Revise 410.73(G) to read:

(G) Disconnecting Means.

(1) General. In indoor locations, other than dwellings and associated accessory structures, fluorescent luminaires that utilize double-ended lamps and contain ballast(s) that can be serviced in place shall have a disconnecting means either internal or external to each luminaire. The line side terminals of the disconnecting means shall be guarded.

Exception No. 1: A disconnecting means shall not be required for luminaires installed in hazardous (classified) location(s).

Exception No. 2: A disconnecting means shall not be required for emergency illumination required in 700.16.

Exception No. 3: For cord-and-plug-connected luminaires, an accessible separable connector or an accessible plug and receptacle shall be permitted to serve as the disconnecting means.

Exception No. 4: A disconnecting means shall not be required in industrial establishments with restricted public access where conditions of maintenance and supervision ensure that only qualified persons service the installation by written procedures.

Exception No. 5: Where more than one luminaire is installed and supplied by other than a multiwire branch circuit, a disconnecting means shall not be required for every luminaire when the design of the installation includes

disconnecting means such that the illuminated space cannot be left in total darkness.

(2) Multiwire Branch Circuits. When connected to multiwire branch circuits, the disconnecting means shall simultaneously break all the supply conductors to the ballast, including the grounded circuit conductor.

(3) Location. The disconnecting means shall be located so as to be accessible to qualified persons before servicing or maintaining the ballast. Where the disconnecting means is external to the luminaire, it shall be a single device, and shall be attached to the luminaire or the luminaire shall be located within sight of the disconnecting means.

Panel Statement: The panel has revised the last sentence of the recommendation regarding the location of the luminaire disconnecting means to clarify that an external disconnecting means is either required to be attached to the luminaire (could be attached to the luminaire and located above an accessible ceiling area) or that the luminaire is required to be located within sight of the disconnecting means. In addition this section has been reorganized in order to place multiple requirements into separate subdivisions. This action also aids the user in understanding the application of the exceptions.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

Comment on Affirmative:

O'BOYLE, M.: I would like to emphasize that this requirement was promulgated because of reports of unsafe work practice by personnel during their servicing of double ended lamp luminaires. Since no safety device can protect against all of the possible hazards involved in servicing electrical equipment, all personnel involved in such service operations must be cognizant of the fact that the disconnects required by this section should not be relied upon as the primary means of assuring service personnel protection.

Proper servicing techniques, including the de-energizing the branch circuit and or the use of appropriate protective equipment, must be observed by service personnel to ensure safety. These basic safety tenets must continue to be the foundation of training, supervision and work methods employed by those involved with servicing luminaires.

18-80 Log #2108 NEC-P18 **Final Action: Accept in Part**
(410.73(G))

Submitter: Michael S. O'Boyle, Lightolier Division of the Genlyte Group, LLC

Comment on Proposal No: 18-94

Recommendation: Revise text to read as follows:

(G) Disconnecting Means. In indoor locations, other than dwellings and ~~assorted~~ associated accessory structures, fluorescent luminaires that utilize double ended lamps and contain ballast that can be serviced in place, supplied by branch circuits with voltage exceeding 150-volts to ground, shall have a disconnecting means either internal or external to each luminaire. When connected to multiwire branch circuits, the disconnect shall simultaneously break all the supply conductors of the ballast, including the grounded conductor. The line side terminals of the disconnecting means shall be guarded. The disconnecting means shall be located so as to be accessible to qualified persons before servicing or maintaining the ballast. Where the disconnecting means is external to the luminaire it shall be a single device, located in sight of the luminaire. Existing five exceptions to remain as written in the 2005 NEC.

(Base language is from Proposal 18-90b).

Substantiation: As a function of magnitude, voltages below 150-volts present a lower level of risk than those exceeding 150-volts. 210.5(B) and 210.5(C) recognize this by allowing ordinary screwshell lampholders with accessible live parts on circuits of 120-volts between conductors while prohibiting them on 277-volt circuits. The Canadian Electric Code requires a disconnect when a luminaire is supplied by a circuit exceeding 150-volts; the 150 V level is based on the incident data collected by the Canadian Electrical Safety Authority. No empirical data has been presented in either the US or Canada to substantiate requiring a disconnect for ballast connected to circuits of less than 150 V.

Panel Meeting Action: Accept in Part

The panel accepts only the editorial revision of "assorted" to "associated". The panel rejects the remainder of the recommendation.

Panel Statement: The panel does not accept the argument that the replacement of 120-volt ballasts when energized is any less of a safety hazard than higher voltages. The electrical shock and corresponding startle reaction received from this voltage level can still result in serious injury.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 12 Negative: 1

Explanation of Negative:

CARPENTER, F.: No incident data has been supplied that supports requiring a disconnecting means for luminaires installed on circuits that are less than 150 volts-to-ground. The only data collected suggests that shock incidents have been limited to higher voltage applications.

18-81 Log #2144 NEC-P18 **Final Action: Reject**
(410.73(G))

Submitter: Gary Martin, Brite Electric

Comment on Proposal No: 18-90b

Recommendation: Revise text to read as follows:

~~Fluorescent~~ Luminaires that ~~utilize double ended lamps and~~ contain ballast that can be serviced in place.

Substantiation: This is a serious problem, not only on luminaires with double ended lamps, but on all luminaires where the ballast can be serviced in place.

Panel Meeting Action: Reject

Panel Statement: The commenter has provided no data to substantiate his claim that the unsafe work practice of replacing ballasts without first disconnecting power is a serious problem on all luminaire types where the ballast can be serviced in place.

The provisions of 410.73(G) were adopted to address an unsafe work practice that involved people performing maintenance on linear fluorescent luminaires without first disconnecting power or using the appropriate personal protective equipment. It is hoped that the requirements of 410.73(G) will minimize the number of shock incidents associated with this unsafe work practice, but the requirements are not intended to circumvent the need to wear the appropriate personal protective equipment or to disconnect power before servicing live electrical equipment.

Extending the requirements of 410.73(G) to luminaires other than linear fluorescent luminaires would expose the workers to greater risks from additional shock hazards since other types of electric-discharge lighting systems are more likely to have exposed live electrical parts located within the electrical enclosure, such as exposed capacitor terminals, core & coil (open-coil) ballasts, open-coil relays, open-board starters, etc.

18-87 Log #786 NEC-P18 **Final Action: Reject**
(410.73(G), [410.120(G)])

Submitter: Michael J. Johnston, Plano, TX
Comment on Proposal No: 18-90b
Recommendation: Accept in Principle the proposed text in 18-91 and revise the proposed last sentence of 410.73(G) as follows:
Where the disconnecting means is external to the luminaire, it shall be readily accessible from the luminaire.
Substantiation: Proposal 18-91 (Log #489) is an effort to clarify the external disconnecting means location while at the same time maintaining the spirit and objective of the original rule accepted in the 2005 NEC cycle, which is worker safety. The substantiation provided with proposals 18-92 (Log #1780) and 18-93 (Log #3421) in the 2004 ROP indicated the need for a means of disconnect for worker safety. The location of such disconnecting means is an important part of this requirement to achieve the primary objective of the original requirement. The action on Proposal 18-90b actually results in lessening the requirements gained in 410.73(G) of the 2005 NEC. Perhaps this is what CMP-18 intends. Based on the actions and resulting requirements in the 2005 NEC, CMP-18 inserted requirements that would provide workers a ready means for disconnecting power to ballasts during service operations that would reduce the risks that are currently being taken by workers in the field faced with these decisions. While it was clear that CMP-18 does not condone unsafe work practices, the requirements in 410.73(G) have been reduced as a result of inserting the concept of location a disconnect "in sight" of the luminaire in this section. By definition, this allows the disconnect to be visible from and up to 50 ft away from the luminaire which invites the risks that the original rule was intended to reduce. The general requirements of this section should be geared toward providing a ready means to establish an electrically safe work condition for workers on ladders, lifts, and so forth, and the exceptions to this rule should relax the requirement under specific alternatives that offer equal and effective means for providing equivalent safety objectives. Consider the proposed adjustment or reject the original proposal to revert back to the 2005 language.
Panel Meeting Action: Reject
Panel Statement: The panel does not agree that the action taken on Proposal 18-90b lessens the requirements of 410.73(G). The revisions in Proposal 18-90b and Comment 18-79 now require the disconnecting means to be either attached to the luminaire or that the luminaire is within sight of the disconnecting means. In accordance with the 2005 NEC the disconnecting means could have been located anywhere in the building. Locating an external disconnecting means within sight accomplishes the objective of allowing the luminaire that needs to be serviced to be disconnected from the branch circuit without rendering the entire space dark. The panel did not intend that the disconnecting means has to be readily accessible from the luminaire in those case where a luminaire is within sight of a local switch used as the disconnecting means. See the panel action on Comment 18-79.

Comment on Proposal No: 18-65
Recommendation: Revise as follows:
FPN: The load calculation in 220.43(B) does not limit the length of track on a single branch circuit, and it does not limit the number of luminaires on single track.
Substantiation: This rewording omits statements of intent, changes "fixtures" to "luminaires", and by using "length" instead of "number of feet" avoids a metrication problem.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-90 Log #474 NEC-P18 **Final Action: Hold**
(410.130(G))

Submitter: Gregory J. Steinman, Thomas & Betts Corporation
Comment on Proposal No: 18-90b
Recommendation: Revise as follows:
(G) Disconnecting Means. In indoor locations, other than dwellings and associated accessory structures, fluorescent luminaires that utilize double-ended lamps and contain ballast(s) that can be serviced in place shall have a disconnecting means either internal or external to each luminaire. For existing installed luminaires without disconnecting means, at the time a ballast is replaced, a disconnecting means shall be installed. When connected to multiwire branch circuits, the disconnect shall simultaneously break all the supply conductors of the ballast, including the grounded conductor. The line side terminals of the disconnecting means shall be guarded. The disconnecting means shall be located so as to be accessible to qualified persons before servicing or maintaining the ballast. Where the disconnecting means is external to the luminaire, it shall be a single device, ~~located in sight of~~ adjacent to the luminaire.
Substantiation: Disconnecting means provide a safe working environment for the electrician. It can be added easily at the time a ballast is replaced and will provide a safer installation of the next ballast replacement. There are several ballast disconnecting components available that can be easily installed during ballast replacement. Per Article 100, the words "in sight of" mean within 50 feet. This is too far for a safe replacement. The disconnecting means shall be easily accessible to the electrician.
Panel Meeting Action: Hold
Panel Statement: In accordance with 4.4.6.2.2 and 4.4.6.2.3 of the Regulations Governing Committee Projects, this comment is being held because it introduces new material that has not had adequate public review.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

ARTICLE 411 — LIGHTING SYSTEMS OPERATING AT 30 VOLTS OR LESS

18-91 Log #974 NEC-P18 **Final Action: Accept in Principle**
(411.2)

Submitter: Mark C. Ode, Underwriters Laboratories Inc.
Comment on Proposal No: 18-105
Recommendation: Delete "shall each be" and replace with the word "are" to read as follows:
Lighting Systems Operating at 30 Volts or Less. A lighting system consisting of an isolating power supply, the low voltage luminaires (lighting fixtures), and associated equipment, all identified for the use. The output circuits of the power supply are ~~shall each be~~ rated for not more than 25 amperes and operate at 30 volts (42.4 volts peak) or less under all load conditions.
Substantiation: The NEC Style Manual does not permit mandatory text in a definition so the mandatory text is being replaced with the word "are."
Panel Meeting Action: Accept in Principle
Revise 411.2 to read:
Lighting Systems Operating at 30 Volts or Less. A lighting system consisting of an isolating power supply, the low voltage luminaires, and associated equipment, that are all identified for the use. The output circuits of the power supply are ~~shall each be~~ rated for not more than 25 amperes and operate at 30 volts (42.4 volts peak) or less under all load conditions.
Panel Statement: The panel has made an editorial revision in the first sentence and has also deleted the term (lighting fixture).
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-92 Log #219 NEC-P18 **Final Action: Accept**
(411.3)

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 18-106
Recommendation: The Technical Correlating Committee directs that the Panel reconsider the proposal and add headings to (A) and (B). This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Make the following revisions to 411.3:
Listing Required. Lighting systems operating at 30 volts or less shall comply with 411.3(A) or 411.3(B)
(A) Listed System. Lighting systems operating at 30 volts or less shall be listed as a complete system. The luminaires, power supply and luminaire fittings (including the exposed bare conductors) of an exposed bare conductor lighting system shall be listed for the use as part of the same identified lighting system.
(B) Assembly of Listed Parts. A lighting system assembled from the following listed parts shall be permitted.
Retain existing list items (1) through (6)
Panel Statement: The panel has added headings as directed and has also revised and reorganized the text to clarify application.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-93 Log #1876 NEC-P18 **Final Action: Reject**
(411.4)

Submitter: Steven D. Holmes, Underwriters Laboratories Inc.
Comment on Proposal No: 18-107
Recommendation: Accept 411.4(B) as proposed.
Substantiation:
This proposal should be ACCEPTED IN PRINCIPLE. We agree with the Panel action except for the rejection of the proposed text of 411.4(B). The panel concluded the proposed text of 411.4(B) was in conflict with, and less stringent than, the requirements of Section 680.22(B). Regrettably, the NFPA panel did not identify in the panel statement which of the multiple requirements that make up 680.22(B) of the 2005 NEC were more stringent than, or in conflict with, the requirements of proposed 411.4(B).
Proposed 411.4(B) required the following:

A) Power supply shall be GFCI protected if less than 10 ft horizontal from pool.
B) All system components less than 5 ft horizontal shall be minimum 12 ft above water.

The following table compares proposed 411.4(B) with each sub-section of 680.22(B).

(Table shown below)

Subsection and scope of 680.22(B) requirements for luminaires near permanent pools	**Key required parameters of 680.22(B) requirements for luminaires near permanent pools**	Proposed 411.4(B) **GFCI protected if < 10 ft horiz. 12 ft or more vert. if < 5 ft horiz.**	
		Does proposed 411.4(B) conflict with 680.22(B)( )?	Is proposed 411.4(B) less stringent than 680.22(B)( )?
680.22(B)(1) New Outdoor Installation Clearances	If luminaire above pool or < 5 ft horiz., Req = 12 ft or more vert.	No	No
680.22(B)(2) Indoor Clearances	Same as outdoor, except a totally enclosed luminaire is permitted closer to pool than outdoor if GFCI protected and 7 ft 6 in. or more vert.	No	No
680.22(B)(3) Existing Installations (of luminaires)	If luminaire < 5 ft horiz., Req = 5 ft or more vert., GFCI protected, and attached to structure	No	No
680.22(B)(4) GFCI Protection in Adjacent Areas	If luminaire 5 ft to 10 ft horiz., Req. = GFCI protected or (5 ft or more vert. and attached to structure)	No	No
680.22(B)(5) Cord-and-Plug-Connected Luminaires	If luminaire < 16 ft radially, Req. = comply with 680.7. 680.7 Req. = Cord <3 ft, 12+ AWG grounding conductor, and grounding-type attachment plug	No	No

Proposed requirement 411.4(B) is at least as stringent as all of the multiple requirements in 680.22(B).

Existing 411.4(B) and Article 680, together, (a) permit luminaires as near as 1.5 m (5 ft) from permanent swimming pools, spas, hot tubs, and similar locations and (b) require luminaires to be no less than 3.0 m (10 ft) from storable pools, fountains, and similar locations. This difference in required minimum distance causes confusion and, as a result, inconsistent minimum installation distances being required in the field.

If the panel continues to find proposed 411.4(B) to be in conflict with, or less stringent than requirements of Article 680, submitter asks panel to:

A) Modify proposed 411.4(B) to remove the conflict or make more stringent as needed, and

B) Resolve the significant problem that prompted this proposal and revise 411.4(B) to permit installation distance for storable pools, fountains, and similar locations to be the same as required for permanent pools, spas, hot tubs, and similar locations. If the panel concludes the difference must remain, the submitter asks the panel to identify in a panel statement the safety-based rationale for requiring this difference.

Panel Meeting Action: Reject

Panel Statement: The panel reiterates that the requirements for luminaires adjacent to pools, fountains, spas, hot tubs and similar locations belong in Article 680. The submitter is directed to submit future proposals for changes concerning luminaires and pools to CMP 17 for their action. See action and statement on Comment 18-94.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

18-94 Log #304 NEC-P18 **Final Action: Accept**
(411.4(B))

TCC Action: The Technical Correlating Committee directs that the text be revised to read as follows:

"(B) Pools, Spas, Fountains, and Similar Locations. Lighting systems shall not be installed less than 3 m (10 ft) horizontally from the nearest edge of the water unless permitted by Article 680."

The Technical Correlating Committee revised the wording so that the text will comply with the NEC Style Manual.

Submitter: Code-Making Panel 17

Comment on Proposal No: 18-107

Recommendation: CMP-17 accepts the changes shown in the proposal for the title of 411.4 and section 411.4(A). CMP-17 has modified 411.4(B) to read as follows:

"(B) Pools, Spas, Fountains, and Similar Locations. Lighting systems shall be installed no closer than a minimum of 3 m (10 ft) horizontally from the nearest edge of the water. Unless permitted by Article 680."

Substantiation: Actions of CMP-18. Furthermore, we believe that referring the user to Article 680 provides the user with a more detailed explanation of the requirements.

This comment has been balloted through CMP-17 with the following ballot results:

16 eligible to Vote
13 Affirmative
1 Negative
1 Abstention
1 Not Returned (B. Hanthorn)

Mr. T. Blewitt voted negatively stating: "The changes in headings are an improvement and are supported. The Panel's proposed new text for 411.4(B) only restates the existing requirement in different sentence structure and is not supported. It does not clarify the requirement. In addition, the Panel comment ("...more detailed explanation of the requirements.") is not supported. The submitter sought to clearly state the requirements in 411.4(B) so that they did not need to be explained. Such explanation becomes necessary due to the general reference to "Article 680," a seeming noncompliance with 4.1.1 of the NEC Style Manual."

Mr. R. Sweigart abstained from voting stating: "Since I am also a member of CMP-18, I do not want my vote to influence the collective vote of CMP-17."

Mr. R. Yasenchak voted affirmatively stating: "We agree with the modifications set forth in this comment. The substantiation for this comment, however, is in conflict with the suggested action, by agreeing with the panel action on 18-107 and promoting no change. We believe that the substantiation should agree only with the intent of the panel action on Proposal 18-107, and endorse the suggested modification."

Panel Meeting Action: Accept

Panel Statement: The panel notes that the requirement is a single sentence that reads: "(B) Pools, Spas, Fountains, and Similar Locations. Lighting systems shall be installed no closer than a minimum of 3 m (10 ft) horizontally from the nearest edge of the water unless permitted by Article 680."

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

18-95 Log #2224 NEC-P18 **Final Action: Reject**
(411.4(B))

Submitter: James Durkin, MDL Corporation

Comment on Proposal No: 18-107

Recommendation: As a manufacturer of Listed power supplies (transformers) for the low voltage landscape lighting industry we would like to make a suggestion to clarify the section of the NEC that deals with the spacing around pools, spas and fountains. To read as follows:

Low voltage power supplies (transformers) must be connected to a GFCI and be mounted no closer than 10 ft (3.05 m) of pools, spas, fountains or similar locations. Low voltage landscape fixtures should not be mounted closer than 5 ft (1.52 m) of pools, spas, fountains or similar locations and must be connected to a listed isolation type transformer.

Substantiation: We believe that this will help end some of the confusion and conflict and will add to the safe use of electrical equipment around pools.

Panel Meeting Action: Reject

Panel Statement: See the panel actions on Comments 18-93 and 18-94 and the panel statement on Comment 18-93.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

17-5 Log #1979 NEC-P17 **Final Action: Reject**
(422.12, FPN (New))

Submitter: Noel Williams, Herriman, UT

Comment on Proposal No: 17-10

Recommendation: This Proposal should have been Accepted.

Substantiation: The proposed FPN was intended only to remind users that the exceptions do not alter the requirements of 210.23 which specify permissible loads. Contrary to the panel objection to the proposal being inadequate, a FPN could not say what is or is not permitted to be supplied - such prescriptive language must be in the code itself, as it is in 422.12. The second part of the panel statement that the FPN as proposed could be misleading to users is interesting in light of the completely inaccurate substantiation for this proposal for the 2005 NEC. That proposal and the panel's acceptance of the proposal left many users (especially those who read the ROP and ROC for assistance in interpretation) to be misled that this new exception was actually likely to be usable or that the loads being non-coincident had anything to do with making the exception usable. Article 422 cannot modify Article 210 so the branch circuits covered by Article 422 must also comply with Article 210. Both Exceptions to 422.12 permit the circuit in question to be other than an individual branch circuit, but limit the other loads that may be supplied and, therefore, answer the question as to what may or may not be supplied.

Exception No. 1 is often usable because the other permitted loads are very small. Exception No. 2 is more difficult to use because the sum of the loads cannot exceed the branch circuit rating. In addition, many fixed central heating appliances have ratings that exceed 50 percent of the smallest permitted branch circuit and do not leave enough for permanently connected AC equipment. The proposed FPN is intended only to remind users that the requirements of 210.23 still apply.

Panel Meeting Action: Reject

Panel Statement: Branch circuits should be sized in accordance with the requirements of Articles 210, 220, 424, and 440. The addition of an FPN that just refers to 210.23 could mislead the user to believe that additional undefined loads could be added to the circuit dedicated to central heating.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13

Ballot Not Returned: 1 Gill, C.

ARTICLE 422 — APPLIANCES

17-6 Log #454 NEC-P17 **Final Action: Reject**
(422.12 Exception No. 2)

Submitter: Dan Leaf, Seneca, SC

Comment on Proposal No: 17-9

Recommendation: Accept proposal as modified:
~~Permanently Connected~~. Air conditioning equipment and central heating equipment shall be permitted to be connected to the same branch circuit where means are provided to prevent simultaneous operation.

Substantiation: There doesn't seem to be a safety reason (or practical reason) why a cord-and-plug connected room air conditioner should not be permitted. A circuit could supply an air conditioner receptacle and baseboard heating in the same room (baseboard heaters are not central heating). Means should be provided to prevent simultaneous outage. Older or infirm persons may suffer severe consequences if reliability is compromised. Simultaneous operation whether cord or permanently connected can be easily prevented with a selector switch.

Panel Meeting Action: Reject

Panel Statement: Cord- and plug-connected air conditioners require a receptacle that can accept other loads. Means to prevent simultaneous operation would compromise the assured power intended for central heating equipment.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13

Ballot Not Returned: 1 Gill, C.

17-7 Log #1981 NEC-P17 **Final Action: Accept**
(422.13)

Submitter: Noel Williams, Herriman, UT
Comment on Proposal No: 17-12
Recommendation: This Proposal should have been Accepted.
Substantiation: The panel statement is not responsive to the proposal. Certainly, the sizing of branch circuits is already covered by the code. It is also covered by 422.3 as the FPN that follows 422.13 states. That is not the point. The point is that this language prior to 2005 was only about the branch circuit, the new language in 2005 extended this to feeders and services without substantiation, and the new language is inconsistent with other code rules, including other code rules under the jurisdiction of Panel 17 and other proposals accepted by panel 17. 424.3 applies the continuous load language to branch circuits only, which is consistent with 220.51 since 220.51 applies only to the feeder. As worded in 422.13, a water heater is a continuous load at all stages, so the continuous load language applies in 215.2, 215.3, and 230.42 in addition to the branch circuit requirements of 210.19 and 210.20. Yet, 220.53 permits a demand factor to be applied to appliances fastened in place and does not exclude water heaters. The previous language of 422.13 applied only to branch circuits, and nothing in the substantiation for the change in 2005 supported the expansion of this requirement beyond the branch circuit. All that was asked in the proposal for 2005 was to clarify if the 125 percent language was intended to imply that the branch circuit load was to be treated as a continuous load or not. Panel 17 accepted the proposal without apparent regard for the other unsubstantiated change that was being made. The proposal and this comment are intended to repair that problem.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gill, C.

17-8 Log #425 NEC-P17 **Final Action: Reject**
(422.16(B)(4)(5))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 17-18
Recommendation: Accept proposal.
Substantiation: Individual branch circuit is to provide for a possible equipment replacement although 90.1(A)(b) indicates the code relates to safety, not future expansion. There was no valid substantiation in Proposal 17-21 in the 2004 ROP for an individual circuit. An individual circuit is not required for a permanently connected (hard wired) range hood; these may also be replaced. This requirement does not correlate with the definition of Branch Circuit. Appliance, which permits more than one appliance on a circuit.
Panel Meeting Action: Reject
Panel Statement: The panel accepted the original substantiation for accepting 422.16(B)(4)(5) in the 2005 NEC. Section 90.1(B) is a warning to installers to let them know that meeting the minimum requirements of the NEC may not allow for future expansion of the installation; it is not a limitation on the Code for establishing minimum requirements for installations.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gill, C.

17-9 Log #1050 NEC-P17 **Final Action: Accept**
(422.16(B)(5))

Submitter: Richard J. Cripps, Association of Home Appliance Manufacturers
Comment on Proposal No: 17-13
Recommendation: Reject proposal.
Substantiation: I am taking this opportunity to enlarge on an issue which I raised in Item 4 of my Explanation of Negative on the Panel Vote.

I draw attention to a Power Point Presentation entitled "Fires Starting With Electrical Distribution Equipment" prepared for the NFPA by Dr. John Hall, Jr., in May, 2005. Slide 14 is entitled "U.S. Cord or Plug Structure Fires, 1980 to 2002." It depicts an incident rate declining at a fairly uniform rate from 15,000 per year in 1980 to 4,300 in 2002.

This substantial and sustained trend, I suggest, is the long term result of improvements to power cord specification already adopted by manufacturers for appliances including room air heaters prior to and during the period under review. The progressive decline reflects the aging and taking out of service and replacement of appliances manufactured prior to each successive specification enhancement; that is, the greater the proportion of appliances to post-enhancement specification in the overall population, the lower will be the number of incidents.

This trend will continue, particularly as further improvements to power cords for heaters are being investigated by UL as the Panel has been informed. The imposition of additional protective equipment at this time is, therefore, not justified. The final rejection of this proposal as required by the written ballot at the ROP stage should be upheld.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept
Panel Statement: Currently, UL is in the process of revising the product safety standards (UL 1278, Movable and Wall or Ceiling Hung Electric Room Heaters, and UL 1042, Electric Baseboard Heaters) to upgrade the power supply cords in lieu of adding protective devices. The revisions are expected to be adopted in 2007.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 1
Ballot Not Returned: 1 Gill, C.
Explanation of Negative:

ROCK, B.: NEMA affirms its support for AFCI and LCDI technology to prevent cord fires. The significant amount of cord fires attributed to portable electric heaters, combined with high probability of these products being operated unattended, further attests to the need for these technologies to reduce cord fires.

The comment rationale relies heavily on a recent NFPA study that utilizes a new reporting system over the previous reports and is suspect as to whether the reduction of fires is a result of product improvements or flaws by the change in the reporting system. We base this on the statements made by the author of this study, Dr. John Hall, as cited below:

- Estimates of fire incidents and nonfatal injuries after 1998 are not yet reliable.
- Rapid, deep declines that seem to relate to unresolved analysis problems rather than reality.
- We're still working on this.
- Problems do not affect deaths or loss as much.

These key issues were omitted from the comment's substantiation by extracting only a page from the entire report. Of particular note, the number of reported deaths is not declining as rapid as the reported fire data.

Fires are resulting from damaged cords and can be prevented by incorporating the safety devices recommended in Comment 17-11 (Log #2133) by a proven technology as evaluated by UL for this very purpose.

Comment on Affirmative:

BLEWITT, T.: Revisions have been submitted for comment to the Standards Technical Panel (STP1042) responsible for the product safety standards (UL 1278, Movable and Wall or Ceiling Hung Electric Room Heaters, and UL 1042, Electric Baseboard Heaters). Comments from the STP are due by January 31, 2007 after which the proposed revisions will be balloted for adoption.

HIRSCH, B.: It is the Edison Electric Institute's position that the requirements for end-use electrical devices that are **not** installed as part of the permanent premises wiring system are best covered by appropriate product standards. It is not the National Electrical Code's intent or scope to set requirements for end-use electrical devices that would typically be purchased by the after market consumer.

Work done by the Panel 17 Task Group on Protective Devices Integral with Electric Appliance Power Supply Cords revealed that there is no one solution that will provide complete protection in all cases. Thus, for the NEC to attempt to legislate a particular protection scheme makes no sense. The EEI/EL&P Companies recognizes that a Joint Task group on Power Supply Cord Safety, set up by UL and others, is currently in operation. A preliminary report was issued by the Task Group in 2006 which calls for performance based requirements for electric fans and electric room heaters. This approach allows manufacturers an option of meeting safety criteria in a number of ways. The EEI/EL&P Companies supports this approach.

The Edison Electric Institute supports the entire electrical safety system that integrates product standards, installation standards, product testing and evaluation, electrical inspection, manufacturer's products, qualified electrical installation and maintenance, electric supply system characteristics, and the owner's use and operation. Covering product standards in the National Electrical Code could negate the responsibility of the appropriate product standard and adversely impact the entire process.

The integrity of the electrical safety system is anchored in the systematic integration of the National Electrical Code, installation inspection, product safety standards and product testing. If non-premises end-use product safety issues are usurped by the National Electrical Code, the product safety standard process will be weakened resulting in the entire process being weakened. In addition, since non-premises end-use products are not normally in place during the inspection process, enforcement of such a requirement under the NEC would be impossible

17-10 Log #1367 NEC-P17 **Final Action: Accept**
(422.16(B)(5))

Submitter: Wayne E. Morris, AHAM
Comment on Proposal No: 17-13
Recommendation: The Code Panel should Reject the original Proposal 17-13.
Substantiation: The CMP 17 should reject the original proposal 17-13 for the following reasons:

1. The original proposal used as substantiation newspaper clippings of supposed fires on portable electric air heaters. The information is based on inadequate support and poor information AHAM hired one of the preeminent safety statistics firms to report on the numbers of accidents that might be caused by power supply cords of heaters. The maker of the code proposal states

the "most" of the portable heater fires are caused by power supply cords. According to Heiden Associates, an independent research firm, less than 2 percent of any portable heater fires are due to power supply cords.

2. The use of AFCIs and/or LCDIs on Room Air Conditioners since mid-2005 have been very problematic, and there is no indication that they have reduced fires. The addition of AFCI/LCDIs to power cords of room air conditioners have resulted in numerous nuisance tripping incidents. This has caused owners to cut off the devices, rewire attachment plugs and potentially diminish the safety and operation of the products.

3. Efforts are underway with the US Safety Standards for Portable Electric heaters to improve the safety of not only the power cord but other elements of the heater as well. The UL Standards Technical Panel (the committee responsible for the standards) has endorsed a number of standards changes to advance the safety of the products. These will include changes to the power cord to address some of the issues that have been raised by the Code Making Panel. The direction of the STP is to address the actual root causes of the problem, not add an unproven and inadequate component. The UL STP is presenting a detailed report within a few weeks to request comment on proposals to address this situation. This will result in changes to address this issue in a much more rapid and thorough manner than the NEC proposal.

4. Testing with LCDIs and AFCIs have shown that the two devices are not equivalent and do not provide equal electrical safety protection. They should have never been included in a proposal as implying they provide similar electrical protection. Power cord AFCIs have been shown to have little or no effect on series arcs. There are even questions whether they will prevent problems in parallel areas. LCDIs have no effects on arcs inside the product. Neither power cord AFCIs nor LCDIs have any effect on arcing in receptacles or extension cords.

5. The National Electrical Code panel responsible for circuit breakers has advanced a proposal in the 2008 NEC to require AFCI breakers on all household circuits. This will protect all the house circuits on new construction from the panel box through the receptacle. As has been shown most of the home electrical fires are not due to portable electric fans but rather to home wiring, receptacles or even extension cords. AFCI breakers on all household circuits is a much more effective way of reducing home fires.

6. The UL Working Group, representing many stakeholders including a manufacturer of cord mounted AFCIs and LCDIs has suggested an alternate course of action. This course of action. This course of action should be given preference and allowed to further the safety of these products through the changes to the UL standards.

Panel Meeting Action: Accept

Panel Statement: The panel accepts that documentation does exist of issues relating to power supply cords with portable electric heaters. The panel observes that item 5 of the submitter's substantiation does not address existing dwellings. Refer to panel action and statement for Comment 17-9.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 12 Negative: 1

Ballot Not Returned: 1 Gill, C.

Comment on Affirmative:

HIRSCH, B.: See my Comment under Comment 17-9.

17-11 Log #2133 NEC-P17 **Final Action: Reject**
(422.16(B)(5))

Submitter: Edward A. Schiff, Technology Research Corp.

Comment on Proposal No: 17-13

Recommendation: New text as originally submitted in Proposal, deleting the following from the panels' recommendation:

~~or other listed protection equal to or exceeding that of an LCDI or AFCI.~~

Substantiation: The submitter wishes to sincerely thank the Panel for their consideration and input. This substantiation is to address he comments made by the panel members.

The revised text is intended to allow for other new technologies that might be developed to prevent cord fires that might be developed. New classification will take a long time to have standards developed and would likely be qualified under UL 1699 which currently covers AFCI and LCDI cords. It is impossible to predict if any such technologies will be developed and they can be added to this article through the normal Code development process.

The UL Standards Technical Panel is dominated by the manufactures of appliances and does not have the balance nor the self interests of the NEC Code Member Panel. As cited in the original substantiation, there are a tremendous number of precedents for incorporation into the NEC which leads to a change in the product standard. The proposed changes do not address the damage that can and has occurred to cords on portable products of this nature that include pinching crushing, and overheating which will lead to series and parallel faults within the cord, the type of fault that the AFCI and LCDI cords will prevent.

The suggestion that there are serious technical issues is without any substantiation. UL has done extensive testing on these devices, developed appropriate standards and the products have been in service for over a decade.

The concern over the plug head leading to the use of plug strips is interesting. Our history with this sort of device in the plug head (GFCIs, ALCIs, IDCIs, ELCIs, LCDIs, etc.) is that they are plugged into the lower outlet to allow for use of the upper outlet. This would make it impossible to plug two heaters into the same outlet, which would reduce the risk of overloading the branch circuit, since these devices are typically rated for 12 Amps. In the scenario of plugging in the heaters to a plug strip, there would be a 15A breaker providing short circuit and overload protection. This type of device has a long history of use in the field with a great track record for reliability and a mature standard for performance. There is no history known to the submitter of modification of the cord. This is a low cost product that if damaged, would far more likely be replaced as opposed to modified.

Heater cord is a foreseeable problem that has and will continue to lead to electrical fires which the purpose of the NEC is to prevent foreseeable problems.

Panel Meeting Action: Reject

Panel Statement: Proposal 17-13 has been rejected by the action on Comment 17-9, and this comment is therefore not applicable.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 12 Negative: 1

Ballot Not Returned: 1 Gill, C.

Explanation of Negative:

ROCK, B.: NEMA continues to support the protection of cords through the use of technology that has a proven history. The proposed solution (of AFCI or LCDI technology) by the commentor would address fires resulting from damaged appliance cords as determined by the UL standard to evaluate this technology (UL 1699). Due to the facts that noted data sources indicate that fires are occurring due to damaged cords supplying portable heaters, there is no reason not to require a known technology that will eliminate or prevent this hazard.

Comment on Affirmative:

BLEWITT, T.: The commentor stated: "The UL Standards Technical Panel is dominated by the manufactures (sic) of appliances and does not have the balance nor the self interests of the NEC Code Member Panel." STPs are governed by standards development regulations complying with ANSI Essential Requirements as accredited by the American National Standards Institute (ANSI).

HIRSCH, B.: See my Comment under Comment 17-9.

17-18 Log #1102 NEC-P17 **Final Action: Accept**
(422.16(B)(5) (New))

Submitter: Wayne Myrick, Mahwah, NJ

Comment on Proposal No: 7-13

Recommendation: Support the code making panel's recommendation to Reject the original Proposal.

Substantiation: The NEC is not the proper place for portable product requirements. While this may be within the jurisdiction of the NEC and there is precedent for doing so, it is better to include end product requirements in the applicable product safety standards. End product requirements in the NEC are generally unenforceable by AHJs. The statistics cited by the proposer may not reflect safety improvements required by current editions of the product safety standards. Addition of an AFCI or LCDI will reduce the overall reliability of the product and may lead to consumers cutting the LCDI or AFCI off of the cord or making unsafe cord modifications or repairs. A UL task group has been looking into cord failures and may come up with better alternatives to deal with the root cause rather than electronic bandaids that attempt to detect and respond to particular failures.

Panel Meeting Action: Accept

Panel Statement: Also refer to the panel action and statement on Comment 17-9.

The panel does not agree with the submitter's substantiation.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 12 Negative: 1

Ballot Not Returned: 1 Gill, C.

Explanation of Negative:

ROCK, B.: See reason for NEMA vote on Comment 17-9 (Log #1050). Note: Comment 17-18 (Log #1102) was incorrectly transcribed to be associated with Proposal 7-13 (Log #198) rather than Proposal 17-13 (Log #3563) and is consequently misreferenced on the ballot.

Comment on Affirmative:

HIRSCH, B.: See my Comment under Comment 17-9.

17-20 Log #1159 NEC-P17 **Final Action: Accept**
(422.16(B)(5), 422.52 (New))

Submitter: Stephen T. Pastor, The Kirby Company

Comment on Proposal No: 17-29

Recommendation: The code panel should reject Proposals 17-29 and 17-13.

Substantiation: An AFCI and LCDI cannot detect a problem upstream of the protective device. Protection at the panel box will detect problems throughout the circuit including any issues with any appliances. Regulation should be focused at upgrading all home panel boxes to obtain the greatest benefit at the least expense.
Panel Meeting Action: Accept
Panel Statement: Also refer to the panel action and statement on Comments 17-9 and 17-17.
The panel does not agree with the submitter's substantiation.
Number Eligible to Vote: 14

17-22 Log #1166 NEC-P17 **Final Action: Accept**
(422.16(B)(5), 422.52 (New))

Submitter: Ramona Saar, AHAM
Comment on Proposal No: 17-13
Recommendation: The Code Panel should reject Proposals 17-13 and 17-29.
Substantiation: The statistics upon which the proposals are (1) based are anecdotal in nature, not on research, and (2) do not take into account improvements made to the UL safety standards for fans and heaters.
The devices (AFCI/LCDI) have not been proven to be reliable and the addition of these devices will (1) add additional possible sources of failure to the appliances and (2) lead to possible consumer tampering with devices - creating unsafe conditions.
UL's Task Group on power cord safety advocates strengthening the safety tests for power cords - not mandating AFCIs and LDCIs. The recommendations of the technical experts that make up the UL Task Group should take precedence.
Panel Meeting Action: Accept
Panel Statement: Also refer to the panel action and statement on Comments 17-9 and 17-17.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 1
Ballot Not Returned: 1 Gill, C.

17-24 Log #1174 NEC-P17 **Final Action: Accept**
(422.16(B)(5))

Submitter: Larry Albert, Black & Decker
Comment on Proposal No: 17-13
Recommendation: The code Panel should reject Proposal 17-13.
Substantiation: The submitter's intent is to prohibit the use of the messenger from ever being a current carrying conductor. Sections 250.32(B)(1) and 250.32(B)(2) in the 2005 NEC clearly set forth the rules for when this conductor can be a grounding conductor and when it can be a grounded conductor. Acceptance of this proposal would negate these applicable requirements when this wiring method is used. Article 396 should be used to determine the use, installation, and construction specifications for messenger supported wiring. Article 250 should be used to determine the grounding requirements. No evidence is offered that any of the incidents cited by the submitter is, or has been corrected by the application of insulated neutrals. No evidence is offered that using the messenger as a current carrying conductor is a hazard.
Panel Meeting Action: Accept
Panel Statement: Also refer to the panel action and statement on Comment 17-9.
The substantiation does not reflect the proposal for the code change. It is clearly based on some other proposal and not on Proposal 17-13.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 1
Ballot Not Returned: 1 Gill, C.
Explanation of Negative:
ROCK, B.: See reason for NEMA vote on Comment 17-9 (Log #1050).
Comment on Affirmative:

17-29 Log #1368 NEC-P17 **Final Action: Accept**
(422.16(B)(5))

Submitter: Lawrence Wethje, Association of Home Appliance Manufacturers
Comment on Proposal No: 17-13
Recommendation: The Code Panel should Reject Proposal 17-13.
Substantiation: The proposal is based on anecdotal incident data from newspaper clippings, which is not dependable. The proposed AFCI/LCDI devices have not been proven to be reliable in this application. There have been many problems associated with the use of these devices in a similar application with room air conditioners. The addition of these devices will result in increased sources of failure of the appliances in the field and lead to consumer tampering which will create unsafe conditions. Furthermore, the proposal does not take into account improvements that are being made to the UL safety standard for these products. UL's Task Group on power cord safety is strengthening the requirements for power cords, which will be more effective in improving safety than adding AFCIs or LCDIs.
Panel Meeting Action: Accept
Panel Statement: Also refer to the panel action and statement on Comment 17-9.
The panel does not agree with the submitter's substantiation.

17-31 Log #1430 NEC-P17 **Final Action: Accept**
(422.16(B)(5), 422.52 (New))

Submitter: Walter G. Birdsell, Kaz, Incorporated
Comment on Proposal No: 17-13
Recommendation: The Code Panel should Reject Proposals 17-13 and 17-29.
Substantiation: ● The NEC is not the most appropriate vehicle for mandating requirements to consumer portable products. While this may be within the jurisdiction of the NEC, it would be better to use the applicable safety standards, which can be better enforced on products, let UL make the appropriate recommendations with support from the appliance industry, consumer groups, and the CPSC. UL has better knowledge of the appliance usages in the field.

● The Code Panel action in January 2006 confused the issue, is inappropriate, and would cause interpretation problems for test agencies and authorities having jurisdiction (AHJs - i.e., electrical inspectors). [Note the panel action was to include the words, "422.52 single phase cord-and plug-connected electric fans shall be provided with factory-installed LCDI, AFCI, or other listed protection equal to or exceeding that of an LCDI or AFCI. The protection shall be an integral part of the attachment plug or located in the power supply cord within 300 mm (12 in.) of the attachment plug."] The members noted that the addition of this language would make this section impossible to administer. The statement is open ended, thus needs to be better defined, this statement interjects the mandate of any technology that can be marketed, but not properly evaluated.

● UL has had, for the past 2 years, a Task Group dedicated to investigating power supply cord issues and will be unveiling its second report in a few weeks. This report will make recommendations for changes to address the root cause of the issue, not add a component onto the product. This is a better way to address the issue and a better way to enforce the changes. The recommendation expands beyond appliances, suggests that extension cords should be enhanced to the same tough standards as portable appliances. Extension cords per the NFPA Fire Stats 0505 report by Dr. John R. Hall, Jr., are indicated as a greater cause of fires than end appliances.

● There have been many problems identified in applying AFCIs and/or LCD's to room air conditioners. These are only slowly coming to light and have not completely been resolved. Consumers/users are cutting the devices off cords or returning the products due to false tripping or nuisance activation. When these devices were added, the fault tree compounded due to the complexity of going from a standard power cord plug to an electronic device that has a complex circuit that can fail due to power surges, or mishandling of the power cord. The devices are heavy, loose wall outlets compound the failure mode, depending on how the receptacle is installed; ground pin located on the top or bottom. Receptacles, per the NFPA Fire Stats 0505 report by Dr. John R. Hall, Jr., are a greater cause of fires than the end appliance.

● The dependability of the LCDIs and AFCIs have not been conclusively proven. The code panel seems to overlook this important aspect of component mandates. There are many different types of products in the market that need to interact with these potential mandated components, the component manufactures are not interested in the end product application or usage, only that their sales numbers will explode if these proposals pass. For example: the shield of the LCDIs makes the power cord very stiff, their current design will not pass the current standards for oscillation products. The new proposals to enhance power cords will make this test more rigorous. The code panel is not taking into consideration the specific tests that are required for these applications. The charts and the table I have provided show how AFCI/LCDI are not the do all protectors for different types of failures.

● The use of the recommended AFCIs or LCDIs may lead to increased user interference with the equipment.

● Limited testing with AFCIs has shown that in many cases, the device will not open the circuit when encountering an arcing condition in the product. In addition, most AFCIs will not open circuit when encountering a series arc failure. LCDIs must have a fault only in the power cord. They do not work on arcs in the product. Neither of these can detect problems upstream in the receptacle.

● According to NFPA, receptacle, extension cord, power outlet strip, and house wiring electrical fires far outweigh any of the statistics from proven power supply cord issues. Little has been done to improve the safety of these other important areas. There are greater sales in outlets or receptacles (with price points from well under a dollar to just over ten dollars) and extension cords (varying size styles and proposed applications or usages) in the market than portable appliances (heater, fans, or air conditioners). Extension cords or receptacles could be used for a specific designed purpose or the wrong application unknown to the manufacture. This uncertainty of application by the end consumer causes serious events as the charts, I have provided show. Any combination of a loose receptacle, extension cord and a high current drawing appliance is a dangerous combination that adding an AFCI or LCDI device on a fan or heater will not overcome a serious event. The devices will not see upstream.

● AFCIs and LCDIs are not the same and should not be looked upon as a solution to the issues that have been raised. There are many other ways to improve the safety other than adding an unproven component to the product.

● Changes to the UL standards for Heaters (UL 1278) were made in the early 1990's and the statistics cited by the maker of the code proposal may not reflect these improvements. In addition, the UL standards for fans and heaters have recently made changes to improve wiring for oscillating products to address many of these power supply cord issues. These changes need time to be reflected in the statistics.

Note: Supporting material is available for review at NFPA Headquarters.

17-34 Log #1720 NEC-P17 **Final Action: Accept**
(422.16(B)(5) (New))

Submitter: J.B. Hoyt, Whirlpool Corporation
Comment on Proposal No: 17-13
Recommendation: The Code Panel should Reject Proposal 17-13.
Substantiation: ● As a major manufacturer of Room Air Conditioners, Whirlpool Corporation has firsthand experience with the real world application of AFCI's and LCDI's. There have been many problems identified in applying these devices to room air conditioners.

● The dependability/reliability of the AFCIs and LCDIs have not been conclusively proven.

● Consumers/users are cutting the devices off cords or returning the products due to nuisance tripping problems.

● Nuisance tripping has also led to increased consumer complaints and service calls.

● The reliability of an AFCI or LCDI is less than a traditional plug and could lead to premature failures and to consumers making ill-advised or inappropriate repairs.

● According to NFPA, receptacle, extension cord, power outlet strip, and house wiring electrical fires far outweigh any of the statistics from proven power supply cord issues. This would be a more impactful area of focus, rather than on the products which may be plugged into such devices.

● Underwriters Laboratories has had a Task Group dedicated to investigating power supply cord issues and will be producing its second report shortly. This report is expected to make recommendations for changes to address the root cause of the issue, not add a component onto the product. This is a better way to address the issue and a better way to enforce the changes.

● The NEC often drives requirements that are included in product safety standards of UL or CSA, but without the benefit of manufacturing experience from a broad range of interested parties. Additionally, the enforcement of the NEC may not be as complete as it would be by following the UL or CSA

standards making and certification process. The use of this process should be preferred and allowed to progress as these processes have the ability to enforce safety requirements directly on the products for the entire USA market in a manner that best achieves the objective.

● Limited testing with AFCI's has shown that in many cases, the device will not open the circuit when encountering an arcing condition in the product. In addition, most AFCI's will not open circuit when encountering a series arc failure. LCDI's must have a fault only in the power cord. They do not work on arcs in the product.

● Neither, the AFCI nor the LCDI can detect problems upstream in an extension cord or in the receptacle, which, according to NFPA data is a much bigger problem that, therefore, would not be addressed.

● AFCI's and LCDI's are not the same and should not be looked upon as a solution to the issues that have been raised. There are many other ways to improve the safety other than adding an unproven component to the product.

● AFCI and LCDI devices are electronic devices with a complexity that exhibits the potential of typical electronics failures such as arc track and component overheating or burnout etc. In comparison, these failure modes do not exist with power plugs. Bad material choices and manufacturing issues have been observed. The question whether the increased risk and number of failures outweighs the alleged number of failures has not been answered satisfactorily. Meaning, are these devices really a safety improvement, especially considering reports of cut of devices, etc., in order to avoid nuisance tripping.

17-13 Log #1983 NEC-P17 **Final Action: Accept**
(422.33(A))

Submitter: Noel Williams, Herriman, UT
Comment on Proposal No: 17-23
Recommendation: This Proposal should have been Rejected.
Substantiation: The proposal said it was only editorial in nature ("Edit"), but it actually results in a significant and onerous change. This rule will require the receptacle for a refrigerator to be located in a space other than behind the refrigerator. Since a refrigerator in most existing installations and in common practice usually has to be pulled out a bit to access its receptacle outlet, the outlet is not readily accessible and another disconnect would be required. Similarly, a receptacle for a dishwasher or range that is accessible by pulling the appliance out from the wall would no longer qualify as a disconnect for that appliance. No substantiation was provided for these drastic changes in the requirements for appliance disconnects.
The substantiation is also incorrect in stating that a receptacle "cannot be ' not accessible' (closed in by building finish)...". This statement is based on the definition of accessible as applied to wiring methods. Receptacles are not "wiring methods" and are not covered by Chapter 3, they are a type of "Equipment for General Use" covered by Chapter 4. The definition of accessible that should be applied to receptacles is Accessible (as applied to equipment): "Admitting close approach; not guarded by locked doors, elevation, or other effective means."
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gill, C.

17-14 Log #407 NEC-P17 **Final Action: Reject**
(422.45)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 17-25
Recommendation: Accept.
Substantiation: This requirement is virtually impossible to enforce. It puts an obligation on the builder or electrical contractor which has never, to my knowledge, been enforced. At time of final inspection there may be no occupant; are follow-up inspections intended to enforce compliance? Such a requirement is more appropriate in manufacturer literature or instructions. How can it be ascertained if a portable smoothing iron is ever to be provided.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any new substantiation to delete the text.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 1
Ballot Not Returned: 1 Gill, C.
Explanation of Negative:
HIRSCH, B.: The proposer makes the point that this is impossible to enforce. The EEI/ELEP Companies agrees with this comment. The EEI also believes this is an appliance requirement and as such does not belong in the Code. It is the Edison Electric Institute's position that the requirements for end-use electrical devices that are **not** installed as part of the permanent premises wiring system are best covered by appropriate product standards. It is not the National Electrical Code's intent or scope to set requirements for end-use electrical devices that would typically be purchased by the after market consumer.
The Edison Electric Institute supports the entire electrical safety system that integrates product standards, installation standards, product testing and evaluation, electrical inspection, manufacturer's products, qualified electrical installation and maintenance, electric supply system characteristics, and the owner's use and operation. Covering product standards in the National Electrical Code could negate the responsibility of the appropriate product standard and adversely impact the entire process.
The integrity of the electrical safety system is anchored in the systematic integration of the National Electrical Code, installation inspection, product safety standards and product testing. If non-premises end-use product safety issues are usurped by the National Electrical Code, the product safety standard process will be weakened resulting in the entire process being weakened. In addition, since non-premises end-use products are not normally in place during the inspection process, enforcement of such a requirement under the NEC would be impossible.

17-15 Log #463 NEC-P17 **Final Action: Accept in Principle**
(422.52 (New))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 17-28
Recommendation: Accept proposal revised:
Electric drinking fountains shall be provided with ground-fault circuit-interrupter protection.
Substantiation: The submitter has proposed a good safety requirement.
Panel Meeting Action: Accept in Principle
Add new 422.52 to read as follows:
422.52 Electric Drinking Fountains. Electric drinking fountains shall be protected with ground-fault circuit-interrupter protection.
Panel Statement: The panel accepts the submitter's recommendation but has added a title and used the word "protected" rather than "provided" for clarity. It has been brought to the attention of the panel that there have been documented fatalities that have been attributed to this kind of installation.
This requirement is not intended to apply to bottled water coolers.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gill, C.
Comment on Affirmative:
BLEWITT, T.: A single incident was described to the panel though two were reported to have occurred. The described incident involved a water fountain where the factory-supplied grounding pin of the attachment plug cap was removed.

17-16 Log #1029 NEC-P17 **Final Action: Accept**
(422.52 (New))

Submitter: Larry Johnson, National Presto Industries Inc.
Comment on Proposal No: 17-29
Recommendation: The code panel should reject Proposal 17-29.
Substantiation: UL has had, for the past 2 years, a task group (I am a member of the group) dedicated to investigating power supply cord issues and will be unveiling its second report in a few weeks. This report will make recommendations for changes to address the root cause of the issue, not add a component onto the product. This is a better way to address the issue and a better way to enforce the changes.
Panel Meeting Action: Accept
Panel Statement: Also refer to panel action and statement on Comment 17-17.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 1
Ballot Not Returned: 1 Gill, C.
Explanation of Negative:

HIRSCH, B.: See my Comment under Comment 17-9.

17-17 Log #1051 NEC-P17 **Final Action: Accept**
(422.52 (New))

Submitter: Richard J. Cripps, Association of Home Appliance Manufacturers
Comment on Proposal No: 17-29
Recommendation: Reject proposal.
Substantiation: I am taking this opportunity to enlarge on an issue which I raised in Item 4 of my Explanation of Negative on the Panel Vote.
I draw attention to a Power Point Presentation entitled "Fires Starting With Electrical Distribution Equipment" prepared for the NFPA by Dr. John Hall, Jr., in May, 2005. Slide 14 is entitled "U.S. Cord or Plug Structure Fires, 1980 to 2002." It depicts an incident rate declining at a fairly uniform rate from 15,000 per year in 1980 to 4,300 in 2002.
This substantial and sustained trend, I suggest, is the long term result of improvements to power cord specification progressively adopted by manufacturers for appliances generally prior to and during the period reviewed. The decline which has been maintained reflects the aging, taking out of

service and replacement of appliances manufactured prior to each successive specification enhancement; that is, the greater the proportion of appliances to post-enhancement specification in the overall population, the lower will be the number of incidents.

This trend will continue, particularly as further improvements to power cords for fans are being investigated by UL as the Panel has been informed. The imposition of additional protective equipment at this time is, therefore, not justified. The final rejection of this proposal as required by the written ballot at the ROP stage should be upheld.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept

Panel Statement: Currently, UL

is in the process of revising the product safety standard (UL 507, Electric Fans) to upgrade the power supply cords in lieu of adding protective devices. The revisions are expected to be adopted in 2007.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 12 Negative: 1

Ballot Not Returned: 1 Gill, C.

Explanation of Negative:

ROCK, B.: NEMA affirms its support for AFCI and LCDI technology to prevent cord fires. The significant amount of cord fires attributed to portable electric fans, combined with high probability of these products being operated and unattended, further attests to the need for these technologies to reduce cord fires.

The comment rationale relies heavily on a recent NFPA study that utilizes a new reporting system over the previous reports and is suspect as to whether the reduction of fires is a result of product improvements or flaws by the change in the reporting system. We base this on the statements made by the author of this study, Dr. John Hall, as cited below:

- Estimates of fire incidents and nonfatal injuries after 1998 are not yet reliable.
- Rapid, deep declines that seem to relate to unresolved analysis problems rather than reality.
- We're still working on this.
- Problems do not affect deaths or loss as much.

These key issues were omitted from the comment's substantiation by extracting only a page from the entire report. Of particular note, the number of reported deaths is not declining as rapid as the reported fire data.

Fires are resulting from damaged cords and can be prevented by incorporating the safety devices recommended in Comment 17-46 (Log #2234) by a proven technology as evaluated by UL for this very purpose.

Comment on Affirmative:

BLEWITT, T.: Revisions have been submitted for comment to the Standards Technical Panel (STP507) responsible for the product safety standard (UL 507, Electric Fans). Comments from the STP are due by January 19, 2007 after which the proposed revisions will be balloted for adoption.

HIRSCH, B.: See my Comment under Comment 17-9.

17-19 Log #1103 NEC-P17 **Final Action: Accept**
(422.52 (New))

Submitter: Wayne Myrick, Mahwah, NJ

Comment on Proposal No: 17-29

Recommendation: Support the code making panels recommendation to Reject the original Proposal.

Substantiation: The NEC is not the proper place for portable product requirements. While this may be within the jurisdiction of the NEC and there is precedent for doing so, it is better to include end product requirements in the applicable product safety standards. End product requirements in the NEC are generally unenforceable by AHJs. The statistics cited by the proposer may not reflect safety improvements required by current editions of the product safety standards. Addition of an AFCI or LCDI will reduce the overall reliability of the product and may lead to consumers cutting the LCDI or AFCI off of the cord or making unsafe cord modifications or repairs. A UL task group has been looking into cord failures and may come up with better alternatives to deal with the root cause rather than electronic bandaids that attempt to detect and respond to particular failures.

Panel Meeting Action: Accept

17-23 Log #1172 NEC-P17 **Final Action: Accept**
(422.52 (New))

Submitter: Larry Albert, Black & Decker

Comment on Proposal No: 17-29

Recommendation: The Code Panel should reject Proposal 17-29.

Substantiation: The proposer covers the safety of a class of end products by addressing the inclusion of a single device. Product safety is best addressed by the development or amendment of a product safety standard. ANSI standards and ANSI standards making bodies already exist for these appliances. Despite the code Panel's previous activities with respect to air conditioners, this is an inappropriate body for appliance safety. The code Panel is unlikely to adequately cover the overall safety of the product by stipulating only one component. The proposers should submit their proposal to the appropriate end product STP.

Panel Meeting Action: Accept

Panel Statement: Also refer to the panel action and statement on Comment 17-17.

The panel does not agree with the submitter's substantiation.

17-28 Log #1366 NEC-P17 **Final Action: Accept**
(422.52 (New))

Submitter: Wayne E. Morris, AHAM

Comment on Proposal No: 17-29

Recommendation: The Code Panel should Reject the original Proposal 17-29.

Substantiation: The CMP 17 should reject the original proposal 17-29 for the following reasons:

1. The maker of the Code Proposal 17-29 cites inaccurate statistics regarding incidents involving fire incidents and power cord incidents involving electric fans. AHAM hired one of the preeminent statistics firms in the US to review the statistics. First, their finding was that there are less than 20 percent of the incidents per year alleged by the proposal maker. In addition, far fewer incidents even might be involved with power cords. And, many of these will be addressed by most recent changes to the UL standard. The improper use of statistics by the code proposal maker should not be used to address this issue.

2. The use of AFCIs and/or LCDIs on Room Air Conditioners since mid-2005 have been very problematic, and there is no indication that they have reduced fires. The addition of AFCI/LCDIs to power cords of room air conditioners have resulted in numerous nuisance tripping incidents. This has caused owners to cut off the devices, rewire attachment plugs and potentially diminish the safety and operation of the products.

3. Efforts are underway with the US Safety Standards for Portable Electric Fans to improve the safety of not only the power cord but other elements of the fan as well. The Standards Technical Panel (the committee responsible for the standards) has endorsed a number of standards changes to advance the safety of the products. These will include changes to the power cord to address some of

the issues that have been raised by the Code Making Panel. The direction of the STP is to address the actual root causes of the problem, not add an unproven and inadequate component. The UL STP is presenting a detailed report within a few weeks to request comment on proposals to address this situation. This will result in changes to address this issue in a much more rapid and thorough manner than the NEC proposal.

4. Testing with LCDIs and AFCIs have shown that the two devices are not equivalent and do not provide equal electrical safety protection. They should have never been included in a proposal as implying they provide similar electrical protection. Power cord AFCIs have been shown to have little or no effect on series arcs. There are even questions whether they will prevent problems in parallel areas. LCDI's have no effects on arcs inside the product. Neither power cord AFCIs nor LCDIs have any effect on arcing in receptacles or extension cords.

5. The National Electrical Code panel responsible for circuit breakers has advanced a proposal in the 2008 NEC to require AFCI breakers on all household circuits. This will protect all the house circuits on new construction from the panel box through the receptacle. As has been shown most of the home electrical fires are not due to portable electric fans but rather to home wiring, receptacles or even extension cords. AFCI breakers on all household circuits is a much more effective way of reducing home fires.

6. The UL STP has made several changes to improve safety of electric fans by increasing requirements for oscillating fan cords. This will improve safety and address one of the main sources of issues presented in CPSC incident reports.

7. The UL Working Group, representing many stakeholders including a manufacturer of cord mounted AFCIs and LCDIs has suggested an alternate course of action. This course of action should be given preference and allowed to further the safety of these products through the changes to the UL standards.

Panel Meeting Action: Accept

Panel Statement: The panel accepts that documentation does exist of issues relating to power supply cords with portable electric fans. The panel observes that item 5 of the submitter's substantiation does not address existing dwellings. Refer to panel action and statement on Comment 17-17.

17-30 Log #1369 NEC-P17 **Final Action: Accept**
(422.52 (New))

Submitter: Lawrence Wethje, Association of Home Appliance Manufacturers
Comment on Proposal No: 17-29
Recommendation: The Code Panel should Reject Proposal 17-29.
Substantiation: The proposal is based on anecdotal incident data from newspaper clippings, which is not dependable. The proposed AFCI/LCDI devices have not been proven to be reliable in this application. There have been many problems associated with the use of these devices in a similar application with room air conditioners. The addition of these devices will result in increased sources of failure of the appliances in the field and lead to consumer tampering which will create unsafe conditions. Furthermore, the proposal does not take into account improvements that are being made to the UL safety standard for these products. UL's Task Group on power cord safety is strengthening the requirements for power cords, which will be more effective in improving safety than adding AFCIs or LCDIs.

Panel Meeting Action: Accept

Panel Statement: Also refer to the panel action and statement on Comment 17-17.

The panel does not agree with the submitter's substantiation.

17-32 Log #1487 NEC-P17 **Final Action: Accept**
(422.52 (New))

Submitter: Cyral M. Walsh, BSH Home Appliances Corp.
Comment on Proposal No: 17-29
Recommendation: The code Panel should reject Proposal 17-29.
Substantiation: 1. The requirements for end use electrical devices that are not installed as part of the permanent premises should be covered by the appropriate product standard.

a. This is especially true where the appliances are consumer "carry home" units, most of which are produced off shore.

b. Built in, cord connected fans, such as range hoods, can have characteristics that are incompatible with existing LCDI/AFCI devices.

2. There are serious technical issues with the overall reliability of LCDI/AFCI devices and their ability to respond dependably to the fault conditions against which they are intended to protect.

3. LCDI/AFCI devices would have a reliability less than that of a simple attachment plug. A failure of the device, or nuisance tripping, would lead to either return of a properly operating unit or consumer modification of the cord (e.g. cutting off the LCDI/AFCI device and replacing it with an after market plug which may or may not be properly attached or grounded.

4. The phrase "...protection equal to or exceeding that of an LCDI or AFCI" is ambiguous and open to misinterpretation. LCDI and AFCI devices operate differently and are not comparable to one another, let alone to some undeveloped technology. It would be impossible for manufacturers, code authorities, authorities having jurisdiction and certification organizations to consistently interpret that requirement.

17-33 Log #1719 NEC-P17 **Final Action: Accept**
(422.52 (New))

Submitter: J.B. Hoyt, Whirlpool Corporation
Comment on Proposal No: 17-29
Recommendation: The Code Panel should Reject Proposal 17-29.
Substantiation: ● As a major manufacturer of Room Air Conditioners, Whirlpool Corporation has firsthand experience with the real world application of AFCIs and LCDIs. There have been many problems identified in applying these devices to room air conditioners.

● The dependability/reliability of the AFCIs and LCDIs have not been conclusively proven.

● Consumers/users are cutting the devices off cords or returning the products due to nuisance tripping problems.

● Nuisance tripping has also led to increased consumer complaints and service calls.

● The reliability of an AFCI or LCDI is less than a traditional plug and could lead to premature failures and to consumers making ill-advised or inappropriate repairs.

● According to NFPA, receptacle, extension cord, power outlet strip, and house wiring electrical fires far outweigh any of the statistics from proven power supply cord issues. This would be a more impactful area of focus, rather than on the products which may be plugged into such devices.

● Underwriters Laboratories has had a Task Group dedicated to investigating power supply cord issues and will be producing its second report shortly. This report is expected to make recommendations for changes to address the root cause of the issue, not add a component onto the product. This is a better way to address the issue and a better way to enforce the changes.

● The NEC often drives requirements that are included in product safety standards of UL or CSA, but without the benefit of manufacturing experience from a broad range of interested parties. Additionally, the enforcement of the NEC may not be as complete as it would be by following the UL or CSA standards making and certification process. The use of this process should be preferred and allowed to progress as these processes have the ability to enforce safety requirements directly on the products for the entire USA market in a manner that best achieves the objective.

● Limited testing with AFCI's has shown that in many cases, the device will not open the circuit when encountering an arcing condition in the product. In addition, most AFCI's will not open circuit when encountering a series arc failure. LCDI's must have a fault only in the power cord. They do not work on arcs in the product.

● Neither, the AFCI nor the LCDI can detect problems upstream in an extension cord or in the receptacle, which, according to NFPA data is a much bigger problem that, therefore, would not be addressed.

● AFCI's and LCDI's are not the same and should not be looked upon as a solution to the issues that have been raised. There are many other ways to improve the safety other than adding an unproven component to the product.

● AFCI and LCDI devices are electronic devices with a complexity that exhibits the potential of typical electronics failures such as arc track and component overheating or burnout etc. In comparison, these failure modes do not exist with power plugs. Bad material choices and manufacturing issues have been observed. The question whether the increased risk and number of failures outweighs the alleged number of failures has not been answered

satisfactorily. Meaning, are these devices really a safety improvement, especially considering reports of cut of devices, etc., in order to avoid nuisance tripping.

17-45 Log #2190 NEC-P17 **Final Action: Reject**
(422.52 (New))

Submitter: Gary Beideman, Lasko Products, Inc.
Comment on Proposal No: 17-29
Recommendation: Revise text to read as follows:
422.52 Cord-and-Plug-Connected Electric Fans. Single-Phase cord-and plug connected electric fans shall be provided with a listed factory-installed Over Current Protective Device, LCDI or AFCI, ~~or other listed protection equal to or exceeding that of an LCDI or AFCI.~~ The protection shall be an integral part of the attachment plug or be located in the power supply cord within 152 mm (6 in.) ~~300 mm (12 in.)~~ of the attachment plug.
Substantiation: AFCIs and LCDIs are both current limiting devices. They function differently and have limitations as to the type of failures they react to. The goal I see, no matter how robust the cord, is to limit the current, i.e., available energy when a failure occurs. The comment line (or other listed protection equal to or exceeding that of an LCDI or AFCI) is misleading and will be open to interpretations where no other device can be considered because AFCIs and LCDIs operate on different principles. Alternate devices can meet the current (energy) limiting goal and in many ways exceed the performance of AFCIs and LCDIs. The addition of the wording "LISTED" and "OVERCURRENT PROTECTION DEVICE" will allow for new and presently existing technology to be considered and not limit choices to only two devices. I have submitted a study performed by ARAI (Accident Reconstruction Analysis) which details the benefit of existing fuse technology by limiting available energy to ignite surrounding combustibles.) (Earl W. Roberts is a former presenter to the NEC Code Panel 17 Working Group. In his published book, "Under Currents and Over Currents". On pages 6 and 7 of this book, he details the simplicity, long reliable history and indigenous ability of a fuse to quickly clear and current-limit a fault condition.)
The (300 mm, 12 in.) length of cord stated from the plug to the device is not constant with existing UL codes for other devices. The 12 in. length will expose excessive cord that is unprotected. The amount of unprotected cord should be kept to a minimum. Changing the length to (152 mm, 6 in.) is consistent with experience gained in other UL standards, i.e., the standard for Christmas Tree lighting (UL Standard 588, paragraph 7.3).
Lasko Products Inc. has 13,000,000 fan products in the field which utilized a Listed Design, Molded Fuse into the plug and have received no reports of cord set fires associated with these products.
Note: Supporting material is available for review at NFPA Headquarters.

Comment on Proposal No: 17-13
Recommendation: Revise text to read as follows:
422.53 Room Air Heaters. Single-Phase cord-and plug connected room air heaters shall be provided with a listed factory-installed Over Current Protective Device, LCDI or AFCI, ~~or other listed protection equal to or exceeding that of an LCDI or AFCI.~~ The protection shall be an integral part of the attachment plug or be located in the power supply cord within 152 mm (6 in.) ~~300 mm (12 in.)~~ of the attachment plug.
Substantiation: AFCIs and LCDIs are both current limiting devices. They function differently and have limitations as to the type of failures they react to. The goal I see, no matter how robust the cord, is to limit the current, i.e., available energy when a failure occurs. The comment line (or other listed protection equal to or exceeding that of an LCDI or AFCI) is misleading and will be open to interpretations where no other device can be considered because AFCIs and LCDIs operate on different principles. Alternate devices can meet the current (energy) limiting goal and in many ways exceed the performance of AFCIs and LCDIs. The addition of the wording "LISTED" and "OVERCURRENT PROTECTION DEVICE" will allow for new and presently existing technology to be considered and not limit choices to only two devices. (Earl W. Roberts is a former presenter to the NEC Code Panel 17 Working Group. In his published book, "Under Currents and Over Currents", on pages 6 and 7 of this book, he details the simplicity, long reliable history and indigenous ability of a fuse to quickly clear and current-limit a fault condition.)
The (300 mm, 12 in.) length of cord stated from the plug to the device is not constant with existing UL codes for other devices. The 12 in. length will expose excessive cord that is unprotected. The amount of unprotected cord should be kept to a minimum. Changing the length to (152 mm, 6 in.) is consistent with experience gained in other UL standards, i.e., the standard for Christmas Tree lighting (UL Standard 588, paragraph 7.3).
Panel Meeting Action: Reject
Panel Statement: Proposal 17-13 has been rejected by the action on Comment 17-9, and this comment is therefore not applicable.
The panel does not agree with the submitter's substantiation.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gill, C.
Comment on Affirmative:
HIRSCH, B.: See my Comment under Comment 17-9.

ARTICLE 424 — FIXED ELECTRIC S PACE-HEATING EQUIPMENT

17-49 Log #384 NEC-P17 **Final Action: Accept**
(424.19)

Submitter: Bryan P. Holland, City of North Port
Comment on Proposal No: 17-31
Recommendation: I continue to support this proposal and the revision made by the panel.
Substantiation: The disconnecting means rating should match that of 424.3(B) and be calculated at 125% as revised by the panel.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Gill, C.

17-50 Log #464 NEC-P17 **Final Action: Accept in Principle**
(424.19)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 17-32
Recommendation: Accept proposal revised:
An approved means shall be provided ~~to~~ that simultaneously disconnects all ungrounded conductors of the circuit for the heater, motor controller(s), and supplementary overcurrent device(s) from all fixed electric space heating equipment ~~from all ungrounded conductors~~.
Substantiation: Since the panel declined to limit disconnecting means to switches and circuit breakers, they should be specifically required to be approved. Lugs, terminals, and wire connectors are means of disconnection which may not be suitable. Ungrounded conductors should be specifically required to be simultaneously disconnected, as required in many code sections.
Panel Meeting Action: Accept in Principle
Revise the first sentence of 424.19 to read as follows:
Means shall be provided to simultaneously disconnect the heater, motor controller(s), and supplementary overcurrent protective device(s) of all fixed electric space-heating equipment from all ungrounded conductors.
Panel Statement: The revised language more clearly presents the requirement and meets the intent of the submitter.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Gill, C.

ARTICLE 426 — FIXED OUTDOOR ELECTRIC DEICING AND SNOW-MELTING EQUIPMENT

17-51 Log #764 NEC-P17 **Final Action: Reject**
(426.32 Exception)

Submitter: Neal Fenster, Thermo Systems Technology, Inc.
Comment on Proposal No: 17-46
Recommendation: We propose to add the revised exception to read:
Where conditions of maintenance and supervision ensure that only qualified personnel will service and maintain the impedance heating elements, and the maximum voltage of the impedance heating elements shall not exceed 80 volts where protected by a ground fault protector set to trip at a value not greater than 30 ma above the inherent leakage of the impedance heating elements, and access to the impedance heating elements is restricted by either of the following conditions.
- The impedance heated system is located behind locked enclosures.
- Access to the impedance heating system is restricted by fencing or elevation.

Substantiation: The revised text is proposed to address the Panel's concern by specifying the maximum voltage rise and ma leakage current based upon system design. It, furthermore, spells out the personnel and physical access restrictions.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided substantiation for using GFPE versus GFCI protection for personnel.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Gill, C.

17-52 Log #504 NEC-P17 **Final Action: Accept in Principle**
(426.50(A))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 17-47
Recommendation: Accept as revised:
All fixed outdoor deicing and snow melting equipment shall be provided with ~~a~~ an approved means for simultaneous disconnection ~~from~~ of all ungrounded supply conductors. Where readily accessible to the user of the equipment the branch circuit switch or circuit breaker shall be permitted to serve as the disconnecting means. ~~Switches or circuit breakers used as the~~ The disconnecting means shall be ~~of the indicating type~~ indicate a closed or open position and be provided with a positive lockout provision in the "off" position.
Substantiation: Since the proposal to provide a switch or circuit breaker was rejected, it should be specifically required to be approved, since wire connectors, lugs, links, relays, etc., are also disconnecting means. Disconnection should be simultaneous for ungrounded conductors of the circuit. The disconnecting means of 427.55(A) and 427.56(A) require positive lockout provisions and should be required for these disconnecting means which may be remote from the equipment. The proposal specifies what "indicating type" is. The last sentence should apply to all disconnecting means not just switches and circuit breakers.
Panel Meeting Action: Accept in Principle
Revise 426.50(A) to read as follows:
(A) Disconnection. All fixed outdoor deicing and snow-melting equipment shall be provided with a means for simultaneous disconnection from all ungrounded conductors. Where readily accessible to the user of the equipment, the branch-circuit switch or circuit breaker shall be permitted to serve as the disconnecting means. The disconnecting means shall be of the indicating type and be provided with a positive lockout in the "off" position.
Panel Statement: The revised text more clearly presents the requirements and meets the intent of the submitter.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Gill, C.

17-53 Log #210 NEC-P17 **Final Action: Accept**
(426.52)

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 17-49
Recommendation: It is the action of the Technical Correlating Committee that the panel reconsider the proposal and clarify that branch circuit sizing does not provide overcurrent protection. This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the recommendation to reconsider. See the panel action and statement on Comment 17-54.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Gill, C.

17-54 Log #978 NEC-P17 **Final Action: Accept in Principle**
(426.52)

Submitter: Mark C. Ode, Underwriters Laboratories Inc.
Comment on Proposal No: 17-49
Recommendation: Revise as follows:
426.52 Overcurrent Protection.
Fixed outdoor electric de-icing and snow melting equipment shall be connected to a ~~protected against overcurrent by~~ a branch circuit rated not less than 125 percent of the load and protected by an overcurrent protective device rated at 125% of the load.
Substantiation: It is not the branch circuit that is providing the overcurrent protection as would have been the case in the rewrite of the text by the proposal. It is the intent to size the branch circuit and the branch circuit overcurrent protective device at 125%.
Panel Meeting Action: Accept in Principle
Delete 426.52.
Panel Statement: The elimination of 426.52 meets the intent of the submitter because the sizing of the overcurrent protection devices is to be accomplished in accordance with other articles that address sizing for continuous loads. Section 426.4 was revised in 2005 to specify that all fixed outdoor electric deicing and snow melting equipment are continuous loads.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Gill, C.

ARTICLE 427 — FIXED ELECTRIC HEATING EQUIPMENT

17-55 Log #713 NEC-P17 **Final Action: Reject**
(427.5)

Submitter: Robert Kelleher, Paramount Electrical Services
Comment on Proposal No: 17-50
Recommendation: The action should be to Reject.
Substantiation: The addition of these NECA Fine Print Notes, serves no benefit to the user of the National Electrical Code. These are not standards, they are a compilation of generic information and do not serve as information to the user. These must be purchased through NECA. This FPN as written is nothing more than free advertisement for generic, readily available information which must be purchased by the code user. Code Making Panel 17 should Reject this proposal to coordinate with the other technical committees in the NEC project and with 90.1(C). A total of seventeen new Fine Print Notes were proposed to reference NECA standards. Sixteen were unanimously rejected. Inclusion of this Fine Print Note is in direct conflict with 90.1(C). In the action to reject proposal 8-3, one technical committee member promotes NECA standards as "….a tool to assist untrained electricians to make safer and better installations." The TCC should intervene, uphold the provisions of 90.1(C) and prohibit these types of Fine Print Notes. CMP 17 should reject this FPN. Failure to do so will mean adding Fine Print Notes for IEC, EEI, IBEW, IAEI, ACC, NETA, NEI, SEIA, AISI, API, ASHE, AHAM, ICEAI, NYBFU and dozens of others when they decide to develop income through generic standards development. If this type of Fine Print Note is placed anywhere in the NEC an Annex should be included with coupons for the code user. If the NEC is to be used for advertisement purposes, coupons should be included.
Panel Meeting Action: Reject
Panel Statement: The ANSI standards referenced in the FPN of the panel action on Proposal 17-50 are not requirements but provide insight for users of the Code.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 1
Ballot Not Returned: 1 Gill, C.
Explanation of Negative:
ROCK, B.: NEMA supports this comment to oppose the portion of the panel action and panel statement to revise 427.1 FPN. NEMA continues its position that this reference should not be included in the NEC since the NEC is not a design, installation or maintenance manual. NEC 90.1(C) specifically states: "This code is not intended as a design specification or an instruction manual for untrained persons."

17-56 Log #880 NEC-P17 **Final Action: Reject**
(427.5)

Submitter: John P. Masarick, Independent Electrical Contractors Inc.
Comment on Proposal No: 17-50
Recommendation: The panel is encouraged to continue to Reject Proposal 17-50.
Substantiation: The reasons to continue to Reject the Proposal are as follows:
1. The trend by the CMPs over the last several code cycles has been to limit the use of FPNs.
2. There is also a correlation issue. There is a conflict between those panels that accepted the proposal and those that rejected the proposal.
3. These standards are also covered by a Fine Print Note in 110.12.
4. The FPN should not be accepted because numerous standards and installation manuals exist and to only mention one does not adequately inform the public about accepted industry practices. The NEC is not intended to be an instruction manual for untrained persons. If the FPNs are allowed to reference these standards, then they should list all applicable standards.
5. Since the referenced installation standards are intentionally general to cover different models of equipment, approval of the FPN may lead many to believe these standards can be used instead of listed or labeled manufacturer's instructions which would be in violation of 110.3(B).
6. If the CMP would like to include the reference, it should be placed in the Annex with the other references.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 17-55.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 1
Ballot Not Returned: 1 Gill, C.
Explanation of Negative:
ROCK, B.: NEMA supports this comment to oppose the portion of the panel action and panel statement to revise 427.1 FPN. NEMA continues its position that this reference should not be included in the NEC since the NEC is not a design, installation or maintenance manual. NEC 90.1(C) specifically states: "This code is not intended as a design specification or an instruction manual for untrained persons."

17-57 Log #765 NEC-P17 **Final Action: Reject**
(427.27)

Submitter: Neal Fenster, Thermo Systems Technology, Inc.
Comment on Proposal No: 17-55
Recommendation: We propose to add the revised exception to read:
Where conditions of maintenance and supervision ensure that only qualified personnel will service and maintain the impedance heating elements, and the maximum voltage of the impedance heating elements shall not exceed 80 volts where protected by a ground fault protector set to trip at a value not greater than 30 ma above the inherent leakage of the impedance heating elements, and access to the impedance heating elements is restricted by either of the following conditions.
● The impedance heated system is located behind locked enclosures.
● Access to the impedance heating system is restricted by fencing or elevation.
Substantiation: The revised text is proposed to address the Panel's concern by specifying the maximum voltage rise and ma leakage current based upon system design. It, furthermore, spells out the personnel and physical access restrictions.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided substantiation for using GFPE versus GFCI protection for personnel.

Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Gill, C.

17-58 Log #420 NEC-P17 **Final Action: Accept in Principle**
(427.55)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 17-57
Recommendation: Accept revised:
Means shall be provided to simultaneously disconnect all ungrounded conductors of the branch circuit(s) supplying fixed electric pipeline heating equipment. ~~from all ungrounded conductors.~~ The branch circuit switch or circuit breaker shall be permitted as the disconnecting means. The disconnecting means shall ~~be of the indicating type~~ indicate the open (off) and closed (on) positions and be provided with a positive lockout means for locking in the open (off) position, that is identified for the purpose.
Substantiation: The disconnecting means should be specified to simultaneously disconnect all ungrounded conductors and specify the conductors as a branch circuit since a feeder or service disconnect complies with the literal wording of the first sentence. Indication of open (off) and closed (on) is more specific than "indicating type". The lockout provisions should be identified for the purpose to preclude makeshift means.
Panel Meeting Action: Accept in Principle
Revise 427.55(A) to read as follows:
(A) Switch or Circuit Breaker. Means shall be provided to simutaneously disconnect all fixed electric pipeline or vessel heating equipment from all ungrounded conductors. The branch-circuit switch or circuit breaker, where readily accessible to the user of the equipment, shall be permitted to serve as the disconnecting means. The disconnecting means shall be of the indicating type and shall be provided with a positive lockout in the "off" position.
Panel Statement: The revised text more clearly presents the requirement and meets the intent of the submitter.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Gill, C.

ARTICLE 430 — MOTORS, MOTOR CIRCUITS, AND CONTROLLERS

11-3 Log #610 NEC-P11 **Final Action: Accept in Principle**
(430.2)

Submitter: Paul Guidry, Fluor Enterprises, Inc.
Comment on Proposal No: 11-17
Recommendation: This is a companion proposal for the addition of valve actuator motors. Companion proposal section numbers are: 430.6(D), 430.22(F), 430.24(B), 430.52(E) and 430.102(A).
Revise text to read as follows:
430.2 Valve Actuator Motor Assemblies. A manufactured assembly consisting of a valve, valve actuator motor, and other components such as controllers, torque switches, limit switches, and overload protection. Valve actuator motor assemblies are also commonly referred to as "motor-operated valves" or "MOVs".
FPN: Valve actuator motors have a unique design that can result in significantly different operating characteristics than NEMA Design B motors. Continuous duty motors, such as NEMA Design B motors, are rated in horsepower, which implies a constant torque. Valve actuator motors are neither continuous duty nor constant torque at rated speed. They can be characterized as short duty time, high starting torque motors.
FPN material is from IEEE Std. 1290-1996. Copyright © 1996 IEEE. All rights reserved.
Substantiation: This comment is based on proposal 11-17. It was my understanding in the proposal stage that the panel felt like Valve Actuator Motors (VAMs) should be covered by Article 430 (see panel comment on proposal 11-81). However, instead of adding a new Part XI, it was suggested that the current structure of the Code be modified for any rules regarding VAMs. Adding this definition (directly from IEEE Std. 1290) to 430.2 should satisfy the panel's concern that the requirements for VAMs won't be confused with valve modulating motors.
Users in the industrial/petrochemical have tried for years to apply Article 430 to valve actuator motors without success. These motors do not fit into any of the present rules that are in Article 430. I believe they need their own special rules in some areas.
Panel Meeting Action: Accept in Principle
Panel Statement: The submitter's concerns are addressed by the action on Comment 11-4. See action and statement on Comment 11-4.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-4 Log #814 NEC-P11 **Final Action: Accept in Principle in Part**
(430.2)

Submitter: Paul Guidry, Fluor Enterprises, Inc.
Comment on Proposal No: 11-17
Recommendation: This is not a duplicate comment. A previous comment has been made on this proposal (Log #610) It was brought to my attention during the comment stage that copyrighted material may be an issue with publishing it in the NEC should this comment be accepted.
This comment rewrites the text in the FPN found in the previous comment (Log #610) so the IEEE copyrights shouldn't be an issue.
This is a companion proposal for the addition of valve actuator motors. Companion proposal section numbers are: 430.6(D), 430.22(F), 430.24(B), 430.52(E) and 430.102(A).
Add text to read as follows:
430.2 Valve Actuator Motor Assemblies (VAMs). A manufactured assembly consisting of a valve, valve actuator motor, and other components such as controllers, torque switches, limit switches, and overload protection. Valve actuator motor assemblies are also commonly referred to as "motor-operated valves" or "MOVs".
FPN: Valve actuator motors have considerable differences in operating characteristics as compared to NEMA Design B motors due to the VAMs unique design. NEMA Design B motors are continuous duty and rated in horsepower, which implies a constant torque. Valve actuator motors are usually characterized as short duty time, high starting torque motors and are neither continuous duty or constant torque motors.
Substantiation: Users in the industrial/petrochemical have tried for years to apply Article 430 to valve actuator motors without success. These motors do not fit into any of the present rules that are in Article 430. I believe they need their own special rules in some areas. This comment along with the others identified as companion proposals address this need.
This comment is based on proposal 11-17. It was my understanding in the proposal stage that the panel felt like Valve Actuator Motors (VAMs) should be covered by Article 430 (see panel comment on proposal 11-81). However, instead of adding a new Part XI, it was suggested that the current structure of the Code be modified for any rules regarding VAMs. Adding this definition to 430.2 should satisfy the panel's concern that the requirements for VAMs won't be confused with valve modulating motors.
Panel Meeting Action: Accept in Principle in Part
Add a new definiton to 430.2 to read as follows:
"430.2 Valve Actuator Motor (VAM) Assemblies. A manufactured assembly used to operate a valve consisting of an actuator motor, and other components such as controllers, torque switches, limit switches, and overload protection.
FPN: VAMs typically have short-time duty and high torque characteristics.
Sequence in alpabetical order with existing definitions."
Panel Statement: The panel rejects the part of the definition pertaining to the valve and the reference to motor-operated valves (MOVs). The panel also rejects the part of the submitter's FPN that pertains to NEMA Design B motors.
The panel edits the definiton and FPN for clarity.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

1-108 Log #69 NEC-P01 **Final Action: Hold**
(430.2)

TCC Action: The Technical Correlating Committee understands that Proposal 11-16a from Code-making Panel 11, Comment 1-109 from Code-Making Panel 3, Comment 1-110 from Code-Making Panel 14, Comment 1-111 from Code-Making Panel 6, Comment 1-112 from Code-Making Panel 2, and Comment 1-113 from Code-Making Panel 10 are reported as "Hold" for review during the 2011 NEC revision cycle.
Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 11-16a
Recommendation: The Technical Correlating Committee Rejects the panel action to add a new definition for "Engineering Supervision" to Article 430. The term is used throughout the NEC and if a definition is needed it should be under the purview of Code-Making Panel 1. The Technical Correlating Committee directs that this proposal be sent to Code-Making Panel 1 for consideration of action in Article 100 during the comment phase. This action will be considered by Code-Making Panel 1 as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the direction of the Technical Correlating Committee to consider the recommendation contained in Proposal 11-16a for inclusion in Article 100. The panel has considered this proposal and Comment 1-109 from Code-Making Panel 3, Comment 1-110 from Code-Making Panel 14, Comment 1-111 from Code-Making Panel 6, Comment 1-112 from Code-Making Panel 2, and Comment 1-113 from Code-Making Panel 10. The panel concludes that Proposal 11-16a and these Comments be reported as "Hold" for review in the 2011 NEC revision cycle as no consensus presently exists and the issue cannot be resolved in this Code cycle. It requests the Technical Correlating Committee to appoint a Task Group having representation from those panels where the term "Engineering Supervision" has application, to determine if a definition of the term appropriate for general application in Article 100 can be developed.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
ANTHONY, M.: The issue is complex and subtle and we are in agreement that the issue should be tabled. NEC code panels have difficulty defining utility, neutral, bedroom and no doubt a universal "engineering supervision" definition will be difficult as the comments suggest. If an Article 100 definition is possible, the definition should take into account the professional registration regulations for each state. For example, some states issue a general professional engineering license; other state grant licenses in established disciplines.

1-109 Log #289 NEC-P01 **Final Action: Hold**
(430.2)

TCC Action:The Technical Correlating Committee understands that Proposal 11-16a from Code-making Panel 11, Comment 1-109 from Code-Making Panel 3, Comment 1-110 from Code-Making Panel 14, Comment 1-111 from Code-Making Panel 6, Comment 1-112 from Code-Making Panel 2, and Comment 1-113 from Code-Making Panel 10 are reported as "Hold" for review during the 2011 NEC revision cycle.
Submitter: Code-Making Panel 3,
Comment on Proposal No: 11-16a
Recommendation: CMP-3 recommends adding the proposed definition of "Engineering Supervision" to Article 100.
Substantiation: There are approximately 28 references to engineering supervision in various locations throughout the NEC. Although none of these references occur within Articles under the jurisdiction of CMP-3, this definition, inserted into Article 100 and placed under the jurisdiction of CMP-1 should be adequately defined, and placing it within Article 100 would provide a convenient location for this general definition.
This comment has been balloted through CMP-3 with the following results:
13 Eligible to Vote
9 Affirmative
3 Negative
1 Not Returned (J. sleights)
Mr. L. Easter voted negatively stating: "This proposal should be Rejected. The phrase "engineering supervision" is found 58 times in various articles of the NEC. As such, a definition does not belong in Article 430, where it would apply to only Article 430. If it were to be included as a definition in the NEC, it would more appropriately be placed in Article 100. However, the development of a definition of "Engineering Supervision" in Article 100 must consider the context and use of this term in each of the 58 locations of this term in the NEC."
Mr. D. Pace voted negatively stating: "A definition of the term "Engineering Supervision" should not be added to Article 100. the term needs to be defined specifically for the intended need. One definition cannot accurately cover all of the uses that are currently in the NEC. Also, the definition, as written, does not provide criteria for determining qualifications "supervision" and specifying an "Electrical Engineer" is too restrictive and is not feasible or necessary in some cases."
Mr. M. Sanders voted negatively stating: "The basis for Proposal 11-16a and Proposals 11-34 and 11-45 which did not receive the necessary consensus, and, therefore have been rejected by the Technical Correlating Committee. The negative comments on proposals by Mr. Hamer and Mr. Wright should have been taken into account, along with the comment of the Code-Making Panel 3 Task Group in Item 5.
The proposed text considered for inclusion into Article 100 is specific to Article 430 applications, and the apparent text has been adapted from the present 240.86(A), which is specific to field selected and installed series component overcurrent protection assemblies and is restricted to existing, not new, installations. The Code-Making Panel 3 Task Group states there are 28 instances where variations on this proposed text is employed. In order for this definition to be considered for inclusion into Article 100, each of those instances should be reviewed for the proposed text applicability.
This proposed text should be held for further review by all the affected Code-Making Panels and report back to the 2011 NEC cycle. This is too important to handle within the limited time of a Comment period."
Panel Meeting Action: Hold
Panel Statement: See the panel statement on Comment 1-108.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
ANTHONY, M.: See my explanation of affirmative vote on Comment 1-108.

1-110 Log #301 NEC-P01 **Final Action: Hold**
(430.2)

TCC Action: The Technical Correlating Committee understands that Proposal 11-16a from Code-making Panel 11, Comment 1-109 from Code-Making Panel 3, Comment 1-110 from Code-Making Panel 14, Comment 1-111 from Code-Making Panel 6, Comment 1-112 from Code-Making Panel 2, and Comment 1-113 from Code-Making Panel 10 are reported as "Hold" for review during the 2011 NEC revision cycle.
Submitter: Code-Making Panel 14,
Comment on Proposal No: 11-16a
Recommendation: a) Not support Technical Correlating Committee action to include a general definition as the issue is not applicable to CMP-14 texts.
A) Delete the word "engineering" from sections 501.140 and 505.17.
B) CMP-14 does not support the inclusion of the proposed definition of "engineering supervision" in Article 100.
Substantiation: A) This action makes these sections consistent with terms used in some 13 other places within CMP-14 texts and ensures that any action taken by CMP-1 on Proposal 11-16a will not impact installations under the responsibility of CMP-14.
B) Adding the proposed definition of "engineering supervision" within Article 100 would be too restrictive. Some engineering functions within the responsibility of CMP-14 could be better accomplished by persons with chemical, mechanical, process engineering backgrounds. The responsibility to determine specific qualifications for specific functions required in various areas within the NEC should remain with the Code-Making Panel that includes those qualifications. A general term cannot adequately cover all applications.
This comment was balloted through CMP-14 with the following ballot results:
14 Eligible to Vote
13 Affirmative
1 Negative (J. Kuczka)
Mr. Kuczka voted negatively stating: "NEMA agrees with not including a definition of engineering supervision, but does not agree with sending a comment to CMP-1 to delete wording in articles outside their jurisdiction. Furthermore, the deletion of the word "engineering" in 501 and 505 would be considered new material."
Mr. D. Cook voted affirmatively stating: "While I agree the engineering judgment required for electrical installations in hazardous (classified) locations may, and in some cases should, be addressed by engineers with other than an electrical background, I believe a definition in Article 100 would be useful for the general requirements in the NEC, providing the proposed definition in Article 100 would require the Code-Making Panel's responsible for Chapters 5, 6, and 7 to review the use of the term and determine if those "special" occupancies, equipment, and conditions require the use of a different term. At this point in the 2008 NEC Cycle, that does not seem possible."
Mr. M. O'Meara voted affirmatively stating: "Adding a definition of "Engineering Supervision" clarifies the level of responsibility the phrase is intended to require and will be helpful throughout the code in determining the proper level of supervision necessary."
Panel Meeting Action: Hold
Panel Statement: See the panel statement on Comment 1-108.
Number Eligible to Vote: 12

ANTHONY, M.: See my explanation of affirmative vote on Comment 1-108.

1-111 Log #316 NEC-P01 **Final Action: Hold**
(430.2)

TCC Action: The Technical Correlating Committee understands that Proposal 11-16a from Code-making Panel 11, Comment 1-109 from Code-Making Panel 3, Comment 1-110 from Code-Making Panel 14, Comment 1-111 from Code-Making Panel 6, Comment 1-112 from Code-Making Panel 2, and Comment 1-113 from Code-Making Panel 10 are reported as "Hold" for review during the 2011 NEC revision cycle.
Submitter: Code-Making Panel 6,
Comment on Proposal No: 11-16a
Recommendation: This definition should not be incorporated in Article 100.

Substantiation: The application of specific formulas does not necessarily require the general expertise of an electrical engineer. For instance, a mathematical proof of conditions under application of 310.15(C) might be judged by the AHJ (who may be an electrical engineer doing plan checking) as acceptable although not done by an electrical engineer. Other engineers and other trained personnel may be fully qualified.

"Engineering supervision" alone provides a definition as clear as required.

1-112 Log #321 NEC-P01 **Final Action: Hold**
(430.2)

TCC Action: The Technical Correlating Committee understands that Proposal 11-16a from Code-making Panel 11, Comment 1-109 from Code-Making Panel 3, Comment 1-110 from Code-Making Panel 14, Comment 1-111 from Code-Making Panel 6, Comment 1-112 from Code-Making Panel 2, and Comment 1-113 from Code-Making Panel 10 are reported as "Hold" for review during the 2011 NEC revision cycle.
Submitter: Code-Making Panel 2
Comment on Proposal No: 11-16a
Recommendation: Reject the proposal.
Substantiation: The Task Group recommends to reject this proposal. The Task Group agrees that this definition is under the scope of CMP-1. The extent that "engineering supervision" is used throughout the code may have many different implications. The term given in the proposal of "electrical engineer" may conflict with other terms in the code using licensed professional engineers under engineering supervision. It appears that anytime the term "engineering supervision" or "maintenance and supervision" are used, they are always used in the connotation of relaxing the requirements of the code. The CMP-2 Task Group recommends that this be covered by a multi-panel Task Group during the next code cycle.

This comment was balloted through CMP-2 with the following ballot results:

ANTHONY, M.: See my explanation of affirmative vote on Comment 1-108.

1-113 Log #349 NEC-P01 **Final Action: Hold**
(430.2)

TCC Action: The Technical Correlating Committee understands that Proposal 11-16a from Code-making Panel 11, Comment 1-109 from Code-Making Panel 3, Comment 1-110 from Code-Making Panel 14, Comment 1-111 from Code-Making Panel 6, Comment 1-112 from Code-Making Panel 2, and Comment 1-113 from Code-Making Panel 10 are reported as "Hold" for review in the 2011 NEC.
Submitter: Code-Making Panel 10,
Comment on Proposal No: 11-16a
Recommendation: Reject this proposal.
Substantiation: This comment was developed by a Task Group comprised of the following members of CMP-10: James Dollard, Chair; Charles Blizzard; Dennis Darling; Charles Eldridge; Carl Fredericks; Clive Kimblin; John Kovacik; Frank Ladonne; George Ockuly; Gerald Williams; Alan Manche and Vince Saporita.

The phrase "engineering supervision" is found 58 times in various articles of the NEC. As such, it does not belong in Article 430, where it would apply to only Article 430. If it were to be included as a definition in the NEC, it would more appropriately be placed in Article 100. However, the development of a definition of "Engineering Supervision" in Article 100 must consider the context and use of this term in each of the 58 locations of this term in the NEC.

This comment was balloted through CMP-10 with the following ballot results:

11-5 Log #1035 NEC-P11 **Final Action: Reject**
(430.6(A)(1) and (2))

Submitter: Charles M. Trout, Maron Electric Co. Inc.
Comment on Proposal No: 11-18
Recommendation: This proposal should be Accepted. I am not offering new sub
stantiation but rather I am disagreeing with the Panel Statement. The Panel offers no definitive or technical substantiation that a problem exists with wiring electric motors in accordance with their nameplate full load current. The requirements of 430.6(A) are in direct opposition to the purpose and intent of the Code as stated in 90.1(A) and (C). The Code is not intended as a design specification. The requirements of 430.6(A) mandate electrical design in the branch circuit wiring of electric motors beyond that required by the design of the electric motor. This requirement mandates oversizing motor branch circuit conductors based on the premise of an emergency condition which has not been substantiated. Electric motor replacement entails much more than conductor sizing. Motor mounts, shaft size, and shaft position must be accounted for. Thousands of motors are installed everyday. How many of these electric motors will have an emergency problem where replacement may present a problem that a competent electrician cannot handle.
Substantiation: See above.
Panel Meeting Action: Reject
Panel Statement: The panel rejects the comment.

As specifics of new and replacement motors are often unknown at the time of initial system design or installation, use of the tables provides a consistent source that provides safety over a wide range of motor applications. The AHJ has the authority to accept an installation design based on specific motor data if documentation and substantiation are provided and accepted. Refer to 90.4. Enforcement.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-6 Log #611 NEC-P11 **Final Action: Reject**
(430.6(D))

Submitter: Paul Guidry, Fluor Enterprises, Inc.
Comment on Proposal No: 11-19
Recommendation: This is a companion proposal for the addition of valve actuator motors. Companion proposal section numbers are: 430.2, 430.22(F), 430.24(B), 430.52(E) and 430.102(A).

Add new 430.6(D) as follows:

430.6(D) Valve Actuator Motors. For valve actuator motors, the rated current shall be the nameplate full-load current. This nameplate current shall be used to determine the ampacity of the branch-circuit conductors covered in 430.22 and 430.24, and the ampere rating of the motor branch-circuit short-circuit and ground-fault protective device.

Substantiation: Valve actuator motors are based on a manufacturer motor size-not horsepower like a NEMA Design B, C,D motor. For a given size of VAM, there are 2, 4, 6, and 8 pole motors. The motor sizes are each rated in full-load current and locked rotor current. The conductor size and breaker size should be calculated based on the nameplate full-load current rating. It is impossible to create a table such as 430.250 for full load currents since there are so many variables in the construction of VAMs. And, the VAM assemblies are geared differently for each valve resulting in varying currents for the same size motor.

This comment is based on proposal 11-81. It was my understanding in the proposal stage that the panel felt like Valve Actuator Motors (VAMs) should be covered by Article 430 (see panel comment on proposal 11-81). However, instead of adding a new Part XI, it was suggested that the current structure of the Code be modified for any rules regarding VAMs.
Panel Meeting Action: Reject
Panel Statement: Valve actuator motors (VAMs) are high torque motors and are already covered in 430.6(A)(1).
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-7 Log #387 NEC-P11 **Final Action: Reject**
(Table 430.7(B), FPN (New))

Submitter: Paul Schwartz, FLUOR
Comment on Proposal No: 11-20
Recommendation: Add a FPN below Table 430.7(B) as follows:

To convert the Table 430.7(B) values to the ratio of locked rotor amps to full load amps (LRA/FLA), multiply the Code letter values (kVA per HP with locked rotor) by (Rated Power Factor x Rated Efficiency/0.746).
Substantiation: NEMA MG-1 and the NEC require all induction motors to have a locked rotor code Letter stamped on the motor nameplate. This code letter provides a range of values for kVALR per HP from which the starting current under locked rotor condition can be calculated for a given motor. Some power system analysis programs use this Code letter as input data for motor models for motor staring and short circuit calculations. However, other programs use LRA and FLA as input data. The purpose of this FPN addition to Table 430.7(B) is to clarify the relationship between the Code Letter value and the ratio of LRA/FLA.

CONVERSION OF THE MOTOR CODE LETTER VALUE TO THE RATIO OF LRA/FLA

Motor HP = kVAR + *PFR* EFFR/0.746 where the subscript R stands for rated)

The Motor Code Letter = kVALR/HP = kVALR/ (kVAR + PFR* EFFR/0.746)

The Motor Starting Current in per unit of full load current = kVALR/kVAR = (sqrt3 * VR* LRA)/(sqrt 3* VR * FLA) = LRA/FLA

The Motor Code Letter = kVALR/HP = (LRA/FLA) * (0.746/PFR * EFFR)

Therefore, the ratio of LRA/FLA =kVALR/HP) * (PFR * EFFR/0.746)

(Note when PFR * EFFR = 0.746, the Code Letter Value equals the ratio of LRA/FLA)

MEDIUM VOLTAGE INDUCTION MOTOR EXAMPLE

HP = 13,500 HP
kVR = 13,200 V
PFR = 89%
EFFR = 96.5%
FLA = 512.9 A
LRA = 2718.4 A

The LRA/FLA = 2718/512.9 = 5.3

The kVALR/HP = (LRA/FLA) * (0.746/PFR * EFFR) = (5.3 * 0.746)/ (0.89 * 0.965) = 4.6

(Note the 530% motor inrush current is much greater than the 460% motor kVALR/HP).

CODE LETTER APPLICATION SUMMARY

It can be seen from the above that there can be a significant difference in the numerical per unit values of kVALR/HP and LRA/FLA for a given motor. Thus, in modeling motors in a computer program, it is important to determine exactly what the program needs and to validate that the program uses the required data (either kVALR/HP or LRA/FLA) correctly to get the correct motor model in terms of 1/LRA on the motor per unit subtransient reactance.

Note that not all of the US motor standards require the Code letter to be included on the motor nameplate. For example, API-541-2004 and API-546-1997 require the locked rotor amps to be included on the motor nameplate. NEMA C50.41-2000 requires the locked rotor amps to be included on the motor nameplate but notes that, when agreed to between the user and the manufacturer, the locked rotor Code Letter may be used.

Based on the above, it is recommended that the above FPN be added below Table 430.7(B).

Panel Meeting Action: Reject

Panel Statement: The comment is not related to the original proposal; therefore it is not in compliance with 4.4.2 of the NFPA Regulations Governing Committee Projects.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

11-8 Log #587 NEC-P11 **Final Action: Reject**
(430.9(C))

Submitter: Gregory J. Steinman, Thomas & Betts Corporation

Comment on Proposal No: 11-21

Recommendation: The panel should reconsider the action on this proposal and Accept in Principle.

~~C. Torque Requirements. Control circuit devices with screw type pressure terminals used with 14 awg or smaller conductors shall be torqued to a minimum of 0.8 N m (7 lb in.) unless identified for a different torque value.~~ Electrical Connections. Electrical connections at motor terminals and leads shall be made with an identified method of connection. Twist-on wire connectors, soldered, and insulation piercing type connectors shall not be used for this purpose. Connectors shall be insulated with a material that will not support combustion.

Substantiation: Mr. Cartel is correct as the AHJ has limited ability in confirming compliance with this article as written. Safe and reliable connections are needed and are best described in NFPA 79, Electrical Standard for Industrial Machinery, 2002 Edition. The proposed revision is based upon section 14.5.9.2 - 14.5.9.4 from NFPA 79.

Panel Meeting Action: Reject

Panel Statement: The panel reiterates its position on Proposal 11-21.

The submitter has not provided any new or additional substantiation. The recommendation for revised text is new material and changes the subject from control terminals to motor and motor controller terminals. The reason for the change has not been supported with substantiation and is not related to original proposal. Section 110.14 addresses the concerns in regard to types of connectors and their use.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

11-9 Log #1126 NEC-P11 **Final Action: Reject**
(430.9(C))

Submitter: Andre R. Cartal, Princeton Borough Building Dept.

Comment on Proposal No: 11-21

Recommendation: Delete (C) of this section.

Substantiation: This NEC provision is unenforceable by Electrical inspectors: Do I have the properly calibrated equipment? Do I need PPE to perform this inspection? Is it possible I could alter the torque and be subject to liability? This requirement belongs in the product standard, not in the NEC.

Panel Meeting Action: Reject

Panel Statement: This requirement, as presently written, does in fact allow the AHJ to require the installer to verify the correct tightness of these conductors. The present wording allows the AHJ to have the installer prove the connections are tightened to a minimum of 7 lb-in. when there is no torque value given by the manufacturer. Without this requirement, the AHJ has no minimum torque value to enforce, thereby possibly allowing unreliable connections for these conductors.

The current text is consistent with the manner in which terminals of control devices are presently marked.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

Comment on Affirmative:

BUNCH, R.: I support the action to reject, but add that we should avoid specification requirements in the NEC that belong in product standards or work standards. General torque requirements on fasteners does not belong in the NEC, in my opinion.

11-10 Log #719 NEC-P11 **Final Action: Accept**
(430.19)

Submitter: Robert Kelleher, Paramount Electrical Services

Comment on Proposal No: 11-25

Recommendation: Continue to Reject .

Substantiation: Continue to Reject. The addition of these NECA Fine Print Notes, serves no benefit to the user of the National Electrical Code. These are not standards, they are a compilation of generic information and do not serve as information to the user. These must be purchased through NECA. This FPN as written is nothing more than free advertisement for generic, readily available information which must be purchased by the code user. A total of sixteen new Fine Print Notes were proposed to reference NECA standards. ALL were unanimously rejected. Inclusion of this Fine Print Note is in direct conflict with 90.1(C). The TCC should intervene to prohibit these types of Fine Print Notes. CMP 11 should continue to reject this FPN. Failure to do so will mean adding Fine Print Notes for IEC, EEI, IBEW, IAEI, ACC, NETA, NEI, SEIA, AISI, API, ASHE, AHAM, ICEAI, NYBFU and dozens of others when they decide to develop income through generic standards development. If this type of Fine Print Note is placed anywhere in the NEC an Annex should be included with coupons for the code user. If the NEC is to be used for advertisement purposes, coupons should be included.

Panel Meeting Action: Accept

Panel Statement: The panel accepts the sumitter's comment to reject and upholds its position on Proposal 11-25.

The panel does not agree with all of the submitter's substantiation.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

11-11 Log #613 NEC-P11 **Final Action: Reject**
(430.22(F))

Submitter: Paul Guidry, Fluor Enterprises, Inc.

Comment on Proposal No: 11-81

Recommendation: This is a companion proposal for the addition of valve actuator motors. Companion proposal section numbers are: 430.2, 430.6(D), 430.24(B), 430.52(E) and 430.102(A).

Add new 430.22(F) as follows:

430.22(F) Valve Actuator Motors. Conductors that supply a single VAM shall have an ampacity of not less than 125 percent of the VAM's rated full-load current as determined by 430.6(D).

Substantiation: VAMs are rated differently from valve to valve and manufacturer to manufacturer. Some are rated in horsepower, others in kVA or kW. All are rated in full-load current and locked rotor current. These motors are not constant torque motors and a current table cannot be made for them such as 430.250. They are not continuous duty, however a 125 percent multiplier to the nameplate current is sufficient, yet not excessive.

This comment is based on proposal 11-81. It was my understanding in the proposal stage that the panel felt like Valve Actuator Motors (VAMs) should be covered by Article 430 (see panel comment on proposal 11-81). However, instead of adding a new Part XI, it was suggested that the current structure of the Code be modified for any rules regarding VAMs.

Panel Meeting Action: Reject

Panel Statement: Valve actuator motor (VAM) conductors are already covered in the main rule of 430.22(E) based on the full load current of 430.6(A)(1).

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

11-12 Log #614 NEC-P11 **Final Action: Reject**
(430.24(B))

Submitter: Paul Guidry, Fluor Enterprises, Inc.

Comment on Proposal No: 11-81

Recommendation: This is a companion proposal for the addition of valve actuator motors. Companion proposal section numbers are: 430.2, 430.6(D), 430.22(F), 430.52(E) and 430.102(A).

Make existing text in 430.24 part (A). Add new part (B) as follows:

430.24(B) Valve Actuator Motors. Conductors supplying several VAMs, or a VAM(s) and other load(s) shall have an ampacity not less than 125 percent of the VAM's rated nameplate current plus the sum of the full-load current rating

of the highest rated motor plus the sum of the full-load current ratings of all the other motors in the group, plus the ampacity required for the other loads.
Substantiation: VAMs are rated differently from valve to valve and manufacturer to manufacturer. Some are rated in horsepower, others in kVA or kW. All are rated in full-load current and locked rotor current. These motors are not constant torque motors and a current table cannot be made for them such as 430.250. They are not continuous duty, however a 125 percent multiplier to the nameplate current is sufficient, yet not excessive. The remainder of the text is virtually the same as existing 430.24.

This comment is based on proposal 11-81. It was my understanding in the proposal stage that the panel felt like Valve Actuator Motors (VAMs) should be covered by Article 430 (see panel comment on proposal 11-81). However, instead of adding a new Part XI, it was suggested that the current structure of the Code be modified for any rules regarding VAMs.
Panel Meeting Action: Reject
Panel Statement: The submitter's concerns are addressed in 430.6(A)(1) and 430.24.

11-13 Log #2327 NEC-P11 **Final Action: Accept**
(430.28(4))

Submitter: Jim Pauley, Square D Company
Comment on Proposal No: 11-34
Recommendation: Reject the Proposal.
Substantiation: The negative commentors are correct and raise substantial issues that make this an unacceptable approach.

This proposal will reduce electrical safety. Overcurrent protection rules in the NEC need to be uniformly applied across application. This revision creates a significant anomaly to that uniformity. The expectation that the system is controlled enough to be able to have such exacting requirements for conductor protection is a flawed expectation.

The current tap rules have served well in a large variety of installations and they are consistent with the engineering and maintenance approaches taken in all installations including large industrial.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-14 Log #615 NEC-P11 **Final Action: Reject**
(430.52(E))

Submitter: Paul Guidry, Fluor Enterprises, Inc.
Comment on Proposal No: 11-81
Recommendation: This is a companion proposal for the addition of valve actuator motors. Companion proposal section numbers are: 430.2, 430.6(D), 430.22(F), 430.24(B), and 430.102(A).

Add new 430.52(E) as follows:
430.52(E) Valve Actuator Motors. Valve actuator motor branch circuits shall be protected at a maximum of 125% of the motor nameplate full-load current rating and in accordance with 240.4(B). Circuit breakers shall be of the inverse time type. Fuses shall be of the dual-element time-delay type. It shall be determined that the branch-circuit short-circuit and ground-fault protective device will not open under the most severe normal conditions of service that may be encountered.
Substantiation: VAMs are completely self-protected and are not dependent on the branch-circuit protective device to protect the VAM. The branch-circuit protective device only protects the conductors in this case. This section has been coordinated with 430.22.

Based on the current Code, instantaneous or type MCP breakers wouldn't be allowed since they're not a part of a listed assembly with the controller. So, it should be made clear that the breakers shall be inverse time type. Because of the high inrush on locked-rotor, fuses should be DETD type.

This comment is based on proposal 11-81. It was my understanding in the proposal stage that the panel felt like Valve Actuator Motors (VAMs) should be covered by Article 430 (see panel comment on proposal 11-81). However, instead of adding a new Part XI, it was suggested that the current structure of the Code be modified for any rules regarding VAMs.
Panel Meeting Action: Reject
Panel Statement: The submitter's concerns are addressed in existing Table 430.52.

The existing Table 430.52 for "single-phase motors" and "AC polyphase motors other than wound-rotor squirrel cage other than Design B energy-efficient" applies to AC valve actuator motor assemblies.

(430.59 (New))

Submitter: Paul S. Hamer, Richmond, CA
Comment on Proposal No: 11-48
Recommendation: This proposal (and its companion Proposals 2-6, 2-88, 2-285 and 11-49 - Comments submitted separately) should be accepted. Add to the end of the proposed wording: This requirement shall become effective January 1, 2011. This aligns with Mr. Weber's Explanation of Negative for Proposal 2-88 regarding the development of new, life-saving concepts and addresses the Panel Statement of Proposal 2-88. The Proposal wording, and its included phrase "shall be permitted," is important so the GFCIS-3Ph is identified as a specific permitted alternative. The Panel Statement, "The panel recognizes that the application of this system is permitted to be used for motor circuits as an added technology," avoids the reality that unless a permitted concept is identified in the NEC, it will not be applied. Adding the delayed effective date would provide the incentive and the necessary time for the Three-Phase Ground-Fault Circuit-Interrupter System (GFCIS-3Ph) to be further developed and commercialized.
Substantiation: The Panel Statement of Proposal 2-88, the base Proposal for the GFCIS-3Ph concept, includes "...The submitter's substantiation notes that the hazard is when unqualified persons work on equipment without taking the appropriate precautions to deenergize the circuit and verify that circuit is disconnected...". There are numerous instances where unqualified persons were electrocuted by faulty or defective equipment (see the supporting material submitted with the proposals), and these people may have been protected from electrocution by the proposed GFCIS-3Ph. The patent applications are pending for the GFCIS-3Ph as of this date, but further field measurements made since the Proposal submittal date indicate that the distributed phase capacitances on an actual installed three-phase 480 volt power system are balanced enough to permit the sensitivity described in the proposals.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any new motor-related substantiation for reconsideration.

Although the panel rejects the submitter's comment, this new technology is an important step forward in the protection of electrical systems and personnel. The panel encourages the submitter to return in the next Code cycle with documentation to the effectiveness, reliability, and availability of this new technology.

Again, the panel recognizes that the application of this system is permitted to be used for motor circuits as an added technology.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:

CACCAMESE, J.: I would encourage the submitter to keep the panel apprised of the availability of this emerging technology through the proposal stage for the next code cycle. The use of 3-phase GFCI device provides a promising step in the right direction for safety.

Submitter: Joseph C. Warren, Joseph C. Warren Electrical Consulting Services
Comment on Proposal No: 11-50
Recommendation: Revise text to read:

Notes:

2. 400 percent of value specified in Table 310.16 for 60°C conductors. (Table ~~310.17~~)

Substantiation: Note No. 2 of Table 430.72(B) states 400 percent of value specified in Table 310.17 for 60°C conductors. Since Table 310.17 is for free air ampacities only and Note No. 2 of Table 430.72(B) is given under column B for conductors within enclosures, Table 310.17 should not be used for this situation.

According to Webster's dictionary, "free air is air not affected by local conditions", and "part of the atmosphere that lies above the frictional influence of the earth's surface". This means to me that air circulation is not affected, as it is in an enclosure.

You can liken a motor controller to a safe that has no air circulation when closed.

The panel statement about conductors not bundled in enclosures is not correct because many times they are done like this to keep the conductors neat, and they are often installed in boiler rooms where very hot conditions exist.

I really don't know how else to explain that inside an enclosure is not free air conditions. The panel should have listened to the comments by Mr. Fahey who agreed with me.

Panel Meeting Action: Reject

Panel Statement: The submitter has not provided substantiation that this has been a problem.

Table 430.72(B) is for overcurrent protection and is not used for sizing control circuit conductors.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

11-19 Log #830 NEC-P11 **Final Action: Accept in Principle**
(430.73)

TCC Action: **Due to the panel action of relocating 430.73(B), the Technical Correlating Committee directs that 430.73(A) be combined into a single section with a title and arrangement to read as follows:**

"430.73 Protection of Conductor from Physical Damage. Where damage to a motor control circuit would constitute a hazard, all conductors of such a remote motor…".

Submitter: Paul Dowden, Fluor
Comment on Proposal No: 11-52
Recommendation: The submitter's original proposal should be accepted modified as follows:

Assign 430.75 to the second paragraph of 430.73 and title it as "ELECTRICAL ARRANGEMENT OF CONTROL CIRCUITS", and keep the paragraph as written.

Substantiation: This would provide the most clear arrangement of this section of the code.

Panel Meeting Action: Accept in Principle

Relabel existing 430.74 to 430.75.

Create new 430.74 to read as follows:

"Electrical Arrangement of Control Circuits. Where one side of the motor control circuit is grounded, the motor control circuit shall be arranged so that an accidental ground in the control circuit remote from the motor controller will (1) not start the motor and (2) not bypass manually operated shutdown devices or automatic safety shutdown devices."

Delete the second paragraph of existing 430.73, as it has been moved to new 430.74. The first paragraph of existing 430.73 remains unchanged.

Panel Statement: The change meets the submitter's intent.

The panel chooses to retain the existing section title. The change adds clarity.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

11-20 Log #1319 NEC-P11 **Final Action: Reject**
(430.81(A))

Submitter: Vincent J. Saporita, Cooper Bussmann
Comment on Proposal No: 11-53a
Recommendation: Modify the proposal so that the phrase "protective device" is not removed from the original wording. It should be included with the phrase "disconnecting means" that was added by the panel.

(A) Stationary Motor of 1/8 Horsepower or Less. For a stationary motor rated at 1/8 hp or less that is normally left running and is constructed so that it cannot be damaged by overload or failure to start, such as clock motors and the like, the branch-circuit disconnecting means or protective device shall be permitted to serve as the controller.

Substantiation: Replacing the words "protective device" with "disconnecting means" made a subtle but significant change. It would preclude the application of a 1/8 hp or less stationary motor from being installed where a Type S fuse is protecting the motor and where removal of the fuse would serve as the disconnecting means (430.109(B)). The phrase "protective device" in 430.81(A) has been in the NEC, without reported issues, since at least the 1947 edition. I don't believe that the Panel intended to make this subtle but significant change.

Panel Meeting Action: Reject

Panel Statement: For stationary motors of 1/8 horsepower or less, a fuse may be used as the disconnecting means as permitted in 430.109(B). Because a fuse can be considered as the disconnecting means, it can also be considered the controller.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

SAPORITA, V.: Text from the 1933 NEC through the 2005 NEC specifically allowed the overcurrent protective device to be both the controller (430.81(A)) and the disconnecting means (430.109(B)).

For 2008, 430.109(B) still allows the overcurrent protective device to be the disconnecting means but the proposed text only allows the disconnecting means to be the controller. The wording infers therefore, that the overcurrent protective device can also be the controller. (The overcurrent protective device can be disconnecting means, and disconnecting means can be the controller, therefore, the overcurrent protective device can be the controller.) This two-step process adds confusion, which would not be necessary if the text remained unchanged from the 2005 edition of the NEC.

1-114 Log #70 NEC-P01 **Final Action: Accept**
(Table 430.91)

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 11-56
Recommendation: The Technical Correlating Committee directs that this proposal be sent to Code-Making Panel 1 for action. This action will be considered by Code-Making Panel 1 as a Public Comment. The actions taken on Proposals 1-95 and 11-55 relocates Table 430.91 to 110.20.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

Panel Statement: The panel accepts this comment and editorially revises the superscript from "2" to "1" on line 3 of the Table "For Outdoor Use" which matches the text already accepted by the panel in proposal 1-95 as published in the A2007 NEC ROP.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

11-21 Log #567 NEC-P11 **Final Action: Reject**
(430.102(A))

Submitter: J. Ron Caccamese, Nathan Alterman Electric Company, Ltd. / Rep. International Brotherhood of Electrical Workers
Comment on Proposal No: 11-60
Recommendation: Revise as follows:
430.102 Location.
(A) Controller. An individual disconnecting means shall be provided for each controller and shall disconnect the controller. The disconnecting means shall be located in sight and be readily accessible from the controller location.
Substantiation: In addition to the substantiation provided by the submitter of Proposal 11-60 (window as a barrier), there are other obstacles (elevation, fencing, and inaccessible terrain) that would prevent access even though a disconnect is "within sight". The submitter's concern is well founded, and even though 430.7 provides "readily accessible" requirements, further evaluation is warranted due to safety issues associated with controller disconnect accessibility. This is a safety issue regarding the installation of disconnecting means and readily accessible.
Panel Meeting Action: Reject
Panel Statement: The panel reiterates its position on Proposal 11-60.
The disconnecting means for the controller is not always required to be readily accessible from the controller. See 430.107 for readily accessible requirements. Existing Code text requires that at least one of the disconnecting means be readily accessible.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:
CACCAMESE, J.: Due to the nature of motorized equipment and the hazards associated with same, allowing a disconnecting means that serves the control to qualify as the disconnect that is "readily accessible", as indicated in 430.107, to also serve as the 'readily accessible" disconnect for the motor itself is a safety concern that distresses this panel member. Further consideration should be given this arrangement and an assured means of access to the both disconnect for the controller and motor be evaluated.
FAHEY, R.: The panel action should have been to accept this comment. Both the submitter of original Proposal 11-60 and the submitter of this comment have provided sufficient substantiation that shows a safety issue exists. To ensure personnel safety, both disconnects required in 430.102(A) for the controller and 430.102(B) for the motor should be readily accessible. Requiring a readily accessible disconnect at both locations would provide a safety measure for the electrician and maintenance personnel. By providing disconnects in sight from and "readily accessible" of the motor controller would solve the safety concerns brought forth in the original proposal.

11-22 Log #771 NEC-P11 **Final Action: Reject**
(430.102(A) Exception No. 1)

Submitter: Louis A. Barrios, Shell Global Solutions
Comment on Proposal No: 11-62
Recommendation: The panel action should have been to "accept" rather than "reject".
Substantiation: The hazards associated with working on a motor controller are equivalent regardless if the motor is rated 600V and below, or above 600V. The actual motor control voltage is typically less than 600V in both cases. Therefore, the location of the controller disconnecting means, as long as the provisions in 430.102(A) Exception No. 1 are met should be equivalent regardless of the motor voltage. The intent of this proposal is similar to Proposal 11-63. Proposal 11-62 is a cleaner code change.
Panel Meeting Action: Reject
Panel Statement: The submitter has provided no new substantiation for the panel to reconsider.
The panel reiterates its position on Proposal 11-62.
Allowing this exception for lower voltages may reduce worker safety. For equipment less than 600 volts, the physical limitations that apply to equipment over 600 volts do not apply.
The required disconnect is for the controller regardless of the control voltage level.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
HAMER, P.: The panel action should be to accept the comment and allow the exception for all voltages. This exception only applies to a controller's disconnect, and would negate the requirement for a redundant controller disconnect in a hostile physical environment (in situations where the motor controller may be out in the plant's operating facility) that could introduce additional hazards to the worker. For most controllers rated 600 volts and below, permitting this exception would have no effect, since the controller's disconnect and the controller are within the same enclosure in the common 600 volt class motor control center.

11-23 Log #612 NEC-P11 **Final Action: Accept in Principle in Part**
(430.102(A) Exception No. 3)

TCC Action: The Technical Correlating Committee directs that the word "Provided" be deleted from the panel action text of 430.102(A), Exception No. 3 (a) so that it reads as follows:
"(a) The valve actuator motor assembly is marked with a warning label giving the location of the disconnecting means."
This corrects an editorial error.
Submitter: Paul Guidry, Fluor Enterprises, Inc.
Comment on Proposal No: 11-81
Recommendation: This is a companion proposal for the addition of valve actuator motors. Companion proposal section numbers are: 430.2, 430.6(D), 430.22(F), 430.24(B), and 430.52(E).
Add new 430.102(A) Exception No. 3 as follows:
Exception No. 3: The disconnecting means shall not be required to be in sight of valve actuator motor assemblies containing the controller under either condition (a) or (b), provided the disconnecting means is capable of being locked in the open position. The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed.
(a) Where such a location of the disconnecting means introduces additional or increased hazards to persons or property
(b) In industrial locations, with written safety procedures, where conditions of maintenance and supervision ensure that only qualified persons service the equipment.
FPN No. 1: An example of increased or additional hazard is where the valve actuator motor is used for a process emergency shutdown and the failure of the disconnecting means near the valve actuator motor containing the controller would prevent the valve from operating.
Substantiation: This comment is based on proposal 11-81. It was my understanding in the proposal stage that the panel felt like Valve Actuator Motors (VAMs) should be covered by Article 430 (panel comment on proposal 11-81), and that it was reasonable in some situations not to require a disconnecting means within sight of the controller. However, instead of adding the new Part XI as proposed, it was suggested that the current structure of the Code be modified for any rules regarding VAMs. This text is based on the existing exception for motor disconnects in 430.102(B).
I believe the existing 430.102(B) applies to VAMs without an integral controller already and doesn't require modification.
Panel Meeting Action: Accept in Principle in Part
Add a new exception to 430.102(A) to read as follows:
Exception No. 3: The disconnecting means shall not be required to be in sight from valve actuator motor (VAM) assemblies containing the controller where such a location introduces additional or increased hazards to persons or property and conditions (a) and (b) are met.
(a) Provided the valve actuator motor assembly is marked with a warning label giving the location of the disconnecting means.
(b) The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed.
Panel Statement: The panel rejects the submitter's part (b) and the FPN. The panel recognizes there could be an increased safety hazard associated with part (b) of the submitter's recommendation. The FPN note is not required because the text of 430.102(A) Exception No. 3 is considered sufficient.
The panel edits the submitter's Exception No. 3 for clarity.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-24 Log #772 NEC-P11 **Final Action: Accept in Principle in Part**
(430.102(A) Exception No. 3)

Submitter: Louis A. Barrios, Shell Global Solutions
Comment on Proposal No: 11-63
Recommendation: The panel action should have been to "accept in principle" rather than "reject" with the proposed changes to the original proposal as shown below:
Exception No. 3: In industrial installations with written safety procedures, where conditions of maintenance and supervision ensure that only qualified persons service the equipment, the controller disconnecting means shall not be required to be in sight from the controller ~~motor and the driven machinery~~ location provided the controller disconnecting means is individually capable of being locked in the open position. The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed.
Substantiation: The proposed modifications to the original proposal clarify that the intent of the proposed Exception No. 3 was to address the controller disconnecting means. As noted in Mr. Glover's negative ballot, "The submitter is specifically requesting an extension to this exception (for motors) to allow the same exception (for controllers) in the case of motor operated valves (MOVs). The question arises as a result of the controller location, which in the case of MOVs is integral with the motor. The 430.102(B) exception exempts the motor disconnecting means from being in sight of the motor if all conditions are met, it does not specifically exempt the controller disconnecting means from being within sight of the controller." An easier method to accomplish the same intent is to accept Proposal 11-62, which proposes to make the controller disconnecting means requirement similar for both motors 600V and below, and above 600V.
Panel Meeting Action: Accept in Principle in Part
Panel Statement: The panel rejects the expansion of the exception to industrial locations. The panel chooses not to expand the exception beyond valve actuator motor (VAM) assemblies.
The submitter's other concerns are addressed by the action on Comment 11-23. See the action and statement on Comment 11-23.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

11-26 Log #568 NEC-P11 **Final Action: Reject**
(430.102(B))

Submitter: J. Ron Caccamese, Nathan Alterman Electric Company, Ltd. / Rep. International Brotherhood of Electrical Workers
Comment on Proposal No: 11-64
Recommendation: Revise as follows:

430.102 Location.

(B) Motor. A disconnecting means shall be located in sight and be readily accessible from the motor location and the driven machinery location.

Substantiation: In addition to the substantiation provided by the submitter of Proposal 11-60 (window as a barrier), there are other obstacles (elevation, fencing, and inaccessible terrain) that would prevent access even though a disconnect is "within sight". The submitter's concern is well founded, and even though 430.7 provides "readily accessible" requirements, further evaluation is warranted due to safety issues associated with controller disconnect accessibility. This is a safety issue regarding the installation of disconnecting means and readily accessible.
Panel Meeting Action: Reject
Panel Statement: The panel reiterates its position on Proposal 11-64.

The disconnecting means for the motor is not always required to be readily accessible from the motor. See 430.107 for readily accessible requirements. Existing Code text requires that at least one of the disconnecting means be readily accessible.

In addition, the definition of "in sight from" allows up to 50 feet between the disconnecting means and the motor. The disconnecting means and the motor do not have to be accessible from each other.

Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:

CACCAMESE, J.: See my explanation of negative vote on Comment 11-21.

FAHEY, R.: The panel action should have been to accept this comment. Both the submitter of original Proposal 11-64 and the submitter of this comment have provided sufficient substantiation that shows a safety issue exists. Adding "readily accessible" to this code section would be a very important step forward for worker safety, readily accessible will reiterate the need to have this disconnect available for the service personnel. 430.107 does, in fact, require one of the disconnecting means to be readily accessible, I believe if the panel would have accepted both Comments 11-26 and 11-21, the panel would be making the workplace safer. Providing disconnects at both locations which are readily accessible will provide the personnel who use these devices with a safer workplace. If this disconnect is capable of being reached quickly, without having the obstacle of locked doors with windows (within sight), located between the disconnect and the motor, the personnel will have the ability to use the disconnect. When the disconnect is behind a locked door with a window, the personnel may and sometimes does work the equipment energized due to production concerns or the urgency to keep the process operational. If the disconnect is important enough to be located in sight from, the disconnecting means should then be important enough to be readily accessible.

11-27 Log #792 NEC-P11 **Final Action: Accept**
(430.102(B))

TCC Action: The Technical Correlating Committee directs that the accepted text be revised to read as follows:

"430.102(B) Motor. A disconnecting means shall be provided for a motor in accordance with (1) or (2).

(1) Separate Motor Disconnect. A disconnecting means for the motor shall be located in sight from the motor location and the driven machinery location.

(2) Controller Disconnect. The controller disconnecting means required in accordance with 430.102(A) shall be permitted to serve as the disconnecting means for the motor if it is located in sight from the motor location and the driven machinery location.

Exception to (1) and (2): The disconnecting means for the motor shall not be required under either condition (a) or (b), provided the controller disconnecting means required in accordance with 430.102(A) is individually capable of being locked in the open position. The provision for locking or adding a lock to the controller disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed.

(a) Where such a location of the disconnecting means for the motor is impracticable or introduces additional or increased hazards to persons or property.

(b) In industrial installations, with written safety procedures, where conditions of maintenance and supervision ensure that only qualified persons service the equipment.

FPN No. 1: Some examples of increased or additional hazards include, but are not limited to, motors rated in excess of 100 hp multimotor equipment, submersible motors, motors associated with adjustable speed drives and motors located in hazardous (classified) locations.

FPN No. 2: For information on lockout/tagout procedures, see NFPA 70E- 2004, Standard for Electrical Safety in the Workplace."

This Technical Correlating Committee action adds the appropriate driver language to the main paragraph to make it clear that either (1) or (2) can be used to satisfy the requirement for a motor disconnect. The exception has been relocated to follow both (1) and (2) and has been made clear to apply to both (1) and (2). This revision is necessary because the arrangement of the text from the comment leads the user to assume that (2) would still be applicable even if the exception under (1) was used for compliance. In addition, the Technical Correlating Committee has added titles as required by the NEC Style Manual.

Submitter: Charles A. Goetz, Underwriters Laboratories Inc.
Comment on Proposal No: 11-67
Recommendation: Revise text from 2005 edition as follows:
430.102(B) Motor.
(1) A disconnecting means **for the motor** shall be located in sight from the motor location and the driven machinery location.
*Exception: The disconnecting means **for the motor** shall not be required ~~to be in sight from the motor and the driven machinery location~~ under either condition (a) or (b), provided the **controller** disconnecting means required in accordance with 430.102(A) is individually capable of being locked in the open position. The provision for locking or adding a lock to the **controller** disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed.*
*(a) Where such a location of the disconnecting means **for the motor** is impracticable or introduces additional or increased hazards to persons or property.*
(b) In industrial installations, with written safety procedures, where conditions of maintenance and supervision ensure that only qualified persons service the equipment.
FPN No. 1: Some examples of increased or additional hazards include, but are not limited to, motors rated in excess of 100 hp multimotor equipment, submersible motors, motors associated with adjustable speed drives and motors located in hazardous (classified) locations.

FPN No. 2: For information on lockout/tagout procedures, see NFPA 70E-2004, *Standard for Electrical Safety in the Workplace*.

(2) The **controller** disconnecting means required in accordance with 430.102(A) shall be permitted to serve as the disconnecting means for the motor if it is located in sight from the motor location and the driven machinery location.

Substantiation: Acceptance of proposal 11-67 undoes panel action from the 2005 cycle (2004 ROP, proposal 11-65). Additionally, when taken together with panel action on proposal 11-68, the resulting revision to 430.102(B) seems to allow not only the disconnect in sight of the motor (first sentence) to be absent from a motor installation but also the controller disconnect in sight of the motor (second sentence), covered by section 430.102(A), to be absent from a motor installation. This would create confusion over what is intended by Section 430.102(A), which does not include a similar exception. The proposed revision addresses the submitters concerns in 11-67 by revising section 430.102 (B) to individually number the two sentences, and also continues to revise the exception as accepted by the committee in 11-68.

In the current text, the term "disconnecting means" sometimes refers to the disconnecting means required by 430.102(B) and sometimes refers to the disconnecting means required by 430.102(A). Additional revisions are made to consistently refer to the disconnecting means required by 430.102(B) as the "disconnecting means for the motor" and the disconnecting means required by 430.102(A) as the "controller disconnecting means".
Panel Meeting Action: Accept

Ballot Results: Affirmative: 15

11-28 Log #2201 NEC-P11 **Final Action: Reject**
(430.102(B) Exception)

Submitter: Michael A. Anthony, University of Michigan Business & Finance / Rep. Association of Higher Education Facilities Professionals
Comment on Proposal No: 11-69
Recommendation: This Proposal should be Accepted.
Substantiation: Most colleges and universities have laboratory, hospital and manufacturing facilities at least as complex as any found out in "industry". Space is always at a premium in legacy mechanical rooms and acceptance of this proposal would give some flexibility in designing HVAC renovations that might result in a net gain in overall safety. The term "industrial installation" itself may be an artifact of an earlier era in which manufacturing plants were more complex and better managed than the building systems we see in higher education today.

The education industry represents a large group of knowledgeable users of the NEC. These users are frequently backed up by active OSHA compliance offices that put safety in the workplace above all else. I would estimate that except for the larger manufacturers, even our smaller colleges and universities have safety programs that exceed the safety programs of the more common small and medium-sized manufacturer.

Unfortunately, however, not all colleges and universities operate in jurisdictions where the general purpose clause of 90.4 is exercised even if written procedures are presented to the inspector. Relaxing the motor disconnect exception would permit the use of limited resources to other purposes where permanent staff is well trained.

Panel Meeting Action: Reject

Panel Statement: The panel reiterates its position on Proposal 11-69.

It is the panel's intent to provide the highest level of safety for all facilities; therefore, the expansion of this exception will reduce the level of safety in many other facilities.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

11-29 Log #465 NEC-P11 **Final Action: Reject**
(430.109(A)(1))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 11-74
Recommendation: Accept proposal.
Substantiation: The proposal provides specifics in addition to HP requirements which alone is not comprehensive and should not be the only criterion. Proposal clarifies suitability as specified in 110.3(A)(1)(7)(8). Switches do not generally have instructions for use per 110.3.
Panel Meeting Action: Reject
Panel Statement: NEC 110.3(A)(1)#(7) provide the information for the motor switch the submitter is requesting. Providing the same requirement in this Code section would be redundant.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-30 Log #1089 NEC-P11 **Final Action: Accept**
(430.110 Exception)

Submitter: Jim Pauley, Square D Company
Comment on Proposal No: 11-75
Recommendation: Revise the panel action text by deleting the words "without fuse holders" so that the final text reads:
Exception: A listed unfused motor circuit switch having a horsepower rating not less than the motor horsepower shall be permitted to have an ampere rating less than 115 percent of the full load current rating of the motor.
Substantiation: The wording "unfused" and "without fuse holders" is redundant. I agree with the panel changing from "nonfused" to "unfused", but adding the "without fuse holders" implies that there is an unfused switch with fuse holders. The UL White Book describes switches without fuseholders as "unfused".
I agree with the panel's rejection of the balance of the original proposal. The panel is correct that the intended percentage is 115% and that molded case switches should not be included in the Exception because they should be sized to comply with the main rule.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-31 Log #438 NEC-P11 **Final Action: Reject**
(430.110(C)(2) Exception)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 11-75
Recommendation: Revise panel action:
Exception: A listed ~~unfused~~ motor circuit switch without fuseholders having a horsepower rating not less than the motor horsepower rating or a listed molded case switch shall be permitted to have an ampere rating not less than ~~115~~ 100 percent of the current rating of the motor.
Substantiation: "Unfused" seems to be superfluous. The phrase "less than 115 percent" does not establish a lower limit; is 90 percent acceptable? Molded case switches are permitted in 430.109(A)(2) and they and motor circuit switches are rated for 100 percent of their ampere rating and such use would comply with 110.3(A)and (B). If not, why not?
Panel Meeting Action: Reject
Panel Statement: The panel notes that the submitter intended to refer to 430.110(A)(1) Exception rather than 430.110(C)(2) Exception.

The panel reiterates its position on Proposal 11-75.

The panel rejects the change "not less than 100 percent." The exception reflects the same percentage value as does the main rule.

Section 430.109(A)(1) requires a motor-circuit switch to be rated in horsepower. In the exception to 430.110(A), the horsepower rating of the switch must equal or exceed the horsepower rating of the controlled motor. Any ampere rating included on the motor circuit switch is not required to comply with the main rule and can be less than the 115 percent.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-32 Log #502 NEC-P11 **Final Action: Reject**
(430.227)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 11-83
Recommendation: Accept revised second sentence:
The provision for locking shall be identified for the purpose ~~or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means~~ and shall remain in place with or without the lock installed.
Substantiation: It is somewhat self-evident the locking means will be at or on the disconnecting means. The provisions should apply to all disconnecting means, not limited to switches and circuit breakers. Locking means should be identified for the purpose.
Panel Meeting Action: Reject
Panel Statement: The revised text from Proposal 11-83 for the second sentence is similar to text found in 430.102(B) Exception for motor installations under 600 volts, thereby creating consistency between similar requirements.

Product standards require testing of products for specific uses that would therefore limit their use to the specific application. Locking means are required by 110.3(B) to be installed in accordance with any listings and/or instructions provided by the manufacturer.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-33 Log #72 NEC-P11 **Final Action: Accept**
(430.242(3))

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 11-86
Recommendation: The Technical Correlating Committee directs the panel to clarify the action on this proposal as to whether or not they intend to include references to the other Articles between 500 and 517. This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the direction of the TCC to review and clarify the panel action.

See panel action and statement on Comment 11-34.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-34 Log #263 NEC-P11 **Final Action: Accept**
(430.242(3))

Submitter: Stanley J. Folz, Morse Electric, Inc.
Comment on Proposal No: 11-86
Recommendation: Revise text to read:
(3) If in a hazardous (classified) location. ~~As described in 500.5 and 517.60.~~
Substantiation: 500.5 and 517.60 are not the only classified areas that would apply in this case. Rather than create a laundry list of classified locations that would apply, the sentence should be allowed to stand alone in referring to classified locations.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-35 Log #791 NEC-P11 **Final Action: Hold**
(430.243)

TCC Action: The Technical Correlating Committee directs that both this comment and Proposal 11-87 be reported as "hold" and submitted to Code-Making Panel 5 for action in 250.114 during the next cycle.

The revisions made by the panel to 430.243 creates correlation issues with 250.114(2) and 250.114(2), Exception. 250.114(2) continues to only require grounding where the cord and plug connected equipment is operating at over 150V to ground. The exception to 250.114 exempts all motors from grounding where they are guarded.

Submitter: Charles A. Goetz, Underwriters Laboratories Inc.
Comment on Proposal No: 11-87
Recommendation: Revised from 2005 edition as follows:
430.243 Portable Motors. The frames of portable motors supplied by a premises wiring system ~~that~~ and operate at 50 V or more ~~over 150 volts to ground~~ shall be ~~guarded or~~ grounded unless guarded or isolated from contact.

~~FPN No. 1: See 250.114(4) for grounding of portable appliances in other than residential occupancies.~~

FPN ~~No. 2~~: See 250.119(C) for color of equipment grounding conductor.

Exception No. 1: Listed motor operated tools, listed motor operated appliances, and listed motor operated equipment shall not be required to be grounded where protected by a system of double insulation or its equivalent. Double insulated equipment shall be distinctively marked.

Exception No. 2: Listed motor operated tools, listed motor operated appliances, and listed motor operated equipment connected by a cord and attachment plug other than those required to be grounded in accordance with 250.114.

Substantiation: Acceptance of proposal 11-87 during the ROP meeting will require motor frames on all portable motor operated appliances, which must comply with Article 430 as noted in Section 422.3, to be grounded regardless of the use voltage, the intended use or listing for the purpose. By eliminating the voltage requirement, all portable motors are affected including those that operate at 50V or less where the revision imposes a higher level of compliance for motor frames than currently stated in section 430.232 for live parts. The revision to section 430.243 effectively supercedes the current section 250.114 which would otherwise cover cord and plug connected equipment operating at 150V to ground or less. Currently listed motor operated appliances operating at not more than 150V to ground and that do not involve water or use in wet locations may be connected by a two conductor cord and attachment plug. The listing requirements for such appliances operating at 150V or less to ground require leakage currents available at accessible metal parts to be monitored during various operating conditions including, in some cases, high humidity conditions, and to not exceed prescribed limits in the product Standards. The substantiation for proposal 11-87 did not indicate any problems with specific portable motors that necessitated the revision. The requirements in Section 250.114 appropriately cover grounding for residential and non-residential applications of motor operated appliances.

In addition, (portable) equipment, connected by a cord and plug, can be double insulated, which is neither grounded nor guarded, and would not comply with the revised section 430.243. The current section 250.114 permits listed double insulated equipment to be utilized without need for grounding, guarding or isolation.

To address these issues, the recommended text for 430.243 has been revised to (1) include provision to omit grounding for frames of motors rated 50V or less; (2) add exception for listed double insulated equipment similar to the current exception to 250.114; and (3) add exception to refer to section 250.114 for listed motor-operated appliances, and delete Fine Print Note 1.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

Comment on Affirmative:

GOETZ, C.: During the ROC meeting, the panel agreed to editorially modify the recommended text as follows:

"The frames of portable motors supplied by a premises wiring system and that operate at 50V or more shall be grounded unless guarded or isolated from contact."

ARTICLE 440 — AIR-CONDITIONING AND REFRIGERATING EQUIPMENT

11-36 Log #397 NEC-P11 **Final Action: Accept in Principle**
(440.2)

Submitter: Earl W. Roberts, Reptec

Comment on Proposal No: 11-90

Recommendation: Accept the proposal as written.

Substantiation: The English language is used in this text, so let's use it. Just because some other organization may have used incorrect English is NO excuse for copying them. A Device is a Device, is Device. The Panel substantiation attempts to justify its position because the incorrect language "is an integral component of a cord set".

The correct term could just as well be used. The Panel Statement that "the phrase is used in product standards" is not substantiated. How was it used? It's still possible to use the phrase correctly and not call it a "device."

Panel Meeting Action: Accept in Principle

In 440.2, change the definition of "Leakage Current Detection and Interruption (LCDI) Protection" to "Leakage-Current Detector-Interrupter (LCDI). A device provided in a power supply cord or cord set that senses leakage current flowing between or from the cord conductors and interrupts the circuit at a predetermined level of leakage current."

Panel Statement: The panel changes the text of 440.2 to correlate with the product standard.

Consistency with definitions between the product standard and the NEC is important for the user of both documents.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

Comment on Affirmative:

GOETZ, C.: It is understood that panel only modified the defined term for LCDI to use the terminology found in the product standard. The balance of the definition is unchanged by the panel action.

11-37 Log #569 NEC-P11 **Final Action: Reject**
(440.14 Exception No. 1)

Submitter: J. Ron Caccamese, Nathan Alterman Electric Company, Ltd. / Rep. International Brotherhood of Electrical Workers

Comment on Proposal No: 11-96

Recommendation: Revise as follows:

440.14 Location. ~~Exception No. 1~~: Delete the exception in its entirety.

Substantiation: The installation and application of a disconnecting means within sight does not hinder the operation of air-conditioning equipment as applied to an industrial process when the conditions include written safety procedures, and the conditions of maintenance and supervision are only performed by qualified personnel. By placing a disconnect switch within sight, safety is assured.

Panel Meeting Action: Reject

Panel Statement: The panel reiterates its position on Proposal 11-96.

The submitter has not provided any new or additional substantiati on. The exception as written provides safeguards for qualified persons. The conditions listed in the exception specifically limit the application.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

CACCAMESE, J.: The removal of the exception provides greater worker safety in the workplace by allowing the worker access to the disconnecting means within site of the work area and the ability to lock the disconnect where the work will take place. The switch could be locked in the closed position (energized) using a generic lock that all the mechanical trades would have access to, the lock could be removed and replaced with an approved lock device used exclusively for lock-out procedures (de-energized) and supplied to the worker working on the equipment. In addition, to reiterate my previous position, the installation and application of a disconnecting means within sight does not hinder the operation of the air-conditioning equipment as applied to an industrial process when the conditions include written safety procedures, and the conditions of maintenance and supervision are only performed by qualified personnel, but helps to ensure worker safety.

11-38 Log #570 NEC-P11 **Final Action: Reject**
(440.22(A), FPN (New))

Submitter: J. Ron Caccamese, Nathan Alterman Electric Company, Ltd. / Rep. International Brotherhood of Electrical Workers

Comment on Proposal No: 11-98

Recommendation: Add a new Fine Print Note to 440.22(A):

FPN: Circuit breakers that open as a result of a ground fault or short circuit at or near their maximum interrupting rating shall be tested or serviced or replaced before reenergizing the motor circuit. NEMA A4B Guidelines for Inspection and Preventive Maintenance or MCCBs Used in Commercial and Industrial Applications is a source for correct procedures to follow.

Substantiation: The submitter's original substantiation shows the need for the installer/maintainer being aware of the hazard of re-energizing a breaker without clearing of a fault; however, a FPN would make the qualified person performing work aware of the existence of the proper procedure needed for safe work practices.

Panel Meeting Action: Reject

Panel Statement: The recommendation of this proposal is not part of the electrical installation requirements of the NEC. Refer to the recommendations in NFPA 70B.

This issue is already addressed in 225.3 of NFPA 70E.

The magnitude (e.g., 5KA, 10KA, 20KA fault) of fault current for a specific event cannot readily be ascertained in the field.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

CACCAMESE, J.: The addition of a fine print note informing the user that guidelines exist regarding the precautions associated with energizing a circuit breaker that has operated as a a result of a ground fault or short circuit is at the least reasonable. While the panel statement is correct in that this information is available in NFPA 70B and 70E, to provide guidance in NFPA 70 or at least provide a FPN that directs the user to the referenced NFPA codes and standards. In regard to the fault level imposed, one must presume that when a fault occurs it is at the maximum value of the breaker's withstand rating. Finally, a FPN would make the qualified person performing work aware of the existence of the proper procedure needed for safe work practices.

11-41a Log #CC1100 NEC-P11 **Final Action: Accept**
(440.65)

Submitter: Code-Making Panel 11,
Comment on Proposal No:
Recommendation: Change the title of 440.65 to read as follows:
440.65 Leakage-Current Detector-Interrupter (LCDI) and Arc Fault Circuit Interrupter (AFCI)
Substantiation: See action and statement on Comment 11-36.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
GOETZ, C.: It is understood that this panel comment is related to proposals 11-90 and 11-107 and is intended to correlate the revision made in Comment 11-36 with Section 440.65, which is the only Section in Article 440 where the defined term, LCDI, is used.

ARTICLE 445 — GENERATORS

13-4 Log #718 NEC-P13 **Final Action: Accept**
(445.3)

Submitter: Robert Kelleher, Paramount Electrical Services
Comment on Proposal No: 13-4
Recommendation: Continue to Reject .
Substantiation: Continue to Reject. The addition of these NECA Fine Print Notes, serves no benefit to the user of the National Electrical Code. These are not standards, they are a compilation of generic information and do not serve as information to the user. These must be purchased through NECA. This FPN as written is nothing more than free advertisement for generic, readily available information which must be purchased by the code user. A total of seventeen new Fine Print Notes were proposed to reference NECA standards. Sixteen were unanimously rejected. Inclusion of this Fine Print Note is in direct conflict with 90.1(C). The TCC should intervene to prohibit these types of Fine Print Notes. CMP 13 should continue to reject this FPN. Failure to do so will mean adding Fine Print Notes for IEC, EEI, IBEW, IAEI, ACC, NETA, NEI, SEIA, AISI, API, ASHE, AHAM,ICEAI, NYBFU and dozens of others when they decide to develop income through generic standards development. If this type of Fine Print Note is placed anywhere in the NEC an Annex should be included with coupons for the code user. If the NEC is to be used for advertisement purposes, coupons should be included.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14
Ballot Not Returned: 1 Gustafson, R.

13-5 Log #866 NEC-P13 **Final Action: Accept**
(445.3 (New))

Submitter: John P. Masarick, Independent Electrical Contractors Inc.
Comment on Proposal No: 13-4
Recommendation: The panel is encouraged to continue to Reject Proposal 13-4.
Substantiation: The reasons to continue to Reject the Proposal are as follows:
1. The trend by the CMPs over the last several code cycles has been to limit the use of FPNs.
2. There is also a correlation issue. There is a conflict between those panels that accepted the proposal and those that rejected the proposal.
3. These standards are also covered by a Fine Print Note in 110.12.
4. The FPN should not be accepted because numerous standards and installation manuals exist and to only mention one does not adequately inform the public about accepted industry practices. The NEC is not intended to be an instruction manual for untrained persons. If the FPNs are allowed to reference these standards, then they should list all applicable standards.
5. Since the referenced installation standards are intentionally general to cover different models of equipment, approval of the FPN may lead many to believe these standards can be used instead of listed or labeled manufacturer's instructions which would be in violation of 110.3(B).
6. If the CMP would like to include the reference, it should be placed in the Annex with the other references.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14
Ballot Not Returned: 1 Gustafson, R.

13-6 Log #1963 NEC-P13 **Final Action: Reject**
(445.13)

Submitter: Elliot Rappaport, Electro Technology Consultants
Comment on Proposal No: 13-7
Recommendation: Change "250.30(A)" to "250.30(A)(8)".
Substantiation: The reference to 250.30(A) is too general since it includes grounding electrode conductors which are not intended to carry ground fault currents.
Panel Meeting Action: Reject
Panel Statement: Refer to the substantiation on Proposal 13-7, "Accepting the revised text will identify that the conductors in question are part of a "system" as opposed to a service which is supplied by a utility. Section 250.30(A)(2) and (8) contain the proper sizing requirements and are a more appropriate reference for the systems which are the subject of 445.13."
Number Eligible to Vote: 15
Ballot Results: Affirmative: 12 Negative: 2
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
HORNBERGER, B.: The comment should be accepted. The commenter references a more specific area of the code which applies to the sizing of conductors that must carry ground fault current. Reference to the entire section of 250.30(A) applies to sizing of other parts of the grounding system which do not apply to separately derived system generators. This comment supports the negative vote comment by R.Swayne in the Proposal ballot stage.
RAPPAPORT, E.: The panel statement is correct but the panel action is not. The reference in the proposal to "250.30(A)" is too inclusive and should be changed to "250.30(A)(2) and (8)" to limit the text to sections that are applicable.
Comment on Affirmative:
GALLO, E.: This comment should be accepted in principle with the recommendation revised as change "250.30(A)" to "250.30(A)(2) or 250.30(A)(8)" to provide clarity and correlate with the panel statement.

13-7 Log #1338 NEC-P13 **Final Action: Reject**
(445.18)

Submitter: Steve Englund, Cummins Power Generation
Comment on Proposal No: 13-9
Recommendation: Delete text added by panel action, "lockable in the open position".
Substantiation: As proposed, the provision for lockable disconnect would be interpreted as applying to all generators types not covered by the exceptions, including generator types such as portable, RV, and commercial vehicle where a lockout is not needed to provide safety. Persons working on these types of generators or the electrical circuits or equipment connected to these generators, will be in sufficient proximity to the entire system so as to assure they have control over the status of the generator, circuits, and equipment.

Also, disconnect for these generators is generally provided by recognized supplementary protectors that are not available with features or accessories that can be added to provide a lockout means. Requiring a lockout means would be a substantial burden for manufacturers of RV, CM, portable, and home standby gensets as small supplementary protectors that are used are not directly procurable with a lock out hasp, and if available, would be a more expensive part and may also require new generator features to fit the revised protectors.

This submitter recognizes the panel might believe that there is relief for the mentioned generator types due to exception (1), however, applicability of this exception for these generator types is an untested concept.

If the text added by panel action is not deleted, an exception should be created for portable, RV, and commercial vehicle generator types: "Disconnects for portable, recreational vehicle, and other mobile vehicle generators are not required to be lockable in the open position.
Panel Meeting Action: Reject
Panel Statement: The disconnect must be lockable in the open position to provide a means to lockout/tagout the generator supply when working on equipment powered by the generator. In the case of the portable generators noted by the commenter, compliance with (1) and (2) would obviate the need for the disconnect switch altogether.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14
Ballot Not Returned: 1 Gustafson, R.

13-8 Log #1615 NEC-P13 **Final Action: Reject**
(445.18)

Submitter: Lawrence A. Bey, Cummins Power Generation
Comment on Proposal No: 13-9
Recommendation: Reject the proposal.
Substantiation: The substantiation given for the proposal is not correct. Locking the disconnect in the open position does not provide additional safety for someone working on the generator, because locking the disconnect does not prevent the line terminals from being energized or the prime mover from starting and running. The generally accepted safety procedure for working on generators is to disable the driving means, typically by use of the prime mover controller start/stop switch and/or disconnecting the starting batteries.

The NEC does not require locking provisions with other disconnects for services, motors, etc., and there is no disconnect locking provisions required for all installations in Article 110; so it is not clear why generator disconnects should be singled out for locking provisions.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 13-7.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14
Ballot Not Returned: 1 Gustafson, R.

13-9 Log #1617 NEC-P13 **Final Action: Reject**
(445.18)

Submitter: Lawrence A. Bey, Cummins Power Generation
Comment on Proposal No: 13-9
Recommendation: Add "or within locked outdoor enclosures" after "lockable in the open position" so that the new clause reads "lockable in the open position or within locked outdoor enclosures.
Substantiation: 110.26(F)(1) requires a suitable enclosure to outdoor electrical equipment that provides protection from unauthorized personnel. Where the generator is outdoors in a locked enclosure, the requirement for locking the disconnect open should not apply.
Panel Meeting Action: Reject
Panel Statement: There is no requirement for the enclosure to meet the lockout/tagout rules.
The presence of an enclosure does not obviate the need for locking out the disconnect. Also, see panel action and statement on Comment 13-7.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14
Ballot Not Returned: 1 Gustafson, R.

13-10 Log #698 NEC-P13 **Final Action: Hold**
(445.19)

TCC Action: The Technical Correlating Committee directs that this comment and Proposal 13-11 be reported as "Hold" since the comment points out that the proposal introduced potential conflicts with material under the jurisdiction of Code-Making Panels 3 and 15. The Technical Correlating Committee will appoint a task group with members from Code-Making Panels 3, 13, and 15 to address these issues.
Submitter: Kurt Eckroth, Waukesha County Technical College
Comment on Proposal No: 13-11
Recommendation: Proposal 13-11 should be rejected.
Substantiation: 702.6 requires the use of a transfer switch to connect a portable generator to premises wiring. The proposed addition to Article 445 would require GFCI protection on all outlets of all portable generators. Unfortunately, GFCI protected generators are incompatible with currently available transfer switch technology. If the proposed addition to Article 445 is approved, users may be encouraged, if not forced, to connect their new GFCI protected generator to their premises wiring by ungrounded backfeeding. Backfeeding is a notoriously dangerous practice, and the reason for the NEC transfer switch requirement in the first place. It is illogical to institute a change to Article 445 that forces/encourages users to violate Article 702. Therefore, the proposal should be rejected.

523.23(C) prohibits GFCI protection of egress lighting at carnivals, circuses, fairs and similar events. These events are commonly powered by portable generators. The proposed addition to Article 445, which would require GFCI protection on all outlets of all portable generators, would be in direct conflict with 523.23(C). It is illogical to institute a change to Article 445 that requires users to violate Article 523. Therefore, the proposal should be rejected.

The exception to 590.6(A) exempts GFCI protection of circuits in temporary installations where a greater hazard sold be created if power were interrupted. The proposed addition to Article 445, which would require GFCI protection on all outlets of all portable generators, would be in direct conflict with 590.6(A). It is illogical to institute a change to Article 445 that requires users to create safety hazards anticipated by Article 590. Therefore, the proposal should be rejected.

The proposed addition to Article 445 would require GFCI protection on all outlets of all portable generators. The GFCI protection would only function if the portable generator was properly grounded to a properly installed grounding rod. It is common knowledge that a significant percentage of users of portable generators do not ground the generator. It is illogical to require the addition of a "safety" device to a portable generator that, in many instances, will not function, but only provide the user with the illusion of safety and a false sense of security. Therefore, the proposal should be rejected.
Panel Meeting Action: Reject
Panel Statement: The GFCI provides a significantly higher level of safety for the user of a portable generator, regardless of the location of the generator. The requirements of Article 590 do nothing to protect users who are not on the jobsite. When connecting a GFCI-protected portable generator to a premise wiring system, the generator becomes a separately derived system. This does not eliminate the possibility of using a transfer switch – the transfer switch will need to be a multiple pole transfer switch that also switches the neutral conductor. The proposal does not require GFCI protection of all outlets, only 30 A and less, 125 or 125/250 V outlets. With respect to the exception to 590.6(A), portable generators should not be used where loss of power would create a hazard. The commenter is mistaken regarding the operation of the GFCI on a generator. Since the generator frame is the system ground, the grounded circuit conductor is then bonded to the frame, and the GFCI functions properly.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 12 Negative: 2
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:

ELKINS, D.: These comments modifying Proposal 13-11 should have been accepted. Proposal 13-11 as accepted by the Panel does not provide an exception for industrial applications of portable generators in which loss of power can have safety consequences. Examples include: refrigeration compressors for cryogenic storage of flammable materials, flood lighting for workers on elevated structures, egress lighting, magnetically held cutting/welding tools or ventilation/pressurization for enclosures.

FLACH, G.: I agree that GFCI protection should not be required on 30-ampere, 125- and 250-volt receptacles.
Comment on Affirmative:

GALLO, E.: This comment should be accepted in principle by using wording in Comment 13-18. The panel statement does not address use of portable generators for existing premises wiring systems that do not have a transfer switch that also switches the neutral conductor.

13-11 Log #1409 NEC-P13 **Final Action: Reject**
(445.19)

Submitter: Michael Flegel, Reliance Controls Corporation
Comment on Proposal No: 13-11
Recommendation: Revise text to read as follows:

Ground-Fault Circuit Interrupter Protection for Receptacles on Bonded Neutral Portable Generators. All 120 ~~and 120/240~~ volt, single-phase, 15~~-~~, and 20~~-, and 30~~ ampere receptacle outlets that are part of a portable generator where the grounded conductor and grounding conductor are bonded shall have listed ground-fault circuit interrupter protection for personnel.

Substantiation: A requirement for GFCI protection on **all** receptacles on **all** portable generators for **all** applications is not necessary and may be undesirable based on the following facts:

(1) In Article 590.6(A), GFCI protection can be supplied by add-on devices and does not have to be built into the generator receptacles. One reason this option exists is to comply with the exception in 590.6(A) where GFCI protection is not allowed to supply equipment that would create a greater hazard if power was interrupted or having a design that is not compatible with GFCI protection.

(2) Article 525.23(C) does not allow GFCI protection on egress lighting.

(3) Some applications have safety records that do not require GFCI protection. These safety records are easily supported by sound technical reasoning. One of these applications is Article 702, Optional Standby Systems. My following comments will be on these systems with a 120/240 volt single phase generator:

(a) The majority of Optional Standby Systems are used for home standby power when utility power fails. In most applications, this happens infrequently and in an environment void of power tools and heavy equipment that you would see on a construction site. As a result, there is less likelihood the equipment and cords are worn or damaged.

(b) UL and the CPSC did research for STP2201 to find reported injuries or deaths when using a portable generator to power a premise wiring system. They found one case but not enough information was available to conclude that GFCI protection would have saved this life.

(c) Very few people, if any, ground their generator with a ground rod and generators generally sit on pavement and/or wheel kits when operating. Some generators don't have a connection between generator ground and the neutral (floating neutral). As a result, generators do not have a connection to earth which means **no ground faults can exist**. There can be failures in the isolation but this is remote especially in the benign home standby environment. For a catastrophe to occur there has to be two things that happen to the isolation. In a floating neutral generator, the first failure would have to be so unique that it has to make a connection between the neutral and the earth that doesn't involve a hot lead shorting to the neutral and tripping the generator circuit breaker. In a bonded neutral generator, a good connection between the generator frame and earth has to exist. The second isolation failure that has to occur connects the person standing on the ground to a hot lead coming from the generator, again unique enough that it doesn't short a hot and trip the circuit breaker.

(d) People are instructed to plug in the power cord into the generator before they start the generator and remove it after they stop the generator, thus people do not have to handle the cord when the generator is running.

(e) As soon as the generator is plugged in to the house, the generator ground is bonded with the neutral through the service entrance panel and a good connection between the generator ground and earth is made. Also, since home standby systems are generally non-separately derived systems with a common neutral between the generator and the utility, the ground is bonded to neutral at the service entrance. The system no longer has double isolation. This single isolation seems sufficient based on points 3a, 3b, 3c, and 3d above. Even if people handle the cord with the generator running, the protection reverts to double isolation as soon as it is unplugged from the house.

(f) If GFCI protection is added to generators as stated in the proposal, then the bonded neutral generator cannot be connected to a premises wiring system using a conventional two-pole transfer switch. This will require a system using a three-pole transfer switch. Floating neutral generators can use a conventional two pole transfer switch. Almost all the installed home standby systems in the US have two pole transfer switches. Both floating and bonded neutral generators are used. There will be a great deal of confusion to the homeowner trying to make a decision especially on a replacement generator with GFCI protection as proposed. If they find themselves with a GFCI protected bonded neutral generator and a conventional two-pole transfer switch, they will find ways to make them work which will have a negative effect on safety like cutting off the ground blade on the cord plug to the generator.

(g) If GFCI protection is required for all generators, the cost of generators and transfer switches will increase. People will probably be willing to spend more money on generators but will have less money left to buy the more expensive three pole transfer switches. Transfer switch use will decrease. Back feeding causing injury to utility workers and others is a widely documented safety issue which will be made worse by adding GFCI protection to all portable generators.

(h) A floating neutral generator is safe based on isolation, and GFCI protection adds cost while adding no additional level of safety.

(i) Switching the neutral (three pole transfer switch) is more prone to failure than a solid connection (two pole transfer switch). Losing the neutral can create unsafe conditions.

Summary

There is no evidence of safety issues in home standby systems and sound electrical theory supports this. Article 590 allows the addition of GFCI protective equipment to outlets that don't have this protection. The protection does not have to be built-in to the outlet on the generator. There is no data to support that a problem exists with these methods

Currently floating neutral generators have more than enough levels of safety to prevent injury without GFCI protection, especially in the home standby environment. Adding unnecessary expense to these systems will decrease the use of transfer switches and create a larger back-feeding safety problem which is already serious.

Not providing GFCI protection on 120/240 volt receptacles on bonded neutral generators will allow people to use new generators with existing transfer switches without creating unsafe modifications and eliminating the need to switch the neutral which is more likely to cause problems than a solid neutral connection. This also allows compliance with sections of the code that prohibit GFCI protection for certain equipment. I don't believe the safety records indicate that drastic and immediate action is required and more discussion may be needed before the final outcome is determined.

Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 13-10.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 11 Negative: 3
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:

ELKINS, D.: See My Explanation of Negative on Comment 13-10.

NASBY, J.: See NEMA Explanation of Negative on Comment 13-18.

RAPPAPORT, E.: GFCI receptacles should be required on 15 and 20 ampere, 125 volt receptacles where individual loads are used. 30 ampere and 125/250 volt receptacles will be used to feed multiple loads such as residences. If the premises wiring is grounded, the GFCI will trip making it unusable. This will likely result in modifications to the generator wiring that could make it unsafe. The GFCI receptacles on portable generators should be limited to 15 and 20 ampere, 125 volt ratings.

13-12 Log #1828 NEC-P13 **Final Action: Reject**
(445.19)

Submitter: William R. Drake, Marinco
Comment on Proposal No: 13-11
Recommendation: Reject the Proposal.
Substantiation: Although I support GFCI protection for most every situation, GFCI protection should not be required in circuits where it adds cost without any benefit. Requiring GFCI protection on all portable generators is unnecessary. GFCI protection makes sense for non-isolated generators that have a connection to ground, but for generators where the neutral and ground are isolated, the GFCI provides no additional protection.

Isolated generators are commonly used to provide temporary power for homes when the utility power is out, and the ground and neutral are tied together downstream at the service for the house. There is appropriate GFCI protection within the house, and a GFCI at the generator provides no benefit.

I suggest that the Code Panel establish a task group to thoroughly think through which applications are appropriate, and which are not, for GFCI protection. When the safety record is good, it is irresponsible to add cost without benefit.

13-14 Log #2239 NEC-P13 **Final Action: Reject**
(445.19)

Submitter: Wes Hoppler, American Power Technologies Inc.
Comment on Proposal No: 13-11
Recommendation: Revise text to read as follows:
All 120 ~~and 120/240~~ volt single phase 15-, 20-, and 30 ampere receptacle outlets that are a part of a portable generator shall have listed ground fault circuit interrupter protection for personnel.
Substantiation: The requirement for 120/240 volt receptacles to have GFCI protection will cause many more dangerous conditions to exist. If adopted as proposed, future built portable generators will be incompatible with previously code conforming installations of 2 pole transfer switches that are part of the premises wiring. Instead of reducing the problems with safe generator usage during power outages, may new dangerous configurations may be attempted to get future built generators to work with existing transfer switches. The application should be regulated (temporary power usage for construction, maintenance...), not the equipment (all generators). For non-premises wire connected applications GFCI adapters could be required in lieu of GFCI protected 120/240 volt receptacles on the generator.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 13-10.

13-17 Log #1479 NEC-P13 **Final Action: Reject**
(445.19 (new 445.20))

Submitter: James Allison, Mechanical Products Co.
Comment on Proposal No: 13-11
Recommendation: Revise as follows:
Ground-Fault Circuit Interrupter Protection for Receptacles on Portable Generators. All 120 ~~and 120/240~~ volt, single-phase, 15- and 20, ~~and 30~~ ampere receptacle outlets that are part of a portable generator shall have listed ground-fault circuit interrupter protection for personnel.
Substantiation: Mechanical Products Co. recommends that GFCI protection NOT be required on 30 amp 120/240 VAC twist-lock receptacles for use with portable generators. One of the biggest arguments against this proposal is that it will necessitate the installation of a more expensive three-pole transfer switch. Higher consumer (residential user) cost for these transfer switches will inevitabley equate to an overall reduction in the number of new switches installed. Fewer installed switches mean more back-feed problems, and this simply exacerbates safety issues the proposal is attempting to eliminate.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 13-10.

13-18 Log #1090 NEC-P13 **Final Action: Reject**
(445.20)

Submitter: Jim Pauley, Square D Company
Comment on Proposal No: 13-11
Recommendation: Revise the panel action text as follows:
445.20 Ground-Fault Circuit Interrupter Protection for Receptacles on Portable Generators. All 120 and 120/240 volt, single-phase, 15-, and 20~~, and 30~~ ampere receptacle outlets that are a part of a portable generator shall have listed ground-fault circuit interrupter protection for personnel.
Substantiation: Although I would agree in general that having GFCI protection on all receptacles is a positive approach, the addition on the 30 ampere receptacles creates a significant concern in many applications of portable generators.
As the panel is aware, the application of portable generators as an optional power source for electrical systems has become very popular. The typical connection is to install a small sub panel with interlocked circuit breakers to allow for transfer between the utility and generator power sources. This panel is fed from a flanged inlet that is then cord connected to the portable generator. There are thousands of these installations in place with 30 ampere connections. If GFCI protection is provided on the 30A receptacle on the generator, the system will not work because the GFCI will trip. The technical reason for this is because none of these installations have the neutral switched and the GFCI detects the grounded neutral at the service.
If the panel moves forward with the requirement, as soon as a new generator is purchased, it renders these existing installations useless. This will lead the user to find a way to bypass the GFCI protection so that the generator will work with their installation. The panel should drop the 30 ampere provision to allow the generator to continue to serve in the optional stand-by applications.
The provision for 15 and 20 ampere receptacles can continue since very few of these generators are connected at 20A or less.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 13-10.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 11 Negative: 3
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
FLACH, G.: See my explanation of negative vote on Comment 13-10. GFCI protection should not be required on 30-ampere, 125- and 250 volt receptacles.
NASBY, J.: NEMA disagrees with Panel Action. The Comment should have been accepted. The submitter is correct that when the generator is used as an alternate power source in accordance with Article 702, the GFCI will not function properly on systems where the neutral is not switched. The vast majority of residential stand by systems do not have the neutral switched at

the transfer equipment. For construction site applications, Article 590 already provides requirements for protection of the 30 ampere circuits.

RAPPAPORT, E.: See my explanation of negative vote on Comment 13-11.

Comment on Affirmative:

GALLO, E.: This comment should be accepted for reasons stated by the submitter.

13-19 Log #1864 NEC-P13 **Final Action: Reject**
(445.20 (New))

Submitter: Michael Walls, American Chemistry Council
Comment on Proposal No: 13-11
Recommendation: Add text to read as follows:

Exception: In industrial establishments only, where conditions of maintenance and supervision ensure that only qualified personnel are involved, portable generators without GFCI receptacles may be applied when serving loads whose loss are judged by the Authority Having Jurisdiction to have safety consequences.

Substantiation: The proposal ignores industrial applications of portable generators in which loss of power can have safety consequences. Examples might include: refrigeration compressors for cryogenic storage of flammable materials, flood lighting for workers on elevated structures, magnetically held cutting/welding tools or ventilation/pressurization for enclosures in a hazardous location. The proposal could be supported if an exception is added as shown above.
Panel Meeting Action: Reject
Panel Statement: Portable generators should not be used where maintaining the power supply is essential to life safety.

Submitter: Rod Belisle, NECA-IBEW Electrical Training Center
Comment on Proposal No: 9-142
Recommendation: "Accept in principle" with the addition of the following:
The provisions for locking shall remain in place with or without the lock installed.
Substantiation: This proposal should have been "accept in principle" with the addition of the following: "The provisions for locking shall remain in place with or without the lock installed."

See my previous comments for a negative vote in the ROP on this proposal.

Panel Meeting Action: Reject
Panel Statement: CMP 9 reaffirms its panel statement on this subject. The statement applies whether or not the locking arrangements are permanent.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 9 Negative: 2
Explanation of Negative:

BELISLE, R.: The addition of an insight disconnect at the transformer provides an additional level of safety that would benefit workers providing maintenance and installation. Lock out and safety of energized equipment should always be considered when workers are required to work on the associated equipment.

SZENDRE, M.: I agree that insight disconnecting means should be required, and if not insight a means provided for locking. Safety of electrical workers cannot be ignored and with increased fault currents and FR clothing requirements, this issue will not go away.

9-77 Log #721 NEC-P09 **Final Action: Accept**
(450.20(A))

Submitter: Robert Kelleher, Paramount Electrical Services
Comment on Proposal No: 9-143
Recommendation: Continue to Reject .
Substantiation: Continue to Reject. The addition of these NECA Fine Print Notes, serves no benefit to the user of the National Electrical Code. These are not standards, they are a compilation of generic information and do not serve as information to the user. These must be purchased through NECA. This FPN as written is nothing more than free advertisement for generic, readily available information which must be purchased by the code user. A total of seventeen new Fine Print Notes were proposed to reference NECA standards. Sixteen were unanimously rejected. Inclusion of this Fine Print Note is in direct conflict with 90.1(C). The TCC should intervene to prohibit these types of Fine Print Notes. CMP 9 should continue to reject this FPN. Failure to do so will mean adding Fine Print Notes for IEC, EEI, IBEW, IAEI, ACC, NETA, NEI, SEIA, AISI, API, ASHE, AHAM, ICEAI, NYBFU and dozens of others when they decide to develop income through generic standards development. If this type of Fine Print Note is placed anywhere in the NEC an Annex should be included with coupons for the code user. If the NEC is to be used for advertisement purposes, coupons should be included.
Panel Meeting Action: Accept
Panel Statement: The Panel does not necessarily agree with all the substantiation provided by the submitter of this Comment.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11
Comment on Affirmative:

SZENDRE, M.: While I understand the submitter's comment on limiting fine print notes, I disagree that they are a compilation of generic information that provides no information to the users. These manuals are well written and provide valuable information to the users.

13-20 Log #2183 NEC-P13 **Final Action: Reject**
(455.7(C))

Submitter: Patrick Gaffney, Ronk Electrical Industries, Inc.

Comment on Proposal No: 13-13

Recommendation: 455.7 covers the overcurrent protection for the input side of the phase converter, not the output side. If a short circuit occurs in the input section of the converter, or wiring from overcurrent protection to the input, the only limiting factor is source impedance. Therefore, accept text as proposed in Proposal 13-13 for those cases where a power loss hazard exists, which by the way, are very rare instances. Current 125 percent or next standard size limit is too restrictive for equipment which must operate for safety and may be operating at loads exceeding rated full load of the motor operating the device.

Substantiation: The panel statement speaks of phase converter supplying short circuit current, Section 455.7 covers phase converter input overcurrent protection only. Output overcurrent is covered by Articles for the type of equipment being operated (Article 430 for motor loads, for example). 240.4(A) allows equipment to be protected for short circuit only when power loss hazards exist if overcurrent protection is based on typical overload sizing. If nothing else, there certainly needs to be something that allows more than the existing 125 percent or next standard size limit that now exists, when loads that must operate are involved, say 300-1000 percent at minimum.

Panel Meeting Action: Reject

Panel Statement: This comment does not comply with Section 4.4.5 (c) of the NFPA Regulations Governing Committee Projects in that it does not provide text of the comment, including the wording to be added, revised (and how revised), or deleted.

ARTICLE 480 STORAGE BATTERIES

13-21 Log #1421 NEC-P13 **Final Action: Accept in Principle**
(480.5 (New))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Comment on Proposal No: 13-16

Recommendation: NEMA disagrees with the panel action. NEMA recommends that Proposal 13-16 be Accepted as written:

480.5 (new) Disconnecting Means. A disconnecting means shall be provided for all ungrounded conductors derived from a stationary battery system. A disconnecting means shall be readily accessible and located within sight of the battery system.

Substantiation: The panel action on Proposal 13-16 should be Rejected for the following reasons:

From an infrastructure standpoint of using and maintaining a safe battery system, battery systems require maintenance. The purpose of this proposal is to provide a safe and standardized method to perform routine battery maintenance. Mr. Nasby's, Mr. Stafford's and Mr. Swayne's negative panel comments clearly describe the potential hazards to not having a disconnecting means readily accessible and located within sight of the battery system.

The proposal specifically left out details and ratings for disconnect means as that is not in the purview of an installation code. Construction details, ratings and performance criteria are best developed in specific product standards.

Panel Meeting Action: Accept in Principle

Revise the new 480.5 to read as follows:

480.5 Disconnecting Means. A disconnecting means shall be provided for all ungrounded conductors derived from a stationary battery system over 30 volts. A disconnecting means shall be readily accessible and located within sight of the battery system.

Panel Statement: A disconnect is necessary for maintenance of battery systems over 30 volts.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 11 Negative: 3

Ballot Not Returned: 1 Gustafson, R.

Explanation of Negative:

ELKINS, D.: This comment as modified by the panel should be rejected. No substantial basis was provided for the 30 Volt threshold, nor was any amp-hour minimum or basis provided for the disconnect requirement.

GALLO, E.: This comment should be rejected for the following reasons:

1. The practical effect of the language accepted by the panel is only to create confusion. According to the definition in Article 100, Disconnecting Means is a device, or group of devices, or other means by which the conductors of a circuit can be disconnected from their source of supply. Therefore, as CMP 13 confirmed by acceptance of Comment 13-37, disconnecting means can be bolted connections or terminals and do not necessarily have to be switches or circuit breakers. Since installation of storage batteries typically already have volted connections at their terminals, this language is redundant and the effect of this proposal will only be to create confusion among users of the NEC.

2. The rationale for having a disconnecting means for storage batteries is flawed. The panel seems to be concerned with the possibility of arcing during the disconnection.

a) Typically, battery maintenance is not done while batteries are charging or discharging, but while the batteries are on float. In this condition, the float current is tiny and the hydrogen evolution is minimal.

b) Building codes require adequate ventilation of battery rooms to prevent the accumulation of an explosive mixture. In addition, modern battery chargers are typically designed to prevent situations that lead to excessive hydrogen evolution, such as overcharging or reverse charging.

c) Article 480 covers various types of storage batteries. Not all storage batteries emit hydrogen, so in many cases, this concern is moot.

d) If the panel really intended to address the alleged explosion hazard than the proposed text is inadequate since it does not assure that the disconnect means does not generate sparks.

3. The panel provides no substantiation whatsoever for the 30 Volt threshold. Why is the threshold selected by the panel different from the established battery disconnect threshold in 690.71(E) and 690.71(F)? Note that these apply to the more severe situation where the batteries are cycled frequently as opposed to typical usage for back-up purposes where the batteries are not cycled frequently.

HORNBERGER, B.: There are other methods of providing disconnecting means without the installation of a single disconnect device. The wording proposed in this section is not clear as to the number of disconnects allowed. There is no substantiation for the need of a single disconnect device nor the need for it to be in sight of the battery.

ARTICLE 490 EQUIPMENT, OVER 600 VOLTS, NOMINAL

9-81 Log #1836 NEC-P09 **Final Action: Reject**
(490.21(A)(4)(2))

TCC Action: The Technical Correlating Committee directs that this comment be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.
Submitter: Michael Walls, American Chemistry Council
Comment on Proposal No: 9-152
Recommendation: The panel should have voted to Accept this Proposal.
Substantiation: This proposal as written recognizes a system that provides reliable power to loads in large manufacturing plants. These secondary selective systems are common in double ended substations where maintaining power to loads is critical for operation or system safety in continuous manufacturing facilities and generating stations. These systems utilize automatic logic that parallels sources only momentarily and prohibits continuous paralleling. IEEE 666, "Design Guide for Electric Power Service Systems for Generating Stations" specifically allows this arrangement. Transformer impedances required to allow continuous paralleling would limit the ability to start very large motors in these facilities when operating on a single source. Also, the probability of a fault during the very brief time when both sources are connected in parallel is very low.
Panel Meeting Action: Accept in Principle

Convert the text to mandatory text, as follows:
Insert the following new (5)

(5) Ratings for Systems with Tie Breakers. Circuit breakers shall be permitted to be rated based on the maximum contribution from all connected sources of energy with the tie breaker open provided all of the provisions in (1) through (3) are met.

(1) The conditions of maintenance and supervision shall assure that only qualified persons will design and operate the system.

(2) The system shall have a transfer scheme that limits the time the sources can be operated in parallel.

(3) The time period for which the source and tie breakers can be simultaneously closed during source transfers shall be strictly limited through compliance with (a) and (b.)

(a) A source breaker is arranged to automatically open at the end of the design delay, which shall not exceed 1 second.

(b) Any failure of a source breaker to open at the end of the design delay period results in the generation of an alarm at a continuously monitored point.

Panel Statement: CMP 9 agrees that the comment has merit, however, the subject has many mandatory features and does not qualify for inclusion as a fine print note.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 7 Negative: 4
Explanation of Negative:

BELISLE, R.: Although I agree with the panel in allowing alternative methods to provide switching, manual vs. automatic; in double ended power systems, I do not agree that a time amount can be determined at random to allow for overlap of both systems, thereby exceeding the Fault Current Rating of the associated equipment for any amount of time. In electrical terms, one second is an extremely long time and no documentation was presented to show that said equipment can function in this method without damage or failure. I do not believe the CMP was provided with adequate information to make such a change.

BREITKREUTZ, B.: This comment should be rejected because it would allow the short circuit rating to be exceeded for too much time. There should be no intentional delay.

OSBORNE, R.: The comment permits the sources to be in parallel for 1 second. A fault can occur in much less than 1 second and significant damage may occur within 1/2 cycle or less. If the circuit breaker has an interrupting rating that is less that the fault current, the breaker may fail to interrupt the fault, may be violently destroyed, and may present a fire hazard. Failure to interrupt fault current can in turn cause catastrophic damage to the entire system.

RUPP, B.: This comment should have continued to be rejected. As stated by the panel in the ROP, a tie breaker should have a short circuit interrupting rating based on an evaluation that considers contributions from ALL available sources. There was no substantiation that paralleling for one second without an adequately rated interrupting device results in a safe installation.

9-82 Log #1243 NEC-P09 **Final Action: Accept**
(490.37, 490.55, and 490.72(D))

Submitter: Neil F. LaBrake, Jr., Syracuse, NY
Comment on Proposal No: 9-18
Recommendation: Accept CMP-9's Panel action reference items 10, 11, and 12 on 490.37, 490.55, and 490.72(D) in Proposal 9-18.
Substantiation: This Comment was developed by a Task Group assigned by the NEC Technical Correlating Committee to address actions that were other than "accept" taken by Code-Making Panels on proposals from the TCC to resolve 2005 NEC Proposal 5-1 and Comment 5-1. Members of the Task Group on Grounding and Bonding for this Comment included: C. Douglas White; Michael Johnston; Jeffrey Boksiner; Daleep Mohla; Phil Simmons; Christopher Hutchings; James Carroll; Alan Rebeck; Richard Loyd; Paul Dobrowsky; and Neil F. LaBrake, Jr.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

9-83 Log #580 NEC-P09 **Final Action: Accept**
(490.46)

Submitter: Charles Ball, S & C Electric Company
Comment on Proposal No: 9-158
Recommendation: Reject Proposal 9-158 and retain the text in the 2005 edition.
Substantiation: Most utilities have their own design requirements for customer-owned switchgear that is connected to their system. These requirements are based on decades of experience and typically apply to incoming and metering sections. Proposal 9-158 contains design requirements for the incoming section of metal-clad or metal-enclosed switchgear applied as high-voltage service equipment. While these requirements are based on those of one utility, not all utilities have the same requirements. When there is a conflict, the utility will continue to insist that their requirements be met if the power user wants service. The power user will be in a catch 22 between utility requirements and NEC requirements.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 8 Negative: 3
Explanation of Negative:

FOGARTY, R.: Proposal 9-158 should not have been rejected. The requirements were reviewed and affirmed by the member utilities of the Edison Electric Institute which represents the consensus of the utility industry through EEI and not just of one utility.

HARTWELL, F.: Please refer to my Explanation of Negative vote on Comment 9-91.

MCCULLOUGH, R.: See my explanation of negative vote on Comment 9-91.

9-84 Log #889 NEC-P09 **Final Action: Accept**
(490.46)

Submitter: Brad Gruenewald, We Energies
Comment on Proposal No: 9-158
Recommendation: Reject Proposal 9-158 and retain the text in the 2005 edition.
Substantiation: As an electric utility, We Energies has design requirements for customer-owned medium-voltage switchgear, which is connected to our electrical system. These design requirements have been developed with decades of experience. Our design requirements for medium-voltage switchgear (either metal-clad or metal-enclosed) require separate incoming (termination) and metering bay sections. Typically the termination compartment and isolating switch are contained in the same compartment. This compartment is exclusively under utility control. Our utility personnel are fully qualified to perform switching, testing and phasing operations. This Proposal 9-158 to the 2008 National Electrical Code (NEC) contains design requirements for the termination section of medium-voltage switchgear when applied as service equipment which is in direct conflict with our design requirements.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 8 Negative: 3
Explanation of Negative:

FOGARTY, R.: Proposal 9-158 should not have been rejected. The requirements were reviewed and affirmed by the member utilities of the Edison Electrical Institute which represents the consensus of the utility industry through EEI and not just of one utility.

HARTWELL, F.: Please refer to my Explanation of Negative vote on Comment 9-91.

MCCULLOUGH, R.: See my explanation of negative vote on Comment 9-91.

9-85 Log #916 NEC-P09 **Final Action: Accept**
(490.46)

Submitter: George House, Yaskawa Electric America, Inc.
Comment on Proposal No: 9-158
Recommendation: Reject Proposal 9-158 and retain the text in the 2005 edition.
Substantiation: It would appear unwise to make such a widespread amendment based on the requirements of one utility since not all utilities have the same requirements. In such a conflict it will be the "user" of such equipment caught between the requirements of the electric utility and the NEC requirements. Why must NEC amend and enforce new design requirements that utilities have (for many years) provided for to incoming and metering sections of metal-clad and metal-enclosed switchgear? This amendment will have serious repercussions for customers desiring NEC approval and meeting the demands of the electric utilities' requirements.
Please strike completely.
Panel Meeting Action: Accept
Panel Statement: The Panel does not necessarily agree with all the substantiation provided by the submitter of this Comment.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 8 Negative: 3
Explanation of Negative:
FOGARTY, R.: Proposal 9-158 should not have been rejected. The requirements were reviewed and affirmed by the member utilities of the Edison Electrical Institute which represents the consensus of the utility industry through EEI and not just of one utility.
HARTWELL, F.: Please refer to my Explanation of Negative vote on Comment 9-91.

9-86 Log #1451 NEC-P09 **Final Action: Accept**
(490.46)

Submitter: Robert Molde, Xcel Energy
Comment on Proposal No: 9-158
Recommendation: Reject Proposal 9-158 and retain the text in 490.46 in the 2005 edition.
Substantiation: The design requirements included in Proposal 9-158 are too limiting. Utilities typically have specific requirements for customer-owned switchgear connected to their system. Not all utilities have the same requirements. Contrary to Proposal 9-158 our utility presently specifies the service conductors and an isolating switch in the same compartment and the metering equipment is required to be in an adjacent separate metering compartment. Although there is a footnote in Proposal 9-158 stating the utility may have additional requirements, conflicts with customers will occur when the mandatory requirements of the utility differ from the NEC rule.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 8 Negative: 3
Explanation of Negative:
FOGARTY, R.: Proposal 9-158 should not have been rejected. The requirements were reviewed and affirmed by the member utilities of the Edison Electrical Institute which represents the consensus of the utility industry through EEI and not just of one utility.
HARTWELL, F.: Please refer to my Explanation of Negative vote on Comment 9-91.
MCCULLOUGH, R.: See my explanation of negative vote on Comment 9-91.

9-87 Log #1825 NEC-P09 **Final Action: Reject**
(490.46)

Submitter: Jerry Baskin, Federal Pacific
Comment on Proposal No: 9-158
Recommendation: Omit (delete) the entire proposed Section 490.46 Metal Enclosed and Metalclad Service Equipment.
Substantiation: This proposed section develops specific design criteria for metal-enclosed switchgear. (1) The NEC is not be be design oriented, (2) There is no particular safety advantage in arranging the switchgear in the described fashion (i.e., there is the same exposure to high voltage), (3) The developed design precludes other configurations of metal-enclosed and metalclad switchgear that have been used successfully for decades, (4) The developed design precludes the use of certain other classes of equipment such as wall-mounted switches and pad-mounted switchgear that have been used successfully for decades as high-voltage service equipment and (5) The developed design is known to be presently used only in a small area of the United States and only by one organization.
Panel Meeting Action: Reject
Panel Statement: There is no substantiation to delete the entire existing section 490.46, as well as the proposed text. See panel action and statement on Comment 9-83.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

9-88 Log #1838 NEC-P09 **Final Action: Accept in Principle**
(490.46)

Submitter: Michael Walls, American Chemistry Council
Comment on Proposal No: 9-158
Recommendation: This proposal should have been rejected by the Panel.
Substantiation: The panel should have voted to reject this proposal. The submitter provided no substantiation as to the safety benefits to be added by these new requirements over existing practices. These are design specifications.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Comment 9-83.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 8 Negative: 3
Explanation of Negative:
FOGARTY, R.: Proposal 9-158 should not have been rejected, Consistency in equipment is of benefit for safety where contractors work on equipment connecting to different utilities.
HARTWELL, F.: Please refer to my Explanation of Negative vote on Comment 9-91.
MCCULLOUGH, R.: See my explanation of negative vote on Comment 9-91.

9-89 Log #2173 NEC-P09 **Final Action: Accept**
(490.46)

Submitter: Daniel Wycklendi, Copper Power Systems
Comment on Proposal No: 9-158
Recommendation: Reject Proposal 9-158 and retain the text in the 2005 edition.
Substantiation: Most utilities have their own design requirements for customer-owned switchgear that is connected to their system. These requirements are based on decades of experience and typically apply to incoming and metering sections. Proposal 9-158 contains design requirements for the incoming section of metal-clad or metal-enclosed switchgear applied as high-voltage service equipment. While these requirements are based on those of one utility, not all utilities have the same requirements. When there is a conflict, the utility will continue to insist that their requirements be met if the power user wants service. 9-90 Log #2232 NEC-P09 **Final Action: Accept**
(490.46(1))

Submitter: Anne Morgan, Pepco
Comment on Proposal No: 9-158
Recommendation: Reject Proposal 9-158 and retain the text in the 2005 edition.
Substantiation: The proposed wording contains design requirements, but little that addresses safety. Our design requirements for primary customers have been in place for decades and used successfully for both the customer and our electric system. We require MC switchgear with drawout breakers, glow tubes, voltage transformers as well as the equipment listed. For special installations we need to be able to design to the need and not be limited to the devices listed in the NEC. We also require a ground and test device for testing and phasing. Isolating switches and ground bails would not be allowed in the MC switchgear connecting to our system. I am not sure from the wording that the difference between MC and ME switchgear is understood. The proposed wording addresses design and goes well beyond the stated purpose of the NEC. It leaves our customers with the difficult choice of designing to our requirements or the NEC requirements.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 8 Negative: 3

Explanation of Negative:
FOGARTY, R.: Proposal 9-158 should not have been rejected. The requirements were reviewed and affirmed by the member utilities of the Edison Electric Institute which represents the consensus of the utility industry through EEI and not just of one utility. The proposal does not restrict the use of additional requirements of a particular utility.
HARTWELL, F.: Please refer to my Explanation of Negative vote on Comment 9-91.
MCCULLOUGH, R.: See my explanation of negative vote on Comment 9-91.

9-91 Log #1176 NEC-P09 **Final Action: Reject**
(490.46(B)(1))

Submitter: Neil F. LaBrake, Jr., National Grid / Rep. Edison Electric Insitute-Electric Light & Power Group
Comment on Proposal No: 9-158
Recommendation: The Panel action rewording of paragraph 490.46(B)(1) should be changed back to the original wording of the submitter. The text would now read as follows:
(B)(1) Door. The compartment shall include a hinged door with provision for applying a separate lock in the field.
Accept the remainder of the text as shown in the Panel meeting action section published in the ROP on Proposal 9-158.
Substantiation: The hinged cover provides for more immediate access to service entrance equipment which enhances safety for the purpose of testing for the presence of voltage and applying safety grounds. A hinged cover provides a safer means of access.
Edison Electric Institute affirms the remainder of the Panel's action and the work of the Panel represents the consensus of the utility industry through EEI and not just of one utility.
Panel Meeting Action: Reject
Panel Statement: The panel action on Comment 9-83 has removed this text. Refer to the substantiation in Comments 9-83, 9-84, 9-85, 9-86, 9-88, 9-89 and 9-90.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 8 Negative: 3
Explanation of Negative:
FOGARTY, R.: Proposal 9-158 should not have been rejected, and this comment should have been accepted. The requirements were reviewed and affirmed by the member utilities of the Edison Electric Institute which represents the consensus of the utility through EEI and not just of one utility.
HARTWELL, F.: This comment should have been accepted. It is apparent that the utilities have coalesced, finally, around consensus language that would lead to a consistent approach that would allow consistency in training. It is worthy of note that of the negative comments, only two were from utilities, although the reported negative oral comment from a former utility member of this panel is of concern. This comment should form the basis for a further attempt at consensus during the next cycle.
Note to the TCC: Assuming this comment remains rejected, this submitter's Comment 4-51 should be reported as rejected as well. CMP 4 met before CMP 9 and would not have been aware of this action. In addition, the staff decision in the Draft to locate this section as 490.47 is correct and should stand.
MCCULLOUGH, R.: I concur with the reasoning of Mr. Fogarty and Mr. Hartwell. Comment 9-158, submitted on behalf of the EEI, does indeed indicate consensus by that segment of the industry.

(500.6(A), FPN 3)

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 14-14
Recommendation: The Technical Correlating Committee directs the panel to reconsider the action on this proposal and include the Fahrenheit temperature in order to maintain consistency with the balance of the code. This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept in Part
The panel is accepting the TCC direction to reconsider. But the panel is not changing the action on Proposal 14-14
Panel Statement: The panel is not changing the action on Proposal 14-14 because:
- Degrees Celsius is the industry standard for this application.
- The panel wishes to maintain consistency with Table 4.4.2 of NFPA 497, which reports data in degrees Celsius.
The panel notes that portions of the Code express certain parameters as a percentage of the autoignition temperature in degrees Celsius. The percentage of the autoignition temperature in degrees Fahrenheit is not the same.

Substantiation: The standard referenced, ISA TR12.13.03 will be published prior to the ROC meeting.
Panel Meeting Action: Reject
Panel Statement: This particular standard has not been published and, therefore, cannot be referenced.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-3 Log #2026 NEC-P14 **Final Action: Reject**
(500.7(K), FPN 1)

Submitter: Patrick J. Byrne, FM Approvals, LLC
Comment on Proposal No: 14-18
Recommendation: Revise as follows:
FPN No. 1: For further information, see ANSI/ISA-12.13.01, Performance Requirements, Combustible Gas Detectors, ~~and ANSI/UL2075~~, Gas ~~and Vapor Detectors and Sensors.~~
Substantiation: There are three main technical reasons to show that a gas detector listed to ANSI/UL 2075 not only contradicts the requirements of ANSI/ISA 12.13.01 it also contradicts the requirements of this article within the NEC. ANSI/UL 2075 does not mandate acceptance to ANSI/ISA 12.13.01 section 15.1 it requires compliance to ANSI/ISA 12.13.01 or UL 284. The section 15.1 e) which references ANSI/ISA 12.13.01 violates two main requirements in ANSI/ISA 12.13.01, it allows both the measurement and the alarm levels to exceed 100% LEL. ANSI/ISA 12.13.01 limits the measurement to 100% LEL and limits Alarm levels not to exceed 60 percent LEL. Section 9.4.1 states "Removal of a snap on cover to gain access to the sensitivity control is permissible only when no hazardous voltage parts are able to be contacted by the user. By not requiring a too secured cover or password protection to the adjustments, this requirement contradicts the first sentence of 500.7 K) "...where the conditions of maintenance and supervision ensure that only qualified persons service the installation." Section 2.7.2 of ANSI/ISA 12.13.01 states a special tool is required to gain access to, or to adjust, controls. The design of the tool is intended to discourage unauthorized interference with the apparatus.
The use of this standard is not common practice by the gas detection community in fact the standard, in its current format, has been rejected by the gas detection community. Three of the most predominate nationally recognized testing laboratories (NRTL) that list gas detection equipment for the detection of combustible gas detectors are FM Approvals. CSA International and UL.

As a representative of FM approvals, I can state that it is FM approvals policy to use our FM 6310.6320 and ANSI/ISA 12.13.01 to certify a combustible gas detector. I have provided documents taken from both CSA International and from the UL website which identifies the requirements for having a gas detector listed for performance both documents state ISA 12.13, as the performance requirement and neither identify ANSI/UL 2075 as a required standard. Furthermore, there are only six manufacturers that have any gas detection equipment listed by these three NRTLs to ANSI/UL 2075. Of the six certifications, only two are certified as a combustible gas detector that can be used in this application. Both are certified to ISA 12.13 but neither are certified to the current edition of ANSI/UL 2075. I have discussed this standard with manufacturers including one of the UL listed manufacturers, and they have no intention to use this standard for a number of reasons. One of the main technical reasons is one test requires the exclusion of dust. This test will exclude one the of the most common types of technology used, catalytic sensors. A catalytic sensor requires an explosionproof protection method. A sintered metal disk is used to protect the sensor which acts as a flame arrestor, during this dust test the sintered disk would clog resulting in a failure. Based on the extremely limited use of the standard, the contradiction between the ANSI/UL 2075 with the National Electrical Code and ANSI/ISA 12.13.01 and that the testing will exclude one of the most common types of technology in use today please reconsider the addition of this standard.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: UL 2075 references ISA 12.13.01 for performance requirements. It also includes requirements for reliability of circuitry and components. The panel notes that the substantiation statement references a UL document (UL 284) that does not exist.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

Comment on Affirmative:

LAWRENCE, JR., W.: The submitter notes that a typographical error was introduced into the comment and that the correct UL Standard is UL 1484, not the UL284 as was shown in the comment.

ARTICLE 501 CLASS I LOCATIONS

14-4 Log #1254 NEC-P14 **Final Action: Accept**
(501, 502, 503, 505, 506, and 511)

Submitter: Neil F. LaBrake, Jr., Syracuse, NY

Comment on Proposal No: 14-22

Recommendation: Continue to accept the following portions of the TCC Grounding and Bonding Task Group proposal 14-22 as modified and revised by the actions of CMP-14: 501.10(A)(1)(c), 501.10(B)(2)(5), 501.15(A)(4) Exception No. 2, 501.140(B)(2), 501.145, 502.10(A)(1)(3), 502.140(2), 502.145(A), 502.145(B), 503.140, 505.15(B)(1)(b), 505.17(2), 506.15(A)(3), 506.17(2), and 511.16(B)(2).

Substantiation: The CMP-14 revisions to the proposal have been made for clarity and continue to be consistent with the Grounding and Bonding Task Group's original initiatives.

This Comment was developed by a Task Group assigned by the NEC Technical Correlating Committee to address actions that were other than "accept" taken by Code-Making Panels on proposals from the TCC to resolve 2005 NEC Proposal 5-1 and Comment 5-1. Members of the Task Group on Grounding and Bonding for this Comment included: C. Douglas White; Michael Johnston; Jeffrey Boksiner; Daleep Mohla; Phil Simmons; Christopher Hutchings; James Carroll; Alan Rebeck; Richard Loyd; Paul Dobrowsky; and Neil F. LaBrake, Jr.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-5 Log #117 NEC-P14 **Final Action: Accept in Part**
(501.10(A)(1)(c) and (d))

TCC Action: In accordance with the direction of the Technical Correlating Committee at the Report on Proposal stage, the Technical Correlating Committee directs that the following FPNs be deleted.

FPN No. 2 of 501.10(A)(1)d

FPN No. 4 of 501.15

FPN of 502.10(A)(1)

FPN No. 2 of 506.15(A)(3) Exception

The Technical Correlating Committee notes that the purpose of establishing Annex A was to eliminate the need to have FPNs throughout the code that reference the product standards. There is no basis for the Chapter 5 articles to be treated differently.

The Technical Correlating Committee further directs that the title for UL 2225 in Annex A be revised from "Metal-Clad Cables and Cable-Sealing Fittings for Use in Hazardous (Classified) Locations" to "Cables and Cable Fittings for Use in Hazardous (Classified) Locations" to be consistent with the title from the product standard.

Submitter: Technical Correlating Committee on National Electrical Code

Comment on Proposal No: 14-26

Recommendation: The Technical Correlating Committee directs that the panel reconsider the action on this Proposal. The requirement in the main text is for the cable in question to be listed. The FPNs add a reference to the product standard. Annex A of the NEC was specifically added to handle these types of references. The panel should delete the new FPNs and add a reference to UL 2225 into Annex A. This will make the text consistent with how standards for listing are treated elsewhere in the code. This action will be considered by the panel as a public comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept in Part

The panel has accepted the direction of the TCC to reconsider the issue and agrees that the reference should also be in Annex A. However, it is the position of the panel that it is essential to retain the fine print notes and references for the benefit of users of this particular part of the Code.

Panel Statement: To help ensure safe application and installation of the equipment. This is additional information to lead the user to a specific reference document. The panel points out that the purpose of the standard references in these fine print notes is to improve the usability of the Code.

Number Eligible to Vote: 14

Recommendation: CMP-8 recommends that CMP-14 accept this proposal in principle with the revised text:

Exception: Type PVC Conduit and Type RTRC Conduit ~~Rigid nonmetallic conduit complying with Article 352~~ shall be permitted where encased...

Substantiation: CMP-8 recommends CMP-14 Accept in Principle Proposal 14-27 with the proposed revised wording based on CMP-8's actions on Proposals 8-53 and 8-78. This revision also addresses the NEC Style Manual.

This comment has been balloted through CMP-8 with the following ballot results:

12 Eligible to Vote

11 Affirmative

1 Negative

Mr. R. Loyd voted negatively stating: "Proposal 14-27 was to Reject. No comment necessary, CMP-8 has no substantiation for recommending that CMP-14 reverse their action. Note: UL does not recognize any RTRC nonmetallic conduit as comparable to schedule 80 PVC which is suitable for use where subject to physical damage.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-8 Log #548 NEC-P14 **Final Action: Accept in Principle**
(501.10(B)(1)(7))

TCC Action: The Technical Correlating Committee notes that the purpose of establishing Annex A was to eliminate the need to have FPNs throughout the code that reference the product standards. There is no basis for the Chapter 5 articles to be treated differently.

Directs that the FPN added in the panel action be deleted. Product standards references are to be included in Annex A and are not to be added as FPNs.

Submitter: Edward M. Briesch, Underwriters Laboratories Inc.

Comment on Proposal No: 14-33a

Recommendation: Revise text to read as follows:

(7) In industrial establishments with restricted public access where the conditions of maintenance and supervision ensure that only qualified persons service the installation and where metallic conduit does not provide sufficient corrosion resistance, Reinforced Thermosetting Resin Conduit (RTRC) marked with suffix -XW, factory elbows, and associated fittings in accordance with 355.6, and Schedule 80 PVC Conduit, factory elbows and associated fittings, in accordance with 352.6 shall be permitted.

Where seals are required for boundary conditions as defined in 501.15(A)(4), the Division 1 wiring method shall extend into the Division 2 area to the seal which shall be located on the Division 2 side of the Division 1 – Division 2 boundary.

Substantiation: In order to obtain RTRC with the equivalent mechanical strength of Schedule 80 PVC, RTRC marked RTRC-XW needs to be specified.

Panel Meeting Action: Accept in Principle

Revise text to read as follows:

(7) In industrial establishments with restricted public access where the conditions of maintenance and supervision ensure that only qualified persons service the installation and where metallic conduit does not provide sufficient corrosion resistance, Reinforced Thermosetting Resin Conduit (RTRC) factory elbows, and associated fittings, all marked with suffix -XW, ~~in accordance with 355.6,~~ and Schedule 80 PVC Conduit, factory elbows and associated fittings~~, in accordance with 352.6~~ shall be permitted.

Where seals are required for boundary conditions as defined in 501.15(A)(4), the Division 1 wiring method shall extend into the Division 2 area to the seal, which shall be located on the Division 2 side of the Division 1 – Division 2 boundary.

Add a fine print note to 501.10(B)(1)(7) to read:

FPN: For additional information on RTRC-XW, see ANSI/UL 1684A, Supplemental Requirements for Extra-Heavy Wall Reinforced Thermosetting Resin Conduit (RTRC) and Fittings

Also, add ANSI/UL 1684A, Supplemental Requirements for Extra-Heavy Wall Reinforced Thermosetting Resin Conduit (RTRC) and Fittings, to Annex A.

Panel Statement: The panel has moved the reference to "XW" marking to clarify that it applies to the elbows and fittings as well as the conduit itself. The references to 352.6 and 355.6 are deleted because they are covered in 90.3. A fine print note has been added to provide a correlation between RTRC-XW and the specific product standard. A reference has been added to Annex A to the appropriate product standard. See also panel action on Comment 14-5.

Number Eligible to Vote: 14

Submitter: Richard E. Loyd, Sun Lakes, AZ

Comment on Proposal No: 14-33a

Recommendation: Do not change the existing text. Please Reject this Proposal.

Substantiation: There is no substantiation provided that Reinforced Thermosetting Resin Conduit (RTRC) or Schedule 80 PVC will adequately stand up to and safely contain all of the types of hazardous liquids, vapors or gases likely to be present at sometime during the life of the installation. PVC is not recommended for use where subject to petroleum based products. Although explosions are not likely to occur in a Class I Division 2 location they do and no testing has been done on these products to verify they will withstand pressure piling or contain an explosion. Also, the solvent attached couplings will not allow the gases to escape slowly to allow them to cool to a safe level. Static is another source of ignition that has not been examined when the raceways are nonmetallic. The proposed language would permit limited use of nonmetallic raceways where metal raceway does not provide sufficient corrosion protection. The corrosion performance of the PVC coated rigid metal conduit and the rigid PVC conduit is virtually identical. However, the PVC coated rigid metal conduit provides increased physical strength and electric conductive performance. PVC coated rigid metal conduit provides superior sun light resistance protection and its characteristics do not change when exposed to extreme hot or cold environments.

The 2006 UL White book states that RTRC 40 and RTRC 80 are not suitable for use where subject to physical damage. There are many more valid reasons why this proposal should not be accepted, even the prevention of one loss property or life accident is reason enough to reject the proposal.

Panel Meeting Action: Reject

Panel Statement: The concerns raised by the submitter were previously addressed in the substantiation to Proposal 14-33a, and the panel concludes that the substantiation continues to be valid. Additionally, RTRC-XW has been specified to address locations subject to physical abuse. In Division 2 locations, raceway systems are not required to contain an explosion.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

BERNSEN, M.: I disagree with the Panel's action to "reject" and I am voting negative for the following reasons:

There is no substantiation that Reinforced Themosetting Resin Conduit (RTRC) or Schedule 80 PVC will be adequate as a wiring method in a hazardous location. I would first question the lack of testing and evaluation, especially the ability of the attached fittings and solvent to allow the gases to cool and escape slowly. Where metal raceways do not permit sufficient corrosion protection, PVC coated rigid metal conduit will provide the physical protection as well as corrosion protection.

The 2006 UL White book clearly states that RTRC 40 and 80 are not suitable for use where subject to physical damage.

I don't believe that RTRC or PVC schedule 80 should be permitted to be installed in hazardous locations without further evaluation.

14-10 Log #1231 NEC-P14 **Final Action: Reject**
(501.10(B)(1)(7))

Submitter: Joseph Dodds, P.E., Trafford, PA

Comment on Proposal No: 14-33a

Recommendation: Proposal should be Rejected.

Substantiation: Several technical and safety issues exist for rejecting this proposal for installing Schedule 80 PVC and RTRC in Division 2 applications.

Substantiation #1 states that poor installation concerns are a general problem and are addressed by limiting the installations to industrial facilities with qualified personnel. Limiting the installations to industrial facilities with qualified personnel does not resolve the concerns associated with Schedule 80 PVC and RTRC in Division 2 applications because the installation procedure is much different.

Adhesives are used to make the connections of Schedule 80 PVC and RTRC; the proper use of adhesives significantly complicates the installation and safety. Limiting the application to industrial facilities does not insure that qualified personnel familiar with the proper application of adhesives will occur. Cleanliness of the surfaces to be joined; proper mixing of the adhesive; and application conditions such as temperature and humidity greatly impact the formation of an acceptable and safe connection. There is no test identified in the substantiation to confirm that a Schedule 80 PVC or RTRC connection is acceptable; an electrical continuity test can be used to confirm that metal thread connections are acceptable.

NEC Section 500.8 states, "Equipment shall be identified not only for the class of location, but also for explosive, combustible, or ignitable properties of the specific gas vapor, dust, fiber, or flyings that will be present." What test or qualification data are presented for Schedule 80 PVC or RTRC to confirm performance in these applications?

Substantiation #4 states that the risk of physical damage has been minimized by use of RTRC or Schedule 80 PVC. When exposed to impact or crush loads, the failure mode of RTRC or Schedule 80 PVC is not the same as metal conduit. Not only will the RTRC or Schedule 80 PVC become severely damaged at a much lesser impact or crush load, but the failure mode and consequences of the failure mode present a greater safety concern. Metal conduit will be deformed from an impact or crush load, but physical protection for the internal wiring continues. Usually RTRC and Schedule 80 PVC will fracture. The PVC fragment could cut wire insulation and cause short circuits. RTRC will fracture allowing ingress of the corrosive elements and exposing the re-enforcing fibers to attack. Once the RTRC is fractured, its impact and crush strength are greatly reduced.

Substantiation #5 questions materials that might "attack" RTRC or Schedule 80 PVC, but considers this to be addressed by 110.11 and it was suggested that this was not a greater hazard than any other material currently used. Externally PVC coated, internally polyurethane coated steel metal conduit is a product that has successfully performed for nearly 20 years in many very corrosive environments. This product not only provides corrosion protection, but also the rigid metal conduit provides physical protection. Rigid metal conduit will not corrode if the coating adhesion is maintained. Excellent coating adhesion is now confirmed by performance testing in high humidity and high temperature conditions for extended periods of time. Some coated conduit products are now labeled by recognized test laboratories confirming that process procedures produce consistent adhesion. A corrosion resistant product with protective coatings and mechanical strength provided by steel conduit is available for Class I, Division 2 applications.

Substantiation #9 says "Ingress of vapors is assumed as is the case for all other installations and thus is not different for RTRC or PVC conduit installations." The ingress of vapors may be assumed for all installations; however, the mechanical protection and safety performance of an internally coated metal conduit system is superior to RTRC and PVC installations. The protection against impact and crush loads as well as the electrical shielding provided by the coated metal conduit system cannot be duplicated by an RTRC or PVC conduit system. This substantiation appears to imply that it is not different.

Substantiation #10 reports that UL-1684 indicates that Reinforced Thermosetting Resin Conduit (RTRC) material is tested and must be stronger than the connected equipment; therefore it is acceptable. This conclusion does not necessarily follow that a material is acceptable because it must be stronger than the connected equipment. It is necessary to know the specific characteristics that are acceptable and that the characteristics will confirm the safety of the installed system. As stated earlier, the failure mode is also an important indicator of safe performance.

Substantiation #11 states that "Generation of static electricity is not an issue that is specific to RTRC or PVC conduits, since these materials are used for enclosures, flexible connections, etc. which are already permitted." For applications in ordinary locations this statement may be acceptable, but in hazardous locations static electricity is a significant issue. It is also a significant issue where electrical shielding is required. The static electricity issue is resolved by providing a discharge path. This is accomplished easily with metal

conduit or coated metal conduit because the steel is electrically conductive and when properly grounded will provide a discharge path. Removing the static charge from RTRC or PVC conduit is more difficult and impacts the safe operation of these conduit systems.

Based on the concerns expressed above the proposal should be rejected unless test results and evaluations are produced to confirm the performance and safety of RTRC and PVC conduit in Class I, Division 2 application conditions.

Panel Meeting Action: Reject

Panel Statement: The concerns raised by the commenter were previously addressed in the substantiation to Proposal 14-33a, and the panel concludes that the substantiation continues to be valid. Additionally, RTRC-XW has been specified to address locations subject to physical abuse.

14-11 Log #1384 NEC-P14 **Final Action: Accept in Principle**
(501.10(B)(1)(7))

Submitter: William Wagner, Certification Solutions

Comment on Proposal No: 14-33a

Recommendation: This Proposal should continue to be Accepted with the following revision to the proposed text:

In industrial establishments with restricted public access where the conditions of maintenance and supervision ensure that only qualified persons service the installation and where metallic conduit does not provide sufficient corrosion resistance, Reinforced Thermosetting Resin Conduit (RTRC), factory elbows, and associated fittings identified for use in areas where subject to physical damage in accordance with 355.12(C), and Schedule 80 PVC Conduit, factory elbows, and associated fittings~~, in accordance with 352.6,~~ shall be permitted. Where seals are required for boundary conditions as defined in 501.15(A)(4), the Division 1 wiring method shall extend into the Division 2 area to the explosionproof seal which shall be located on the division 2 side of the Division 1 - Division 2 boundary.

FPN: Type XW RTRC is identified for use in areas where subject to physical damage.

Substantiation: The proposed revision addresses the Technical Correlating Committee's comment regarding redundant references. The referenced section for RTRC was changed from 355.6 to 355.12(C), which addresses the requirement that conduit used in areas where subject to physical damage shall be identified for the use. A reference to 352.12(C) is not needed as Schedule 80 PVC Conduit is listed and identified for use in areas where subject to physical damage. A FPN was added to show the correct identification for RTRC currently acceptable for use in locations where subject to Physical Damage.

Panel Meeting Action: Accept in Principle

Panel Statement: The commenter's concerns have been addressed by the panel action on Comment 14-8.

Ballot Results: Affirmative: 14

14-13 Log #2159 NEC-P14 **Final Action: Accept in Principle**
(501.10(B)(1)(7))

Submitter: David H. Kendall, Carlon

Comment on Proposal No: 14-33a

Recommendation: This Proposal should continue to be Accepted with the following revision to the proposed text:

In industrial establishments with restricted public access where the conditions of maintenance and supervision ensure that only qualified persons service the installation and where metallic conduit does not provide sufficient corrosion resistance, Reinforced Thermosetting Resin Conduit (RTRC) identified as XW, factory elbows, and associated fittings ~~in accordance with 355.x~~, and Schedule 80 PVC Conduit, factory elbows, and associated fittings~~, in accordance with 352.6,~~ shall be permitted.

Where seals are required for boundary conditions as defined in 501.15 (A)(4), the Division 1 wiring method shall extend into the Division 2 area to the explosionproof seal which shall be located on the Division 2 side of the Division 1 - Division 2 boundary.

Substantiation: The proposed revision addresses the Technical Correlating Committee's comment regarding redundant references. The referenced sections were deleted since both RTRC-XW and Schedule 80 conduits are both listed and identified for areas of physical damage.

In addition, RTRC-XW was added since RTRC is required to be identified for areas of physical damage. This requirement is the same for the Schedule 80 PVC conduit and ensures additional protection of the wiring method.

Panel Meeting Action: Accept in Principle

Panel Statement: The commenter's concerns have been addressed by the panel action on Comment 14-8.

14-14 Log #2206 NEC-P14 **Final Action: Reject**
(501.10(B)(1)(7))

Submitter: William A. Wolfe, Steel Tube Institute of North America

Comment on Proposal No: 14-33a

Recommendation: This Proposal should be Rejected.

Substantiation: Schedule 80 PVC and RTRC are allowed to be used in Class I, Division 2 locations when encased in concrete and provided with 24 in. of cover. This condition has appeared in the NEC for years. Before Intermediate Metal Conduit (IMC) was allowed to be used in hazardous locations, Panel 14 required a UL fact-finding investigation to show that IMC was suitable for use in these critical locations. The UL investigation covered four areas: explosion pressure test, flame propagation test, hydrostatic strength tests and tensile strength tests. IMC passed all of the tests and was accepted by Code Panels 8 and 14 for use in hazardous locations in 1978.

There has been no fact-finding investigation to show that Schedule 80 PVC and RTRC are suitable for use in these hazardous locations without concrete encasement, etc. A special task group from Panel 14 reviewed product literature and concluded that the products were suitable. This product literature review, however, is not equivalent to actual performance testing. For example, the explosion tests that IMC was subjected to were run to determine as closely as possible the maximum explosion pressures which would result from different mixtures of explosive gases and piping/devices or test configurations. Four hundred and ninety-nine (499) tests were run to conclude that at no time was the pressure great enough to rupture the conduit. Two hundred (200) flame propagation tests were run to show that flame would not propagate to the exterior of an IMC conduit system with threaded joints.

Schedule 80 PVC and RTRC should also be subjected to such testing rather than a literature review to determine if the long-standing restrictions for use in Class 1, Division 2 locations should be removed.

The proposal includes text stating that these conduits may be used "where metallic conduit does not provide sufficient corrosion resistance". In severely corrosive areas, metal conduit with supplementary corrosion protection can be used to provide not only the performance characteristics of metal conduit but additional corrosion protection.

Panel Meeting Action: Reject

Panel Statement: The raceway system in a Division 2 location is not expected to contain an explosion, and therefore tests similar to what were performed to accept IMC, which is a Division 1 wiring method, would not be appropriate.

14-21 Log #2189 NEC-P14 **Final Action: Reject**
(501.140(A)(3) (New))

Submitter: Stephen V. Norako, EGS Electrical Group
Comment on Proposal No: 14-53
Recommendation: Add new text to read as follows:

The raceway shall be sealed to minimize the gas or vapor in the well-pit from being communicated to the location of the power source. This seal shall not be required to be explosionproof.

Substantiation: These well pits are below grade and due to the accumulation of vapors and gases, typically classified Class I Division 1. The flexible cord is the wiring method. The submersible pump is listed Class I Division 1 (typically explosionproof). The pump comes with flexible cord factory installed and factory sealed (Class I Division 1 seal) where it makes connection to the pump. No additional explosionproof seal is needed. This "Suitable Raceway" is not the wiring method (the flexible cord is). The "Suitable Raceway" (typically RMC or RNMC) is there to protect the flexible code from physical damage and allow it to be run underground. It needs to be sealed to only minimize the passage of gases and vapors, not flames. The problem is that this is a subject of much confusion. Installations range from no seal being used to the enforcement of an explosionproof seal. A seal must be used but only to limit the passage of gases, but not to prevent the passage of flames. Although an explosionproof seal is a safe option, engineers are concerned with what happens when the pump needs to be removed for maintenance. This is normally performed by the mechanical trade. The explosionproof seal is ripped out and never replaced. Engineers and contractors have voiced the need for another type of seal such as a mechanical device that can be removed and reinstalled to better address the maintenance issue.
Panel Meeting Action: Reject
Panel Statement: The change in the wording from "wireway" to "raceway" does not preclude the requirements for sealing. Existing requirements for sealing in 501.15 already apply if an electrical raceway is used and is connected to an electrical apparatus.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-22 Log #2222 NEC-P14 **Final Action: Reject**
(501.140(A)(3))

Submitter: Steven J. Blais, EGS Electrical Group
Comment on Proposal No: 14-53
Recommendation: Revise text to read as follows:

The raceways shall be sealed to minimize the gas or vapor in the well-pit from being communicated to the location of the power source. This seal shall not be required to be explosionproof.

Substantiation: These well pits are below grade and due to the accumulation of vapors and gases, typically classified Class I Division 1. The flexible code is the wiring method. The submersible pump is listed Class I Division 1 (typically explosionproof). The pump comes with flexible cord factory installed and factory sealed (Class I Division 1 seal) where it makes connection to the pump. No additional explosionproof seal is needed. This "Suitable Raceway" is not the wiring method (the flexible cord is). The "Suitable Raceway" (typically RMC or RNMC) is there to protect the flexible code from physical damage and allow it to be run underground. This causes the confusion as the rule permits an open ended conduit. It is this open ended conduit that can act as means to communicate gases into the adjacent area. The code panel statement on Proposal 14-53 does refer to the prescribed requirements for boundary seals however this does not alleviate the confusion. The requirements in Class I, Division 1 boundary seals in 501.15(A)(4) requires by "guidance" of the FPN No. 1 of 501.15 that this seal is to minimize the gases and vapors and prevent the passage of flames... So by the code panel referencing back to the requirements of boundary seals it supersedes the intent of minimizing the amount of gas or vapor... which is prescribed for a Class I, Division 1 boundary seal in 501.15(A)(4). The way the current rules are written results in a cord replacement installation not being sealed to even minimize the migration of gases into the open conduit. It would be a safer requirement to require that a seal be provided, one in which can be retrofitted during cord replacement. The purpose of this seal would be to minimize the migration of gases and vapors into the open ended circuit.

The problem is that this is a subject of much confusion. Installations range from no seal being used to the enforcement of an explosionproof seal. A seal must be used but only to limit the passage of gases but not to prevent the passage of flames. Although an explosionproof seal is a safe option, engineers are concerned with what happens when the pump needs to be removed for maintenance. This is normally performed by the mechanical trade. The explosionproof seal is ripped out and never replaced. Engineers and contractors have voiced the need for another type of seal such as a mechanical device that can be removed and reinstalled to better address the maintenance issue.

Recommendation: Accept as revised:
(3) Be connected to terminals ~~in an approved manner~~ in accordance with 110.14 ~~and 501.45.~~ Alternatively, delete (3).
Substantiation: Proposal provides specificity. Panel statement that reference to 110.14 is not necessary because it already applies, also makes (3)unnecessary. The requirements of 110.14 and this section, worded differently, may cause confusion.
Panel Meeting Action: Reject
Panel Statement: The reference to 110.14 is not necessary because it applies throughout the Code.
CMP-14 notes that the complete wording of 501.140(B)(3) was not shown.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
COOK, D.: The submitter and the panel statement both clarify that nothing in 501.140(B)(3) is different than the general requirements in Chapters 1 through 4. NEC 90.3 states the requirements in Chapters 5, 6, and 7 supplement or modify the general rules. The CMP-14 statement indicates there is no reason to include a reference to the general requirements for termination included in 110.14 and I agree with that statement. The current text requires the cord to be terminated in an approved manner which is required for all installations in 110.2. The submitter's alternate recommendation was to delete item 3 completely. Since the text does not supplement or modify the general requirements in Chapters 1 through 4, that recommendation should be accepted.

ARTICLE 502 CLASS II LOCATIONS

14-23 Log #124 NEC-P14 **Final Action: Accept in Part**
(502.10)

TCC Action: The Technical Correlating Committee directs that the FPN of 502.10(A)(3) be deleted in accordance with the direction given to the panel in Comment 14-23. The Technical Correlating Committee intends that the use of Annex A be consistent throughout the code.
Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 14-56
Recommendation: The Technical Committee Committee directs the panel to reconsider this proposal and to relocate the reference into Annex A to be consistent with other parts of the Code. This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept in Part
Panel Statement: See panel action on Comment 14-5.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-24 Log #125 NEC-P14 **Final Action: Accept in Part**
(502.30(A) Exception)

TCC Action: The Technical Correlating Committee directs that the Exception to 502.30(A), be revised to read as follows:
"Exception: The specific bonding means shall be required only to the nearest point where the grounded circuit conductor and the grounding electrode are connected together on the line side of the building or structure disconnecting means as specified in 250.32(B), provided the branch-circuit overcurrent protection is located on the load side of the disconnecting means."
This action correlates the exception with the revised text of 250.32 as accepted by Code-Making Panel 5 in Comment 5-58.
Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 14-62
Recommendation: It was the action of the Technical Correlating Committee that this proposal be reconsidered and correlated with the action on Proposal 5-119. This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept in Part
Panel Statement: See panel action on Comment 14-18.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-25 Log #1871 NEC-P14 **Final Action: Reject**
(502.115)

Submitter: Michael Walls, American Chemistry Council
Comment on Proposal No: 14-63
Recommendation: Retain the current text and reject the action taken on the proposal.
Substantiation: There are two conditions affected by this proposal. The first is the deletion of text within A(1). This text should not be deleted as this text defines criteria for other similar devices, not identified in the "types" identified and additionally there is no justification offered to support this specific change being proposed. In the second case for isolating switches containing no fuses and not installed where dusts of an electrically conductive nature are present, permits these identified types of devices to be installed in dust-tight like enclosures. This has been a historical practice which has yet to be shown unsafe. The comparison to 502.115 (B) is not correct as these are not the same types of devices and the likelihood of ignition is not the same (for example containing fuses in (B) and not containing fuses in (A)(2)). Additionally see the balloting comments for Mr. Wechsler.
Panel Meeting Action: Reject
Panel Statement: The current requirement permits a construction in Division 1, which would not be permitted by 502.115(B) in Division 2.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 2
Explanation of Negative:
WECHSLER, D.: Comments 14-25 and 14-26.
The action should have been to Accept in Principle, with the following revised text which follows the action taken on log 14-28:
502.115 Switches, Circuit Breakers, Motor Controllers, and Fuses.
(A) Class II, Division 1. In Class II, Division 1 locations, switches, circuit breakers, motor controllers, and fuses shall comply with 502.115(A)(1) through (A)(~~2~~ 3).
(1) Type Required. Switches, circuit breakers, motor controllers, and fuses, including pushbuttons, relays, and similar devices that are intended to interrupt current during normal operation or that are installed where combustible dusts of an electrically conductive nature may be present, shall be provided with identified dust-ignitionproof enclosures.
(2) Isolating Switches. Disconnecting and isolating switches containing no fuses and not intended to interrupt current and not installed where dusts may be of an electrically conductive nature shall be provided either
(a) with tight metal enclosures that shall be designed to minimize the entrance of dust and that shall (1) be equipped with telescoping or close-fitting covers or with other effective means to prevent the escape of sparks or burning material and (2) have no openings (such as holes for attachment screws) through which, after installation, sparks or burning material might escape or through which exterior accumulations of dust or adjacent combustible material might be ignited, or
(b) in dusttight enclosures.
Effective January 1, 2011 only dusttight enclosures shall be permitted.
(~~2~~) (3) Metal Dusts. In locations where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present, fuses, switches, motor controllers, and circuit breakers shall have enclosures identified for such locations.
Discussion
Comments 14-25 and 14-26:
During our Panel discussions of 502 and dusttight enclosures we seem to have lost sight of the significant importance that 502.115 (A)(2) provides to industry for personal safety and the basis for the rational for having defined (A) (1) and (A) (2) as was done many years ago with the current texts.
There is a very important distinction made in 502.115 between (A) (1) which is addressing the normal equipment control; how the equipment is designed to be started and stopped during normal operations when such equipment is in a Class II, Division 1 location, and that which is often frequent need to "isolate" for safety reasons rotating equipment which is addressed in (A) (2). I think we all understand normal start/stop controls and the appropriate design needed for use in a Class II, Division 1 location.
"Isolating switches" addressed in (A) (2) are not used for control, but rather they represent a very important additional level of protection which is often needed to allow operators to address problems within processing equipment due to blockage or obstruction or impediment of the process stream. Many Class II processes involve materials which may cake-up or form blockages within the process equipment. When this occurs prompt action must be taken to restore the process. Industry has recognized that the risk to the operator is often too great to merely depend on the standard on-off equipment switch to be used as a single safeguard to prevent the restart of rotating equipment especially when the operator may be exposed to rotating components, as is often the case when the need arises to remove the impediments to the process flow. The isolation switch as addressed in (A)(2) is treated as an additional protection level of protection used in accordance with a administrative control. Typically the actions under this administrative control include, a determination that a blockage has
occurred within the process; stopping of the process using the standard equipment controls, use of the isolation switches under a non-running/non load condition; verification that the isolation has been made, then opening the equipment as appropriate to correct the processing problem. Once the problem has been corrected, the equipment is restored to it closed operating condition, the isolation switch re-closed, the process rechecked, and then the process is restarted.
Again it is important to recognize that the isolation switch is not an operating switch and thus a comparison to other switches used for control in a Division 1 or Division 2 location is not a valid comparison. By design and application there is no transfer of electrical energy under load when the isolation switch is used, as the mechanical equipment is off and at rest. Further it is most important that the isolation switch be locally visible and accessible to permit prompt resolution to the process impairment.

Industry needs to have these isolation switches and our Code panel needs to continue to recognize the significant safety purpose for having these isolation switches and for not treating them as general equipment controls. Aside from the dusttight issue that was discussed the texts in (A) (1) and (A) (2) serve important design roles. These texts need to be retained. Eliminating the complete aspect addressed by Isolation Switches under (A) (2) would be a major disservice to industrial users and by implication could result in the possible application of using only a single means of control with life threatening potentials.

WIRFS, M.: I agree that the original text did not need to be modified. However, Mr. Wechsler has suggested changing the panel action to Accept in Principle with additional changes that have not been fully debated by the panel members.

Since the original comments asked to REJECT the original action on Proposal 14-63 and to leave the existing text in the Code, I realize that a NEGATIVE vote on the panel action leaves the original comment as an unresolved response.

If the panel action to REJECT does not receive sufficient votes to pass, it would seem to me that another action cannot be undertaken at this time and the Technical Correlating Committee should HOLD the original proposal over for the next code cycle when appropriate actions and public review can be processed.

Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 2
Explanation of Negative:

WECHSLER, D.: Comments 14-25 and 14-26

The action should have been to Accept in Principle, with the following revised text which follows the action taken on log 14-28:

502.115 Switches, Circuit Breakers, Motor Controllers, and Fuses.

(A) Class II, Division 1. In Class II, Division 1 locations, switches, circuit breakers, motor controllers, and fuses shall comply with 502.115(A)(1) through (A)(~~2~~ 3).

(1) Type Required. Switches, circuit breakers, motor controllers, and fuses, including pushbuttons, relays, and similar devices that are intended to interrupt current during normal operation or that are installed where combustible dusts of an electrically conductive nature may be present, shall be provided with identified dust-ignitionproof enclosures.

(2) Isolating Switches. Disconnecting and isolating switches containing no fuses and not intended to interrupt current and not installed where dusts may be of an electrically conductive nature shall be provided either
(a) with tight metal enclosures that shall be designed to minimize the entrance of dust and that shall (1) be equipped with telescoping or close-fitting covers or with other effective means to prevent the escape of sparks or burning material and (2) have no openings (such as holes for attachment screws) through which, after installation, sparks or burning material might escape or through which exterior accumulations of dust or adjacent combustible material might be ignited, or
(b) in dusttight enclosures.
Effective January 1, 2011 only dusttight enclosures shall be permitted.
~~(2)~~ (3) Metal Dusts. In locations where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present, fuses, switches, motor controllers, and circuit breakers shall have enclosures identified for such locations.

Discussion

Comments 14-25 and 14-26:

During our Panel discussions of 502 and dusttight enclosures we seem to have lost sight of the significant importance that 502.115 (A)(2) provides to industry for personal safety and the basis for the rational for having defined (A) (1) and (A) (2) as was done many years ago with the current texts.

There is a very important distinction made in 502.115 between (A) (1) which is addressing the normal equipment control; how the equipment is designed to be started and stopped during normal operations when such equipment is in a Class II, Division 1 location, and that which is often frequent need to "isolate" for safety reasons rotating equipment which is addressed in (A) (2). I think we all understand normal start/stop controls and the appropriate design needed for use in a Class II, Division 1 location.

"Isolating switches" addressed in (A) (2) are not used for control, but rather they represent a very important additional level of protection which is often needed to allow operators to address problems within processing equipment due to blockage or obstruction or impediment of the process stream. Many Class II processes involve materials which may cake-up or form blockages within the process equipment. When this occurs prompt action must be taken to restore the process. Industry has recognized that the risk to the operator is often too great to merely depend on the standard on-off equipment switch to be used as a single safeguard to prevent the restart of rotating equipment especially when the operator may be exposed to rotating components, as is often the case when the need arises to remove the impediments to the process flow. The isolation switch as addressed in (A)(2) is treated as an additional protection level of protection used in accordance with a administrative control. Typically the actions under this administrative control include, a determination that a blockage has occurred within the process; stopping of the process using the standard equipment controls, use of the isolation switches under a non-running/non load condition; verification that the isolation has been made, then opening the equipment as appropriate to correct the processing problem. Once the problem has been corrected, the equipment is restored to it closed operating condition, the isolation switch re-closed, the process rechecked, and then the process is restarted.

Again, it is important to recognize that the isolation switch is not an operating switch and thus a comparison to other switches used for control in a Division 1 or Division 2 location is not a valid comparison. By design and application there is no transfer of electrical energy under load when the isolation switch is used, as the mechanical equipment is off and at rest. Further it is most important that the isolation switch be locally visible and accessible to permit prompt resolution to the process impairment.

Industry needs to have these isolation switches and our Code panel needs to continue to recognize the significant safety purpose for having these isolation switches and for not treating them as general equipment controls. Aside from the dusttight issue that was discussed the texts in (A) (1) and (A) (2) serve important design roles. These texts need to be retained. Eliminating the complete aspect addressed by Isolation Switches under (A) (2) would be a major disservice to industrial users and by implication could result in the possible application of using only a single means of control with life threatening potentials.

14-28 Log #1872 NEC-P14 **Final Action: Accept in Principle**
(502.120(B)(2))

TCC Action: The Technical Correlating Committee directs that the panel action be modified to editorially correct the use of the term "provided" so that the last portion of the first sentence reads "…or shall be installed in dusttight enclosures."
Submitter: Michael Walls, American Chemistry Council
Comment on Proposal No: 14-64
Recommendation: Revise text to read as follows:

2) Coils and Windings. Where not located in the same enclosure with switching mechanisms, control transformers, solenoids, and impedance coils shall be provided with tight metal housings without ventilating openings or in dusttight enclosures.

Substantiation: With the addition of the defined term "dusttight" clearly coils and windings should be located within this type of enclosure. However, the historical precedence of permitting the use of a tight metal housing has existed without being cited as an unsafe condition. No justification has been offered to delete the current practice and this text should therefore be retained.
Panel Meeting Action: Accept in Principle
Revise 502.120(B)(2) to read:
(2) Coils and Windings. Where not located in the same enclosure with switching mechanisms, control transformers, solenoids, and impedance coils shall be provided with tight metal housings without ventilating openings or shall be provided in dusttight enclosures. Effective January 1, 2011, only dusttight enclosures shall be permitted.
Panel Statement: The panel has provided time for manufacturers to transition their equipment to dusttight.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:

COSPOLICH, J.: This should become effective with the 2008 NEC.

14-29 Log #550 NEC-P14 **Final Action: Reject**
(502.125(B))

Submitter: Edward M. Briesch, Underwriters Laboratories Inc.
Comment on Proposal No: 14-65
Recommendation: The panel action should be to accept Proposal 14-65.
Substantiation: It makes no sense to require dusttight boxes, fittings and wiring systems and permit dust entrance into a motor or generator. There is a greater likelihood of an ignition source being present in the motor enclosure than in a raceway, conduit fitting or junction box. Furthermore, the Exception is vague, unenforceable and permits a construction in a Class II location that appears to be suitable only for a Class III location. The Panel Statement, fails to address the basic issue of why boxes, fittings and wiring systems need to be capable of excluding dust but motors and generators do not. The requirement for dusttight enclosures for other types of equipment in Class II, Division 2 was accepted by the Panel in the actions taken on Proposals 14-63, 14-64, 14-69 and 14-73.
Panel Meeting Action: Reject
Panel Statement: The commenter has provided no additional information or substantiation to convince the panel that the current requirement and exception do not adequately cover rotating equipment in Class II Division 2 locations. The panel notes the text in in the panel action was not correct. The panel confirms its intent to reject the proposal.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 2
Explanation of Negative:
BRIESCH, E.: The panel action should be to accept Comment 14-29 and accept Proposal 14-65. It makes no sense to require dustight boxes, fittings and wiring systems and permit dust entrance into a motor or generator. There is a greater likelihood of an ignition source being present in the motor enclosure than in a raceway, conduit fitting or junction box. Furthermore, the exception is vague, unenforceable and permits a construction in a Class II location that appears to be suitable only for a Class III location. The panel statement still fails to address the basic issue of why boxes, fittings, and wiring systems need to be capable of excluding dust, but motors and generators do not. The requirement for dustight enclosures was accepted on other types of equipment by the panel in the actions taken on Proposal 14-63; -64; -69 and -73.
COOK, D.: The requirements throughout Article 502 recognize that electrical equipment is capable of igniting combustible dust. The special requirements in Article 502 should provide reasonable assurance the electrical system will not become a source of ignition in these environments. To require the wiring method and termination box at a motor be dusttight and allow the entrance of dust for the motor or generator is beyond logic. It is impossible to understand how conductors in a raceway or box; transformers and capacitors; switches, breakers or motor controllers; luminaires; plugs and receptacles; and other electrical equipment could ignite dust but motors and generators could operate in the same environment and not be ignition capable. While I agree that a delayed effective date would be needed to allow manufacturers time to develop the equipment and have it evaluated, rejection of the proposal and comment to evolve motors and generators seem irresponsible. If the current product standards for "dusttight" enclosures cannot be met my motors and generators, possibly the product standards should be adjusted. The current requirements to "minimize" rather than "exclude" the entrance of dust are impossible to consistently evaluate in the field. Owner/operators, installers, and enforcers have no standard to determine an acceptable amount of dust that can safely be allowed to enter the enclosure. If an acceptable amount could be determined, there would be no way to measure that amount in the field.

14-32 Log #1873 NEC-P14 **Final Action: Reject**
(502.130(B)(2))

Submitter: Michael Walls, American Chemistry Council
Comment on Proposal No: 14-69
Recommendation: The action taken by the Panel should have been to reject this proposal and retain the current text.
Substantiation: The action taken by the Panel should have been to reject this proposal. The current text in 502.130 (B)(2) addresses "Luminaries…where NOT of a type identified for Class II locations,…" and specifically that apparatus as defined in the proposed deleted text addresses this permitted apparatus. The new proposed text to provide dusttight enclosures which would be of a type that is identified for Class II locations, would not be of a type that is not identified Class II locations. Therefore this proposal needs to be rejected.
Panel Meeting Action: Reject
Panel Statement: The commenter has not provided any additional information to justify rejecting the proposal.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
WECHSLER, D.: The action taken by the Panel should have been to reject this original proposal 1873 by accepting this comment.
While it is probably a good goal for the next code cycle to reconsider an editorial rewrite of Article 502 to correct a number of seemingly conflicting texts, the proposed action on this proposal does not make any sense.
The current text in 502.130 (B)(2) addresses "Luminaries…where NOT of a type identified for Class II locations,…". With the proposed action "dusttight" would have replaced the design qualifier wording. However "dusttight" is identified for Class II locations. Therefore what the Panel action would do is provide no ability to use anything but an identified luminary and if is the case, the code already has this provision. The existing text follows the same format as that for Class II, Division 1. Improvement has not been made by the proposed action and until a more complete fix can be made we should stay with the current text.

14-33 Log #458 NEC-P14 **Final Action: Reject**
(502.140(3))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 14-71
Recommendation: Accept as revised:
(3) Be connected to terminals ~~in an approved manner~~ in accordance with 110.14 ~~and 501.45~~. Alternatively, delete (3).
Substantiation: Proposal provides specificity. Panel statement that reference to 110.14 is not necessary because it already applies, also makes (3) unnecessary. The requirements of 110.14 and this section, worded differently may cause confusion.
Panel Meeting Action: Reject
Panel Statement: The reference to 110.14 is not necessary because it applies throughout the Code.
CMP-14 notes that the complete wording of 502.140(3) was not shown.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
COOK, D.: The submitter and the panel statement both clarify that nothing in 502.140(3) is different than the general requirements in Chapters 1 through 4. NEC 90.3 states the requirements in Chapters 5, 6, and 7 supplement or modify the general rules. The CMP-14 statement indicates there is no reason to include a reference to the general requirements for termination included in 110.14 and I agree with that statement. The current text requires the cord to be terminated in an approved manner which is required for all installations in 110.2. The submitter's alternate recommendation was to delete item 3 completely. Since the text does not supplement or modify the general requirements in Chapters 1 through 4, that recommendation should be accepted.

14-33a Log #CC1400 NEC-P14 **Final Action: Accept**
(502.150(B))

TCC Action: To be consistent with the panel action on Comment 14-28 and to correct the errors noted in the negative voting, the Technical Correlating Committee directs that the panel action be modified as follows:
Revise item (B)(1) of the panel action to read:
"(1) Contacts. Enclosures shall comply with 502.150(A)(2), or contacts shall have tight metal enclosures designed to minimize the entrance of dust and shall have telescoping or tight-fitting covers and no openings through which, after installation, sparks or burning material might escape or shall be installed in dusttight enclosures, effective January 1, 2011, only dusttight enclosures shall be permitted."
The Exception remains as shown in the panel action.
Revise Item (B)(2) of the panel action to read:
"(2) Transformers and Similar Equipment. The windings and terminal connections of transformers, choke coils, and similar equipment shall comply with 502.120(B)(2)."
Revise Item (B)(3) of the panel action to read:
"(3) Resistors and Similar Equipment. Resistors, resistance devices, thermionic tubes, rectifiers, and similar equipment shall comply with 502.120(B)(3)".

Submitter: Code-Making Panel 14,
Comment on Proposal No: 14-73
Recommendation: Revise 502.150(B) to read as follows:
(B) Class II, Division 2. In Class II, Division 2 locations, signaling, alarm, remote-control, and communications systems; and meters, instruments, and relays shall comply with 502.150(B)(1) through (B)(5).

(1) Contacts. Contacts shall be provided in dusttight Eenclosures. shall comply with 502.150(A)(2), or contacts shall have tight metal enclosures designed to minimize the entrance of dust and shall have telescoping or tight-fitting covers and no openings through which, after installation, sparks or burning material might escape.

Exception: In nonincendive circuits, enclosures shall be permitted to be of the general-purpose type.

(2) Transformers and Similar Equipment. The windings and terminal connections of tTransformers, choke coils, and similar equipment shall comply with 502.120(B)(2)be provided with tight metal enclosures without ventilating openings.

(3) Resistors and Similar Equipment. Resistors, resistance devices, thermionic tubes, rectifiers, and similar equipment shall comply with 502.120(B)(3) 502.130(A)(3).

Exception: Enclosures for thermionic tubes, nonadjustable resistors, or rectifiers for which maximum operating temperature will not exceed 120°C (248°F) shall be permitted to be of the general-purpose type.

Items (4) and (5) remain unchanged by this Panel Comment
Substantiation: This comment correlates 502.150(B) with previous actions on Comment 14-28 and removes some redundancy in the code.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 2
Explanation of Negative:

BRIESCH, E.: The text of the recommendation for Comment 14-33a provided with the ballot from NFPA is not what was agreed upon and accepted by the panel at the ROC meeting. Comment 14-33a modifies the panel action to accept Proposal 14-73. The following text is what I believe, based on my notes, was accepted as Comment 14-33a and correlates with the action taken on comment 14-28.

(B) Class II, Division 2. In Class II, Division 2 locations, signaling, alarm, remote-control, and communications systems; and meters, instruments, and relays shall comply with 502.150(B)(1) through (B)(5).

(1) Contacts. Enclosures shall comply with 502.150(A)(2), or contacts shall have tight metal enclosures designed to minimize the entrance of dust and shall have telescoping or tight-fitting covers and no openings through which, after installation, sparks or burning material might escape or shall be provided in dusttight enclosures, effective January 1, 2011, only dusttight enclosures shall be permitted.

Exception: In nonincendive circuits, enclosures shall be permitted to be of the general-purpose type.

(2) Transformers and Similar Equipment. The windings and terminal connections of transformers, choke coils, and similar equipment shall comply with 502.120(B)(2) ~~be provided with tight metal enclosures without ventilating openings.~~

(3) Resistors and Similar Equipment. Resistors, resistance devices, thermionic tubes, rectifiers, and similar equipment shall comply with 502.120(B)(3) ~~502.130(A)(3)~~.

~~Exception: Enclosures for themionic tubes, nonadjustable resistors, or rectifiers for which maximum operating temperature will not exceed 120°C (248°F) shall be permitted to be of the general purpose type.~~

COOK, D.: The text included in Comment 14-33a is not the text CMP-14 developed and approved at the meeting. The purpose of this panel comment was to extend the January 1, 2011 effective date used on Comment 14-28 for required dusttight ratings to the enclosures in 502.150. That would correlate with the allowance provided by Comment 14-28. The 2005 NEC describes an enclosure that minimizes the entrance of dust. Proposal 14-73 revised that requirement and required the enclosure to be "dusttight". During discussion of Comment 14-28, CMP-14 agreed to an effective date to allow equipment manufacturers time to develop dusttight enclosures and allow time for those enclosures to be evaluated as dusttight. Additional revisions were included to remove redundancy in this section. The text was developed in a Microsoft Word document during the panel meeting. Obviously the transfer of text from the Word document to the Filemaker database failed to include the text that was approved at the meeting. I agree with the action taken at the meeting in Redondo Beach, but do not agree with the recommendation included with the ballot. While chairing the meeting I was not able to save a copy of the 14-33a text, but assume other panel members may have the exact text that was voted on during the meeting. I would voted affirmative for that text.
Comment on Affirmative:

NEAGLE, J.: The recommendation made by CMP-14 includes several typos, accepting this recommendation would accept these typos into the NEC text.

In Item (B)(1), the capital "E" should be deleted from the word "enclosures", and the word should be immediately followed by a comma, not a period.

In Item (B)(2), the capital "T" should be deleted from the word "transformers."

WECHSLER, D.: My notes from this action in part agree with the comments of Ed Briesch, but with some differences.

In brief summary, my notes reflect that following discussions the Committee action focused on a "principle" which was the aspect of 'how tight' a metal enclosure was, and that dusttight provided this definition. However the metal enclosure had been an accepted NEC practice without any problem over many years of use and it was concluded that a good fix to allow for implementation was to do as was done in Comment 14-28. Comment 14-28 caused a sentence to be added to the end of the existing text which read, "Effective January 1, 2011 only dusttight enclosures shall be permitted". The Committee action for this Committee generated Comment (14-33a) to accept is actually based upon the "accept in principle" "See action on Comment 14-28" and was to apply the time implementation sentence to the end of the existing text. Since the former action on the proposal 14-73 was to accept, the Committee comment began with the proposal text. The committee actually agreed not to accept the proposal text but as was done in 14-28 accept in principle regarding the metal enclosure as the principle but with the action of 14-28. This is why the text appears in the ballot action. Missing however were the editorial strikeouts, etc which is the point correctly identified by Ed Briesch. However adding the new sentence "Effective January 1, 2011 only dusttight enclosures shall be permitted" does not work for this 502.150(B)(1) paragraph because enclosures may still comply with 502.150(A)(2) (a condition found in the first part of this clause) and there was no action in this cycle to change 502.150(A)(2). Therefore, to correct just this portion of the action, the Committee Comment should read as follows:

{502.150}

(B) Class II, Division 2. In Class II, Division 2 locations, signaling, alarm, remote-control, and communications systems; and meters, instruments, and relays shall comply with 502.150(B) (1) through (B)(5).

(1) Contacts. Enclosures shall comply with 502.150(A)(2), or contacts shall either be in dusttight enclosures or have tight metal enclosures* designed to minimize the entrance of dust and shall have telescoping or tight-fitting covers and no openings through which, after installation, sparks or burning material might escape. *Effective January 1, 2011, only dusttight enclosures shall be permitted.

Exception: In nonincendive circuits, enclosures shall be permitted to be of the general-purpose type.

Additional actions taken under this same Committee Comment deal with (B)(2) and (B)(3).

In the case of (B)(2) my notes again reflect the Committee focus on the text reading "provided with tight metal enclosures without ventilating openings". In the proposal phase Proposal 14-73 suggested replacement of metal without ventilating openings with the term "dust" which would have resulted in the phrase "..shall be provided with dusttight enclosures.". In the comment phase this action was suggested as again deleting the "metal…" phrase and replacing this with "shall comply with 502.120(B)(2). However my notes again suggest some discussion that 502.120 (B)(2) might not be the appropriate reference since this was a different section and that if this was a correct reference that Committee action at the next NEC cycle to address Article 502 would best resolve this issue. Therefore the Committee action was to follow the actions taken in (B)(1) which would read as follows:

(2) Transformers and Similar Equipment. The windings and terminal connections of transformers, choke coils, and similar equipment shall comply with 502.120(B)(2). be provided with tight metal enclosures without ventilating openings or in dusttight enclosures. Effective January 1, 2011, only dusttight enclosures shall be permitted.

For (B)(3), the Comment was to correct the reference from 502.130(A)(3) to 502.120(B)(3) as this was an editorial error. An examination of the NEC record while reflecting that this was indeed an error does not support that the revision to reference 502.120(B)(3), but rather it should be to 502.150(A)(3). Going back to the 1999 NEC the section in question was 502-14 (b)(3) and it referred to (a)(3). In the 2002 NEC, this same section became 502.14 (B)(3) and the reference back was to 502.14(A)(3). Thus the correct reference back would be to 502.150(A)(3) with the following corrected:

(3) Resistors and Similar Equipment. Resistors, resistance devices, thermionic tubes, rectifiers, and similar equipment shall comply with 502.120(B)(3) 502.130(A)(3) 502.150(A)(3).

Exception: Enclosures for thermionic tubes, nonadjustable resistors, or rectifiers for which maximum operating temperature will not exceed 120°C (248°F) shall be permitted to be of the general-purpose type.

14-34 Log #578 NEC-P14 **Final Action: Reject**
(502.150(B))

Submitter: William M. Lewis, Martinsville, IN
Comment on Proposal No: 14-73
Recommendation: The proposal should be rejected.
Substantiation: The submitter provided no technical justification nor record of safety issues that would justify deleting the exception.
Panel Meeting Action: Reject
Panel Statement: See Panel Comment 14-33a (Log #CC1400).
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-35 Log #1874 NEC-P14 **Final Action: Reject**
(502.150(B))

Submitter: Michael Walls, American Chemistry Council
Comment on Proposal No: 14-73
Recommendation: The action taken by the Panel should have been to reject this proposal.
Substantiation: The submitter's substantiation is insufficient to warrant the extent of the changes proposed. The specific term "dusttight" is not applicable to the enclosures for (2) Transformers and Similar Equipment and would, in essence, require that a new type of equipment be created and approved. There is no substantiation for the removal of the Exception to (3) Resistors and Similar Equipment which presently allows general purpose enclosure types under specific conditions.
Panel Meeting Action: Reject
Panel Statement: See Panel Comment 14-33a (Log #CC1400).
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 503 CLASS III LOCATIONS

14-36 Log #126 NEC-P14 **Final Action: Accept in Part**
(503.30(A) Exception)

TCC Action: The Technical Correlating Committee directs that the Exception to 503.30(A), be revised to read as follows:
"Exception: The specific bonding means shall be required only to the nearest point where the grounded circuit conductor and the grounding electrode are connected together on the line side of the building or structure disconnecting means as specified in 250.32(B), provided the branch-circuit overcurrent protection is located on the load side of the disconnecting means."
This action correlates the exception with the revised text of 250.32 as accepted by Code-Making Panel 5 in Comment 5-58.
Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 14-81
Recommendation: It was the action of the Technical Correlating Committee that this proposal be reconsidered and correlated with the action on Proposal 5-119. This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept in Part
Panel Statement: See panel action on Comment 14-18.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-37 Log #428 NEC-P14 **Final Action: Reject**
(503.130(B))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 14-83
Recommendation: Accept proposal revised:
A luminaire (fixture) that ~~may be~~ is likely to be exposed to physical damage shall be protected by a suitable guard.
Substantiation: Panel statement is that this requirement covers luminaires that are subject to damage on an intermittent basis or changing conditions. The text does not reflect those conditions. The word "may" includes unforeseeable future conditions. This section doesn't correlate with 110.27(B) which uses the phrase "likely to be exposed to physical damage". Many "not permitted" uses in the code simply state: "where subject to physical damage" without qualifiers of continuous or intermittent basis or different conditions.
Panel Meeting Action: Reject
Panel Statement: The panel continues to reject the proposal and concludes that the word "may" is correct.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-38 Log #459 NEC-P14 **Final Action: Reject**
(503.140(3))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 14-84
Recommendation: Accept as revised:
(3) Be connected to terminals ~~in an approved manner~~ in accordance with 110.14 ~~and 503.145.~~ Alternatively, delete (3).
Substantiation: Proposal provides specificity. Panel statement that reference to 110.14 is not necessary because it already applies, also makes (3) unnecessary. The requirements of 110.14 and this section, worded differently, may cause confusion.
Panel Meeting Action: Reject
Panel Statement: The reference to 110.14 is not necessary because it applies throughout the Code.
CMP-14 notes that the complete wording of 503.140(3) was not shown.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
COOK, D.: The submitter and the panel statement both clarify that nothing in 503.140(3) is different than the general requirements in Chapters 1 through 4. NEC 90.3 states the requirements in Chapters 5, 6, and 7 supplement or modify the general rules. The CMP-14 statement indicates there is no reason to include a reference to the general requirements for termination included in 110.14 and I agree with that statement. The current text requires the cord to be terminated in an approved manner which is required for all installations in 110.2. The submitter's alternate recommendation was to delete item 3 completely. Since the text does not supplement or modify the general requirements in Chapters 1 through 4, that recommendation should be accepted.

ARTICLE 504 INTRINSICALLY SAFE SYSTEMS

14-39 Log #127 NEC-P14 **Final Action: Accept**
(504.2)

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 14-86
Recommendation: The Technical Correlating Committee directs the panel to reconsider the proposal and revise the Fine Print Note so that it does not contain mandatory text. This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Delete the words "to be" in FPN (b).
In 504.2, definition of Simple Apparatus, FPN(b) will read:
(b) sources of stored energy consisting of single components in simple circuits with well-defined parameters, for example, capacitors or inductors, whose values are ~~to be~~ considered when determining the overall safety of the system;
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-40 Log #128 NEC-P14 **Final Action: Accept**
(504.30(A)(1) Exception No. 3 (New))

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 14-88a
Recommendation: The Technical Correlating Committee directs the panel to reconsider the proposal relative to the comments expressed in the voting that the Exception, as worded, covers requirements outside the Scope of Article 504. This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: See panel action on Comment 14-41.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-41 Log #635 NEC-P14 **Final Action: Accept in Principle**
(504.30(A)(1) Exception No. 3 (New))

Submitter: Eliana Beattie, ISA
Comment on Proposal No: 14-88a
Recommendation: ISA supports W. Lawrence's affirmative comment on this proposal.
Substantiation: W. Lawrence's comment completely addresses the required revisions to this section.
Panel Meeting Action: Accept in Principle
Revise Exception No. 3 to read:
Exception No. 3 : Intrinsically safe circuits in a Division 2 or Zone 2 location shall be permitted to be installed in a raceway, cable tray or cable along with nonincendive field wiring circuits when installed in accordance with 504.30(B).
Add a new Exception No. 4 and fine print note to read:
Exception No. 4: Intrinsically safe circuits passing through a Division 2 or Zone 2 location to supply apparatus that is located in a Division 1, Zone 0, or Zone 1 location shall be permitted to be installed in a raceway, cable tray, or cable along with nonincendive field wiring circuits when installed in accordance with 504.30(B).
FPN: Nonincendive field wiring circuits are described in 501.10(B)(3), 502.10(B)(3), 503.10(B)(3), 505.15(C)(1)(g), and 506.15(C)(7).
Panel Statement: The panel action overrides the action on Proposal 14-88a. The fine print note is added for scope clarification and correlation.

Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
NEAGLE, J.: The two exceptions suggested in the panel action do not include Zones 20, 21, or 22. These exceptions make reference to 504.30(B) for two specific installation scenarios, but do not account for all possible installation scenarios where intrinsically safe circuits and nonincendive field wiring circuits may be installed together. There is no need to qualify the location of the circuits in question as long as they are separated in accordance with the referenced section. We may be better served by a single exception that states: "Intrinsically safe circuits shall be permitted to be installed in a raceway, cable tray, or cable along with nonincendive field wiring circuits when installed in accordance with 504.30(B)." retaining the suggested FPN.

14-42 Log #129 NEC-P14 **Final Action: Accept**
(504.30(A)(2))

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 14-89
Recommendation: The Technical Correlating Committee directs the panel to reconsider the proposal and revise both the new FPN to (1) and the existing FPN No. 1 to item (5) to comply with the NEC Style Manual. Both FPNs contain recommendations and interpretations in the form of a "preferred method" and the text "generally considered acceptable". FPNs shall only contain explanatory information. This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Delete the fine print note to 504.30(A)(2)(2).
Revise 504.30(A)(2)(2) to read:
"(2) Separation from conductors of nonintrinsically safe circuits by use of a grounded metal partition 0.91 mm (0.0359 in.) or thicker."
Revise existing FPN No. 1 to 504.30(A)(2)(5) to read:
"FPN No. 1: The use of separate wiring compartments for the intrinsically safe and nonintrinsically safe terminals is a typical ~~the preferred~~ method of complying with this requirement."
Panel Statement: The panel notes that the TCC's direction to reconsider should have been directed at FPN to 504.30(A)(2)(2), not (1).
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-43 Log #1251 NEC-P14 **Final Action: Accept in Principle**
(504.50(A))

Submitter: Neil F. LaBrake, Jr., Syracuse, NY
Comment on Proposal No: 14-22
Recommendation: Reject the Panel's action on 504.50(A) and keep the original proposed text.
Substantiation: The Panel rejected the original proposal indicating "…because connection to an equipment grounding conductor is not always the appropriate method to accomplish the requirement of 504.50(A)." The Grounding and Bonding Task Group recognizes that in certain instances supplemental bonding to a grounding electrode may be required. However, the requirements for connection to a grounding electrode can be found in 504.50(B) as well as the FPN to 504.50(A). The requirements in 504.50(A) apply only to connection to the equipment grounding conductor. Applying the definitions of Equipment Grounding Conductor and Grounded in Proposal 5-6, 504.50(A) should be revised as indicated in the original proposed text.
This Comment was developed by a Task Group assigned by the NEC Technical Correlating Committee to address actions that were other than "accept" taken by Code-Making Panels on proposals from the TCC to resolve 2005 NEC Proposal 5-1 and Comment 5-1. Members of the Task Group on Grounding and Bonding for this Comment included: C. Douglas White; Michael Johnston; Jeffrey Boksiner; Daleep Mohla; Phil Simmons; Christopher Hutchings; James Carroll; Alan Rebeck; Richard Loyd; Paul Dobrowsky; and Neil F. LaBrake, Jr. The following is the minority affirmative comment by one Task Group member during the Task Group's results balloting:
"Revise the first paragraph of the substantiation as follows:
The Panel rejected the original proposal indicating "…because connection to an equipment grounding conductor is not always the appropriate method to accomplish the requirement of 504.50(A)." The Grounding and Bonding Task Group recognizes that in certain instances supplemental bonding to a grounding electrode may be required. However, the requirements for connection to a grounding electrode can be found in 504.50(B) as well as information is provided in the FPN to 504.50(A). The requirements in 504.50(A) apply only to connection to the equipment grounding conductor. Applying the definitions of Equipment Grounding Conductor and Grounded in Proposal 5-6, 504.50(A) should be revised as indicated in the original proposed text.
Reason for suggested change, "Fine Print Notes are not permitted to contain requirements."
Panel Meeting Action: Accept in Principle
Revise 504.50 to read:
"(A) Intrinsically Safe Apparatus, Enclosures, ~~Associated Apparatus,~~ and Raceways. Intrinsically safe apparatus, ~~associated apparatus, cable shields,~~ enclosures, and raceways, if of metal, shall be ~~grounded~~ connected to the equipment grounding conductor.
(B) Associated Apparatus and Cable Shields. Associated apparatus and cable shields shall be grounded in accordance with the required control drawing. See 504.10(A).
_FPN: Supplementary connection(s) ~~bonding~~ to the grounding electrode may be needed for some associated apparatus, for example, zener diode barriers, if specified in the control drawing. See ANSI/ISA RP 12.06.01-2003 ~~2002~~, Wiring Methods for Hazardous (Classified) Locations Instrumentation Part 1: Intrinsic Safety."
Designate current (B) as (C). Delete current (C) and its exception.
Panel Statement: The panel split 504.50(A) into two parts so that the term "equipment grounding conductor" can be applied correctly as the task group recommended. With this change, the language of the fine print note was modified to be consistent with (A) and (B).
This action supercedes the action on Proposal 14-91 and incorporates the action from Proposal 14-92.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 505 CLASS I, ZONE 0, 1, AND 2 LOCATIONS

14-44 Log #1 NEC-P14 **Final Action: Reject**
(505)

Submitter: Steven R. Carlson, Pfizer Global Manufacturing
Comment on Proposal No: 14-101
Recommendation: Clarify the use of IEC (European) rated equipment for Zone use in the United States. Within the pharmaceutical industry, many suppliers are of EU origin and rate their equipment according to IEC standards.
Substantiation: Using a different Zone rating from EU source creates confusion and ultimately will lead to misinterpretation of what is acceptable. For instance, if a piece of equipment carries an EU Class 1 Zone 2 designation, it would be acceptable for US Zone 2 installations. Having separate requirements causes added expense and an uncompetitive position for US industry.
Panel Meeting Action: Reject
Panel Statement: The comment does not include a recommendation and does not comply with Section 4.4.5 of the Regulations Governing Committee Projects. The panel notes that IEC, European, and NEC equipment requirements are not the same. Electrical equipment used in hazardous (classified) locations in the United States is subject to the OSHA 29 CFR 1910 requirements.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-45 Log #1188 NEC-P14 **Final Action: Reject**
(505.7(A))

Submitter: Neil F. LaBrake, Jr., National Grid / Rep. Edison Electric Insitute-Electric Light & Power Group
Comment on Proposal No: 14-109
Recommendation: Reject Proposal 14-109 and the requirement for a "Qualified Registered Professional Engineer" should be maintained.
Substantiation: The proposal did not include any substantiation for the removal of the requirement for a "Qualified Registered Professional Engineer". It did not include any documentation for how many installations have been completed in the United States and did not document any training programs that are available to develop "qualified persons". A "Qualified Registered Professional Engineer" is needed to provide the necessary direction and oversight so that only "qualified persons" are involved in all aspects of the design, AHJ approval, and installation of these systems.
Panel Meeting Action: Reject
Panel Statement: The panel concludes that the text incorporated in Article 506 is satisfactory to require that qualified persons be involved in the classification, design, and selection of equipment and methods for zone classification for combustible dusts. There is a need that qualified individuals be involved at all levels of the project. The panel concludes that it is not practical to require a single individual to oversee projects in zone areas. These projects require a variety of qualified specialists to properly engineer, design, and implement these installations. As such, the panel agrees with modifying the requirements in Article 505 as stated.

Number Eligible to Vote: 14
Ballot Results: Affirmative: 11 Negative: 3
Explanation of Negative:

COOK, D.: I agree with the panel statement that qualified persons are required for every part of an electrical installation installed in hazardous locations. This would include the area classification, design, equipment selection, installation, inspection, operation and maintenance. While it is possible for individuals to be qualified for more than one of those activities, it is not likely that many individuals are qualified as defined in NEC Article 100 for all of those functions. The current requirement in 505.7 requires oversight or supervision of the area classification, equipment selection and wiring selection by a person that has multiple qualifications. That person must have skills and knowledge related to the construction and operation of the electrical equipment and installations and has received safety training on the hazards involved. Based on the fact that CMP-14 is only aware of one project where Article 505 was utilized for the complete installation, it is very difficult to believe that an abundance of truly qualified persons are available for area classification and equipment and wiring selection. This requires the Professional Engineer to practice within the limits of his or her qualifications. The supervision of an Article 505 project might include the delegation of specific components of the area classification and equipment and wiring selection to other qualified professionals. Based on the registration criteria, I would assume the PE has the knowledge and ability to determine which aspects of each specific project that would require delegation to others. Most other parties involved in electrical installations are required to be licensed and/or qualified in some way. I am not aware of any other registration or license that includes the responsibility for self-limitation of the individual to activities which the person is qualified to perform. The current requirement in 505.7(A) does not prohibit qualified persons that are not Registered Professional Engineers from actively participating in electrical installation using Article 505. It simply requires those persons involved in area classification and selection of equipment and wiring to be under the supervision of the qualified Registered PE. This requirement should be retained in Article 505 and added to all electrical installations within hazardous locations.

O'MEARA, M.: Although I agree with the panel's position reflected in the panel statement that it isn't practical to require a single individual to oversee projects in zone areas, I am convinced that the panel action does not help to improve the situation. The proposed changes will still allow a single individual to oversee these installations, as long as he/she is "qualified". How this individual becomes "qualified" is not addressed, and the new text does not accomplish the panel's intentions to have a qualified team of individuals bring their individual expertise together to properly oversee the installation. By staying with a "qualified registered professional engineer", we can rest assured that the engineer that is supervising the classification, selection and installation of equipment in zone areas will pull together the proper experts for each aspect of the installation to ensure that when it receives his/her approval all concerns have been addressed and the installation is safe.

WIRFS, M.: I vote negative to panel action to reject the comment and accept the comment to reject the original proposal.

This submitter agrees that the original substantiation was insufficient and I agree. As stated before:

The original substantiation that similar language was fully considered for Article 506 is insufficient. I personally feel that it was NOT properly or fully addressed during the previous code cycle when Article 506 was introduced and the panel was inconsistent in not including similar language. A companion proposal for the 2008 NEC (14-148) has addressed this oversight. During panel discussion it was suggested that some compromise had been struck within the panel to include this provision in return for consideration of passage of the new Article 505 when it was first introduced and that some "time limit" applied. I again I believe that principles have no time limit and I am disappointed that any panel member would compromise those opinions or principles based on this premise. There is no "time limit" on my opinion or my original voting on this subject and I still maintain that this provision has the same validity that it did when it was first introduced with Article 505. This is a step forward to a higher standard of responsibility and certification of the most important issue with the application of this article. The submitter did not provide any technical or convincing argument to remove or modify this provision.

14-46 Log #130 NEC-P14 **Final Action: Accept in Part**
(505.8(I))

TCC Action: The Technical Correlating Committee directs that FPN No. 1 of 505.8(K) be deleted in accordance with the direction given to the panel in Comment 14-46. The Technical Correlating Committee intends that the use of Annex A be consistent throughout the code.

In addition, the Technical Correlating Committee directs that the following references be added to Annex A of the NEC.

"Combustible Gas Detectors, Performance Requirements - ANSI/ISA 12.13.01"

"Gas and Vapor Detector Sensors - ANSI/UL 2075".

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 14-119
Recommendation: The Technical Correlating Committee directs the panel to reconsider this proposal and to relocate the reference into Annex A to be consistent with other parts of the Code. This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept in Part
Panel Statement: See panel action on Comment 14-5.

(505.9(D)(1))

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 14-125
Recommendation: The Technical Correlating Committee directs the panel to reconsider the proposal and place the example text of the recommendation into a Fine Print Note. This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
In 505.9(D)(1), delete the last sentence and insert the following fine print note:
FPN: As an example, such a marking might be "–30°C to +40°C."
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-49 Log #1795 NEC-P14 **Final Action: Reject**
(505.15(B)(g))

Submitter: Robert L. Seitz, Artech Engineering
Comment on Proposal No: 14-129
Recommendation: Revise original proposal to read:

(g) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, and where the cable is not subject to physical damage, listed TC-ER cable, with suitable overall jacket of suitable material, a basket weave conductive armor beneath the outer jacket, shall be permitted to be installed where all of the following conditions are met:

(1) Maximum length is 3 meters
(2) Has separate grounding in accordance with 250.122
(3) Maximum conductor size is #14awg.
(4) Use is restricted to shielded pair (single or multiple pair) instrument cables or multiple conductor control cable
(5) Termination fittings listed for the application are used
(6) Termination fittings provide continuity with conductive armor
(7) Cable is installed according to the requirements of Article 336.10(7) Exception.

Substantiation: All substantiation stated in original proposal still holds. The primary issue is to provide an installation such that the connecting cable to devices and equipment that is subject to removal or overhaul is not subject to damage when disconnected from the device or equipment. MC-HL cable is very frequently and easily damaged by the activity because it cannot be moved clear of the work area sufficiently. The damage to the cables include crimped and broken armor due to over bending, deformation of the armor, damage to the jacket and other compromise to the cable configuration by the work activities and tools and equipment employed in the removal or repair activities.

The AHJ in Alaska has become aware of the damage that is done to MC-HL cable when disconnected from its equipment or end device and has expressed concern.

This submitter has been told by members of the CMP that proposal of use of a cable that already has a listing and which has a conductive sheath would be worthy of consideration for installation in a Class I, Zone 1 area.

Shipboard cable as originally proposed is available with dual listing as Shipboard cable and TC-ER cable. It is available with a conductive metal sheath that is called armor (basket weave and other). My comment on proposal modifies the original proposal to change from shipboard cable to TC-ER cable which is permitted by Chapter 3. The submitter had submitted a proposal to add Shipboard cable in Article 310 for special application.

Extra hard usage cord is allowed by Article 505.17 but extra hard usage cord is only available in a power cord configuration. Instrumentation and control configurations are not available. Request for consideration of the original proposal to only consider TC-ER in instrument and control cable configurations is proposed to fill this gap.

By restricting to instrument and control cable and to #14 AWG available fault current is greatly restricted.

While MC-HL cable can have crush and impact resistance as much as 10 times that required for, TC-ER cable has actually crush and impact resistance as much as 5 times that required for MC-HL cable.

Use of basket tray will allow protection to close proximity of the end device yet provide means to allow the cable and tray to be easily relocated out of the way during removal and overhaul activities.

Allowance of up to 3 meters of TC-ER cable would allow installation of an increase safety junction box near the equipment or device at a distance sufficient to permit moving the cable out of the way when necessary. This increased safety junction box would be a splice point between the MC-HL cable and TC-ER cable.

This proposal was made with the basic intent to provide a safer, more durable installation that can be made with only MC-HL cable. Problems similar to those experienced with MC-HL cable have been observed with conduit installations in Division 1 areas where conduit connections had to be removed when removing or overhauling equipment. Conduit runs damaged under such circumstances eventually have to be replaced. A tough cable, with a flexible armor and sufficient flexibility to be moved out of the way will enhance the safety of an installation.

Panel Meeting Action: Reject

Panel Statement: The substantiation is insufficient for the introduction of TC-ER Cable.

The conditions of maintenance and supervision for the installations referenced are not in accordance with 505.15(B)(1)(b) for Type MC-HL cable. The sight plan must account for the foreseeable use, including maintenance. Qualified maintenance persons must not exceed the minimum bending radius restrictions found in 330.12 for Type MC and MC-HL cable. Similar restrictions exist for TC-ER, including a minimum bending radius requirement in 336.24. The reasons for the cited damage to the referenced MC-HL cable will similarly risk damage to TC-ER, or any other cable.

By shipboard cable, it is assumed that the submitter refers to Marine Shipboard Cable. The submitter has provided no information regarding installation and use restrictions in the regulations that permit Marine Shipboard Cable in a Zone 1 location, nor how the regulations are similar to or different from the requirements for Type TC-ER in Article 336.

The statement regarding crush testing is incorrect. Cables are listed to minimum requirements in a consensus standard. The minimum crush requirements for Type TC-ER cable as found in ANSI/UL 1277, Electrical Power and Control Tray Cable with Optional Fiber Optic Members, is 33 percent lower than the minimum requirement in UL 2225, Cables and Cable-Fittings for Use in Hazardous (Classified) Locations.

The proposed wording requires termination fittings listed for the application. There are no published requirements for the construction and performance of Type TC-ER termination fittings for Class I, Zone 1. Currently listed Marine Shipboard Cable fittings are for installation and use offshore according to US Coast Guard Electrical Engineering Regulations found in the Code of Federal Regulations (CFR).

The requirement for the "armor" to provide continuity with the termination fitting does not address the CMP-14 statement regarding the need for mechanical protection.

The proposal requires a maximum length of 3 meters. The proposed wording references installation practices per 336.10(7). CMP-14 did previously reject the proposed installation of TC-ER cable in this manner. No substantiation has been provided to demonstrate satisfaction of the stated concerns.

14-52 Log #1385 NEC-P14 **Final Action: Accept**
(505.15(B)(1)(f))

Submitter: William Wagner, Certification Solutions

Comment on Proposal No: 14-128

Recommendation: This Proposal should be Accepted as originally proposed.

(f) Rigid nonmetallic conduit ~~complying with Article 352~~ shall be permitted where encased in a concrete envelope a minimum of 50 mm (2 in.) thick and provided with not less than 600 mm (24 in.) of cover measured from the top of the conduit to grade.

Substantiation: As noted in the TCC action on this proposal, this is a redundant reference to Article 352 as it is already covered by 90.3. Additionally, with the panel actions taken on Proposals 8-53 and 8-78, it is also an incorrect reference, as Article 352 now only pertains to Type PVC rigid nonmetallic conduit. Types HDPE and RTRC, which were formerly covered by Article 352, are now covered by Articles 353 and 355, respectively.

Panel Meeting Action: Accept

(505.15(B)(1)(f))

Submitter: Code-Making Panel 8,

Comment on Proposal No: 14-128

Recommendation: CMP-8 recommends that CMP-14 accept this proposal in principle with the revised text:

(f) Type PVC Conduit and Type RTRC Conduit ~~Rigid nonmetallic conduit complying with Article 352~~ shall be permitted where encased....

Substantiation: CMP-8 recommends that CMP-14 Accept in Principle Proposal 14-128 with the proposed revised wording based on CMP-8's actions on Proposals 8-53 and 8-78. This revision also addresses the NEC Style Manual.

This comment has been balloted through CMP-8 with the following ballot results:

12 Eligible to Vote
11 Affirmative
1 Negative

Mr. R. Loyd voted negatively stating: "Proposal 14-128 was to Reject. No comment necessary, CMP-8 has no substantiation for recommending that CMP-14 reverse their action. Note: UL does not recognize any RTRC nonmetallic conduit as comparable to Schedule 80 PVC which is suitable for use where subject to physical damage."

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-54 Log #549 NEC-P14 **Final Action: Accept in Principle**
(505.15(C)(1))

TCC Action: The Technical Correlating Committee directs that the FPN added in the panel action for 505.15(C)(1)(g) be deleted. This action is consistent with the Technical Correlating Committee direction given to place product standards references in annex A. The Technical Correlating Committee intends that the use of Annex A be consistent throughout the code.

Submitter: Edward M. Briesch, Underwriters Laboratories Inc.

Comment on Proposal No: 14-33a

Recommendation: Revise text to read as follows:

(C) Class I, Zone 2.

(1) General. In Class I, Zone 2 locations, the wiring methods in (C)(1)(a) through (C)(1)(h~~g~~) shall be permitted.

(a) All wiring methods permitted by 505.15(B).

(b) Types MI, MC, MV, or TC cable with termination fittings, or in cable tray systems and installed in a manner to avoid tensile stress at the termination fittings. Single conductor Type MV cables shall be shielded or metallic-armored.

(c) Type ITC cable as permitted in 727.4.
(d) Type PLTC cable in accordance with the provisions of Article 725, or in cable tray systems. PLTC shall be installed
in a manner to avoid tensile stress at the termination fittings.
(e) Enclosed gasketed busways, enclosed gasketed wireways.
(f) Threaded rigid metal conduit, threaded steel intermediate metal conduit.
(g) In industrial establishments with restricted public access where the conditions of maintenance and supervision ensure that only qualified persons service the installation and where metallic conduit does not provide sufficient corrosion resistance, Reinforced Thermosetting Resin Conduit (RTRC) marked with suffix -XW, factory elbows, and associated fittings in accordance with 355.6, and Schedule 80 PVC Conduit, factory elbows and associated fittings, in accordance with 352.6 shall be permitted. Where seals are required for boundary conditions as defined in 505.16(C)(1)(b), the Zone 1 wiring method shall extend into the Zone 2 area to the seal which shall be located on the Zone 2 side of the Zone 1 – Zone 2 boundary.
(h) ~~(g)~~ Nonincendive field wiring shall be permitted using any of the wiring methods permitted for unclassified locations. Nonincendive field wiring systems shall be installed in accordance with the control drawing(s). Simple apparatus, not shown on the control drawing, shall be permitted in a nonincendive field wiring circuit, provided the simple apparatus does not interconnect the nonincendive field wiring circuit to any other circuit.
FPN: Simple apparatus is defined in 504.2. Separate nonincendive field wiring circuits shall be installed in accordance with one of the following:
(1) In separate cables
(2) In multiconductor cables where the conductors of each circuit are within a grounded metal shield
(3) In multiconductor cables where the conductors of each circuit have insulation with a minimum thickness of 0.25 mm (0.01 in.)

Substantiation: Since Zone 2 locations as defined in Article 505 and Division 2 locations are technically the same, these wiring methods should be included in 505.15(C)(1) as well as in 501.10(B)(1).
Panel Meeting Action: Accept in Principle
Add a new item (g) to read:
"(g) In industrial establishments with restricted public access where the conditions of maintenance and supervision ensure that only qualified persons service the installation and where metallic conduit does not provide sufficient corrosion resistance, Reinforced Thermosetting Resin Conduit (RTRC), factory elbows, and associated fittings all marked with suffix -XW and Schedule 80 PVC Conduit, factory elbows, and associated fittings shall be permitted. Where seals are required for boundary conditions as defined in 505.16(C)(1)(b), the Zone 1 wiring method shall extend into the Zone 2 area to the seal, which shall be located on the Zone 2 side of the Zone 1 – Zone 2 boundary."
Add a fine print note to 505.15(C)(1)(g) to read: FPN: For additional information on RTRC-XW, see ANSI/UL 1684A, Supplemental Requirements for Extra-Heavy Wall Reinforced Thermosetting Resin Conduit (RTRC) and Fittings.
Also, add ANSI/UL 1684A, Supplemental Requirements for Extra-Heavy Wall Reinforced Thermosetting Resin Conduit (RTRC) and Fittings, to Annex A.
Panel Statement: This change correlates with the action on Comment 14-8. A fine print note has been added to provide a correlation between RTRC-XW and the specific product standard. A reference has been added to Annex A to the appropriate product standard. See also panel action on Comment 14-5.
Number Eligible to Vote: 14

14-57 Log #460 NEC-P14 **Final Action: Reject**
(505.17(3))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 14-134
Recommendation: Accept as revised:
(3) Be connected to terminals ~~in an approved manner~~ in accordance with 110.14 ~~and 503.145.~~ Alternatively, delete (3).
Substantiation: Proposal provides specificity. Panel statement that reference to 110.14 is not necessary because it already applies also makes (3) unnecessary. The requirements of 110.14 and this section, worded differently, may cause confusion.
Panel Meeting Action: Reject
Panel Statement: The reference to 110.14 is not necessary because it applies throughout the Code.
CMP-14 notes that the complete wording of 505.17(3) was not shown.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
COOK, D.: The submitter and the panel statement both clarify that nothing in 505.17(3) is different than the general requirements in Chapters 1 through 4. NEC 90.3 states the requirements in Chapters 5, 6, and 7 supplement or modify the general rules. The CMP-14 statement indicates there is no reason to include a reference to the general requirements for termination included in 110.14 and I agree with that statement. The current text requires the cord to be terminated in an approved manner which is required for all installations in 110.2. The submitter's alternate recommendation was to delete item 3 completely. Since the text does not supplement or modify the general requirements in Chapters 1 through 4, that recommendation should be accepted.

14-58 Log #136 NEC-P14 **Final Action: Accept in Part**
(505.25(A) Exception)

TCC Action: The Technical Correlating Committee directs that the Exception to 505.25(A), be revised to read as follows:
"Exception: The specific bonding means shall be required only to the nearest point where the grounded circuit conductor and the grounding electrode are connected together on the line side of the building or structure disconnecting means as specified in 250.32(B), provided the branch-circuit overcurrent protection is located on the load side of the disconnecting means."
This action correlates the exception with the revised text of 250.32 as accepted by Code-Making Panel 5 in Comment 5-58.
Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 14-137
Recommendation: It was the action of the Technical Correlating Committee that this proposal be reconsidered and correlated with the action on Proposal 5-119. This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept in Part
CMP-14 accepts the TCC direction to reconsider the action on Proposal 14-137. CMP-14 recognizes that CMP-5 actions on Proposal 5-119 have revised the application of 505.25(A) Exception. However, the text in 505.25(A) Exception remains correct.
Panel Statement: The text continues to reference applicable requirements: 250.32 (A), (B), and (C). No additional action is required from CMP-14 for correlation.

(506.9)

Submitter: Nicholas P. Ludlam, FM Approvals
Comment on Proposal No: 14-153a
Recommendation: Delete existing Table 506.20(F) and replace with the proposed table as shown below and relocate to 506.9, renumber table and references to align.

Table 506.9(C)(2)(2) Types of Protection Designation

Designation	Technique	Zone*
iaD	Protection by intrinsic safety	20
ibD	Protection by intrinsic safety	21
[iaD]	Associated apparatus	Unclassified**
[ibD]	Associated apparatus	Unclassified**
maD	Protection by encapsulation	20
mbD	Protection by encapsulation	21
pD	Protection by pressurization	21
tD	Protection by enclosures	21

*Does not address use where a combination of techniques is used.
**Associated apparatus is permitted to be installed in a hazardous (classified) location if suitably protected using another type of protection.

Delete clause 506.20(F)

~~(F) Types of Protection Allowed. The types of protection allowed in Zones 20, 21, and 22 are shown in Table 506.20(F).~~
Substantiation: The modification to Table 506.20(F) proposed as panel Proposal 14-153a shown above as 506.9(C)(2)(2) provides additional information that was omitted in the initial panel Proposal 14-153a and the suggested alternative is aligned with that shown in proposed for 505.9(C)(2)(4). If the table is modified as shown, then the information provided in 506.20(F) is incorrect. Relocating this table to 506.9, Equipment Requirements, aligns the positioning with the existing information provided in 505 and will help users familiar with 505 to locate the similar information in 506.
Panel Meeting Action: Accept
Also, in 506.9(C)(2)(2), change the table reference to Table 506.9(C)(2)(2).
Panel Statement: The additional action corrects the cross-reference.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-71 Log #139 NEC-P14 **Final Action: Accept in Part**
(506.9(C)(1) & (2) (New))

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 14-150b
Recommendation: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept in Part
The panel has accepted the direction of the TCC to reconsider the comments made during voting on the proposal.
Panel Statement: The referenced standards have now been published, and the original action on the proposal stands.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-72 Log #638 NEC-P14 **Final Action: Accept**
(506.9(C)(1) & (2) (new))

Submitter: Eliana Beattie, ISA
Comment on Proposal No: 14-150b
Recommendation: The explanation of negative votes indicates that the standards covering the protection techniques specified in the recommendation are not currently published. The referenced standards for type of protection "iD", "tD", "maD", and "mbD" have since been published and are publicly available. The referenced standard for type of protection "pD" will be published and publicly available prior to the ROC meeting. The original proposal should be approved as written.
Substantiation: ISA 61241-11 (type of protection "iD") is published. ISA 61241-18 (type of protection "maD" and "mbD") is published. ISA 61241-1 (type of protection "tD") is published. ISA 61241-2 (type of protection "pD") will be published prior to the ROC meeting.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-73 Log #140 NEC-P14 **Final Action: Accept in Part**
(506.15(A)(3))

TCC Action: The Technical Correlating Committee directs that FPN No. 2 of 506.15(A)(3) be deleted in accordance with the direction given to the panel in Comment 14-73. The Technical Correlating Committee intends that the use of Annex A be consistent throughout the code.
Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 14-152
Recommendation: The Technical Correlating Committee directs the panel to reconsider this proposal and to relocate the reference in the FPNs into Annex A to be consistent with other parts of the Code. This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept in Part
Panel Statement: See panel action on Comment 14-5.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-76 Log #142 NEC-P14 **Final Action: Accept in Part**
(506.25(A) Exception)

TCC Action: The Technical Correlating Committee directs that the Exception to 506.25(A), be revised to read as follows:

"Exception: The specific bonding means shall be required only to the nearest point where the grounded circuit conductor and the grounding electrode are connected together on the line side of the building or structure disconnecting means as specified in 250.32(B), provided the branch-circuit overcurrent protection is located on the load side of the disconnecting means."

This action correlates the exception with the revised text of 250.32 as accepted by Code-Making Panel 5 in Comment 5-58.

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 14-155
Recommendation: It was the action of the Technical Correlating Committee that this proposal be reconsidered and correlated with the action on Proposal 5-119. This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept in Part
CMP-14 accepts the TCC direction to reconsider the action on Proposal 14-155. CMP-14 recognizes that CMP-5 actions on Proposal 5-119 have revised the application of 506.25(A) Exception. However, the text in 506.25(A) Exception remains correct.
Panel Statement: The text continues to reference applicable requirements: 250.32(A), (B), and (C). No additional action is required from CMP-14 for correlation.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 511 COMMERCIAL GARAGES, REPAIR AND STORAGE

14-77 Log #1946 NEC-P14 **Final Action: Accept**
(511.3(A))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 14-156
Recommendation: Accept the proposal, except in 511.3(A) change "unclassified" to "permitted to be unclassified."
Substantiation: The proposed text is now fully in accordance with the existing NEC text. The submitter respectfully disagrees with CMP 14 relative to editorial merit. The existing NEC syntax is one of the most difficult passages in the entire code, because there are two parallel subsections, each of which overlap the other. For example, you may have a ventilated floor that suggests a lack of classification and a pit that does suggest classification. When this first appeared in the ROP I spent 4 days trying to sort out exactly what went where, finally working long hours over the telephone with Marshall Klein on the 30A Committee. The comment also brings in a more well-rounded selection of extracted material, which provides essential context and assures comprehensive coverage. In the end, we came up with a product that he suggested go into the NEC Handbook as the guide text to 511.3. Please revisit this proposal on its merits.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-78 Log #1947 NEC-P14 **Final Action: Reject**
(511.4(A))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 14-159
Recommendation: Accept the proposal.
Substantiation: The submitter agrees that the boundary seal referenced in the substantiation for this proposal was erroneously described, and that it would be explosionproof. The reason for the 501.15(A)(4) reference is that historically these areas have been described as Division 1. The Panel may choose to apply a 501.15(B)(2) seal instead. This is a difficult call because the location is generally too rich for ignition, but that richness contributes to an ignition-capable mixture within the conduit system. Clearly the 514.8 seal is a Div. 1 seal. The submitter would appreciate a technical response from CMP 14 on this issue relative to the expected hazardous vapor content within a below grade raceway at these locations.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its prior action, recognizing the difference between an aircraft hangar or dispensing facility, with its large quantities of fuel, and a repair garage, with much smaller quantities. As such, the panel concludes that the area below the repair garage floor is normally not capable of accumulating enough fuel to justify sealing the conduit at its emergence.

Comment on Proposal No: 14-181
Recommendation: It was the action of the Technical Correlating Committee that further consideration be given to 4.1.1 of the NEC Style Manual. This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Delete the reference to Article 250 in 514.16(A).
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 515 BULK STORAGE PLANTS

14-83 Log #358 NEC-P14 **Final Action: Accept in Principle (515.7(A))**

Submitter: Code-Making Panel 8,
Comment on Proposal No: 14-184
Recommendation: CMP-8 recommends that CMP-14 accept this proposal in principle with the revised text:

(A) Fixed Wiring. All fixed wiring above Class I locations shall be in metal raceways, ~~or PVC~~ Schedule 80 ~~rigid nonmetallic~~ PVC conduit, Type RTRC conduit listed for and identified for use in areas of physical damage per 355.10(F), ~~or equivalent,~~ or MI, TC, or MC cable.

Substantiation: CMP-8 recommends CMP-14 Accept in Principle Proposal 14-184 with the proposed revision. Type RTRC conduit listed for and identified for use in areas of physical damage per 355.10(F) is the only type RTRC conduit equivalent to Schedule 80 PVC conduit. 355.10(F) is referenced based on the Panel 8 action on Proposal 8-78.

This comment has been balloted through CMP-8 with the following ballot results:

12 Eligible to Vote
12 Affirmative

Mr. R. Loyd voted affirmatively stating: "Proposal 14-184 was to Accept in Principle. I agree with Mr. Burns' recommendation to revise the panel action, however, there is no fiber glass conduit equal to Schedule 80 PVC conduit and I believe omitting the reference to RTRC would make the text more user friendly."

Panel Meeting Action: Accept in Principle
Revise 515.7(A) to read: All fixed wiring above Class I locations shall be in metal raceways, Schedule 80 PVC Conduit, Type RTRC marked with suffix -XW, MI, TC or MC cable.
Panel Statement: The revised text correlates with the panel action on Comment 14-8 and meets the intent of the commenter.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 516 SPRAY APPLICATION, DIPPING, AND COATING PROCESSES

14-84 Log #1252 NEC-P14 **Final Action: Accept in Principle (516.10(A)(6), 516.10(B)(4) and 516.10(C)(4)(b))**

TCC Action: The Technical Correlating Committee directs that the FPN added by the panel be revised to read as follows:

"FPN: For more information on grounding and bonding for static electricity purposes, see NFPA 33 - Standard for Spray Application Using Flammable or Combustible Materials, NFPA 34 - Standard for Dipping and Coating Processes Using Flammable or Combustible Liquids and NFPA 77 - Recommended Practice on Static Electricity."

This action corrects the implied mandatory reference to NFPA 33, 34, and 77 by the FPN accepted by the panel.

Submitter: Neil F. LaBrake, Jr., Syracuse, NY
Comment on Proposal No: 14-22
Recommendation: Reject the Panel's action on 516.10(A)(6), 516.10(B)(4) and 516.10(C)(4)(b) and modify the text as follows:

Revise 516.10(A)(6) as follows:

(6) Grounding. All electrically conductive objects in the spray area, except those objects required by the process to be at high voltage, shall be ~~adequately~~ electrically bonded and grounded. This requirement shall apply to paint containers, wash cans, guards, hose connectors, brackets, and any other electrically conductive objects or devices in the area.

Revise 516.10(B)(4) as follows:

(4) Electrostatic Equipment. All electrically conductive objects in the spraying area shall be ~~adequately~~ electrically bonded and grounded. This requirement shall apply to paint containers, wash cans, and any other electrical conductive objects or devices in the area. The equipment shall carry a prominent, permanently installed warning regarding the necessity for this grounding feature.

Revise 516.10(C)(4)(b) as follows:

(b) All electrically conductive objects within the powder-coating area shall be ~~adequately~~ electrically bonded and grounded. The powder-coating equipment shall carry a prominent, permanently installed warning regarding the necessity for grounding these objects.

Substantiation: The term "adequately grounded" is not defined and appears to be in conflict with 3.2.1 of the NEC Style Manual which states, "The NEC shall not contain references or requirements that are unenforceable or vague." Also, the Panel statement indicates that "Any paint can, wash can, bracket, etc. that was sitting on a grounded concrete floor would be considered grounded but would not likely be adequately grounded." The definition of "Grounded (Grounding)" in Proposal 5-9 is "Connected to ground or to a conductive body that extends the ground connection." A paint can "sitting" on a grounded concrete floor would not likely be considered "connected" as required by the definition. However, to address the Panel's concerns the term "adequately grounded" should be changed to "electrically bonded and grounded" which is consistent with the terminology used in other spray application, dipping and coating process standards including NFPA 33-2003, *Standard for Spray Application Using Flammable and Combustible Materials*, and NFPA 34-2003, *Standard for Dipping and Coating Processes Using Flammable or Combustible Liquids*.

This Comment was developed by a Task Group assigned by the NEC Technical Correlating Committee to address actions that were other than "accept" taken by Code-Making Panels on proposals from the TCC to resolve 2005 NEC Proposal 5-1 and Comment 5-1. Members of the Task Group on Grounding and Bonding for this Comment included: C. Douglas White; Michael Johnston; Jeffrey Boksiner; Daleep Mohla; Phil Simmons; Christopher Hutchings; James Carroll; Alan Rebeck; Richard Loyd; Paul Dobrowsky; and Neil F. LaBrake, Jr. The following is the minority negative ballot comment by one Task Group member during the Task Group's results balloting:

"4. Comment (include proposed new wording, or identification of wording to be deleted):

Reject the Panel's action on 516.10(A)(6), 516.10(B)(4) and 516.10(C)(4)(b) and modify the text as follows:

Revise 516.10(A)(6) as follows:

(6) Bonding ~~Grounding~~. All electrically conductive objects in the spray area, except those objects required by the process to be at high voltage, shall be ~~adequately~~ bonded ~~grounded~~. This requirement shall apply to paint containers, wash cans, guards, hose connectors, brackets, and any other electrically conductive objects or devices in the area.

Revise 516.10(B)(4) as follows:

(4) Electrostatic Equipment. All electrically conductive objects in the spraying area shall be ~~adequately~~ bonded ~~grounded~~. This requirement shall apply to paint containers, wash cans, and any other electrical conductive objects or devices in the area. The equipment shall carry a prominent, permanently installed warning regarding the necessity for this bonding requirement ~~grounding feature~~.

Revise 516.10(C)(4)(b) as follows:

(b) All electrically conductive objects within the powder-coating area shall be ~~adequately~~ bonded ~~grounded~~. The powder-coating equipment shall carry a prominent, permanently installed warning regarding the necessity for bonding ~~grounding~~ these objects.

5. Statement of Problem and Substantiation for Comment:

The term "adequately grounded" is not defined and appears to be in conflict with 3.2.1 of the NEC Style Manual which states, "The NEC shall not contain references or requirements that are unenforceable or vague."

As indicated in the Panel statement, these sections refer to electrostatic painting operations and thus the goal is to have conductive objects "bonded" and not "grounded". CMP-5 accepted a revised definition for "Bonding (Bonded)" in Proposal 5-2. The accepted definition reads, "Connected to establish electrical continuity and conductivity." CMP-5 also accepted a change to the definition of "Grounded" in Proposal 5-9. The accepted definition reads, "Grounded (Grounding) Connected to ground or to a conductive body that extends the ground connection." The definition of the term "Ground" has been revised in Proposal 5-8 as "The earth." So, it does not seem Panel 14's intent is to have the language in these sections mean, "All electrically conductive objects" such as paint containers, wash cans, and any other electrical conductive objects "shall be adequately connected to earth."

Also, the Panel statement indicates that "Any paint can, wash can, bracket, etc. that was sitting on a grounded concrete floor would be considered grounded but would not likely be adequately grounded." A paint can "sitting" on a grounded concrete floor would not likely be considered "connected" as required by the definition.**"**

Panel Meeting Action: Accept in Principle

Add a fine print note to each of these three sections to read:

FPN: Criteria for grounding for this purpose can be found in NFPA 33 and NFPA 34. See also NFPA 77.

Panel Statement: The panel reconsidered the language and determined that "adequately grounded" is the proper term for this concept and added a fine print note to refer the user to more detailed documents.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-85 Log #1253 NEC-P14 **Final Action: Accept (516.10(C)(1))**

Submitter: Neil F. LaBrake, Jr., Syracuse, NY

Comment on Proposal No: 14-22

Recommendation: Continue to accept the Panel's actions on 516.10(C)(1) as modified by proposal 14-191.

Substantiation: The CMP-14 revisions to the proposal have been made for clarity and continue to be consistent with the Grounding and Bonding Task Group's original initiatives.

This Comment was developed by a Task Group assigned by the NEC Technical Correlating Committee to address actions that were other than "accept" taken by Code-Making Panels on proposals from the TCC to resolve 2005 NEC Proposal 5-1 and Comment 5-1. Members of the Task Group on Grounding and Bonding for this Comment included: C. Douglas White; Michael Johnston; Jeffrey Boksiner; Daleep Mohla; Phil Simmons; Christopher Hutchings; James Carroll; Alan Rebeck; Richard Loyd; Paul Dobrowsky; and Neil F. LaBrake, Jr.

Panel Meeting Action: Accept

14-86 Log #146 NEC-P14 **Final Action: Accept (516.16)**

Submitter: Technical Correlating Committee on National Electrical Code

Comment on Proposal No: 14-193

Recommendation: It was the action of the Technical Correlating Committee that further consideration be given to 4.1.1 of the NEC Style Manual. This action will be considered by the panel as a public comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

Delete the reference to Article 250 in 516.16(A).

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

ARTICLE 517 HEALTH CARE FACILITIES

15-2 Log #400 NEC-P15 **Final Action: Reject (517.2)**

Submitter: Daniel Leaf, Seneca, SC

Comment on Proposal No: 15-3

Recommendation: Accept the proposal.

Substantiation: Ungrounded circuits may be supplied from an isolating (isolation) transformer with a grounded secondary such as a 2-wire 240 volt circuit from a 120/240 volt secondary which is grounded. The proposal should be judged on merit, not conformance to other standards.

Panel Meeting Action: Reject

Panel Statement: Proposal 15-3 suggests additional language that would expand the definition beyond its current scope. The existing definition includes language: "...and its ungrounded circuit conductors", which clearly indicates the secondary circuit conductors must be ungrounded.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

15-3 Log #431 NEC-P15 **Final Action: Reject (517.2)**

Submitter: Dan Leaf, Seneca, SC

Comment on Proposal No: 15-5

Recommendation: Accept proposal.

Substantiation: See proposal substantiation. Proposal should be judged on merit not whether it conforms to other standards.

Panel Meeting Action: Reject

Panel Statement: The terms "isolation", "isolating" and "isolated" are used to state the purpose, performance and condition of the specific equipment and/or system. The terms are clearly understood in their context as used.

It is the intent of the panel to use extracted material whenever possible in order to maintain consistency between documents. In this case, the source document is NFPA 99.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

15-4 Log #1634 NEC-P15 **Final Action: Accept in Principle (517.2)**

TCC Action: The Technical Correlating Committee directs that the FPN following the title of Article 517 be revised to read as follows:

"FPN: Rules that are followed by a reference in brackets contain text that has been extracted from NFPA 99-2002, Standard for Health Care Facilities and NFPA 101-2006, Life Safety Code. Only editorial changes were made to the extracted text to make it consistent with this Code."

This revision is necessary to accommodate the addition of extract material from NFPA 101.

Submitter: Marvin J. Fischer, Monroe Township, NJ

Comment on Proposal No: 15-6

Recommendation: Accept Proposal 15-6.

Substantiation: It is not within the scope of the National Electrical Code project to define the various types of health care facilities that exist within the U.S. This is the responsibility of the T/C on Safety to Life.

Panel Meeting Action: Accept in Principle

Revise Ambulatory Health Care Facility to read as follows:

Ambulatory Health Care Occupancy. A building or portion thereof used to provide services or treatment simultaneously to four or more patients that provides, on an outpatient basis, one or more of the following:

(1) treatment for patients that renders the patients incapable of taking action for self-preservation under emergency conditions without the assistance of others;

(2) anesthesia that renders the patients incapable of taking action for self-preservation under emergency conditions without the assistance of others;

(3) emergency or urgent care for patients who, due to the nature of their injury or illness, are incapable of taking action for self-preservation under emergency conditions without the assistance of others. [101:3.3.168.1]

Panel Statement: The panel understands that the intent of the submitter is to correlate with the definition from LSC 101. The panel agrees with the submitter.

The panel requests the Standards Council to review and clarify the ownership of definitions common to NFPA 99, LSC 101 and NFPA 70.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

15-5 Log #1635 NEC-P15 **Final Action: Reject (517.2)**

Submitter: Marvin J. Fischer, Monroe Township, NJ

Comment on Proposal No: 15-7

Recommendation: Accept Proposal 15-7.

Substantiation: NFPA Standards Council has written that it wants one definition of a term used in NFPA documents. It is not within the scope of the National Electrical Code project to define the parameters of an anesthetizing location.

Panel Meeting Action: Reject

Panel Statement: The panel action on Proposal 15-1 retains the existing definition for "Anesthetizing Location" contained in NFPA 70. This action is consistent with provisions of the NFPA Glossary of Terms, Section 2.1.2(b) for Secondary Definitions.

NFPA 70, as an international document, should continue to recognize the use of flammable anesthesia.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

15-6 Log #1636 NEC-P15 **Final Action: Accept in Principle (517.2)**

Submitter: Marvin J. Fischer, Monroe Township, NJ
Comment on Proposal No: 15-8
Recommendation: Accept Proposal 15-8.
Substantiation: Term "critical branch" originated in the 1960s by the T/C on Essential Electrical Systems (NFPA 76A) when it established requirements for essential electrical systems in health care facilities.
Panel Meeting Action: Accept in Principle
Revise Critical Branch to read as follows:
Critical Branch. A subsystem of the emergency system consisting of feeders and branch circuits supplying energy to task illumination, special power circuits, and selected receptacles serving areas and functions related to patient care and that are connected to alternate power sources by one or more transfer switches during interruption of normal power source. [99:3.3.26]
Panel Statement: The panel understands that the intent of the submitter is to correlate with the definition from NFPA 99. The panel agrees with the submitter.
The panel requests the Standards Council to review and clarify the ownership of definitions common to NFPA 99, LSC 101 and NFPA 70. The NFPA Glossary of Terms currently indicates that NFPA 70 is the responsible document for this definition.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

15-7 Log #1637 NEC-P15 **Final Action: Reject (517.2)**

Submitter: Marvin J. Fischer, Monroe Township, NJ
Comment on Proposal No: 15-9
Recommendation: Accept Proposal 15-9.
Substantiation: Conform to NFPA Standards Council policy on one definition for a term. Not within the scope of the National Electrical Code project to define parameters of a critical (patient) care area.
Panel Meeting Action: Reject
Panel Statement: There are sufficient differences between the definitions and, as such, an extract reference is not appropriate.
The panel action on Proposal 15-1 retains the existing definition for "Critical Care Area" contained in NFPA 70. This action is consistent with the provisions of NFPA Glossary of Terms, Section 2.1.2(b) for Secondary Definitions.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
SEABURY, III, J.: The proposal should be Accepted in Principle. NFPA 99 should be responsible for this term.

15-8 Log #1638 NEC-P15 **Final Action: Accept (517.2)**

Submitter: Marvin J. Fischer, Monroe Township, NJ
Comment on Proposal No: 15-10
Recommendation: Accept Proposal 15-10.
Substantiation: T/C on Safe Use of Electricity in Patient Care Areas of Health Care Facilities created and defined term "electrical life support equipment" in 1980s. Question NFPA Glossary of Terms assignment of responsibility for this term.
Panel Meeting Action: Accept
Panel Statement: The panel requests the Standards Council to review and clarify the ownership of definitions common to NFPA 99, LSC 101 and NFPA 70.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

15-9 Log #1639 NEC-P15 **Final Action: Reject (517.2)**

Submitter: Marvin J. Fischer, Monroe Township, NJ
Comment on Proposal No: 15-11
Recommendation: Correlate use of term "Emergency System" in Article 700 with same term as used in Article 517.
Substantiation: Term "emergency system" was created and defined by the T/C on Essential Electrical Systems in the 1960s. Both Article 517 and Article 700 use the term. Article 517 uses the term in the same way that NFPA 99 uses the term. Article 700 has a different meaning for the term, correlation is required.
Panel Meeting Action: Reject
Panel Statement: The term "Emergency System" as applied in Article 517 is not in conflict with use of the term in Article 700. There is correlation between the appropriate parts of each article by means of reference(s) in each to the other.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
SEABURY, III, J.: Correlation of the term "Emergency System" is required by the Technical Correlating Committee. 517.2 and NFPA 99 define this term as it relates to healthcare facilities. 700.1 has a much broader definition.

15-10 Log #1640 NEC-P15 **Final Action: Reject (517.2)**

Submitter: Marvin J. Fischer, Monroe Township, NJ
Comment on Proposal No: 15-12
Recommendation: Accept Proposal 15-12.
Substantiation: 1. Term "equipment system" was created and defined by the T/C on Essential Electrical Systems in the 1960s. Both Article 517 and Article 700 use the term, and use the term in the same way. Question NFPA Glossary of Terms assignment of responsibility for this term.
2. Article 700 has a different meaning for the term. Correlation is required.
Panel Meeting Action: Reject
Panel Statement: There are sufficient differences between the definitions and, as such, an extract reference is not appropriate.
Use of the defined term "Equipment System" is unique to Article 517 in NFPA 70. It is not used in Article 700 as a defined system or portion of a system. Correlation is not needed.
The panel requests the Standards Council to review and clarify the ownership of definitions common to NFPA 99, LSC 101 and NFPA 70.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

15-11 Log #1641 NEC-P15 **Final Action: Accept in Principle (517.2)**

Submitter: Marvin J. Fischer, Monroe Township, NJ
Comment on Proposal No: 15-13
Recommendation: Accept Proposal 15-13.
Substantiation: Term "essential electrical system" was originated in the 1960s by the T/C on Essential Electrical Systems (NFPA 76A) when it established requirements for essential electrical systems in health care facilities. Question NFPA Glossary of Terms assignment of responsibility for this term.
Panel Meeting Action: Accept in Principle
Revise Essential Electrical System to read as follows:
Essential Electrical System. A system comprised of alternate sources of power and all connected distribution systems and ancillary equipment, designed to ensure continuity of electrical power to designated areas and functions of a health care facility during disruption of normal power sources, and also to minimize disruption within the internal wiring system. [99 3.3.44]
Panel Statement: The panel understands that the intent of the submitter is to correlate with the definition from NFPA 99. The panel agrees with the submitter.
The panel requests the Standards Council to review and clarify the ownership of definitions common to NFPA 99, LSC 101 and NFPA 70. The NFPA Glossary of Terms currently indicates that NFPA 70 is the responsible document for this definition.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

15-12 Log #1642 NEC-P15 **Final Action: Reject (517.2)**

15-15 Log #1645 NEC-P15 **Final Action: Accept (517.2)**

TCC Action: The Technical Correlating Committee understands that the panel action results in "[NFPA 99: 3.3.96]" being added to the definition of "Life Safety Branch".

Submitter: Marvin J. Fischer, Monroe Township, NJ

Comment on Proposal No: 15-19

Recommendation: Accept Proposal 15-19.

Substantiation: Term "life safety branch" originated in the 1960s by the T/C on Essential Electrical Systems (NFPA 76A) when it established requirements for essential electrical systems in health care facilities.

Panel Meeting Action: Accept

Panel Statement: The panel requests the Standards Council to review and clarify the ownership of definitions common to NFPA 99, LSC 101 and NFPA 70.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

15-16 Log #1646 NEC-P15 **Final Action: Accept in Principle in Part (517.2)**

Submitter: Marvin J. Fischer, Monroe Township, NJ

Comment on Proposal No: 15-22

Recommendation: Accept in Part Proposal 15-22. Revise definition of "patient care area" as recommended by Mr. Erickson in his negative vote.

Substantiation: Standards Council has stated that it wants one definition for a term used in NFPA documents. Not within the scope of the National Electrical Code project to define parameters of a patient care area.

Panel Meeting Action: Accept in Principle in Part

Revise Patient Care Area to read as follows:

Patient Care Area. Any portion of a health care facility wherein patients are intended to be examined or treated. Areas of a health care facility in which patient care is administered are classified as general care areas or critical care areas, ~~either of which may be classified as a wet location.~~ The governing body of the facility designates these areas in accordance with the type of patient care anticipated and with the following definitions of the area classification.

FPN: Business offices, corridors, lounges, day rooms, dining rooms, or similar areas typically are not classified as patient care areas.

Revise Wet Locations to read as follows:

Wet Locations. Those spaces within patient care areas where a procedure is performed and that are normally subject to wet conditions while patients are present. These include standing fluids on the floor or drenching of the work area, either of which condition is intimate to the patient or staff. Routine housekeeping procedures and incidental spillage of liquids do not define a wet location.

Panel Statement: The panel accepts the submitter's recommendation pertaining to the definition of patient care area.

The panel rejects the submitter's recommendation to remove reference to governing bodies.

The panel rejects the changes to the definition to wet locations and provides alternate text that better defines the location. This text addresses the submitter's desire to better correlate with NFPA 99.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

15-17 Log #2329 NEC-P15 **Final Action: Accept in Principle (517.2)**

Submitter: Marcus Sampson, Lysistrata Electric

Comment on Proposal No: 15-4

Recommendation: The panel should review the merits of this proposal.

The term "Wet Locations" should should be change to "Wet Procedure Areas" to clearly differentiate the condition.

Substantiation: While inspectors and installers familiar with the long-time NEC classifications of patient care areas in health care facilities (may) understand the distinction between "Location, Wet" as defined in Article 100 and and "Wet Locations" as used in Article 517, adopting this proposal eliminates an unnecessarily subtle nuance.

Code requirements should not be esoteric.

Users should find clear, readily understood terms that are used consistently throughout the document. This minor change would result in a better understanding of the meaning of the term. For consistency and clarity, "Patient Care Areas" should be divided into three other types of AREAS - not two types of "areas" and one type of "location."

517.18 General Care Areas

517.19 Critical Care Areas

517.20 Wet Procedure Areas

While the panel's response indicates that the change would not comply with the NEC Style Manual for extracted text, Article 517 is not made up entirely of extractions from NFPA 99. The submitter did indicate that this proposal was also sent to that committee.

Panel Meeting Action: Accept in Principle

Change the title of "Wet Locations" to "Wet Procedure Locations".

Panel Statement: The panel agrees with the submitter to change the title of the definition. The panel replaces the word "areas" with "locations" because it is a location within an area.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

15-17a Log #CC1500 NEC-P15 **Final Action: Accept (517.2, 517.20, 517.20(A) and 517.60)**

Submitter: Code-Making Panel 15,

Comment on Proposal No: 15-4

Recommendation: Change the terms "wet location" to "wet procedure location" and "wet locations" to "wet procedure locations" in Section 517.2, 517.20, 517.20(A) and 517.60.

Substantiation: This is required as the title was changed. See panel action and statement in Comment 15-17.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

15-18 Log #1257 NEC-P15 **Final Action: Accept (517.13(B) Exception No. 1, 517.18.(B), 517.19(B)(2), and 517.19(D))**

Submitter: Neil F. LaBrake, Jr., Syracuse, NY

Comment on Proposal No: 15-2

Recommendation: Continue to accept the following portions of the TCC Grounding and Bonding Task Group proposal 15-2 as modified and revised by the actions of CMP-15 for which the TCC Grounding and Bonding Task Group agrees with the CMP-15 editorial revisions to the Sections 517.13(B) Exception No. 1, 517.18(B), 517.19(B)(2), and 517.19(D).

Substantiation: TCC Grounding and Bonding Task Group understands the revisions to the proposal have been made for clarity and continue to be consistent with the Grounding and Bonding Task Group's original initiatives.

This Comment was developed by a Task Group assigned by the NEC Technical Correlating Committee to address actions that were other th an "accept" taken by Code-Making Panels on proposals from the TCC to resolve 2005 NEC Proposal 5-1 and Comment 5-1. Members of the Task Group on Grounding and Bonding for this Comment included: C. Douglas White; Michael Johnston; Jeffrey Boksiner; Daleep Mohla; Phil Simmons; Christopher Hutchings; James Carroll; Alan Rebeck; Richard Loyd; Paul Dobrowsky; and Neil F. LaBrake, Jr.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

15-19 Log #783 NEC-P15 **Final Action: Accept in Principle in Part (517.13(B) Exception No. 2)**

Submitter: David G. Humphrey, Midlothian, VA
Comment on Proposal No: 15-28
Recommendation: Revise text to read as follows:

Luminaires (light fixtures) more than 2.3 m (7 1/2 ft) above the floor and switches located outside of the patient vicinity shall ~~not be required to be grounded by an insulated equipment grounding conductor.~~ be permitted to be grounded by the metal raceway system, or metallic cable armor, or sheath assembly complying with 517.13(A).

Substantiation: The existing text of 517.13(B) Exception No. 2 permits the omission of an insulated equipment grounding conductor for luminaires more than 7 1/2 ft above the floor and switches located outside of the patient vicinity. A literal reading of 517.13(B)(would require an insulated "copper" equipment grounding conductor with Exception No. 2 merely permitting this copper conductor to be uninsulated. 517.13(A) requires a metal raceway system, or metallic cable armor, or sheath assembly qualifying as an equipment ground return path in accordance with 250.118 as a wiring method for fixed electric equipment in patient care areas. The proposed text revision would both reinforce the requirements of 517.13(A) and clarify that an insulated equipment grounding conductor, copper or otherwise for luminaires located more than 7 1/2 ft above the floor or switches located outside of the patient vicinity is optional.

Panel Meeting Action: Accept in Principle in Part

Revise Exception No. 2 to read as follows:

Exception No. 2: Luminaires (light fixtures) more than 2.3 m (7 1/2 ft.) above the floor and switches located outside of the patient vicinity shall ~~not be required to be grounded by an insulated equipment grounding conductor.~~ be permitted to be connected to an equipment grounding return path complying with 517.13(A).

Panel Statement: The panel accepts the removal of the wording referring to an insulated equipment grounding conductor.

The panel rejects reference to specific wiring system methods and instead references to an equipment grounding return path complying with 517.13(A).

The revised wording provides clarity while meeting the submitter's intent.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

15-20 Log #1422 NEC-P15 **Final Action: Hold (517.17(B))**

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 15-29
Recommendation: NEMA recommends that Proposal 15-29 be Accept as written.
Substantiation: In order to provide the reliability in the essential electrical system that the CMP wants, multiple levels of GFP (ground fault protection) must be provided for the following reasons:

1. Ground faults are the most common form of faults in a operating electrical system. Multiple levels of GFP on both the normal and alternate source sides of the system are needed to isolate such faults as close to their point of occurrence as possible, thus providing a level of selective coordination and yielding the minimum disruption to the essential electrical system. It would seem that minimizing such disruption is even more important when a ground fault has occurred.

2. Closing a transfer switch or a generator into a ground fault presents the real possibility of damaging the transfer switch, or generator, or both, thus potentially decreasing system reliability.

As Mr. Wiseman pointed out in his negative comment, the panel statement is incorrect. The proposed deletion does not establish a conflict. The conflict is in the existing language since the additional level of ground-fault protection is prohibited in portions of the essential electrical system that could be fed from the alternate power source, while Article 700 actually permits ground-fault protection at the source. There is no substantiation that deviating from the requirement in Article 700 for ground-fault protection enhances the reliability of the system.

The panel statement suggests that most generators are small and, therefore, the risk of burn-down is not an issue. That statement may be accurate, but has no relevance to this discussion since the requirement for ground-fault protection is triggered by the size of the service disconnect in 230.95 or the feeder in 215.10. Therefore, the smaller generators which do not include a feeder disconnect rated 1000A or greater are not required to have ground-fault protection.

There has been no evidence presented or substantiation presented in the panel statement that supports rejecting this proposal.

Panel Meeting Action: Hold
Panel Statement: The panel holds both Proposal 15-29 and Comment 15-20.

The panel contents that this issue requires further review, study and discussion to understand the complexity in terms of coordination and protection (including energy produced by standby generator). The panel cannot adequately address these issues at this time and therefore recommends to place the proposal and comment on hold and create a task group to research further.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

15-21 Log #2233 NEC-P15 **Final Action: Hold (517.17(B))**

Submitter: Eugene E. Morgan, Clakamas County, Building Codes Divison
Comment on Proposal No: 15-29
Recommendation: Panel 15 should reconsider the merits of this proposal. The submitter's intent could be met and clarified with a revision of existing and new text, rather than a deletion as originally proposed:

517.15(B) Feeders. Revise last sentence of main paragraph as follows and add new text:

The additional levels of ground-fault protection shall not be ~~installed as follows~~: required on the following systems:

(1) On the load side of an essential electrical system transfer switch, where the alternate power source is 750 kVA or less

(2) Between the on-site generating unit(s) described in 517.35(B) and the essential electrical system transfer switch(es), where the alternate power source is 750 kVA or less

(3) On electrical systems that are not solidly grounded wye systems with greater than 150 volts to ground but not exceeding 600 volts phase-to-phase

Essential electrical systems where the alternate power source is rated over 750 kVA, and the system is designed under qualified engineering supervision, shall be permitted to have ground-fault protection. Where the alternate power source is 750 kVA or less, ground-fault detection shall be provided in accordance with 700.7(D), and shall include detection at the second level of feeders as specified in this section.

Substantiation: I respectfully disagree with the panel's action and statement on three points:

(1) The original submittal, and the comment submitted herewith are not in conflict with 700.7(D), which provides for ground-fault detection. Article 700 provides for ground-fault detection, but it does not prohibit the use of ground-fault protection.

(2) Section 700.26 states that ground-fault protection shall not be required, but it is not prohibited.

(3) There is a trend toward larger regional hospitals with generators that exceed 1 megawatt of output. The original proposal gave the example of an 8 megawatt installation. In the jurisdiction that I serve, there is a new hospital generator system installation rated at 4.5 megawatts. The argument that a majority of hospitals have smaller alternate power sources does not answer the need for safety in the newer, larger installations. In the 4.5 megawatt system installed locally, the available fault current at the first transfer switch is 51,800 amps. The potential for a system meltdown in the event of a fault actually exceeds the fault current and potential damage from the utility transformers.

There should be some valid point at which ground-fault protection is needed. It is true that small alternate power sources should have ground-fault detection, and not ground-fault protection. The distinction between systems over 750 kVA (typically 1 megawatt or larger), and those 750 kVA or under, distinguishes between systems where available fault current would be significant. With the revision outlined above, the provision for an engineer to utilize ground-fault protection is available, but it is clearly at the engineer's discretion and not mandatory. This is also an opportunity to point out that Section 700.7(D) provides for ground-fault detection, which should always be installed when ground-fault protection is not an option.

Panel Meeting Action: Hold
Panel Statement: The panel holds both Proposal 15-29 and Comment 15-21.

The panel contents that this issue requires further review, study and discussion to understand the complexity in terms of coordination and protection (including energy produced by standby generator). The panel cannot adequately address these issues at this time and therefore recommends to place the proposal and comment on hold and create a task group to research further.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

15-22 Log #2352 NEC-P15 **Final Action: Hold (517.17(B))**

Submitter: Alan Manche, Square D Company
Comment on Proposal No: 15-29
Recommendation: The Panel should reconsider Proposal 15-29 and Accept it.
Substantiation: In order to provide the reliability in the essential electrical system that the CMP wants, multiple levels of GFP (ground fault protection) must be provided, once the first level is provided, for the following reasons:

1. Ground faults are the most common form of faults in an operating electrical system. Multiple levels of GFP on both the normal and alternate source sides of the system are needed to isolate such faults as close to their point of occurrence as possible, thus providing a level of selective coordination and yielding the minimum disruption to the essential electrical system. It would seem that minimizing such disruption is even more important when a ground fault has occurred.

2. Closing a transfer switch or a generator into a ground fault presents the real possibility of damaging the transfer switch, or generator, or both, thus potentially decreasing system reliability.

As Mr. Wiseman pointed out in his negative comment, the panel statement is incorrect. The proposed deletion does not establish a conflict. The conflict is in the existing language since the additional level of ground-fault protection is prohibited in portions of the essential electrical system that could be fed from the alternate power source, while NEC 700 actually permits ground-fault protection at the source. There is no substantiation indicating a need to amend NEC Article 700 for NEC 517 installations nor is there substantiation that disallowing a properly installed ground-fault protection system will enhance the reliability of the system.

The panel statement suggests that most generators are small and therefore the risk of burn-down is not an issue. That statement may be accurate but has no relevance to this discussion since the requirement for ground-fault protection is triggered by the size of the service disconnect in 230.95 or the feeder in 215.10. Therefore, the smaller generators which do not include a feeder disconnect rated 1000A or greater are not required to have ground-fault protection, and this revision would have no impact on them.

There has been no evidence presented or substantiation presented in the panel statement that supports rejecting this proposal.

Panel Meeting Action: Hold

Panel Statement: The panel holds both Proposal 15-29 and Comment 15-21.

The panel contents that this issue requires further review, study and discussion to understand the complexity in terms of coordination and protection (including energy produced by standby generator). Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

15-23 Log #2051 NEC-P15 **Final Action: Hold**
(517.17(B)(2))

Submitter: Hugh O. Nash, Jr., Nash Lipsey Burch

Comment on Proposal No: 15-29

Recommendation: Continue to reject 15-29 which applies to 517.17 Ground-Fault Protection. Add the following sentence to 517.17(B)(2):

For solidly grounded wye-emergency systems of more than 150 volts to ground and circuit-protective devices rated 1000 or more, refer to 700.7(D).

(Note: The intent is to refer to the language in the 2005 edition. If this wording is deleted, the entire text of 517.17(B)(2) shall be added here.)

Substantiation: Regardless of the size of the alternate source, ground-fault interruption on the alternate source overcurrent device can cause interruption of the alternate source feed to health care facility essential system loads. Automatic disconnecting should not be provided under any circumstances. 517.17(B) states, "The additional levels of ground-fault protection shall not be installed as follows: (1) On the load side of the essential electrical system transfer switch, (2) Between the onsite generating unit as described in 517.35(B) and the essential electrical system transfer switch(es). For many years, 517.17 warned against placing GFP interruption between the alternate source and the transfer switch(es). This warning has now become a prohibition. There are documented instances where GFP interrupted the normal source and the alternate source, leaving critical care areas without normal or alternate power.

Panel Meeting Action: Hold

Panel Statement: The panel holds both Proposal 15-29 and Comment 15-21.

The panel contents that this issue requires further review, study and discussion to understand the complexity in terms of coordination and protection (including energy produced by standby generator). Submitter: Susan B. McLaughlin, SBM Consulting, Ltd. / Rep. NFPA Health Care Section Executive Board

Comment on Proposal No: 15-34

Recommendation: Reject this Proposal.

Substantiation: In reviewing this new requirement, the NFPA Health Care Section Executive Board is of the opinion that the need for indicator lights on receptacles should not become a minimum standard. Panel 15 appears to have reacted to a proposal based on one reported incident. Is the fix a mechanical one or is there a better way to resolve the issue with better staff training, panel schedules, etc.? All newly installed critical care outlets are required to have the circuit number labeled on the front so that staff can quickly determine if the outlets are on the same circuit. If a hospital wants to install devices with illuminated faces or indicator lights, they are permitted to do so as this exceeds the Code. A code is a set of standards that shall have substantial justification behind the need and should not be changed as a result of a few isolated instances where the staff may not have been properly trained on the environment in which they are working.

Ballot Results: Affirmative: 12

15-27 Log #2103 NEC-P15 **Final Action: Accept**
(517.18(B) and 517.19 (B)(2))

Submitter: Stephen J. Grose, The Washington State Society for Healthcare Engineering

Comment on Proposal No: 15-34

Recommendation: Reject this proposal.

Substantiation: In reviewing this new requirement, it is the opinion of the Washington State Society for Healthcare Engineering that the need for indicator lights on receptacles should not become a minimum standard. One reported incident should not justify a new code without careful consideration and a significant review of incident locations facilities emergency preparation and response. Most hospitals have tied critical equipment into UPS sources that will initiate alarms when activated allowing for a period of time to react without jeopardizing patient safety. Best practices would stipulate panel labeling at the outlet and multiple breakers to feed one room to offset just this issue. Code revision based on this incident will set a precedent that would make code revisions reactive and not proactive raising the already high costs to build and operate our facilities. The primary responsibility of healthcare engineering is to ensure the environmental health and safety of the patients, facilities, and staff we serve. If the code recommendation could not be off set by effective emergency plans, staff training, and following existing code standards, I would support this code. A proactive review of the incident should show one of these tree elements were missing.

Comment on Proposal No: 15-34

Recommendation: Delete the text as amended by the CMP.

Substantiation: I am in agreement with all of the negative comments from the CMP-15 members.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

15-28 Log #795 NEC-P15 **Final Action: Accept**
(517.18(B) and 517.19(B)(2))

Submitter: Douglas S. Erickson, American Society for Healthcare Engineering (ASHE)
Comment on Proposal No: 15-34
Recommendation: Reject this proposal.
Substantiation: In reviewing this new requirement, the American Society for Healthcare Engineering is of the opinion that the need for indicator lights on receptacles should not become a minimum standard. Panel 15 appears to have reacted to a proposal based on one reported incident. Is the fix a mechanical one or is there a better way to resolve the issue with better staff training, panel schedules, etc? All newly installed critical care outlets are required to have the circuit number labeled on the front so that staff can quickly determine if the outlets are on the same circuit. If a hospital wants to install devices with illuminated faces or indicator lights, they are permitted to do so as this exceeds the Code. A code is a set of standards that shall have substantial justification behind the need and should not be changed as a result of a few isolated instances where the staff may not have been properly trained on the environment in which they are working.

(517.26)

TCC Action: See the Technical Correlating Committee action on Comment 15-35.
Submitter: Michael J. Johnston, Plano, TX
Comment on Proposal No: 15-43
Recommendation: This proposal should be rejected. Restore the language in this section to the text in the 2005 NEC as follows:
517.26 Application of Other Articles. The essential electrical system shall meet the requirements of Article 700, except as amended by Article 517.
Substantiation: Nothing is gained by this revision as proposed. In fact, much is lost as a result of this action. The consequences of accepting this change are far reaching as indicated in the statement to the negative by Mr. Morgan representing Electrical Code Enforcement. Another significant consequence of this change is that selective coordination of overcurrent protective devices used in emergency systems will be lost for the critical care branch, which, in a hospital, is an extremely important part of the emergency system, for obvious reasons. The proposal reduces current requirements without adequate substantiation. The submitter correctly made the point about Article 700 being applicable to the life safety branch, but removing the requirement for selective coordination required by 700.27 goes against the fundamental concepts of NFPA 99 and its objectives to maintain continuity of power for patient care electrical systems, especially the critical care branch. I strongly suggest reconsidering the original action on this proposal and its intended or unintended consequences.
Panel Meeting Action: Reject
Panel Statement: The panel upholds its position on Proposal 15-43.
The life safety branch of the health care facility is comparable to the emergency system of commercial (and other) building types, since both provide power for life safety systems. The critical branch of the health care facility serves patient care related circuits and equipment, and thus it is not appropriate to apply Article 700.
Emergency power supply systems need to be governed by one entity. The panel requests the Standards Council and the TCC to review scopes and charges of NFPA 99, NFPA 110, Articles 517 and 700 as it pertains to emergency power systems.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 8 Negative: 4
Explanation of Negative:
MORGAN, E.: I strongly disagree with the Panel action and statement on this comment. The original Proposal 15-43 removes some extremely important installation requirements from the critical branch of the emergency system. This action effectively removes requirements such as: 700.3 Equipment approval for use on emergency systems; 700.4 Acceptance test, maintenance and periodic testing of the critical branch; 700.9(A) Identification of boxes and enclosures for critical branch feeders and circuits; 700.9(D) Fire Protection of feeders in buildings over 75 ft. in height; 700.12(B)(5) Auxiliary power supply provisions where the generator set may require more than 10 seconds to develop full power; and 700.27 Selective coordination of overcurrent devices. These all have a significant impact on the safe design, installation and inspection of critical branch systems. Good design alone cannot be enforced by an Authority Having Jurisdiction if the requirements are not part of Article 517, or incorporated by reference to Article 700.
The Panel Statement fails to acknowledge the primary reason for this change is to avoid the requirement for selective coordination of the critical branch overcurrent devices. This appears to be a contradiction of the actions of Panels 13 and 20. In Article 700 and new Article 585, those Panels each reaffirmed the

necessity and practicability of selective coordination to minimize and localize power outage when there is a short circuit or overcurrent. The critical branch of a health care facility emergency system must have continuity of operation as one of its' highest priorities. Removing the Article 700 requirements has no apparent benefit other than cost saving. If the Panel's intent was to avoid the requirement for selective coordination (and I object to that concept), then at a minimum the other safe installation requirements as outlined in the above paragraph should be incorporated into Article 517.

It should be noted that the editors of the NEC 2005 Handbook © consider the requirements of Article 700 to apply to the critical branch of the essential electrical system. Quoting from the commentary following the definition in 517.2: "Emergency System. Emergency systems in occupancies other than health care are installed primarily for life safety and building evacuation. The emergency systems in hospitals are for life safety systems as well as maintenance of power for critical patient care systems."

The Panel statement requests "the Standards Council and the TCC to review scopes and charges of NFPA 99, NFPA 110, Articles 517 and 700 as it pertains to emergency systems." If this request is accepted, I would also ask that consideration be given to the apparent discrepancy between Article 700 emergency systems and Article 517 emergency systems that would be created by this change.

TALKA, D.: See my explanation of negative vote on Comment 15-35.

WHITE, A.: See my explanation of negative vote on Comment 15-35.

WISEMAN, J.: NEMA disagrees with the panel action. The panel action results in the removal of the critical branch from the requirements for emergency systems found in Article 700. The critical branch includes task illumination and selected receptacles for critical care areas, isolated power systems, patient care areas, nurse call systems, blood banks, bone banks, tissue banks, telephone equipment rooms, and task illumination for cardiac test labs, coronary care units, emergency rooms, and intensive care units.

15-34 Log #1352 NEC-P15 **Final Action: Reject**
(517.26)

Submitter: Tim Janof, Sparling
Comment on Proposal No: 15-43
Recommendation: Revise text to read as follows:

517.26 Application of Other Articles. The life safety branch of the emergency system ~~essential electrical system~~ shall meet the requirements of Article 700, except as amended by Article 517. The critical branch shall not be required to meet the requirements of Article 700. The equipment branch shall not be required to meet the requirements of Article 701.

Substantiation: I support the panel's action on Article 517.26 and propose to further clarify that the Equipment System is not required to comply with Article 701. I support the notion that the Life Safety branch is analogous to the Article 700 branch, and I believe the same principle should be extended to the Equipment Branch, in that it is analogous to Article 701 branch. While I do not support the requirement for selective coordination in Articles 700 and 701, if they are to remain in the Code, limiting the requirement to the life safety branch in healthcare facilities is sensible.

When selective coordination is considered, most people first envision a patient on an operating room table. This is perhaps the most emotionally charged scenario depicted by those who support the requirement for selective coordination. When one examines this situation, however, one finds that the requirement for selective coordination is difficult to justify. UL, Article 517, and NFPA 99 already have provisions that result in safe health care facilities:

- UL requires that critical medical equipment have integral batteries. Heart-lung machines, for example, typically have 1-hour batteries, which is plenty of time for hospital personnel to find and turn on a breaker that may have tripped inadvertently.
- The NEC requires redundancy in electrical systems in healthcare facilities. For example, facilities with critical care functions are required to have a back-up emergency power system, such as a diesel generator. The NEC also requires that power be provided from two separate power branches to each patient care area, including critical care areas and operating rooms. Power must be fed from both a normal and emergency power branch, or from two separate transfer switches. If there were an outage in one branch of power, the other branch would still be available. The only scenarios in which both branches of power would not be available involve some sort of catastrophic event, such as an emergency generator failure, fire, or earthquake, which the requirement for selective coordination would not prevent. The NEC's power system redundancy requirements have an excellent track record of supporting the healthcare environment.
- NFPA 99 requires that operating rooms and other anesthetizing locations have lighting with integral 90-minute battery back-up.

If there were evidence that a lack of selective coordination has resulted in injury or loss of life within healthcare facilities, I would fully support the requirement for selective coordination. But given the lack of any such case history, I can see no justification for requiring that owners pay the additional cost and sacrifice the additional space for a system that will not result in any patient benefit. Healthcare capital development budgets are limited and money not used for marginal electrical reliability benefits can be directly used for additional beds or medical equipment. I am now aware of any data that demonstrates that lives have been lost or that patients were injured due to a lack of selective coordination in healthcare facilities.

Panel Meeting Action: Reject
Panel Statement: The panel does not agree with submitter's substantiation relative to UL requirements that critical medical equipment have integral batteries.

The equipment branch should not be excluded from the requirements of Article 701.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

15-35 Log #2269 NEC-P15 **Final Action: Reject**
(517.26)

TCC Action: The Technical Correlating Committee directs that this comment be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.

In addition, the Technical Correlating Committee directs that Proposal 15-43 be reported as "Reject" since the panel no longer appears to have consensus on the issue.

Submitter: James Wiseman, Schneider Electric / Square D
Comment on Proposal No: 15-43
Recommendation: The panel should reconsider the action taken on this proposal, Accept in Principle, and relocate 517.26 to become 517.3, reading as follows:

517.3 Other Articles. The life safety branch of the emergency system shall meet the requirements of Article 700, except as amended by Article 517. The critical branch shall not be required to meet the requirements of Article 700.

Substantiation: We support the attempt at clarifying the portions of the healthcare electrical system to which the requirements of Article 700 apply. But the attempt did not go quite far enough. For many years, there has been confusion because Article 517 uses the "emergency" term differently than it is used in Article 700. Several attempts have been made, starting with the 1999 NEC edition, to minimize the confusion and still comply with rules for referencing other NEC Articles. Each has retained some portion of the problem.

The Recommendation and Substantiation in Proposal 15-43 are entirely consistent with the stance taken by the CMP (CMP-17, at that time) during the 2002 cycle. The ROC for that cycle, in Log #206 (Comment 17-15, on Proposal 17-10 covering the definition of Emergency System in 517-3) includes the following sentence as a part of the Panel Statement: "The panel's intent is that Article 700 apply only to the 'Life safety branch.'" Unfortunately, they took no further action within Article 517 to clear up the confusion for items such as sizing of generators or the number of transfer switches.

The problem with leaving 517.26 as it is proposed in Proposal 15-43 is that, due to 517.26 being under Part III of Article 517, it leaves the "Equipment System" branch in question. Since Part III covers Essential Electrical Systems, it addresses not only the "Emergency System" but also the "Equipment System." If the section is to stay as 517.26, the last sentence should be changed to read "Neither the critical branch nor the equipment system shall be required to meet the requirements of Article 700." Moving the section to become 517.3 not only eliminates this confusion, but also matches Article 517 with other Articles in using the.3 number for "Other Articles".

Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 7 Negative: 5
Explanation of Negative:

MORGAN, E.: I strongly disagree with the Panel action on this proposal. There is not sufficient substantiation in either Proposal 15-43 or Comment 15-35 to justify such a change. Throughout NFPA 99 and NEC Article 517, the critical branch is considered an inseparable part of the emergency system. By definition, the critical branch serves such important functions as task illumination, special power circuits, and selected receptacles related to patient care. A more complete list of the locations served by these circuits is in NFPA 99, Section 4.4.2.2.2.3. It includes locations such as coronary care, intensive care, postoperative recovery rooms, hemodialysis rooms and emergency rooms.

Removal of the requirement to comply with Article 700 is more than an editorial change. It would literally remove requirements such as: Identification of boxes, enclosures and panels as part of the emergency system (700.9); the requirement for audible and visual signals for the alternate power source (700.7); and the periodic testing required by 700.4.

Removing the critical branch from requirements of Article 700 may also be mistakenly seen by some designers and installers of smaller facilities as eliminating the requirements for emergency systems in 517; such as separation from other circuits, and mechanical protection.

SHELLY, B.: The critical branch, as defined by Article 517, is a subsystem of the emergency system and therefore, part of the essential electrical system (Article 517.30(B)(2)). The assurance of these systems to be reliable shall require the components of Article 700 for the proper performance, maintenance and testing. The Proposal 15-43 should be rejected.

TALKA, D.: The panel debated long and hard on this item due to the significance of the result of the action as well as its controversial nature. One thing the panel did agree on whas that there needs to be a clear path established regarding which documents owns the responsibility of the involved part of the code, that is NFPA 70, NFPA 99, NFPA 101, etc. Until such time as that responsibility has been made clear, it is desirable to not take action on this significant proposed code revision. Once the responsibility has been confirmed, the lead document will take the proper action and the other documents will follow suit. Changing the NEC now allows the risk of creating more confusion and setting the stage for years of unintended actions in design and installations of and within healthcare facilities.

WHITE, A.: As the phrase implies, the critical branch of a health care facilities emergency electrical system provides service to critical patient care areas and functions. Removing the provisions of Article 700 does nothing to improve the performance of the critical branch. Some of these important provisions include:

- Testing (acceptance, load and operational)
- Battery Maintenance
- Selective Coordination
- Transfer Switch Specifications
- Fuel Supply Specifications
- Signaling (battery carrying load, nonfunctioning battery charger, ground fault)
- Emergency Illumination
- Emergency Receptacle Power
- Physical Separation of Normal and Critical Circuits
- Identification (circuit, box, enclosure, panel)

Removing the requirements of Article 700 potentially undermines this critically important system.

WISEMAN, J.: NEMA disagrees with the panel action. The panel action results in the removal of the critical branch from the requirements for emergency systems found in Article 700. The critical branch includes task illumination and selected receptacles for critical care areas, isolated power systems, patient care areas, nurse call systems, blood banks, bone banks, tissue banks, telephone equipment rooms, and task illumination for cardiac test labs, coronary care units, emergency rooms, and intensive care units.

15-51 Log #1827 NEC-P15 **Final Action: Reject (517.26)**

TCC Action: See the Technical Correlating Committee action on Comment 15-35.
Submitter: Eugene E. Morgan, Clakamas County, Building Codes Divison
Comment on Proposal No: 15-43
Recommendation: The Panel 15 should reconsider its action. Proposal 15-43 should be rejected, leaving existing text as is.
Substantiation: Throughout NFPA 99 and NEC Article 517, the critical branch is considered an inseparable part of the emergency system. By definition, the critical branch serves such important functions as task illumination, special power circuits, and selected receptacles related to patient care. A more complete list of locations served by those circuits is in NFPA 99, 4.4.2.2.2.3. It includes locations such as coronary care, intensive care, postoperative recovery rooms, hemodialysis rooms and emergency rooms.

Removal of the requirements to comply with Article 700 is more than an editorial change. It would literally remove requirements such as: Identification of boxes, enclosures and panels as part of the emergency system (700.9); the requirement for audible and visual signals for the alternate power source (700.7); and the periodic testing required by 700.4.

Removing the requirements of Article 700 from the critical branch may be mistakenly seen by some designers and installers of smaller facilities as eliminating the requirements for emergency systems in Article 517; such as separation from other circuits, and mechanical protection.

The only apparent reason for removing the critical branch from the requirements of Article 700 would be a possible cost saving, which in my view, does not justify the change. The critical branch should remain as a recognizable, integral part of the emergency system.
Panel Meeting Action: Reject
Panel Statement: The panel notes the print line is incorrect; it should be 517.26.

The panel upholds its position on Proposal 15-43.

The life safety branch of the health care facility is comparable to the emergency system of commercial (and other) building types, since both provide power for life safety systems. The critical branch of the health care facility serves patient care related circuits and equipment, and thus it is not appropriate to apply Article 700.

Emergency power supply systems need to be governed by one entity. The panel requests the Standards Council and the TCC to review scopes and charges of NFPA 99, NFPA 110, Articles 517 and 700 as it pertains to emergency power systems.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 3
Explanation of Negative:

MORGAN, E.: I believe the Panel accepted Proposal 15-43 without sufficient substantiation as required by the NFPA Regulations Governing Committee Projects, Section 4.3.3(d). The statement by the submitter is an opinion, not substantiation of a problem or requirement that needed change. Yet, the Panel overlooked the substantiation provided in Comments 15-33 and 15-51 regarding the negative consequences of the action.

I also strongly disagree with the Panel Statement "The critical branch of the health care facility serves patient care related circuits and equipment, and thus it is not appropriate to apply Article 700." This implies that egress lighting for ambulatory patients, staff and visitors to exit a building is more important than continuity of power for surgeries in process, for patients who may be on life support, for patients in critical care, or the other many patient-related lights and receptacles served by the critical branch.

As noted in my negative vote on Comment 15-33, the reason for the original proposal is to avoid selective coordination of critical branch circuit overcurrent devices as required by Section 700.27. The effort to avoid this requirement seems to be in conflict with action taken by Panels 13 and 20, in their actions on Article 700 and the new Article 585.

The Panel statement requests "the Standards Council and the TCC to review scopes and charges of NFPA 99, NFPA 110, Articles 517 and 700 as it pertains to emergency systems." If this request is accepted, I would also ask that consideration be given to the apparent discrepancy between Article 700 emergency systems and Article 517 emergency systems that would be created by this change

WHITE, A.: See my explanation of negative vote on Comment 15-35.

WISEMAN, J.: NEMA disagrees with the panel action. The panel action results in the removal of the critical branch from the requirements for emergency systems found in Article 700. The critical branch includes task illumination and selected receptacles for critical care areas, isolated power systems, patient care areas, nurse call systems, blood banks, bone banks, tissue banks, telephone equipment rooms, and task illumination for cardiac test labs, coronary care units, emergency rooms, and intensive care units.

15-36 Log #1647 NEC-P15 **Final Action: Reject (517.30(B)(4))**

Submitter: Marvin J. Fischer, Monroe Township, NJ
Comment on Proposal No: 15-47
Recommendation: Accept in Part Proposal 15-47. Correlate 517.30(B)(4) with 517.41(B).
Substantiation: Section 517.41(B) identifies text as extracted from NFPA 99, 4.5.2.2.1.
Panel Meeting Action: Reject
Panel Statement: No recommended text is provided with the comment as required by 4-3.3(c) of the Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

15-37 Log #1386 NEC-P15 **Final Action: Accept in Principle (517.30(C)(3))**

Submitter: William Wagner, Certification Solutions
Comment on Proposal No: 15-57
Recommendation: This Proposal should continue to be Accepted as follows:

(1) Nonflexible metal raceways, Type MI cable, or Schedule 80 rigid ~~nonmetallic~~ PVC conduit. Nonmetallic raceways shall not be used for branch circuits that supply patient care areas.

(2) Where encased in not less than 50 mm (2 in.) of concrete, Schedule 40 rigid ~~nonmetallic~~ PVC conduit, flexible nonmetallic or jacketed metallic raceways, or jacketed metallic cable assemblies listed for installation in concrete. Nonmetallic raceways shall not be used for branch circuits that supply patient care areas.
Substantiation: The only type of rigid nonmetallic conduit that is currently listed in Schedule 40 and Schedule 80 dimensions is rigid PVC conduit. As each of the rigid nonmetallic conduit Articles require the conduit to be listed, this revision would not inadvertently eliminate any other conduit type. Additionally, with the renaming of Article 352 as a result of panel action on Proposal 8-53, this revision would help to clarify where the applicable requirements are located. Therefore, the references in 517.30(C)(3) should be revised as noted above.
Panel Meeting Action: Accept in Principle

Change 517.30(C)(3) to read as follows:

(1) Nonflexible metal raceways, Type MI cable, or Schedule 80 ~~rigid nonmetallic~~ PVC conduit. Nonmetallic raceways shall not be used for branch circuits that supply patient care areas.

(2) Where encased in not less than 50 mm (2 in.) of concrete, Schedule 40 ~~rigid nonmetallic~~ PVC conduit, flexible nonmetallic or jacketed metallic raceways, or jacketed metallic cable assemblies listed for installation in concrete. Nonmetallic raceways shall not be used for branch circuits that supply patient care areas.
Panel Statement: This correlates with action on Comment 15-41.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

15-38 Log #1648 NEC-P15 **Final Action: Reject (517.30(C)(3))**

Submitter: Marvin J. Fischer, Monroe Township, NJ
Comment on Proposal No: 15-53
Recommendation: Accept Proposal 15-53.
Substantiation: NFPA 99, section 4.4.2.2.4.4 is only stating performance criteria for the emergency system wiring (i.e., some mechanical protection in raceway), but referencing NFPA 70 for the installation requirements as to what type of wiring protection can be used.

Panel Meeting Action: Reject
Panel Statement: Mechanical protection of the emergency system is an installation standard of NFPA 70, not a performance criteria. NFPA 99 contains performance criteria, and correctly contains the reference to NFPA 70, rather than the reverse as the comment suggests.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

15-39 Log #2045 NEC-P15 **Final Action: Hold**
(517.30(C)(3))

Submitter: Phil Simmons, National Armored Cable Manufacturers
Comment on Proposal No: 15-54
Recommendation: Revise 517.30(C)(3) as follows:

(3) Mechanical Protection of the Emergency System. The wiring of the emergency system in hospitals shall be mechanically protected. Where installed as branch circuits in patient care areas, the installation shall comply with the requirements of 517.13(A) and 517.13(B). The following wiring methods shall be permitted:

(1) Nonflexible metal raceways, Tpe MI cable, or Schedule 80 rigid PVC conduit. Nonmetallic raceways shall not be used for branch circuits that supply patient care areas.

(2) Where encased in not less than 50 mm (2 in.) of concrete, Schedule 40 rigid PVC conduit, flexible nonmetallic or jacketed metallic raceways, or jacketed metallic cable assemblies listed for installation in concrete. Nonmetallic raceways shall not be used for branch circuits that supply patient care areas.

(3) Listed flexible metal raceways and listed metal-sheathed cables. ~~assemblies in any of the following:~~
~~a. Where used in listed prefabricated medical headwalls~~
~~b. In listed office furnishings~~
~~c. Where fished into existing walls or ceilings, not otherwise accessible and not subject to physical damage~~
~~d. Where necessary for flexible connection to equipment.~~

(4) Flexible power cords of appliances or other utilization equipment connected to the emergency system.

(5) Secondary circuits of Class 2 or Class 3 communication or signaling systems with or without raceways.

FPN: See 517.13 for additional grounding requirements in patient care areas.
Substantiation: Listed Type AC and Type MC cables are more than adequate to provide mechanical protection of the emergency systems in hospitals and should be accepted for that purpose. In fact, Code Panel 15 made that appropriate conclusion in its Panel Statement on Proposal 15-42 for the 2005 NEC. CMP 15 stated in part, "Types AC and MC cables that are listed provide adequate physical and mechanical protection for the emergency system of health care facilities." We agree with the Panel's conclusion. However, we feel the Panel inappropriately, and without technical justification for such action, limited the use of Type MC and AC cables as shown in the 2005 NEC.

Adequate documentation on the rigorous testing Type AC and MC cables must pass to be listed was submitted with Proposal 15-42. This documentation, plus the satisfactory field experience of CMP-15 members, no doubt led to the conclusion reached by the Panel in processing the 2005 NEC.

Type AC and MC cables are required to satisfactorily pass brutal treatment during the listing process. The testing includes crushing, bending and elongating. The tests the cables must satisfactorily pass are no doubt harsher than would be expected during installation of the cables.

The UL Fact-Finding Report on Nail Penetration of Types AC and MC Cable Installed Parallel to Framing Members (provided) show the cable is more resistant to damage from nails and screws than is Electrical Metallic Tubing. Type MC and AC cables need to be accepted for mechanical protection of the emergency system in hospitals to be treated equally.

It should be noted that items (3)(1) and (3)(2) in the list of accepted uses of listed flexible metal raceways and listed metal-sheathed cables seem to be incorrect as the wiring methods used in the construction of listed equipment by the manufacturer is controlled by the UL Safety Standard that regulates the construction of such equipment. See also 90.7 for an explanation of field examination or evaluation of listed equipment.

The information in this comment should not be considered a new concept as the issue has been before the Panel during the processing of both the 2005 and 2008 NECs.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Hold
Panel Statement: The panel intends to hold the comment only.

The proposed revision(s) dealing with AC cable and unrestricted use constitutes new material that has not had the benefit of public review during this cycle and cannot be considered at this stage of the Code-making cycle. Refer to 4.4.6.2.2 of the Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

SEABURY, III, J.: The proposal should be Accepted. Its contents are not new material. The material was reviewed during the last code cycle, as well as this code cycle dealing with original Proposal 15-54.

15-40 Log #147 NEC-P15 **Final Action: Accept**
(517.30(C)(3)(4) and 517.30(C)(3)(2))

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 15-57
Recommendation: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 8-53. This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the direction of the TCC to reconsider and correlate with the action on Proposal 8-53.

See panel action and statement on Comment 15-41.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

15-41 Log #359 NEC-P15 **Final Action: Accept**
(517.30(C)(3)(4) and 517.30(C)(3)(2))

Submitter: Code-Making Panel 8,
Comment on Proposal No: 15-57
Recommendation: CMP-8 recommends that CMP-15 accept this proposal in principle with the revised text:

(1) Nonflexible metal raceways, Type MI cable, or Schedule 80 ~~rigid nonmetallic~~ PVC conduit. Nonmetallic raceways shall not be used for branch circuits that supply patient care areas.

(2) Where encased in not less than 50 mm (2 in.) of concrete, Schedule 40 ~~rigid nonmetallic~~ PVC conduit, flexible nonmetallic or jacketed metallic raceways, or jacketed metallic cable assemblies listed for installation in concrete. Nonmetallic raceways shall not be used for branch circuits that supply patient care areas.
Substantiation: CMP-8 recommends that CMP-15 Accept in Principle Proposal 15-57 with the proposed revised wording. The word "rigid" was also deleted in addition to "nonmetallic" to correlate with the action taken by CMP-8 on Proposal 8-53.

This comment has been balloted through CMP-8 with the following ballot results:
12 Eligible to Vote
11 Affirmative
1 Negative

Mr. J. Dabe voted negatively stating: "CMP-8 recommends that CMP-15 reconsider this proposal and Accept in Principle. CMP-15 should add RTRC to the wiring methods in both (1) and (2)."

Mr. R. Loyd voted affirmatively stating: "Proposal 15-57 was to Accept. I agree with Mr. Burns' recommendation to revise the panel action."
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

15-50 Log #712 NEC-P15 **Final Action: Reject**
(517.42)

Submitter: Burton R. Klein, Burton Klein Associates
Comment on Proposal No: 15-77
Recommendation: Accept Proposal 15-77.
Substantiation: NFPA 99, section 4.5.2.2.2, already uses the term "Emergency System" for the items listed in 517.42. The list in 517.42 is the same as that in NFPA 99, section 4.5.2.2.2. This issue is not related to that of subdividing the "emergency system" in nursing homes into 2 branches.
Panel Meeting Action: Reject
Panel Statement: Section 517.40(B) requires that Nursing Homes which incorporate "Inpatient Hospital Care Facilities"
must have an Essential Electrical System meeting the requirements of 517.30 through 517.35. Within those requirements, Section 517.31 addresses requirements of the emergency system, including automatic connection to alternate power after interruption of the normal power source. The submitter's concerns are addressed in existing code language.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

15-52 Log #1656 NEC-P15 **Final Action: Reject**
(517.44(C))

Submitter: Marvin J. Fischer, Monroe Township, NJ
Comment on Proposal No: 15-83
Recommendation: Accept Proposal 15-83.
Substantiation: Although Panel 15 has extracted text that is "recommended" in NFPA 99 [A.4.4.1.1.2(5)], and made it mandatory, it is still based on text in another NFPA document, and thus subjected to "Extract Policy." Not clear, however, whether this action is acceptable under NFPA Standards Council policy on "Extract Policy".
Panel Meeting Action: Reject
Panel Statement: This text is not in the body of NFPA 99. The submitter references material contained in an informative annex and since the annex is not mandatory text, an extract is not appropriate.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

15-53 Log #338 NEC-P15 **Final Action: Accept**
(517.61(B)(5))

Submitter: Michael J. Johnston, Plano, TX
Comment on Proposal No: 15-87
Recommendation: The proposal should have been rejected. Restore the original language as follows:

(5) Receptacles and Attachment Plugs. Receptacles and attachment plugs located above hazardous (classified) anesthetizing locations shall be listed for hospital use for services of prescribed voltage, frequency, rating, and number of conductors with provision for the connection of the grounding conductor. This requirement shall apply to attachment plugs and receptacles of the 2-pole, 3-wire grounding type for single-phase, 120-volt, nominal, ac service.

Substantiation: This section is specific to receptacles and attachment plugs used above a hazardous (classified) anesthetizing location. The type of receptacle used in these applications is a specific type that is listed for hospital use. These receptacles and attachment plug configurations are unique in design to allow only restricted compatibility and use, thus reducing hazards in these locations. While it is understood that many health care facilities no longer use flammable anesthetizing agents, the requirements in the NEC (an international electrical Code) still continues to include rules for facilities that use flammable anesthetics and are thus classified as hazardous locations in accordance with 517.60.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

15-54 Log #1657 NEC-P15 **Final Action: Reject**
(517.63(A))

Submitter: Marvin J. Fischer, Monroe Township, NJ
Comment on Proposal No: 15-93
Recommendation: Accept Proposal 15-93.
Substantiation: NFPA 99 reference to 700.12(E) in NFPA 70 was intended for the wiring of such lighting units, not for the requirement of installing battery-operated lights in anesthetizing locations. Responsibility for requiring battery-operated lights in anesthetizing locations for the purpose of providing lighting is a Health Care Facility project responsibility. Such lighting units are not for emergency exiting purposes; rather they are for evaluating patient condition, as well as eliminate need for anesthesiologist(s) to hold a flashlight while trying to assess patient condition.

A proposal to NFPA 99 may be in order to clarify this more.

Panel Meeting Action: Reject
Panel Statement: The reference in NFPA 99: 13.4.1.2.6.1(E) to NFPA 70, 700.12(E) is incorrect due to revision in numbering in the 2005 edition. NFPA 99: 13.4.1.2.6.1(E) refers to 517.63(A) which contains the correct reference to 700.12(F).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

15-55 Log #453 NEC-P15 **Final Action: Accept in Principle**
(517.71(A))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 15-99
Recommendation: Accept as revised:

"...by means of a wiring method ~~that meets the general requirements of this code~~ in accordance with 517.12.

Substantiation: "General requirements" is vague and can be perceived as including all wiring methods. The proposal has nothing to do with equipment wiring between parts, which may be cords, but conductors that connect to the power supply. The exception permits cords for such connections.

Panel Meeting Action: Accept in Principle

Revise 517.71(A) to read as follows:

517.71(A) Fixed and Stationary Equipment. Fixed and stationary X-ray equipment shall be connected to the power supply by means of a wiring method complying with applicable requirements of Chapters 1 through 4 of this *Code*, as modified by this Article. ~~that meets the general requirements of this *Code*.~~

Exception remains unchanged.

Panel Statement: The text change improves usability and satisfies the submitter's intent.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

15-56 Log #2050 NEC-P15 **Final Action: Hold**
(517.80 Exception No. 3 (New))

TCC Action: The Technical Correlating Committee directs that this comment be reported as "Hold" because it introduces a concept that has not had adequate public review in that the original proposal only applied to protection from raceways and the placement in 517.13(B) can be interpreted to extend that to requirements other than the protection via a raceway. The exception is not written to clearly indicate to what portion of the requirements the exception applies.

The action on Proposal 15-103 remains as printed in the Report on Proposals.

Submitter: Hugh O. Nash, Jr., Nash Lipsey Burch
Comment on Proposal No: 15-103
Recommendation: Delete 517.80 Patient Care Areas, including the FPN. Add an additional exception under 517.13(B).

Exception No. 3 shall read: Secondary circuits of Class 2 and Class 3 communications or signaling systems.

Substantiation: 517.80 has been a source of confusion for many years. Nurse call and other Class 2 and Class 3 communications systems at the patient bedside are intrinsically safe. This section has been misinterpreted by many AHJs. Some have interpreted this section to mean that nurse call wiring must be installed in metallic conduit for mechanical protection. This has never been the intent of 517.80, since nurse call systems are not a part of the emergency system. Some AHJs have required insulated green ground conductors and metallic conduit. 517.30(C)(3)(5) permits secondary circuits of Class 2 or Class 3 communication or signaling systems to be installed without mechanical protection. The proposed exception under 517.13(B) will make it clear that metal conduit and an insulated green ground conductor are not required for electrical safety.

Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 3
Explanation of Negative:

MORGAN, E.: The Panel previously accepted Proposal 15-103, which gave sufficient language to clarify the intent and requirement of Section 517.80. However, this comment would delete all of 517.80 and establish a new Exception No. 3 to 517.13(B). I believe this is incorrect for several reasons:

This Comment would establish a new exception to a section dealing with the dual ground path requirement for receptacles and equipment in a patient care area. It is not an appropriate location for an exception dealing with Class 2 and Class 3 circuits.

Section 517.80 should not be deleted. Class 1 circuits would not be covered in the proposed Comment language. Class 1 circuits may produce up to 1,000 volt-amperes (33.3 amps at 30 volts). Class 2 and Class 3 circuits can produce power up to 100 volt-amperes (5 amps at 20 volts, or 1 amp at 100 volts). Refer to NEC Article 725 and Tables 11 and 12 in Chapter 9. While these low-power sources may not be of great concern in usual wiring applications, they can produce sufficient energy to be hazardous to a person with compromised resistance or health, particularly in a wet environment.

Finally, I believe that Comment 15-56 has introduced new material, and is indeed in conflict with the original Proposal 15-103. This Comment does not accomplish the same purpose as did the original proposal, nor is there adequate substantiation to enact such a change. I hereby request that the TCC review this material and determine whether the Panel action is appropriate or not.

TALKA, D.: Comment 15-56 was intended to be a modification of Proposal 15-103, which served to clarify the intent of 517.80 with respect to what communications, signaling, data fire alarm and other systems operating less than 120 volts nominal are intended to be enclosed in raceways and which addressed the apparent conflict with 517.30(C)(5). The 15-56 comment, as written, goes well beyond the original intent of Proposal 15-103 as it excludes from consideration circuits that should be subject to mechanical protection and grounding requirements. Further, Class 2 and 3 circuits are not necessarily intrinsically safe which is one of the main points of the substantiation. This action should revert back to the last point of panel consensus, as noted in 15-103 of the June 2007 ROP.

WHITE, A.: The removal of the requirements of communications circuits from 517 Part VI Communications, Signaling Systems, Data Systems, Fire Alarm Systems, and Systems less than 120 Volts, to 517 Part II, specifically 517.13, Grounding of Receptacles and Fixed Electric Equipment in Patient Care Areas, presents real utilization issues for code users. One would logically look to 517 Part VI communication, signaling systems and not to 517.13 patient care area receptacle and equipment grounding for guidance concerning communications and signaling systems.

Furthermore, the assertions that Class 2 and Class 3 communication circuits are intrinsically safe is simply incorrect, both Class 2 and 3 systems may be supplied by power supplies that are "not inherently power limited" [see 2005 NEC Table 11A].

15-57 Log #430 NEC-P15 **Final Action: Accept in Part**
(517.160(A)(1))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 15-105
Recommendation: Accept revised:

Such isolation shall be accomplished by means of one or more isolation transformers, ~~having no electrical connection between primary and secondary~~ by means of ~~motor~~ generator sets, or by means of electrically isolated batteries. Isolation transformers, motor-driven generators, and chargers for isolated batteries shall be supplied from the critical branch.

Substantiation: There is no need to describe characteristics of the transformer if specified as an isolation type which is defined. Generators other than motor-driven types may be suitable. "Suitably" is subjective and not specific. The definition of "isolated" in Article 100 pertains to accessibility while the intent appears to pertain to electrical separation. Proposal clarifies the supply system branch.

Panel Meeting Action: Accept in Part

Change 517.160(A)(1) to read as follows:

517.160(A)(1) Isolated Power Circuits. Each isolated power circuit shall be controlled by a switch that has a disconnecting pole in each isolated circuit conductor to simultaneously disconnect all power. Such isolation shall be accomplished by means of one or more isolation transformers, ~~having no electrical connection between primary and secondary windings,~~ by means of ~~motor~~ generator sets, or by means of ~~suitably~~ electrically isolated batteries.

Panel Statement: The panel accepts that part of the comment that improves readability of the section.

The panel rejects the submitter's second sentence as connection to the critical branch is already required by Section 517.33(A)(1).

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

15-58 Log #2270 NEC-P15 **Final Action: Reject**
(517.160(A)(5))

Submitter: James Wiseman, Schneider Electric / Square D

Comment on Proposal No: 15-106

Recommendation: The Panel should reconsider Proposal 15-106 and Reject it.

Substantiation: We disagree with the panel action and panel statement. While we certainly agree with the critical nature of these circuits, we do not agree that a change in color coding is desirable. The use of orange and brown in isolated power systems has been mandated by the NEC since 1978, at least. It is our contention that this long-standing use along with the low probability of intermixing, as cited below, "leaves no question as to the nature of their service" (quoting the Panel Statement.)

The submitter correctly notes that the NEC also uses orange as the color to identify the high leg of a 3-phase, 4-wire delta system, and also cites the practice of using orange and brown in 480Y/277 V systems. While the latter may be true, it is not a requirement of the NEC. But, more importantly, the probability of encountering either of the other two uses of the orange / brown color-coding in the same area occupied by conductors on an isolated power system is extremely low.

Properly designed and installed, isolated power systems have very few joints made up within junction boxes or other enclosures. And they are not installed in the same raceway with other systems. So the probability of an electrician being misled through the act of checking for voltage-to-ground on a brown or orange wire – an example of the potential problems that was cited during the Panel meeting – is very low. (That same approach for determining if a circuit is de-energized also would be ineffectual if used on the orange wire of a 4-wire delta system. Only through knowledge of the voltage systems in use in the area and the use of proper verification techniques can an electrician assure a circuit is not energized.)

Additionally, we are concerned that this change would significantly impact reasonable availability of properly color-coded conductors for isolated power systems. This has two components. The first is the obvious one of a striped conductor having lower commercial demand than a solid-colored one. The other issue is that isolated power systems typically are designed to use insulated conductors having a very low dielectric constant (as mentioned in 517.160(A)(6) FPN No. 2) in order to meet the requirements of NFPA 99 and expected performance requirements. Availability of such conductors with striped insulation should be assured before a change of this nature is considered.

Panel Meeting Action: Reject

Panel Statement: The panel reaffirms its position on Proposal 15-106.

The requirement for color coding of isolation systems provides an additional level of safety. The unique color stripe provides identification for safety purposes.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

MORGAN, E.: I agree with the Panel action on Proposal 15-106, reaffirmed by action on Comment 15-58; requiring a "distinctive colored stripe other than white, green or gray" on secondary conductors of an Isolated Power System. However, the language may have fallen short of describing how the colored stripe must be provided. For example, in Section 200.6, identification of a grounded conductor size #6 AWG or smaller, reads in part: "…shall be identified by … by three continuous white stripes … along its entire length." It should be noted that the Panel statement on Proposal 15-106 indicated a concern about availability of wire: "… the recommended colors have been revised to ensure ready availability of colored striped conductors." It should be clear that the Panel intended the color stripe identification must be part of the insulation color identification as manufactured, not field-applied by tape or other means at the points of termination.

15-59 Log #1658 NEC-P15 **Final Action: Reject**
(517.160(B))

Submitter: Marvin J. Fischer, Monroe Township, NJ

Comment on Proposal No: 15-107

Recommendation: Accept Proposal 15-107.

Substantiation: Requirements in 517.160(B) are performance characteristics for line isolation monitors (e.g., level of hazard current at which alarm will be activated, use of lights to indicate LIM status). Wording is very much, if not identical, to that in NFPA 99.

Panel Meeting Action: Reject

Panel Statement: There are sufficient differences between the defined characteristics contained in NFPA 99 and NFPA 70, and therefore, an extract reference is not appropriate.

The panel requests the Standards Council to review and clarify the ownership of defined characteristics common to NFPA 99 and NFPA 70.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

ARTICLE 518 PLACES OF ASSEMBLY

15-60 Log #805 NEC-P15 **Final Action: Accept**
(518.4(A))

Submitter: John Kincaid, Systimax Solutions

Comment on Proposal No: 15-110

Recommendation: Continue to reject this proposal.

Substantiation: The submitter's substantiation does not address the fact the general-purpose cables are used in concealed spaces unless the concealed space is part of the air handling system; only then are plenum cables, which sit atop the cable substitution hierarchy, required.

It appears that the submitter is attempting to change the requirements for cables in an air handling system. Standards Council Decision 05-24 (SC#05-7-4) dated July 29, 2005 requires that the NEC Project maintain the status quo on issues related to plenum cables.

Panel Meeting Action: Accept

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

15-61 Log #1679 NEC-P15 **Final Action: Accept**
(518.4(A))

Submitter: Richard J. Rockosi, ARKEMA Chemicals

Comment on Proposal No: 15-110

Recommendation: Continue to reject this proposal.

Substantiation: The submitter's statement about "fluropolymers" (sic) is grossly inaccurate. Fluoropolymers are used to make the highest performing plenum cables available on the market today. The first plenum cables listed by UL in 1978 had fluoropolymer insulation. Their combustion toxicity was reviewed by the NFPA Toxicity Advisory Committee (see their report dated 5/21/84). A toxic hazard evaluation has been published; see Richard W. Bukowski, "Toxic Hazard Evaluation of Plenum Cables", *Fire Technology,* Vol. 21, No. 4, November 1985, p. 25.

Panel Meeting Action: Accept

Panel Statement: The panel makes no judgment about the technical accuracy of the commenter's substantiation, however, completely aside from toxicity issues, the panel reiterates the other reasons for rejection of the original proposal as outlined in the ROP.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

15-62 Log #1387 NEC-P15 **Final Action: Reject**
(518.4(C) Exception (New))

Submitter: William Wagner, Certification Solutions

Comment on Proposal No: 15-112

Recommendation: This Proposal should be Accepted as revised below:

Electrical nonmetallic tubing and rigid nonmetallic conduit are not recognized for use in other space used for environmental air in accordance with 300.22(C).

Exception: Phenolic Type RTRC rigid nonmetallic conduit shall be permitted for use in other space used for environmental air as covered in 300.22(C) if listed as having adequate fire-resistant and low smoke-producing characteristics.

Substantiation: This proposal was presented as a companion proposal to 3-92 (NEC 300.22). It was rejected due to insufficient technical substantiation. However, technical substantiation has now been developed to demonstrate the ability of these products to be safely used in these applications and is being presented to CMP-3 in support of revised proposal 3-92, CMP-8 in support of revised proposals 8-79 and 8-80, and CMP-15 in support of revised proposal 15-112.

The position of Underwriters Laboratories in relation to flame spread and smoke developed values for materials used in plenums was put forth in UL's Mr. Randy Laymon's letter dated December 15, 2004.

As a result of my initial proposal, and this UL position paper, FRE Composites (2005) Inc. undertook testing with Underwriters Laboratories of their phenolic RTRC products to both UL 2024 plenum and riser tests, and the ASTM E84 flame spread and smoke developed tests. As can be seen from the UL test data and reports, phenolic RTRC products, in a variety of trade sizes, were able to complete each of these testing programs with flame and smoke ratings significantly below the criteria established for products to be used in both plenum and riser applications.

The performance of these products, as demonstrated, is summarized as follows:

Test	Maximum Permitted Value	Maximum Test Value
Plenum (UL 2024) Flame	5.0 ft	2.0 ft
Plenum (UL 2024) Smoke Peak	0.50	0.10
Plenum (UL 2024) Smoke Avg.	0.15	0.02
Riser (UL 2024) Flame	12.0 ft	4.0 ft
Riser (UL 2024) Temperature	850.0˚F	371˚F
ASTM E84 Flame Spread Index (FSI)	25	5
ASTM E84 Smoke Developed Index (SDI)	50	0

Therefore, in consideration of the data generated by an independent, NRTL accredited test laboratory, and in conjunction with UL's stated position on this issue, these conduit products have conclusively demonstrated their ability to perform acceptably in both plenum and riser applications and I recommend their inclusion in NEC 355.10 in accordance with the revised proposal. It should be noted that this proposal has been slightly modified from its original version in order to delete the FPN indicating suggested acceptance criteria for these products. The development of appropriate flame and smoke criteria, along with the product's listing requirements is best left to the determination of the listing organization. However, regardless of which of the established flame and smoke criteria the listing organization chooses, phenolic RTRC has demonstrated its ability to perform safely.

Additionally, a reference to "phenolic" RTRC conduit has been added in order to limit this proposal to only that conduit type which was evaluated as part of the technical substantiation provided with this comment.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: Toxicity is not the only issue. Not only are the technical substantiations inadequate and not appropriate, no mechanical properties were provided. Physical protection is of paramount importance in assembly occupancies where temporary changes to the venue occur on a regular basis.

This action correlates with the action taken by CPM-3 on Comment 3-68 on Proposal 3-92.

(518.4(C) Exception and FPN (New))

Submitter: Technical Correlating Committee on National Electrical Code

Comment on Proposal No: 15-112

Recommendation: It was the action of the Technical Correlating Committee that this proposal be sent to Code-Making Panel 3 for consideration in Article 300 during the public comment stage. The issues raised in the proposal are not unique to Article 518 and are more appropriately judged by Code-Making Panel 3 relative to general wiring methods. This action will be considered by Code-Making Panel 3 as a public comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

The panel rejects Proposal 15-112.

Panel Statement: This continues to be a proposal to be rejected based on Standards Council Decision 05-24 (SC #05-7-4). This decision relates to combustibles in plenums and would include cables in conduit as well as "plenum cables."

"1. Jurisdiction over combustibles in plenums. As the Council has indicated earlier in this decision, the Technical Committee on Air Conditioning, rather than the NEC Project, has, for many years, and should continue to have, primary jurisdiction for air distribution systems including the subject of combustibles, such as cables, in ducts, plenums and other air handling spaces (plenum spaces)."

15-63 Log #318 NEC-P15 **Final Action: Reject**

(518.5)

Submitter: Code-Making Panel 6,

Comment on Proposal No: 15-116

Recommendation: Accept in principle Proposal 15-116 by deleting the last sentence of the 2005 text of 518.5 rather than by the action published for Proposal 15-116.

Substantiation: The general rule of Chapter 3 already requires that any neutral involving a circuit with a major portion of nonlinear load must be considered a current carrying conductor. 310.15(B)(4) specifies that neutrals of nonlinear loads are to be counted. Neutrals of linear loads are not directed to be counted as current carrying conductors.

The necessity of considering the neutral of even a linear load dimming system as a current carrying conductor should be under the control of CMP-15's expertise. The 2005 text of 518.5 served to require that even the neutral of a linear load dimming system be considered as a current carrying conductor. If CMP-15 has agreed that linear load dimming systems no longer need to be included, then the removal of their previous special rule seems the most appropriate and clear solution.

The inclusion of the words "or may use" would mean that all neutrals would have to be considered current carrying conductors.

If this comment is accepted, then CMP-15 may consider a fine print note forewarning of the 310.15(B)(4) requirements as related to nonlinear loads, including some dimming systems, to protect this special wiring installation.

This comment was balloted through CMP-6 with the following balloting results:

11 Eligible to Vote

10 Affirmative

1 Negative

Mr. Friedman voted negatively stating: "This comment does not indicate that CMP-15's action was incorrect. It only advised that the method of handling neutrals of nonlinear loads is covered in 310.15(B)(4).

However, CMP-15 decided that the best way to handle the proposal was to advise of the two different dimmer systems and when to count neutrals as current carrying conductors. This was done to be helpful to the users of phase control and sine wave dimmer systems.

Since the comment statement finds no fault with CMP-15's action, but only a different way it could have been done, I do not agree with the comment.

The CMP-6 comment should be that "CMP-6 supports CMP-15 action to clarify de-rating for neutral conductors of feeders used to supply phase control and solid state sine wave dimmer loads."

Panel Meeting Action: Reject

Panel Statement: Prior to 2005, there was only one type of solid state dimmer: the phase control type that presented a nonlinear load and required neutrals of feeders to be considered current carrying conductors. Furthermore that non-linearity was not due to traditional and recognizable reasons. This required special emphasis in Article 518 and 520. The emergence of new technology solid state sine wave dimmers that presents a linear load makes it necessary to draw a clear differentiation between the two types, and the associated special neutral requirements (or lack thereof) for each type of solid state dimmer. This cannot be left in an ambiguous state by simply leaving out the special neutral requirements for sine wave dimmers—it needs to be explicitly stated that such dimmers do not require the neutral to be considered a current-carrying conductor. The wording of the original panel action on the proposal accomplishes this. Finally, the wording "... or may use both phase-control and sine-wave dimmer... ' is needed to clearly require that systems using field-interchangeable plug-in phase-control and sine-wave dimmers must be treated as if the worst case use of phase control dimmers applies, even if the modules installed at time of system installation are sine wave modules.

15-64 Log #150 NEC-P15 **Final Action: Accept**
(519 (New))

TCC Action: The Technical Correlating Committee advises that article scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee Accepts the panel action.
Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 15-121
Recommendation: The Technical Correlating Committee directs the following actions on this proposal.

The Technical Correlating Committee directs that the new Article be numbered as Article 522 to provide for proper placement and allow some additional open article numbers to remain.

Article scope statements and titles are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee is modifying the panel action on the scope to make it clear that the conductors covered by the article are control circuit conductors to read as follows:.

"519.1 Scope. This article covers the installation of control circuit power sources and control circuit conductors for electrical equipment, including associated control wiring in or on all structures, that are an integral part of a permanent amusement attraction."

The Technical Correlating Committee accepts the title of the new article.

The Technical Correlating Committee directs the panel to reconsider the proposal and clarify the intended application of wiring methods. The current text permits multi-conductor cable assemblies to be used, but allows conductors down to 30 AWG. It is unclear as to whether Chapter 3 wiring methods are required or some other method is intended. This action will be considered by Code-Making Panel 15 as a Public Comment.

The Technical Correlating Committee directs the Panel, in 519.28, to change the parenthetical reference to a Fine Print Note or remove it.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept

Renumber Article 519 to Article 522.

Revise scope to read as follows:

"522.1 Scope. This article covers the installation of control circuit power sources and control circuit conductors for electrical equipment, including associated control wiring in or on all structures, that are an integral part of a permanent amusement attraction."

Table 522.22 Conductor Ampacity Based on Copper Conductors with 60°C and 75°C Insulation in an Ambient Temperature of 30°C.

Conductor Size AWG	Ampacity	
	60°C	75°C
30	-	0.5
28	-	0.8
26	-	1
24	2	2
22	3	3
20	5	5
18	7	7
16	10	10

Note 1: For ambient temperatures, other than 30°C, use see Table 310.16 temperature correction factors.
Note 2: Ampacity adjustment for Conductors with 90°C or greater insulation shall be based on ampacities in the 75°C column.

Change 519.28 to read as follows:

522.28 Control Circuits in Wet Locations. Where wet contact ~~(immersion not included)~~ is likely to occur, ungrounded two-wire dc control circuits shall be limited to 30 volts maximum for continuous dc or 12.4 volts peak for dc that is interrupted at a rate of 10 to 200 Hz. ~~(Reference - Chapter 9, Table 11B).~~
Panel Statement: The panel accepts the direction of the TCC to review and act on this proposal.

The panel accepts renumbering of Article 519 to Article 522.

The panel accepts insertion of "control circuit" into Scope as directed.

Table 519.22 appears to have been inadvertently omitted during the Article 519 processing between ballot and publication of the ROP and replaced with proposed text of Section 505.2. Unrelated text has been inserted into the ROP which appears to be a transcription error (ROP page 574-575).
Panel 15 agrees that the parenthetical reference in 522.28 is inappropriate.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

15-65 Log #291 NEC-P15 **Final Action: Accept in Principle**
(519 (New))

Submitter: Code-Making Panel 3,
Comment on Proposal No: 15-121
Recommendation: Accept the change as proposed.
Substantiation: While there may be some similarities with Class 1, Class 2, and Class 3 circuits, it appears the Task Group that worked on this proposed new article has covered many of the same issues. For example, overcurrent protection of the circuit is similar to those found in 725.21(A)(2) for power sources other than transformers. A review of the sections within the new article reveals a thoroughness and attention to detail for this very special system of permanent amusement rides.

This comment was balloted through CMP-3 with the following results:
13 Eligible to Vote
12 Affirmative
1 Not Returned (J. Sleights)

Mr. T. Guida voted affirmatively stating: "It is understood that the panel has determined that 30 AWG conductors are acceptable as shown in 519.21. The wording of (A) is clear that these conductors are acceptable where a third party lists the component or assembly. The wording of (B) presents a problem because there are no cables defined in the NEC with 30 AWG conductors that are suitable for these circuits. Machine Tool Wire has a minimum conductor size of 22 AWG. Type TC and MC cables are 18 AWG and larger. Fixture wire is 18 AWG or larger. Cables with 30 AWG conductors are Type CM or CL2 for communication or Class 2 circuits. Appliance wiring Material (AWM) is not intended for evaluation other than as a component of a Listed product."

Mr. M. Sanders voted affirmatively stating: "The Technical Correlating Committee noted that 519.28 contained the parenthetical reference "(Reference - Chapter 9, Table 11B)" and noted it should either be a Fine Print Note or be deleted. The specific information for use in 519.28 eliminates the need to refer users to Chapter 9, Table 11(B), and is not needed and should be deleted as not all parts of this Table are to be mandatory."
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 15-64.

15-69 Log #152 NEC-P15 **Final Action: Accept (525.2)**

Submitter: Technical Correlating Committee on National Electrical Code

Comment on Proposal No: 15-145

Recommendation: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal in accordance with 2.2.2 of the NEC Style Manual to not contain the term being defined. The panel is also directed to correlate this proposal with the action taken on Proposal 15-144a. This action will be considered by the panel as a public comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

Panel Statement: The panel accepts the direction of the TCC to clarify the panel action on this proposal and accepts the definition of portable structure as modified by Comment 15-70.

See action and statement on Comment 15-70.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

15-70 Log #1359 NEC-P15 **Final Action: Accept (525.2. Operator, Portable Structures)**

Submitter: Mark R. Hilbert, Wolfeboro, NH

Comment on Proposal No: 15-144a

Recommendation: Accept the proposed new definitions in Principle, in Part.

Revise the proposed new definitions as follows:

Operator. ~~As used in this Article, the operator shall be t~~The individual responsible for starting, stopping and controlling an amusement ride or supervising a concession.

Portable Structures. Units designed to be moved including, ~~For the purposes of this Article the term portable structures shall include,~~ but not limited to, amusement rides, attractions, concessions, tents, trailers, trucks, and similar units.

Substantiation: Revising the proposed new definitions in the manner above will incorporate the directive from the TCC in Proposal 15-145 to follow the NEC Style Manual and not include the term being described in the definition. The language "for the purposes of this Article" was removed from both definitions as it is not necessary in these new definitions as they are only used in Article 525. Further, revising the definition of "Portable Structures" here will correlate with the panel action on proposal 15-145 to be more concise and accurately reflect the terms used in the industry with this proposal.

Panel Meeting Action: Accept

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

15-71 Log #1360 NEC-P15 **Final Action: Accept in Principle (525.11)**

TCC Action: The Technical Correlating Committee directs that the word "device" be inserted between "overcurrent" and "supplying" in the last sentence of the panel action. This action is consistent with the affirmative comment on vote indicating the needed editorial correction.

Submitter: Mark R. Hilbert, Wolfeboro, NH

Comment on Proposal No: 15-150

Recommendation: Revise text to read as follows:

525.11 Multiple Sources of Supply. Where multiple services or separately derived systems, or both, supply portable structures, the equipment grounding conductors of all the sources of supply that serve such structures separated by less than 3.7 m (12 ft) shall be ~~connected to the same grounding electrode system~~ bonded together at the portable structures. The bonding conductor shall be sized in accordance with Table 250.122 based on the largest overcurrent supplying the portable structures.

Substantiation: Revising the meeting action on this proposal as recommended will increase safety by using the shortest means possible to reduce the potential between the portable structures and will add clarity to this section by specifying how the conductor is to be sized as the recommended text in Proposal 15-150 provided no specific guidance on how to size the bonding conductor. Further, by requiring bonding of the grounding electrode systems, the implication is that a grounding electrode system must be installed when, in fact, there is no requirement to do so. Prior to the 2005 NEC, the frame of a vehicle mounted generator was recognized by 250.34 as a grounding electrode and, therefore, the frames of the vehicles could be bonded together to comply with the intent of 525.11. However, with the revision of that section in 2005, the vehicle frame is not recognized as serving as a electrode nor is it required to be connected to one. Accepting the text as proposed will provide an effective means of reducing the potential differences between portable structures while providing a prescriptive requirement for the installation.

Panel Meeting Action: Accept in Principle

Revise text to read as follows:

525.11 Multiple Sources of Supply. Where multiple services or separately derived systems, or both, supply portable structures, the equipment grounding conductors of all the sources of supply that serve such structures separated by less than 3.7 m (12 ft) shall be ~~connected to the same grounding electrode system~~ bonded together at the portable structures. The bonding conductor shall be copper and sized in accordance with Table 250.122 based on the largest overcurrent supplying the portable structures, but not smaller than No. 6 AWG.

Panel Statement: The panel is concerned that conductors smaller than No. 6 AWG copper will be subject to physical damage, therefore, a minimum size is defined.

The change satisfies the submitter's intent.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

Comment on Affirmative:

MORGAN, E.: I agree with the Panel action on Comment 15-71, but there is apparently an editorial change needed in the last sentence. The term "overcurrent" should be stated as "overcurrent device":

525.11 Multiple Sources of Supply. Where multiple services or separately derived systems, or both supply portable structures, the equipment grounding conductors of all the sources of supply that serve such structures separated by less than 3.7 m (12 ft.) shall be bonded together at the portable structures. The bonding conductor shall be copper and sized in accordance with Table 250.122 based on the largest overcurrent device supplying the portable structures, but not smaller than No. 6 AWG.

15-72 Log #1363 NEC-P15 **Final Action: Accept in Principle (525.11)**

Submitter: Mark R. Hilbert, Wolfeboro, NH

Comment on Proposal No: 15-150

Recommendation: Revise text to read as follows:

525.11 Multiple Sources of Supply. Where multiple services or separately derived systems, or both, supply portable structures, the equipment grounding conductors of all the sources of supply that serve such structures separated by less than 3.7 m (12 ft) shall be ~~connected to the same grounding electrode system~~ bonded together at the portable structures. The bonding conductor shall be sized in accordance with Table 250.122 based on the largest overcurrent supplying the portable structures.

Substantiation: Revising the meeting action on this proposal as recommended will increase safety by using the shortest means possible to reduce the potential between the portable structures and will add clarity to this section by specifying how the conductor is to be sized as the recommended text in proposal 15-150 provided no specific guidance on how to size the bonding conductor. Further, by requiring the bonding of the grounding electrode systems together the implication is that a grounding electrode system must be installed when, in fact, there is no requirement to do so. Prior to the 2005 NEC the frame of a vehicle mounted generator was recognized by 250.34 as a grounding electrode

and therefore the frames of the vehicles could be bonded together to comply with the intent of 525.11. However, with the revision of that section in 2005, the vehicle frame is not recognized as serving as a electrode nor is it required to be connected to one. Accepting the text as proposed will provide an effective means of reducing the potential differences between portable structures while providing a prescriptive requirement for the installation.

15-73 Log #1361 NEC-P15 **Final Action: Reject**
(525.21(A))

Submitter: Mark R. Hilbert, Wolfeboro, NH
Comment on Proposal No: 15-152
Recommendation: Accept this Proposal in Principle and revise as follows:
525.21 Rides, Tents and Concessions.
(A) Disconnecting Means. Each ride and concession shall be provided with a disconnecting means in accordance with (1); or (2) ~~or (3)~~.
(1) A fused disconnect switch or circuit breaker located within sight and within 1.8 m (6 ft) of the operator's station. The disconnecting means shall be readily accessible to the operator, including when the ride is in operation. Where accessible to unqualified persons, the enclosure for the switch or circuit breaker shall be of the lockable type.
~~(2) Where the ride or concession is provided with fused disconnect switch or circuit breaker, an additional disconnecting means without internal overcurrent protection shall be permitted where it is located within sight and within 1.8 m (6 ft) of the operator's station.~~ The disconnecting means shall be readily accessible to the operator, including when the ride is in operation. Where accessible to unqualified persons, the enclosure for the switch or circuit breaker shall be of the lockable type.
Exception: Where the ride or concession is provided with overcurrent protection, the disconnecting means shall not be required to have overcurrent protection.
~~(3)~~ (2) A shunt trip device that opens the fused disconnect or circuit breaker when a switch located in the ride operator's console is closed shall be a permissible method of opening the circuit.
Substantiation: Revising the proposal as indicated above will make it clear that the ride or concession is still required to have overcurrent protection while allowing a nonfused disconnect switch to be used within 6 ft of the operator's station when the ride or concession is provided with overcurrent protection. Although the panel discussion at the ROP meeting indicated that it was not the intent of the original language requiring a fused disconnect switch or circuit breaker to provide overcurrent protection for the ride or concession, revising the proposal as recommended by the meeting action could create a situation where there was no overcurrent protection at the ride or concession or in the disconnecting means within sight of the operators station. Further this revision will address the concern expressed in the negative vote as to removing only the overcurrent language in the first sentence of the existing section.
Panel Meeting Action: Reject
Panel Statement: The meaning is not materially changed by the proposed language and it uses an exception, which is to be avoided per the Manual of Style.

(525.30)

Submitter: Mark R. Hilbert, Wolfeboro, NH
Comment on Proposal No: 15-156
Recommendation: Accept Proposal 15-156 in its entirety.
Substantiation: Accepting the proposal in its entirety will clarify how the bonding required by this section is to take place. The definition of an equipment grounding conductor in Article 100 on its own does not adequately address how the bonding required by this section is to take place. Further, not all of those using the NEC read the ROP and ROC to get the benefit of the additional information provided by NEC Code Making Panels. Including text in this section that specifically identifies that the equipment grounding conductor of the circuit that is supplying the equipment specified in 525.30(1) through (3) can serve as the bonding means will reduce the confusion created by the current text and add clarity to the section. Further, the recommended text in proposal 15-156 will add consistency to the NEC as it is in line with the language already used in 250.104(B) regarding the bonding requirements for "other metal piping."

Submitter: Neil F. LaBrake, Jr., Syracuse, NY
Comment on Proposal No: 15-2
Recommendation: Continue to accept the following portions of the TCC Grounding and Bonding Task Group proposal 15-2 as modified and revised by the actions of CMP-15 for which the TCC Grounding and Bonding Task Group recommends that CMP-15 accept the revisions to 530.64(B) as proposed in Proposal 15-2. This retains the specific references to Parts VI and VII of Article 250 in the last sentence of this section.
Substantiation: The changes proposed to 530.64(B) were made as a part of the Task Group's work to meet the requirements of the NEC Style Manual Section 4.1.1 which does not permit a section to refer to an entire article, but does permit references to the appropriate parts of such articles.
This Comment was developed by a Task Group assigned by the NEC Technical Correlating Committee to address actions that were other than "accept" taken by Code-Making Panels on proposals from the TCC to resolve 2005 NEC Proposal 5-1 and Comment 5-1. Members of the Task Group on Grounding and Bonding for this Comment included: C. Douglas White; Michael Johnston; Jeffrey Boksiner; Daleep Mohla; Phil Simmons; Christopher Hutchings; James Carroll; Alan Rebeck; Richard Loyd; Paul Dobrowsky; and Neil F. LaBrake, Jr.
Panel Meeting Action: Reject
Panel Statement: No action is necessary on 530.64(B) as it already refers to an equipment grounding conductor and makes no reference to Part VI and Part VII of Article 250.
See Comment 15-74a (Log #CC 1501).
Number Eligible to Vote: 15

ARTICLE 547 AGRICULTURAL BUILDINGS

19-3 Log #1449 NEC-P19 **Final Action: Reject**
(547.2)

Submitter: Donald W. Zipse, Electrical Forensics, LLC
Comment on Proposal No: 9-5
Recommendation: Delete section 547.2 ~~**Equipotential Plane.**~~
Substantiation: . The "**Panel Statement:** The panel contends that it is necessary to retain the definition of Equipotential Plane because it is used in Article 547." This statement does not make any sense and if the correlating committee was on the ball they should have rejected the panel statement for not making sense. There were three other proposals that eliminated the words **Equipotential Plane(s)** in Article 547. So this time PLEASE do your homework and give me a statement and reasons than makes sense.
The rules are to limit each proposal to a "SINGLE SECTION", which was done. Therefore your statement is invalid since I have follow instructions and have submitted detailed proposals for all the other sections dealing with the so-called Equipotential Plane, which would have remove the offending words from Article 547.

For you education and enlightenment I am enclosing an attachment of a peer reviewed Institute of Electrical and Electronic Engineers' technical paper titled, "**Equipotential Planes, A Figment of the Imagination**".

If you continue to allow the inaccurate definition to remain in the NEC you will be telling the readers of the NEC that you are NOT familiar with OHM'S LAW nor do you have any understanding of OHM'S LAW. Sorry to tick you off, but I do not have 21 years to continue to debate this with you as I did when I was younger – Took 21 years to have Panel 5 adopt 4-wire for electric ranges and dryers. So if you insist on keeping erroneous and incorrect information in the Code, I suggest that you insert a FPN stating,

Fpn: "For this Article OHM's LAW does not apply"

Mr. Lawrence C. Neubauer and Donald W. Zipse have conducted tests on many dairies over the past two years that involve so-called Equipotential Planes. These test are described in the technical paper, which is the substation for this comment. We have testified that the so-called Equipotential Planes DO NOT exist and in dairies are very harmful. Non- Equipotential Planes concrete pads have also been tested and found to lack and harmful voltages or current flow. This panel was fooled back during the 1987 code cycle into adopting a flawed proposal, which was based on a misunderstood concept. This information is contained in the technical paper. And PLEASE do not write that I have failed to give you any substation as the technical paper contains 12, 175 words of substation.

Note: Supporting material is available for review at NFPA Headquarters

Panel Meeting Action: Reject

Panel Statement: In the substantiation provided with this proposal, the submitter states that equipotential planes as used in the dairy industry and swimming pools are dangerous. In the substantiation of Comment 17-94 on Proposal 17-114a, the submitter states that cows have approximately the same internal resistance as humans and that dairies have the same electrical setup as swimming pools.

Based on the submitter's remarks, it is clear that he recognizes the similarities between the bonding requirements of swimming pools and agricultural areas.

Therefore, in light of the testing data presented in the Georgia Tech Study provided with Comment 17-98, the panel does not agree with the submitter's substantiation.

The submitter has not substantiated the increase in danger associated with equipotential planes, or an improved level of safety when no equipotential plane is installed.

Number Eligible to Vote: 8

Ballot Results: Affirmative: 8

19-4 Log #322 NEC-P19 **Final Action: Accept**
(547.5(A))

Submitter: Code-Making Panel 7,

Comment on Proposal No: 19-11

Recommendation: CMP-7 recommends Proposal 19-11 be rejected.

Substantiation: Type UF, NMC, and Copper SE cables can be run as an exposed wiring method, but must be protected against physical damage. Article 547 should reference the appropriate wiring articles for the uses of the wiring method desired and comply with the appropriate provisions as required.

This comment was balloted through CMP-7 with the following balloting results:

14 Eligible to Vote

13 Affirmative

1 Not Returned (W. Crist)

Mr. J. Daley voted affirmatively stating: "I agree with the CMP-7 comment that Proposal 19-11 should be Rejected.

CMP-7 has the responsibility for defining the Uses Permitted and Uses Not Permitted and the installation requirements and limitations for the cable types within their Scope.

I can appreciate the problem that the submitter of Proposal 19-11 is trying to address, but any such change should be made in Article 334, not Article 547. I refer the submitter of Proposal 19-11 to my Comment on Negative Vote on Proposal 7-45 as a possible solution to the problem."

Panel Meeting Action: Accept

The panel understands that the action on this comment will cause the action on Proposal 19-11 to be "reject".

Panel Statement: Public comments on Proposal 19-11 offer valid reasons for rejecting the proposal: (1) Code-Making Panel 7 has the responsibility for defining uses and limitations of cable types within their Scope, and (2) No technical substantiation has been provided to support deletion of the requirements in Article 334.

Number Eligible to Vote: 8

Ballot Results: Affirmative: 8

Comment on Affirmative:

19-5 Log #468 NEC-P19 **Final Action: Reject**
(547.5(A))

Submitter: Dan Leaf, Seneca, SC

Comment on Proposal No: 19-12

Recommendation: Accept proposal revised:

Type NM cable suitable for the location shall be permitted in areas not covered by 547.1(A) and (B) and which do not require a thermal finish rating.

Substantiation: There are many barns, fruit and vegetable stands, and accessory buildings wired with Type NM cable. Type UF and NMC are permitted. All applicable code rules would apply, e.g., protection from physical damage.

Panel Meeting Action: Reject

Panel Statement: As per the Scope of Article 547, this article only applies to areas that are covered by 547.1(A) and (B). See 547.3.

Additionally, it is unclear whether the submitter intended the new sentence to replace the original proposed language or to accompany such language.

Number Eligible to Vote: 8

Ballot Results: Affirmative: 8

19-6 Log #645 NEC-P19 **Final Action: Accept**
(547.5(A))

Submitter: Linda J. Little, St. Louis, MO

Comment on Proposal No: 19-11

Recommendation: Proposal 19-11 should be Rejected.

Substantiation: The submitter correctly states that 340.10(4) places restrictions on the use of Type UF cable. No technical substantiation is presented to warrant deviation from these restrictions in agricultural areas. If surface wiring is "preferred," then <u>appropriate</u> surface wiring methods should be selected.

The Panel contradicts itself in the panel statements of Proposals 19-10 and 19-11. In 19-10, the submitter is informed that data verifying the effects of the hazards caused by rodent damage should be submitted before a change is warranted. Then in Proposal 19-11, the panel statement not only acknowledges the damage caused by rodents, but claims that this damage is increased by concealment of nonmetallic types of cables. It is inappropriate to tell one submitter that documentation is required to make a change, and then turn right around and make another change (in opposition to the recommended uses of a particular wiring method) without the same documentation.

The general rules in Chapters 1-4 should only be modified when essential for a reliable and safe installation. Certainly, there must be adequate justification to warrant any such deviation. Alteration of the general rules should enhance the installation and make it safer - this is not a convenience issue. If damage due to rodents is serious enough to warrant a change, more durable wiring methods (as suggested by the submitter of Proposal 19-10) will not only enhance the installation, they will promote safety by using wiring methods in the manner intended and already approved by earlier articles in the NEC.

Panel Meeting Action: Accept

Panel Statement: See the panel action and statement on Comment 19-4.

Number Eligible to Vote: 8

Ballot Results: Affirmative: 8

Comment on Affirmative:

EWING, M.: See my Explanation of Affirmative Vote on Comment 19-7.

19-7 Log #1295 NEC-P19 **Final Action: Accept**
(547.5(A))

Submitter: James M. Daly, Upper Saddle River, NJ

Comment on Proposal No: 9-11

Recommendation: The panel action on the Proposal should be Reject.

Substantiation: I agree with the Explanation of Negative vote by J. Bernson.

No technical substantiation has been provided to support deletion of the installation requirements of Part II of Article 334 when Type UF or Type SE cables are installed as interior wiring in other structures permitted to be Types III, IV, or V construction.

The same requirements apply to these substitute interior wiring methods as for Type NMC cable. When installed as interior wiring in other structures permitted to be Types III, IV, or V construction, all of these cable types must comply with 334.10(3) which requires that "Cables shall be concealed within walls, floors, or ceilings that provide a thermal barrier of material that has at least a 15-minute finish rating as identified in listings of fire-rated assemblies."

Types UF and SE cables, when used for interior wiring, and Type NMC cable must comply with Part II of Article 334.

These requirements are in accordance with the decision of the NFPA Standards Council, in accepting Proposal 7-137 of the NEC 2001 Report on Proposals, which was subsequently upheld by the NFPA Board of Directors.

Panel Meeting Action: Accept
Panel Statement: See the panel action and statement on Comment 19-4.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8
Comment on Affirmative:
EWING, M.: I agree with Mr. Daly's comment to Proposal 7-45 and his submitted Comment 7-21 which acknowledges that there is need for creating an Exception to the 15-minute finish requirement for agricultural buildings. Remember that 547.5 wiring methods apply to 547.1(A) & (B) areas only and the areas outside of 547.1(A) & (B) are wired according to 547.3. Mr. Daly's Comment 7-21 will apply to all animal housing/storage facilities and not just those areas originally accepted by Proposal 19-11. If Comment 7-21 is accepted by CMP-7, it makes Comments 19-4, 19-6, and 19-7 worthy of acceptance to reject Proposal 19-11. Note: There is no requirement for tray cable (TC) to be concealed in Article 336 and TC is permitted to be installed in 547.1(A) & (B) areas per 547.5 "other cables or conduits suitable for the location."
Technical substantiation may be provided from the panel members themselves during the review process and does not necessarily have to be part of the submitter's written substantiation. There was no technical substantiation for requiring the 334.10(3) finish rating requirement to apply to agricultural buildings when it was created but, as presently written it applies.

19-8 Log #224 NEC-P19 **Final Action: Accept**
(547.5(A), FPN)

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 19-13
Recommendation: The Technical Correlating Committee directs the panel to reconsider the proposal relative to 353.44 which does not exist. This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regu lations Governing Committee Projects.
Panel Meeting Action: Accept
The panel accepts the direction of the Technical Correlating Committee to reconsider Proposal 19-13.
Panel Statement: See the panel action on Comments 19-9 and 19-10.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

(547.5(A), FPN)

Submitter: William Wagner, Certification Solutions
Comment on Proposal No: 19-13
Recommendation: This Proposal should be Accepted as revised below:
FPN: See 300.7, ~~and~~ 352.44, and 355.44 for installation of raceway systems exposed to widely different temperatures.
Substantiation: In accordance with the TCC Action on Proposal 19-13, the FPN to 547.5(A) should be revised to include the correct references to the rigid nonmetallic conduit requirements. This correlates with the panel action on Proposals 8-53 and 8-78.
Panel Meeting Action: Accept
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-11 Log #293 NEC-P19 **Final Action: Accept in Part**
(547.5(B))

Submitter: Code-Making Panel 3,
Comment on Proposal No: 19-14
Recommendation: CMP-3 recommends rewording the recommended text to read as follows:
"Nonmetallic boxes, fittings, conduit, and cables shall be permitted to be mounted directly to any building surface covered by this article without maintaining the 6 mm (1/4 in.) airspace in accordance with 300.6(D) and 312.2(A)."
Substantiation: This exclusion has been in the code since the 1990 NEC and was permitted for any building surfaces for two reasons. The first reason was to install the wiring method to closely follow the contour of the building structure to keep animals from easily damaging the wiring methods. The second reason was there was no data available indicating that water and other liquids were causing damage to these wiring methods on wood structures.
This comment was balloted through CMP-3 with the following results:
13 Eligible to Vote
11 Affirmative
1 Negative
1 Not Returned (J. Sleights)
Mr. M. Sanders voted negatively stating: "The issue that was raised by the Technical Correlating Committee is that the basic rule of 300.6(D), in conjunction with 312.2(A), already states the exception that addresses the submitter's concern, and is unclear as to what is the technical reason why it should be repeated a third time in Article 547. The exceptions in Article 300 and Article 372 (the forerunner to present Article 312) have been in place since the 1990 edition of the NEC specifically to address the issue where livestock or other humid wash down environments may occur. This does not add clarity, it adds a third location where future correlation may be needed, and provides needless cross-referencing, which the revisions to 90.3 the past few code cycles have sought to eliminate. It is incumbent upon code users to know the provisions of the first four chapters and that they apply to the Chapters 5, 6, and 7 articles unless they are specifically modified due to substantiated problems or technical concerns.
If there is a problem to be solved with this redundant text, the following is offered for consideration.
"Nonmetallic boxes, fittings, conduit, and cables shall be permitted to be installed in accordance with 300.6(D) Exception and 312.2(A) Exception."
This should reduce future correlation problems, it will mandate the desired usage, and provide clarity."
Panel Meeting Action: Accept in Part
The panel rejects the addition of the reference to 312.2(A) and accepts the remainder of the comment.
Panel Statement: See Code-Making Panel 9 substantiation on Comment 19-12.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8
Comment on Affirmative:
EWING, M.: In rewriting ROP 19-14, the CMP failed to incorporate the word "cabinet" with nonmetallic boxes in the second sentence of 547.5(B). Without that word, there is no point in making a reference to 312.2(A). The reason this is in 547 is to permit mounting of nonmetallic enclosures to indoor damp or wet wood surfaces where not permitted by 300.6(D) Exception. Also see Comment to 19-12.

19-12 Log #312 NEC-P19 **Final Action: Accept in Principle**
(547.5(B))

Submitter: Code-Making Panel 9,
Comment on Proposal No: 19-14
Recommendation: The proposal as originally submitted should be accepted.
Substantiation: The proposal, as written, correctly identifies a lack of correlation created by the recent reorganization and expansion of 300.6 in the 2005 code cycle. CMP-9 does not agree, however, that text addressing "nonmetallic boxes, fittings, conduit, and cables" includes equipment within the scope of Article 312. Article 312 only coves cabinets, cutout boxes, and meter socket enclosures, and, therefore, there is no conceptual conflict between the existing text and 312.2(A). Although occasionally made from nonmetallic materials, there is no substantiation on record to wave the spacing requirement when this equipment is mounted on an absorbent surface in an indoor wet location. Note that the existing text of 300.6(D) Exception does waive the spacing requirement on nonabsorbent surfaces.
The spacing waiver in Article 547 originated as a CMP-19 proposal to cover nonmetallic cables in the 1990 code cycle (Proposal 19-8). That proposal preceded the current 300.6(D) (Exception) (which entered the NEC in the 1993 edition) and referred to problems with animals having an easier time of chewing on cables that were spaced out from the surface, as well as problems with cables being hooked by farm implements during the normal course of

work. The proposal was broadened during the comment period (Comment 19-1) to its present form because nonmetallic boxes and conduits are not subject to corrosion. Although CMP-19 reaffirmed its intention to have the spacing waiver applied to wood and other absorbent surfaces in the 1999 cycle (see Proposal 19-13a), that action remained in the more limited context of boxes and wiring methods, not cabinets.

CMP-9 certainly agrees that nonmetallic cabinets are incapable of corrosion, however, we are concerned that the larger surface area of Article 312 enclosures may cause their anchoring provisions to fail if the absorbent mounting surface, typically wood, changes dimension as the moisture level changes. For larger enclosures, a proportional change in dimension creates greater stress on the mounting provisions than would be the case for a box or conduit support. In addition, equipment within the scope of Article 312 should not normally be placed where it would subject to animal attack or where farm implements would inadvertently get behind it (see 110.26(F), for example). This calls into question the relevance of the 1990 substantiation for Article 312 enclosures. Before this change is made, CMP-9 would like to see CMP-19 provide technical substantiation supporting the necessity of broadening this allowance.

This comment has been balloted through CMP-9 with the following balloting results:

11 Eligible to Vote
10 Affirmative
1 Not Returned (H. deVega)

Panel Meeting Action: Accept in Principle

The panel accepts the concept of retaining the original proposal but prefers the language used in Comment 19-11.

Panel Statement: See the panel action and statement on Comment 19-11.

Number Eligible to Vote: 8

Ballot Results: Affirmative: 8

Comment on Affirmative:

EWING, M.: Presently, I know of only one cabinet manufacturer (Eaton) who makes a nonmetallic panelboard/cabinet for use in agricultural buildings although I haven't seen one installed as yet. The installations I see consist of nonmetallic NEMA 4X box installed per 547.5(B), with a complete panelboard/cabinet assembly installed within it. Unlike 314.23, there is no securing or supporting requirements found in Article 312. It surprises me to see Panel 9's concern for the possibility of anchoring failure when secured flat against wood rather than supported 1/4 in. or more out from the wood with the cabinet tabs and spacers. From my perspective, I've seen less damage to nonmetallic enclosures when they are secured to a flat surface (which provides more surface area for support) than spacing it 1/4 in. or more out from the surface regardless of the surface material. Also, see Comment to 19-11.

19-13 Log #225 NEC-P19 **Final Action: Accept**
(547.5(F))

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 19-18
Recommendation: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal. It is unclear as to whether the panel was accepting the held proposal or the held public comment. The Technical Correlating Committee also notes that this action is unclear relative to the action taken by accepting Proposal 19-3 that revised 547.5(F).

This action will be considered by the Panel as a Public Comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

The panel accepts the direction of the Technical Correlating Committee to clarify the panel action on this proposal.

The panel modified the language in 547.5(F), and the panel intends to keep the word "grounding" for this application. The need to change from "grounding" to "bonding" in Proposal 19-3 is no longer necessary. The panel intended to accept Proposal 19-18 as written.

The text of 547.5(F) in the NEC 2008 ROP Draft is correct and reads as follows:

"(F) Separate Equipment Grounding Conductor. Where an equipment grounding conductor is installed within a location falling under the scope of Article 547, it shall be a copper conductor. Where an equipment grounding conductor is installed underground, it shall be insulated or covered copper."

Panel Statement: The original Proposal 19-10 (Log # 1968) in the May 2004 ROP was to change the term "equipment grounding conductor" to "equipment bonding conductor." That proposal was rejected by the panel because the change in terms did not clarify requirements. The original proposal should continue to be rejected, particularly in light of the Panel 19 action on Proposal 19-3 (Log # 1530) in the A2007 ROP and the recommendations of the TCC Task Group on Grounding and Bonding.

It was the intent of CMP 19 to accept the held Comment 19-8 (Log # 3026) in the May 2004 ROC on Proposal 19-10 (Log # 1968) in the May 2004 ROP and, thereby, accept Proposal 19-18 (Log # 221) in the A2007 ROP. By accepting Proposal 19-18, the previously accepted Proposal 19-3 regarding 547.5(F) is no longer required.

Number Eligible to Vote: 8

Ballot Results: Affirmative: 8

19-14 Log #452 NEC-P19 **Final Action: Reject**
(547.5(F))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-19
Recommendation: Accept proposal revised:

Noncurrent-carrying metal parts of equipment, raceways, and other enclosures, ~~where required~~ to be grounded... (remainder unchanged).

Substantiation: Where grounding is not required by code, but done by choice the requirements should apply. This section may be perceived as modifying 250.1(1) which indicates Article 250 applies where grounding is "permitted". The text does not support the panel statement that voluntary grounding requires the insulated or covered conductor since this section relates to required grounding.

Panel Meeting Action: Reject

Panel Statement: The submitter's substantiation is based on text that no longer exists. See the panel action and statement on Comment 19-13.

Number Eligible to Vote: 8

Ballot Results: Affirmative: 8

19-15 Log #1272 NEC-P19 **Final Action: Reject**
(547.5(F))

Submitter: Neil F. LaBrake, Jr., Syracuse, NY
Comment on Proposal No: 19-18
Recommendation: Revise 547.5(F) as follows:

(F) Separate Equipment Grounding ~~Bonding~~ Conductor. Non–current-carrying metal parts of equipment, raceways, and other enclosures, where required to be grounded, shall be connected to ground~~ed~~ by a copper equipment grounding ~~bonding~~ conductor installed between the equipment and the building disconnecting means. If installed underground, the equipment grounding ~~bonding~~ conductor shall be insulated or covered.

Substantiation: The use of the term "equipment grounding conductor" is correct according to the Panel action on Proposal 5-76 and for the definition of this term in Proposal 5-6.

This Comment was developed by a Task Group assigned by the NEC Technical Correlating Committee to address actions that were other than "accept" taken by Code-Making Panels on proposals from the TCC to resolve 2005 NEC Proposal 5-1 and Comment 5-1. Members of the Task Group on Grounding and Bonding for this Comment included: C. Douglas White; Michael Johnston; Jeffrey Boksiner; Daleep Mohla; Phil Simmons; Christopher Hutchings; James Carroll; Alan Rebeck; Richard Loyd; Paul Dobrowsky; and Neil F. LaBrake, Jr.

Panel Meeting Action: Reject

Panel Statement: This comment is based on language that was modified in the proposal stage. See the panel action and statement on Comment 19-13.

Number Eligible to Vote: 8

Ballot Results: Affirmative: 8

19-16 Log #226 NEC-P19 **Final Action: Accept**
(547.9)

TCC Action: To be consistent with the panel action on Proposal 19-3, the Technical Correlating Committee directs that item (2) of the panel action text be revised from "…is bonded to…" to "…is connected to…".

This revision will make the use of the terms consistent with the previous panel actions.

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 19-26
Recommendation: It was the action of the Technical Correlating Committee that the panel reconsider the proposal and avoid repeating the requirements of Article 250 in 547.9. The Technical Correlating Committee notes that all of the requirements outlined in 547.9(B)(3) are covered in Article 250 with the exception of the increased requirement that the equipment grounding conductor be the same size as the ungrounded conductors.

For correlation purposes, it would be more appropriate for the panel to reference the requirements in Article 250 and include the increased requirement for the EGC sizing.

This action will be considered by the panel as a public comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

The panel accepts the comment and has revised the text per the Technical Correlating Committee direction.

Revise the text of 547.9(B)(3) to read as follows:

"(3) Grounding and Bonding. For each building or structure, grounding and bonding of the supply conductors shall be in accordance with the requirements of 250.32 ~~a separate equipment grounding conductor shall be run with the supply conductors to the building(s) or structure(s)~~, and the following conditions shall be met:

(1) The equipment grounding conductor shall be the same size as the largest supply conductor if of the same material, or adjusted in size in accordance with the equivalent size columns of Table 250.122 if of different materials.

(2) The equipment grounding conductor is bonded to the grounded circuit conductor and the site-isolating device at the distribution point.

~~(3) A grounding electrode system is provided in accordance with Part III of Article 250 and connected to the equipment grounding conductor at the building(s) or structure(s) disconnecting means.~~

~~(4) The grounded circuit conductor is not connected to a grounding electrode or to any equipment grounding conductor on the load side of the distribution point.~~

~~Exception: For existing premises wiring systems only, the grounded conductor run with the supply to the building or structure shall be permitted where all the requirements of 250.32(b)(1), Exception are met."~~

Panel Statement: By referencing 250.32, a separate equipment grounding conductor is required to be run to each building or structure as the submitter requested in the original proposal (Proposal 19-26). By reference, this will also allow use of the exception for existing premises wiring systems. Redundant language in 547.9(B)(3), list items (3) and (4), is eliminated, as these requirements are covered in 250.32(A) and 250.32(B)(1). The increased requirement for the equipment grounding conductor remains in 547.9(B)(3)(1), and requirements for bonding to the site-isolating device remain in 547.9(B)(3)(2).

Number Eligible to Vote: 8

Ballot Results: Affirmative: 8

19-17 Log #1683 NEC-P19 **Final Action: Reject**
(547.10)

Submitter: Donald W. Zipse, Electrical Forensics, LLC

Comment on Proposal No: 19-30

Recommendation: Delete the whole Section 547.10.

Substantiation: The panel statement states- "The use of equipotential planes is an accepted practice in various industries for reducing step-touch potential."

The writer can understand the confusion that appears to exist with the panel between Equipotential Planes and Step – Touch Potentials. The four (4) original Ag Professors also did not understand the difference between the two.

First one has to learn the difference between **FAULT CURRENT** and **STEADY STATE OR CONTINUOUS CURRENT FLOW**.

FAULT CURRENT – (From the IEEE) (general) A current that flows from one conductor to ground or to another conductor owing to an abnormal connection (including an arc) between the two. A fault current flowing to ground may be called a ground fault current.

From The peer reviewed technical paper "Equipotential Planes, A Figment of the Imagination"- (Which was sent with 547.2, 19-5.)

"It is opined that Gustafson, et al and the NEC Making Panels did not take into consideration the purpose of the IEEE Standard 80, "Guide for Safety in AC Substation Grounding".

IEEE Standard 80 states:

"1.2 Purpose. The intent of this guide is to provide guidance and information pertinent to safe grounding practices in ac substation design.

The specific proposes of this guide are to

a) Establish, as a basis for design, the **safe limits of potential differences** that can exist in a substation **under fault conditions** (Author's emphases) between points that can be contacted by the human body.

b) Review substation grounding practices with special reference to safety, and develop criteria for a safe design.

c) Provide a procedure for the design of practical grounding systems, based on these criteria.

d) Develop analytical methods as an aid in the understanding and solution of typical gradient problems."

It is a fact and is very clear that Clause 1.2 a) states that IEEE Standard 80 is under **fault conditions.** Stray current or if one insists, stray voltage, exists under normal continuous flow of neutral distribution current, under continuous utility operating conditions, not fault conditions."

Now one needs to know the difference between fault current and steady state.

STEADY STATE OR CONTINUOUS CURRENT FLOW - (IEEE) steady current

A current that does not change with time.

We have two types of current flow. Fault current that lasts for cycles until the protective device opens such as a circuit breaker, fuse, recloser or other protective device. Therefore a fault current is usually HIGH LEVELS OF CURRENT FOR A VERY SHORT PERIOD OF TIME.

However, a steady state flow of current such as would be flowing to a lamp, or motor, or in a distribution system, such as the current flowing into transformers, is continuous and compared to fault current, steady state is a low level of continuous flow of current.

Table from presentation to Industrial and Commercial Power System Technical Conference, May, 2006, has been provided.

So step – touch potential is associated with fault current. Steady state flow of current is associated with Equipotential Planes

Code-Making Panel stated in their statement that "The submitter's... substantiation is anecdotal and provides insufficient data to justify removing the requirement for equipotential planes. The following is NOT ANECDOTAL, but are facts.

The graph provided is alternating current flow across an Equipotential Plane. The bottom graph is the sum of alternating current flowing through the Equipotential Plane and the alternating current is being rectified into direct current plus a maximum of 0.74 volts that could be coming from galvanic action of the copper conductors and iron re-bar in the concrete that the NEC CODE MAKING PANEL REQUIRES for the equipment grounding conductor to connect to the Equipotential Plane which contains iron re-bar.

If the panel were well versed in Equipotential Planes theory and understanding the panel would require iron conductors instead of copper in dairies and pig confinement areas.

In addition to the graph which is just one of approximately 1,000, is 4 camera screens provided were taken on a dairy.

Camera 1 is showing a cow standing on an Equipotential Plane. The cow is eating wetted crushed corn, sugar to a cow. For ease of discussion we will assume the current is flowing up the cow's legs, through the cow's body and out the mouth into the wetted corn. From the wetted and conductive corn through an iron wire to the direct current ammeter shown in view 3 and to the ac ammeter shown in view 2. From the instrumentation the iron conductor takes the current back to the metal rail adjacent to the cow that the cow would and can touch, thus completing a part of the circuit that originated at the utility distribution substation. Normally we have a top view of the cow in camera 4, which is blank during this test.

The last diagram provided is the electrical circuit from the utility substation and showing the dangerous and hazardous multigrounded neutral electrical distribution system. If one were to follow the red conductor one would see that the current is directed directly into the dairy's Equipotential Plane and back to the substation.

As the peer reviewed technical paper submitted with my Comment on Proposal 9-5(547.2) shows, Equipotential Planes, Are a Figment of the Imagination.

Please delete Section 547.10 and Equipotential Planes.

Therefore, please save the cows and delete 547.10. In one dairy 5 cows a day were dying from stray current until the dairyman realized the problem was Equipotential Planes

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The panel does not agree with the submitter's substantiation based on the testing data provided as a part of the substantiation on Comment 17-98. See the panel action and statement on Comment 19-3.

Number Eligible to Vote: 8

Ballot Results: Affirmative: 8

19-18 Log #2218 NEC-P19 **Final Action: Accept**
(547.10(A))

Submitter: Jeff Fitzloff, State of Idaho Division of Building Safety

Comment on Proposal No: 19-36

Recommendation: Revise text to read as follows:

547.10 Equipotential Planes and Bonding of Equipotential Planes. The installation and bonding of equipotential planes shall comply with 547.10(A) and 547.10(B). For the purposes of this section, the term livestock shall not include poultry.

(A) Where Required. Equipotential planes shall be installed where required in (1) and (2). [ROP 19-36]

(1) Indoors. Equipotential planes shall be installed in confinement areas with concrete floors where metallic equipment is located that may become energized and is accessible to livestock. [ROP 19-36]

(2) Outdoors. Equipotential planes shall be installed in concrete slabs where metallic equipment is located that may become energized and is accessible to livestock. [ROP 19-36]

The equipotential plane shall encompass the area where the livestock stands while accessing metallic equipment that may become energized. [ROP 19-36]

Substantiation: This change is a great improvement clarifying the areas where equipotential planes are required.

Panel Meeting Action: Accept

Number Eligible to Vote: 8

Ballot Results: Affirmative: 8

19-19 Log #2191 NEC-P19 **Final Action: Accept**
(547.10(B), FPN No. 1 and 2)

Submitter: Barry Bauman, Alliante Energy
Comment on Proposal No: 19-35
Recommendation: Revise text to read as follows:
547.10 Equipotential Planes and Bonding of Equipotential Planes.
FPN No. 1: Methods to establish equipotential planes are described in American Society of Agricultural and Biological Engineers (ASABE) EP473.2-2001, Equipotential Planes in Animal Containment Areas.
FPN No. 2: Methods for safe installation of livestock waterers are described in American Society of Agricultural and Biological Engineers (ASABE) EP342.2-1995, Safety for Electrically Heated Livestock Waterers.
Substantiation: Along with the American Society of Agricultural Engineers name change to American Society of Agricultural and Biological Engineers, the acronym has been changed from ASAE to ASABE.
Panel Meeting Action: Accept

Ballot Results: Affirmative: 8

ARTICLE 550 MOBILE HOMES, MANUFACTURED HOMES, AND MOBILE HOME PARKS

19-20 Log #1511 NEC-P19 **Final Action: Accept**
(550.4(C))

Submitter: Jeffrey Boksiner, Telcordia Technologies, Inc.
Comment on Proposal No: 19-39
Recommendation: Use the term "neutral conductor" as originally proposed.
Substantiation: This comment was developed by the Technical Correlating Committee (TCC) Task Group (TG) on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6). The TCC directed that the action on this proposal be sent to the TG for review and comment.
TG concludes that the term "neutral conductor" is more appropriate because a set of conductors supplies the mobile home. This set of conductors includes the neutral conductor. A system with a neutral point may not necessarily carry the neutral conductor along with the other conductors.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Miller, T.

19-21 Log #503 NEC-P19 **Final Action: Reject**
(550.12(D)(3))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-43
Recommendation: Accept proposal.
Substantiation: The literal indicates a single "outlet" which may contain a single receptacle shall not supply a load in excess of 80 percent of the branch circuit rating. A branch circuit supplying a single receptacle for a single appliance is an individual circuit which per 210.23 may supply a load for which it is rated. What special circumstance or hazard justifies a modification of 210.23?
Panel Meeting Action: Reject
Panel Statement: Section 210.23(A)(1) specifies that any one cord-and-plug utilization equipment not fastened in place shall not exceed 80 percent of the branch-circuit ampere rating. Section 422.10(A) requires the branch-circuit rating for an appliance to be not less than 125 percent of the marked rating of the appliance. Therefore, a "special circumstance or hazard" is not needed to justify the requirements in 550.12(D)(3).
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Miller, T.

19-22 Log #427 NEC-P19 **Final Action: Reject**
(550.14(E).xx (New))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-61
Recommendation: Accept proposal.
Substantiation: It is not clear whether requirements in Article 210 apply. If Chapters 1 through 4 apply generally, why are 550.12, 550.13, 550.16, 550.18, 550.25, 550.32(B)(2)(4)(5), for example included in this article since they are already covered elsewhere in the code? The bulk of the code could be reduced by eliminating all sections of this article that are also covered elsewhere in the code, which indicates no need for repetition.
Panel Meeting Action: Reject
Panel Statement: The substantiation states the submitter's request to reduce bulk by eliminating repetition of the requirements, yet the proposal is to repeat a requirement already stated in the general chapters.
The requirements in Chapters 1 through 4 apply generally except as amended by Chapters 5 through 7. Since the lighting outlet requirements are not amended in Article 550, those requirements in Article 210 already apply.
There is no need for the additional language (see NEC Style Manual 4.1).
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Miller, T.

19-23 Log #1273 NEC-P19 **Final Action: Reject**
(550.15(D))

Submitter: Neil F. LaBrake, Jr., Syracuse, NY
Comment on Proposal No: 19-48
Recommendation: Accept the original proposal from the NEC TCC Task Group on Grounding and Bonding.
Substantiation: The NEC TCC Task Group on Grounding and Bonding agreed that simplification of the definitions was in order and that prescriptive elements would be proposed for specific Article texts as made in Proposal 19-48. The Task Group requests Panel 19 clarify and reconsider the Panel Action on this Proposal to be consistent with the TCC Grounding and Bonding Task Group's original initiatives.
This Comment was developed by a Task Group assigned by the NEC Technical Correlating Committee to address actions that were other than "accept" taken by Code-Making Panels on proposals from the TCC to resolve 2005 NEC Proposal 5-1 and Comment 5-1. Members of the Task Group on Grounding and Bonding for this Comment included: C. Douglas White; Michael Johnston; Jeffrey Boksiner; Daleep Mohla; Phil Simmons; Christopher Hutchings; James Carroll; Alan Rebeck; Richard Loyd; Paul Dobrowsky; and Neil F. LaBrake, Jr.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its position as stated in the panel statement on Proposal 19-48.
This is identical to the language used in 406.5(B), and there is no need to be more prescriptive as to the method of grounding.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Miller, T.

19-24 Log #426 NEC-P19 **Final Action: Accept in Principle in Part**
(550.15(E))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-45
Recommendation: Accept as revised:
~~If~~ Where a range or clothes dryer, or ~~similar appliance~~ is connected by metal covered cable or flexible ~~metal~~ conduit, a length of not less than...(remainder unchanged).
Substantiation: "Similar appliance" is subjective and not defined; what constitutes a similar appliance? This section addresses metal covered cable and flexible metal conduit, if used, but doesn't require such methods or limit or prohibit other methods covered in 550.15 such as LFMC ad LFNC. Though FMC provides some protection so do LFMC and LFNC. However, 348.12(7) prohibits FMC were subject to damage the same as 350.12(1) for LFMC and 356.12(1) for LFNC.
Panel Meeting Action: Accept in Principle in Part
In the recommendation, the panel revises "similar appliance" to "other appliance".
The panel does not accept the deletion of the word "metal".
Panel Statement: The panel rejects striking the word "metal" as proposed. Striking this word and leaving the remainder of the section unchanged as indicated in the comment would leave conflicting requirements within this section.
The change from "similar appliance" to "other appliance" meets the intent of the submitter and provides clarification.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Miller, T.

19-25 Log #501 NEC-P19 **Final Action: Reject**
(550.18(A)(2))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-59
Recommendation: Accept the proposal.
Substantiation: See Substantiation for proposal. The Code provides for a specific minimum va/sq ft for general lighting and this does not increase if more than the minimum number of circuits is installed. This is reasonable since additional circuits simply exceed Code minimums and provide reliability, diversity, and efficiency due to less voltage drop. This is recognized in 210.52(B)(2), Exception. If a square foot area requires a minimum of three general lighting circuits and six circuits are installed, the calculated feeder or service load is not required to be increased.
Panel Meeting Action: Reject
Panel Statement: Substantiation for this comment with regard to lighting circuits is irrelevant since this section deals with small-appliance branch circuits. The submitter cites 210.52(B)(2) Exception, which is irrelevant since 210.52 defines where outlets are required, not load calculations. Section 210.52(B)(2) has two exceptions, neither of which pertains to load calculations in 550.18(A)(2).

It is true that additional lighting circuits can be added without increasing the required load calculation in 550.18(A)(1). This mirrors the requirements in 220.12 for dwelling unit lighting loads.

Section 550.18(A)(2) only requires 1500 volt-amperes for each small appliance branch circuit, paralleling the requirements in 220.52(A). Small-appliance branch circuits are intended for appliances. The load on these circuits is expected to be more than on a general-purpose branch circuit, hence the additional load requirement. The submitter has not provided sufficient technical substantiation for changing the requirements for small- appliance branch circuits.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Miller, T.

19-26 Log #498 NEC-P19 **Final Action: Accept**
(550.32(B)(2)(4)(6))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-66
Recommendation: Accept the proposal for (B)(2) to delete "equipment".
Substantiation: Service equipment per Article 100 covers switches and circuit breakers. "Service" as defined in Article 100 covers conductors, service equipment and related equipment, not limited to service equipment. Service equipment (switches and circuit breakers) are not covered by part I through Part IV.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Miller, T.

19-27 Log #227 NEC-P19 **Final Action: Accept**
(550.33)

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 19-68
Recommendation: The Technical Correlating Committee directs the panel to reconsider the proposal and determine if the current reference to 310.15(B)(6) is necessary in 550.31 since the panel has accepted the addition of the same reference in 550.33(B). This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept

The panel accepts the Technical Correlating Committee direction to reconsider the proposal and agrees that the reference to 310.15(B)(6) in 550.31 is not necessary and should be deleted.
Panel Statement: Under the direction of the Technical Correlating Committee, the panel has deleted the reference to 310.15(B)(6) in 550.31.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Miller, T.

19-28 Log #228 NEC-P19 **Final Action: Accept**
(550.33(A) Exception)

TCC Action: The Technical Correlating Committee directs that in lieu of the panel action on this comment, a new exception be added to 550.33(A) from the Report on Proposals text. The exception will read:

"Exception: For an existing feeder that is installed between the service equipment and a disconnecting means as covered in 550.32(A), it shall be permitted to omit the equipment grounding conductor where the grounded circuit conductor is grounded at the disconnecting means in accordance with 250.32(B) Exception."

The panel created a potential new requirement with their revision in this comment. For mobile homes, feeder conductors can be between the mobile home service equipment and the mobile home or between remote service equipment and a disconnect located within 30 feet. The original exception applied to the feeder between remote service equipment and the disconnect located at the mobile home.

As worded by the panel, the text would require the feeder between the mobile home disconnect and the mobile home to comply with 250.32. This reference would require a grounding electrode at the mobile home which is not required today and was not substantiated during the revision process. The new exception will make it clear that the equipment grounding conductor can be omitted for an existing feeder.
Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 19-69
Recommendation: It was the action of the Technical Correlating Committee that the proposal be reconsidered and that the panel consider correlating this proposal with the Code-Making Panel 5 action on Proposal 5-119 relative to an exception for existing installations. This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept

The panel accepts the comment and has revised the text per the Technical Correlating Committee direction as follows:

Revise 550.33(A) to read as follows:

550.33 Feeder.

(A) Feeder conductors shall comply with the following:

(1) Feeder conductors shall consist of either a listed cord, factory installed in accordance with 550.10(B), or a permanently installed feeder consisting of four insulated, color-coded conductors that shall be identified by the factory or field marking of the conductors in compliance with 310.12. Equipment grounding conductors shall not be identified by stripping the insulation.

(2) Feeder conductors shall be installed in compliance with 250.32(B).

Panel Statement: Under the direction of the Technical Correlating Committee, the panel has revised the text to correlate with the Panel 5 action on Proposal 5-119.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Miller, T.

ARTICLE 551 RECREATIONAL VEHICLES AND RECREATIONAL VEHICLE PARKS

19-29 Log #2212 NEC-P19 **Final Action: Accept**
(551.42(C))

Submitter: Bruce A. Hopkins, RVIA
Comment on Proposal No: 19-78
Recommendation: Revise Panel Meeting action as follows:

Such recreational vehicles shall be permitted to be equipped with distribution panelboards rated 120 volts maximum or 120/240 volts maximum listed for 30 amp ~~or 50 amp~~ application~~s~~ supplied by the appropriate power supply assemblies.
Substantiation: This would clarify that a 120 volt only rated panelboard would still be permitted with a 30 amp power supply assembly. Also, reference to a 50 amp application should be deleted since 551.42(C) only applies to 30 amp application. 50 amp requirements are covered under 551.42(D).
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Miller, T.

19-30 Log #432 NEC-P19 **Final Action: Reject**
(551.44(A)(B) and (C))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-81
Recommendation: Accept proposal.
Substantiation: See substantiation for proposal. The panel reference to 551.40(B) only provides a general requirement which may not be known to code users. 551.44(D) does not use the term "or larger"; 551.46(C) has specific ratings which do not include the phrase "or larger".
Panel Meeting Action: Reject
Panel Statement: Definitions in Article 555 for Marinas and Boatyards do not apply to Article 551 for Recreational Vehicles and Recreational Vehicle Parks.

551.46(A) requires the power supply assembly to be factory supplied or factory installed, so it is unnecessary to be concerned whether "Code users" are aware of the general requirement in 551.40(B) for compatibility of power supply components. Language in 551.46(C)(1), (2), and (3) specifies 15- 20- and 30-ampere attachment plugs, so plug caps rated higher than the conductors are not permitted as suggested by the substantiation. However, retaining the "or larger" language does allow for conductors larger than the minimum required for the rating of the attachment plug cap.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Miller, T.

19-31 Log #313 NEC-P19 **Final Action: Accept**
(551.45(D) (New))

Submitter: Code-Making Panel 9,
Comment on Proposal No: 19-84
Recommendation: Continue to reject the proposal.
Substantiation: Although it is certainly true that there will normally be readily accessible upstream methods available to disconnect power to the main conductors supplying a recreational vehicle, that does not mean that the work will be performed deenergized in accordance with safe work practices. Many electricians utilize this (backfed) main to de-energize the panel and then perform maintenance realizing the line side of the main is still energized. Since this device is still energized, it is imperative that provisions to prevent the main from being unplugged are in place. This requirement is intended to provide an additional measure of safety when the work is done hot, even if it shouldn't be done that way. "Field-installed" in this context applies to all wiring done outside of the panelboard manufacturing facilities, including the wiring done in a recreational vehicle assembly facility.

This comment has been balloted through CMP-9 with the following ballot results:

11 Eligible to Vote
10 Affirmative
1 Not Returned (H. deVega)

Panel Meeting Action: Accept

19-33 Log #1275 NEC-P19 **Final Action: Reject**
(551.47(M))

Submitter: Neil F. LaBrake, Jr., Syracuse, NY
Comment on Proposal No: 19-86
Recommendation: Accept the original proposal from the NEC TCC Task Group on Grounding and Bonding.
Substantiation: The NEC TCC Task Group on Grounding and Bonding agreed that simplification of the definitions was in order and that prescriptive elements would be proposed for specific Article texts as made in Proposal 19-86. The Task Group requests Panel 19 clarify and reconsider the Panel Action on this Proposal to be consistent with the TCC Grounding and Bonding Task Group's original initiatives.

This Comment was developed by a Task Group assigned by the NEC Technical Correlating Committee to address actions that were other than "accept" taken by Code-Making Panels on proposals from the TCC to resolve 2005 NEC Proposal 5-1 and Comment 5-1. Members of the Task Group on Grounding and Bonding for this Comment included: C. Douglas White; Michael Johnston; Jeffrey Boksiner; Daleep Mohla; Phil Simmons; Christopher Hutchings; James Carroll; Alan Rebeck; Richard Loyd; Paul Dobrowsky; and Neil F. LaBrake, Jr.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its position as stated in the panel statement on Proposal 19-86.

This is identical to the language used in 406.5(B), and there is no need to be more prescriptive as to the method of grounding.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Miller, T.

19-34 Log #2213 NEC-P19 **Final Action: Accept in Principle**
(551.47(P)(2))

Submitter: Bruce A. Hopkins, RVIA
Comment on Proposal No: 19-87
Recommendation: Revise 551.47(P)(2) as follows:

(2) Direct Wired. That portion of a branch circuit that is installed in an expandable unit shall be permitted to be connected to the portion of the branch circuit in the main body of the vehicle by means of flexible cord in accordance with 551.47(P)(2)(a) through (P)(2)(d) or other acceptable wiring methods.

a. The flexible cord shall be listed for had usage and for use in wet locations.

b. The flexible cord shall be permitted to pass through the interior of a wall ~~or through a floor~~ in lengths not to exceed 600 mm (24 in.) before terminating at an outlet or junction box. ~~c.~~ The flexible cord shall be installed in a nonflexible conduit or tubing that runs continuously from ~~the~~ an outlet or junction box inside the recreational vehicle to a strain relief connector listed for use in wet locations that is located on the underside of the recreational vehicle.

c. The flexible cord shall be permitted to pass directly through a floor, and shall be protected by conduit ~~or~~ and bushings or equivalent.

d. The outer jacket of the flexible cord shall be continuous to an ~~the~~ outlet or junction box.

Substantiation: The language to allow other wiring methods should be accepted. RV manufacturers may choose to make the transition from flexible cord to romex in a wet location J-box located on the underside of the slideout room. In this case, the flexible cord would not enter a wall or floor. The current language restricts the RV manufacturer to one very specific installation, when any installation in compliance with the NEC should be permitted.

The change to b. would allow the flexible cord to run in the wall only when installed in the nonflexible conduit as outlined.

The new c. would permit the cord to pass through a floor in the same manner as a power supply assembly (also a flexible cord) is permitted to pass through floors in 551.46(A)(2).
Panel Meeting Action: Accept in Principle

Revise the wording of the recommendation in the comment to read as follows:

"(2) Direct Wired. That portion of a branch circuit that is installed in an expandable unit shall be permitted to be connected to the portion of the branch circuit in the main body of the vehicle by means of flexible cord installed in accordance with 551.47(P)(2)(a) through (e) or other approved wiring method.

a. The flexible cord shall be listed for hard usage and for use in wet locations.

b. The flexible cord shall be permitted to be exposed on the underside of the vehicle.

c. The flexible cord shall be permitted to pass through the interior of a wall or floor assembly or both a maximum concealed length of 600 mm (24 in.) before terminating at an outlet or junction box.

d. Where concealed, the flexible cord shall be installed in nonflexible conduit or tubing that is continuous from the outlet or junction box inside the recreational vehicle to a weatherproof outlet box, junction box, or strain relief fitting listed for use in wet locations that is located on the underside of the recreational vehicle. The outer jacket of the flexible cord shall be continuous into the outlet or junction box.

e. Where the flexible cord passes through the floor to an exposed area inside of the recreational vehicle, it shall be protected by means of conduit and bushings or equivalent.

Where subject to physical damage, the flexible cord shall be protected with RMC, IMC, Schedule 80 PVC, or other approved means and shall extend at least 150 mm (6 in.) above the floor. A means shall be provided to secure the flexible cord where it enters the recreational vehicle."

Panel Statement: The word "acceptable" is not in the NFPA Style Manual; however, "approved" is and is enforceable under 110.2.

The word "had" was changed to "hard" usage cord in (a).

The panel's language in (b) acknowledges the fact that the cord is permitted between outlet or junction boxes where exposed below the recreational vehicle in addition to where it enters the recreational vehicle.

The panel is retaining the maximum of 24 in. of flexible cord to pass concealed from below the recreational vehicle to an outlet or junction box located inside the recreational vehicle.

No substantiation to permit a length greater than the existing 24 in. has been submitted.

The proposed bushing prevents abrasion to the cord where it leaves the raceway, however, it does not provide strain relief to keep the cord from pulling on terminations.

The panel has created new items "d." and "e." to differentiate between exposed installations that are subject to physical damage and those that are not.

The revised language in (d) and (e) ensures that protection from physical damage and strain relief is provided whether the cord is concealed or exposed.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Miller, T.

19-35 Log #646 NEC-P19 **Final Action: Accept**
(551.47(S))

Submitter: Linda J. Little, St. Louis, MO
Comment on Proposal No: 19-89
Recommendation: This proposal should have been Accepted in Principle.
Revise the last sentence in 551.47(S)(3):
"An ampere rating ~~compatible with the device~~ not to exceed 80 percent of the circuit rating shall be legibly marked in the blank space."
Substantiation: This new requirement will add safety as the submitter suggests. However, the intended purpose of the circuits is to feed future appliances. These "other appliances or devices" may operate on a continuous basis and the circuit should be rated accordingly as done in 551.47(Q)(3).
Panel Meeting Action: Accept
Panel Statement: The panel notes that in the recommendation of Proposal 19-89, in (2) the last word should be changed from "tapped" to "taped."
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Miller, T.

19-36 Log #528 NEC-P19 **Final Action: Reject**
(551.73)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-94
Recommendation: Accept the proposal.
Substantiation: Service-entrance conductors are service conductors but all service conductors are not service-entrance conductors. There must be service conductors from the utility to the service disconnecting means. The FPN for Service-Entrance Conductors, Underground System indicates there may be no service-entrance conductors. Service lateral conductors terminated at outside service equipment are service conductors but not service-entrance conductors, and are not covered by Table 551.73.
Panel Meeting Action: Reject
Panel Statement: Conductors falling under the jurisdiction of the utility are not subject to the demand factors in Table 551.73. Those service conductors that are not considered service entrance conductors typically fall under the jurisdiction of the utility.
No substantiation has been provided to warrant expanding the use of demand factors in Table 551.73 to conductors other than service entrance conductors.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Miller, T.

19-37 Log #625 NEC-P19 **Final Action: Reject**
(551.73)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-95
Recommendation: Accept proposal for (A).
Substantiation: Where the site has a 50-ampere 250-volt receptacle supplied by one feeder and a 20-ampere 125 volt receptacle supplied by a different feeder, present wording requires only the highest rated receptacle to be used for load calculation. The feeder for the 20-ampere receptacle has no required load calculation. Omission of the lowest rated receptacle is only reasonable if supplied by the same feeder. Limiting the calculated load to only the highest rated receptacle should be permitted, not required; a higher calculation should not be a violation. Table 551.73 demand factors appear to be developed specifically for vehicle sites, not for club houses, recreational buildings, swimming pools, tennis courts, etc. which would be covered by the proposed exception. There is no prohibition of 220.61 for such other loads.
Panel Meeting Action: Reject
Panel Statement: The additional language "supplied by the same feeder" is unnecessary since each feeder is calculated on the basis of what it supplies per site as required by the first sentence of 551.73(A). The "permitted to be" language is also unnecessary, as 551.73(C) FPN and 551.73(D) FPN clearly indicate that the minimum values as calculated by 551.73(A) may be inadequate, so conductor size may need to be increased.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Miller, T.

19-38 Log #527 NEC-P19 **Final Action: Reject**
(551.75)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-98
Recommendation: Accept the proposal as revised:
All exposed noncurrent-carrying metal parts of electrical equipment and installation shall be grounded as required by 250.110.
Substantiation: Proposal correlates with 250.110 which specifies "exposed" and "noncurrent-carrying" metal and provides exceptions. It may be perceived that this section modifies 250.110. 551.76 has wording similar to the proposal.
Panel Meeting Action: Reject
Panel Statement: The additional language is unnecessary and does not add clarity. The panel disagrees with the statement, "it may be perceived that this section modifies 250.110," since 551.75 clearly states that the grounding requirements in Article 250 apply.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Miller, T.

19-39 Log #229 NEC-P19 **Final Action: Accept**
(551.76(D))

TCC Action: The Technical Correlating Committee directs that the panel action text be revised from "250.32(B)(1) Exception" to "250.32(B) Exception". This action will correlate with the action of Code-Making Panel 5 on Comment 5-58.
Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 19-102
Recommendation: It was the action of the Technical Correlating Committee that the proposal be reconsidered and the panel consider correlating with the Code-Making Panel 5 action on Proposal 5-119 relative to an exception for existing installations. This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
The panel accepts the comment and has revised the text per the Technical Correlating Committee direction.
Revise 551.76(D) as shown in the ROP Draft to read as follows:
"...for separately derived systems, and 250.32(B)(1) Exception for separate buildings."
Panel Statement: Under the direction of the Technical Correlating Committee, the panel has modified the text to correlate with the Panel 5 action on Proposal 5-119.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Miller, T.

19-40 Log #363 NEC-P19 **Final Action: Accept**
(551.80(B))

Submitter: Code-Making Panel 8,
Comment on Proposal No: 19-105
Recommendation: CMP-8 recommends that CMP-19 Accept this proposal in Principle with the following revised text:
"(B) Protection Against Physical Damage. Direct-buried conductors and cables entering or leaving a trench shall be protected by rigid metal conduit, intermediate metal conduit, electrical metallic tubing with supplementary corrosion protection, rigid, nonmetallic conduit, liquidtight flexible nonmetallic conduit, liquidtight flexible metal conduit, or other approved raceways or enclosures. Where subject to physical damage, the conductors or cables shall be protected by rigid metal conduit, intermediate metal conduit, or Schedule 80 ~~rigid nonmetallic~~ PVC conduit. All such protection shall extend at least 450 mm (18 in.) into the trench from finished grade."
Substantiation: CMP-8 recommends that CMP-19 Accept in Principle Proposal 19-105 with the following revised wording. The word "rigid" was also deleted in addition to "nonmetallic" to correlate with the action taken by CMP-8 on Proposal 8-53.
This comment has been balloted through CMP-8 with the following ballot results:
12 Eligible to Vote
12 Affirmative
Mr. R. Loyd voted affirmatively stating: "Proposal 19-105 was to Accept. I agree with Mr. Burns' recommendation to revise the panel action."

ARTICLE 552 PARK TRAILERS

19-41 Log #1276 NEC-P19 **Final Action: Reject**
(552.48(L))

Submitter: Neil F. LaBrake, Jr., Syracuse, NY
Comment on Proposal No: 19-107
Recommendation: Accept the original proposal from the NEC TCC Task Group on Grounding and Bonding.
Substantiation: The NEC TCC Task Group on Grounding and Bonding agreed that simplification of the definitions was in order and that prescriptive elements would be proposed for specific Article texts as made in Proposal 19-107. The Task Group requests Panel 19 clarify and reconsider the Panel Action on this

Proposal to be consistent with the TCC Grounding and Bonding Task Group's original initiatives.

This Comment was developed by a Task Group assigned by the NEC Technical Correlating Committee to address actions that were other than "accept" taken by Code-Making Panels on proposals from the TCC to resolve 2005 NEC Proposal 5-1 and Comment 5-1. Members of the Task Group on Grounding and Bonding for this Comment included: C. Douglas White; Michael Johnston; Jeffrey Boksiner; Daleep Mohla; Phil Simmons; Christopher Hutchings; James Carroll; Alan Rebeck; Richard Loyd; Paul Dobrowsky; and Neil F. LaBrake, Jr.

Panel Meeting Action: Reject

Panel Statement: The panel reaffirms its position as stated in the panel statement on Proposal 19-107.

This is identical to the language used in 406.5(B), and there is no need to be more prescriptive as to the method of grounding.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13

Ballot Not Returned: 1 Miller, T.

19-42 Log #2214 NEC-P19 **Final Action: Accept**
(552.60(B))

Submitter: Bruce A. Hopkins, RVIA

Comment on Proposal No: 19-112

Recommendation: Accept the original proposed language.

Substantiation: The proposed language is identical to the language approved by CMP-19 for recreational vehicles, 551.60(B) in the 1999 edition of the NEC (Reference 19-117, Log #660 - page 50 of the A98 ROP). The change in RVs was permitted on the basis that many of the low-voltage DC components must be removed from the system prior to testing to prevent component damage and would be the same scenario during park trailer production.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13

Ballot Not Returned: 1 Miller, T.

ARTICLE 553 FLOATING BUILDINGS

19-43 Log #230 NEC-P19 **Final Action: Accept**
(553.9)

Submitter: Technical Correlating Committee on National Electrical Code

Comment on Proposal No: 19-114

Recommendation: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal relative to its action on Proposal 19-115. This action will be considered by the Panel as a Public Comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

The panel accepts the direction of the Technical Correlating Committee and continues to accept Proposal 19-114.

Panel Statement: See panel action and statement on Comment 19-44.

Number Eligible to Vote: 8

Ballot Results: Affirmative: 8

19-44 Log #231 NEC-P19 **Final Action: Accept**
(553.9)

Submitter: Technical Correlating Committee on National Electrical Code

Comment on Proposal No: 19-115

Recommendation: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal relative to its action on Proposal 19-114. This action will be considered by the Panel as a Public Comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

The panel accepts the direction from the Technical Correlating Committee and subsequently rejects Proposal 19-115.

Panel Statement: Based on the action taken on Proposal 5-36 relative to the new definition of "Neutral Conductor", it is the intent of the panel to retain the word "neutral".

See the panel action and statement on Comment 19-43.

Number Eligible to Vote: 8

Ballot Results: Affirmative: 8

ARTICLE 555 MARINAS AND BOATYARDS

19-45 Log #232 NEC-P19 **Final Action: Accept**
(555.1)

Submitter: Technical Correlating Committee on National Electrical Code

Comment on Proposal No: 19-116

Recommendation: The Technical Correlating Committee directs the panel to reconsider the proposal at the public comment phase based on its technical merits. Although the Scope of NFPA 303 is limited to other than single family applications, there is no procedural reason why Code-Making Panel 19 cannot develop or apply electrical rules to single family applications if they desire to do so. This action will be considered by the panel as a public comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

The panel accepts the direction of the Technical Correlating Committee to reconsider this proposal, and the panel continues to reject Proposal 19-116.

Panel Statement: The panel encourages the submitter of Proposal 19-116 to submit a proposal during the 2011 Code cycle that is more comprehensive and includes rationale for including and excluding specific requirements in this section necessary to provide the level of safety the submitter envisions.

Number Eligible to Vote: 9

Ballot Results: Affirmative: 9

19-46 Log #385 NEC-P19 **Final Action: Accept in Principle in Part**
(555.9)

Submitter: P.K. Patel, Anchor Engineering Consultants, Inc.

Comment on Proposal No: 19-117

Recommendation: Revise as follows:

"555.9 Electrical Connections. electrical connections shall be located at least 305 mm (12 in.) above the deck of a floating pier.

Conductor splices, ~~within Type 6P junction boxes,~~ utilizing sealed wire connector systems listed for this application shall be permitted where located above the waterline, but below the electrical datum field for floating piers. All electrical connections shall be located at least 305 mm (12 in.) above the deck of a fixed pier, but not below the electrical datum plane."

Substantiation: (a) The use of sealed, waterproof wire-to-wire splices in wet locations is common practice and allowed under the NFPA 70, section 110.14(B).

(b) These type of splices are located above the waterline on a floating dock/pier and are common practice applications in both direct burial and open bottom junction box (NON Type 6P junction boxes) conditions.

(c) It appears to be redundant to allow the use of approved water proof splices and then require these splices to be contained within Type 6P junction boxes.

THEREFORE:

We would like to see the wording "within Type 6P junction boxes" deleted.

Panel Meeting Action: Accept in Principle in Part

Revise the wording in the submitter's recommendation to read as follows:

"555.9 Electrical Connections. Electrical connections shall be located at least 305 mm (12 in.) above the deck of a floating pier.

Conductor splices, <u>within approved junction boxes</u>, utilizing sealed wire connector systems <u>listed and identified for submersion</u> shall be permitted where located above the waterline, but below the electrical datum field for floating piers. All electrical connections shall be located at least 305 mm (12 in.) above the deck of a fixed pier, but not below the electrical datum plane."

Panel Statement: The panel deleted the words "Type 6P" because a Type 6P box may not be needed in every case. However, a junction box suitable for the location is still required for splicing.

In lieu of the 6P box, the panel added the requirement for sealed wire connector systems to be listed and identified for submersion. Not all listed sealed wire connector systems provide the same degree of protection from moisture ingress.

Number Eligible to Vote: 9

Ballot Results: Affirmative: 9

19-47 Log #429 NEC-P19 **Final Action: Reject**
(555.10(A) Exception (New))

Submitter: Dan Leaf, Seneca, SC

Comment on Proposal No: 19-118

Recommendation: Accept the proposed exception.

Substantiation: Conduit bodies do not generally have external lugs or ears for attachment screws. The last sentence infers that holes shall be drilled for attachment screws Conduit bodies are not always installed abutting a surface to which they can be attached by screws through the back. The panel statement

that these locations are more likely to be subject to damage is unsubstantiated opinion and should be judged by the AHJ. Conduit bodies under a pier or dock are somewhat protected and less likely exposed to physical damage.
Panel Meeting Action: Reject
Panel Statement: The submitter is correct in that conduit bodies under a pier or dock are somewhat protected and less likely to be exposed to physical damage. Likewise, conduit bodies installed above the deck level are more likely to be exposed to physical damage.

Since 555.10(A) deals with securing and supporting electrical equipment enclosures installed on piers above deck level, the original panel statement that these locations are more likely to be subject to damage is in agreement with the submitter's substantiation.

No technical substantiation has been provided to justify allowing conduit to support electrical equipment enclosures.
The exception for 314.23(E) should not be allowed for these installations.
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-48 Log #1402 NEC-P19 **Final Action: Accept**
(555.21)

Submitter: Leslie Sabin-Mercado, San Diego Gas & Electric Company
Comment on Proposal No: 19-127
Recommendation: Revise text of the 2005 NEC to read as follows:
_555.21 Motor Fuel Dispensing Stations — Hazardous (Classified) Locations.

(A) General. Electrical wiring and equipment located at or serving motor fuel dispensing ~~stations~~ locations shall comply with Article 514 in addition to the requirements of this article. All electrical wiring for power and lighting shall be installed on the side of the wharf, pier, or dock opposite from the liquid piping system.

FPN: For additional information, see NFPA 303-2000, *Fire Protection Standard for Marinas and Boatyards*, and NFPA 30A-2003, *Motor Fuel Dispensing Facilities and Repair Garages*.

(B) Classification of Class I, Division 1 and 2 Areas.

The following criteria shall be used for the purposes of applying Tables 514.3(B)(1) and 514.3(B)(2) to motor fuel dispensing equipment on floating or fixed piers, wharfs or docks.

(1) Closed Construction. Where the construction of floating docks, piers, or wharfs is closed so that there is no space between the bottom of the dock, pier, or wharf and the water, such as concrete enclosed expanded foam or similar construction, and having integral service boxes with supply chases:

(a) The space above the surface of the floating dock, pier, or wharf shall be a Class I, Division 2 location with distances as identified in Table 514.3(B)(1) Dispenser and Outdoor.

(b) The space below the surface of the floating dock, pier or wharf having areas or enclosures such as tubs, voids, pits, vaults, boxes, depressions, fuel piping chases, or similar spaces where flammable liquid or vapor can accumulate shall be a Class I, Division 1 location.

Exception No. 1: Dock, pier, or wharf sections that do not support fuel dispensers and abut but are 6.0m (20 feet) or more from dock sections that support fuel dispenser(s) shall be permitted to be Class I, Division 2 where documented air space is provided between dock sections to permit flammable liquids or vapors to dissipate and not travel to these dock sections. Such documentation shall comply with 500.4(A).

Exception No. 2: Dock, pier, or wharf sections that do not support fuel dispensers and do not directly abut sections that support fuel dispensers shall be permitted to be unclassified where documented air space is provided and where flammable liquids or vapors can not travel to these dock sections. Such documentation shall comply with 500.4(A).

FPN: See 500.4(A) for documentation requirements.

(2) Open Construction. Where the construction of piers, wharfs, or docks is open, such as decks built on stringers supported by pilings, floats, pontoons or similar construction:

(a) The area 450 mm (18 in) above the surface of the dock, pier or wharf and extending 6.0 m (20 ft) horizontally in all directions from the outside edge of the dispenser and down to the water level shall be Class 1 Division 2.

(b) Enclosures such as tubs, voids, pits, vaults, boxes, depressions, piping chases, or similar spaces where flammable liquids or vapors can accumulate within 6.0 m (20 ft) of the dispenser shall be a Class I, Division 1 location.

Substantiation: Panel 19 accepted Proposal 19-127 unanimously but determined that a task group to address the technical merits of this proposal was in order. A Task Group comprised of members from CMP-19, CMP-19, CMP-14, NFPA 30A, NFPA 303, and the submitter of Proposal 19-127, met to discuss and coordinate the requirements of the proposal with those in Article 514, NFPA 30A and NFPA 303. Refer to Task Group Member list attached.

The Task Group has added no new requirements to this proposal. The terms have been altered to align with NFPA 30A-2003, *Motor Fuel Dispensing Facilities and Repair Garages*, and NFPA 303-2000, *Fire Protection Standard for Marinas and Boatyards*, such as "docks, piers and wharfs". The addition of these terms is not intended to expand the application of the requirements of the proposal but to be inclusive of various terms used to describe the same structure. Another phrase, "tubs, voids, pits, vaults, boxes, depressions, piping chases, or similar spaces where flammable liquids or vapors can accumulate" is borrowed from NFPA 30A for consistency between NFPA Standards. Metric dimensions have been included to meet the requirements of the NEC Style Manual. User-friendly language has been added to help the user correctly apply the requirements of Table 514.3(B)(1) and Table 514.3(B)(2). The proposed exception was subdivided to clarify declassification methods for dock sections that abut and for those that do not, so that the requirements of this section parallel those in 514.3. Two exceptions are added to provide a reasonable boundary of Class I, Division 1 and 2 areas. It is intended that these exceptions, along with other modified text, do not provide a new concept that is not contained in the Proposal or Article 514.
Panel Meeting Action: Accept
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

20-1 Log #1559 NEC-P20 **Final Action: Reject**
(585 Title)

Submitter: Lawrence A. Bey, Cummins Power Generation
Comment on Proposal No: 20-1
Recommendation: Revise text to read as follows:
Change the title of Article 585 to Critical Operation Facilities.
Substantiation: This new article is located in Chapter Five, which is Special Occupancies. A power system is not an occupancy. The article covers more than just a critical operations power system.
Panel Meeting Action: Reject
Panel Statement: The panel rejects changing the title of the proposed article. See the panel action on Panel Comment CC-2000, which recommends relocating proposed Article 585, covering special conditions to the Chapter 7 of the NEC. The panel understands that location of articles in the NEC is the responsibility of the Technical Correlating Committee.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

20-1a Log #CC2000 NEC-P20 **Final Action: Accept**
(Article 585)

TCC Action: The Technical Correlating Committee directs that the Article be located as new Article 708.
Submitter: Code-Making Panel 20,
Comment on Proposal No: 20-1
Recommendation: Relocate Article 585, Critical Operations Power Systems to Chapter 7 between Articles 705 and 720.
Substantiation: CMP-20 recommends that the TCC move this article to Chapter 7 between Articles 705 and 720. The requirements of this Article are more appropriately located in Chapter 7 covering special conditions because the systems within this article may apply to multiple areas or facilities at a particular site and not just to a single building or occupancy. A critical operations power system is a special condition, not a special occupancy.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

20-1b Log #CC2001 NEC-P20 **Final Action: Accept**
(585.1)

Submitter: Code-Making Panel 20,
Comment on Proposal No: 20-1
Recommendation: Add a new Fine Print Note No. 6 to 585.1 to read:
For further information regarding physical security see NFPA 730-2006, *Guide for Premises Security*.
Reidentify FPN No.6 shown in the panel action on Proposal 20-1 as FPN No. 7.
Substantiation: The new fine print note provides direction to information regarding physical security. This guidance will aid in application of 585.5. The panel understands that scope statements are under the purview of the Technical Correlating Commmittee and the panel recommends to the Technical Correlating Committee that this fine print note be located in 585.1 for consistency with the approach taken in Proposal 20-1 of locating the informational references to other documents in this section.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

20-2 Log #2109 NEC-P20 **Final Action: Accept in Principle**
(585.1)

TCC Action: The Technical Correlating Committee advises that article scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the panel action.
Submitter: Richard E. Loyd, Sun Lakes, AZ
Comment on Proposal No: 20-1
Recommendation: Revise text to read as follows:
I. General.
585.1 Scope. The provisions of this article apply to the electrical installation, operation, monitoring, control, and maintenance of critical operations power systems, and to the HVAC, Fire Alarm, Security, Communications and Signaling supplying designated the DCOA or equipment ~~consisting of~~

~~circuits and equipment intended to supply, distribute and control electricity to~~ designated vital operations in the event of disruption to elements of the normal system. Critical operations power systems are those systems so classed by municipal, state, federal, or other codes, by any governmental agency having jurisdiction or by facility engineering documentation establishing the necessity for such a system.

Substantiation: The proposed Scope is unclear and does not include the items listed in 585.14. I found it difficult to define the bounds of the article as written. I would assume that the intent is to cover certain equipment such as pumps in flood areas etc., as well as the DCOA. Which may be a specially constructed concrete bunker of some type that is intended to withstand the expected disaster?

585.5 seems to be a performance requirement while 585.14 is prescriptive, but does not seem to assure compliance with the requirements in 585.5? It would seem that all of the wiring be required to meet 585.10(C)?

Consider identifying the performance requirements as such (see 250.4) and revise prescriptive requirements to meet them. I believe the proposed scope is concise and describes the proposed application of the article. Please consider.

Panel Meeting Action: Accept in Principle

The provisions of this article apply to the ~~electrical~~ installation, operation, monitoring, control, and maintenance of ~~critical operations power systems consisting of circuits and equipment~~ the portions of the premises wiring system intended to supply, distribute and control electricity to designated ~~vital~~ critical operations areas (DCOA) in the event of disruption to elements of the normal system.

Critical operations power systems are those systems so classed by municipal, state, federal, or other codes, by any governmental agency having jurisdiction, or by facility engineering documentation establishing the necessity for such a system. These systems include but are not limited to power systems, HVAC, fire alarm, security, communications and signaling for designated critical operations areas.

Panel Statement: The panel acknowledges that the proposed wording of 585.1 Scope was unclear and would cause some confusion among users of this Code. The panel's action clarifies that Article 585 applies to the electrical system supplying power to the critical operations facility and its related systems. The panel understands that article scopes are the responsibility of the Technical Correlating Committee and submits this change for TCC approval.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

20-3 Log #1193 NEC-P20 **Final Action: Reject**
(585.1.Scope)

Submitter: Neil F. LaBrake, Jr., National Grid / Rep. Edison Electric Insitute-Electric Light & Power Group

Comment on Proposal No: 20-1

Recommendation: Revise the Scope and Fine Print Notes of proposed Article 585 in Proposal 20-1 as follows:

585.1 Scope. The provisions of this article apply to the electrical installation, ~~operation, monitoring, control, and maintenance~~ of critical operations power systems consisting of circuits and equipment intended to supply, distribute and control electricity to designated vital operations in the event of disruption to elements of the normal system.

Critical operations power systems are those systems so classed by municipal, state, federal, or other codes, by ~~any governmental agency~~ the authority having jurisdiction or as an optional system where ~~by~~ facility engineering documentation establishes~~ing~~ the necessity for such a system.

FPN No. 1: Critical Operations Power Systems are generally installed in vital infrastructure facilities that, if destroyed or incapacitated, would disrupt national security, the economy, public health or safety; and where enhanced electrical infrastructure for continuity of operation has been deemed necessary. ~~by governmental authority.~~

FPN No. 2: For further information on disaster and emergency management see NFPA 1600-2004 edition, *Standard on Disaster/Emergency Management and Business Continuity Programs*.

Substantiation: 1) Material Outside the NEC Committee Scope: The scope of Article 585 as accepted by the Panel covers material that is outside the Committee Scope of the National Electrical Code because it contains provisions for "operation, monitoring, control, and maintenance of critical operations power systems."

The Committee Scope of the National Electrical Code is printed on Page 22 of the 2005 NEC. The NEC Committee Scope (included as a reference for discussion) is as follows:

Committee Scope: This Committee shall have primary responsibility for documents on minimizing the risk of electricity as a source of electric shock and as a potential ignition source of fires and explosions. It shall also be responsible for text to minimize the propagation of fire and explosions due to electrical installations.

The NEC Committee Scope applies to only the **installation** portion of the electrical system and *not* the operation, monitoring, control and maintenance of such systems. Broadening the NEC Committee Scope or the proposed Scope of Article 585 will have unwanted applications and will make these provisions unenforceable. Provisions for the operation, monitoring, control and maintenance of such systems should be placed in an Annex of the National Electrical Code.

2) Mandatory Requirements or Optional System: The wording of the second paragraph of the Article Scope seems to indicate that Critical Operations Power Systems (COPS) are classified by either a government agency having jurisdiction or by facility engineering documentation establishing the necessity for such a system. The text of the paragraph is included for discussion purposes below:

Critical operations power systems are those systems so classed by municipal, state, federal, or other codes, by any governmental agency having jurisdiction or by facility engineering documentation establishing the necessity for such a system.

The issue is the identification of which governmental agency will actually classify such systems. Also, can any engineer classify their electrical system or facility as a Critical Operations Power System?

Typically, the term "authority having jurisdiction" is widely accepted in the NFPA documentation and used in standards. In Edison Electric Institute's opinion, this term should be the chosen term as the one to classify such systems. The wording of this paragraph (paragraph 2 of the Scope) as currently written eliminates some authorities such as the non-governmental ones with statutory authority such as the investor-owned electric utility companies.

Also, any engineering documentation for a facility can classify the facility, or portion of such, as a critical operations power system. This action would further support the requirements of an optional system for those who choose to implement these requirements for their own use.

Article 585 is intended and written as a set of mandatory regulations. However in Edison Electric Institute's opinion, the document may be best served as information in a Recommended Practice or an optional system. For example, 585.4 Risk Assessment outlines a requirement for conducting a risk assessment for critical power operations power systems including identifying the hazards, their likelihood of occurrence and the vulnerability of the electrical system to those hazards. Hazards are to be identified as naturally occurring and human-caused events.

Once the hazards are known by completing the Risk Assessment, a mitigation strategy addressing the results of the risk assessment is to be developed. Much of the language that currently appears in Article 585 is not easily enforceable and is highly subjective for the engineer or individual conducting the Risk Assessment. Also, the section on mitigation strategy would be at best performance requirements of a standard.

Panel Meeting Action: Reject

Panel Statement: The panel disagrees with the submitter's comment that the National Electrical Code is precluded from including language requiring operation, control, monitoring, or maintenance of electrical systems. In numerous instances, including 700.1 and 701.2, currently in the Code scope statements include similar language. The panel acknowledges that this article addresses a wiring system that is absolutely vital to life safety and thus intends language to require a higher oversight than previously included within the Code.

The panel also disagrees with the submitter's comments concerning mandatory or optional. Article 585 is mandatory when a critical operations facility is designated by another party. This is a similar concept to Article 645 concerning information technology rooms where the regulations only apply under certain designated conditions. The example of the "investor-owned electric utility companies" is already addressed by 90.2(B)(5)c which excludes "Installations under the exclusive control of an electric utility where such installations … are on property owned or leased by the electric utility for the purpose of communications, metering, generation, control, transformation, transmission, or distribution of electric energy." During construction of those facilities, the utility can request that Article 585 be used, which would then fall under the "facility engineering documentation establishing the necessity for such occupancy."

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

20-4 Log #1560 NEC-P20 **Final Action: Reject**
(585.1 Scope)

Submitter: Lawrence A. Bey, Cummins Power Generation

Comment on Proposal No: 20-1

Recommendation: Revise text to read as follows:

The provisions of this article shall apply to the electrical installation, operation, monitoring, control, and maintenance of critical operations facilities that are intended to remain operational and/or occupied in the event of a disaster, both naturally occurring and manmade. The requirements of this article not only apply to single function buildings but are also intended to be individually applied to a critical operation facility within a multifunction building. Critical operations facilities are those facilities so classed by municipal, state, or federal agencies having jurisdiction and authority.

Substantiation: The article covers more than just a critical operations power systems, such as requirements found in 585.4, 585.14, and 585.64; and the scope needs to be broadened to cover those special occupancy requirements. This article should only address governmental mandated facilities and not optional systems based on a facilities engineer's documentation. Facility engineering documentation is not defined and minimum requirements for the documentation are not established. The proposed scope statement was modeled on Article 517 for a facility instead of Article 700 for a power system.

Panel Meeting Action: Reject
Panel Statement: See the panel actions on Comment 20-1a and Comment 20-2.

(585.4)

Submitter: Lawrence A. Bey, Cummins Power Generation
Comment on Proposal No: 20-1
Recommendation: Delete this section.
Substantiation: Risk assessment is outside the scope of the NEC. Risk assessment is addressed by 585.1 FPN No. 2 which calls out NFPA 1600 as a referenced document.
Panel Meeting Action: Reject
Panel Statement: The panel disagrees that risk assessment is outside the scope of this Code. There are numerous instances where outside information necessary to enforce code provisions is required, including testing of ground-fault protection of equipment in 230.95 and performance of ground rods in 250.56. Due to the high degree of reliability that the wiring system for a critical operations area is required to meet, an assessment of potential hazards is vital to ensure proper minimum requirements for a safe and reliable installation. Article 585 does not designate which facilities are classified as critical to operations, nor does it designate what types of hazards the electrical system must withstand that is the purpose of the risk assessment.
Number Eligible to Vote: 16

Submitter: Lawrence A. Bey, Cummins Power Generation
Comment on Proposal No: 20-1
Recommendation: Delete 585.5 and 585.5(1).
Substantiation: The requirement for a strategy for physical security is a vague and unenforceable requirement of an electrical installation.
Panel Meeting Action: Reject
Panel Statement: The panel disagrees that physical security is unenforceable. A risk assessment identifies potential physical hazards that are mitigated during installation of the wiring system. This concept is no different from protecting against physical damage or severe physical damage as required elsewhere in the Code. In fact, requiring a risk assessment provide a more definitive indication of physical risk than is provided elsewhere in the Code. See the panel action on Comment 20-1b for a reference to information on premises security considerations.

(585.10(B))

Submitter: Richard E. Loyd, Sun Lakes, AZ
Comment on Proposal No: 20-1
Recommendation: Revise text to read as follows:
585.10(B) Wiring. Wiring of two or more COPS circuits supplied from the same source shall be permitted in the same raceway, cable, box, or cabinet. Wiring outside of the DCOA from a COPS source or COPS source distribution overcurrent protection ~~to critical loads~~ shall be identified by a distinctive color or marking and be kept entirely independent of all other wiring and equipment.
~~Exception: Where the COPS feeder is installed in transfer equipment enclosures.~~
Substantiation: It is vitally important for all COPS components outside the DCOA to be easily distinguishable from the other electrical power, control and communications components.
Panel Meeting Action: Reject
Panel Statement: The panel rejects the recommendation to identify the COPS wiring methods that are installed outside the DCOA because of the the unique security risks that may be associated with such identification. Identifying such circuits in these areas could facilitate intentional tampering and vandalism. The exception needs to be retained because it is necessary to have the COPS wiring system in the transfer switch enclosure with the wiring from the normal source and alternate source.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

20-8 Log #2207 NEC-P20 **Final Action: Reject**
(585.10(C)(1)(1))

Submitter: William A. Wolfe, Steel Tube Institute of North America
Comment on Proposal No: 20-1
Recommendation: Revise the text as follows:
(1) Rigid Metal Conduit, Intermediate Metal Conduit, Electrical Metallic Tubing, Type MI cable or Schedule 80 rigid nonmetallic conduit.
Substantiation: Electrical Metallic Tubing (EMT) is the logical wiring method for many of the applications in these areas. COPS circuits will undoubtedly be routed through ceiling spaces and other locations where they will not be subject to severe physical damage. The text in 585.10 (C) (1) (1) appears to be modeled after the text in 517.30 (3) **Mechanical Protection of the Emergency System.** This text allows the use of "nonflexible metal raceways" which includes EMT. There is no allowance for the use of EMT anywhere in 585.10 (C) (1). This is a robust wiring method allowed for use where not subject to "severe physical damage". Some of the wiring methods allowed in 585.10 (C) (1) such as Schedule 40 rigid nonmetallic conduit and metallic cable assemblies are not allowed at all where subject to any type of physical damage.
Panel Meeting Action: Reject
Panel Statement: The panel intends that COPS feeder wiring be installed in raceways suitable for exposure to severe physical damage or otherwise protected from severe physical damage.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

20-8a Log #CC2003 NEC-P20 **Final Action: Accept**
(585.10(C)(1)(1) and 585.10(C)(1)(2))

Submitter: Code-Making Panel 20,
Comment on Proposal No: 20-1
Recommendation: Revise 585.10(C)(1)(1) by removing "Schedule 80 rigid nonmetallic conduit".
Revise 585.10(C)(1)(2) to read:
Where encased in not less than 50 mm (2 in.) of concrete any of the following wiring methods shall be permitted:
a. Schedule 40 or Schedule 80 Rigid Polyvinyl Chloride Conduit (Type PVC)
b. Reinforced Thermosetting Resin Conduit (Type RTRC)
c. Electrical Metallic Tubing (Type EMT)
d. Flexible nonmetallic or jacketed metallic raceways
e. Jacketed metallic cable assemblies listed for installation in concrete
Substantiation: The panel has removed Schedule 80 from 585.10(C)(1)(1) because it is necessary to use metal wiring methods for physical protection in order that the fire protection required by 585.10(C)(2) also can be provided. The panel has added RTRC nonmetallic conduit to 585.10(C)(1)(2) based on the Panel 8 action to separate that type of nonmetallic raceway into a separate article. The panel has also added electrical metallic tubing to 585.10(C)(1)(2) because with 2 inches of concrete encasement the raceway is provides the intended physical and fire protection for the contained conductors. The panel action to permit nonmetallic raceways only where they are installed within concrete encasement provides the enhanced level of physical protection that is necessary for feeder circuits supplying mission critical loads.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

20-9 Log #2208 NEC-P20 **Final Action: Accept**
(585.10(C)(3))

Submitter: William A. Wolfe, Steel Tube Institute of North America
Comment on Proposal No: 20-1
Recommendation: Revise text as follows:
(3) **Floodplain Protection.** Where COPS feeders are installed below the level of the 100-year floodplain, the circuit conductors shall be listed for use in a wet location and be installed in a wiring method that is permitted for use in wet locations.
Substantiation: (3) **Floodplain Protection.** Where COPS feeders are installed below the level of the 100-year floodplain, the circuit conductors shall be listed for use in a wet location and be installed in a wiring method that is permitted for use in wet locations.

Substantiation: Article 585 requires certain wiring methods for COPS feeders which the NEC allows for use in wet locations but that do not have a "wet location" marking on the listing label. For example, Article 344 allows rigid metal conduit to be used *"under all atmospheric conditions and occupancies."* Section 344.10(B) also states that rigid metal conduit *shall be permitted to be installed in concrete, in direct contact with the earth."* Rigid metal conduit is listed to UL 6 which references that the product be installed in accordance with the NEC but does not require the product to be marked for use in wet locations. Schedule 80 rigid nonmetallic conduit is listed to UL 651. This standard references the NEC, which allows Schedule 80 rigid nonmetallic conduit to be used in wet locations. UL 651 does not require a "wet location" marking on the listing label, however. This change in text will maintain the requirement in 585.10(C) (3) but will not confuse the user who may think the product has to be marked as listed for use in wet locations.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

20-9a Log #CC2004 NEC-P20 **Final Action: Accept (585.10(D))**

Submitter: Code-Making Panel 20,
Comment on Proposal No: 20-1
Recommendation: Revise 585.10(D) to read:
(D) COPS Branch Circuit Wiring.
(1) Outside of the DCOA. COPS branch circuits installed outside the DCOA shall comply with the physical and fire protection requirements of 585.10(C)(1) through (3).
(2) Within the DCOA. Any of the wiring methods recognized in Chapter 3 of this *Code* shall be permitted within the DCOA.
Substantiation: This comment provides additional clarity with respect to the wiring methods permitted for branch circuits that are installed within the DCOA. The construction of the DCOA will provide a higher degree of physical and fire protection for the wiring methods than is afforded to the wiring located outside of the DCOA.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

20-10 Log #2209 NEC-P20 **Final Action: Reject (585.10(D))**

Submitter: William A. Wolfe, Steel Tube Institute of North America
Comment on Proposal No: 20-1
Recommendation: Reconsider the requirements in this section for branch circuit wiring.
Substantiation: We are not sure of the intent of the Panel regarding branch circuit wiring. The existing text states that COPS branch circuits installed outside the DCOA must comply with the same requirements as the COPS feeder circuits. If the DCOA is a specific area within a very large building, do all feeder and branch circuits within the entire building have to comply with the requirements of 585.10 (C)(1) and (2)? If so, this seems to mandate, for example, that there be no exposed conduit within the entire building or that no electrical metallic tubing is allowed to be used for branch circuit wiring. We are also not sure why there are no special requirements for wiring within the DCOA. It seems as if this area could be subjected to the same stresses that the panel is concerned about in areas feeding the DCOA or outside of the DCOA.
Panel Meeting Action: Reject
Panel Statement: The panel has rejected this comment in accordance with 4.4.5(c) of the Regulations Governing Committee Projects because the recommendation does not include or refer to specific Code text to be added, revised, or deleted. See the panel action on Comment 20-9a.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

20-11 Log #2210 NEC-P20 **Final Action: Accept in Principle in Part (585.14, 585.14(1), 585.14(7), and 585.14(8))**

Submitter: William A. Wolfe, Steel Tube Institute of North America
Comment on Proposal No: 20-1
Recommendation: Revise the text as follows:
585.14 Wiring of HVAC, Fire Alarm, Security, Emergency Communications, and Signaling Systems. The wiring of heating, ventilation, and air-conditioning remote control and signaling circuits; fire alarm circuits; circuits for security; circuits for emergency communications; and signal systems shall be installed in any of the metal ~~conduits~~ raceways listed in 585.10(C)(1)(1).and in addition shall comply with (1) through (8) as applicable.
585.14 (1) Signal and communication wires shall use shielded twisted pairs. ~~be installed in any of the metal conduits installed in accordance with 585.10(C)~~
585.14(7) Riser communication cables shall be 2-hour fire resistive cables or a listed 2-hour electrical circuit protective system.
585.14(8) Control, monitoring, and power wiring to HVAC systems shall be 2-hour fire resistive cables or a listed 2-hour electrical circuit protective system.
Substantiation: The requirement for metal raceways should be relocated from (1) to the charging paragraph that contains the general requirements for this section. To ensure continuity of service, specially in COPS systems, these critical systems should be installed in noncombustible raceways which provide protection from physical damage, whether intentional or accidental. The word "conduit" was replaced with "raceway" in 585.14 in the event that our proposal to 585.10(C)(1)(1) to add Electrical Metallic Tubing is accepted. EMT is usually not included under the definition of "conduit" but EMT and the other conduits listed in 585.10(C)(1)(1) are all raceways.
Panel Meeting Action: Accept in Principle in Part
Revise 585.14 to read:
585.14 Wiring of HVAC, Fire Alarm, Security, Emergency Communications, and Signaling Systems. All conductors or cables shall be installed using any of the metal wiring methods permitted by 585.10(C)(1) and in addition shall comply with 585.14
(1) through 585.14 (8) as applicable.
(1) Signal and communication wires shall use shielded twisted pairs.
(2) Shields of signal and communication wires shall be continuous.
(3) Fiber optic cables shall be used for connections between two or more buildings on the property and under single management.
(4) Listed secondary protectors shall be provided at the terminals of the communication circuits.
(5) Conductors for all control circuits rated above 50 V shall be installed with wire rated not less than 600 V.
(6) Communications, fire alarm, and signaling circuits shall use relays with contact ratings that exceed circuit voltage and current ratings in the controlled circuit.
(7) Riser communication cables shall be 2-hour fire-resistive cable or a listed 2-hour electrical circuit protective system.
(8) Control, monitoring, and power wiring to HVAC systems shall be 2-hour fire-resistive cable or a listed 2-hour electrical circuit protective system.
Panel Statement: This action achieves the original panel objective of providing physical protection in addition to a 2-hour fire rating for these circuits. The panel rejected the recommendation to change the word "conduit" to "raceway" because it is the panel's intent to limit the wiring method to only those conduit types identified in 585.10(C) and did not accept the recommendation to add electrical metallic tubing to the permitted wiring methods. The panel has accepted the recommendation to change the term "rated" to "resistive".
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

20-12 Log #2348 NEC-P20 **Final Action: Accept in Principle (585.24(C))**

Submitter: Alan Manche, Square D Company
Comment on Proposal No: 20-1
Recommendation: Revise text to read:
(C) Automatic Transfer Switches. ~~Automatic transfer switches shall comply with (C)(1) and (C)(2).~~
~~(1) Automatic transfer switches shall be listed for emergency use.~~
~~(2)~~ Automatic transfer switches shall be electrically operated and mechanically held.
Substantiation: There has been no substantiation presented that equipment failure is an issue where appropriately rated and installed electrical equipment is used. The proposed text only requires a transfer switch to listed, which is only one of many solutions for transferring power to alternate sources. Multiple switchboards from multiple manufacturers are often employed in large facilities to control the power from multiple power sources. It is not reasonable to require such an installation to have equipment that is specifically listed for transfer or paralleling of sources.
The panel should reconsider the lack of substantiation for this requirement and consider the broader applications of products that control the electrical system. The panel must consider the restriction being placed on the user by requiring listing which inherently will exclude safe and possibly more reliable product solutions, without any substantiation that safety or reliability will be enhanced by requiring listing. The proposed wording should be revised as noted above to reflect the language currently found in Article 700.
Panel Meeting Action: Accept in Principle
Revise the first sentence of 585.24(C) to read:
(C) Automatic Transfer Switches. Where used with sources that are not inherently synchronized, automatic transfer switches shall comply with (C)(1) and (C)(2).

Panel Statement: The panel has revised this section to address the concerns expressed in the substantiation and has added a condition under which compliance with 585.24(C)(1) and (2) is required. The safety issues addressed by this section are inherent to sources that are not synchronized at the time of transfer.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

20-13 Log #1994 NEC-P20 **Final Action: Reject**
(585.54)

Submitter: Ed Larsen, Square D Company
Comment on Proposal No: 20-1
Recommendation: Delete proposed 585.54 that would require the selective coordination of ALL overcurrent devices.

~~585.54 Coordination. Critical operations power system(s) overcurrent devices shall be selectively coordinated with all supply side overcurrent protective devices.~~

Substantiation: The Panel agreed to include this new text for public comment and it is apparent from the proposals to NEC 700.27 and the comments from the voting members of CMP 20 that selectivity is not an independent technical solution as it impacts reliability, personnel safety from arc-flash hazard being increased, and the removal of isolation devices such as circuit breakers in the electrical system. By unnecessarily driving the size of overcurrent devices larger throughout the system, the size of conductors, raceways and electrical equipment are also unnecessarily increased with no added technical performance benefit. In fact, the performance reliability can be reduced and the arc-flash hazard increased from over-sizing overcurrent device that provide no further isolation.

NFPA 110 Emergency and Standby Power Systems does not require all devices to be selective. the proposed NEC 585.54 requires all devices to be selective as compared to the definition in Article 100 that provides the engineer the necessary latitude to choose the appropriate overcurrent devices and system configuration. Requiring all overcurrent devices to be selective is an over design of the system, which is recognized by the IEEE examples presented in the substantiation found in numerous proposals to delete or revise NEC 700.27 and 701.18. This results in an increase in the size of equipment, conductors and raceways, leading to unnecessary equipment cost and size increases, higher available short circuit currents and increased arc flash hazard for the installation.

I have assisted in the selective coordination of a number of facilities across the country and all of the following points have entered into the discussion at some point. The points discussed below are independent of applying fuses or circuit breakers; as a matter of fact, the overcurrent devices in the switchboard and the generator are based on the manufacturer dependent 2:1 fuse ratio. Consider the diagram I have provided and the challenges with selective coordination.

Proposal 585.54 must be deleted, leaving selectivity to the engineering community in order to ensure that the most reliable and safest system is installed. Many other technical performance issues are left to the engineering community such as:

1) Voltage drop, where you have an NEC compliant installation that is selectively coordinated and the lights dim and drop out computer systems.

2) Sizing motor overcurrent devices for selectivity, where the motors are unable to start but they are NEC compliant, permitting exhaust fans in the legally required standby system to be code compliant even if they are unable to start.

3) Ground-fault protection, where none is required on the emergency system source but may be found on the normal source. Hence a small ground fault can take down the normal source which is often more reliable than the alternate source. Once again a performance issue that is ignored in the NEC but the engineer addresses the issue in design.

These few examples illustrate reliability issues that are left to the engineer to address. Why is selectivity more important than these examples that are not addressed by the NEC for enhanced safety and reliability?

Industry is having to address the implications of selectivity that has been added in 700.27 due to the engineering community's demand to ensure appropriate design that are both safe and legally compliant. Here are a few of the amendments that are utilized in the industry to address some of these issues:

1) The State of Washington has amended the Selectivity requirement in the 2005 NEC.

2) The healthcare industry in the State of Florida recognizes the challenges of selective coordination and permits overcurrent devices to overlap where no additional isolation is gained in the system. The 2005 NEC fails to address this issue.

3) The inspection community in plan review has recognized this challenge as we have engaged in numerous conversations between engineers and inspectors that are working together to optimize selectivity per NFPA 110. They are recognizing that the 2005 NEC is more restrictive than necessary and are having to address designs through 90.4 by getting permission from the AHJ to permit appropriate latitude to comply with NFPA 110 even though they are not compliant with NEC 585.54. There is no safety or performance compromised and it is easy to recognize enhancements in performance and reliability with enhanced safety as a by-product of a reduction in the size of the overcurrent devices.

The panel should reconsider the action taken on this proposal and the numerous others looking for relief in this section to provide the safest and most reliable system to the facility they are designing. Delete NEC 585.54 and leave the performance issues to the engineer as is done with numerous other aspects of the electrical system.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The overriding theme of Articles 585 is to keep the power on for vital loads. Selective coordination is obviously essential for the continuity of service required in critical operations power systems. Selective coordination increases the reliability of the COPS system. The use of the term "all" in the requirement has to be taken in context with the definition of selective coordination in Article 100 that reads, "Localization of an overcurrent condition to restrict outages to the circuit or equipment affected, accomplished by the choice of overcurrent protective devices and their ratings or settings." The panel addressed the several issues that were common to the comments they received on selective coordination. These issues and the panel responses follow:

1. Increase in the size of equipment resulting in higher available short-circuit current and increased arc-flash and equipment damage.

Panel Response: Design can incorporate techniques such as zone-selective interlocking and arc-reduction maintenance switches to address the increased arc-flash energy resulting from the larger equipment used to achieve selective coordination.

2. Performance/reliability reduction.

Panel Response: Selective coordination increases reliability by localizing the effects of a fault on the system. Selective coordination does not decrease the reliability of the system where properly engineered.

3. Eliminating the expertise of the professional engineer.

Panel Response: The requirement for selective coordination increases the necessity to provide a design based on the individual system.

4.The interpretation of the term "selectivity of all overcurrent protective devices".

Panel Response: There is a need for all of the devices to be evaluated in order to ensure that selective coordination is provided by all overcurrent protective devices. However, selective coordination does not mean that two devices installed in series will not localize the fault due to overlapping time/current responses.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:

CARROLL, J.: The panel came to consensus during the discussion of Comment 20-13 that selective coordination is necessary to ensure a higher degree of reliability for a critical operations power system. The panel statement recognizes the requirement, as presently worded, falls short of establishing the requirement as intended. The panel discussion was clearly spent on understanding the requirement and addressing many of the concerns expressed by the numerous submitters where every device is not always selective. The panel action on Comment 20-16 should have been an accept in principle with a panel action to revise the wording that would provide the appropriate latitude necessary for the system engineer to make the correct engineering decision without a legal mandate that each device be selective. The panel should have at the minimum considered the new language that was reached in Panel 13 on this very topic. Inconsistency between this article and Article 700 will simply reinforce the rigid compliance for only this article. The panel statement in this comment is valuable for those reading and instructing on this topic but it contradicts the actual wording which is the requirement.

HICKMAN, P.: We are voting affirmative with the panel action to reject Comment 20-13. The major theme of Article 585 is "Continuity of Service". Keep the power on! Selective Coordination plays a major part in keeping the power on. For far too long engineers and overcurrent device manufacturers have relied on a "cookie cutter" approach to coordination. With a little more work on the consulting engineer's part, Critical Operations Power Systems can be designed and installed so that overcurrent conditions are isolated to only the affected circuit, so that other parts of the system are not needlessly shut down.

Panel 20 discussed the possibility of adding the two exceptions that Panel 13 added for emergency and legally required standby systems. Those exceptions were for two overcurrent devices of the same size in series, and for devices on the primary and secondary of a transformer. Panel 13 recognized that these exceptions do not really affect selective coordination because no additional parts of the electrical system are shut down. It doesn't matter if one or both of the devices open, the same amount of circuits are off line. Panel 20 felt that these exceptions were unnecessary, because selective coordination is not really affected, since no additional parts of the electrical system are shut down.

Panel 13 thought it best to specifically explain to the users that two devices of the same size in series and devices on the primary and secondary of a transformer do not have to selectively coordinate, and Panel 20 felt that these same devices did not affect the selective coordination of the system so they did not need to add the exceptions. Different approach. Same outcome. The important point is that both Panels recognized the need for selective coordination for these critical systems, where loss of power can lead to injury or death.

However, to improve clarity, usability and for consistency is may be appropriate for the TCC to place the same exceptions in Article 585 as accepted by CMP-13 for two overcurrent devices of the same size in series, and for devices on the primary and secondary of a transformer.

The argument that a selectively coordinated system creates other safety hazards is without merit. NFPA 70E requires an electrically safe work condition and recognizes energized work only where the task is infeasible or deenergization would create a greater hazard. Arc reduction maintenance switches and current limiting overcurrent protective devices can also be used in the system design to reduce arc flash energy for energized work when it is infeasible or a greater hazard to deenergize.

ZGONENA, T.: When implemented properly, selective coordination will normally enhance a power system's ability to maintain power to critical loads. Selective coordination is appropriate for specifically determined critical areas and loads. Selective coordination is desirable in order to localize overcurrent conditions, and to limit circuit interruption to the circuits in which the overcurrent is occurring. While selective coordination with all overcurrent protective devices under all overcurrent conditions will provide such localization, there are some conditions under which this coordination may not be desirable from a safety or reliability standpoint. Requiring selective coordination of all overcurrent protective devices under all possible overcurrent conditions will require a selective coordination study be conducted, but does not allow for relaxation of this requirement where such coordination is not necessary. Where a selective coordination study reveals that complete selective coordination introduces safety concerns which are greater than those encountered if the system is not entirely coordinated, a relaxation of the requirement may be appropriate, but the current wording will not allow such a relaxation under any condition. Additional guidance needs to be provided within the code to better define where and how selective coordination is to be implemented.

20-14 Log #2104 NEC-P20 **Final Action: Reject (585.54)**

Submitter: Philip M. Piqueira, General Electric Co.
Comment on Proposal No: 20-1
Recommendation: I disagree with the panel action. I recommend that the text in 585.54 of the panel action be deleted in its entirety.
Substantiation: GE strongly supports selective coordination as a valuable safety asset in the current range where overloads most often occur. However, GE does not support the mandate for Selective Coordination for ALL current ranges and ALL overcurrent devices because safety and reliability can both actually be diminished. This is due to increased hazardous arc flash energy with increased equipment damage and potential fire initiation, decreased reliability, and extended downtime before service restoration. Mandates for selective coordination for ALL current ranges and ALL overcurrent devices will not always provide the optimum safety solution or optimum reliability. Such a solution requires the expertise and judgment of a Professional Engineer who can balance the design, safety and operating requirements in order to determine the optimum design for each specific facility.

Selective coordination is a system design issue, not a Code issue.

The wording of this section states that ALL overcurrent devices selectively coordinate, but this is not what the definition in Article 100 implies. The definition deals with localization of an overcurrent and, in many cases, selective coordination for ALL overcurrent devices serves no useful localization purpose such as when: 1) Overcurrent devices are located on the primary and secondary sides of a low voltage transformer with no loads in between. 2) A feeder overcurrent device is connected in series with the main overcurrent device in a downstream panelboard with no loads in between. 3) An overcurrent device on a generator is in series with an overcurrent device in a switchboard with no loads in between. In these instances, requiring both devices to be selectively coordinated does not add to the reliability of the system, which is the stated objective of the CMP.

When overcurrent devices are located on the primary and secondary sides of a low voltage transformer, sized to meet the NEC transformer protection requirements, it is almost impossible to also meet the requirement for selective coordination of this section, regardless of the type of overcurrent protective device chosen.

In many instances it may not be possible to meet the requirements for generator protection provided by an overcurrent device located on or near the generator and provide selective coordination with downstream overcurrent devices. Further, the generator protection functions provided within the engine-generator controller by the manufacturer might not be able to selectively coordinate with downstream overcurrent devices.

The paralleling of generators is often done to enhance system reliability, which is the stated objective of the CMP, however, in order to meet the requirement for selective coordination each generator overcurrent device and controller must selectively coordinate with all downstream overcurrent devices. This may not be possible if the generators are of unequal size.

The upgrade or expansion of an existing building may require the replacement of existing upstream equipment so that it will selectively coordinate with the new downstream equipment it must feed. The State of Washington has recognized the significant economic burden this is placing on building owners and businesses and has issued an emergency order exempting existing buildings from meeting the selective coordination requirements of the 2005 NEC.

Systems are normally designed for selective coordination in the overload region of the overcurrent device time-current curves. If this were not so, they would not operate under normal conditions, so what is really being called for in this requirement is overload and short circuit selective coordination. In order to achieve total short circuit selective coordination, the size of upstream overcurrent protective devices may need to be increased and/or time delay trip characteristics increased, thereby possibly increasing the arc flash hazard. In other words, by forcing selective coordination for an event that most likely will never occur, namely a bolted fault, the hazards involved in performing tasks which most likely will occur, namely system maintenance, may be increased. This is another reason why system designers need the flexibility to optimize the design of a system, which the current requirement does not allow.

Further, we wish to point out the following:

1. The need for the flexibility to optimize the design of a system is recognized in IEEE Standard 242-2001 (The Buff Book). Section 15.1 states, "In applying protective devices, it is occasionally necessary to compromise between protection and selectivity. While experience may suggest one alternative over another, the preferred approach is to favor protection over selectivity. Which choice is made, however, is dependent on the equipment damage and the affect on the process."

2. The need for the flexibility to optimize the design of a system is also recognized in NFPA 110-2005, Standard for Emergency and Standby Power Systems. Section 6.5.1 states, "The overcurrent protective devices in the EPSS shall be coordinated to optimize selective tripping of the circuit overcurrent protective devices when a short circuit occurs. A further explanation of this statement is given in Annex A section A.6.5.1, "It is important that the various overcurrent devices be coordinated, as far as practicable, to isolate faulted circuits and to protect against cascading operation on short circuit faults. In many systems, however, full coordination is not practicable without using equipment that could be prohibitively costly or undesirable for other reasons."

3. This NEC text conflicts with Chapter 27 of the International Building Code that specifically requires compliance with NFPA 110 for emergency systems. This presents a conundrum for the system designer and the AHJ. Which code takes precedence, the IBC or the NEC?

In summary, GE strongly supports selective coordination as a valuable safety asset in the current range where overloads most often occur. However, GE does not support the mandate for Selective Coordination for ALL current ranges and ALL overcurrent devices because safety and reliability can both actually be diminished, thus the section should be deleted.

20-15 Log #2228 NEC-P20 **Final Action: Reject (585.54)**

Submitter: Kevin J. Lippert, Eaton/Cutler-Hammer
Comment on Proposal No: 20-1
Recommendation: Disagree with the panel action. Recommend that the text in 585.54 be deleted in its entirety.
Substantiation: Eaton strongly supports selective coordination as a valuable safety asset in the current range where overloads most often occur. However, there are circumstances where overcurrent devices (both fuses and circuit breakers) selected specifically to coordinate across ALL current ranges, will have the unwanted consequence of substantially increasing the hazardous arc flash energy with corresponding increased equipment damage and potential fire initiation. Mission critical systems must also weigh the importance of extended downtime before service restoration. This mandate eliminates the Professional Engineer's expertise and judgment from determining the optimum design for each specific facility. Optimum designs are a balance between safety and operating requirements.

Alternatively, CMP-20 could choose to make this a FPN, similar to the 2002 NEC FPN to 700.25, with advice that selective coordination MAY increase overall reliability of the system.

20-16 Log #2347 NEC-P20 **Final Action: Reject**
(585.54)

Submitter: Alan Manche, Square D Company
Comment on Proposal No: 20-1
Recommendation: Revise text to read:
~~585.54 Coordination. Critical operations power system(s) overcurrent devices shall be selectively coordinated with all supply side overcurrent protective devices.~~
585.54 Coordination. The overcurrent protective devices in the COPS shall be selected to optimize selective coordination.
Substantiation: I agree with Mr. Carroll's and Mr. Moniz's position that requiring all overcurrent devices to be selective is over restrictive and can actually establish a less reliable and reduce safety and performance of the overall electrical system.

Square D supports the deletion of NEC 585.54, however, if the panel is reluctant to address the safety, reliability and performance issues by deleting it, it would be prudent for the panel to revise the text to address many of the concerns addressed in Mr. Carroll's comment.

Utilizing similar language to that found in NFPA 110 would permit some latitude to address many of these issues found in his comment to enhance the reliability and performance of the system.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Comment 20-13.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:

CARROLL, J.: The panel came to consensus during the discussion of Comment 20-13 that selective coordination is necessary to ensure a higher degree of reliability for a critical operations power system. The reason for this negative vote is that the panel statement recognizes the requirement, as presently worded, falls short of establishing the requirement as intended. The panel discussion was clearly spent on understanding the requirement and addressing many of the concerns expressed by the numerous submitters where every device is not always selective. The panel action should have been an accept in principle with a panel action to revise the wording that would provide the appropriate latitude necessary for the system engineer to make the correct engineering decision without a legal mandate that each device be selective. The panel should have, at the minimum, considered the new language that was reached in Panel 13 on this very topic. Inconsistency between this article and Article 700 will simply reinforce the rigid compliance for only this article. The panel statement in Comment 20-13 is valuable for those reading and instructing on this topic, but it contradicts the actual wording which is the requirement.
Comment on Affirmative:

ZGONENA, T.: See My Affirmative with Comment on 20-13.

20-17 Log #2346 NEC-P20 **Final Action: Reject**
(585.56)

Submitter: Alan Manche, Square D Company
Comment on Proposal No: 20-1
Recommendation: Include the phase loss text in Mr. Carroll's affirmative comment and revise text to read:

585.56 Phase Loss. All ungrounded service or feeder conductors of the circuit shall be automatically opened during an overcurrent condition.
Substantiation: I agree with Mr. Carroll's comment that a loss of one phase on feeder or service conductors can place the entire system at risk. Based on the scope of this article it is prudent to have such a requirement for reliability in place. This is a reliability issue that is more elementary than appropriate selective coordination. The proposed revised text excludes branch circuits by recognizing that a phase loss in a branch circuit would only place connected utilization equipment at risk such as motor driven equipment including the HVAC system. The panel may revert to include all circuits if they so choose to ensure appropriate reliability, however the focus on the service and feeder is due to the loss of a transformer from overheating or overloading of conductors that can be masked in the system that would be detrimental to the entire electrical system and may make it impossible to bring the system back on line if such a system condition persisted for any substantial amount of time. Utilization equipment may be designed to be protected by a specific type or configuration of overcurrent protection which is not impacted by phase loss, hence the comment to revise the language proposed by Mr. Carroll.
Panel Meeting Action: Reject
Panel Statement: The comment correctly identifies continuity of power for vital loads as one of the primary goals of Article 585. However, opening all three poles of overcurrent protective devices actually decreases reliability and continuity of power for many vital loads. For example, since most faults are phase-to-ground faults, assume a phase-to-ground fault in an emergency feeder circuit that supplies power for egress lighting and other critical single-phase and phase-to-phase loads. If all three poles of the overcurrent device open because of this phase-to-ground fault, the entire emergency lighting circuit and many other vital loads are without power. This is a blackout condition caused by one phase-to-ground fault. It is much better for only one pole to open in such a situation, which would leave two thirds of these loads energized. Protection for individual branch-circuit three-phase motor loads has been addressed since the 1971 NEC(R) began requiring three overcurrent relays and there are other means that can be deployed. Solid state overloads and solid state drives as well as additional phase loss relays are optionally available for branch circuits where enhanced protection is warranted for specific critical motor circuits.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:

CARROLL, J.: I am casting an affirmative vote in support of the panel action as there was a lack of substantiation for the panel to consider the necessity of including such a requirement in this article. My greatest concern is the panel statement fails to consider the aspects of protecting critical sensitive electrical loads such as communication equipment and computers that will be necessary to ensure a critical operations facility remains operational during an emergency. This article has included a number of performance requirements that include selectivity and fire protection, it should also consider power quality issues (from single phasing in this case) that would damage the equipment necessary to support emergency needs.

As a manufacturer and partner in designing numerous mission-critical environments, single phasing is an extremely critical from a performance standpoint. Consider the response of the UPS to single phasing. Single-phasing of the rectifier input supply to a static UPS, for example, will typically cause the UPS to begin supplying power to the critical load from its stored-energy source (typically batteries). Single-phasing of the UPS output can cause the UPS to start attempting to balance the load, which can result in UPS overload. The preservation of the load then becomes dependent upon the over-all topology of the system and the loading of the system. For these reasons, protection from single phasing is almost exclusively found in the applications of these critical facilities.

The panel statement makes a couple of points that raise the question regarding the necessity of requiring such robustness and reliability. The panel statement goes further to inaccurately state that protection from single phasing will reduce the reliability of the system, which is refuted in the example above. There is merit to protecting the system from single phasing to ensure power quality that will not damage sensitive electronic loads along with others, however, there may need to be boundaries established around such a performance requirement to address certain aspects of the system power quality issues.

HICKMAN, P.: We are voting affirmative with the panel action to reject Comment 20-17. The NEC already requires single-phasing protection of three phase motors by demanding an overload relay in each of the three phases. We certainly would not want to knock off all the lighting in a three phase branch circuit when a short occurs in a ballast in one lighting fixture. Protection for other specific types of loads, such as for UPS systems, is an issue for product standards where manufacturers and users can provide the very best possible solutions.

It should be noted that single phasing conditions have many causes, including damaged motor starter contacts, burned-open overload relays, damaged switch or circuit breaker contacts, open fuses, open cables, and open windings in transformers. Whenever critical loads need to be protected from single phasing, they cannot simply be protected by requiring three pole operation of the overcurrent protective device. For example, a three pole molded case circuit breaker is not designed to open to protect against single phasing damage caused by an open winding in an upstream transformer.

The proposed text as written would literally guarantee that all power for lighting, communications and every other function critical to police stations, fire departments, emergency rescue departments, coast guard and others be removed completely on a single ground fault. The result would be a total loss of power. Inclusion of this suggested requirement would be reason to reject the entire Article.

Submitter: John P. Masarick, Independent Electrical Contractors Inc.
Comment on Proposal No: 3-110
Recommendation: The panel is encouraged to continue to Reject Proposal 3-110.
Substantiation: The reasons to continue to Reject the Proposal are as follows:
1. The trend by the CMPs over the last several code cycles has been to limit the use of FPNs.
2. There is also a correlation issue. There is a conflict between those panels that accepted the proposal and those that rejected the proposal.
3. These standards are also covered by a Fine Print Note in 110.12.
4. The FPN should not be accepted because numerous standards and installation manuals exist and to only mention one does not adequately inform the public about accepted industry practices. The NEC is not intended to be an instruction manual for untrained persons. If the FPNs are allowed to reference these standards, then they should list all applicable standards.
5. Since the referenced installation standards are intentionally general to cover different models of equipment, approval of the FPN may lead many to believe these standards can be used instead of listed or labeled manufacturer's instructions which would be in violation of 110.3(B).
6. If the CMP would like to include the reference, it should be placed in the Annex with the other references.
Panel Meeting Action: Accept

3-86 Log #2142 NEC-P03 **Final Action: Reject**
(590.2(C) (New))

Submitter: Ronald E. Maassen, Lemberg Electric Co., Inc.
Comment on Proposal No: 3-110
Recommendation: Add new text to read as follows:
590.xx Temporary electrical power and lighting installed in a neat and workmanlike manner.
FPN: Accepted industry practices are described in ANSI/NECA 200-2002, Recommended Practice for Installing and Maintaining Temporary Electrical Power at Construction Sites, and other ANSI-approved installation standards.
Substantiation: The panel action to reject Recommended Practices for Installing and Maintaining Temporary Electrical Power at Construction Sites, and referring to 110.12 FPN, did not take into consideration the specifics of the document. The NECA 200-2002 is specific to temporary wiring and gives the contractor and AHJ a document to better understand the installation of temporary wiring on construction sites and holiday lighting. I believe this document should be included as a fine print note to Article 590.
Panel Meeting Action: Reject
Panel Statement: The panel reiterates that Section 110.12 already provides requirements for electrical equipment to be installed in a neat and workmanlike manner with an accompanying fine print note for accepted industry practices. Inserting this same requirement in Article 590 is not necessary since Chapters 1 through 4 are general requirements and anyone installing temporary wiring in accordance with Article 590 must adhere to 110.12.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
MAASSEN, R.: The panel should have accepted the this comment. Many temporary installations are slip shod, at best, and have and can created hazards. Giving guidelines to the authority having jurisdiction and to the electrician, can only help in making these installations safer. Other Code-Making Panels have accepted many of the NECA/ANSI Fine Print Note proposals.

3-87 Log #1203 NEC-P03 **Final Action: Accept**
(590.4(D) and 590.6 (B)(2)(a))

Submitter: Neil F. LaBrake, Jr., Syracuse, NY
Comment on Proposal No: 3-5
Recommendation: 1) The NEC TCC Grounding and Bonding Task Group agrees with the CMP-3 editorial revisions to Section 590.4(D).
2) The NEC TCC Grounding and Bonding Task Group recommends that CMP-3 reconsider accepting the existing proposed text for Section 590.6(B)(2)(a).
Substantiation: The NEC TCC Grounding and Bonding Task Group:
1) Understands the revisions to Section 590.4(D) have been made for clarity and continue to be consistent with the Grounding and Bonding Task Group's original initiatives.
2) Concludes that the proposed revision as worded for 590.6(B)(2)(a) provides good clarification and properly identifies the specific conductor referred to in this section. The specific grounding conductor referenced in this rule is the equipment grounding conductor which accomplishes the grounding and provides an effective ground-fault current path for operation of protective devices supplying the equipment. This prescriptive language can only make the provision required by OSHA 1926.404 more effective. The Task Group does not agree that this change would affect OSHA's acceptance of this prescriptive method of protection. The intent of this grounding is to facilitate operation of protective devices in the situation of a ground fault. The wording proposed by the Task Group is consistent with prescriptive requirements in 250.114, 250.138, 406.3(C), and 590.4(D) referenced in 590.6(B)(2).

This Comment was developed by a Task Group assigned by the NEC Technical Correlating Committee to address actions that were other than "accept" taken by Code-Making Panels on proposals from the TCC to resolve 2005 NEC Proposal 5-1 and Comment 5-1. Members of the Task Group on Grounding and Bonding for this Comment included: C. Douglas White; Michael Johnston; Jeffrey Boksiner; Daleep Mohla; Phil Simmons; Christopher Hutchings; James Carroll; Alan Rebeck; Richard Loyd; Paul Dobrowsky; and Neil F. LaBrake, Jr.

(590.6)

Submitter: Paul J. Casparro, Scranton Electricians JATC / Rep. International Brotherhood of Electrical Workers
Comment on Proposal No: 3-125
Recommendation: This Proposal should continue to be Accepted.
Substantiation: This proposal eliminates a possible misunderstanding of the current text of the NEC. The intent of the section is to make sure that all persons on a construction site are protected by a ground fault circuit interrupter regardless of the source of power. The addition of this text adds clarity to this section.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-89 Log #890 NEC-P03 **Final Action: Reject**
(590.6(B) Exception)

Submitter: Paul Schnackenberg, Gen/Tran Corp.
Comment on Proposal No: 3-129
Recommendation: Revise as follows:
Exception: 30A-125V and 125/250V receptacles on portable generators, when used for home standby systems with approved transfer switches, and temporary wiring, shall not be required to have GFCI protection for these specific receptacles.
Substantiation: Add to substantiation provided: In searching through catalogs, tool supply outlets and rental companies, no tools have been found using a 30A-125V plug. The only use of a 125/250V receptacle on a construction site is to power a "Spider Box" which already have GFCI protection. Combining all of the leakage in a spider box will cause nuisance tripping in genset GFCI.
Panel Meeting Action: Reject
Panel Statement: While the substantiation has provided additional text regarding the use of spider boxes and protection on construction sites, the text in the exception still deals with portable generators connected for use as home standby systems. The panel reiterates its statement from the proposal as follows: Section 590.6 only applies to temporary power to equipment used by personnel during construction, remodeling, maintenance, repair, or demolition of buildings, structures, equipment, or similar activities. This proposed text more appropriately belongs in Article 702 since the proposal is addressing portable generators used for optional standby power for a dwelling unit.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-90 Log #1148 NEC-P03 **Final Action: Reject**
(590.8 (New))

Submitter: Neil F. LaBrake, Jr., National Grid / Rep. Edison Electric Insitute-Electric Light & Power Group
Comment on Proposal No: 3-131
Recommendation: Accept Proposal 3-131.
Substantiation: Requirements of Article 702 apply to the installation of optional standby systems that are permanently installed in their entirety and not for temporary installations. The specific requirements for temporary installations in 590.2, 590.3, and 590.4 should cover the temporary connection of portable generators.
The proposed addition of 590.8 in Proposal 3-131, properly deals with the "temporary connection of portable generators", and has additional requirements that are not covered under the provisions of Article 702.
Panel Meeting Action: Reject
Panel Statement: The scope of Article 702 was changed to include portable alternate power supplies as follows:
"702.1 Scope. The provisions of this article apply to the installation and operation of optional standby systems. The systems covered by this article consist of those that are permanently installed in their entirety, including prime movers, and those that are arranged for a connection to a premises wiring system from a portable alternate power supply." Since this proposed text provides requirements for connection of portable generators to permanent premises wiring, the text more appropriately belongs in Article 702, not in Article 590.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

ARTICLE 600 ELECTRIC SIGNS AND OUTLINE LIGHTING

18-95a Log #CC1800 NEC-P18 **Final Action: Accept**
(600.7)

Submitter: Code-Making Panel 18,
Comment on Proposal No: 18-123
Recommendation: Revise the Panel Action in Proposal 18-123 to read:
600.7 Grounding and Bonding
(A) Grounding.
(1) Equipment Grounding. Signs and metal equipment of outline lighting systems shall be grounded by connection to the equipment grounding conductor of the supply branch circuit(s) or feeder using the types of equipment grounding conductors specified in 250.118.
Exception: portable cord-connected signs shall not be required to be connected to the equipment grounding conductor where protected by a system of double insulation or its equivalent. Double insulated equipment shall be distinctively marked.
(2) Size of Equipment Grounding Conductor. The equipment grounding conductor size shall be in accordance with 250.122 based on the rating of the overcurrent device protecting the branch circuit or feeder conductors supplying the sign or equipment.
(3) Connections. Equipment grounding conductor connections shall be made in accordance with 250.130 and in a method specified in 250.8.
(4) Supplementary Grounding Electrode. Supplementary grounding electrode(s) shall be permitted for electric signs and outline lighting systems covered by this article and shall meet the requirements of 250.54.
(5) Metal Building Parts. Metal parts of a building shall not be permitted as a secondary return conductor or an equipment grounding conductor.
(B) Bonding.
(1) Bonding of Metal Parts. Metal parts and equipment of signs and outline lighting systems shall be bonded together and to the equipment grounding conductor of the branch circuit or feeder supplying the sign or outline lighting system and shall meet the requirements of 250.90.
(2) Bonding Connections. Bonding connections shall be made in accordance with 250.8.
(3) Metal Building Parts. Metal parts of a building shall not be permitted to be used as a means for bonding metal parts and equipment of signs or outline lighting systems together or to the equipment grounding conductor of the supply circuit.
(4) Flexible Metal Conduit Length. Listed flexible metal conduit or listed liquidtight flexible metal conduit that encloses the secondary circuit conductor from a transformer or power supply for use with neon tubing shall be permitted as a bonding means if the total accumulative length of the conduit in the secondary circuit does not exceed 30 m (100 ft.).
(5) Small Metal Parts. Small metal parts not exceeding 50 mm (2 in.) in any dimension, not likely to be energized and spaced at least 19 mm (3/4 in.) from neon tubing shall not require bonding.
(6) Nonmetallic Conduit. Where listed nonmetallic conduit is used to enclose the secondary circuit conductor from a transformer or power supply and a bonding conductor is required, the bonding conductor shall be installed separate and remote from the nonmetallic conduit and be spaced at least 38 mm (1 1/2 in) from the conduit when the circuit is operated at 100 Hz or less or 45 mm (1 3/4 in.) when the circuit is operated at over 100 Hz.
(7) Bonding Conductors. Bonding conductors shall comply with (a) and (b).
(a) Bonding conductors shall be copper and not smaller than 14 AWG.
(b) Bonding conductors installed external of a sign or raceway shall be protected from physical damage.
(8) Signs in Fountains. Signs or outline lighting installed inside a fountain shall have all metal parts and bonded to the equipment grounding conductor of the branch circuit for the fountain recirculating system. The bonding connection shall be as near as practicable to the fountain and shall be permitted to be made to metal piping systems that are bonded in accordance with 680.53.
FPN: Refer to 600 32(J) for restrictions in length of high-voltage secondary conductors.
Substantiation: This revision to 600.7 addresses the recommendation or a portion of the recommendation in Comments 18-96, 18-97, 18-98,18-99,18-100, and 18-101. The panel concurs with the TCC Grounding and Bonding Task Group recommendation that the specific references to sections within Article 250 are necessary to ensure compliance. The panel added titles where necessary to comply with the NEC Style Manual and also modified 600.7(B)(1) and 600.7(B)(3) to clarify that all metal parts (other than as exempted in 600.7(B)(5)) of a sign or outline lighting are to be bonded to the equipment grounding conductor of the supply circuit. The panel clarified the protection of a bonding conductor installed external to a sign or outline lighting system.

Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 11 Negative: 2
Explanation of Negative:

KIEFFER, S.: CMP-18 has erred by including in this panel comment six cross-references to specific sections of Article 250.

Those cross-references do not change the application of any of the requirements of Article 250 to signs and outline lighting. The cross-references do not change the requirements for signs and outline lighting. They do not modify or amend Chapters 1 through 4. To conform with 90.3, Article 600 should only include statements that modify Chapters 1 through 4.

The only substantiation provided for these cross-references is to improve clarity. However, providing only six cross-references to specific sections of Article 250, while ignoring twenty-six other sections of Article 250 that frequently apply to signs and outline lighting, will not improve clarity. Instead the cross-references will increase the incidents of false interpretations of the code, creating confusion in the field, rather than code compliance. Individuals will erroneously conclude that the only requirements in Article 250 applicable to signs and outline lighting are the six cross-referenced sections. Erroneous interpretations of the code are always a problem. The panel should avoid creating additional potential for this to occur, particularly when the panel's action does not change the requirements of the code.

The code clearly states in 90.1 that is not a training manual for untrained persons. A common sense analysis readily concludes that the only individuals who might gain a little benefit from these cross-references are untrained persons: persons who are presently failing to comply with the requirements of the code. Trained persons are knowledgeable of the requirements in Article 250. A massive, nationwide training effort exists to reinforce this knowledge.

Panel Comment 18-95a should be modified, deleting all cross-references to Article 250, similar to what was recommended in Comment 18-98. The recommendation in 18-95a should be as follows:

600.7 Grounding and Bonding.

(A) Grounding.

(1) Equipment Grounding. Signs and metal equipment of outline lighting systems shall be grounded by connection to the equipment grounding conductor of the supply branch circuit(s) or feeder.

(2) Metal Building Parts. Metal parts of a building shall not be permitted as a secondary return conductor or an equipment grounding conductor.

(B) Bonding.

(1) Bonding of Metal Parts. Metal parts and equipment of signs and outline lighting systems shall be bonded together and to the equipment grounding conductor of the supply circuit.

(2) Metal Building Parts. Metal parts of a building shall not be permitted to be used as a means of bonding metal parts and equipment of signs and outline lighting together or to the equipment grounding conductor of the supply circuit.

(3) Flexible Metal Conduit. Listed flexible metal conduit or listed liquidtight flexible metal conduit that encloses the secondary circuit conductor from a transformer or power supply for use with neon tubing shall be permitted as a bonding means if the total accumulative length of the conductor in the secondary circuit does not exceed 30 m (100 ft).

(4) Small Metal Parts. Small metal parts not exceeding 50 mm (2 in.) in any dimension, not likely to be energized and spaced at least 19 mm (3/4 in.) from neon tubing shall not require bonding.

(5) Nonmetallic Conduit. Where listed nonmetallic conduit is used to enclose the secondary circuit conductor from a transformer or power supply and a bonding conductor is required, the bonding conductor shall be installed separate and remote from the nonmetallic conduit and be spaced at least 38 mm (1 1/2 in.) from the conduit when the circuit is operated at 100 Hz or less or 45 mm (1 3/4 in.) when the circuit is operated at over 100 Hz.

(6) Bonding Conductors. Bonding conductors shall comply with (a) and (b).

(a) Bonding conductors shall be copper and not smaller than 14 AWG.

(b) Bonding conductors installed external of a sign or raceway shall be protected from physical damage.

(8) Signs in Fountains. Signs or outline lighting installed inside a fountain shall have all metal parts and equipment grounding conductors bonded to the equipment grounding conductor for the fountain recirculating system. The bonding connection shall be as near as practicable to the fountain and shall be permitted to be made to metal piping systems that are bonded in accordance with 680.53.

FPN: Refer to 600.32(J) for restrictions on length of high-voltage secondary conductors.

TODD, S.: The panel action included references to Article 250 in Section 600.7 that do supplement or modify the general rules of Chapters 1-4 as stated in Section 90.3. The placement of the references in Section 600.7 could be construed by the casual user of the NEC to be the only requirements from Article 250 that apply to Article 600 which is not consistent with Section 90.3.

Comment on Affirmative:

WRIGHT, R.: I concur with the actions and the correction.

18-96 Log #386 NEC-P18 **Final Action: Accept in Principle (600.7)**

Submitter: Michael J. Johnston, Plano, TX
Comment on Proposal No: 18-123
Recommendation: Continue to accept Proposal 18-123 as revised by CMP-18 and include the following revisions to the proposal.

Add a title to 600.7(A)(1) as follows: 600.7(A)(1) Equipment Grounding.
Add a title to 600.7(B)(1) as follows: 600.7(B)(1) Bonding of Metal Parts.
Add a title to 600.7(B)(2) as follows: 600.7(B)(2) Bonding Connections.

600.7 Grounding and Bonding.

(A) Grounding

(1) Equipment Grounding. Signs and metal equipment of outline light systems shall be grounded by connection to the equipment grounding conductor of the supply branch circuit or feeder using any of the types of equipment grounding conductors specified in 250.118.

Exception: Portable cord-connected signs shall not be required to be connected to the equipment grounding conductor where protected by a system of double insulation or its equivalent. Double insulted equipment shall be distinctively marked.

(2) The equipment grounding conductor size shall be in accordance with 250.122 based on the rating of the overcurrent device protecting the branch circuit or feeder conductors supplying the sign or equipment.

(3) Connections. Equipment grounding conductor connections shall be made in accordance with 250.130 and in a method specified in 250.8.

(4) Supplementary Grounding Electrode. Supplementary grounding electrode(s) shall be permitted for electric signs and equipment covered by this article and shall meet the requirements of 250.54.

(5) Metal Building Parts. Metal parts of a building shall not be permitted as a secondary return conductor or an equipment grounding conductor.

(B) Bonding.

(1) Bonding of Metal Parts. Metal parts of electric signs and outline lighting systems shall be bonded together and to the associated transformer or power supply equipment grounding conductor of the supply branch circuit or feeder and shall meet the requirements of 250.90.

(2) Bonding Connections. Bonding connections shall be made in accordance with 250.8.

(3) Metal Building Parts. Metal parts of a building shall not be permitted to be used as a means for bonding metal parts of signs or outline lighting systems together or to the transformer of power supply equipment grounding conductor.

(4) Flexible Metal Conduit Length. Listed flexible meal conduit or listed liquidtight flexible metal conduit that encloses the secondary circuit conductor from a transformer or power supply for use with neon tubing shall be permitted as a bonding means if the total accumulative length of the conduit in the secondary circuit does not exceed 30 m (100 ft).

(5) Small Metal Parts. Small metal parts not exceeding 50 mm (2 in.) in any dimension, not likely to be energized and spaced at least 19 mm (3/4 in.) from neon tubing shall not require bonding.

(6) Nonmetallic Conduit. Where listed nonmetallic conduit is used to enclose the secondary circuit conductor from a transformer or power supply and a bonding conductor is required, the bonding conductor shall be installed separate and remote from the nonmetallic conduit and be spaced at least 38 mm (1 1/2 in.) from the conduit when the circuit is operated at 100 Hz or less or 45 mm (1 3/4 in.) when the circuit is operated at over 100 Hz.

(7) Bonding Conductors. Bonding conductors shall be copper and not smaller than 14 AWG. Bonding conductors installed external shall be protected where subject to physical damage.

(8) Signs in Fountains. Signs or outline lighting installed inside a fountain shall have all metal parts and bonded to the equipment grounding conductor of the branch circuit for the fountain recirculating system. The bonding connection shall be as near as practicable to the fountain and shall be permitted to be made to metal piping systems that are bonded in accordance with 680.53.

FPN: Refer to 600.32(J) for restrictions in length of high-voltage secondary conductors.

Substantiation: This comment is an effort to provide editorial revisions to the proposal by inserting titles to the list items in 600.7(A)(1), 600.7(B)(1) and 600.7(B)(2). The suggested revisions will help provide clarity and improve usability of this section as revised. This comment does not introduce new requirements and is intended as an editorial adjustment only.

Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Panel Comment 18-95a (Log #CC1800).
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-97 Log #1195 NEC-P18 **Final Action: Accept in Principle (600.7)**

Submitter: Stephen G. Kieffer, Kieffer & Co., Inc. / Rep. International Sign Association
Comment on Proposal No: 18-123
Recommendation: Revise the panel action to read as follows:

(A) Grounding.

(1) Signs and metal equipment of outline lighting systems shall be grounded in accordance with Article 250 Part VI and Part VII by connection to the equipment grounding conductor of the supply branch or feeder circuit(s) ~~or feeder using the types of equipment grounding conductors specified in 250.18.~~

Exception: Portable cord-connected signs shall not be required to be connected to the equipment grounding conductor where protected by a system of double insulation or its equivalent. Double insulated equipment shall be distinctively marked.

~~(2) The equipment grounding conductor size shall be in accordance with 250.122 based on the rating of the overcurrent device protecting the branch-circuit or feeder conductors supplying the sign or equipment.~~

(3) ~~Connections~~. Equipment grounding conductor connections shall be made in accordance with ~~250.130 and in a method specified in~~ 250.8.

(4) Supplementary Grounding Electrode. Supplementary grounding electrode(s) shall be permitted for electric signs and ~~equipment~~ outline lighting systems ~~covered by this article~~ and shall meet the requirements of 250.54.

(5) Metal Building Parts. Metal parts of a building shall not be permitted as a secondary return conductor or an equipment grounding conductor.

(B) Bonding.

(1) Metal parts and equipment of signs and outline lighting systems shall be bonded together and to the ~~associated transformer or power supply~~ equipment grounding conductor of the branch or feeder circuit(s) ~~or feeder~~ and shall meet the requirements of Article 250 Part V ~~250.90~~.

(2) Bonding connections shall be made in accordance with 250.8.

(3) Metal Building Parts. Metal parts of a building shall not be permitted to be used as a means for bonding metal parts and equipment of signs or outline lighting systems ~~together or to the transformer or power supply equipment grounding conductor.~~

(4) Flexible Metal Conduit Length. Listed flexible metal conduit or listed liquidtight flexible metal conduit that encloses the secondary circuit conductor from a transformer or power supply for use with neon tubing shall be permitted as a bonding means if the total accumulative length of the conduit in the secondary circuit does not exceed 30 m (100 ft).

(5) Small Metal Parts. Small metal parts not exceeding 50 mm (2 in.) in any dimension, not likely to be energized and spaced at least 19 mm (3/4 in.) from neon tubing shall not require bonding.

(6) Nonmetallic Conduit. Where listed nonmetallic conduit is used to enclose the secondary circuit conductor from a transformer or power supply and a bonding conductor is required, the bonding conductor shall be installed separate and remote from the nonmetallic conduit and be spaced at least 38 mm (1 1/2 in.) from the conduit when the circuit is operated at 100 Hz or less or 45 mm (1 3/4 in.) when the circuit is operated at over 100 Hz.

(7) Bonding Conductors.

(a) Bonding conductors shall be copper and not smaller than 14 AWG.

(b) Bonding conductors required by 600.7(B)(6) to be installed ~~external~~ separately from the conduit shall be protected from physical damage.

(8) Signs in Fountains. Signs or outline lighting installed inside a fountain shall have all metal parts and bonded to the equipment grounding conductor of the branch circuit for the fountain recirculating system. The bonding connection shall be as near as practicable to the fountain and shall be permitted to be made to metal piping systems that are bonded in accordance with 680.53.

FPN: Refer to 600.32(J) for restrictions in length of high-voltage secondary conductors.

Substantiation: Should the panel elect to continue with partial cross-references to specific portions of Article 250 (Note: see submitter's other comment on 18-123 which addresses the error of this action), then the cross-reference should be to complete parts of the article rather than select sections. Highlighting through cross-reference to a few select sections, while ignoring other applicable sections of a part of Article 250 increases the potential for errors and misunderstanding in the application of the code.

This comment also includes changes in (A)(1), (A)(4), (B)(1), (B)(3) and (B)(7) to better clarify the intent and improve usability.

Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Panel Comment 18-95a (Log #CC1800).
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-98 Log #1197 NEC-P18 **Final Action: Accept in Principle in Part (600.7)**

Submitter: Stephen G. Kieffer, Kieffer & Co., Inc. / Rep. International Sign Association
Comment on Proposal No: 18-123
Recommendation: Revise the panel action to read as follows:

(A) Grounding.

(1) Signs and metal equipment of outline lighting systems shall be grounded by connection to the equipment grounding conductor of the supply branch or feeder circuit(s) ~~or feeder using the types of equipment grounding conductors specified in 250.18.~~

~~Exception: portable cord-connected signs shall not be required to be connected to the equipment grounding conductor where protected by a system of double insulation or its equivalent. Double insulated equipment shall be distinctively marked.~~

~~(2) The equipment grounding conductor size shall be in accordance with 250.122 based on the rating of the overcurrent device protecting the branch-circuit or feeder conductors supplying the sign or equipment.~~

~~(3) Connections. Equipment grounding conductor connections shall be made in accordance with 250.130 and in a method specified in 250.8.~~

~~(4) Supplementary Grounding Electrode. Supplementary grounding electrode(s) shall be permitted for electric signs and equipment covered by this article and shall meet the requirements of 250.54.~~

(5) Metal Building Parts. Metal parts of a building shall not be permitted as a secondary return conductor or an equipment grounding conductor.

(B) Bonding.

(1) Metal parts and equipment of signs and outline lighting systems shall be bonded together and to the ~~associated transformer or power supply~~ equipment grounding conductor of the branch or feeder circuit(s) ~~or feeder and shall meet the requirements 250-90.~~

~~(2) Bonding connections shall be made in accordance with 250.8.~~

(3) Metal Building Parts. Metal parts of a building shall not be permitted to be used as a means for bonding metal parts and equipment of signs or outline lighting systems ~~together or to the transformer or power supply equipment grounding conductor.~~

(4) Flexible Metal Conduit Length. Listed flexible metal conduit or listed liquidtight flexible metal conduit that encloses the secondary circuit conductor from a transformer or power supply for use with neon tubing shall be permitted as a bonding means if the total accumulative length of the conduit in the secondary circuit does not exceed 30 m (100 ft).

(5) Small Metal Parts. Small metal parts not exceeding 50 mm (2 in.) in any dimension, not likely to be energized and spaced at least 19 mm (3/4 in.) from neon tubing shall not require bonding.

(6) Nonmetallic Conduit. Where listed nonmetallic conduit is used to enclose the secondary circuit conductor from a transformer or power supply and a bonding conductor is required, the bonding conductor shall be installed separate and remote from the nonmetallic conduit and be spaced at least 38 mm (1 1/2 in.) from the conduit when the circuit is operated at 100 Hz or less or 45 mm (1 3/4 in.) when the circuit is operated at over 100 Hz.

(7) Bonding Conductors

(a) Bonding conductors shall be copper and not smaller than 14 AWG.

(b) Bonding conductors required by 600.7(B)(6) to be installed ~~external~~ separately from the conduit shall be protected from physical damage.

(8) Signs in Fountains. Signs or outline lighting installed inside a fountain shall have all metal parts and be bonded to the equipment grounding conductor of the branch circuit for the fountain recirculating system. The bonding connection shall be as near as practicable to the fountain and shall be permitted to be made to metal piping systems that are bonded in accordance with 680.53.

FPN: Refer to 600.32(J) for restrictions in length of high-voltage secondary conductors.

Substantiation: The Panel's action is in direct conflict with the 2003 National Electrical Code Style Manual, 4.1 "do not use a reference if the requirement is already covered by 90.3". The proposed references to 250.18, 250.122, 250.130, 250.8, 250.54 and 250.90 do not supplement or modify the rules in Chapters 1 through 4. These references conflict with the arrangement of the code as specified in 90.3. and should not be included in Article 600.

Concurrently, by having selected only a few references to Article 250 the proposal ignores numerous other sections of Article 250 which are applicable to electric signs and outline lighting systems including: 250.4, 250.6, 250.10, 250.12, 250.52, 250.53, 250.62, 250.66, 250.68, 250.70, 250.90, 250.96, 250.98, 250.102, 250.110, 250.112, 250.114, 250.118, 250.119, 250.120, 250.132, 250.134, 250.136, 250.138, 250.144 and 250.148. Therefore, the proposal adds confusion and potential misunderstandings rather than clarity. By only including a few cross-references, non-of-which modify Article 250, the proposal could readily result in failures to read and comply with all applicable requirements of Article 250.

This comment also includes changes in (A)(1); (B)(1); (B)(3) and (B)(7) to better clarify the intent and improve usability.

Panel Meeting Action: Accept in Principle in Part
The panel rejects the deletion of the specific references to Artilce 250. The panel accepts the remainder of the recommendation in principle.
Panel Statement: The panel concurs with the TCC Grounding and Bonding Task Group that the specific references to the sections of Article 250 are necessary to ensure compliance. See the panel action and statement on Panel Comment 18-95a (Log #CC1800).

18-102 Log #220 NEC-P18 **Final Action: Accept (600.12)**

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 18-133
Recommendation: It was the action of the Technical Correlating Committee that this proposal be sent to Code-Making Panel 3 for comment regarding the use of Class 2 wiring methods without there being a Class 2 power supply. This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: See the panel action and statement on Comment 18-103.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-103 Log #292 NEC-P18 **Final Action: Accept (600.12)**

Submitter: Code-Making Panel 3,
Comment on Proposal No: 18-133
Recommendation: Change (C) in the recommendation to read as follows:

(C) Less than 50 Volts. Secondary circuit wiring less than 50 volts shall be installed in accordance with any of the following:

(1) Any wiring method included in Chapter 3 suitable for the conditions.

(2) Where the power source complies with the requirements in 725.41, wiring methods shall be permitted to be installed in accordance with 725.52(A) or (B).

Substantiation: Just limiting the power source to less than 50 volts does not cover the power sources that may exceed the current limitations outlined in Tables 11(A) and 11(B) in Chapter 9. For example, 725.21 permits Class 1 power limited circuits to be 30 volts and 1000 volt-amperes with a current rating of 33.33 amps. Where a power-limited Class 1 power source is other than a transformer, the maximum output or VAmax can be as high as 2500 volt-amperes with a current peak of 83.33 amps. Obviously, a Class 2 wiring method would not be acceptable for circuits with amperage and volt-ampere levels in these ranges.

This comment has been balloted through CMP-3 with the following ballot results:

13 Eligible to Vote
11 Affirmative
1 Negative
1 Not Returned (L. Sleights)

Mr. S. Egesdal voted negatively stating: "The apparent intention of the revision to 600.12 is to be able to use Class 2 and Class 3 wiring methods. It is important for the installation of Class 2 and Class 3 cable to comply with Part I and Part III of Article 725. The references in the text proposed by the Task Group only refer to selected sections in Part III of Article 725. Local authorities inspecting an installation could have concern for Class 2 and Class 3 cables not installed in compliance with Part I, such as 725.8 Mechanical Execution of Work and 725.10, Class 1, Class 2, and Class 3 Circuit Identification. Where other articles use Class 2 and Class 3 wiring methods, it is important that all the relevant requirements of Article 725 are met.

Suggestion: Change 600.12(C)(2) to: "Class 2 and Class 3 wiring methods shall be permitted where installed in compliance with Part I and Part II of Article 725."

Mr. M. Sanders voted affirmatively stating: "Change the second sentence of (C) to read as follows: "Secondary circuit wiring less than 50 volts shall be istalled in accordance with ~~any~~ one of the following:". There are only two methods permitted, so the choice is between one of them or the other. Because the choices stated are for two different conditions, the user should not be left with the impression that both can be used at the same location unless that is the intent, in which case it should be made more clear."

Panel Meeting Action: Accept
Panel Statement: Panel 18 confirms that it is their intent to use Class 2 power supplies and wiring methods that are installed in accordance with 725.41 and 725.52. Article 600 has never prohibited the use of the circuits and wiring methods covered within the scope of Article 725.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-104 Log #1198 NEC-P18 **Final Action: Accept**
(600.24)

Submitter: Stephen G. Kieffer, Kieffer & Co., Inc. / Rep. International Sign Association
Comment on Proposal No: 18-139
Recommendation: Revise the panel action on 600.24 as follows:
600.24 Class 2 Power Sources.
Signs and outline lighting systems supplied by Class 2 transformers, power supplies, and power sources shall comply with the applicable requirements of Article 600 and all of the following:
(A) Listing. Class 2 Power supplies and Power sources shall be listed for use with electric signs and outline lighting systems and shall comply with 725.41.
(B) Grounding. ~~Systems shall be grounded where required by 250.20(A).~~ Metal parts of signs and outline lighting systems shall be grounded and bonded in accordance with 600.7 ~~and 250.112(G).~~
(C) Secondary Wiring. Secondary wiring from Class 2 power sources shall comply with 600.12(C).
Substantiation: 250.20(A) enables ungrounded AC systems below 50 volts. This provision of Chapter 2 has been modified by 600.7 which requires grounding of all signs and outline lighting. Therefore, 250.20 should not be referenced as that reference results in an apparent conflict with 600.7 and the second sentence of 600.24(C).
The reference to 250.112 should be deleted as this is a circular reference because 250.112s sole function is to reference 600.7.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-105 Log #1196 NEC-P18 **Final Action: Accept**
(600.32(A)(1))

TCC Action: The Technical Correlating Committee directs that this section be revised to delete the term "rigid nonmetallic conduit" to be consistent with other actions taken in the NEC and to revise the text to comply with the NEC Style Manual.
The Technical Correlating Committee understands that the panel meeting action on Comment 18-105 supplements the panel actions on Proposals 18-146 and 18-148 to read as follows:
"(1) Installation. Conductors shall be installed in rigid metal conduit, intermediate metal conduit, PVC conduit, RTRC, liquidtight flexible nonmetallic conduit, flexible metal conduit, liquidtight flexible metal conduit, electrical metallic tubing, metal enclosures, on insulators in metal raceways, or in other equipment listed for use with neon secondary circuits over 1000 volts."
Submitter: Stephen G. Kieffer, Kieffer & Co., Inc. / Rep. International Sign Association
Comment on Proposal No: 18-148
Recommendation: Revise text to read:
600.32(A)(1): Conductors shall be installed on insulators, in rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, liquidtight flexible nonmetallic conduit, flexible metal conduit, liquidtight flexible metal conduit, electrical metallic tubing, metal enclosures, or other equipment listed for use with neon secondary circuits over 1000 volts and shall be installed in accordance with the requirements of Chapter 3.
Substantiation: The subject of 600.32 is neon secondary circuits. I believe the submitter's intent was to identify the specific purpose, for neon secondary circuits, as opposed to requiring a general high-voltage listing, which would be an extensive expansion of the requirements.
No substantiation was provided to support imposing the requirements for high-voltage general wiring on neon secondary circuits.
Panel Meeting Action: Accept

18-108 Log #1194 NEC-P18 **Final Action: Accept**
(600.32(G))

Submitter: Stephen G. Kieffer, Kieffer & Co., Inc. / Rep. International Sign Association
Comment on Proposal No: 18-153
Recommendation: Accept the proposal and revise 600.32(G) to read:
(G) Conductors in Raceways.
~~(1) Damp or Wet Locations. In damp or wet locations the insulation on all conductors shall extend not less than 100 m (4 in.) beyond the metal conduit or tubing.~~
~~(2) Dry Locations. In dry locations~~, the insulation on all conductors shall extend not less than 65 mm (2 1/2 in.) beyond the metal conduit or tubing.
Substantiation: Electrode enclosures required by 600.42 are listed under UL 879 Standard for Sign Components for damp and wet locations and include requirements that the GTO cable be enclosed.
The demonstration samples of GTO submitted at the panel meeting were not subject to failure testing while the GTO was inside of a required enclosure. They were not tested in an installation that complies with the code or with the applicable UL standards. The samples appearance of failure can only be produced by an open circuit, shorted to ground, power by a transformer or power supply that does not have the required secondary-circuit ground-fault protection.
UL is presently conducting a fact-finding investigation of GTO cable.
In analyzing this proposal and the opposition to the proposals it is important to keep in mind that a hazard would only exist as a result of multiple concurrent failures; a neon tube must break; the listed electrode enclosure required in 600.42 and the UL required GTO enclosure must both fail thus exposing the bare conductor at the splice to wet conditions and grounded metal; and the secondary-circuit ground-fault protection required in 600.23 must fail to perform and allow a continuous short to ground. It is only if all four of those fault conditions exist that GTO insulation performance might become an issue.
Additionally, the Panel's actions in Proposal 18-146; 18-154; and 18-158 collectively eliminate any instances where GTO can be installed in a wet location external from an electrical enclosure.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept
Panel Statement: The panel notes that the "t" in "the" should be capitalized at the beginning of the sentence.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 10 Negative: 3
Explanation of Negative:
OWENS, T.: I continue to oppose the removal of the 4 inch requirement for wet locations. A report of a study by UL was presented just prior to the panel meeting. I concede that the report did provide documentation about the reaction of GTO cable in a pristine environment that would seem to support the Sign Industry proposal and comment. However, questions were raised about the validity of the report to actual installations situations. Included within the report was a statement by the engineer that the absence of contamination was a detriment to causing arc-tracking. Every installation of outline lighting is subject to contamination of the surface of the GTO due to dust in the air, exterior environmental conditions, and poor maintenance of the installation also, the report did not take into account of the different electrical conditions created by the presence of capacitive coupling created where the GTO exists a conduit. These two omissions provide sufficient concern to retain the current requirements.
Another issue that was raised during this meeting was that the 4 inch requirement was being required under the UL standards for signs and components. This NEC section addresses only the installation of neon secondary-circuit conductors in field installed skeleton tubing or, by 600.12 field-installed wiring of section signs. Therefore, the NEC language does not apply to any wiring contained within a listed electric sign. The subject report should be submitted to the standards bodies for their action.

SMITH, M.: The submitter has not shown any safety benefit to reducing the amount of GTO cable from 4 in. to 2 1/2 in. The Fact Finding Study by UL shows no difference in the performance of the conductor, yet no data was presented as to why the original length of 4 in. was required. In talking with several installers, the 4 in. was thought to be required in ordered to make a drip loop. This loop would prevent moisture from seeping back into the raceway or tube.

WRIGHT, R.: I disagree with the panel's action to lower the fire safety of exposed GTO wire based on a fact-finding report provided by a Sign Association, which had no relationship to real application of field use of the wire in question. Those results even confirmed that 4 in. would fail under certain conditions. Why allow 2 1/2 in.? Remember, field-installed skeleton tubing is not required to be listed when installed in conformance with this code. The current article has stood the test of time and should not be changed to allow a few product flaws. Please vote your better judgment on this safety issue.

Comment on Affirmative:

KIEFFER, S.: 600.32(G) Conductors in Raceways has been applicable to three different situations: when GTO exists conduit or tubing into open air; when GTO exits conduit or tubing of a raceway (an enclosed metal or nonmetallic channel): and when GTO exits conduit or tubing inside of an enclosure.

The first application occurs when GTO exits conduit or tubing at the face of a build
ing wall, interior or exterior, and continues in open air following the wiring method "conductors on insulator" (600.32(A)) to the connection with the neon tube electrodes. That connection is most commonly made by a twisted wire connection as allowed by 600.42(B). That connection point must be in a listed enclosure (600.42(B)). this is the wiring method most referenced when someone complains about GTO failures. However, with almost 100 percent certainty I can declare that those referenced wet-location failures will be non-code-compliant installations. Why? Because the applicable UL Standard #879 requires that the listed wet location enclosures required by 600.42(B) include enclosure of the GTO and physical connection of that GTO enclosure to the conduit or tubing. Therefore in a code-compliant wet-location installation the GTO cannot be exposed to open-air and weather

CMP-18's action this cycle have further reinforced this requirement by:

1) Approving the sign industry's proposal to delete conductor on insulator as an approved wiring method for all locations.

2) Added 600.42 (A) Points of Transition. Where the high voltage secondary circuit conductors emerge from the wiring methods specified in 600.32(A), they shall be enclosed in a listed assembly. This reinforces the requirements in UL 879 and make the requirement applicable to all locations: wet, damp and dry.

Therefore, it can be concluded that installations involving exposed GTO are no longer allowed by the code or the applicable UL standard. Wet-location exposed GTO is no longer allowed by the code.

The second and third application of 600.32(G) occurs when GTO exits conduit or tubing in another raceway or in an enclosure. The most common occurrences of this condition involve conduit connected to a large metal raceway which contains other conductors, such as a splice enclosure, or conductors and equipment such as a transformer or power supply.

There is certainly some confusion caused by the definitions, an overlap between the code definitions of a raceway and an enclosure, verse the sign industry definition which lumps both into a single category, and UL standards for the sign industry which treat them in an identical manner. The code further compounds this confusion by stating that a fabricated metal raceway may contain equipment, thus essentially meeting the definition of an enclosure.

Regardless of the definition confusion, the practical application has been to apply the spacing requirements of 600.32(G) to the inside of metal raceways and enclosures at any point where conduit or tubing is connected to the enclosure or raceway. This requirement is considered to be applicable any time GTO exits conduit or tubing. Regardless of whether it is a raceway or enclosure, the requirements for "conductors in raceways" are applied. This application of the requirements of 600.32(G) will continue and is the basic concern being addressed by the sign industry's proposal, comment, and the UL fact-finding investigation.

The UL fact finding investigation was specifically designed to create a wet-location failure of the insulation in order to determine whether or not there was a performance difference in UL listed GTO when installed with the code required 2 1/2 in. dry location spacing versus the 4 in. wet location spacing. The fact-finding investigation determined that there is no performance difference. This answers the panel question regarding the proposal.

The fact-finding investigation was not a test of the reliability or suitability of GTO insulation that conforms to the requirements of the code. The test is not intended to question the validity of the UL standard or the code requirement for this wire.

It is important to recognize that the fault protection device, in this case secondary-circuit fault-protection, was bypassed.

The primary purposes of insulation are to protect conductors from physical damage, such as corrosion, and to maintain electrical separation," the separation of conductors by means of nonconductors so as to prevent the transfer of electricity" during normal operations. Conductor insulators are not intended to always maintain electrical separation and protect electric circuits during major fault conditions. Fault protection devices exist for this purpose. It is not intended that conductor insulation exist and be able to handle any fault condition. The main fault protector for general wiring circuits is the circuit breaker, not the conductor's insulation. The primary fault protection for a neon circuit is the secondary-circuit ground-fault protector (SCGF), not the GTO wire insulation. SCGF protectors are used in neon circuits because the transformers and power supplies in these circuits do not include an internally wired connection between the primary and secondary coils. Therefore, a secondary fault will not trip the primary circuit protector. The SCGF protectors in neon circuits must conform to a specific UL standard for those products. That standard is quite complex. The testing is extensive. The circuit requirements are such that a ground fault in a neon secondary circuit must trip the protector within a few cycles, a fraction of a second. A layman's description is that the UL standard requirements for transformers and power supplies preclude a secondary circuit fault being able to start a fire in tissue paper.

Yes the GTO failed. It was a failure test. The test sequence wasn't complete until UL found a failure condition. That does not mean there is anything wrong with this product. The failure was induced solely for purposes of measuring the difference in performance, if any, with a change in spacing. It is important to note that UL has stated they have not received field complaints regarding GTO listed under the current standard. Therefore, it appears reasonable to conclude that any reported failures of neon circuits must involve factors other than the insulation on GTO wire, or must be installations that are not code compliant.

This test should be considered to be no different than taking a general wiring product, such as THHN insulated wire, and spraying water on it until it shorts to ground while simultaneously bypassing the circuit breaker. That insulation would also fail the test. Such a failure would be much more dramatic than what was seen with GTO in a neon secondary circuit. Such a test would have no bearing on the code requirements for conductors. The vast majority of insulation used on conductors would fail such testing.

Further, it should be pointed out that CMP-18, in ROP 18-146, deleted approval of the conductor on insulator wiring method, and when combined with ROP 18-154 and 18-158 eliminates any instance where GTO can be wired exposed to a wet location. The conductor must always be enclosed.

The only application remained for 600.32(G) is when GTO exits conduit or tubing inside of another wireway. Article 600 enables other equipment in wireways. Therefore, the practical application of 600.32(G) is anytime GTO exits conduit and tubing in an enclosure or another raceway. This would never be a wet location. At times, the applicable UL standard will treat the inside of such enclosures as if they were damp location. The UL test for GTO wire already addresses damp location through the water immersion conditioning requirements that must occur before some of the testing.

The FFI does not support the need for extra spacing for damp and wet locations. Therefore, it is proper to approve the comments and allow a single spacing dimension to be applicable with the knowledge that the net results of all of the code changes the panel has approved is the elimination of any instances where GTO can be installed in a wet location; it must always be enclosed.

ARTICLE 604 MANUFACTURED WIRING SYSTEMS

19-49 Log #708 NEC-P19 **Final Action: Accept in Principle in Part (604.6 and 604.7 (New))**

TCC Action: The Technical Correlating Committee understands that Proposal 19-131 is being reported as "hold" in addition to the portion of the comment that was held by the panel. The only revision that will be made to the NEC from this comment is the addition of the following text:

"604.7 Installation. Manufactured wiring systems shall be secured and supported in accordance with the applicable cable or conduit article for the cable or conduit type employed."

Since the panel held the requirement for listing, the Technical Correlating Committee also understands that the addition of UL 183 to Annex A will be "held" as well.

Submitter: Dean Negrelli, Wiremold/Legrand

Comment on Proposal No: 19-131

Recommendation: The Panel should continue to accept in principle and revise the ROP draft text as follows:

604.6 Listing Requirements. Manufactured wiring systems shall be listed manufactured wiring systems or shall be constructed in accordance with 604.7.

FPN: One method of determining applicable requirements for listing of manufactured wiring systems is to refer to ANSI/UL 183-2004, Standard for Manufactured Wiring Systems.

604.67 Construction. Manufactured wiring systems that are not listed manufactured wiring systems shall be constructed in accordance with (A) through (E).

(A) Wiring Methods. ~~Manufactured wiring systems shall be listed as manufactured wiring systems assemblies or shall be constructed in accordance with (1), (2), or (3).~~

~~FPN: One method of determining applicable requirements for listing of manufactured wiring systems is to refer to ANSI/UL 182-2004, Standard for Manufactured Wiring Systems.~~

(1) Cables. Cable shall be one of the following:

(~~1~~a) Listed Type AC cable containing nominal 600-volt, 8 to 12 AWG insulated copper conductors with a bare or insulated copper equipment grounding conductor equivalent in size to the ungrounded conductor.

(~~2~~b) Listed Type MC cable containing nominal 600-volt, 8 to 12 AWG insulated copper conductors with a bare or insulated copper equipment grounding conductor equivalent in size to the ungrounded conductor.

(~~3~~c) Listed Type MC cable nominal 600 volts, 8 to 12 AWG insulated copper conductors with an aluminum grounding conductor and armor assembly identified as acceptable ground paths. The aluminum ground armor assembly shall have a current-carrying capacity equivalent to the ungrounded copper conductor.

The rest of this section in the ROP draft is to remain as is.

Substantiation: The title of 604.6(A) has been revised to "Wiring Methods" in the ROP draft, but this section deals with the listing of the entire manufactured wiring system as well as wiring methods.

This section should be changed to "Listing Requirements" and remaining sections reidentified. The final result of this comment is that the listing requirements for manufactured wiring systems are covered by 604.6 and the construction requirements for manufactured wiring systems that are not listed are covered by 604.7.

Panel Meeting Action: Accept in Principle in Part

1. The FPN was moved to Annex A. (See the panel action on Comment 19-50.)

2. Move existing 604.6(E) to become new 604.7 as follows:

"604.7 Installation. Manufactured wiring systems shall be secured and supported in accordance with the applicable cable or conduit article for the cable or conduit type employed."

3. The panel is holding "604.6, Listing Requirements" and "604.6~~7~~ Construction Manufactured wiring systems that are not listed manufactured wiring systems shall be constructed in accordance with (A) through (E)", based on the action taken on Comments 19-51, 19-52, and 19-53.

The remaining text is accepted in principle based on the actions taken on Comments 19-55 and 19-56.

Panel Statement: 1. The FPN was moved to Annex A by the action taken on Comment 19-50.

2. This action is a clarification that this is an installation requirement, rather than a type of construction, and does not belong under 604.6.

3. See the panel action and statement on Comments 19-55 and 19-56.

Number Eligible to Vote: 8

Ballot Results: Affirmative: 7 Negative: 1

Explanation of Negative:

LICHTENSTEIN, T.: The panel action should be to accept in principle and in part and make the changes noted in 1 and 2 below.

1. The FPN was moved to Annex A Comment 19-50.

2. The installation section should be moved from 604.6(E) to 604.8.

The remainder of the recommended text of Comment 19-49 should be accepted. Proposal 19-131 should not be held until the 2011 cycle. See my negative to Comment 19-51.

Holding over this proposal and applicable comments until the 2011 Code cycle is unnecessary and should not be permitted. The panel members have had 11 months to study the impact of this change to Article 604 and no new substantiation has been provided that would meet the criteria for a hold as detailed in the NFPA Rules and Regulations Governing Committee Projects as follows:

4.4.6.2.2 Hold. It shall hold for processing as a proposal for the next revision cycle a comment that:

(a) Would introduce a concept that has not had public review by being included in a related proposal as published in the Report on Proposals.

(b) Would change the text proposed by the TC to the point that the TC would have to restudy the text of the Report on Proposals or other affected parts of the document.

(c) Would propose something that could not be properly handled within the time frame for processing the report.

4.4.6.2.3 Basis for Hold. In determining whether to hold a comment pursuant to 4.4.6.2.2, the TC may consider any relevant factors including, but not limited to, the extent to which the comment proposes a change that is new and/or substantial, the complexity of the issues raised, and whether sufficient debate and public review has taken place.

Comment on Affirmative:

EWING, M.: For clarity: The Panel is holding the Submitter's comment language regarding "604.6, Listing Requirement" and "604.7 Construction.....

MCNEIVE, T.: It is appropriate to hold this comment until 2011 NEC Cycle. The submitter of proposal 19-131 has UL non-compliance with longstanding requirements in Section 604.6(A)(2) as the fundamental substantiation for suggesting expanded permission to list manufactured wiring systems constructed of "nonstandard" components presently required to be themselves listed according to Section 604.6 (A)(1), (2) and (3). Code-making Panel 16 has traditionally been cautious in expanding the application and construction for manufactured wiring systems. The ramifications of the proposed change is potentially far reaching and deserves more thoughtful consideration and perhaps inputs from code-making panels having jurisdiction over the conduits and wiring systems covered by Section 604.6 (A)(1), (2) and (3).

19-50 Log #233 NEC-P19 **Final Action: Accept**
(604.6(A))

TCC Action: The Technical Correlating Committee understands that the reference will not be added to Annex A since the requirement for listing was held through the action on Comment 19-49.

Submitter: Technical Correlating Committee on National Electrical Code

Comment on Proposal No: 19-131

Recommendation: It was the action of the Technical Correlating Committee that the panel reconsider the proposal and move the FPN reference to the product standard into Annex A. The NEC Style Manual requires that product standards references appear in Annex A. This action will be considered by the panel as a public comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

The panel accepts the recommendation of the Technical Correlating Committee to reconsider the proposal, and the panel moves the product standard reference in 604.6(A) to Annex A.

Panel Statement: This action is taken under the direction of the Technical Correlating Committee and to be consistent with the NEC Style Manual. The panel notes that this product standard reference already exists in Annex A.

Number Eligible to Vote: 8

Ballot Results: Affirmative: 8

19-51 Log #475 NEC-P19 **Final Action: Hold**
(604.6(A))

Submitter: Gregory J. Steinman, Thomas & Betts Corporation

Comment on Proposal No: 19-131

Recommendation: Change the panel action to Reject.

Substantiation: The comments accompanying Mr. Bernson's and Mr. McNeive's negative votes should be considered by the CMP and the CMP's action reconsidered.

Panel Meeting Action: Hold

The panel is holding Proposal 19-131.

Panel Statement: Proposal 19-131 seeks to amend 604.6(A) to include an option that listed manufactured wiring systems be permitted to be made from components that themselves are not listed as required presently in 604.6(A) (1), (2) and (3). The submitter's substantiation is based on past practice by Underwriter's Laboratories that, by the submitter's admission, is in conflict with the present requirement in 604.6(A)(2).

ANSI/UL 183-2004, Manufactured Wiring Systems, is cited in the proposal as "One method for determining applicable requirements for listing of manufactured wiring systems." The scope of this standard states: "The products covered under this standard are to be installed in accordance with Article 604 of the National Electrical Code, ANSI/NFPA 70." Yet, this standard contains provisions that allow manufactured wiring systems to be listed without conformance to 604.6(A)(2).

Code panel members are concerned about the precedent that it might set in accepting the proposal with this substantiation and some panel members are concerned about the ability of all nationally recognized testing laboratories to consistently apply the subjectivity of the scope requirements permitted to be considered in UL 183.

Holding further action on Proposal 19-131 and related comments until the 2011 Code cycle will enable further evaluation, by panel members, of the system for managing and applying the requirements in UL 183 and the impact of such a broad change.

Number Eligible to Vote: 8

Ballot Results: Affirmative: 7 Negative: 1

Explanation of Negative:

LICHTENSTEIN, T.: The panel action should be to reject Comment 19-51.

Holding over this proposal and applicable comments until the 2011 Code cycle is unnecessary and should not be permitted. The panel members have had 11 months to study the impact of this change to Article 604 and no new substantiation has been provided that would meet the criteria for a hold as detailed in the NFPA Rules and Regulations Governing Committee Projects as follows:

4.4.6.2.2 Hold. It shall hold for processing as a proposal for the next revision cycle a comment that:

(a) Would introduce a concept that has not had public review by being included in a related proposal as published in the Report on Proposals.

(b) Would change the text proposed by the TC to the point that the TC would have to restudy the text of the Report on Proposals or other affected parts of the document.

(c) Would propose something that could not be properly handled within the time frame for processing the report.

4.4.6.2.3 Basis for Hold. In determining whether to hold a comment pursuant to 4.4.6.2.2, the TC may consider any relevant factors including, but not limited to, the extent to which the comment proposes a change that is new and/or substantial, the complexity of the issues raised, and whether sufficient debate and public review has taken place.

Proposal 19-131 should be accepted per the ROP ballot. Proposal 19-131 seeks to require that Manufactured Wiring Systems be listed as a Manufactured Wiring System to UL 183, the Standard for Manufactured Wiring Systems or be constructed in accordance with the Listed cables and conduits detailed in 604.6(A). UL 183, the Standard for Manufactured wiring Systems has very specific requirements for investigating conduits for equivalency to a Listed conduit. The requirements detailed in Section 7.4 are specifically written so that misinterpretation of the requirements by other certification organizations is highly unlikely as was the concerns of some panel members. The requirements from UL 183 are below:

"7.4 Flexible metal conduit, liquid-tight flexible metal conduit, or liquid-tight flexible nonmetallic conduit shall comply with the Standard for Flexible Metal Conduit, UL 1, the Standard for Liquid-Tight Flexible Steel Conduit, UL 360, or the Standard for Liquid-Tight Flexible Nonmetallic Conduit, UL 1660.

Exception: Flexible metal conduit is not required to comply with all specified construction dimensions under the following conditions:

a) Trade sizes of 9/16-inch and 5/8-inch oval shaped and flexible metal conduit shall comply with the 1/2-in trade size performance requirements in UL 1, and trade size of 3/8-inch reduced wall flexible conduit shall be provided with internal and external diameters as specified in Table 7.1. All other construction and performance requirements shall be in accordance with UL 1.

b) All mating fittings and connector assemblies used with conduit specified in (a) shall be factory installed:

c) The flexible metal conduit in (a) shall be subjected to follow up evaluation on performance testing in accordance with UL 1 on the indicated trade sizes."

The only permitted deviation is the shape and maximum outer diameter of the conduit. This permits for different shape conduits and sizes to reduce the bending radius and increase the flexibility of the conduit for ease of installation of manufactured wiring systems in the field. The minimum inner diameter of the conduit is required to be the same as listed conduit so that the wire fill capabilities are not affected. The different shapes in trade sizes permitted only affect the capability of the conduit to be used with standardized listed conduit fittings. Because of that, these conduits are required by section 7.4 Exception (b) of UL 183 to have their conduit connectors factory installed, so that the fittings that are specifically listed for use on those conduits are factory assembled to the conduits and just have to be terminated to the standard trade size knock out in the field if applicable. Typically, these are terminated to proprietary modular connectors and do not require termination except for the power in feed to the system and comply with 604.6(C) and (D).

These conduits in question are UL component recognized conduits and have been a component part of Listed manufactured wiring systems for over 20 years with no adverse field history. They are evaluated to be the equivalent of Listed conduit as part of an overall Listed manufactured wiring assembly intended for installation in accordance with Article 604 of the NEC.

It is not the Panel's responsibility to judge the ability of a certification organization to apply a nationally recognized standard in their certification process or to write code around the abilities of different accredited laboratories. We have to assume that if an accredited nationally recognized testing laboratory has Listed a product as defined in Article 100, that they have followed the appropriate standard as is required by their accreditation. The panel's concern regarding all nationally recognized testing laboratories ability to consistently apply the requirements in a safety standard is not an adequate technical justification for rejecting or holding a proposal without impeaching all the Code's Listing requirements and the ability of an electrical inspector to base his approval of an installation on a products Listing as is permitted in 90.7. If a certification organization is not acceptable to the authority having jurisdiction, they can always reject the certified product in the field.

Comment on Affirmative:

EWING, M.: I don't see a problem with components being listed as part of an assembly rather than have the cost of listing the components and then listing them again as part of an assembly. The problem with the submitted language is that there is no code language proposed or present to address installation requirements for the assembly cables or raceway components when they are not addressed by Chapters 1-4 installation requirements. The proposed FPN is not an enforcement tool for installation requirements should someone create there own standard other than ANSI or UL 183 to test these assemblies to.

MCNEIVE, T.: See my Explanation of Affirmative Vote on Comment 19-49.

19-52 Log #647 NEC-P19 **Final Action: Hold**
(604.6(A))

Submitter: Linda J. Little, St. Louis, MO
Comment on Proposal No: 19-131
Recommendation: This proposal should have been Accept in Principle and in Part.
Substantiation: The FPN product standard reference should be accepted and it should be moved to Annex A as per the NEC Style Manual. The remainder of the proposal should have been Rejected.

If this proposal is allowed to be Accepted, there are two major issues of concern. First, is the appropriateness of allowing manufactured wiring systems assemblies to be constructed of component parts that are not individually listed for use or allowed by the NEC. If listing laboratories have inconsistent interpretations of the standards, competitive manufacturers can possibly use substandard components for listed assemblies. The Standard for Manufactured Wiring Systems ANSI/UL 183 permits metal conduit that may not be listed. This alone should not be a reason for the NEC to reduce its standards to allow non-listed components.

The second concern is that by accepting this proposal, Code-Making Panel 19 is setting a dangerous precedent. The substantiation for this change states that some manufactured wiring systems have been constructed with flexible metal conduit that is not listed, in violation of the requirement in 604.6(A)(2). It is inappropriate to make a change based upon the fact that the current rule is being violated. If some manufactured wiring systems are being constructed with component parts that are listed, those are the ones we should be using. If we change the code because someone is violating the requirements, we are undermining the issue of safety. Rather than compromising the minimum standards set forth by the code, we should require the manufactured wiring systems assemblies to be constructed of listed components.

Panel Meeting Action: Hold
Panel Statement: See the panel action and statement on Comment 19-51.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 7 Negative: 1
Explanation of Negative:

LICHTENSTEIN, T.: The panel action should be to reject.

See my negative for Comment 19-51. Holding over Proposal 19-131 and applicable comments until the 2011 code cycle is unnecessary and should not be permitted. The Panel members have had 11 months to study the impact of this change to Article 604 and no new substantiation has been provided that wold meet the criteria for a hold as detailed in the NFPA Rules and Regulations Governing Committee Projects as follows:

4.4.6.2.2 Hold. It shall hold for processing as a proposal for the next revision cycle a comment that:

(a) Would introduce a concept that has not had public review by being included in a related proposal as published in the Report on Proposals.

(b) Would change the text proposed by the TC to the point that the TC would have to restudy the text of the Report on Proposals or other affected parts of the document.

(c) Would propose something that could not be properly handled within the time frame for processing the report.

4.4.6.2.3 Basis for Hold. In determining whether to hold a comment pursuant to 4.4.6.2.2, the TC may consider any relevant factors including, but not limited to, the extent to which the comment proposes a change that is new and/or substantial, the complexity of the issues raised, and whether sufficient debate and public review has taken place.

Comment on Affirmative:

EWING, M.: See my Explanation of Affirmative Vote on Comment 19-51.

MCNEIVE, T.: See my Explanation of Affirmative Vote on Comment 19-49.

19-53 Log #1296 NEC-P19 **Final Action: Hold**
(604.6(A))

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 19-131
Recommendation: The Proposal should be Rejected.
Substantiation: I concur with the Explanation of Negatives by Mr. McNeive and Mr. Bernson. They both have provided valid reasons for the Proposal to be Rejected.
Panel Meeting Action: Hold
Panel Statement: See the panel action and statement on Comment 19-51.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 7 Negative: 1
Explanation of Negative:

LICHTENSTEIN, T.: The panel action should be to reject.

See my negative for Comment 19-51. Holding over Proposal 19-131 and applicable comments until the 2011 code cycle is unnecessary and should not be permitted. The Panel members have had 11 months to study the impact of this change to Article 604 and no new substantiation has been provided that wold meet the criteria for a hold as detailed in the NFPA Rules and Regulations Governing Committee Projects as follows:

4.4.6.2.2 Hold. it shall hold for processing as a proposal for the next revision cycle a comment that:

(a) Would introduce a concept that has not had public review by being included in a related proposal as published in the Report on Proposals.

(b) Would change the text proposed by the TC to the point that the TC would have to restudy the text of the Report on Proposals or other affected parts of the document.

(c) Would propose something that could not be properly handled within the time frame for processing the report.

4.4.6.2.3 Basis for Hold. In determining whether to hold a comment pursuant to 4.4.6.2.2, the TC may consider any relevant factors including, but not limited to, the extent to which the comment proposes a change that is new and/or substantial, the complexity of the issues raised, and whether sufficient debate and public review has taken place.

Comment on Affirmative:

EWING, M.: See my Explanation of Affirmative Vote on Comment 19-51.

MCNEIVE, T.: See my Explanation of Affirmative Vote on Comment 19-49.

19-54 Log #648 NEC-P19 **Final Action: Reject**
(604.6(A)(1))

Submitter: Linda J. Little, St. Louis, MO
Comment on Proposal No: 19-133
Recommendation: This proposal should be Rejected.
Substantiation: Although the general rules in Chapters 1 through 4 may be modified in Chapter 6, there should be a substantial reason for doing so, and in this case there is not.

330.108 requires Type MC cable to comply with 250.118(10) where it is used for equipment grounding, and 250.118(10) requires Type MC cable to be "listed and identified for grounding." The new language in 604.6(A)(1)(b) and (c): "Listed Type MC Cable," is not consistent with language in 250.118(10).

Additionally, the "grounding conductor and armor assembly identified as acceptable ground paths" in 604.6(A)(1)(c) does not meet the "listed and identified for grounding" requirement in 250.118(10).

If, as the submitter states, the ground path of this cable does in fact provide an effective ground fault current path before and after physical performance testing, there should be no reason why this cable cannot be listed and identified for grounding. It is inappropriate to modify the general rules in this code to allow a nonlisted product when other listed products are readily available.

Panel Meeting Action: Reject
Panel Statement: The substantiation states that the cable in the proposal is not listed and identified for grounding.

This cable is listed and identified for grounding.

Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-55 Log #1119 NEC-P19 **Final Action: Accept in Principle in Part**
(604.6(A)(1))

Submitter: James Daly, Upper Saddle River, NJ
Comment on Proposal No: 19-133
Recommendation: The Panel Action should be to Accept in Principle and modify the Proposal as follows.

In a., b., and c. renumber as (1), (2), and (3) as shown in the Preprint, delete the first word "Listed" and revise as follows:

(1) ~~a. Listed~~ Type AC cable containing nominal 600 V ~~600-volt~~, 8 to 12 AWG insulated copper conductors with a bare or insulated copper equipment grounding conductor in accordance with 250.118 and sized in accordance with 250.122. ~~equivalent in size to the ungrounded conductor.~~

(2) ~~b. Listed~~ Type MC cable containing nominal 600 V ~~600-volt~~, 8 to 12 AWG insulated copper conductors with a grounding conductor and armor assembly listed and identified for grounding ~~as acceptable ground paths~~ in accordance with 250.118(10) and sized in accordance with 250.122. ~~bare or insulated copper equipment grounding conductor equivalent in size to the ungrounded conductor.~~

~~(3) Listed Type MC cable nominal 600 volts, 8 to 12 AWG insulated copper conductors with an aluminum grounding conductor and armor assembly identified as acceptable ground paths. The aluminum ground armor assembly shall have a current-carrying capacity equivalent to the ungrounded copper conductor.~~

Substantiation: Articles 320 (Type AC) and 330 (Type MC) do not require the cables to be listed. 250.118(10) does require "Type MC cable where listed and identified for grounding in accordance with the following:" to be used as an equipment grounding conductor.

Combining (2) and (3) will still accomplish the Submitter's objective while eliminating additional text. The rewording of (2) will permit copper or aluminum grounding conductor(s), either individually or in conjunction with an aluminum or copper metallic sheath to be used as the equipment grounding conductor provided it complies with 250.118(10) [listed and identified] and is sized in accordance with 250.122.

The change from "600-volt" to "600 V" is in accordance with the Standard Terms and Units of Measurement in Annex B of the NEC Style Manual.

Panel Meeting Action: Accept in Principle in Part

The panel accepts the principle of changing "600-volt" to "600 V", and the inclusion of "grounding conductor and armor assembly listed and identified for grounding in accordance with 250.118(10)."

The panel rejects the remainder of the comment.

Panel Statement: See the panel action and statement on Comment 19-56.

The panel rejects the redundant reference to 250.122. Chapters 1 through 4 apply generally, unless modified by this section. In addition, this section does contain modified sizing requirements for the equipment grounding conductor, and there is no technical substantiation to warrant a change.

The panel rejects the combining of (2) and (3) and the renumbering as the submitter requests, because these changes do not add clarity. The subdivisions and numbering in the original proposal comply with the NEC Style Manual.

Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-56 Log #1298 NEC-P19 **Final Action: Accept in Principle in Part**
(604.6(A)(1))

TCC Action: The Technical Correlating Committee understands that the reference in item (3) of the panel action text is to 250.118(10) in accordance with the panel action on 19-55.
Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 19-133
Recommendation: The panel action should be to Accept in Principle in Part and modify the Proposal as follows:

Delete the first word "Listed" in a., b., and c. [(1), (2), and (3) in the Preprint].

In c. add the word "containing", change "volts" to "volt" and revise as follows:

c. ~~Listed~~ Type MC cable containing nominal 600 volts~~,~~ 8 to 12 AWG insulated copper conductors with an aluminum grounding conductor and armor assembly listed and identified for grounding ~~as acceptable ground paths~~ in accordance with 250.118(10). The aluminum ~~ground~~ grounding conductor and armor assembly shall have a current-carrying capacity equivalent to the ungrounded copper conductor.

Substantiation: Articles 320 (Type AC) and 330 (Type MC) do not require the cables to be listed. 250.118(10) does require "Type MC cable where listed and identified for grounding in accordance with the following:" to be used as an equipment grounding conductor.

Addition of the word "containing" and making volt singular provides consistency with a. and b. and provides clarity.

While the Type MC cable may not be listed, if the grounding conductor and armor assembly are to be used for grounding, it must comply with 250.118(10).

The revision in the last sentence is for clarity.

Panel Meeting Action: Accept in Principle in Part
Revise the wording in Proposal 19-133, 604.6(A)(1)(a), (b), and (c), to read as follows:

"(1) Listed Type AC cable containing nominal 600 V, 8 to 12 AWG insulated copper conductors with a bare or insulated copper equipment grounding conductor equivalent in size to the ungrounded conductor.

(2) Listed Type MC cable containing nominal 600 V, 8 to 12 AWG insulated copper conductors with a bare or insulated copper equipment grounding conductor equivalent in size to the ungrounded conductor.

(3) Listed Type MC cable containing nominal 600 V, 8 to 12 AWG insulated copper conductors with a grounding conductor and armor assembly listed and identified for grounding in accordance with 250.118(10)a. The combined metallic sheath and grounding conductor shall have a current-carrying capacity equivalent to the ungrounded copper conductor."

The remainder of the text is unchanged.

Panel Statement: It has been the panel's intent since the inclusion of Article 604 in the 1981 NEC that cables be listed AC or MC cable. The change of "volts" to "volt" is not accepted by the panel. See the panel action and statement on Comment 19-55.

The panel has renumbered the list using (1), (2), (3), per the NEC Style Manual "Structuring and Numbering" and revised (3) to delete the prescriptive construction requirements.

Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-57 Log #364 NEC-P19 **Final Action: Accept**
(604.6(A)(4) (New))

Submitter: Code-Making Panel 8
Comment on Proposal No: 19-132
Recommendation: CMP-8 supports the action on this proposal by CMP-19.
Substantiation: CMP-8 supports the action on this proposal by CMP-19.

This comment has been balloted through CMP-8 with the following ballot results:

12 Eligible to Vote
11 Affirmative
1 Negative

Mr. Dabe voted negatively stating: "CMP-8 recommends that CMP-19 delete in accordance with 368.12, 368.17(D) and 368.30. It could be interpreted that these are the only references in Article 368 that apply. Trolley-Type Busway must comply with all of Article 368."

Mr. Loyd voted affirmatively stating: "Proposal 19-132 was to Accept in Principle in Part. I agree with Mr. Burns' recommendation to revise the panel

action."
Panel Meeting Action: Accept
Panel Statement: Although the panel accepts this comment, the panel notes that 368.12, 368.17(D), and 368.30 detail applicable sections of Article 368 that should be applied when using a busway as part of a manufactured wiring system. Section 368.12 addresses uses not permitted, 368.17(D) addresses overcurrent protection of branch circuits that utilize a busway, and manufactured wiring systems are not permitted for feeders. Section 368.30 addresses support. It was not the intent of Code-Making Panel19 to adopt all of Article 368 when a busway is used as part of a manufactured wiring system. Article 604 includes other specific criteria for these installations.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

ARTICLE 610 — CRANES AND HOISTS

12-1 Log #73 NEC-P12 **Final Action: Accept**
(610, 620, 630, 640, 645, 650, and 665)

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 12-1
Recommendation: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal by inserting the specific Sections or Parts of Article 250 that apply as required by 4.1.1 of the NEC Style Manual. This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Revise 620.82 and 680.83, to read as follows:
620.82 Electric Elevators. For electric elevators, the frames of all motors, elevator machines, controllers, and the metal enclosures for all electrical equipment in or on the car or in the hoistway shall be bonded in accordance with Article 250, Parts V and VII.
620.83 Nonelectric Elevators. For elevators other than electric having any electric conductors attached to the car, the metal frame of the car, where normally accessible to persons, shall be bonded in accordance with Article 250, Parts V and VII.
Panel Statement: The panel accepts the TCC direction and has added the required parts in 620.82 and 620.83.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

12-2 Log #529 NEC-P12 **Final Action: Reject**
(610.14(A))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 12-4
Recommendation: Accept the proposal as revised:
Add: Neutral conductors that comply with 310.15(B)(4)(a) shall not be required to be counted in determining allowable ampacities.
Substantiation: 310.15(B)(4)(a) permits the neutral not to be counted as current-carrying. Tables 310.15(B)(2)(a), 310.16, and 310.18 headings use the phrase "current-carrying" which exempt neutrals that comply with 310.15(B)(4)(a).
Panel Meeting Action: Reject
Panel Statement: Existing footnotes to Table 610.14(A) meet the concerns of the submitter.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

12-3 Log #74 NEC-P12 **Final Action: Accept**
(Table 610.14(D))

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 12-6
Recommendation: The Technical Correlating Committee directs the panel to reconsider this proposal and clarify if their revisions are to the recommendation or the existing code text. This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Change the title of Table 610.14 (D) in the 2005 NEC to "Minimum Contact Conductor Size Based on Distance Between Supports".
Add the word "Minimum" in front of the column title "Size of Wire (AWG)"
Panel Statement: The panel accepts the TCC direction and clarifies the meeting action to apply to the 2005 NEC text and not the text of Proposal 12-6.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

12-4 Log #1852 NEC-P12 **Final Action: Accept in Principle**
(610.31)

Submitter: Michael Walls, American Chemistry Council
Comment on Proposal No: 12-9
Recommendation: Revise text to read as follows:
The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed. ~~Portable means for adding a lock to the switch or circuit breaker shall not be permitted.~~
Substantiation: The last sentence that was added by the panel "Portable means for adding a lock to the switch or circuit breaker shall not be permitted." Will prohibit the use of portable devices that provide for the attachment of multiple locks (i.e. Scissors) to the locking mechanism. The sentence should be removed.
Panel Meeting Action: Accept in Principle
Revise the sentence that reads "Portable means for adding a lock to the switch or circuit breaker shall not be permitted." of committee action on Proposal 12-9 to read as follows:
"Portable means for adding a lock to the switch or circuit breaker shall not be permitted as the means required to be installed at and remain with the equipment."
Panel Statement: An attachment device (i.e., scissors or multiple lock hasp) that provides a means to attach multiple locks to the locking device on the disconnect is not prohibited. Instead of inserting one lock in the locking device, the multiple lock hasp is inserted and multiple locks can be used. The intention of prohibiting portable means for adding a lock is so that a provision for locking or adding a lock to the disconnect is permanent.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13
Comment on Affirmative:
QUAVE, D.: The new language will clarify the fact that the additional language was not meant to prohibit the use of Lock out/Tag out devices, but assures that there will be a place to install the Lock out/Tag out device.

12-5 Log #1246 NEC-P12 **Final Action: Reject**
(610.61)

Submitter: Neil F. LaBrake, Jr., Syracuse, NY
Comment on Proposal No: 12-1
Recommendation: Revise the Panel's action on 610.61 as follows:
610.61 Grounding. All exposed non-current-carrying metal parts of cranes, monorail hoists, hoists, and accessories, including pendant controls, shall be bonded to each other and to an equipment grounding conductor either by mechanical connections or bonding jumpers, where applicable so that the entire crane or hoist is a ground fault current path as required or permitted by Article 250, Parts V and VII.
Moving parts, other than removable accessories, or attachments that have metal-to-metal bearing surfaces, shall be considered to be electrically bonded to each other through bearing surfaces for grounding purposes. The trolley frame and bridge frame shall not be considered as electrically grounded through the bridge and trolley wheels and its respective tracks. A separate bonding conductor jumper shall be provided.
Substantiation: The addition of "to each other and to an equipment grounding conductor" in 610.61 clarifies what needs to be bonded and to where, which is the equipment grounding conductor. See the Panel action on Proposal 5-76 and on the definition of the term "equipment grounding conductor" in Proposal 5-6. The change of the term "bonding conductor" to "bonding jumper" in the second paragraph in 610.61 is consistent with the NEC TCC Task Group on Grounding and Bonding's original initiative that "bonding jumper" as defined in Article 100 is the proper use of the term.
This Comment was developed by a Task Group assigned by the NEC Technical Correlating Committee to address actions that were other than "accept" taken by Code-Making Panels on proposals from the TCC to resolve 2005 NEC Proposal 5-1 and Comment 5-1. Members of the Task Group on Grounding and Bonding for this Comment included: C. Douglas White; Michael Johnston; Jeffrey Boksiner; Daleep Mohla; Phil Simmons; Christopher Hutchings; James Carroll; Alan Rebeck; Richard Loyd; Paul Dobrowsky; and Neil F. LaBrake, Jr.
Panel Meeting Action: Reject
Panel Statement: The original panel action in the ROP took into account the NEC TCC task group recommendation as presented in ROP Proposal 12-1 as it applied to cranes and hoists. While the intended results are the same, the changes proposed in the comment fail to regard some of the special physical constraints such as requiring the use of an impractically long jumper versus grounding conductor-collector systems required in some equipment systems.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

ARTICLE 620 — ELEVATORS, DUMBWAITERS, ESCALATORS, MOVING WALKS, WHEELCHAIR LIFTS, AND STAIRWAY CHAIR LIFTS

12-6 Log #2095 NEC-P12 **Final Action: Reject**
(620.11(A) Exception (New))

Submitter: Kevin L. Brinkman, AEMA, Dave Balmer
Comment on Proposal No: 12-23
Recommendation: The proposal has been reworded below to clarify the intent. Please consider approval as modified.

620.11(A) Hoistway Door Interlock Wiring. The conductors to the hoistway door interlocks from the hoistway riser shall be flame retardant and suitable for a temperature of not less than 200°C (392°F). Conductors shall be Type SF or equivalent.

Exception: Where Firefighters' Emergency Operation is not required, the conductors to hoistway door interlocks shall comply with 620.11(C).

Substantiation: The Panel Statement indicates that the purpose of this rule is to protect firefighters who are using the equipment during firefighters operations. The intent of this proposal was to defer to requirement 620.11(C) for equipment that does not have firefighters operation because it is not intended for use during fires (such as private residence elevators, platforms lifts, etc.).
Panel Meeting Action: Reject
Panel Statement: Whether the elevator is used by firefighters or not, protection should be provided to prevent the elevator from running with the doors open due to melted insulation on the hoistway door interlock wiring.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-7 Log #402 NEC-P12 **Final Action: Reject**
(Table 620.14)

Submitter: Daniel Leaf, Seneca, SC
Comment on Proposal No: 12-24
Recommendation: Accept in Part. Where Table 620.14 is used no other demand factors shall be permitted.
Substantiation: 220.61(B)(2) allows a demand factor for certain feeders that may supply elevator rooms. Proposal would clarify that both demand factors cannot be used.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any additional substantiation for the change.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-8 Log #1305 NEC-P12 **Final Action: Reject**
(620.15)

Submitter: David Sroka, Turner Falls, MA
Comment on Proposal No: 1-54
Recommendation: Add a sentence as follows:

"The short-circuit current rating shall be included on the nameplate for elevator controllers."

Substantiation: This data is hard to obtain after the original installation. It is important information. The nameplate is the best place for the controller's short-circuit current rating. Integral component's rating can mistakenly be taken as the controller's rating. Lastly, it is safest to read the nameplate to get this information rather than physical removal of covers, moving wires, etc. The function of an elevator controller is so critical that the rating merits inclusion on the nameplate.
Panel Meeting Action: Reject
Panel Statement: The FPN to 620.15 states, "For controller markings, see 430.8". Section430.8 requires the short-circuit current rating to be marked on the controller.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-9 Log #75 NEC-P12 **Final Action: Accept**
(620.21 Exception)

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 12-25
Recommendation: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal regarding the exact location of the Exception.

The Technical Correlating Committee understands that the last phrase in the first sentence should read "the pump shall be permitted to be cord connected."

This action will be considered by the Panel as a Public Comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Following 620.21(A)(1)(d), add the following text:

(e) A sump pump or oil recovery pump located in the pit shall be permitted to be cord connected. The cord shall be a hard usage oil resistant type, of a length not to exceed 1.8 m (6 ft), and shall be located to be protected from physical damage.

Panel Statement: The panel accepts the direction of the TCC and has clarified the panel action and furthermore rewrites the exception into positive Code language.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-10 Log #2094 NEC-P12 **Final Action: Reject**
(620.21(A)(2)(d) Exception (New))

Submitter: Kevin L. Brinkman, AEMA, Dave Balmer
Comment on Proposal No: 12-30
Recommendation: The proposal has been reworded to reflect this change. Please consider approval as modified:

620.21(A)(2)(d) Add Exception as follows:

Exception: Flexible metal conduit, liquidtight flexible metal conduit, or liquidtight flexible nonmetallic conduit shall be permitted, in lengths not to exceed 3.6 m (12 ft) without being installed in a raceway and where the conduit is located to be protected from physical damage and is clamped every 1.8 m (6 ft) and where the conductors are of the flame retardant type.

Substantiation: In certain applications, such as wiring from a car top box to switches mounted on the car frame, it is very difficult to run hard conduit due to the close conditions and the need to "weave" in and around the car frame. Allowing longer lengths of flex conduit, while adding a requirement for clamping of the conduit every 6 ft, should provide equivalent safety to the current requirements.
Panel Meeting Action: Reject
Panel Statement: Flexible metal conduit, liquidtight flexible metal conduit, or liquidtight flexible nonmetallic conduit are raceways and would not be installed in another raceway.
No technical substantiation has been provided for modifying the support distance required in 348.30, 350.30, and 356.30.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-11 Log #76 NEC-P12 **Final Action: Accept**
(620.21(A)(3)(e))

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 12-31
Recommendation: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal since the proposal text is unclear as to how the final sentence is incorporated into the preceding text. This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Revise the recommendation of Proposal 12-31 to read as follows:

(e) Flexible cords and cables in lengths not to exceed 1.8 m (6 ft) that are of a flame-retardant type and located to be protected from physical damage shall be permitted in these rooms and spaces without being installed in a raceway.

They shall be part of:
(1) Listed equipment,
(2) A driving machine, or
(3) A driving machine brake.

Panel Statement: The panel accepts the direction of the TCC and has clarified 620.21(A)(3)(e).
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-12 Log #551 NEC-P12 **Final Action: Accept**
(620.21(A)(4))

Submitter: Andy Juhasz, Kone, Inc. / Rep. National Elevator Industry Inc. (NEII)
Comment on Proposal No: 12-33
Recommendation: Remove the (d) shown in the very beginning of the text in the original proposal. It was incorrectly included. The proposal should read as follows:

(4) Counterweight. ~~Flexible metal conduit, liquidtight flexible metal conduit, liquidtight flexible nonmetallic conduit or flexible cords and cables, or conductors grouped together and taped or corded that are part of listed equipment, a driving machine, or a driving machine brake shall be permitted on the counterweight assembly, in lengths not to exceed 1.8 m (6 ft), without being installed in a raceway and where located to be protected from physical damage and are of a flame-retardant type.~~

The following wiring methods shall be permitted on the counterweight assembly in lengths not to exceed 1.8 m (6 ft):

(a) flexible metal conduit
(b) liquidtight flexible metal conduit
(c) liquidtight flexible nonmetallic conduit
(d) flexible cords and cables, or conductors grouped together and taped or corded, shall be permitted to be installed without a raceway. They shall be located to be protected from physical damage and shall be of a flame-retardant type and shall be part of:
(1) listed equipment
(2) a driving machine, or
(3) a driving machine brake

Substantiation: The Technical Correlating Committee was misled in their understanding as the original submittal was in error when it indicated 620.21(A)(4)(d) in the text of the revision. The subject of the revision is 620.21(A)(4).
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-13 Log #1718 NEC-P12 **Final Action: Reject**
(620.37(D))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association
Comment on Proposal No: 12-47
Recommendation: Add new language to 620.27 as follows:
620.37(D) Interface with Fire Alarm System. Wiring connecting the fire alarm recall outputs to the Elevator Control System shall be kept within the elevator machine room, the elevator control room, or the elevator control space.
Substantiation: This new language has been proposed by the Technical Correlating Committee of the National Fire Alarm Code. This proposal is consistent with NFPA 70's goal's "for the practical safeguarding of persons and property from hazards arising from the use of electricity." It is hoped that the Task Group appointed by the NEC-TCC Chair will be able to reach a compromise on language that will meet the needs of those jurisdictions who only have adopted the NEC and not NFPA 72 to protect persons and property from hazards arising from the use of electricity.
Panel Meeting Action: Reject
Panel Statement: The submitter has provided no new substantiation for Proposal 12-47.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-14 Log #552 NEC-P12 **Final Action: Accept**
(620.44)

TCC Action: The Technical Correlating Committee understands that the panel action to Accept the comment text replaces both existing paragraphs in 620.44.
Submitter: Andy Juhasz, Kone, Inc. / Rep. National Elevator Industry Inc. (NEII)
Comment on Proposal No: 12-48
Recommendation: Recommend Panel reconsider Proposals 12-48 and 12-49.

Proposed change:

620.44 Installation of Traveling Cables. Traveling cables that are suitably supported and protected from physical damage shall be permitted to be run without the use of a raceway in either or both of the following:

(a) when used inside the hoistway, on the elevator car, hoistway wall, counterweight, or controllers and machinery that are located inside the hoistway provided the cables are in the original sheath

(b) from inside the hoistway, to elevator controller enclosures and to elevator car and machine room, control room, machinery space, and control space connections that are located outside the hoistway for a distance not exceeding 1.8 m (6 ft) in length as measured from the first point of support on the elevator car or hoistway wall, or counterweight where applicable, provided the conductors are grouped together and taped or corded, or in the original sheath. These t~~T~~raveling cables shall be permitted to be continued to this equipment ~~elevator controller enclosures and to elevator car and machine room, control room, machinery space, and control space connections, as fixed wiring, provided they are suitably supported and protected from physical damage~~.

Substantiation: NFPA 70 permits elevator travel cables that are properly supported to be used as fixed wiring in the hoistway without the use of junction boxes. There is no technical rationale to require these same cables that are located within the hoistway to be in raceways when lengths exceed 1.8 m (6 ft) when they are properly supported and protected from the risk of damage. Fully sheathed elevator travel cables are robust and designed to survive in an elevator hoistway for great lengths, as much as 250 meters, in unsupported conditions. Cables are designed for little strain on the copper conductors by use of a steel support member typically used as a center member in a round cable and as integral support members in flat construction and must meet the requirements of NFPA 70. Fully sheathed travel cables that are attached to cars, counterweights, and other hoistway machinery and suitably protected from physical damage have no more risk of damage than cables provided in raceways in these locations.

I have submitted examples with this comment on applications in accordance with the proposed change and note the travel cables are not exposed to any new hazards in the hoistway or on the car.

The supporting material are two examples that would permit application of elevator traveling cables in their original sheath in lengths greater than the current 6 ft limitation of NFPA 70, 620.44 in the hoistway and on the car. Elevator traveling cables are designed to be hung at great lengths within the hoistway, and when secured and protected from physical damage the use of raceways within the hoistway are not necessary.

Note: Supporting material is available for review at NFPA Headquarters.

(620.51(A) Exception No. 2)

Submitter: Kevin L. Brinkman, AEMA, Dave Balmer
Comment on Proposal No: 12-57
Recommendation: Please consider approval as modified:
620.51 Disconnecting Means.
Add to end of Exception for (A) the following:
Where an individual branch circuit supplies a stairway chairlift, the stairway chairlift shall be permitted to be cord-and-plug connected provided it complies with 422.16(A).
Substantiation: Stairway chairlifts are typically supplied with a flexible cord for connection to a receptacle. This type of equipment may need to be removed for service, similar to many appliances. A cord-and-plug connected stairway chairlift allows the unit to be easily disconnected for service. The proposal has been reworded to use language similar to that in 422.16 for cord-and-plug connected appliances.
Panel Meeting Action: Accept in Principle
Number the existing exception as Exception No.1 and add the following new Exception No. 2:
Exception No. 2: Where an individual branch circuit supplies a stairway chairlift, the stairway chairlift shall be permitted to be cord-and-plug connected, provided it complies with 422.16(A) and the cord does not exceed 1.8m (6 ft) in length.
Panel Statement: The panel agrees with the intent of this comment and believes the revised wording meets the intent of the submitter.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-21 Log #2092 NEC-P12 **Final Action: Reject**
(620.51(C))

Submitter: Kevin L. Brinkman, AEMA, Dave Balmer
Comment on Proposal No: 12-60
Recommendation: Please consider approval as modified.
620.51 Disconnecting Means.
(C) Location.
(4) On Wheelchair Lifts and Stairway Chairlifts. On wheelchair lifts and stairway chairlifts, the disconnecting means shall be located within sight of the motor controller. Where the disconnecting means cannot be located within sight of the motor controller lift shall be provided with a manually operated switch in the control circuit to prevent starting. The manually operated switch shall be located adjacent to the equipment.
Substantiation: On most platform (wheelchair) lifts the motor controller is located within the structure of the lift mechanism and the lift is installed within a runway enclosure, unlike an elevator that traditionally has had a separate machine room or space. The running clearance requirements in ASME A18.1 do not allow sufficient room within the runway to mount the disconnecting means and provide working clearance; therefore, the disconnecting means needs to be mounted outside the runway. Also, for curved stairway lifts that may have the motor controller on the platform, it is not possible to have the disconnecting means within sight of the controller on the platform. The following revised proposal addresses the Panel's statement regarding the runway door and uses requirements similar to those in 620.51(C)(1).
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided sufficient technical substantiation for the change. Furthermore, the comment would create contradictory requirements within the Code.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-22 Log #1326 NEC-P12 **Final Action: Accept in Principle**
(620.51(C)(1))

Submitter: Kevin S. Arnold, Bussmann
Comment on Proposal No: 12-58
Recommendation: Add this new text to the end of the proposed text: "The additional switch shall be a listed device." proposed by the original proposal. This switch shall comply with 620.91(C) if connected on the line side of the elevator controller if additionally powered by an emergency or standby power system.
Substantiation: We feel that this additional text should be added for safety reasons. Adding an additional disconnect within slight is intended to increase the level of safety for this type of installation. The traditional shunt trip disconnect that is used to disconnect the elevator motor has an auxiliary contact that is mechanically connected to the disconnecting mechanism of the switch so it disconnects all power sources, both the normal power and the emergency or standby power which, for a hydraulic elevator, controls a solenoid to a piston drain valve. Adding an additional non-fused disconnect will negate this safety feature if it does not also disconnect both normal and emergency or standby power. Just disconnecting the non-fused switch for normal power will still leave the emergency or standby power operable, providing power to the solenoid and allowing the piston drain valve to open which allows the elevator to move and create a safety issue. Therefore, where an emergency or standby power source is connected to the controller, the new additional disconnect must be required to disconnect both the normal and emergency or standby power.
Overall, we feel this will provide for a safer system as long as all power to the elevator motor is disconnected by this requirement.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
Revise the last sentence of the committee action on Proposal 12-58 to read as follows:
The additional switch shall be a listed device and shall comply with 620.91(C).

Ballot Results: Affirmative: 11

12-29 Log #1349 NEC-P12 **Final Action: Accept**
(620.62)

Submitter: Bruce W. Blouin, Power Analysis Associates Inc
Comment on Proposal No: 12-72
Recommendation: The Panel should continue to reject this Proposal.
Substantiation: New York City has had a requirement for Selective Coordination for decades. The NEC has also required selective coordination for ground faults in health care facilities for decades. Requirements for selectively coordinated overcurrent protective devices in elevator circuits have existed in the NEC since the 1993 edition. Beginning with the 2005 NEC, requirements were added for selective coordination of emergency circuits and legally required standby systems. We've found design solutions to meet these requirements, with both circuit breakers and fused switches, without compromising safety or reliability, and wonder what all the fuss is about.

We are a consulting engineering firm that specializes in short-circuit and coordination studies, so we are intimately familiar with what it takes to selectively coordinate both fuses and circuit breakers. It does take sharp engineering skills to design both a selectively coordinated system and at the same time to minimize arc-flash energies and equipment short-circuit damage, but that is precisely what's needed for critical circuits such as are found in elevator, emergency systems, and legally required standby systems. But, it can be and is achieved on a regular basis. Requiring total selectivity does not tie our hands when it comes to multiple emergency generators. We can design in transfer switches. We've heard of complaints about two devices in series of the same size not coordinating. Simply making the downstream disconnecting means a non-fused switch solves that problem. There is enough latitude in 450.3 to choose the overcurrent protective devices on the line side and load side of a transformer so that they will selectively coordinate. We also do not see any issues with violations of other NFPA Standards that call out for "optimized" selective coordination. To us, optimized means the very best that you can do, and total selectivity is certainly the very best that you can do. Finally, there are arguments that there needn't be a requirement to selectively coordinate in the short-circuit range because short-circuits rarely happen. If that were the case, we don't need Sections 110.9 and 110.10 in the NEC. Nor do we need the new requirements for marked short-circuit current ratings on industrial machinery or industrial control panels. Do you insure your home for just $5,000 because most claims are under that amount? Or, do you insure it for the full value, just in case it does burn to the ground or get blown away in a storm? Of course you insure it for the full value, even though a total loss may be an unusual event. Needless to say, we believe the Panel should continue to support the requirement for selective coordination in elevator circuits.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-30 Log #1401 NEC-P12 **Final Action: Accept**
(620.62)

Submitter: Merrell Young, Herzig Engineering
Comment on Proposal No: 12-69
Recommendation: Panel 12 needs to continue to Reject this and similar proposals that remove the requirement for total selective coordination of elevator circuits.
Substantiation: I would consider our consulting firm as experts on arc-flash, short-circuit, and coordination studies. As such, we have been able to meet the selective coordination requirements found in 700.27, 701.18, and 620.62, while at the same time, minimizing arc-flash hazards and improving reliability and continuity of service. We are able to obtain selective coordination for both overload and short-circuit conditions by utilizing various design techniques. For example, we can specify zone selective interlocking with short-time delay on the upstream circuit breaker so that upstream and downstream circuit breakers will coordinate in both the overload zone and the short-circuit zone, and provide for instantaneous reaction time for short circuits (including arcing faults), between the circuit breakers, which keeps arc-flash hazards to a minimum. Where our customers want fuses, we specify current-limiting fuses that can both selectively coordinate and minimize arc-flash hazards. We are able to design with transfer switches and different relaying schemes in order to utilize multiple emergency generators in parallel, for the greatest reliability. As far as ground faults are concerned, we sometimes add an additional layer of ground fault protection in order to selectively coordinate under phase to ground faults, utilizing the same approach as is already required for health care facilities. In short, we don't have to compromise to meet the selective coordination requirements, minimize personnel hazards, and protect equipment. It does take time and requires a thorough understanding of the entire electrical system, and that's what consulting engineers get paid to do.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-31 Log #2086 NEC-P12 **Final Action: Reject**
(620.62)

Submitter: Philip M. Piqueira, General Electric Co.
Comment on Proposal No: 12-72
Recommendation: I disagree with the panel action. Accept Proposal 12-72 as written.
Substantiation: Selective coordination is a system design issue, not a Code issue.

Systems are normally designed for selective coordination in the overload region of the overcurrent device time-current curves. If this were not so, they would not operate under normal conditions, so what is really being called for in this requirement is overload and short circuit selective coordination. In order to achieve total short circuit selective coordination, the size of upstream overcurrent protective devices may need to be increased and/or time delay trip characteristics increased, thereby possibly increasing the arc flash hazard. In other words, by forcing selective coordination for an event that most likely will never occur, namely a bolted fault, the hazards involved in performing tasks which most likely will occur, namely system maintenance, may be increased. This is why system designers need the flexibility to optimize the design of a system, which the current requirement does not allow.

The need for the flexibility to optimize the design of a system is recognized in IEEE Standard 242-2001 (The Buff Book). Section 15.1 states, "In applying protective devices, it is occasionally necessary to compromise between protection and selectivity. While experience may suggest one alternative over another, the preferred approach is to favor protection over selectivity. Which choice is made, however, is dependent on the equipment damage and the effect on the process."

In summary, GE strongly supports selective coordination as a valuable safety asset in the current range where overloads most often occur. However, GE does not support the mandate for Selective Coordination for ALL current ranges and ALL overcurrent devices because safety and reliability can both actually be diminished, thus the section should be deleted.
Panel Meeting Action: Reject
Panel Statement: The Code is not a design specification but does provide the minimum requirements. Article 620 provides additional needed requirements for increased reliability and safety of elevator circuits. The selective coordination requirement increases reliability in elevator circuits. How selective coordination is achieved is up to the design engineer.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-32 Log #2195 NEC-P12 **Final Action: Accept**
(620.62)

Submitter: Peter R. Walsh, Peter R. Walsh, P.E. & Associates
Comment on Proposal No: 12-71
Recommendation: The Panel should continue to Reject this Proposal.
Substantiation: The NEC has required selective coordination for elevator circuits for years without major problems. The recent expansion of requirements makes good sense for the users of the buildings. Who wants to to be stranded in an elevator or suffer from a blackout as a result of non-selective coordination? Engineers have software programs, like Easy Power Version 8.0 that can automate selective coordination.

With Zone Selective Coordination trips, almost anything can be coordinated. Arc flash can be adjusted by proper trips. The code making panel should require reliable power through selective coordination of important circuits.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-33 Log #2345 NEC-P12 **Final Action: Reject**
(620.62)

Submitter: Alan Manche, Square D Company
Comment on Proposal No: 12-72
Recommendation: Accept the Proposal in Principle and revise the present text to read:

620.62 Selective Coordination. Where more than one driving machine disconnecting means is supplied by a single feeder, the overcurrent protective devices in each disconnecting means shall be selected to optimize selective coordination with only the immediate line side feeder device ahead of the machine disconnecting means.
Substantiation: It is clearly recognized in the NEMA comment that selective coordination can compromise reliability and safety if the engineering community is not provided appropriate latitude to ensure all performance aspects are addressed. If the panel is not willing to delete this section then it is prudent that the panel recognize this requirement can negatively impact safety and reliability and utilize similar language offered by Mr. Lottmann at NEMA to "optimize selective coordination."

The present wording is often misunderstood across the industry. The wording in 700.27 has likely created this issue by requiring ALL supply side devices to the selective and 620 using the phrase "…any supply side… devices…" Recognizing the reason selectivity was put in place in 620 was to address an identification issue of not knowing the location of the feeder, selectivity was intended to address only that concern not any other safety issue. The historical records are clear and simple. I would invite you to read Mr. Lawry's substantiation in 12-84 and negative comments from panel chair Mr. Trout in the TCR for the 1993 NEC. The panel then decided to addresses the identification issue in a later cycle and did not remove selectivity. The confusion comes into play with the present wording of "…coordinated with any other supply side overcurrent protective device."

Once again, if this is read to be applied back to the service, consider a campus style electrical system arrangement making it impossible to comply with the NEC. One can only conclude that if that is the intent of the panel that this section is not perceived as a safety issue and not being enforced. It also would not address all of the other branch circuits or feeders that are not selective or simply become overloaded and could trip a feeder on the system that supplies the feeder for the elevator. The intent as documented in the historical documents points only between the branch and immediate feeder devices and the challenge of finding the line side overcurrent device that tripped. A revision as provided above would clarify that "optimizing" selectivity on the branch and feeder would be required and remove most of the concerns that create a challenge for maximizing safety, reliability and performance.

Panel Meeting Action: Reject

Panel Statement: The panel does not agree that the requirements for selective coordination reduce the level of reliability based on the substantiation provided. The rule exists to require a certain level of performance that provides the level of reliability needed for elevator circuits. Sufficient technical substantiation is not provided for removal of this requirement.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept

Revise the recommendation of Proposal 12-74 to remove the word "requirement."

Panel Statement: The panel accepts the direction of the TCC and has removed the word "requirement" from the FPN.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-35 Log #80 NEC-P12 **Final Action: Accept**
(620.91, FPN)

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 12-75
Recommendation: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal with respect to the appropriateness of the word "requirement". This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the direction of the TCC. See panel action and statement on Comment 12-34.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

ARTICLE 625 — ELECTRIC VEHICLE CHARGING SYSTEM EQUIPMENT

12-36 Log #533 NEC-P12 **Final Action: Reject**
(625.28)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 12-80
Recommendation: Accept the proposal.
Substantiation: Requirement is superfluous. Hazardous (classified) areas are required to comply with Articles 500 through 516 by 90.3. There are, for example, no specific requirements for wet locations since it is unnecessary; 90.3 indicates Chapters 1 through 4 apply where such locations are covered.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its position. No new substantiation was supplied with the comment.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-37 Log #81 NEC-P12 **Final Action: Accept**
(626 (New))

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 12-81
Recommendation: The Technical Correlating Committee advises that Article placement, titles and scope statements are the responsibility of the Technical Correlating Committee and, based on the current content of the Article, the Technical Correlating Committee directs that the Title and Scope be rewritten to read as follows:

"Article 626 Electrified Truck Parking Spaces

626.1 Scope. The provisions of this article cover the electrical conductors and equipment external to the truck or transport refrigerated unit that connect trucks or transport refrigerated units to a supply of electricity, and the installation of equipment and devices related to electrical installations within an electrified truck parking space."

This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the direction of the TCC. See panel action on Comment 12-44.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

12-38 Log #279 NEC-P12 **Final Action: Reject**
(626 (New))

Submitter: Stanley J. Folz, Morse Electric, Inc.
Comment on Proposal No: 12-81
Recommendation: Delete entire new Article.
Substantiation: All of the information to wire an Electrified Parking Space is already contained in the NEC. Is it the intention of the NEC to provide Articles for every specialized application that exists?
Panel Meeting Action: Reject
Panel Statement: Although many of the actual requirements for an electrified truck parking space are found in Chapters 1 though 4 of the existing NEC Code, there are additional requirements and choices needed to provide a consistent and safe installation as described in the new Article 626, "Electrified Truck Parking Spaces".
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:

QUAVE, D.: The panel action should have been to accept. The submitter's substantiation is correct.

12-39 Log #883 NEC-P12 **Final Action: Reject**
(626 (New))

Submitter: Dan Kelly, St. Louis, MO
Comment on Proposal No: 12-81
Recommendation: The Panel action should have been Reject.
Substantiation: The proposed new Article 626 does not contain any material that supplements or modifies any materials in Chapters 1-4. Therefore, the new article is not needed. Also, there is not any special equipment involved.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Comment 12-38.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:
QUAVE, D.: See my Explanation of Negative Vote on Comment 12-38.

12-40 Log #1327 NEC-P12 **Final Action: Reject**
(626 (New))

Submitter: Robert Clarke, Truck Manufacturers Association
Comment on Proposal No: 12-81
Recommendation: Relative to the currently proposed version of Article 626, we offer the following recommendations:

● Battery chargers, small inverter systems, fuel heaters, fuel/water separator and heaters, and oil pan heaters should be included in the exceptions list, along with engine block heaters. These systems, just as engine block heaters, are employed in past and current tractor models, as well as in future product. We have proposed language, underlined, in the following excerpt which includes sections Twenty-Ampere Power-Supply Assembly [section 626.30.30(1) on page 70-671]; Conductors [section 626.30.30(2)(F)(1) on page 70-671]; Cord [section 626.30.30(2)(F)(2) on page 70-672]:

30.30 Separable Power-Supply Cable Assembly. Where a separable power-supply cable assembly consisting of a cord with a female connector and attachment plug is provided, the vehicle shall be equipped with a permanently mounted, flanged surface inlet in accordance with 626.32(A), wired directly to the panelboard by an approved wiring method. The attachment plug shall be of a listed type. The power-supply cable assembly or assemblies shall be identified OEM (factory) supplied or OEM or factory approved, and be of one of the following types and rating specified herein. Cords with adapters and pigtail ends, extension cords, and similar items shall not be attached to, provided or shipped with a truck.

A. Rating(s).

(1) Twenty-Ampere Power-Supply Assembly. Trucks wired with a 20-ampere, 125-volt truck inlet, in accordance with 626.21(F)(1), shall use a listed 20-ampere power-supply assembly.

Exception: A listed separable power supply cable assembly, either hard-service or extra hard service and rated 15-amperes, 125 volts may be provided for connection to an engine block heater [, battery charger, inverter system using less than 15 amps, fuel heater, oil pan heater, or fuel/water separator/ heater] for legacy vehicles.

(2) Thirty-Ampere Power-Supply Assembly. Trucks wired with a 30-ampere, 120/208-volt truck inlet, in accordance with 626.21(F)(2) shall use a listed 30-ampere main power-supply assembly.

(F) Listed Cord Assemblies.

(1) Conductors. The cord shall be a listed type with three or four conductors, for single phase connection, one of which shall be identified by a continuous green color for use as the equipment grounding conductor.

Exception: A separate listed three conductor separable power supply cable assembly, having one conductor identified by a continuous green color for use as the equipment grounding conductor, and rated 15 amperes, 125-volts may be provided for connection to an engine block heater [, battery charger, inverter system of 1000W or less, fuel heater, oil pan heater, or fuel/water separator/ heater] for legacy vehicles.

(2) Cord. Extra-hard usage flexible cords and cables rated not less than 194°F (90°C), 600 volts; listed for both wet locations and sunlight resistance; and having an outer jacket rated to be resistant to temperature extremes, oil, gasoline, ozone, abrasion, acids, and chemicals shall be permitted where flexibility is necessary between the electrified truck parking space supply equipment and the panelboard and inlet(s) on the truck.

Exception: Cords for the separable power supply cable assembly for 15 and 20A connections may be a hard-service type.

(3) Attachment Plug. The attachment plug(s) shall be listed, by itself or as part of a cord set, for the purpose and shall be molded to or installed on the flexible cord so that it is secured tightly to the cord at the point where the cord enters the attachment plug. If a right-angle cap is used, the configuration shall be oriented so that the grounding member is farthest from the cord. Where a flexible cord is provided with an equipment grounding conductor and equipped with an attachment plug, the attachment plug shall comply with 250.138(A) and 250.138(B).

(3) Connection to a 20-Ampere Receptacle. A separable power supply cable assembly for connection to a truck having a 20-ampere inlet shall have an attachment plug that shall be 2-pole, 3-wire, grounding type, rated 20 amperes, 125 volts and intended for use with the 20-ampere, 125-volt receptacle, conforming to the configuration shown in Figure xxx.21(e). 626.30(c)

Exception: A separable power supply cable assembly, rated 15A, provided for the connection of an engine block heater [, a battery charger, an inverter system of 1000W or less, a fuel heater, an oil pan heater, and/or a fuel/water separator/ heater] only, shall have an attachment plug that shall be 2-pole, 3-wire, grounding type, rated 15 amperes, 125 volts, conforming to the configuration shown in Figure 626.30(c) xxx.21(d).

FPN: Complete details of the 15- or 20-ampere plug and receptacle configuration can be found in the National Electrical Manufacturers Association Standard for Dimensions of Attachment Plugs and Receptacles, ANSI/NEMA WD 6-2002, Figure 5-15 or 5-20.

● Section 626.32.32 proposes specifications for on-board equipment yet vehicle specification standards are the purview of the Society of Automotive Engineers J2698 document. The following two parts of Section 626.32.32 indicated in strikethrough format should therefore be removed:

32.32 Truck/Vehicle Coupler.

(A) Inlet Rating and Configuration. Truck Inlet.

~~(1) Each truck shall be provided with not more than two inlets corresponding to the type and rating of connector of the power supply cable truck parking space supply equipment to which it is intended to be connected. See 626.30(C)~~

~~(D) Protection Against Corrosion and Mechanical Damage. Permanent provisions shall be made for the protection of the inlet and truck distribution panel, attachment plug of the power supply cord and any connector cord assembly or receptacle against corrosion and mechanical damage if such devices are in an exterior location while the truck is in transit.~~

● Section 626.34.34 proposes specifications for on-board equipment and should be removed. The condition of loss of power of the primary power source is accounted for in the Society of Automotive Engineers J2698 document. The following part indicated in strikethrough format should therefore be removed:

~~34.34 Loss of Primary Power Source. Means shall be provided such that, upon loss of voltage from the utility or other electric system(s), energy cannot be back fed through the truck and the truck supply equipment to the electrified truck parking space wiring system unless permitted by 626.36.~~

Substantiation: TMA appreciates the opportunity to provide comments on this latest version of the proposed 2008 National Electrical Code, Article 626: Electrified Truck Parking Space Equipment [hereinafter Article 626]. TMA represents the following companies: Ford Motor Company, Freightliner LLC, General Motors Corporation, International Truck and Engine Corporation, Isuzu Commercial Truck of America, Inc., Kenworth Truck Company, Mack Trucks, Inc., Peterbilt Motors Company, Sterling Truck Company, Volvo Truck North America, Inc., and Western Star Trucks. Many of the recommendations we offered in our September 23, 2005, letter have been addressed in this latest version; we appreciate the NEC code article committee's responsiveness in this regard. A few issues remain, however.

Paralleling the NEC effort, we can report that the corresponding SAE Task Force has balloted SAE J2698 - Primary Single Phase Nominal 120 VAC Wiring Distribution Assembly Design. This document, while still in the approval process, will provide the basis for the on-board vehicle wiring assemblies to which parking space electrical connections can be made. It is critical to the successful implementation of truck stop electrification that the two documents provide a consistent and compatible interface between the vehicle and the electrified parking space.

The following compatibility issues remain crucial to enabling trucks to connect to off-board power:

1. TMA maintains our previous recommendation that a minimum of two 20-ampere, 120-volt AC connections are needed at electrified truck parking spaces. Depending on environmental conditions, the driver and vehicle may not utilize this full capacity, but this minimum availability is necessary for a viable electrified truck parking space system.

2. Trucks may be equipped with: NEMA 5-15P or NEMA 5-20P plugs and/or vehicle shore power connectors for engine block heaters, battery chargers, inverter systems of 1000 watts or less, fuel heaters, fuel/water separator and heaters, and oil pan heaters; and with NEMA 5-20P plugs and/or vehicle shore power connectors for on-board 120VAC systems.

3. At this time, TMA members do not envision their customers needing a 30-ampere, 120/208 volt AC configuration on board the truck. While it is difficult to predict future power configurations, our members who are participating in the SAE J2698 standard development process are only able to identify need for 120-volt AC systems.

Panel Meeting Action: Reject
Panel Statement: The panel realizes that there are many on-board loads but on-board systems are beyond the scope of this article.
The requirements for protection against corrosion and mechanical damage and loss of primary source are necessary and should not be deleted. See panel action and statement on Comment 12-44.

12-41 Log #1420 NEC-P12 **Final Action: Accept in Principle**
(626 (New))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 12-81
Recommendation: [Section numbering in this Comment replaces "**xxx**" from the original Proposal with "**626**" in specific numbering, based on the assignment of this Proposal as new Article 626.]

The Proposal should be Accepted in Principle, with the following specific modifications:

626.3 General Requirements.

A. Systems. This article covers 120-, ~~120/208-, or~~ 120/240-, 208Y/120-, 480-, or 480Y/277-volts, nominal, single-or three-phase, 3 or 4-wire power systems respectively, with ground. [remainder unchanged]

II. Electrified Parking Space Electrical Wiring System. [insert after 626.4, before 626.5]

626.x Hazardous (Classified) Locations.

(A) Motor Fuel Dispensing Stations. Electrified parking space electrical wiring systems located at or serving motor fuel dispensing stations shall comply with Article 514 in addition to the requirements of this article.

(B) Vehicle Repair and Storage Facilities. Electrified parking space electrical wiring systems located at facilities for the repair or storage of self-propelled vehicles that use volatile flammable liquids or flammable gases for fuel or power shall comply with Article 511 in addition to the requirements of this article.

FPN: For additional information, see NFPA 30A, 2003, Motor Fuel Dispensing Facilities and Repair Garages.

[revised 626.5 to reference above]

626.5 Other Articles. Except where required by 626.x, wherever ~~Whenever~~ the requirements of articles of this Code and Article 626 differ, the requirements of Article 626 apply.

626.20(B) Type Receptacles Provided. [626.20(B) main paragraph and 626.20(B)(1) unchanged]

(2) One 30-ampere, 120/208-volt, 3-pole, 4-wire receptacle or one 30-ampere, 125/250-volt, 3-pole, 4-wire receptacle.

~~FPN: Complete details of the 30 ampere plug and receptacle configuration can be found in the Standard for Pin and Sleeve Configurations, UL1686, Configuration sections, Part C2.10 or C3.~~

~~FPN: See Figure 626.21 for details regarding receptacle types.~~

626.21(D) Attachment Plug. [626.21(D) main paragraph and 626.21(D)(1) unchanged]

(2) Connection to a 30-Ampere Receptacle.

(a) rated 30 amperes, 120/208 volts and intended for use with the 30-ampere, 120/208-volt receptacle~~, conforming to the configuration shown in Figure 626.21(g) and intended for use with 120/208 volt switched receptacle configuration conforming to the configuration shown in Figure 626.21(c),~~ or

(b) rated 30 amperes, 125/250 volts and intended for use with the 30-ampere, 125/250-volt receptacle~~, conforming to the configuration shown in Figure 626.21(f) and intended for use with 125/250 volt receptacle configuration conforming to the configuration shown in Figure 626.21(b)~~

~~FPN: Complete details of the 30-ampere plug and receptacle configuration can be found in the Standard for Pin and Sleeve Configurations, UL1686, Configuration sections, Part C2.10 or C3.~~

[next paragraph of 626.21(D) unchanged]

Figure 626.21

[delete configurations (b), (c), (f), and (g) and their rows]

626.21(E) Connector. [626.21(E)(1) unchanged]

(2) The connector for a separable power supply cable assembly, as specified in 626.21(A)(2), shall be a 3-pole, 4-wire grounding type, either:

(a) rated 30 amperes, 120/208 volts, ~~switched inlet connector type, conforming to the configuration shown in Figure 626.21(c) and~~ intended for use with 120/208-volt ~~switched~~ inlet, ~~conforming to the configuration shown in Figure 626.21(c),~~ or

(b) rated 30 amperes, 125/250 volts, ~~conforming to the configuration shown in Figure 626.21(f) and~~ intended for use with 125/250-volt inlet ~~configuration conforming to the configuration shown in Figure 626.21(b)~~.

~~FPN: Complete details of the 30 ampere plug and receptacle configuration can be found in the Standard for Pin and Sleeve Configurations, UL1686, Configuration sections, Part C2.10 or C3.~~

FPN: The connector in 626.21(E)(2)(b) may be used on a 120/208-volt, single-phase circuit.

~~626.20(D) Switch-Rated or Interlocked Receptacles.~~ [delete 626.20(D) in its entirety]

626.21(A) Rating. [626.21(A) main paragraphs unchanged]

(1) Twenty-Ampere Power-Supply Assembly. Trucks wired with a 20-ampere, 125-volt truck inlet, in accordance with ~~626.21(F)(1)~~ 626.21(G)(1), shall use a listed 20-ampere power-supply assembly.

Exception: [unchanged]

(2) Thirty-Ampere Power-Supply Assembly. Trucks wired with a 30-ampere, 120/208- or 125/250-volt truck inlet, in accordance with ~~626.21(F)(2)~~ 626.21(G)(2), shall use a mating listed 30-ampere main power-supply assembly having the same voltage rating.

~~626.21(F) Switch-Rated or Truck Coupler.~~ [delete 626.21(F) in its entirety]

626.21(G) Truck Coupler.

(2) Construction and Installation. The truck coupler shall be ~~constructed in accordance with 626.21(F) and~~ be installed so as to guard against inadvertent personal contact ~~by persons~~ with parts made live from the electrified parking space supply equipment or truck.

~~626.28(D) Switch-Rated or Interlocked Receptacles.~~ [delete 626.28(D) in its entirety]

626.11 Calculations, Table 626.10 Demand Factors for Services and Feeders, and USDA Agriculture Plant Hardiness Zone Map.

This proposal's sole mandatory method to correlate Demand Factor to the USDA Agriculture Plant Hardiness Zone Map should be a nonmandatory FPN (as one possible alternative) to allow the AHJ to select alternative methods to establish the applicable Demand Factor.

Reevaluate the percentage Demand Factors assigned to any given Zone based upon the year-round data, rather than solely upon January data, to ensure that those values reflect the relative balance between heating and cooling loads that shift in the various climatic zones as the summer months approach. Also, the percentage Demand Factors should be based upon coincident peak daily demand rather than average daily demand.

Substantiation: NEMA supports proposed new Article 626 in Principle but disagrees with some specifics within the Proposal, as revised above the substantiated as follows:

626.3: The proposed Article 626 covers Transport Refrigerated Units, also known as Refrigerated Transport Units. American National Standard ANSI/UL1686, Figures C2.11 and C2.12, defines the configurations for receptacles/cord connectors and plugs/inlets, respectively, for such refrigerated transport units and already specifies the North American rating as 30 amperes at 440 volts 3-phase (nominal voltage 480 volts 3-phase). Furthermore, proposed 626.5(A) addresses "480Y/277, and 480 volts". Include 480- and 480Y/277-volts in the 626.3 delineation of covered system voltages. Editorial: show "120/208-" as "208Y/120-" to be consistent with 220.5(A).

626.x Hazardous (Classified) Locations. 626.5: Electrified parking spaces at trucking stops have the potential of being in close proximity to occupancies for fuel dispensing and for vehicle repair and storage; these occupancies are hazardous (classified) locations. Proposed 626.5 is ambiguous and may be misconstrued to mean that specific requirements of Article 626 intended solely for ordinary locations might also be sufficient for hazardous (classified) locations as well and would incorrectly take precedence over requirements of Articles 514 and 511 in those classified locations. Arcing devices such as plugs, outlets, switches, switchgear, etc., should not be used in hazardous (classified) locations, unless evaluated and Listed as suitable for such locations. Revision in accordance with this Comment removes that ambiguity. 626.x(A) and 626.x(B) for trucking vehicles parallel similar established requirements in 555.21 and 555.22, respectively, for boating vehicles.

626.20(B)(2), 626.20(B)(2) FPNs (two), 626.21(D)(2)(a), 626.21(D)(2)(b), 626.21(D)(2) FPN, Figure 626.21, 626.21(E)(2)(a), 626.21(E)(2)(b), 626.21(E)(2) first FPN: Presently, 30-ampere 208Y/120 V or 125/250 V, 3-pole 4-wire, is new to truck stop electrification and there are no specific plug/receptacle configurations standardized for this application either by a ratified consensus standard or by established *de facto* universal practices.

Consequently, unilateral assignment of specific configurations would be prescriptive, rather than postscriptive, on the part of NFPA. There are many eligible plug/receptacle configurations at these ratings. Unilateral assignment by NFPA to these ratings of a specific plug/receptacle configuration neither standardized for this application either by a ratified consensus standard or by established *de facto* practices may raise legal or regulatory issues for NFPA. If nothing else, the Code should not be used as a design manual.

Furthermore, the referenced standard UL1686 Part C (or Part B as well) contains no configurations where 2 ungrounded conductors (2 of 3), 1 grounded conductor (neutral) and 1 grounding conductor (equipment grounding/bonding) are derived from a 208Y/120 V 3-phase + neutral + grounding (5-wire) system. The 2P+N+G configurations indicated as (c) and (g) are not extracted from the published ANIS/UL1686 standard. They may represent a proprietary configuration for a proprietary, patented system of plugs and receptacles.

When Article 625 was established, similar consensus could not be reached on competing configurations and there were no established *de facto* configurations for that new application. Consequently, Article 625 was not permitted to include configurations prescriptively and indeed none are reflected. This same situation exists for Article 626 and these proposed 30-ampere configurations should not be included.

By contrast, the proposal for Article 626 does not reflect the ANSI- and internationally-standardized configuration specifically for the application for refrigerated units (RTU or TRU), in ANSI/UL1686 Figures C2.11 and C2.12, for 30-ampere (North America)/32-ampere (elsewhere), 440-volt/380-volt, 60/50 Hz. Since this plug/receptacle configuration is indeed formally standardized for this specific application, this ANSI- and internationally-standardized configuration should be explicitly included in Article 626.

626.20(D), 626.21(F), 626.21(G)(2), 626.28(D): The proposer's Substantiation for 626.20(D) and 626.21(F) incorrectly state "standard NEMA receptacles, plugs, connectors and inlets have not been rated for make and break under load and may be damaged as a result of repeated connection or disconnection under load."

Standards ANSI/UL498 and ANSI/UL1682 in fact specifically test bladed and pin-and-sleeve devices, respectively, for Overload and Resistance-To-Arcing cycling endurance while rupturing 150 percent of ampere-rated current (some are additionally current-rupture tested based upon horsepower rating) as part of a sequence that includes temperature rise and may include contact

weight retention. Indeed, some NEMA devices are additionally evaluated for 200 percent cycling current rupture for Federal Specification applications. The Substantiation offered no rationale or justification for the 35 kA short circuit withstand rating. Indeed, for decades receptacles, plugs and couplers in the existing ANSI- and internationally-standardized configuration specifically used with refrigerated units (RTU or TRU) are neither mandated to be switch-rated nor to have a short circuit withstand rating at all; per 90.1(C), the Code is not intended as a design specification.

626.21(A)(1), 626.21(A)(2): Incorrectly referenced to subparagraphs in 626.21(F) that does not exist. It would appear to be the subparagraph in 626.21(G) that was intended. 626.21(A)(2) also omitted the 30-ampere, 125/250 V rating present elsewhere.

626.11 Calculations, Table 626.10 Demand Factors for Services and Feeders, and Agriculture Plant Hardiness Zone Map: The Demand Factor is established by Climatic Temperature Zones derived from the USDA Agriculture Plant Hardiness Zone Map. This method to correlate Demand Factor may be difficult for the AHJ to interpret locally and enforce. Locating any particular jurisdiction on the Agriculture Plant Hardiness Zone Map may be difficult in areas bordering zone transitions and may result in conflicting values. This particular methodology should be an optional FPN rather than mandated as the only method to allow the AHJ discretion in selecting alternative methods to establish the applicable demand factor. The AHJ may be faced with drastic changes in elevation within that jurisdiction (mountain passes, canyons, etc.) and may warrant local deviations from the broadly assigned climatic zones.

Per the Proposal Substantiation for 626.10, the assigned percentage Demand Factors are based solely upon January data. Those values may differ at other times of the year where the relative balance between heating and cooling loads shift in the various climatic zones as the summer months approach. Consequently, the profile of kW per occupied space versus USDA Plant Hardiness Zones may differ throughout the year. Also, it is unclear whether peak or average daily demand was used to establish those values. The Proposal Substantiation for 626.10 indicates that "truck stops with electrified parking spaces are filled to capacity or near capacity during the evening rest hours and are virtually empty during the day." The values for demand factors should, therefore, be based on peak daily demand when loads are coincident.

Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Comment 12-44, which meets the intent of the submitter.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:
QUAVE, D.: This proposal brings up some very good questions about the mandatory enforcement of the hardiness zone map for calculating load demands. Without this, there is not any new material in this new Article 626 and should eliminate the entire article.

12-42 Log #1726 NEC-P12 **Final Action: Accept in Principle**
(626 (New))

Submitter: Brian Sisco, Southern California Edison
Comment on Proposal No: 12-81
Recommendation: Accept the Proposal for a new Article 626.
Substantiation: In response to the comment made by Mr. T. Hedges:

The article is necessary because: (1) it contains requirements that are essential for safety and unique to this application, (2) it disallows unsafe options that would otherwise be permitted by the existing code, and (3) it defines the boundaries for electrical inspectors while establishing a safe infrastructure up to that boundary in anticipation of potentially unsafe conditions outside the jurisdiction of the code. Specifically, requirements unique to this application not covered by Chapters 1 through 4 of the Code are: (1) Demand factors based upon climatic temperatures at the site location. (2) Physical layout and configuration of equipment. The article excludes the "turtle back or speed bump" design since such designs are easily damaged by snow removal equipment as well as water and flooding in truck parking sites. This article identifies the post, pedestal, overhead gantry, and raised concrete pad configurations as acceptable types, thereby disallowing so-called turtle-back or speed bump designs that have been shown to be inherently unsafe due to susceptibility to flooding or severe damage by snow plows. (3) Location or placement (height) of equipment at sites where existing/known flood plains exist. (4) Limitations to the maximum length of separable cable assemblies to minimize damage to the cables and prevent use of "daisy-chained" cord sets. Present Code requirements do not limit the length of the cable assemblies that could reach 85 - 90 ft. Such lengths would promote the use of multiple cable assemblies connected in series, unacceptable voltage drops, an increased likelihood of damage to the cable assemblies, and exposure of the series connection (i.e., connector plug) to possible immersion, disconnection under load, etc. (5) Strain relief and breakaway requirements to prevent permanent equipment damage and exposure of live parts for cable assemblies permanently attached to the equipment. (6) Preventing backfeed of energy where not intended. The aftermarket modification of vehicles, which is outside the jurisdiction of electrical inspectors or the OEMs, poses unique problems in that modifications to the trucks may not have or provide appropriate protection. For example, aftermarket auxiliary power units (APU's) and generators are commonly used to supply power to the truck when the engine is shut down. Improper installation of these power sources can result in the backfeed of energy into the grid creating an unsafe condition for electric utility workers. This article defines the boundaries while providing safety up to the point of connection to the equipment. Chapters 1 through 4 do not address the issue of energy back feed.

Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Comment 12-44, which meets the intent of the submitter to include provisions for electrified truck parking spaces.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

12-43 Log #1984 NEC-P12 **Final Action: Reject**
(626 (New))

Submitter: Noel Williams, Herriman, UT
Comment on Proposal No: 12-81
Recommendation: This Proposal should have been Rejected.
Substantiation: More consideration should be given to the explanation of negative by Mr. Hedges. This article does not add very much significantly new or different material other than the definition and the use of a specified connection means. Since Chapter 6 is titled "Special Equipment," and a primary function of Chapter 6 is to provide rules that are different in some respect from other requirements in the first four chapters, there should be something different or special about this equipment and it appears that there is little that is special or different. If a new article must be added, it should be limited in content to those requirements that are special or different. This proposed article contains mostly requirements that are found elsewhere in the NEC. Adding additional unnecessary regulations and bulk to the NEC is not in the interest of usability of this code. Furthermore, this article adds requirements that apply to the truck itself, which is not, according to 90.2(B)(1), even within the scope of the NEC.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Comment 12-38.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:
QUAVE, D.: The panel action should have been to accept. The submitter's substantiation is correct

---

12-44 Log #2025 NEC-P12 **Final Action: Accept in Principle**
(626 (New))

TCC Action: The Technical Correlating Committee directs that the following actions be taken:

1. 626.4(D) is to be deleted because it is outside the scope of the NEC.

2. In 626.22(C), the last sentence is to be deleted as it is already covered in 110.26.

3. In 626.2, make the following revisions to the definition to read as follows:

"Cord Connector. A device which, by inserting it into a truck flanged surface inlet, establishes an electrical connection to the truck for the purpose of providing power for the on-board electric loads and may provide a means for information exchange. This device is part of the truck coupler."

4. In 626.4, revise the wording to read as follows:

"626.4 General Requirements.

(A) Not Covered. The provisions of this article shall not apply to that portion of other equipment in residential, commercial or industrial facilities that require electric power for devices used to load and unload cargo and equipment, operate conveyors, and other devices on the site or truck."

5. In 626.10 Branch Circuit, revise the text to read as follows:

"Electrified truck parking space single-phase branch circuits shall be derived from a 208Y/120 volt, 3-phase, 4-wire system or a 120/240 volt, single phase, 3-wire system."

6. Delete 626.20 as it is already covered by Article 250.

7. In the last sentence of 626.24(B), add "(B)(1) and (B)(2)" after the word "with". Also, revise (B)(1) from "…on an individual…" to "… connected to an individual…".

8. In 626.25(A)(1) and (A)(2), delete the word "wired".

9. In 626.25(B)(1) revise the wording to read as follows:

"(1) Conductors. The cord shall be a listed type with three or four conductors, for single-phase connection, one conductor of which shall be identified in accordance with 400.23.

Exception: It shall be permitted to use a separate listed three conductor separable power supply cable assembly, one conductor of which shall be identified in accordance with 400.23, and rated 15 amperes, 125-volts for connection to an engine block heater for existing vehicles."

10. In 626.25(B)(2), revise the wording to read as follows:

"(2) Cord. Extra-hard usage flexible cords and cables, rated not less than 90°C (194°F), 600 volts; listed for both wet locations and sunlight resistance; and having an outer jacket rated to be resistant to temperature extremes, oil, gasoline, ozone, abrasion, acids, and chemicals shall be permitted where flexibility is necessary between the electrified truck parking space supply equipment, the panelboard, and flanged surface inlet(s) on the truck."

11. In 626.30, replace the word "mentioned" with the word "required".

12. In 626.30(B), replace "Part III" with "Part III of Article 626."

13. In 626.32(B), in the first sentence, add the word "equipment" before the words "grounding conductor".

14. Revise 626.32(C)(1) and (2) to read: "(1) 30-ampere, 480-volt, 3-phase, 3-pole, 4-wire and intended for use with 30-ampere 480-volt, 3-phase, 3-pole 4-wire receptacles and inlets respectively, or
(2) 60-ampere, 208-volt, 3-phase, 3-pole, 4-wire and intended for use with 60-ampere, 208-volt, 3-phase, 3-pole, 4-wire receptacles and inlets,

respectively."
15. In 626.31(B), change "762 mm" to "750 mm".
16. Delete 626.21 as it is already covered in Article 225.
17. Add "Electrified Truck Parking Space" and "Article 626" to Table 210.2 Specific-Purpose Branch Circuits.
18. Add "Electrified Truck Parking Space" and "Article 626" to Table 220.3 Additional Load Calculation References.
Submitter: Roger D. McDaniel, McDonough, GA
Comment on Proposal No: 12-81
Recommendation: Revise Article 626 as follows:
Revise as follows:
Article 626
Electrified Truck Parking Spaces ~~Equipment~~
I. General
626.1 Scope. The provisions of this article cover the electrical conductors and equipment external to the truck or transport refrigerated unit that connect trucks or and transport refrigerated units to a supply of electricity, and the installation of equipment and devices related to electrical installations within an electrified truck parking space.
626.2 Definitions. ~~(See Article 100 for additional definitions.)~~
~~Air Conditioning or Comfort Cooling Equipment. All of that equipment intended or installed for the purpose of processing the treatment of air so as to control simultaneously its temperature, humidity, cleanliness, distribution to meet the requirements of the conditioned space.~~
~~Appliance, Portable. An appliance that is actually moved or can easily be moved from one place to another in normal use.~~
~~article, the following major appliances, other than built are considered portable if cord connected, refrigerators, cook tops, range, television, or other similar appliances.~~
~~FPN: For the purpose of this article, the following major appliances, other than built are considered portable if cord connected: refrigerators, cook tops, range, television, or other similar appliances.~~
Cable management system. An apparatus designed to control and organize unused lengths of cable or cord at electrified truck parking spaces.
Cord Connector. A device that, by insertion into a truck inlet, establishes an electrical connection to the truck for the purpose of providing power for the on-board electric loads and may provide a means for information exchange. This device is part of the truck coupler.
~~Converter. A device that changes electrical energy from one form to another, as from alternating current to direct current.~~
Disconnecting Means, Parking Space. The necessary equipment usually consisting of a circuit breaker or switch and fuses, and their accessories, located near the point of entrance of supply conductors in an electrified truck parking space and intended to constitute the means of cutoff for the supply to that truck.
Electrified Truck Parking Space. A truck parking space that has been provided with an electrical system that allows truckers to "plug in" their vehicles while stopped, and use off-board power sources in order to operate on-board systems such as air conditioning, heating and appliances, without any engine idling.
FPN: An electrified truck parking space may also include dedicated parking areas for heavy duty trucks at travel plazas, warehouses, shipper and consignee yards, depot facilities, border crossings, etc. It does not include areas such as the shoulders of on and off highway ramps and access roads, camping and recreational vehicle sites, residential and commercial parking areas used for automotive parking or other areas where ac power is provided solely for the purpose of connecting automotive and other light electrical loads, such as engine block heaters, and at private residences.
~~Electrified Truck Parking Space Supply Equipment, also known as Truck Stop Electrification Equipment. The conductors, including the ungrounded, grounded and equipment grounding conductors, and the connectors, attachment plugs, and all other fittings, devices, interlocking mechanisms, power outlets, circuit breakers, switches, and fuses, and their related accessories, located near the point of entrance of supply conductors to a electrified parking space, installed specifically for the purpose of delivering energy from the electrified truck parking space wiring system to the truck service equipment within the truck and that is intended to constitute the disconnecting means for the supply to the truck.~~
~~FPN: The electrified parking space supply equipment may be configured in three basic styles (i.e., pedestal, overheat gantry, and raised concrete pad design) for use at different electrified parking spaces in different climatic zones and for different parking configurations, see XXX.18(A).~~
Electrified Truck Parking Space Wiring Systems. All of the electrical wiring, equipment, and appurtenances related to electrical installations within an electrified truck parking space including the electrified parking space supply equipment.
~~Frame Chassis rail and any welded addition thereto metal thickness of 1.35 mm (0.053 in.) or greater Low-voltage. An electromotive force rated 24 volts, nominal, or less, supplied from a transformer, converter, or battery.~~
Overhead Gantry. A structure consisting of horizontal framework supported by vertical columns spanning above electrified truck parking spaces that supports equipment, appliances, raceway and other necessary components for the purpose of supplying electrical, HVAC, internet, communications, and other services to the spaces.
Separable Power Supply Cable Assembly. A flexible cord or cable, including ungrounded, grounded, and equipment grounding conductors, provided with a female connector, an attachment plug and all other fittings, grommets, or devices installed for the purpose of delivering energy from the source of electrical supply to the inlet installed within the truck.
~~Transformer. A device that, when used, raises or lowers the voltage of alternating current of the original source.~~
Transport Refrigerated Unit (TRU), also known as Refrigerated Transport Units (RTU). A trailer with ~~an~~ integrated heating and/or cooling ~~device~~ for the purpose of maintaining the desired environment of temperature-sensitive goods or products ~~(being transported in trucks, trailers, etc.)~~
Truck. ~~A heavy duty vehicular type unit primarily designed for commercial transportation of goods and equipment, which has its own motive power. It is built on a permanent chassis, typically designed with but not required to include a sleeper berth and without a permanent foundation where connected to the required utilities and that may include heating, air conditioning, and electric systems contained therein.~~
Motor vehicle ~~primarily~~ designed for the transportation of goods, services, and equipment.

Truck Coupler. A mating truck inlet and connector set.
Truck Flanged Surface Inlet. The device(s) on the truck into which the connector(s) is inserted for providing electric energy. It may also be used for the exchange of information. This device is part of the truck coupler. For the purposes of this code, the truck flanged surface inlet is considered to be part of the truck and not part of the electrified truck parking space supply equipment.
~~Truck Parking Space. An area within a truck stop vehicle park set aside and identified for the accommodation of a truck on a temporary basis.~~
Truck ~~Service~~ Supply Equipment. The on-board equipment ~~attached to or connected to~~ of the truck containing the disconnecting means, overcurrent protective devices, and flanged surface inlets or other means for connecting the truck to the electrified truck parking space supply equipment.
~~Truck Stop. A plot of land upon which two or more truck parking sites are located, established, or maintained for occupancy by trucks for resting purposes.~~
~~FPN: An electrified parking space may also include dedicated parking areas for heavy duty trucks at travel plazas, warehouses, shipper and consignee yards, depot facilities, border crossings, etc. It does not include areas such as the shoulders of on and off highway ramps and access roads, camping and recreational vehicle sites, residential and commercial parking areas used for automotive parking or other areas where ac power is provided solely for the purpose of connecting automotive and other light electrical loads, such as engine block heaters, and at private residences.~~
~~Truck Stop Electrification. An electrical system that allows truckers to "plug in" their vehicles while stopped, and use off board power sources in order to opeate on board systems such as air conditioning, heating and appliances, without any engine idling.~~
~~Truck Stop Feeder Circuit Conductors. The conductors from the electrified parking space service-equipment to the electrical parking space supply equipment.~~
626.3 Other Articles. Whenever the requirements of other articles of this code and Article 626 differ, the requirements of Article 626 shall apply.
626.4 General Requirements.
~~(A)~~(A) Not Covered. The provisions of this article do not apply to that portion of other equipment in residential, commercial or industrial facilities that require electric power for devices used to load and unload cargo and equipment, operate conveyors, and other devices on the site or truck.
(B) Distribution System Voltages. Unless other voltages are specified, the nominal ac system voltage of 120, 120/240, 208Y/120, 240, or 480Y/277, ~~and 480 volts~~ shall be used to supply equipment covered by this article.
(B)(C) ~~Systems. This article covers 120, 120/240, 120308Y/208120, 480Y277, or 120/240 volts volts nominal single or three phase, 3 or 4 wire ac power supply systems respectively, with ground. Where a different voltage is required by either design or available power supply system, adjustment shall be made in accordance with other articles and sections for the voltage used.~~
~~(C)~~ Connection to Wiring System. The provisions of this article shall apply to the electrified truck parking space supply equipment intended for conection to a wiring system as defined in 626.10(A)~~4~~(B)(3(A).
~~(D)~~(D) Illumination. Illumination shall be provided ~~required~~ to facilitiate safe use of electrified truck parking spaces.
~~625.5 Listed or Labeled. All electrical materials, devices, appliances, fittings, and other equipment shall be listed or labeled by a qualified testing agency and shall be connected in an approved manner when installed.~~
~~Reserved~~
~~I.~~II. Electrified Truck Parking Space Electrical Wiring Systems.
626.10 Branch Circuits. Electrified truck parking space single phase branch circuits shall be derived from a 208Y/120 ~~120/208~~ volt 3-phase system or a 120/240 volt single-phase system.
~~626.6 Primary Distribution Systems.~~
~~(B)(A) Distribution System Voltages. Unless other voltages are specified, the nominal as system voltages of 120, 120/240, 208Y/120, 240, or and 480Y/277, and 480 volts shall be used to supply equipment covered by this article.~~
~~626.4 Other Articles. Whenever the requirements of other articles of this code and article xxx differ, the requirements of Article xxx apply.~~
~~(C) Secondary Distribution Parking Space Supply System. The electrified truck parking space secondary electrical distribution system to electrified truck parking space supply equipment shall be single phase derived from 208Y/120 120/208 volt three phase, four-wire system or 120/240 volt split single phase system.~~
Exception: A 120-volt distribution system ~~Existing electrified truck parking space equipment~~ shall be permitted to supply existing electrified truck parking spaces ~~may also be provided with a 120 volt distribution systems for use by legacy vehicles.~~
~~626.8 Underground Service, Feeder, Branch-Circuit, and Electrified Parking Space Feeder-Circuit Conductors.~~
~~(A) General. All direct-burial conductors, including the equipment grounding~~

conductor if of aluminum shall be insulated and identified for the use. All conductors shall be continuous from equipment to equipment. All splices and taps shall be made in approved junction boxes or by use of material listed and identified for the purpose.

(B) Protection Against Physical Damage. Direct buried conductors and cables entering or leaving a trench shall be protected by rigid metal conduit, intermediate metal conduit, liquidtight flexible nonmetallic conduit, lLiquidtight flexible metal conduit, or other approved raceways or enclosures. Where subject to physical damage, the conductors or cables xhall be protected by rigid metal conduit, intermediate metal conduit, or Schedule 80 rigid nonmetallic conduit. All such protection shall extend at least 450 mm (18 in.) into the trench from finished grade.

FPN: See 300.5 and Article 340 for conductors or Type UF cable used underground or in direct burial in earth.

626.10 626.11 Feeder and Service Load Calculations.

(A) General. The calculated load of a feeder or service shall not be less than the sum of the loads on the branch circuits, supplied, as determined by Part III of this article, as calculated in section 626.12, after any applicable demand factors permitted have been applied.

FPN: See Examples D1(A) through D10 in Annex D.

(B) Demand Factors. Electrified truck parking space electrical wiring systems are based upon the climatic zone in which the equipment is installed.

626.12 Calculations.

(A) Parking Space VA Electrical service and feeders shall be calculated on the basis of not less than 1100 volt-amperes per electrified truck parking space.

(B) Demand Factors. The demand factors set forth in Table xxx.10 626.12(B) shall be the minimum allowable demand factors that shall be permitted in calculating load for service and feeders.

Where the electrical supply for a truck parking space has more than one receptacle, the calculated load shall be calculated for all receptacles. No demand factor shall be allowed for any other load, except as provided in this code.

Table xxx 10 626.12(B) Demand Factors for Services and Feeders

Climatic Temperature Zone Hardiness Zone see Figures 626.12(B)(1) & (2)	Demand Factor (Percent)
1	70%
2a	67%
2b	62%
3a	59%
3b	57%
4a	55%
4b	51%
5a	47%
5b	43%
6a	39%
6b	34%
7a	29%
7b	24%
8a	21%
8b	20%
9a	20%
9b	20%
10a	21%
10b	23%
11	24%

FPN: The Climatic Temperature (hardiness) Zone defines different areas across the country according to temperature zones. These zones are used to correlate power and energy requirements with ambient weather conditions. Data indicates that the HVAC has the highest power requirement in cold climates, with the heating demand representing the greatest load, which in turn is dependent on outside temperature. In very warm climates, where no heating load is necessary, the cooling load increases as the outdoor temperature rises. The U.S. Department of Agriculture (USDA) has developed a commonly used "Plant Hardiness Zone" map that is publicly available. The map provides guidance for determining the Climatic Temperature Zone shown in Table 626.12B.

Figure 626.12(B)(1) US Department of Agriculture Plant Hardiness Zone Map

Figure 626.12(B)(2) US USDA Hardiness Zones and Average Annual Minimum Temperature Range.

(C) Two or More Vehicles. Where the electrical supply is in a location that serves two or more trucks, the equipment for each site shall must comply with xxx.10 626.12(A) and the calculated load shall be computed on the basis of each parking site. No demand facor shall be allowed for any other load, except as provided in this Code.

(D) Conductor Capacity Rating. Truck site branch circuit conductors shall have an capacity ampacity not less than the loads supplied.

626.14 Overcurrent Protection. Overcurrent protection shall be provided in accordance with Article 240.

626.18 Grounding. All electrical equipment and installations in truck parks shall be grounded as required by Article 250.

626.17626.16 Reserved

II.III. Electrified Truck Parking Space Supply Equipment (Off board)

626.18 626.20 Grounding.

(A) Exposed Non-Current-Carrying Metal Parts. Exposed non-current carrying metal parts of fixed equipment, metal boxes, cabinets, and fittings that are not electrically connected to grounded equipment shall be grounded by a continuous equipment grounding conductor run with the circuit conductors from the service equipment or from the transformer of a secondary distribution system. Equipment grounding conductors shall be sized in accordance with 250.122. and shall be permitted to be spliced by listed means.

The arrangement of equipment grounding connections shall be such that the disconnection or removal of a receptacle or other device will not interfere with, or interrupt, the grounding continuity.

(C)(B) Secondary Distribution System Grounding. Each secondary distribution system shall be grounded at the transformer secondary.

(C) Neutral Grounded Conductor Not to Be Used as an Equipment Grounding Conductor. The neutral grounded conductor shall not be used as an equipment grounding conductor fro trucks or equipment within the truck park.

(C) NoLoad-Side Grounding Connections. Bonding Connection to the Grounded Conductor on the Load Side. A grounding connection shall not be made to any grounded conductor on the load side of the service disconnecting means. No connection to a grounding electrode shall be made to the neutral conductor on the load side of the service disconnecting means except as covered in 250.30(A) for separately derived systems. and 250.32(B)(2) for separate buildings.

626.21 Clearances for Overhead Conductors Clearance.

(A)(A) Conductors Not Over 600 Volts. Open cConductors or cables of not over 600 volts, nominal, shall have a vertical clearance of not less than 55 m (18 ft) measured from the surface of the parking lot and a horizontal clearance of not less than 900 mm (3 ft) in all areas subject to truck movement. In all other areas, clearances shall conform to 225.18 and 225.19.

(B) Conductors Over 600 Volts. (B) Conductors Over 600 Volts.

FPN: For clearances of cConductors and cables over 600 volts, nominal, shall conform to 225.60 and 225.61.

626.22 Wiring Methods and Installation Materials.

(A) Electrified Truck Parking Space Supply Equipment Type. The electrified truck parking space supply equipment shall be provided in one of the following forms:

(1) Post or Pedestal.

(2) Overhead Gantry.

(3) Raised Concrete Pad.

(B) Mounting Heights. Post Ppedestal, and raised concrete pad types of electrified truck parking space supply equipment shall be not less than 600 mm (2 ft) above ground, Oor above, the height of the point identified as the prevailing highest water level mark or an equivalent benchmark based on seasonal or storm-driven flooding from the authority having jurisdiction, flood plain level, whichever is greater.

(C) Access and Working Space. All electrified truck parking space supply equipment shall be accessible by an unobstructed entrance or passageway not less than 600 mm (2 ft) wide and not more than 2.0 m (6 ft. 6 in.) high. Working Space. Sufficient space shall be provided in and maintained about all electrical equipment to permit ready and safe operation, in accordance with 110.26.

(D) Facility Disconnecting Means. A disconnecting switch or circuit breaker shall be provided to disconnect one or more electrified truck parking space supply equipment sites from a remote location. in the site supply equipment for disconnecting the power supply to a section of the truck stop. The facility disconnecting means shall be provided and installed in a readily readily visible and accessible location and shall be capable of being locked in the open position. Portable means for adding a lock to the switch or circuit breaker shall not be permitted.

626.23 Overhead Gantry or Cable Management System. Electrified truck parking space equipment provided from either overhead gantry or cable management systems shall be permitted to utilize may be provided with a permanently attached power supply cable in electrified truck parking space supply equipment. Cable(s) It shall be permitted permitted to be permitted to may also include or have be separate an from optional hybrid data, communications, optical fiber cable(s), shielding, and so forth etc.

The cable or cables shall be permitted to terminate in an electrified truck parking space supply equipment module that contains receptacles as described in 626.28(B). The power supply cable shall be connected directly to the terminals of the panelboard or conductors within a junction box in the equipment. and provided with a A mMeans to prevent strain from being transmitted to the terminals shall be provided.

A pPermanently attached The power supply cable(s) shall be provided with a means to de-energize the cable conductors and power service delivery device upon exposure to strain that could result in either cable damage rapture or separation of the cable from the power service delivery device and exposure of live parts.

626.24 Means for Connecting to Electrified Truck Parking Space Supply Equipment.

(A) General Each Ttrucks shall be supplied from electrified truck parking space supply equipment through not more than two suitable extra hard service cables or cords. Each connection to the equipment shall be by a single separable power supply cable assembly.

(B) Type Receptacles Provided NEMA Configurations. All receptacles shall be of the grounding type. A maximum of three receptacles shall be provided. Every truck parking space with electrical supply shall be equipped with:

(1) Two 20-ampere, single receptacles each shall be 125 volt single receptacles 2-pole 3-wire grounding type, rated 20 amperes, 125 volts, conforming to the configurations shown in Figure 626.30(C24(B) view(a), NEMA type 5.20R, and

FPN: For Complete details of the 15 or nonlocking and grounding-type 20-ampere plug and receptacle configuration, see can be found in the National Electrical Manufacturers Association Standard for Dimensions of Attachment Plugs and Receptacles, ANSI/NEMA WD 6-2002, Figure 5.20.

(2) One single receptacle 3-pole, 4-wire grounding type, single phase rated either 30-amperes, 208Y/120/208 volts or 125/250-volts, ~~3 pole, 4 wire receptacle, conforming to the configurations shown in Figure 626.30(C24(B) view (b) or (c)~~. The 125/250-volt receptacle shall be permitted to be used on a 208Y/120-volt, single-phase circuit.

FPN 1: For various configurations. ~~Complete details~~ of ~~the~~ 30-ampere ~~plug~~ pin and sleeve receptacles, see ANSI/UL 1686, ~~configuration can be found in~~ the Standard for Pin and Sleeve Configurations, ~~UL 1686, Cofigurations section~~ Parts Figure C2.~~10~~.9 or Part C3.

~~FPN 2: See Figure 626.30(C) for details regarding receptacle types.~~

Exception: Where electrified truck parking space supply equipment provides the air-conditioning and comfort cooling function without requiring a direct electrical connection at the truck, only the two receptacles identified in 626.2~~12~~524(B)(1) need be provided.

~~Additional receptacles shall be permitted for the connection of electrical equipment outside the truck within the electrified truck parking space.~~

FPN: For Transport Refrigerated Units. (TRU), see Part IV ~~CHECK EDITORIAL~~

~~(D)~~(C) Disconnecting Means, Parking Space. The electrified truck parking space supply equipment shall be provided with a ~~disconnecting~~ switch or circuit breaker for disconnecting the power supply ~~to the individual truck service equipment.~~

~~(E)Switch-Rated or Interlocked Receptacles.~~ Means to Prevent Connection or Disconnection Under Load. Each single receptacle provided by the electrified truck parking space supply equipment and connected to a power supply cable assembly supplying the truck flanged surface inlet shall be either a switch rated receptacle-plug combination, include an interlocked receptacle with an associated switching device of an interlocking type, or provided with an equivalent means to prevent connection or disconnection under load. ~~The switching device shall be marked with a short circuit current rating rated to close into and withstand short-circuit (fault currents of at least 35kA.~~

~~(C)~~(D) The switch rated receptacle-lug combination, the interlocked plug and receptacle combination, or other means provided shall ensure that the ~~use~~ no live parts are exposed to contact, ~~r has no access to live parts.~~

(E)(~~F~~) Ground-Fault Circuit-~~I~~nterrupter Protection for Personnel ~~(GFCI)~~. The electrified truck parking space equipment shall be designed and constructed such that all receptacle outlets are provided with ground-fault circuit interrupter protection ~~GFCI protection~~ for personnel.

626.25 Separable Power-Supply Cable Assembly. ~~Where a~~A separable power-supply cable assembly, consisting of a cord with a female connector ~~and~~ and attachment plug ~~is provided and~~ intended for connection with ~~, the vehicle shall be equipped with a~~ truck permanently ~~mounted,~~ flanged surface inlet, ~~in accordance with **626.32(A),** wired directly to the panelbard by an approved wiring method. The attachment plug~~ shall be of a listed type. The power-supple cable assembly or assemblies shall be ~~i~~ndentified ~~OEM (factory) supplied or OEM or factory approved~~, and be of one of the following types and ratings specified herein. Cords with adapters and pigtail ends, extension cords, and similar items shall not be used ~~attached to, provided or shipped with a truck.~~

~~A.~~(A). Ratings(s).

(1) Twenty-Ampere Power-Supply Cable Assembly. ~~Trucks~~ Equipment wired with a 20-ampere, 125-volt ~~truck inlet~~ receptable, in accordance with 626.2~~1~~24(F~~G~~B)(1), shall use a listed 20-ampere power-supply cable assembly.

Exception: A listed separable power supply cable assembly, either hard-service or extra hard service and rated 15-amperes, 125 volts may be provided for connection to an engine block heater for legacy vehicles.

(2) Thirty-Ampere Power-Supply Cable Assembly. ~~Trucks~~ Equipment wired with a 30-ampere, 208Y/120~~/208~~ volt or 125/250-volt ~~truck inlet~~ receptacle, in accordance with 626.2~~1~~24(F~~G~~B)(2) shall use a listed 30-ampere main power-supply cable assembly.

(~~C~~)(B) Listed Cord Assemblies.

(1) Conductors. The cord shall be a listed type with three or four conductors, for single phase connection, one of which shall be identified by a continuous green color for use as the equipment grounding conductor.

Exception: A separate listed three conductor separable power supply cable assembly, having one conductor identified by a continuous green color for use as the equipment grounding conductor, and rated 15 amperes, 125-volts may be provided for connection to an engine block heater for legacy vehicles.

~~Cord.~~

(2) Cord. Extra-hard usage flexible cords and cables rated not less than ~~194°F~~ (90°C) (194°F), 600 volts; listed for both wet locations and sunlight resistance; and having an outer jacket rated to be resistant to temperature extremes, oil, gasoline, ozone, abrasion, acids, and chemicals shall be permitted where flexibility is necessary between the electrified truck parking space supply equipment and the panelboard and inlet(s) on the truck.

Exception: Cords for the separable power supply cable assembly for 15 and 20 A connections may be a hard-service type.

(3) Cord Overall Length. The exposed cord length shall be measured from the face of the attachment plug to the point of entrance to the truck or the face of the flanged surface inlet or to the point where the cord enters the truck. The overall length of the cable shall not exceed 7.5 m (25 ft) unless equipped with a cable management system that is listed as suitable for the purpose.

~~(2)flexibility is necessary between the electrified truck parking space supply equipment and the panelboard and inlet(s) on the truck.~~

~~Exception: Costs for the separable power supply cable assembly for 15 and 20 A connections may be a hard service type.~~

~~(3)~~ (4) Attachment Plug. The attachment plug(s) shall be listed, by itself or as part of a cord set, for the purpose and shall be molded to or installed on the flexible cord so that it is secured tightly to the cord at the point where the cord enters the attachment plug. If a right-angle cap is used, the configuration shall be oriented so that the grounding member is farthest from the cord. Where a flexible cord is provided, ~~with an equipment grounding conductor and equipped with an attachment plug,~~ the attachment plug shall comply with 250.138(A) ~~and 250.138(B)~~.

~~(1)~~(a) Connection to a 20-Ampere Receptacle. A separable power supply cable assembly for connection to a truck having a 20-ampere inlet shall have a~~n~~ nonlocking-type attachment plug that shall be 2-pole, 3-wire, grounding type, rated 20 amperes, 125 volts and intended for use with the 20-amperes, 125-volt receptacles~~, conforming to the configuration shown in Figure xxx.21(e), 626.3025(A) view (e)~~.

Exception: A separable power supply cable assembly, rated 15 A, provided for the connection of an engine block heater only, shall have an attachment plug that shall be 2-pole, 3-wire, grounding type, rated 15 amperes, 125 volts, conforming to the configuration shown in Figure 626.3025(B) view (cd) xxx.21(d).

FPN: For nonlocking- and grounding-type ~~Complete details of the~~ 15- or 20-ampere plug and receptacle configuration~~s~~, see ~~can be found in the~~ National Electrical Manufacturers Association *Standard for Dimensions of Attachment Plugs and Receptacles*, ANSI/NEMA WD 6-2002, Figure 5-15 or 5-20.

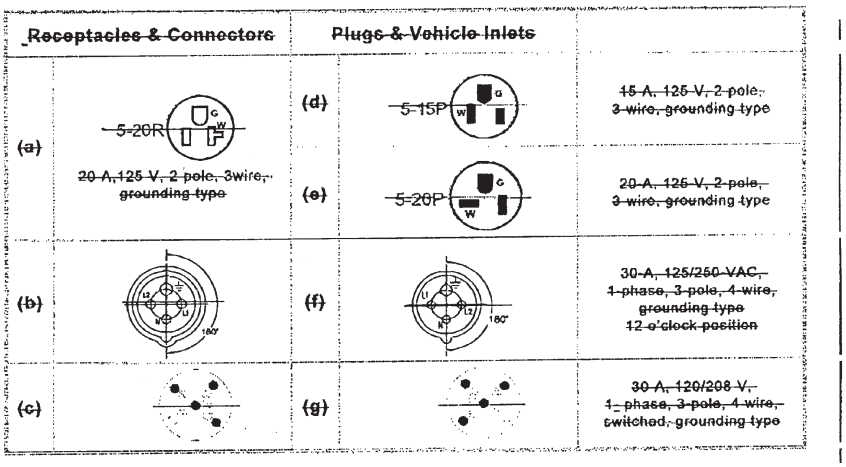
~~(2)~~(b) Connection to a 30-Ampere Receptacle. A separable power supply cable assembly for connection to a truck having a 30-ampere inlet shall have an attachment plug that shall be 3-pole, 4-wire, grounding type, rated 30-amperes, 208Y/120-volts or 125/250-volts, and intended for use with the receptacle in accordance with 626.24(B)(2). The 125/250-volt attachment plug shall be permitted to be used on a 208Y/120-volt, single-phase circuit. ~~either:~~

~~(a)(1)(i) rated 30 ampere, 120/208Y/120 volts and intended for use with the 30 ampere, 120/208Y120volt receptacle, conforming to the configuration shown in Figure 626.30, 25(b) and intended for use with 120/208Y/120 volt switched receptacle configuration conforming to the configuration shown in Figure 626.3025(B), or~~

~~(b)(2)(ii) rated 30 amperes, 125/250 volts and intended for use with the 30 ampere, 125/250 volt receptacle, conforming to the configuration shown in Figure 626.30 25(B) and intended for use with 125/250 volt receptacle configuration conforming to the configuration shown in Figure 626.3025(B).~~

FPN: For various configurations ~~Complete details of the~~ 30 ampere pin and sleeve plugs, see ANSI/UL 1686, *~~and receptacle configuration can be found in the~~ Standard for Pin and Sleeve Configurations*, ~~UL 1636, Configurations section, Parts~~ Figure C2.10 or Part C3.

~~FPN No. 2: The attachment plug in 626.25(B)(4)(b)(2) may be used on a 120/208 volt, single phase circuit.~~



~~Figure 626.25(B)(4)(a) Receptacle, Connector, Attachment Plug and Inlet Configurations, 2-Pole, 3 Wire and 3 Pole, 4 Wire Grounding Types, Used for Electrified Truck Parking Space Supply Equipment, Separable Power Supply Cable Assemblies and Truck Inlets.~~

(5) Cord Connector.

~~(1)~~ The cord for a separable power supply cable assembly, as specified in ~~xxx~~626.25.~~21~~(~~AB~~A)(1), shall be a 2-pole, 3-wire grounding type, rated 20 amperes, 125 volts.

Exception: The cord connector for a separable power supply cable assembly, rated 15A, provided for the connection of an engine block heater ~~only~~ for legacy vehicles, shall have an attachment plug that shall be 2-pole, 3-wire, grounding type, ~~NEMA 5 15R configuration,~~ rated 15 amperes, 125 volts.

~~(2)~~ The cord connector for a separable power supply cable assembly, as specified in ~~xxx.21(A)(2~~626.25(~~B~~A)(2)~~)~~, shall be a 3-pole, 4-wire grounding type, rated 30-amperes, 208Y/120-volts or 125/250 volts. The 125/250-volt cord connector shall be permitted to be used on a 208Y/120-volt, single-phase circuit. ~~either.~~

~~(a)(a)rated 30 amperes, 120/208Y/120 volts, switched inlet connector type, conforming to the configuration shown in Figure xxx.21(c)626.25(B)(4)(a)(view c) and intended for use with 120/208Y/120 volt switched inlet, conforming to the configuration shown in Figure xxx.21(g), 626.25(B)(4)(a)(view g) or~~

~~(b)(b) rated 30 amperes, 125/250 volts, conforming to the configuration shown in Figure 626.25(B)(4)(a)(view b) xxx.21(b) and intended for use with 125/250 volt inlet, conforming to the configuration shown in Figure 626.25(B)(4)(a)(view f) xxx.21(f).~~

FPN: For various configurations ~~Complete details of the~~ 30-ampere cord connectors, ~~plug and receptacle configuration can be found in the~~ these ANSI/UL 1686 *Standard for Pin and Sleeve Configurations*, ~~UL 1686, Configurations section, Parts~~ Figure C2.~~10~~.9 or Part C3.

~~FPN No. 2: The cord connector in xxx.21(E)(b)626.26(B)(5)(b) may be used on a 120/208 volt, single phase circuit.~~

(5~~6~~) Switch-Rated or Interlocked Truck Coupler. Each connector provided by the separable power-supply assembly for use with the electrified truck parking space supply equipment shall be a part of either a switch rated connector-inlet combination, be used with an interlocked connector–inlet combination with an associated switching device of an interlocking type, or provided with an equivalent means to prevent connection or disconnection under load. ~~The switching device shall be marked with a short-circuit current rating rated to close into and withstand short circuit fault currents of at least 35 kA.~~

The switch rated connector-inlet combination, the interlocked connector and inlet combination, or other means provided shall ensure that ~~the user has~~ no ~~access to~~ live parts are exposed to contact.

~~(A) Inlet Rating and Configuration . Truck Inlet.~~

~~(1) Each truck shall be provided with not more than two inlets corresponding to the type and rating of connector of the power-supply cable assemblies provided and the rating of the receptacle in the electrified truck parking space supply equipment to which it is intended to be connected. See 626.30(C).~~

~~(2) Construction and Installation. The truck coupler shall be constructed in accordance with 626.30(C) and be installed so as to guard against inadvertent contact by persons with parts made live from the electrified truck parking space supply equipment or truck. Grounding pole. The truck coupler shall be provided with a grounding pole, unless part of a system identified and listed as suitable for the purpose in accordance with Article 250, Grounding Pole Requirements. The truck coupler shall be so designed that the grounding pole connection is the first to make and the last to break contact.~~

~~(B) Cord Overall Length. The exposed cord length shall be measured from the face of the attachment plug to the point of entrance to the truck or the face of the flanged surface inlet or to the point where the cord enters the truck. The overall length of the cable shall not exceed 7.5 m (25 ft) unless equipped with a capable management system that is listed as suitable for the purpose.~~

~~(C) Point of Entrance. Truck/Vehicle Inlet Location. The point of entrance of the separable power supply cable assembly to the truck or location of the truck inlet shall be in the exterior wall, either in front of or behind the driver door located at a height of not less than 600 mm (24 in.) and not more than 1.8 m (5.2 ft) above the parking surface.~~

~~(D) Protection Against Corrosion and Mechanical Damage. Permanent provisions shall be made for the protection of the inlet and truck distribution panel, attachment plug of the power supply cord and any connector cord assembly or receptacle against corrosion and mechanical damage if such devices are in an exterior location while the truck is in transit.~~

~~626.34~~ Loss of Primary Power ~~Source~~. Means shall be provided such that, upon loss of voltage from the utility or other electric system(s), energy cannot be backfed through the truck and the truck supply equipment to the electrified truck parking space wiring system unless permitted by 626.~~36~~27.

~~626.36~~ 626.27 Interactive Systems. Electrified truck parking space supply equipment and other parts of a system, either on-board or off-board the vehicle, that are identified for and intended to be interconnected to a vehicle and also serve as an optional standby system or an electric power production source or provide for the bi-directional power feed shall be listed as suitable for that purpose. When used as an optional standby system, the requirements of Article 702 shall apply, and when used as an electric power production source, the requirements of Article 705 shall apply.

~~Reserved~~

~~III. H.~~ IV Transport~~ation~~ Refrigerated Units (TRU)

~~626.38~~ 626.30 Transport Refrigerated Units. ~~A number of~~ electrical truck parking spaces ~~with electrical supply~~ intended to supply Transport Refrigerated Units shall ~~may each~~ include ~~be~~ a dedicated ~~equipped with additional~~ circuit and receptacle a~~c grid power capacity to provide~~ for operation of the heating/refrigeration units. The receptacle associated with the ~~For electrified truck parking space equipment covered by Parts I – II, a separate receptacle shall be provided for~~ Transport Refrigerated Units~~. This receptacles~~ shall ~~would~~ be provided ~~used~~ in addition to the three receptacles mentioned in 626.~~30~~284(B~~C~~).

(A) Branch Circuits ~~General Requirements Systems~~. TRU spaces shall be supplied from 208-volt 3-phrase or 480-volt 3-phase branch circuits with equipment grounding conductor. ~~This part covers 208Y/120 120/208, 480Y/277 277/480 volts, three phase, 3 or 4 wire ac power supply systems respectively, with ground. Where different voltage is required by either design or available power supply system, adjustment shall be made in accordance with other articles and sections for the voltage used.~~

(B) Electrified Truck Parking Space Supply Equipment. The electrified truck parking space supply equipment, or portion thereof, providing electrical power for the operation of TRUs ~~transport refrigerated units~~ shall comply with Part IV.

~~(E)~~(D) Reserved

~~626.40~~ 626.31 Disconnecting Means and Branch-Circuit Protective Equipment

(A) Disconnecting Means. Disconnecting means shall be provided to isolate each refrigerated unit from its supply connection.

~~(B) Permitted Disconnect Types. The disconnecting means shall be permitted to consist of a circuit breaker, motor circuit, or both, and shall be properly identified as to which receptacle it controls.~~

~~(C)~~ (B) Disconnect Location. The disconnecting means shall be readily accessible, located not more than 762 mm (30 in.) from the receptacle it controls, and shall be located in the supply circuit ahead of the receptacle. Circuit breakers or switches located in power outlets complying with this section shall be permitted as the disconnecting means.

~~(D)~~ (C) Means to Prevent Connection or Disconnection Under Load. ~~Switch Rated or Interlocked Receptacles~~. Each receptacle provided by the electrified truck parking space supply equipment shall be either a switch rated receptacle-plug combination, include an interlocked receptacle with an associated switching device of an interlocking type, or provided with an equivalent means to prevent connection or disconnection under load. ~~The switching device shall be marked with a short circuit current rating rated to close into and withstand short circuit fault currents of at least 35 kA.~~ The switch rated receptacle-plug combination, the interlocked plug and receptacle combination, or other means provided ~~shall~~ shall ensure that no live parts are exposed to contact.

(D ~~E~~) ~~NEMA Configuration~~ Receptacle Requirements. ~~Type Receptacles Provided.~~ All receptacles shall be of the grounding type. Every electrified truck parking space intended to provide an electrical supply for transport refrigerated units shall be equipped with either a:

(1) ~~(1)~~ 30 ampere, 480-volt, ~~3-phase~~ 3-phase receptacle, or

(2) ~~(2)~~ 60 ampere, 208-volt, 3-~~3~~phase receptacle.

FPN: Complete details of the 30-ampere pin and sleeve receptacle configuration for refrigerated containers (transport refrigerated units) can be found in ANSI/UL 1686, *Standard for Pin and Sleeve Configurations*, Figure C2.11. For various configurations of 60-ampere pin and sleeve receptacles, see ANSI/UL 1686, *Standard for Pin and Sleeve Configurations.*

~~*These electrical supplies shall be permitted to include additional receptacles that have configurations in accordance with xxx.21(B).*~~

~~626.42~~ 626.32 Power Supply Cable Assembly. ~~Where a~~A power supply cable assembly, consisting of a cord with an attachment plug and cord connector, shall ~~is provided, it shall be wired directly to the panelboard by an approved wiring method. The attachment plug shall be of a listed type. The power supply cable assembly or assemblies shall be OEM (factory) supplied or OEM or factory approved, and~~ be of one of the following types and rating specified herein. Cords with adapters and pigtail ends, extension cords, and similar items shall not be used. ~~attached to, provided or shipped with a truck.~~

(A) Rating(s). The power supply cable assembly shall be listed and rated:

(1) -30 ampere, 480-volt, ~~three phase~~ 3-phase, or

(2) -60 ampere, 208-volt, ~~three phase~~ 3-phase.

~~626.42~~ Power Supply Cable Assembly ~~Conductors.~~

~~(A)~~ (B) Listed Cord Assemblies. The cord shall be a listed type with four conductors, for ~~three phase~~ 3-phase connection, one of which shall be identified by a continuous green color for use as the grounding conductor. ~~Cord.~~ Extra-hard usage cables rated not less than 90˚C (194˚F) ~~(90˚C)~~, 600 volts; listed for both wet locations and sunlight resistance; and having an outer jacket rated to be resistant to temperature extremes, oil, gasoline, ozone, abrasion, acids, and chemicals shall be permitted where flexibility is necessary between the electrified truck parking space supply equipment and ~~the panelboard and~~ the inlet(s) on the truck.

~~(B)~~ (C) Listed Attachment Plug(s) and Cord Connector(s). Where a flexible cord is provided ~~with an equipment grounding conductor and equipped~~ with an attachment plug and cord connector, they ~~attachment plug~~ shall comply with 250.138(A). ~~and 250.138(B)~~. An attachment plug and cord connector for the connection of a truck or trailer shall be either:

(1) rated 30 ampere, 480-volt, ~~three phase~~ 3-phase and intended for use with a 480-volt, ~~three phase~~ 3-phase receptacle, or

(2) rated 60 ampere, 208-volt, ~~three phase~~ 3-phase and intended for use with the 60-ampere, 208-volt, ~~three phase~~ 3-phase receptacle ~~and intended for use with 208 volt, three phase receptacle.~~

FPN: Complete details of the 30-ampere pin and sleeve attachment plug and cord connector configurations for refrigerated containers (transport refrigerated units) can be found in ANSI/UL 1686, Standard for Pin and Sleeve Configurations, Figures C2.12 and C2.11. For various configurations of 60-ampere pin and sleeve attachment plugs and cord connectors, see ANSI/UL 1686, Standard for Pin and Sleeve Configurations.

~~FPN: Complete details of the 30-ampere and 60-ampere plug and cord connector configurations can be found in the Standard for Pin and Sleeve Configurations, UL 1686, Configurations section, Part C2 and Part C3.~~

The attachment plug(s) and cord connector(s) shall be listed, by itself or as part of the power supply cable assembly, for the purpose and shall be molded to or installed on the flexible cord so that it is secured tightly to the cord at the point where the cord enters the attachment plug or cord connector. If a right-angle cap is used, the configuration shall be oriented so that the grounding member is farthest from the cord.

~~(C) Truck/Vehicle Point of Entrance Location. The point of entrance of the power supply cable assembly to the truck or location of the transport refrigerated unit inlet shall be located at a height of not less than 600 m (24 in.) above the parking surface.~~

~~(D) Protection Against Corrosion and Mechanical Physical Damage. Permanent provisions shall be made for the protection of the power supply cable assembly, attachment plug and any other exposed portions of the transport refrigeration unit distribution system against corrosion and mechanical damage if such devices are in an exterior location while the truck or trailer is in transit.~~

~~(E)(B) Reserved.~~

Substantiation: The Code Making Panel 12 Chair, Tim Croushore formed a task group of Panel 12 members to develop a comment for proposed Article 626 "Electrified Truck Parking Spaces." The task group members are Roger McDaniel (chairman), William Anderson, Jeff Holmes, Ron Janikowski, Robert Jones, Todd Lottman, and Craig Sato.

The TCC directive was followed concerning the scope and title.

The TCC directive was followed regarding the rewrite of the proposed article for clarity, compliance with the NEC style Manual, and consistency of terminology. Several additions or deletions reflect relocation for clarity.

The article was rewritten to remove any requirements that are not within the scope of NFPA 70 (i.e., onboard truck/transport refrigerated units (TRU) equipment.)

The article was rewritten to remove any requirements that are addressed in other parts of the code. A FPN was added to further identify what an electrified truck parking space consists of and possible locations.

The definitions included in this article were modified to exclude definitions appearing in Article 100 or that related to onboard equipment outside the scope of this article.

Figures 626.12(B)(1) and (2) were deleted per NFPA request because the NEC is not printed in color and the colored map would be confusing to the user. The idea of including a website reference to the map was dismissed because of NFPA requirements as well. More detailed data was retrieved and included in the fine print note following Table 626.12(B) from the HTTP:// www.usna usda.gov/hardzone/ushzmap.html web site which includes the following statement. "Note: This publication is not copyrighted, and permission to reproduce all or any part of it is not required."

The mounting height datum in 626.22(B) was revised for consistency with terminology in Section 682.2(3). Permissive language was changed to mandatory language in 626.23 to prevent the maximum height of a connection from being beyond reach of 6 ft 7 in. height.

Section 626.32 was revised to r
efer to portable cable assemblies that are provided as a part of the means to connect the power supply equipment to the truck/trailer.

Figure 626.25(B)(4)(a) Receptacle, Connector, Attachment Plug, and Inlet Configurations was removed from this article. While the Task Group recognizes the need for standardization of configurations utilized with electrified truck parking spaces, the NEC and Code Making Panels is not the forum for establishing product standards nor in a position to endorse proprietary, patented connection products.

Panel Meeting Action: Accept in Principle

Revise Article 626 to read as follows:

ARTICLE 626
Electrified Truck Parking Spaces

I. GENERAL

626.1 Scope. The provisions of this article cover the electrical conductors and equipment external to the truck or transport refrigerated unit that connect trucks or transport refrigerated units to a supply of electricity, and the installation of equipment and devices related to electrical installations within an electrified truck parking space.

626.2 Definitions.

Cable Management System. An apparatus designed to control and organize unused lengths of cable or cord at electrified truck parking spaces.

Cord Connector. A device which, by inserting it into a truck flanged surface inlet, establishes an electrical connection to the truck for the purpose of providing power for the on-board electric loads and shall be permitted to provide a means for information exchange. This device is part of the truck coupler.

Disconnecting Means, Parking Space. The necessary equipment usually consisting of a circuit breaker or switch and fuses, and their accessories, located near the point of entrance of supply conductors in an electrified truck parking space and intended to constitute the means of cutoff for the supply to that truck.

Electrified Truck Parking Space. A truck parking space that has been provided with an electrical system that allows truck operators to connect their vehicles while stopped, and use off-board power sources in order to operate on-board systems such as air conditioning, heating and appliances, without any engine idling.

FPN: An electrified truck parking space also includes dedicated parking areas for heavy duty trucks at travel plazas, warehouses, shipper and consignee yards, depot facilities and border crossings. It does not include areas such as the shoulders of highway ramps and access roads, camping and recreational vehicle sites, residential and commercial parking areas used for automotive parking or other areas where ac power is provided solely for the purpose of connecting automotive and other light electrical loads, such as engine block heaters, and at private residences.

Electrified Truck Parking Space Wiring Systems. All of the electrical wiring, equipment, and appurtenances related to electrical installations within an electrified truck parking space including the electrified parking space supply equipment.

Overhead Gantry. A structure consisting of horizontal framework supported by vertical columns spanning above electrified truck parking spaces that supports equipment, appliances, raceway and other necessary components for the purpose of supplying electrical, HVAC, internet, communications and other services to the spaces.

Separable Power Supply Cable Assembly. A flexible cord or cable, including ungrounded, grounded, and equipment grounding conductors, provided with a cord connector, an attachment plug and all other fittings, grommets, or devices installed for the purpose of delivering energy from the source of electrical supply to the truck or TRU flanged surface inlet.

Transport Refrigerated Unit (TRU). A trailer or container, with integrated cooling and / or heating, used for the purpose of maintaining the desired environment of temperature-sensitive goods or products.

Truck. Motor vehicle designed for the transportation of goods, services, and equipment.

Truck Coupler. A truck flanged surface inlet and mating cord connector

Truck Flanged Surface Inlet. The device(s) on the truck into which the connector(s) is inserted providing electric energy and other services. This device is part of the truck coupler. For the purposes of this article, the truck flanged surface inlet is considered to be part of the truck and not part of the electrified truck parking space supply equipment.

626.3 Other Articles. Wherever the requirements of other articles of this Code and Article 626 differ, the requirements of Article 626 shall apply. Unless electrified truck parking space wiring systems are supported or arranged in such a manner that they cannot be used in or above locations classified in 511.3 or 514.3 or both, they shall comply with 626.3(A) and 626.3(B) in addition to the requirements of this article.

(A) Vehicle Repair and Storage Facilities. Electrified truck parking space electrical wiring systems located at facilities for the repair or storage of self-propelled vehicles that use volatile flammable liquids or flammable cases for fuel or power shall comply with Article 511.

(B) Motor Fuel Dispensing Stations. Electrified truck parking space electrical wiring systems located at or serving motor fuel dispensing stations shall comply with Article 514.

FPN: For additional information see NFPA 88A-2002, Standard for Parking Structures and NFPA 30A-2003, Code for Fuel Dispensing Facilities and Repair Garages.

626.4 General Requirements.

(A) Not Covered. The provisions of this article do not apply to that portion of other equipment in residential, commercial or industrial facilities that require electric power for devices used to load and unload cargo and equipment, operate conveyors, and other devices on the site or truck.

(B) Distribution System Voltages. Unless other voltages are specified, the nominal ac system voltages of 120, 120/240, 208Y/120, 240, or 480Y/277, shall be used to supply equipment covered by this article.

(C) Connection to Wiring System. The provisions of this article shall apply to the electrified truck parking space supply equipment intended for connection to a wiring system as defined in 626.10(A).

(D) Illumination. Illumination shall be provided to facilitate safe use of electrified truck parking spaces.

II. Electrified Truck Parking Space Electrical Wiring Systems

626.10 Branch Circuits. Electrified truck parking space single phase branch circuits shall be derived from a 208Y/120 volt 3-phase system or a 120/240 volt single-phase system.

Exception: A 120-volt distribution system shall be permitted to supply existing electrified truck parking spaces.

626.11 Feeder and Service Load Calculations.

(A) Parking Space Load. The calculated load of a feeder or service shall not be less than the sum of the loads on the branch circuits. Electrical service and feeders shall be calculated on the basis of not less than 11 kVA per electrified truck parking space.

(B) Demand Factors. Electrified truck parking space electrical wiring system demand factors shall be based upon the climatic temperature zone in which the equipment is installed. The demand factors set forth in Table 626.11(B) shall be the minimum allowable demand factors that shall be permitted in calculating load for service and feeders. No demand factor shall be allowed for any other load, except as provided in this Article.

Table 626.11(B) Demand Factors for Services and Feeders

Climatic Temperature Zone (USDA Hardiness Zone) See Note	Demand Factor (percent)
1	70%
2a	67%
2b	62%
3a	59%
3b	57%
4a	55%
4b	51%
5a	47%
5b	43%
6a	39%
6b	34%
7a	29%
7b	24%
8a	21%
8b	20%
9a	20%
9b	20%
10a	21%
10b	23%
11	24%

Note: The climatic temperature zones shown in Table 626.11(B) correlate with those found on the "USDA Plant Hardiness Zone Map," and the climatic temperature zone selected for use with the table shall be determined through the use of this map based on the installation location.

FPN: The US Department of Agriculture (USDA) has developed a commonly used "Plant Hardiness Zone" map that is publicly available. The map provides guidance for determining the Climatic Temperature Zone. Data indicates that the HVAC has the highest power requirement in cold climates, with the heating demand representing the greatest load, which in turn is dependent on outside temperature. In very warm climates, where no heating load is necessary, the cooling load increases as the outdoor temperature rises.

(C) Two or More Electrified Truck Parking Spaces. Where the electrified truck parking space wiring system is in a location that serves two or more electrified truck parking spaces, the equipment for each space shall comply with 626.11(A) and the calculated load shall be computed on the basis of each parking space.

(D) Conductor Rating. Truck space branch circuit conductors shall have an ampacity not less than the loads supplied.

III. Electrified Truck Parking Space Supply Equipment

626.20 Grounding.

(A) Exposed Non-Current-Carrying Metal Parts.

(1) **Fixed Equipment.** Exposed non-current-carrying metal parts of fixed equipment, metal enclosures, and fittings that are not electrically connected to grounded equipment shall be bonded by a continuous equipment grounding conductor run with the circuit conductors from the service equipment or from the transformer of a secondary distribution system. Equipment grounding conductors shall be sized in accordance with 250.122.

(2) **Grounding Connections.** The arrangement of equipment grounding connections shall be such that the disconnection or removal of a receptacle or other device will not interfere with, or interrupt, the grounding continuity.

(B) Distribution System Grounding. Each distribution system shall be grounded at the transformer secondary in accordance with 250.30(A).

(C) Load-Side Grounding Connections. A grounding connection shall not be made to any grounded conductor on the load side of the service disconnecting means except in accordance with 250.30(A) for separately derived systems.

626.21 Overhead Clearances.

(A) Conductors Not Over 600 Volts. Conductors or cables of not over 600 volts, nominal, shall conform to 225.18 and 225.19.

(B) Conductors Over 600 Volts. Conductors and cables over 600 volts, nominal, shall conform to 225.60 and 225.61.

626.22 Wiring Methods and Materials.

(A) Electrified Truck Parking Space Supply Equipment Type. The electrified truck parking space supply equipment shall be provided in one of the following forms:

(1) Post or Pedestal

(2) Overhead Gantry

(3) Raised Concrete Pad

(B) Mounting Height. Post, pedestal, and raised concrete pad types of electrified truck parking space supply equipment shall be not less than 600 mm (2 ft.) above ground or above the point identified as the prevailing highest water level mark or an equivalent benchmark based on seasonal or storm-driven flooding from the authority having jurisdiction.

(C) Access and Working Space. All electrified truck parking space supply equipment shall be accessible by an unobstructed entrance or passageway not less than 600 mm (2 ft.) wide and not more than 2.0 m (6 ft. 6 in.) high. Sufficient space shall be provided and maintained about all electrical equipment to permit ready and safe operation, in accordance with 110.26.

(D) Disconnecting Means. A disconnecting switch or circuit breaker shall be provided to disconnect one or more electrified truck parking space supply

equipment sites from a remote location. The disconnecting means shall be provided and installed in a readily accessible location and shall be capable of being locked in the open position. Portable means for adding a lock to the switch or circuit breaker shall not be permitted as the means required to be installed at and remain with the equipment.

626.23 Overhead Gantry or Cable Management System.

(A) Cable Management. Electrified truck parking space equipment provided from either overhead gantry or cable management systems shall utilize a permanently attached power supply cable in electrified truck parking space supply equipment. Other cable types and assemblies listed as being suitable for the purpose, including optional hybrid communications, signal, and optical fiber cables, shall be permitted.

(B) Strain Relief. Means to prevent strain from being transmitted to the wiring terminals shall be provided. Permanently attached power supply cable(s) shall be provided with a means to de-energize the cable conductors and power service delivery device upon exposure to strain that could result in either cable damage or separation from the power service delivery device and exposure of live parts.

626.24 Electrified Truck Parking Space Supply Equipment Connection Means.

(A) General. Each truck shall be supplied from electrified truck parking space supply equipment through suitable extra hard service cables or cords. Each connection to the equipment shall be by a single separable power supply cable assembly.

(B) Receptacle. All receptacles shall be listed and of the grounding type. Every truck parking space with electrical supply shall be equipped with:

(1) Two single receptacles, each shall be 2-pole 3-wire grounding type, rated 20 amperes, 125 volts, and shall be on an individual branch circuit, and

FPN: For the nonlocking-type and grounding-type 20-ampere receptacle configuration, see National Electrical Manufacturers Association *Standard for Dimensions of Attachment Plugs and Receptacles*, ANSI/NEMA WD6-2002, Figure 5-20.

(2) One single receptacle 3-pole, 4-wire grounding-type, single phase rated either 30-amperes 208Y/120-volts or 125/250-volts. The 125/250-volt receptacle shall be permitted to be used on a 208Y/120-volt, single-phase circuit.

FPN: For various configurations of 30-ampere pin and sleeve receptacles, see ANSI/UL1686, *Standard for Pin and Sleeve Configurations*, Figure C2.9 or Part C3.

Exception: Where electrified truck parking space supply equipment provides the air-conditioning and comfort cooling function without requiring a direct electrical connection at the truck, only the two receptacles identified in 626.24(B)(1) shall be required.

(C) Disconnecting Means, Parking Space. The electrified truck parking space supply equipment shall be provided with a switch or circuit breaker for disconnecting the power supply to the electric truck parking space. A disconnecting means shall be provided and installed in a readily accessible location and shall be capable of being locked in the open position. Portable means for adding a lock to the switch or circuit breaker shall not be permitted as the means required to be installed at and remain with the equipment.

(D) Ground-Fault Circuit-Interrupter Protection for Personnel. The electrified truck parking space equipment shall be designed and constructed such that all receptacle outlets in 626.24 are provided with ground-fault circuit-interrupter protection for personnel**.**

626.25 Separable Power-Supply Cable Assembly.

A separable power-supply cable assembly, consisting of a power supply cord, a cord connector, an attachment plug and intended for connection with a truck flanged surface inlet, shall be of a listed type. The power-supply cable assembly or assemblies shall be identified and be of one of the following types and ratings specified herein. Cords with adapters and pigtail ends, extension cords, and similar items shall not be used.

(A) Rating(s).

(1) Twenty-Ampere Power-Supply Cable Assembly. Equipment wired with a 20-ampere, 125-volt receptacle, in accordance with 626.24(B)(1), shall use a listed 20-ampere power-supply cable assembly.

Exception: It shall be permitted to use a listed separable power supply cable assembly, either hard-service or extra hard service and rated 15- amperes, 125 volts for connection to an engine block heater for existing vehicles.

(2) Thirty-Ampere Power-Supply Cable Assembly. Equipment wired with a 30-ampere, 208Y/120-volt or 125/250-volt receptacle, in accordance with 626.24(B)(2) shall use a listed 30-ampere main power-supply cable assembly.

(B) Power Supply Cord.

(1) Conductors. The cord shall be a listed type with three or four conductors, for single phase connection, one of which shall be identified in accordance with 400.23.

Exception: It shall be permitted to use a separate listed three conductor separable power supply cable assembly, having one of which shall be identified in accordance with 400.23, and rated 15 amperes, 125-volts for connection to an engine block heater for existing vehicles.

(2) Cord. Extra-hard usage flexible cords and cables rated not less than 90°C (194°F), 600 volts; listed for both wet locations and sunlight resistance; and having an outer jacket rated to be resistant to temperature extremes, oil, gasoline, ozone, abrasion, acids, and chemicals shall be permitted where flexibility is necessary between the electrified truck parking space supply equipment and the panel board and flanged surface inlet(s) on the truck.

Exception: Cords for the separable power supply cable assembly for 15 and 20 ampere connections shall be permitted to be a hard-service type.

(3) Cord Overall Length. The exposed cord length shall be measured from the face of the attachment plug to the point of entrance to the truck or the face of the flanged surface inlet or to the point where the cord enters the truck. The overall length of the cable shall not exceed 7.5 m (25 ft) unless equipped with a cable management system that is listed as suitable for the purpose.

(4) Attachment Plug. The attachment plug(s) shall be listed, by itself or as part of a cord set, for the purpose and shall be molded to or installed on the flexible cord so that it is secured tightly to the cord at the point where the cord enters the attachment plug. If a right-angle cap is used, the configuration shall be oriented so that the grounding member is farthest from the cord. Where a flexible cord is provided, the attachment plug shall comply with 250.138(A).

(a) Connection to a 20-Ampere Receptacle. A separable power supply cable assembly for connection to a truck flanged surface inlet, rated at 20 amperes, shall have a nonlocking-type attachment plug that shall be 2-pole, 3-wire, grounding type, rated 20 amperes, 125 volts and intended for use with the 20-ampere, 125-volt receptacle.

Exception: A separable power supply cable assembly, rated 15 amperes, provided for the connection of an engine block heater, only, shall have an attachment plug that shall be 2-pole, 3-wire, grounding type, rated 15 amperes, 125 volts.

FPN: For nonlocking- and grounding-type 15- or 20-ampere plug and receptacle configurations, see National Electrical Manufacturers Association *Standard for Dimensions of Attachment Plugs and Receptacles*, ANSI/NEMA WD6-2002, Figure 5-15 or 5-20.

(b) Connection to a 30-Ampere Receptacle. A separable power supply cable assembly for connection to a truck flanged surface inlet, rated at 30 amperes, shall have an attachment plug that shall be 3-pole, 4-wire, grounding type, rated 30-amperes, 208Y/120-volts or 125/250-volts, and intended for use with the receptacle in accordance with 626.24(B)(2). The 125/250-volt attachment plug shall be permitted to be used on a 208Y/120-volt, single-phase circuit.

FPN: For various configurations of 30-ampere pin and sleeve plugs, see ANSI/UL1686, *Standard for Pin and Sleeve Configurations*, Figure C2.10 or Part C3.

(5) Cord Connector. The cord connector for a separable power supply cable assembly, as specified in 626.25(A) (1), shall be a 2-pole, 3-wire grounding type, rated 20 amperes, 125 volts. The cord connector for a separable power supply cable assembly, as specified in 626.25(A)(2), shall be a 3-pole, 4-wire grounding type, rated 30-amperes, 208Y/120-volts or 125/250-volts. The 125/250-volt cord connector shall be permitted to be used on a 208Y/120-volt, single-phase circuit.

Exception: The cord connector for a separable power supply cable assembly, rated 15 amperes, provided for the connection of an engine block heater for existing vehicles, shall have an attachment plug that shall be 2-pole, 3-wire, grounding type, rated 15 amperes, 125 volts.

FPN: For various configurations of 30-ampere cord connectors, see ANSI/UL1686 *Standard for Pin and Sleeve Configurations*, Figure C2.9 or Part C3.

626.26 Loss of Primary Power. Means shall be provided such that, upon loss of voltage from the utility or other electric supply system(s), energy cannot be back-fed through the truck and the truck supply equipment to the electrified truck parking space wiring system unless permitted by 626.27.

626.27 Interactive Systems. Electrified truck parking space supply equipment and other parts of a system, either on-board or off-board the vehicle, that are identified for and intended to be interconnected to a vehicle and also serve as an optional standby system or an electric power production source or provide for bi-directional power feed shall be listed as suitable for that purpose. When used as an optional standby system, the requirements of Article 702 shall apply, and when used as an electric power production source, the requirements of Article 705 shall apply.

IV. Transport Refrigerated Units (TRU)

626.30 Transport Refrigerated Units. Electrified truck parking spaces intended to supply Transport Refrigerated Units shall include an individual branch circuit and receptacle for operation of the refrigeration/heating units. The receptacle associated with the Transport Refrigerated Units shall be provided in addition to the receptacles mentioned in 626.24(B).

(A) Branch Circuits. TRU spaces shall be supplied from 208-volt 3-phase or 480-volt 3-phase branch circuits and with an equipment grounding conductor in accordance with 250.118

(B) Electrified Truck Parking Space Supply Equipment. The electrified truck parking space supply equipment, or portion thereof, providing electrical power for the operation of TRU's shall be independent of the loads in Part III.

626.31 Disconnecting Means and Receptacles.

(A) Disconnecting Means. Disconnecting means shall be provided to isolate each refrigerated unit from its supply connection. A disconnecting means shall be provided and installed in a readily accessible location and shall be capable of being locked in the open position. Portable means for adding a lock to the switch or circuit breaker shall not be permitted as the means required to be installed at and remain with the equipment.

(B) Location. The disconnecting means shall be readily accessible, located not more than 762 mm (30 in.) from the receptacle it controls, and shall be located in the supply circuit ahead of the receptacle. Circuit breakers or switches located in power outlets complying with this section shall be permitted as the disconnecting means.

(C) Receptacles. All receptacles shall be listed and of the grounding type. Every electrified truck parking space intended to provide an electrical supply for transport refrigerated units shall be equipped with one or both of the following:

(1) a 30 ampere, 480-volt, 3-phase, 3 pole, 4 wire receptacle,

(2) a 60 ampere, 208-volt, 3-phase, 3 pole, 4 wire receptacle

FPN: Complete details of the 30-ampere pin and sleeve receptacle configuration for refrigerated containers (transport refrigerated units) can be found in ANSI/UL1686 *Standard for Pin and Sleeve Configurations*, Figure C2.11. For various configurations of 60-ampere pin and sleeve receptacles, see ANSI/UL1686 *Standard for Pin and Sleeve Configurations.*

626.32 Separable Power Supply Cable Assembly. A separable power supply cable assembly, consisting of a cord with an attachment plug and cord connector, shall be of one of the following types and rating specified below. Cords with adapters and pigtail ends, extension cords, and similar items shall not be used.

(A) Rating(s). The power supply cable assembly shall be listed and rated:

(1) 30 ampere, 480-volt, 3-phase, or

(2) 60 ampere, 208-volt, 3-phase

(B) Cord Assemblies. The cord shall be a listed type with four conductors, for 3-phase connection, one of which shall be identified in accordance with 400.23 for use as the grounding conductor. Extra-hard usage cables rated not less than 90°C (194°F), 600 volts, listed for both wet locations and sunlight resistance; and having an outer jacket rated to be resistant to temperature extremes, oil, gasoline, ozone, abrasion, acids, and chemicals, shall be permitted where flexibility is necessary between the electrified truck parking space supply equipment and the inlet(s) on the TRU.

(C) Attachment Plug(s) and Cord Connector(s). Where a flexible cord is provided with an attachment plug and cord connector, they shall comply with 250.138(A). The attachment plug(s) and cord connector(s) shall be listed, by itself or as part of the power supply cable assembly, for the purpose and shall be molded to or installed on the flexible cord so that it is secured tightly to the cord at the point where the cord enters the attachment plug or cord connector . If a right-angle cap is used, the configuration shall be oriented so that the grounding member is farthest from the cord. An attachment plug and cord connector for the connection of a truck or trailer shall be either:

(1) Rated 30 ampere, 480-volt, 3-phase, 3pole, 4 wire and intended for use with a 30 ampere 480-volt, 3-phase, 3 pole 4 wire receptacles and inlets respectively, or

(2) Rated 60 ampere, 208-volt, 3-phase, 3 pole, 4 wire and intended for use with a 60-ampere, 208-volt, 3-phase, 3 pole, 4 wire receptacles and inlets respectively

FPN: Complete details of the 30-ampere pin and sleeve attachment plug and cord connector configurations for refrigerated containers (transport refrigerated units) can be found in ANSI/UL1686, *Standard for Pin and Sleeve Configurations*, Figures C2.12 and C2.11. For various configurations of 60-ampere pin and sleeve attachment plugs and cord connectors, see ANSI/UL1686, *Standard for Pin and Sleeve Configurations.*

Panel Statement: The work on Article 626 was a result of a balanced task group assigned by the chairman of CMP-12 to address the issue of electrified truck parking spaces.
This article reflects input from representatives of all facets of the electrical industry. The task group also used expertise from other representatives of the truck parking space industry and technology.
CMP-12 recommends the that the TCC consider the following for correlation with the addition of this new article:

1. Add "Electrified Truck Parking Space" and "Article 626" to Table 210.2 Specific-Purpose Branch Circuits.
2. Add "Electrified Truck Parking Space" and "Article 626" to Table 220.3 Additional Load Calculation References.
3. Add "Electrified Truck Parking Space" and "Article 626" to Table 250.3 Additional Grounding Requirements.

Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:
QUAVE, D.: This proposal was completely overhauled at the panel meeting. Changes were made to require the outlets to be fed from individual branch circuits. All the interlocking features (safety measures) were eliminated. These are just some of the major changes that need more time to be reviewed.

12-45 Log #1728 NEC-P12 **Final Action: Reject**
(626.2)

Submitter: Brian Sisco, Southern California Edison
Comment on Proposal No: 12-81
Recommendation: Retain the original text.
Substantiation: The considerations and substantiation for this article were based on the use of this equipment by the heavy-duty truck industry and truck drivers who are required to stop for a rest period. The revised definition implies that other motor vehicles and the general public could use the equipment. Other potential users of this equipment, as implied by the modified definition, may raise additional concerns with regard to their skills in connecting their vehicles to this equipment, and the connection means, including various types of adapters, they may use in utilizing the electrified truck parking space equipment. This article was intended to serve the only commercially feasible user of electrified truck parking spaces at this time, that is, a heavy-duty truck as included in the original definition.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 12-42.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

12-46 Log #2307 NEC-P12 **Final Action: Accept in Principle**
(626.3)

Submitter: Brian Rock, Hubbell Incorporated
Comment on Proposal No: 12-81
Recommendation: Revise text to read as follows:
626.3 Other Articles. Wherever the requirements of articles of this Code and Article 626 differ, the requirements of Article 626 shall apply. Unless electrified truck parking space wiring systems are supported or arranged in such a manner that they cannot be used in or above locations classified in 511.3 or 514.3 or both, they shall comply with 626.3(A) and 626.3(B) in addition to the requirements of this article.
(A) Vehicle Repair and Storage Facilities. Electrified parking space electrical wiring systems located at facilities for the repair or storage of self-propelled vehicles that use volatile flammable liquids or flammable gases for fuel or power shall comply with Article 511.
(B) Motor Fuel Dispensing Stations. Electrified parking space electrical wiring systems located at or serving motor fuel dispensing stations shall comply with Article 514.
Revise text to read as follows:FPN: For additional information, see NFPA 88A—2002, *Standard for Parking Structures*, and NFPA 30A—2003, *Code for Fuel Dispensing Facilities and Repair Garages*.
Substantiation: Requirements of Article 626 as proposed are intended solely for ordinary locations. Electrified truck parking spaces, however, may be located adjacent to Special Occupancies for fuel dispensing and for vehicle repair and storage; these occupancies are frequently hazardous (classified) locations. As re-titled, Article 626 might be misconstrued as being a Special Occupancy rather than Special Equipment. Consequently, unrevised 626.3 could be misconstrued to mean that specific requirements of Article 626 might also be sufficient for hazardous (classified) locations as well and that Article 626 incorrectly takes precedence over requirements of Articles 511 and 514 in those classified locations. Arcing devices such as switchgear, switches, plugs, outlets, etc., shouldn't be used in hazardous (classified) locations, unless evaluated and Listed as suitable for such locations. Furthermore, Articles 511 and 514 have requirements for wiring and equipment installed above, as well as in, Class I locations. Revision in accordance with this Comment removes that ambiguity. 626.3(A) and 626.3(B) for electrical systems serving trucks are similar to established requirements 555.22 and 555.21, respectively, for electrical systems serving boats.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Comment 12-44, which meets the intent of the submitter.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

12-47 Log #1735 NEC-P12 **Final Action: Reject**
(626.10 and 626.12)

Submitter: Adam McCall, IdleAire Technologies Corporation
Comment on Proposal No: 12-81
Recommendation: Retain the original text.
Substantiation: In the substantiation provided with the original proposal, it was indicated that additional data from various truckstops, where electrified parking space equipment has been installed, would continue to be collected and be available for further review.
The additional data continues to show the Electrified Truck Parking Spaces (ETPS) will not be able to provide sufficient heating and cooling capacity if only two single-phase, 120Vac/20A circuits were provided to a parked truck. This can be clearly seen through the data I have submitted. The compilation of over 1 million hours of service has proven that the current proposed article is correct in suggesting that the required capacity to be delivered to a parked truck will require the 30A 208Vac circuit.
We believe there are two commercially-supported means for justifying this statement - by use of the existing ETPS field data and by reviewing the design capacity for some of the most popular on-board auxiliary power units. The existing ETPS field data continues to show the average demand varying with t he outdoor air temperature, as listed in the Demand Load graph provided in the original substantiation. This graph provided a design basis for the average total site load given the most probable occupancy of an ETPS user and the duty cycles present during the various ambient conditions.
It should be noted that the peak HVAC load present is greater than these averages and thus should be considered when evaluating the requirements for input power loads. The field data shows that in almost all weather conditions, a parked truck could require loads that exceed the available power capacity of a single-phase 20A/120Vac (2400W) branch circuit.
Furthermore, the market today for on-board systems, referred to herein as auxiliary power units (APUs), also suggests that the design requirements have moved well beyond the 2400W range. A quick look at five of the most commonly used APUs shows that the average cooling capacity for APU air conditioning units is 17,200 Btu/Hr, which corresponds to 42A @ 120Vac. This value far exceeds the single 120Vac/20A circuit rating and can only be provided by way of the proposed single-phase 30A 208Vac circuit.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The panel rejects the original wording. It does not provide clarity in accordance with the NEC Style Manual.

Ballot Results: Affirmative: 10

12-48 Log #2344 NEC-P12 **Final Action: Accept in Principle in Part**
(626.20.B)

Submitter: Jeff Kim, Shurepower, LLC
Comment on Proposal No: 12-81
Recommendation: Revise text to read as follows:
B. Type Receptacles Provided. All receptacles shall be of the grounding type. ~~A maximum of three receptacles shall be provided~~. Every truck parking space with electrical supply shall be equipped with:
(1) Two 20-ampere, 125-volt single receptacles, NEMA type 5-20R, and
FPN: Complete details of the 15-or 20-ampere plug and receptacle configuration can be found in the National ElectricalManufacturersAssociationStandar dforDimensionsofAttachmentPlugsandReceptacles, ANSI/NEMAWD6-2002, Figure 520.
(2) ~~One 30-ampere, 120/208-volt, 3-pole, 4-wire receptacle.~~
~~FPN: Complete details of the 30-ampere plug and receptacle configuration can be found in the Standard for Pin and Sleeve Configurations, UL 1686, Configurations section, Parts C2.10 or C3.~~
Substantiation: If power for TRUs is to be supplied there may be 4 or more receptacles for each truck parking space.
All currently available trucks with shore power connections use the 120-volt, type 5-20R or 5-15R receptacles. There is currently no reason to require a 120/208-volt connection. This requirement will only increase the overall cost of the infrastructure and could slow growth or this industry. It should be up to technology provider to decide if the third receptacle is necessary and will meet the needs of their customers. The higher amp connection may also encourage higher energy consumption. Future load requirements could be reduced with the use of energy management systems and insulation of the cab envelope.
Panel Meeting Action: Accept in Principle in Part
Panel Statement: The panel accepts in principle the removal of the maximium number of receptacles. See panel action on Comment 12-44 which meets the intent of the submitter.
The panel does not accept the recommendation for the removal of the 30-ampere receptacle. The substantiation does not allow for future 30-ampere configurations.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

12-49 Log #2350 NEC-P12 **Final Action: Accept in Principle (626.20.D)**

Submitter: Jeff Kim, Shurepower, LLC
Comment on Proposal No: 12-81
Recommendation: Revise text to read as follows:

D. Switch-Rated or Interlocked Receptacles. Each receptacle provided by the electrified parking space supply equipment shall be either a switch rated receptacle- plug combination, include an interlocked receptacle with an associated switching device of an interlocking type, or provided with an equivalent means to prevent connection or disconnection under load. The switching device shall be rated to close-into and withstand short circuit fault currents of at least 35 kA.

The switch rated receptacle-plug combination, the interlocked plug and receptacle combination, or other means provided shall ensure that the user has no access to live parts.

Exception: NEMA type 5-20R and 5-15R.

Substantiation: NEMA type 5-15R and 5-20 receptacles are not interlocked, therefore, they should not be required to have an interlock.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel has removed the requirement for interlocking on any types of receptacles. See panel action on Comment 12-44.
However, the panel does not agree with the submitter's substantiation that the limitation for interlocking be limited to NEMA Type 5-20R and 5-15R configuration receptacles. These configurations can be interlockable.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:

QUAVE, D.: The interlocking of the receptacles in order to protect the user from making or breaking "HOT" electrical circuits was a major selling point of this article. Now that it is to be eliminated, the entire article should be reconsidered.

Recommendation: *[Section numbering in this Comment replaces "626.28(B)" from the ROP Panel Meeting Action with "626. 24(B)" to be used in the CP12 Public Comment renumbering developed by the CP12 Ad Hoc Task Group on new Article 626. Figure 626.30(C) is numbered in accordance with the ROP Panel Meeting Action and may possibly be shown as Figure 626.25(B)(4)(a) in the CP12 Public Comment renumbering developed by the CP12 Ad Hoc Task Group on new Article 626.]*

Delete Figure 626.30(C) for Receptacle, Connector, Attachment Plug and Inlet Configurations

~~626.28~~ 626.24 Means for Connecting to Electrified Truck Parking Space Supply Equipment.

[626.24(A) in-between]

(B) ~~Type~~ Receptacles Provided ~~– NEMA Configurations~~. All receptacles shall be of the grounding type. ~~A maximum of three receptacles shall be provided.~~ Every truck parking space with electric supply shall be provided with:

(1) Two ~~20-ampere, 125-volt,~~ single receptacles, each shall be 2-pole, 3-wire grounding type, rated 20 amperes, 125 volts, ~~conforming to the configurations shown in Figure 626.30(C) view (a), NEMA type 5-20R,~~ and

FPN: For ~~Complete details of the 15- or~~ nonlocking- and grounding-type 20-ampere ~~plug and~~ receptacle configuration, see ~~can be found in~~ the National Electrical Manufacturers Association Standard for Dimensions of Attachment Plugs and Receptacles, ANSI/NEMA WD6-2002, Figure 5-20.

(2) One single receptacle, 3-pole, 4-wire grounding type, single-phase rated either 30 amperes, 208Y/120 volts or 125/250 volts ~~30-ampere, 120/208-volt, 3-pole, 4-wire single receptacle conforming to the configurations in Figure 626.30(C) view (b) or (c)~~. The 125/250-volt receptacle shall be permitted to be used on a 208Y/120-volt, single-phase circuit.

FPN 1: For various configurations ~~Complete details~~ of ~~the~~ 30-ampere ~~plug~~ pin and sleeve receptacles ~~configuration, see can be found in the~~ ANSI/UL1686, *Standard for Pin and Sleeve Configurations*, ~~UL1686, Parts~~ Figure ~~C2.10~~ C2.9 or Part C3.

~~FPN 2: See Figure 626.30(C) for details regarding receptacle types.~~

Exception: Where electrified truck parking space supply equipment provides the air-conditioning and comfort cooling function without requiring a direct electrical connection at the truck, only the two receptacles identified in ~~626.21(B)(1)~~ 626.24(B)(1) ~~need~~ shall be ~~provided~~ required.

FPN 2: For Transport Refrigerated Units (TRU), see Part ~~VI~~ IV.

Substantiation: Mandatory specification of a proprietary, patented, closed-license receptacle and plug configuration violates "GUIDELINE ON REFERENCES IN NFPA DOCUMENTS TO PROPRIETARY PRODUCTS AND SERVICES" in the NFPA Committee Officers Guide.

The configuration for the 20-ampere receptacle is a de facto standard via the widespread usage of the compatible NEMA 5-15 inlet for truck engine block heaters. The specific configuration for that 20-ampere receptacle is documented dimensionally in the Standard for Dimensions of Attachment Plugs and Receptacles, ANSI/NEMA WD6. The FPN directs the reader to the application-specific reference for this dedicated configuration.

Presently, there is no installed base of 30-ampere receptacles for truck applications. No accepted standards organization representing users has adopted the depicted configurations. NFPA should not be put in the position of being the sole standards-setting body determining which eligible receptacle and plug configurations should be permitted or excluded.

Furthermore, UL has indicated that the depicted configuration for the switch-rated 208Y/120-volt device is not among those in ANSI/UL1686 and will only be considered under "new business" upon issuance of the Third Edition after publication of the 2008 NEC®. UL also indicates there is no certainty any "new business" proposal will be adopted into the new edition.

12-53 Log #1723 NEC-P12 **Final Action: Accept in Principle (626.30(4)(a) and Figure 626.30(c))**

Submitter: Brian Sisco, Southern California Edison
Comment on Proposal No: 12-81
Recommendation: Retain the original text.
Substantiation: In response to comment by Mr. T. Lottmann (NEMA):

The proposed article included a choice of two possible means of connection (i.e., receptacle, plug, and connector) for the 30 ampere, 120/208 volt wiring devices. The article did not limit this means of connection to a single proprietary configuration.

The article provides for two means of safely connecting and disconnecting devices that are carrying a load. One is to interlock the receptacle with a separate switching device; the other is to incorporate the switch into the plug and receptacle. Both are commonly used throughout industry and both provide the desired level of safety for this application. Allowing both makes the code open to various technologies and provides equipment suppliers, truckstop operators and users the flexibility of using either of the technologies commonly used today.
Panel Meeting Action: Accept in Principle

(626.40(E))

Submitter: Brian Rock, Hubbell Incorporated
Comment on Proposal No: 12-81
Recommendation: *[Section numbering in this Comment replaces "**626.40(E)**" from the ROP Panel Meeting Action with "**626.31(D)**" to be used in the CP12 Public Comment renumbering developed by the CP12 Ad Hoc Task Group on new Article 626.]*
Revise text and add FPN to 626.31(D).
~~626.40~~ 626.31 Disconnecting Means and Branch-Circuit Protective Equipment
~~(E)~~ (D) ~~NEMA Configuration~~ Receptacle Requirements ~~Type Receptacles Provided~~. All receptacles shall be of the grounding type. Every electrified truck parking space intended to provide an electrical supply for transport refrigerated units shall be equipped with either a:
(1) 30-ampere, 480-volt, 3-phase receptacle, or
(2) 60-ampere, 208-volt, 3-phase receptacle.
FPN: Complete details of the 30-ampere pin and sleeve receptacle configuration for refrigerated containers (transport refrigerated units) can be found in ANSI/UL1686, *Standard for Pin and Sleeve Configurations*, Figure C2.11. For various configurations of 60-ampere pin and sleeve receptacles, see ANSI/UL1686, *Standard for Pin and Sleeve Configurations.*
Substantiation: The configuration for the 30-ampere receptacles, attachment plugs, cord connectors and inlets is already American- and internationally-standardized specific to the refrigerated container (transport refrigerated unit) application. These receptacles, attachment plugs, cord connectors and inlets are not bladed NEMA configurations (ANSI/NEMA WD6), so the indication of "NEMA Configuration" should be deleted. The specific configuration for that 30-ampere receptacle is documented dimensionally in the ANSI/UL *Standard for Pin and Sleeve Configurations*, ANSI/UL1686, in Figure C2.11 for outlet devices (receptacles and cord connectors). The FPN directs the reader to the application-specific reference for this dedicated configuration.
Presently, there is no standardized refrigerated container usage at either 60 amperes or at 208 volts. Consequently, for this application, there is no standardized configuration for receptacles, attachment plugs, cord connectors and inlets. The FPN for the 60-ampere configuration is purely an informative reference, without prejudice or endorsement, to a number of potentially eligible pin and sleeve configuration schemes that could serve the purpose.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Comment 12-44, which meets the intent of the submitter.
Number Eligible to Vote: 10

Comment on Proposal No: 12-81
Recommendation: *[Section numbering in this Comment replaces "**626.42**" and "**626.42(B)**" from the ROP Panel Meeting Action with "**626.32**"and "**626.32(C)**" to be used in the CP12 Public Comment renumbering developed by the CP12 Ad Hoc Task Group on new Article 626.]*
Revise wording to comply with TCC directive and add FPN to 626.32(C). NOTE: 626.32(C) wording differs from that developed by the CP12 Ad Hoc Task Group.
~~626.42~~ 626.32 Power Supply Cable Assembly. ~~Where a~~ A power supply cable assembly, consisting of a cord with an attachment plug and a cord connector, ~~is provided, it~~ shall ~~be wired directly to the panelboard by an approved wiring method. The attachment plug shall be of a listed type. The power supply cable assembly or assemblies shall be OEM (factory) supplied or OEM or factory approved, and~~ be one of the following types and rating specified herein. Cords with adapters and pigtail ends, extension cords, and similar items shall not be ~~attached to, provided or shipped with a truck~~ used.
[626.32(A) and 626.32(B) in-between]
~~(B)~~ (C) Listed Attachment Plug(s) and Cord Connector(s). Where a flexible cord is provided ~~with an equipment grounding conductor and equipped~~ with an attachment plug and a cord connector, ~~the attachment plug~~ they shall comply with 250.138(A) ~~and 250.138(B)~~. An attachment plug and cord connector for connection of a truck or trailer shall be either:
(1) rated 30-ampere, 480-volt, ~~three-phase~~ 3-phase, and intended for use with ~~a~~ 30-ampere, 480-volt, ~~three-phase~~ 3-phase receptacles and inlets, respectively, or
(2) rated 60-ampere, 208-volt, ~~three-phase~~ 3-phase, and intended for use with ~~a~~ 60-ampere, 208-volt, ~~three-phase~~ 3-phase receptacles and inlets, respectively.
FPN: Complete details of the 30-ampere pin and sleeve attachment plug and cord connector configurations for refrigerated containers (transport refrigerated units) can be found in ANSI/UL1686, *Standard for Pin and Sleeve Configurations*, Figures C2.12 and C2.11. For various configurations of 60-ampere pin and sleeve attachment plug and cord connectors, see ANSI/UL1686, *Standard for Pin and Sleeve Configurations*.
The attachment plug(s) and cord connector(s) shall be listed, by itself themselves or as part of the power supply cable assembly, for the purpose and shall be molded to or installed on the flexible cord so that it is they are secured tightly to the cord at the point where the cord enters the attachment plug or cord connector. If a right-angle cap attachment plug or cord connector is used, the configuration shall be oriented so that the grounding member contact is farthest from the cord.
Substantiation: Per TCC action, the Article is to cover the electrical equipment external to the truck or transport refrigerated unit. Consequently, the cord connector must be defined since the power supply cable assembly must be a cord set consisting of an attachment plug, flexible cable and cord connector rather than a power supply cord consisting of an attachment plug and terminated free end of cable.
The configuration for the 30-ampere receptacles, attachment plugs, cord connectors and inlets is already American- and internationally-standardized specific to the refrigerated container (transport refrigerated unit) application. These receptacles, attachment plugs, cord connectors and inlets are not bladed NEMA configurations (ANSI/NEMA WD6), so the indication of "NEMA Configuration" should be deleted. The specific configuration for that 30-ampere receptacle is documented dimensionally in the ANSI/UL *Standard for Pin and Sleeve Configurations, ANSI/UL1686*, in Figure C2.12 for plug devices (attachment plugs and inlets) and Figure C2.11 for outlet devices (receptacles and cord connectors). The FPN directs the reader to the application-specific reference for this dedicated configuration.
Presently, there is no standardized refrigerated container usage at either 60 amperes or at 208 volts. Consequently, for this application, there is no standardized configuration for receptacles, attachment plugs, cord connectors and inlets. The FPN for the 60-ampere configuration is purely an informative reference, without prejudice or endorsement, to a number of potentially eligible pin and sleeve configuration schemes that could serve the purpose.

ARTICLE 640 — AUDIO SIGNAL PROCESSING, AMPLIFICATION, AND REPRODUCTION EQUIPMENT

12-58 Log #544 NEC-P12 **Final Action: Accept**
(640.3)

Submitter: Richard P. Owen, City Of St. Paul
Comment on Proposal No: 12-87
Recommendation: Reject this proposal.
Substantiation: This comment was written by a Task Group consisting of Stan Kaufman and Randy Ivans (Panel 16), John Mortimer (Panel 12) and Ron Maassen, Paul Casparro (Panel 3) plus Task Group Chair Richard Owen (Panel 3). The Task Group was directed by the Technical Correlating Committee to examine proposals submitted to all three Panels concerning abandoned cable and other related issues covered by the Panels.

The Task Group came to consensus on the following issues and submitted comments to the Panels as appropriate:

1) On the issue of abandoned cable removal, the task group agreed that only the accessible portions of abandoned cable should be removed. To require removal of all cable could, in some cases, necessitate demolition of the building finish in order to access cables that were properly fastened to the building in accordance with the rules in the various code articles. Furthermore, the task group agreed that the requirements for abandoned cable removal should not be in Section X.3 (Locations and Other Articles) but should be relocated into the general requirements of each article.

2) The task group also agreed to recommend the addition of a new Fine Print Note to further explain the removal requirement. This addition was thought to be necessary to address a common practice of cables that are "fished" inside existing walls. These cables, if abandoned, can be disconnected from their junction point in a wall and pulled out of the wall without having to harm the building finish. At present, in many cases, these cables are being cut off above the wall and left to drop into the wall space.

3) On the issue of "tagged for future use", the Task Group agreed that it was not necessary to require anything more than the cable tag being "...of sufficient durability to withstand the environment involved." This phrase is used in several other places in the NEC and leaves it up to the AHJ as to what is suitable. This language does not add requirements that are difficult, if not impossible, to enforce by adding unclear requirements for rodent-resistance, etc.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-59 Log #1432 NEC-P12 **Final Action: Accept**
(640.3)

Submitter: Allen C. Weidman, The Society of the Plastics Industry, Inc.
Comment on Proposal No: 12-87
Recommendation: Reject this proposal.
Substantiation: The Society of the Plastics Industry supports the removal of abandoned cables. One of our member companies is in the business of removing abandoned cables from buildings.
Section 300.11 (Securing and Supporting) requires that "Raceways, cable assemblies, boxes, cabinets, and fittings shall be securely fastened in place." It is not possible to remove all abandoned cables if the installation complies with 300.11 and the cables are installed behind a wall.

Proposal 12-87 in one of a series of proposals submitted to panels 3, 12 and 16.

Panel 3 rejected proposals 3-147 and 3-218 with the statement:

"This proposed change would make it a requirement that removal of abandoned cable never damage the building finish or compromise adjacent wiring systems or components. This expectation is unrealistic. If the building owner wants to take a ceiling down to access and remove abandoned cables, the NEC should not and cannot restrict this action. In regard to the removal of accessible cable, the panel refers to the definition of Accessible as it applies to wiring methods."

Panel 16 rejected proposals 16-28, 16-72, 16-176, 16-190, 16-258, 16-323 and 16-364 with the statement:

"The proposed requirement presents a compliance conundrum to installers. Without access, it is impossible to remove cables that are securely fastened without damaging the building or adjacent cables. Gaining access may sometimes require disassembly of part of the building. This is not the intent of the panel. The current requirement to remove only the accessible portion is reasonable."

Ballot Results: Affirmative: 12

12-61 Log #240 NEC-P12 **Final Action: Accept in Principle**
(640.3(A) and 640.6(C))

Submitter: Stanley Kaufman, CableSafe Inc.
Comment on Proposal No: 12-101
Recommendation: Accept this proposal in principle by modifying 640.6(C) as shown.

(C) Abandoned Audio Distribution Cables. The accessible portion of abandoned ~~Abandoned~~ audio distribution cables shall be removed.

Substantiation: The panel action on proposal 12-101 was to accept in principle with a reference to the action on proposal 12-94. Proposal 12-101 recommended moving the requirement to remove abandoned cables to a more appropriate section. The panel action on proposal 12-94 accomplished that objective. However, the panel action on 12-94 also changed the requirement from the removal of only the accessible portion of the cables to requiring the removal of all the cables, including those stapled to studs behind a sheetrock wall.

See proposal 16-27; panel 16 in its rejection statement stated:

"The proposal would require all abandoned cable to be removed, irrespective of accessibility, presenting a compliance conundrum to installers. Without access, it is impossible to remove cables that are securely fastened without damaging the building or adjacent cables. The submitter's substantiation states: "It is not reasonable or necessary to install cables in a manner that prevents their eventual removal." However, the panel previously imposed additional securing and supporting requirements by referencing 300.11 in 800.24. Gaining access may sometimes require disassembly of part of the building. This is not the intent of the panel. The current requirement to remove only the accessible portion is reasonable. The submitter further proposes to add an FPN following 800.3(C) that is already contained in 800.24."

Panel Meeting Action: Accept in Principle
Panel Statement: Refer to the panel action and statement on Comment 12-67.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:

QUAVE, D.: See my Explanation of Affirmative Vote on Comment 12-67.

12-62 Log #1433 NEC-P12 **Final Action: Accept in Principle**
(640.3(A) and 640.6(C))

Submitter: Allen C. Weidman, The Society of the Plastics Industry, Inc.
Comment on Proposal No: 12-94
Recommendation: Modify the panel action on 640.6(C) as shown.
(C) Abandoned Audio Distribution Cables. The accessible portion of abandoned ~~Abandoned~~ audio distribution cables shall be removed.

Substantiation: The Society of the Plastics Industry supports the removal of abandoned cables. One of our member companies is in the business of removing abandoned cables from buildings.

The current requirement for the removal of abandoned cable is in 640.3 Locations and Other Articles. It requires the removal of only the accessible portion of audio distribution cables.

"(A) Spread of Fire or Products of Combustion. The accessible portion of abandoned audio distribution cables shall be removed. See 300.21."

Proposals 12-101 and 12-102 recommended moving the requirement to remove abandoned cables to a more appropriate section. The panel action on proposal 12-94 accomplished that objective.

However, the panel action on 12-94 also changed the requirement from the removal of only the accessible portion of the cables to requiring the removal of all the cables, including those that are inaccessible.

Section 640.9(A)(3) Other Wiring requires compliance with Article 725. Article 725 permits the substitution of Article 800 cables. Both Articles 725 and 800 require the removal of only the accessible portion of abandoned cables.

Continued acceptance of the text in 640.6(C) will produce a conflict in the code. Acceptance of this comment will remove the conflict.

Panel Meeting Action: Accept in Principle

Panel Statement: Refer to the panel action and statement on Comment 12-67.

Number Eligible to Vote: 12

12-66 Log #485 NEC-P12 **Final Action: Reject (640.6)**

Submitter: Timothy P. McNeive, Thomas & Betts Corporation

Comment on Proposal No: 12-92

Recommendation: Change the panel action to Accept in Principle. Add the additional text suggest in the comment on affirmative vote by Mr. Lottmann:

"Cable ties that provide primary support for such cables shall have a minimum loop tensile strength of 23 kg (50 lbs)."

Substantiation: "Minimum loop tensile" strength is commonly marked on packages of cable ties. The 23 kg minimum for cable support is well representative of typical straps, hangers and staples listed for flexible conduit and cable support in accordance with UL 2239, Hardware for Support of Conduit, Tubing and Cable. The panel is also asked to follow the long time position of CMP-7 and not consider in its final decision the requirement that cable ties or other support hardware to be listed.

Panel Meeting Action: Reject

Panel Statement: The cable tie strength or failure has not been illustrated as a problem.

The submitter has not provided definitive technical substantiation for the inclusion of minimum loop tensile strength to the requirement.

Cable ties can be used for securing and supporting cables in a number of Chapter 3 wiring methods without any requirements for a minimum loop tensile strength of 23 kg (50 Ib), or in fact any particular minimum strength. For example, 334.30 covers securing and supporting of "nonmetallic-sheathed cable" and requires "supporting and securing by staples, cable ties, straps, hangers, or similar fittings designed and installed so as not to damage the cable, at intervals not exceeding 1.4 m (4 1/ 2 ft) and within 300 mm (12 in.) of every outlet box, junction box, cabinet, or fitting." It does not have any recommendation for the support strength or similar special considerations. In fact, the cable tie may not be providing any support at all when the tie wrap is simply anchoring the cable to a beam or joist. Types AC and MC cable also give similar permission to use cable ties for securing and supporting these cables in 320.30 and 330.30, respectively. There is not a need to complicate the installation.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

12-67 Log #545 NEC-P12 **Final Action: Accept in Principle (640.6)**

TCC Action: The Technical Correlating Committee directs that the Fine Print Note contained in the panel action be deleted because it contains a statement of intent. The Technical Correlating Committee notes that the rule as written in (C) is clear in that it applies to the accessible portion of the abandoned cable.

Submitter: Richard P. Owen, City Of St. Paul

Comment on Proposal No: 12-94

Recommendation: Revise text to read as follows:

640,6 (C) Abandoned Audio Distribution Cables.The accessible portion of abandoned ~~Abandoned~~ audio distribution cables shall be removed.

FPN : See Article 100 for a definition of accessible. It is desirable to remove as much abandoned cable as is practical but it is not the intent of this clause to require construction or renovation specifically to facilitate the removal of abandoned cable.

640.6 D(1) Cables identified for future use shall be marked with a tag ~~in accordance with the following:~~ of sufficient durability to withstand the environment involved.

640.6D (1) ~~(a.) Tag is impervious to the effects of temperature and dampness.~~

640.6D (1) ~~(b) Tag is resistant to the effects of gnawing by rodents.~~.....

640.6D (2) Cables shall have the following the following information on the tag: ~~or in a database.~~

Substantiation: This comment was written by a Task Group consisting of Stan Kaufman and Randy Ivans (Panel 16), John Mortimer (Panel 12) and Ron Maassen, Paul Casparro (Panel 3) plus Task Group Chair Richard Owen (Panel 3). The Task Group was directed by the Technical Correlating Committee to examine proposals submitted to all three Panels concerning abandoned cable and other related issues covered by the Panels.

The Task Group came to consensus on the following issues and submitted comments to the Panels as appropriate:

1) On the issue of abandoned cable removal, the task group agreed that only the accessible portions of abandoned cable should be removed. To require removal of all cable could, in some cases, necessitate demolition of the building finish in order to access cables that were properly fastened to the building in accordance with the rules in the various code articles. Furthermore, the task group agreed that the requirements for abandoned cable removal should not be in Section X.3 (Locations and Other Articles) but should be relocated into the general requirements of each article.

2) The task group also agreed to recommend the addition of a new Fine Print Note to further explain the removal requirement. This addition was thought to be necessary to address a common practice of cables that are "fished" inside existing walls. These cables, if abandoned, can be disconnected from their junction point in a wall and pulled out of the wall without having to harm the building finish. At present, in many cases, these cables are being cut off above the wall and left to drop into the wall space.

3) On the issue of "tagged for future use", the Task Group agreed that it was not necessary to require anything more than the cable tag being "...of sufficient durability to withstand the environment involved." This phrase is used in several other places in the NEC and leaves it up to the AHJ as to what is suitable. This language does not add requirements that are difficult, if not impossible, to enforce by adding unclear requirements for rodent-resistance, etc.

Panel Meeting Action: Accept in Principle

Revise 640.6(C) and 640.6(D) of the committee action on Proposal 12-94 to read as follows:

(C) Abandoned Audio Distribution Cables.The accessible portion of abandoned audio distribution cables shall be removed.

FPN : See Article 100 for a definition of Accessible. It is desirable to remove as much abandoned cable as is practical but it is not the intent of this clause to require construction or renovation specifically to facilitate the removal of abandoned cable.

(D) Installed Audio Distribution Cable Identified for Future Use.

(1) Cables identified for future use shall be marked with a tag of sufficient durability to withstand the environment involved.

(2) Cable tags shall have the following information:

(a) Date cable was identified for future use

(b) Date of intended use

(c) Information relating to the intended future use of cable

Panel Statement: The panel accepts the recommendation of the two task groups who worked extensively on this material. The panel has shown the text to clarify the requirement, since the recommended text of Comment 12-67 is not clearly presented.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

QUAVE, D.: FPN should be changed to be consistent with CMP-16.

FPN: See Article 100 for definition of Accessible (as applied to wiring methods). It is desirable to remove as much abandoned cable as is practical. ~~but it is not the intent of this section to require construction or renovation specifically to facilitate the removal of abandoned cable.~~

12-68 Log #680 NEC-P12 **Final Action: Reject (640.6)**

Submitter: James M. Daly, Upper Saddle River, NJ

Comment on Proposal No: 12-91

Recommendation: The Panel Action to Accept in Principle is correct, however, the reference to "300.11(A)" should be changed back to "300.11" as it appears in the 2005 Code.

Substantiation: The submitter did not request deletion of (A) after 300.11 and neither the submitter nor the Panel provided any substantiation that the other sections of 300.11, [(B) and (C)], should not apply. The panel's acceptance of Proposal 12-92 further indicates that 300.11(B) and (C) should apply since it would be logical to use cable ties to support Article 640 wiring from raceways or other cables.

The deletion of (A) was not requested in any of the three Proposals addressing this section, 12-91, 12-92, or 12-94.

Panel Meeting Action: Reject

Panel Statement: The ROP panel action recognizes that the technology addressed in Article 640 requires the reference only to 300.4 and 300.11(A), not 300.11(B) and (C). The panel does not agree with the substantiation that cable ties are allowed as support from other cables or raceways.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

12-69 Log #681 NEC-P12 **Final Action: Accept (640.6)**

Submitter: James M. Daly, Upper Saddle River, NJ

Comment on Proposal No: 12-94

Recommendation: I support the Panel Action to delete the FPN from the end of 640.6.

Substantiation: The Panel Action and the Panel Statement indicate that the FPN was deleted, however, the NEC 2008 draft at ROP stage still contains the FPN.

Panel Meeting Action: Accept

Panel Statement: The panel acknowledges the deletion of the FPN from the end of 640.6. The panel notes the panel action text on Proposal 12-94 properly excluded the FPN. (The ROP draft incorrectly contains the FPN.)

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

12-70 Log #888 NEC-P12 **Final Action: Accept in Principle (640.6)**

Submitter: Robert Kelleher, Paramount Electrical Services

Comment on Proposal No: 12-94

Recommendation: Continue to accept in principle in part to delete the FPN.

Substantiation: CMP-12 is correct, the addition of these NECA Fine Print Notes, serves no benefit to the user of the National Electrical code. The NEC is not a training manual. These are not standards, they are a compilation of generic information and do not serve as information to the user. These must be purchased through NECA. This FPN as written is nothing more than free advertisement, for generic, readily available, information, which must be purchased by the code user. Code Making Panel 12 has acted to coordinate with the other technical committees in the NEC project. A total of seventeen new Fine Print Notes were proposed to reference NECA standards. Sixteen were unanimously rejected. Inclusion of this fine print note is in direct conflict with 90.1(C). In the action to reject Proposal 8-3, one technical committee member promotes NECA Standards as "... a tool to assist untrained electricians to make safer and better installations." The TCC should intervene, uphold the provisions of 90.1(C) and prohibit these types of Fine Print Notes. Failure to do so will mean adding Fine Print Notes for IEC, EEI, IBEW, IAEI, ACC, NETA, NEI, SEIA, AISI, API, ASHE, AHAM, ICEAI, NYBFU and dozens of others when they decide to develop income through generic standards development. If this type of fine print note is included in any form, an annex should be included with coupons for the code user. If the NEC is to be used for advertisement purposes coupons should be included.

Panel Meeting Action: Accept in Principle

Panel Statement: The panel agrees with the recommendation to maintain the deletion of the FPN. The panel does not agree with the submitter's substantiation. The panel agrees with the action based on the substantiation provided in Comment 12-69.

The panel notes that changes to Proposal 12-94 have been made through the panel action on Comment 12-67.

Comment on Affirmative:

QUAVE, D.: See my Explanation of Affirmative Vote on Comment 12-67.

12-72 Log #864 NEC-P12 **Final Action: Accept (640.6, FPN)**

Submitter: John P. Masarick, Independent Electrical Contractors Inc.

Comment on Proposal No: 12-95

Recommendation: The panel is encouraged to continue to Accept in Principle Proposal 12-95.

Substantiation: The reasons to continue to Accept in Principle the Proposal are as follows:

1. The trend by the CMPs over the last several code cycles has been to limit the use of FPNs.
2. There is also a correlation issue. There is a conflict between those panels that accepted the proposal and those that rejected the proposal.
3. These standards are also covered by a Fine Print Note in 110.12.
4. The FPN should not be accepted because numerous standards and installation manuals exist and to only mention one does not adequately inform the public about accepted industry practices. The NEC is not intended to be an instruction manual for untrained persons. If the FPNs are allowed to reference these standards, then they should list all applicable standards.
5. Since the referenced installation standards are intentionally general to cover different models of equipment, approval of the FPN may lead many to believe these standards can be used instead of listed or labeled manufacturer's instructions which would be in violation of 110.3(B).
6. If the CMP would like to include the reference, it should be placed in the Annex with the other references.

Panel Meeting Action: Accept
Panel Statement: The panel agrees with the recommendation to maintain the deletion of the FPN. The panel does not agree with the submitter's substantiation. The panel agrees with the action based on the substantiation provided in Comment 12-69.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-73 Log #1860 NEC-P12 **Final Action: Accept in Principle in Part (640.6(D)(1))**

Submitter: Michael Walls, American Chemistry Council
Comment on Proposal No: 12-94
Recommendation: Revise text to read as follows:
640.6D
(1) Cables identified for future use shall be marked with a tag ~~in accordance with the following:~~ of sufficient durability to withstand the environment.
~~640.6D (1) a Tag is impervious to the effects of temperature and dampness~~
~~640.6D(1)b Tag is resistant to the effects of gnawing rodents~~
(2) Cables shall have the following information on the tag or in a database
(a) Date cable was identified for future use
~~(b) Date of intended use~~
(c) Information relating to the intended future use of cable
Substantiation: To obtain a tag with the above requirements would be very difficult and why not use language that is already in the code" of sufficient durability to withstand the environment.
Also it is impracticable to predict when a spare cable will be used. That requirement would be very difficult to enforce and would require monitoring to see if the date has passed.
Panel Meeting Action: Accept in Principle in Part
Panel Statement: The panel accepts the recommendation to delete (D)(1)a and (D)(1)b. The panel disagrees with the deletion of the date of intended use. A cable with no expected date of future use is abandoned. The panel also disagrees with the inclusion of "or in a database" as a way to identify the information on the tag. Databases may not be readily available.
See panel action and statement on Comment 12-67.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
QUAVE, D.: See my Explanation of Affirmative Vote on Comment 12-67.

12-74 Log #1248 NEC-P12 **Final Action: Accept (640.7(A))**

TCC Action: The Technical Correlating Committee directs that this comment be reported as "Accept" to correlate with the actions of other Code-Making Panels relative to the use of the word "bonded".
Submitter: Neil F. LaBrake, Jr., Syracuse, NY
Comment on Proposal No: 12-1
Recommendation: Reject the Panel's action on 640.7(A) and keep the original proposed text.
Substantiation: The Panel's action on 640.7(A) creates redundant use of the word "bonded" in the sentence. The term "connected" is appropriate according to the Panel action on Proposal 5-2 for the definition of the term "bonded (bonding)"and is consistent with the NEC TCC Task Group on Grounding and Bonding's original initiative.
This Comment was developed by a Task Group assigned by the NEC Technical Correlating Committee to address actions that were other than "accept" taken by Code-Making Panels on proposals from the TCC to resolve 2005 NEC Proposal 5-1 and Comment 5-1. Members of the Task Group on Grounding and Bonding for this Comment included: C. Douglas White; Michael Johnston; Jeffrey Boksiner; Daleep Mohla; Phil Simmons; Christopher Hutchings; James Carroll; Alan Rebeck; Richard Loyd; Paul Dobrowsky; and Neil F. LaBrake, Jr.
Panel Meeting Action: Reject
Panel Statement: The word "bonded" is defined as a particular type of "connected." The ROP panel action reflects the intended meaning and is consistent with respect to the particular technology addressed in Article 640.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 645 — INFORMATION TECHNOLOGY EQUIPMENT

12-75 Log #2169 NEC-P12 **Final Action: Reject (645.2)**

Submitter: Ray R. Keden, Erico, Inc. / Rep. BICSI
Comment on Proposal No: 12-104
Recommendation: Accept the Proposal with stated new wording:
645.2 Definitions.
Abandoned Audio Distribution Cable. The definition in 640.2 shall apply.
Abandoned Class 2, Class 3, and PLTC Cable. The definition in 725.2 shall apply.
Abandoned Fire Alarm Cable. The definition in 760.2 shall apply.
Abandoned Optical Fiber Cable. The definition in 770.2 shall apply.
Abandoned Communications Cable. The definition in 800.2 shall apply.
Abandoned Coaxial Cable. The definition in 820.2 shall apply.
Abandoned Network-Powered Broadband Communications Cable. The definition in 830.2 shall apply.
Abandoned Type DP Cable. Installed Type DP cable that is not terminated at equipment and not identified for future use with a tag.
Substantiation: This Proposal offered definitions of the following types of cables that are referenced in 645(D)(5)c.
- Class 2, Class 3, and PLTC Cable. Types CL2 (Class 2), CL3 (Class 3), and PLTC (Article 725).
- Fire Alarm Cable Types NPLF and FPL (Article 760)
- Optical Fiber Cable Types OFC and OFN (Article 770)
- Communications Cable Type CM (Article 800)
- Coaxial Cable Type CATV (Article 820).

BICSI designers and installers place these types of cables, as well as, audio distribution cables and network powered broadband cables, in computer rooms.
Panel Meeting Action: Reject
Panel Statement: See panel action on Proposal 12-106, which established a definition of "Abandoned Supply Circuits and Interconnecting Cables." Individual definitions as recommended in the comment are not necessary.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-76 Log #83 NEC-P12 **Final Action: Accept (645.4(6))**

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 12-108
Recommendation: The Technical Correlating Committee understands that this new Section follows the existing FPN to 645.4(5). The Technical Correlating Committee directs that the panel add a title to the new section.
This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel agrees with the direction of the TCC and clarifies that Proposal 12-108 is rejected by action on Comment 12-78. No new title is necessary.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-77 Log #1316 NEC-P12 **Final Action: Reject (645.4(6) (New))**

Submitter: Stephen McCluer, American Power Conversion Corp
Comment on Proposal No: 12-108
Recommendation: Revise proposal as follows:
645.4(6) ~~Except for lighting and its control, no~~ No electrical distribution equipment or wiring, other than that which supplies the IT equipment, ~~and~~ its associated equipment, and a dedicated heating/ventilating/air conditioning (HVAC) equipment shall be installed in the room.
Exception No. 1: Lighting and its control shall be permitted to be installed.
Exception No. 2: Communications systems and monitoring systems such as telephones, fire alarm systems, fire extinguishing systems, security systems, water detection systems, and other related protection equipment shall be permitted to be installed.
Exception No-3: Power wiring, cabling and wall-mounted receptacles installed as premises wiring within the walls in accordance with Chapters 1-4 of this Code shall be permitted to be installed.
Substantiation: As written, this requirement would prevent the use of wall outlets in an IT space.

The proponent's substantiation implies that he *might* have wanted the stipulation to apply only to power distribution under a raised floor, but the proposal does not say that. Therefore, any non-IT equipment cabling, whether run overhead
in racks and cable trays or within raceways inside of walls, would be prohibited.

Furthermore, the proponent talks about wanting to de-energize the entire room via the disconnecting means. That implies that everything in the entire IT space would have to be powered on the critical bus (usually on conditioned, UPS protected power). 645.10 already requires de-energizing "all electronic equipment" in the IT equipment room. The proponent asks us to provide a higher level of protection for normal power than is required in any other part of the Code, simply because it is an IT room with power cabling under a raised floor.

It is inconceivable to have an IT equipment room with no wall outlets.

● Contractors need to run equipment in the room during installation, maintenance, and renovation. Connecting their heat guns, drills, halogen lights, or other tools and test equipment into the conditioned power at best invites a tripped circuit breaker and nuisance alarms, and at worst causes damage to IT data or equipment.

● If there is a water emergency under the floor, wet vacuums must be plugged in somewhere. They cannot be plugged into the critical power bus.

● In the event of a cooling failure, temporary cooling systems might be rolled in to cool hot spots; they must plug into something - certainly not the critical bus!

● Long extension cords through open doors will reduce environmental control, compromise fire protection systems, compromise security, and can damage extension cord insulation.

● One assumes that any IT space created in existing buildings would require removal of all existing wall outlets in order to comply with the revised Article 645.

● Wall mounted receptacles that are installed in an IT environment that are dedicated to service equipment should be allowed and should be supplied from a non-IT dedicated distribution source. (General purpose distribution sources)

● IT spaces should be provided with the same wall-mounted receptacle spacing as required in 210.52(A)(1): no point measured horizontally along the floor line in any wall space should be more than 1.8 m (6 ft) from a receptacle outlet.

As written, the proposal also suggests that only one HVAC device would be permitted, when most of the time there are multiple dedicated air conditioners.

Taken to its extreme, the wording would even prevent the use of UPS systems in an IT room if they were listed as power systems instead of IT equipment.

Finally, as written the proposal would eliminate many other essential, non-IT equipment types, including communication systems, security systems, monitoring systems, fire alarm systems, fire extinguishing systems, water detection systems, etc. The proponent and the panel appear to have not thought through the unintended consequences of this code.

The safety record of IT spaces is extremely good. Proponent has offered no statistics to justify why more restrictions are required.

See: Marty Ahrens, Computer and Computer Peripheral Fires With a Discussion of Fires, National Fire Protection Association, August 2006. From 1999 to 2003 there were fewer than 30 fires in computer rooms and control spaces. That equates to less than 3 percent of all computer-related fires, less than 0.1 percent of all commercial fires, and less than $200,000 total property damage. That's a darned good record. If ain't broke, don't fix it.

The justification for this proposal is weak and the wording is ill-advised. The proposal should be rejected and returned to sender for rewrite in the next cycle. It is just bad code.

Panel Meeting Action: Reject

Panel Statement: The exceptions as shown in the comment are not necessary due to the action on Comment 12-78. See panel action and statement on Comment 12-78. In addition, the panel does not agree that the action taken during the proposal stage produced "bad code"; rather it reflects the benefits of an open consensus process.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

12-77a Log #2506 NEC-P12 **Final Action: Reject**
(645.4(6) Exception)

Submitter: Technical Committee on Electronic Computer Systems,
Comment on Proposal No: 12-108

Recommendation: Revise the exception to new 645.4(6) to read as follows :

Exception: Communications systems and monitoring systems such as telephone, fire alarm systems, fire extinguishing systems, security systems, water detection systems and other related protective equipment shall be permitted to be installed.

Substantiation: Clarify the fact that monitoring systems should be covered under the exception.

Panel Meeting Action: Reject

Panel Statement: The exception as shown in the comment is not necessary due to the action on Comment 12-78. See panel action and statement on Comment 12-78.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

12-78 Log #1986 NEC-P12 **Final Action: Accept in Part**
(645.4(6) Exception)

Submitter: Noel Williams, Herriman, UT
Comment on Proposal No: 12-108

Recommendation: This Proposal should have been Rejected or Accepted in Principle with the following revision to the Exception:

Exception to (6): Communications, signaling, and fire alarm systems wiring and equipment for control of or connection to equipment related to the information technology room equipment or for required functions shall be permitted.

Substantiation: The proposal is seriously flawed. The panel should give additional consideration to the Explanation of Negative by Mr. Johnson. This proposal creates a direct contradiction with the requirements of 645.5(D)(3), which requires smoke detection, while making an unlimited exception for communications systems (the exception does not require the communications wiring to be related in any way to the IT equipment or the use of the IT room). Also, it could be argued that communications, signaling, and fire alarm wiring is not "electrical distribution equipment or wiring," since it is not clear whether "electrical distribution" modifies just "equipment" or "equipment and wiring." A strict interpretation of the proposed wording would even prohibit interconnecting data wiring that is usually classified as Class 2 under Article 725 as well as the Class 2 wiring for temperature control for a separate HVAC system as permitted by 645.4(2). Even the wiring for and the EPO devices themselves that are required by 645.4(1) and 645.10 are prohibited since it is often not "electrical distribution equipment or wiring" whatever that means. (The panel should understand that strict, literal interpretations will be applied by some jurisdictions.) The exception should also clearly refer only to (6) in this case (especially since it's at the end of the list of requirements.)

Panel Meeting Action: Accept in Part

Reject Proposal 12-108.

Panel Statement: The panel accepts the recommendation to reject Proposal 12-108. The panel does not accept the recommendation to accept in principle the recommendation to include a new exception in the comment.

The panel chairman appointed a task group to study the issues raised in the comments. The task group concluded that the best course of action would be to reject the original proposal and revert back to the language of the 2005 NEC.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

12-79 Log #277 NEC-P12 **Final Action: Accept in Principle**
(645.5)

Submitter: John H. Mortimer, Inductotherm Industries, Inc.
Comment on Proposal No: 12-116

Recommendation: Revise text to read as follows:

645.5(G)(1) Supply circuits and interconnecting cables identified for future use shall be marked with a tag ~~in accordance with the following~~: of sufficient durability to withstand the environment involved.

~~(a) Tag is impervious to the effects of temperature and dampness.~~
~~(b) Tag is resistant to the effects of gnawing by rodents.~~

645.5(G)(2) Supply circuits and interconnecting cables shall have the following information on the tag: ~~or in the database.~~

Substantiation: This comment was prepared by a Task Group after further consideration of the comments expressed in the voting as directed by the Technical Correlating Committee. The revised wording of the section was developed by a Task Group consisting of: Thomas Burke, Jeffrey Holmes, Ron Janikowski, Robert Johnson, John Mortimer, and Kenneth White.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Comment 12-80, which meets the intent of the submitter.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

12-80 Log #546 NEC-P12 **Final Action: Accept in Principle**
(645.5)

TCC Action: The Technical Correlating Committee directs that the Fine Print Note contained in the panel action be deleted because it contains a statement of intent. The Technical Correlating Committee notes that the rule as written in (F) is clear in that it applies to the accessible portion of the abandoned cable.

Submitter: Richard P. Owen, City of St. Paul
Comment on Proposal No: 12-116

Recommendation: Revise text to read as follows:

645.5(F) Abandoned Supply Circuits and Interconnecting Cables. The accessible portion of abandoned ~~Abandoned~~ supply circuits and interconnecting cables shall be removed unless contained in a metal raceway.

FPN : See Article 100 for a definition of accessible. It is desirable to remove as much abandoned cable as is practical but it is not the intent of this clause

to require construction or renovation specifically to facilitate the removal of abandoned cable.

645.5G (1) Supply circuits and interconnecting cables identified for future use shall be marked with a tag ~~in accordance with the following:~~ of sufficient durability to withstand the environment involved.

645.5G (1) ~~(a) Tag is impervious to the effects of temperature and dampness.~~

645.5G (1) ~~(b) Tag is resistant to the effects of gnawing by rodents.~~.....

645.5G (2) Supply circuits and interconnecting cables shall have the following information on the tag: ~~or in a database.~~

Substantiation: This comment was written by a Task Group consisting of Stan Kaufman and Randy Ivans (Panel 16), John Mortimer (Panel 12) and Ron Maassen, Paul Casparro (Panel 3) plus Task Group Chair Richard Owen (Panel 3). The Task Group was directed by the Technical Correlating Committee to examine proposals submitted to all three Panels concerning abandoned cable and other related issues covered by the Panels.

The Task Group came to consensus on the following issues and submitted comments to the Panels as appropriate:

1) On the issue of abandoned cable removal, the task group agreed that only the accessible portions of abandoned cable should be removed. To require removal of all cable could, in some cases, necessitate demolition of the building finish in order to access cables that were properly fastened to the building in accordance with the rules in the various code articles. Furthermore, the task group agreed that the requirements for abandoned cable removal should not be in Section X3 (Locations and Other Articles) but should be relocated into the general requirements of each article.

2) The task group also agreed to recommend the addition of a new Fine Print Note to further explain the removal requirement. This addition was thought to be necessary to address a common practice of cables that are "fished" inside existing walls. These cables, if abandoned, can be disconnected from their junction point in a wall and pulled out of the wall without having to harm the building finish. At present, in many cases, these cables are being cut off above the wall and left to drop into the wall space.

3) On the issue of "tagged for future use", the Task Group agreed that it was not necessary to require anything more than the cable tag being "...of sufficient durability to withstand the environment involved." This phrase is used in several other places in the NEC and leaves it up to the AHJ as to what is suitable. This language does not add requirements that are difficult, if not impossible, to enforce by adding unclear requirements for rodent-resistance, etc.

Panel Meeting Action: Accept in Principle

Revise 645.5(F) and 645.5(G) to read as follows:

(F) Abandoned Supply Circuits and Interconnecting Cables. The accessible portion of abandoned supply circuits and interconnecting cables shall be removed unless contained in a metal raceway.

FPN : See Article 100 for a definition of Accessible. It is desirable to remove as much abandoned cable as is practical, but it is not the intent of this clause to require construction or renovation specifically to facilitate the removal of abandoned cable.

(G) Installed Supply Circuits and Interconnecting Cables Identified for Future Use.

(1) Supply circuits and interconnecting cables identified for future use shall be marked with a tag of sufficient durability to withstand the environment involved.

(2) Supply circuit tags and interconnecting cable tags shall have the following information:

(a) Date identified for future use

(b) Date of intended use

(c) Information relating to the intended future use

Panel Statement: The panel accepts the recommendation of the two task groups who worked extensively on this material. The panel has revised the text to clarify the requirement, since the recommended text of Comment 12-80 is not clearly presented.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

(645.5(C)(6))

Submitter: John P. Masarick, Independent Electrical Contractors Inc.
Comment on Proposal No: 12-109
Recommendation: The panel is encouraged to continue to Reject Proposal 12-109.
Substantiation: The reasons to continue to Reject the Proposal are as follows:

1. The trend by the CMPs over the last several code cycles has been to limit the use of FPNs.

2. There is also a correlation issue. There is a conflict between those panels that accepted the proposal and those that rejected the proposal.

3. These standards are also covered by a Fine Print Note in 110.12.

4. The FPN should not be accepted because numerous standards and installation manuals exist and to only mention one does not adequately inform the public about accepted industry practices. The NEC is not intended to be an instruction manual for untrained persons. If the FPNs are allowed to reference these standards, then they should list all applicable standards.

5. Since the referenced installation standards are intentionally general to cover different models of equipment, approval of the FPN may lead many to believe these standards can be used instead of listed or labeled manufacturer's instructions which would be in violation of 110.3(B).

6. If the CMP would like to include the reference, it should be placed in the Annex with the other references.

Panel Meeting Action: Accept
Panel Statement: The panel agrees with the recommendation to maintain the deletion of the FPN. The panel does not agree with the submitter's substantiation. The panel reaffirms its statement on Proposal 12-109.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-82 Log #688 NEC-P12 **Final Action: Accept**
(645.5(D) (New))

Submitter: Timothy M. Croushore, Allegheny Power
Comment on Proposal No: 12-114
Recommendation: Revise the main text of 645.5(D) to read as follows:

(D) Under Raised Floors. Power cables, communications cables, connecting cables, interconnecting cables, cord-and-plug connections, and receptacles associated with the information technology equipment shall be permitted under a raised floor, provided the following conditions are met:

Add a new (3) ahead of the existing (3). Renumber existing (3) through (6) to (4) through (7). The new (3) is as follows:

(3) Supply cords of listed information technology equipment in accordance with 645.5(B).

Revise the text of existing (4) and renumber it to (5) as recommended above. The revised text and revised number are as follows:

(5) Openings in raised floors for cords and cables protect cords and cables against abrasion and minimize the entrance of debris beneath the floor.

Substantiation: These suggested revisions comply with the intent of the original submitter. These revisions are discussed in my affirmative ballot comment. Cords are manufactured differently than cables due to the requirements for flexibility of the cord. There is confusion in the industry whether cord-and-plug connections from listed information technology equipment supply cords are permitted under the raised floor. This proposal permits listed cords under a raised floor where the length of the supply cord and attachment plug cap does not exceed 15 feet in length. Should any portion of the cord be on the surface of the raised floor, the requirement for protection from physical damage would apply.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-83 Log #789 NEC-P12 **Final Action: Accept in Principle**
(645.5(D)(5)(d))

Submitter: Stephen McCluer, American Power Conversion Corp
Comment on Proposal No: 12-114
Recommendation: Revise the original proposal as follows:

(d) Power supply cords of listed information technology equipment plugged into receptacles under the raised floor when only the portion of the cord required to make the ~~vertical~~ connection occupies the ~~plenum free air space~~ area under the raised floor. Cord assemblies shall be protected from damage and shall not ~~be permitted to~~ lie on the subfloor.

Substantiation: This revision removes the panel's justification for rejecting the original proposal. Despite the chairman's observation that the NEC does not prohibit power supply cords from listed IT equipment from being plugged into receptacles under a raised floor, it is, in fact, a practice in some jurisdictions to prohibit such cord assemblies under raised floors. We request this clarification to ensure uniform enforcement of the Code.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action on Comment 12-82, which meets the intent of the submitter.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-84 Log #1985 NEC-P12 **Final Action: Accept in Principle**
(645.5(D)(5)d.)

Submitter: Noel Williams, Herriman, UT
Comment on Proposal No: 12-103
Recommendation: This Proposal should have been Accepted.
Substantiation: The panel statement to "see the panel action and statement on proposal 12-114" is not responsive to this proposal. As stated in the Comment on Affirmative by Mr. Croushore, the NEC does not prohibit cords in raised floors. And as stated in the Explanation of Negative by Mr. Johnson, the panel has repeatedly refused to make this issue clear. In fact, the NEC specifically permits the receptacles to which the cords must attach to be in the raised floor according to 645.5(D), but the wiring methods permitted in 645.5 do not include any mention of flexible cords. If the receptacles are to be installed in

the underfloor space, it follows that the cords must also be permitted there, and cords are permitted by 645.5(B). However, without a modification here, the restrictions of 400.8(2) and (5) apply and the cord may not be run through the floor assembly into the below-floor area, even if protected as required by 645.5(D)(4). The proposal adds clarity and actually restricts the use of cords to that portion required to make the connection, but is not as restrictive and does not raise the issues to which the panel objected in Proposal 12-114. In fact, none of the issues addressed in the panel statement in Proposal 12-114 are raised by this proposal. The panel statement implies that cords may be used and objects to the increased restrictions, yet the panel refuses to make the permission clear. The first two sentences of the Comment on Affirmative by Mr. Jones are true, and enough reason to resolve this issue, however the rest of the comment is immaterial - no new information is necessary to clarify this long-standing issue.

Panel Meeting Action: Accept in Principle

Panel Statement: See the panel action on Comment 12-82, which meets the intent of the submitter.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

12-85 Log #84 NEC-P12 **Final Action: Accept**
(645.5(F))

Submitter: Technical Correlating Committee on National Electrical Code

Comment on Proposal No: 12-116

Recommendation: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the Panel as a Public Comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

Panel Statement: The panel accepts the direction of the TCC. See panel action and statement on Comment 12-80.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

12-86 Log #1863 NEC-P12 **Final Action: Accept in Principle in Part**
(645.5(F))

Submitter: Michael Walls, American Chemistry Council

Comment on Proposal No: 12-116

Recommendation: Revise text to read as follows:

645.5G

(1) Cables identified for future use shall be marked with a tag ~~in accordance with the following:~~ of sufficient durability to withstand the environment.

~~640.6D (1) a Tag is impervious to the effects of temperature and dampness~~

~~640.6D(1)b Tag is resistant to the effects of gnawing rodents~~

(2) Cables shall have the following information on the tag or in a database

(a) Date cable was identified for future use

~~(b)Date of intended use~~

(c) Information relating to the intended future use of cable

Substantiation: To obtain a tag with the above requirements would be very difficult and why not use language that is already in the code" of sufficient durability to withstand the environment".

Also it is impracticable to predict when a spare cable will be used. That requirement would be very difficult to enforce and would require monitoring to see if the date has passed.

Panel Meeting Action: Accept in Principle in Part

Panel Statement: The panel accepts the recommendation to delete (D)(1)a and (D)(1)b. The panel disagrees with the deletion of the date of intended use. A cable with no expected date of future use is abandoned. The panel also disagrees with the inclusion of "or in a database" as a way to identify the information on the tag. Databases may not be readily available.

See panel action and statement on Comment 12-80.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

12-87 Log #790 NEC-P12 **Final Action: Accept**
(645.10(1))

Submitter: Stephen McCluer, American Power Conversion Corp

Comment on Proposal No: 12-120

Recommendation: Modify the original proposal as follows:

645.10 Disconnecting Means. ~~A~~ An approved means shall be provided to disconnect power to all electronic equipment in the information technology equipment room or in designated zones within the room. There shall also be a similar approved means to disconnect the power to all dedicated HVAC systems serving the room or designated zones and shall cause all required fire/smoke dampers to close. The control for these disconnecting means shall be grouped and identified and shall be readily accessible at the principal exit doors. A single means to control both the electronic equipment and HVAC systems in the room or in a zone shall be permitted. Where a pushbutton is used as a means to disconnect power, pushing the button in shall disconnect the power. Where multiple zones are created, each zone shall have an approved means to confine fire or products of combustion to within the zone.

(1) Revise 645.10 to add an exception and to number the exceptions

~~Exception No. 1: Installations qualifying under the provisions of Article 685.~~

~~Exception No. 2: Installations qualifying under the provisions of paragraph 645.10.1.~~

~~(2) Add a new paragraph 645.10.1~~

~~645.10.1 Zone disconnect means. An approved disconnect means shall be permitted to disconnect power only to an isolated portion of the information technology room when the following conditions are met:~~

~~(1) The disconnect means shall completely remove all power to the isolated portion of the room (which can be one equipment or a common group of equipment's) with a single means of disconnect~~

~~(2) Manual or automatic disconnect means shall be permitted~~

~~(3) Manual disconnect means shall be accessible in a manner acceptable to the authority having jurisdiction~~

~~FPN: The disconnect means may include an approved method to prevent accidental or unauthorized activation~~

~~(4) Manual disconnect means shall be clearly identified with signage so that emergency procedure operating points are identified~~

~~(5) Method of operation shall be well documented and staff shall be trained~~

~~(5) The location of all zoned disconnect means in the IT room shall be identified in such a manner that they are easily located by emergency responders~~

~~(6) All zones with an isolated disconnect means contain an approved method of preventing the spread of smoke and products of combustion beyond the perimeter of the zone.~~

Substantiation: This modification removes the panel's justification for rejecting the original proposal, which stated "it is too complicated and would be difficult to enforce." It eliminates the proposed exception and moves the language into the body of the main paragraph. The proposal codifies practices that are already in use, and it recognizes the technology that is available today.

The proposal does not replace the existing method. It allows an alternative construction which must be approved by the AHJ(s).

Zoned shutdown is already widely used in telecommunications facilities. It usually involves pre-review with the AHJ(s), special signs, posted instructions, and clear identification of the zones, or anything else that satisfies the AHJ that an equivalent level of safety is provided. Some facilities use special floor markings to guide fire fighters to the affected zone. The means still exists to shut down power and air to the entire room if necessary.

Technology today has the ability to control electricity and cooling with extreme precision. The existing requirement for disconnecting means has changed very little in almost 50 years, when NFPA 75 and NEC Article 645 were created for the protection of mission-critical operations. It is time for the Code to reflect reality.

This amendment will actually improve safety, because it will encourage instead of discourage the use of Article 645. Many people today choose not to build ITE rooms per Article 645 because they do not want a single point of failure capable of shutting down their entire mission-critical operation. This modified proposal gives a reasonable balance of safety and business continuity.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

JANIKOWSKI, R.: I am still under the opinion that this would be very hard to enforce. What are "zones"? Where are they defined? How would emergency personnel know where each zone starts and stops? Where would the emergency shutoff disconnect be located for each zone? The Code does not require posted floor plans to identify each zone and is there any maximum number of zones permitted?

LOTTMANN, T.: The panel action on this comment should have been reject. This comment places an excessive burden on the authority having jurisdiction, as there is no consensus National standard cited for the creation of zones in information Technology Rooms. In addition, no technical substantiation has been provided to show the revised language would improve the safety of persons and property over the existing language. Monetary losses should not be used as substantiation for change as they are outside the committee scope and purpose of this code.

ARTICLE 647 — SENSITIVE ELECTRONIC EQUIPMENT

12-88 Log #1948 NEC-P12 **Final Action: Reject**
(647.7(A)(4))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Comment on Proposal No: 12-127

Recommendation: Reject the proposal, or accept its implicit second option.

Substantiation: It is actually unclear what took place under this proposal because the proposal submitter offered the panel a choice and the panel action was a straight accept. This comment assumes that the last sentence was deleted.

The intent of the original drafters of this provision, however, was more in line with the proposal submitter's second option. Because NEMA has not yet produced a plug and receptacle configuration in accordance with this provision, the allowance for conventional receptacles was included as a transitional step. Since these receptacles allow any 120V load to be connected, and since any connected load that does not have a two-pole unit switch (e.g. Edison-base lampholders) will be at 60V to ground internally, the idea is that only qualified personnel should be using them. CMP 12 needs to decide whether to force these systems into disconnection by deleting the lined-out text (thereby leaving the unique configuration as the only connection method), or reinstating the transitional language, perhaps with a sunset date to try to elicit a response from the receptacle industry.
Panel Meeting Action: Reject
Panel Statement: The action taken on Proposal 12-127 is clear, and the panel rejects this comment since it fails to comply with 4.4.5(c) of the Regulations Governing Committee Projects, as the comment does not offer a clear recommended action.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

ARTICLE 660 — X-RAY EQUIPMENT

12-89 Log #532 NEC-P12 **Final Action: Reject**
(660.5)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 12-132
Recommendation: Accept as revised:
An approved disconnecting means that simultaneously disconnects all ungrounded conductors of the circuit with an ampere rating for at least...(remainder unchanged).
Substantiation: Since the panel declined to accept a limitation to a switch or circuit breaker, simultaneous disconnection should be specified, as it may be inferred that other sections that require this are modified.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided adequate substantiation to justify the revision recommended in this comment, which would require simultaneous disconnection.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

ARTICLE 665 — INDUCTION AND DIELECTRIC HEATING EQUIPMENT

12-90 Log #531 NEC-P12 **Final Action: Reject**
(665.12)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 12-137
Recommendation: Accept as revised:
An approved disconnecting means that simultaneously disconnects all ungrounded conductors of the circuit shall be.. (remainder unchanged).
Substantiation: Since the panel declined to accept a limitation to a switch or circuit breaker, simultaneous disconnection should be specified, as it may be inferred that other sections that require this are modified.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided adequate substantiation to justify the revision recommended in this comment, which would require simultaneous disconnection.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-91 Log #1249 NEC-P12 **Final Action: Reject**
(665.26)

Submitter: Neil F. LaBrake, Jr., Syracuse, NY
Comment on Proposal No: 12-1
Recommendation: Reject the Panel's action on 665.26 and keep the original proposed text.
Substantiation: The Panel's action on 665.26 creates redundant use of the word "bonding" in the sentence. The term "connecting" is appropriate according to the Panel action on Proposal 5-2 for the definition of the term "bonded (bonding)" and is consistent with the NEC TCC Task Group on Grounding and Bonding's original initiative.
This Comment was developed by a Task Group assigned by the NEC Technical Correlating Committee to address actions that were other than "accept" taken by Code-Making Panels on proposals from the TCC to resolve 2005 NEC Proposal 5-1 and Comment 5-1. Members of the Task Group on Grounding and Bonding for this Comment included: C. Douglas White; Michael Johnston; Jeffrey Boksiner; Daleep Mohla; Phil Simmons; Christopher Hutchings; James Carroll; Alan Rebeck; Richard Loyd; Paul Dobrowsky; and Neil F. LaBrake, Jr.
Panel Meeting Action: Reject
Panel Statement: The word "bonding" is defined as a particular type of "connecting." The ROP panel action reflects the intended meaning and is consistent with respect to the particular technology addressed in Article 665.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 668 — ELECTROLYTIC CELLS

12-92 Log #526 NEC-P12 **Final Action: Reject**
(668.3(C)(3))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 12-141
Recommendation: Accept the addition of:
"except as specified in 668.11(B)".
Substantiation: Metal enclosures of associated equipment are not required to comply with Article 250 per 668.6(3)(C) while 668.11(B) indicates metal enclosures associated with the cell line dc power circuits shall be grounded.
Panel Meeting Action: Reject
Panel Statement: The existing wording has not caused confusion in this specialized industry. There is no substantiation that the proposed wording adds more clarity. Grounding of power supply enclosures is specifically described in 668.11(B).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-93 Log #473 NEC-P12 **Final Action: Reject**
(668.15)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 12-142
Recommendation: Accept revised:
For equipment, apparatus, and structural components that are required to be grounded the provisions of Article 250 shall apply ~~except a water pipe electrode shall not be required to be used.~~ Any electrode or combinations of electrodes described in 250.52 shall be permitted.
Substantiation: Equipment that is grounded by choice (not required) should also comply with Article 250 since 250.1 (1) indicates Article 250 covers "permitted" grounding and this section may be deemed to modify that. The reference to water pipe electrodes is superfluous since "any" electrode is permitted.
Panel Meeting Action: Reject
Panel Statement: Water pipe electrodes must be an option. In some of the industry, ground leakage current of the process can destroy the water piping. In other sections of the industry, the water piping is purposely isolated from ground.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-94 Log #497 NEC-P12 **Final Action: Reject**
(668.30(D))

TCC Action: The Technical Correlating Committee directs that this comment be reported as "Reject" because less than two-thirds of the members eligible to vote voted in the affirmative.
Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 12-144
Recommendation: Accept the proposal.
Substantiation: The type of protection should be specific; the Code generally specifies whether the protection is from overcurrent or physical damage. Requirements pertaining to the same thing but differently worded may cause confusion per the Style Manual.
Panel Meeting Action: Accept
Panel Statement:
Number Eligible to Vote: 12
Ballot Results: Affirmative: 7 Negative: 5
Explanation of Negative:
CROUSHORE, T.: Upon review of the Negative Ballot statements on Comment 12-94 by Mr. Givens, Mr. Mortimer, Mr. Prichard, and Mr. White, I am changing my vote from affirmative to negative. I agree with their statements. The submitter has not provided any records or case histories of problems existing in the electrolytic cell industry from the current wording of 668.30(D). Furthermore, since the current wording in the NEC is also contained in NFPA 70E and IEEE 463, it would be preferable to keep all three standards consistent in wording and intent. The circuit protection mentioned in 668.30(D) is not just limited to overcurrent protection.
GIVENS, K.: The author of this Comment 12-94 does not provide substantiation that the existing wording is inadequate for this specialized industry. The issue cited has never been brought up by the electrolytic cell industry.
MORTIMER, J.: No technical substantiation for approval of this comment was provided.

No details with existing Code text was provided.

No details that would indicate any knowledge of the very special application of high current electrolytic cells was provided.

PRICHARD, R.: The submitter has not presented any definitive technical substantiation to focus only on overcurrent protection.

WHITE, K.: The submitter of this comment does not provide any definitive substantiation that the existing wording is inadequate for this specialized industry. The same wording is also in NFPA 70E and IEEE Standard 463 which are both used to guide the Electrolytic Industry.

ARTICLE 675 — ELECTRICALLY DRIVEN OR CONTROLLED IRRIGATION MACHINES

19-58 Log #649 NEC-P19 **Final Action: Reject**
(675.8(B))

Submitter: Linda J. Little, St. Louis, MO
Comment on Proposal No: 19-137
Recommendation: This proposal should be Accepted in Principle. A new sentence should be added before the last sentence to read as follows:

"Portable means for adding a lock to the disconnecting means shall not be permitted."

Substantiation: There should be consistency between similar rules in the NEC that call for the disconnecting means to be capable of being locked in the open position. New language accepted by Code-Making Panel 12 should also be adopted here to clarify that portable units are unacceptable. See language accepted by Code-Making Panel 12 (Proposal 12-136) for this same purpose.
Panel Meeting Action: Reject
Panel Statement: The panel contends that the language in the original proposal correlates with the language in 430.102(B), Exception and that the language in Proposal 19-137 is adequate without the additional sentence.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 7 Negative: 1
Explanation of Negative:

LITTLE, L.: The panel should have accepted in principle with the revised sentence: "Portable means for adding a lock to the disconnecting means shall not be permitted as the means required to be installed at and remain with the equipment."

There are claims that some of the portable units available for snapping on to circuit breakers do remain with the switch or circuit breaker after they are installed on the breakers when the lock is not installed, but they are portable. The actions taken by Code-Making Panel 11 in the 2002 cycle in 430.102(B) Exception were fairly clear that the provisions for adding a lock should be more substantial and not portable units.

The modified wording clarifies that portable units are not acceptable as "the provision for locking or adding a lock to the disconnecting means"... that "shall remain in place with or without the lock installed" as in 430.102(B) Exception. Additionally, the language clarifies that this section does not restrict the use of portable accessory features that workers carry to provide for the attachment of multiple locks to the provision installed at the switch or circuit breaker.
Comment on Affirmative:

EWING, M.: The disconnect is required to be provided with a permanent provision to install a lock, it does not require a lock to be used. The need to install a lock comes from Federal, State, other requirements which in general refer to NFPA 70E, where it is permissible to install a portable hasp (with provisions to install multiple locks) into the disconnect's permanent provision for installing a lock.

ARTICLE 680 — SWIMMING POOLS, FOUNTAINS, AND SIMILAR INSTALLATIONS

17-59 Log #2039 NEC-P17 **Final Action: Reject**
(680 (New))

Submitter: Donald Cook, Shelby County Building Inspections
Comment on Proposal No: 17-171
Recommendation: Accept proposed text from Proposals 17-59, 17-60 and either 17-171 or 17-172 as a package to address the lack of electrical requirements for Baptisteries.
Substantiation: When the proposals above were submitted, the bulleted items were inadvertently attached to the substantiation, an obviously were not intended to apply to these proposals. While the panel action on Proposal 17-60 revises the definition of permanently installed and storable pools to include immersion pools, the scope of Article 680 does not seem to include the vessels of concern. Without a revision to the scope, it seems difficult to apply the definition to these vessels. When I look at the installations, it would also be difficult to determine which part of the current Article 680 would apply to these installations. Two options were provided in Proposals 17-171 and 17-172. While I understand the political difficulty of dealing with the various religious practices related to baptism, the proposed definition attempts to address the electrical safety concerns that are similar to those found with swimming pools, spas, hot tubs, hydromassages, and fountains and at the same time realizes that some religious practices related to baptism do not pose the same risk as others. There was no attempt to infer that one practice or the other should be used, but to provide electrical safety where persons are immersed. It was brought to my attention after I made the proposal, that some religious groups wade into a vessel and while standing in the vessel, are sprinkled rather than being immersed. It would seem the definition should be revised to include persons standing or immersed in these vessels. Pictures will be provided for reference. (Note: No pictures were received by NFPA with this Comment).
Panel Meeting Action: Reject

17-62 Log #1949 NEC-P17 **Final Action: Reject**
(680.2)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 17-62
Recommendation: Accept the proposal.
Substantiation: The panel statement is not responsive. The submitter is aware that if water circulation fails, the water level can rise to the brim. This is a very unusual event. It should not be the basis for setting the rules in Article 680. Going to the actual flood level is akin to setting the datum plane in Article 682 at some height that reflected water height in a 100-yr flood. When the permitted height of the swimming pool junction box was lowered,it was done with enough vacant space in the conduit risers that an unusual water event would not compromise the box, and a reasonable result came out of the process. Now, through the adoption of this definition, those earlier results have been nullified, without substantiation. CMP 17 needs to reconsider the definition.
Panel Meeting Action: Reject
Panel Statement: The panel concludes that the current definition provides the appropriate level of safety. The maximum water level as currently defined can occur as a result of natural events such as heavy rainfall as well as failure of the recirculation system. The definition of "Maximum Water Level" was added in the 2002 edition; it did not change the level intended by the panel.

(Table 680.3)

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 17-63
Recommendation: The Technical Correlating Committee directs that the Panel reconsider and correlate with the Panel Action on Proposals 8-53 and 8-78. This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the recommendation of the Technical Correlating Committee to reconsider. See the panel action and statement on Comment 17-65.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 Gill, C.

17-65 Log #1389 NEC-P17 **Final Action: Accept in Principle in Part**
(Table 680.3)

Submitter: William Wagner, Certification Solutions
Comment on Proposal No: 17-63
Recommendation: This Proposal should be Accepted as originally proposed.

Topic	Section or Article
Wiring	Chapters 1 – 4
Junction box support	314.23
Rigid nonmetallic conduit	352.12, 353.12, 355.12
Audio Equipment	Article 640, Parts I and II
Adjacent to pools and fountains	640.10
Underwater speakers*	

*Underwater loudspeakers shall be installed in accordance with 680.27(A).

Substantiation: In accordance with CMP-8's actions on Proposals 8-53 and 8-78, Article 352 will now apply to "Rigid Polyvinyl Chloride Conduit: Type PVC", and Article 353 will continue to apply to "High Density Polyethylene Conduit: Type HDPE" and Article 355 will now apply to "Reinforced Thermosetting Resin Conduit: Type RTRC". Prior to the separation of these Articles for the 2005 and 2008 editions of the NEC, each of these conduit Types was included in Article 352 as "Rigid Nonmetallic Conduit: Type RNC." Therefore, it is necessary to revise the reference in Table 680.3 as noted above.
This will correlate with the TCC Action on Proposal 17-63.
Panel Meeting Action: Accept in Principle in Part
A. Modify Current Table 680.3 as follows:
1. Revise the words "Rigid nonmetallic conduit" to become "Rigid polyvinyl chloride conduit (Type PVC)"
2. Add a new line to read:
"Reinforced thermosetting resin conduit (Type RTRC)" under Topic, and "355.12" under Section or Article.
B. Replace the words "rigid nonmetallic conduit" in Article 680 in accordance with the instructions in the following table:
Table for inclusion in the committee action on Comment 17-65

Section	Replace	With
680.21(A)(1)	"rigid nonmetallic conduit"	"rigid polyvinyl chloride conduit, reinforced thermosetting resin conduit"
680.23(F)(1)	"or rigid nonmetallic conduit"	"rigid polyvinyl chloride conduit or reinforced thermosetting resin conduit"
680.25(A)	"or rigid nonmetallic conduit"	"rigid polyvinyl chloride conduit or reinforced thermosetting resin conduit"
680.27(A)(2) first sentence	"or rigid nonmetallic conduit"	"rigid polyvinyl chloride conduit or reinforced thermosetting resin conduit"
680.27(A)(2) second sentence	"rigid nonmetallic conduit"	"rigid polyvinyl chloride conduit, reinforced thermosetting resin conduit"

Panel Statement: The panel accepts in principle the addition of 355.12 and rejects the addition of 353.12. High density polyethelene conduit, addressed by Article 353, was never permitted by Article 680. The panel has incorporated the changes in Table 680.3 to account for the use of rigid polyvinyl chloride conduit and reinforced thermosetting resin conduit and has also provided correlating changes for terminology throughout Article 680. This action is based on the continued acceptance of Proposals 8-53 and 8-78. It is recommended that the Technical Correlating Co correlate accordingly if this is not the case.
It is also recommended that the TCC consider the use of "RPVCC" instead of PVC to be consistent with acronyms used for other wiring methods and to prevent confusion with the generic compound pvc.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 Gill, C.

17-66 Log #346 NEC-P17 **Final Action: Accept**
(680.7)

TCC Action: The Technical Correlating Committee understands that the panel action on Proposal 17-67 deleted "an" and "(lighting fixture)", and made "luminaire" plural. The panel action on Comment 17-66 added the text "-and-plug-connection".

The final text reads as follows:

"Fixed or stationary equipment, other than underwater luminaires, for a permanently installed pool shall be permitted to be connected with a flexible cord and plug to facilitate the removal or disconnection for maintenance or repair."

Submitter: L. Keith Lofland, International Association of Electrical Inspectors
Comment on Proposal No: 17-66
Recommendation: Revise text to read as follows:

Fixed or stationary equipment other than an underwater luminaire (lighting fixture) for a permanently installed pool shall be permitted to be connected with a flexible cord-and-plug-connection to facilitate the removal or disconnection for maintenance or repair.

Substantiation: After reading this section, without looking back up and reading the title of this section (Cord-and-Plug-Connected Equipment), if you subscribe to this section, an installer or inspector could not allow an underwater wet-niche luminaire (light fixture) installed in a wet-niche forming shell with a flexible cord, which is typically provided by the luminaire manufacture. Section 680.23(B)(3) permits a flexible cord (but not a cord-and-plug-connection) to a wet-niche luminaire (light fixture). Section 680.23(B)(6) basically requires a flexible cord connection (but not a cord-and-plug-connection).

As indicated in the panel statement on Proposal 17-66, 680.7(B) states the cord shall terminate in a grounding-type attachment plug. Adding the words "-and-plug-connection" in the main statement of 680.7, would make this section much clearer that an underwater luminaire (lighting fixture) for a permanently installed pool cannot be cord-and-plug-connected, but can be connected with a flexible cord. This new wording would make this section much more user-friendly.

Panel Meeting Action: Accept

Ballot Not Returned: 1 Gill, C.

17-67 Log #424 NEC-P17 **Final Action: Accept in Principle**
(680.7)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 17-66
Recommendation: Accept proposal.
Substantiation: The text should be consistent with the heading which includes "and plug". The literal text excludes underwater fixtures from being cord connected as it states: "other than an underwater luminaire shall be permitted to be connected with a flexible cord."
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Comment 17-66.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 Gill, C.

17-68 Log #530 NEC-P17 **Final Action: Reject**
(680.7)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 17-66
Recommendation: Accept the proposal as revised:

Fixed or stationary equipment ~~other than underwater luminaires (lighting fixtures)~~ shall be...(remainder unchanged).

Substantiation: Reference to underwater luminaires is unnecessary since the heading covers plug-connected equipment and (A) limits cord length to 3 ft. 680.28 does not appear to provide for plug connections.
Panel Meeting Action: Reject
Panel Statement: The panel does not agree with the submitter's substantiation. The language suggested for deletion needs to be retained to make it clear that underwater luminaires are NOT addressed by this section.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 Gill, C.

17-69 Log #902 NEC-P17 **Final Action: Reject**
(680.8 Exception (New))

Submitter: Terry L. Schneider, Pikes Peak Regional Building Department
Comment on Proposal No: 17-73
Recommendation: 680.8(A) Power. With respect...Figure 680.8.

Exception: Self-contained Spa or Hot Tub. The minimum clearances for overhead conductors shall be reduced to 3.0 m (10 ft) above the water level for self-contained spa(s) or hot tub(s).

Substantiation: In the National Electrical Safety Code, section 234(C)3d, it covers the overhead clearances of utility wires over decks and similar structures and have attached an interpretation from Committee C2. They are in agreement that the clearances are not required for the same reasons as the original submitter. There is a conflict between the NESC and the NEC and II recommend that Panel 17 reconsider this proposal to bring the 2 standards into agreement.

Note: Supporting Material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The panel continues to reject this change. Often spas and swim spas are located in close proximity to pools and the same tools used for pool maintenance are often used for spas. NESC interpretations do not pertain to NEC Article 680.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 Gill, C.

17-70 Log #455 NEC-P17 **Final Action: Accept in Principle**
(680.12)

TCC Action: The Technical Correlating Committee understands that the final text of 680.12 includes both of the panel actions on Comments 17-70 and 17-71.

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 17-79
Recommendation: Accept proposal or revision as follows:

One or more approved means to simultaneously disconnect all ungrounded conductors of the circuit shall be provided...(remainder unchanged).

Substantiation: Since the panel declined to accept a requirement for a switch or circuit breaker, the means should be specifically required to be approved. Simultaneous disconnection should be specified since literal wording, infers that two or three individual disconnecting means may be used. Utilization equipment includes signs within fountains which require a switch or circuit breaker disconnecting means per 600.6. Since this rule is in Chapter 6, it may be construed as amending other sections requiring simultaneous disconnect.
Panel Meeting Action: Accept in Principle
Revise 680.12 to read as follows:
680.12 Maintenance Disconnecting Means. One or more means to simultaneously disconnect all ungrounded conductors shall be provided for all utilization equipment other than lighting. Each means shall be readily accessible and within sight from its equipment.
Panel Statement: The revised language more clearly presents the requirement and meets the intent of the submitter.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 Gill, C.

17-71 Log #1950 NEC-P17 **Final Action: Accept in Principle**
(680.12)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 17-80
Recommendation: Add the following phrase at the end of the last sentence:

"unless separated from the open water by a permanently installed barrier that provides equal or better separation."

Substantiation: The reason the 5-ft requirement was removed was that this disconnect applies throughout Article 680, and frequently the best place for it might be under the skirt f a commercial hot tub, for example. Such a location might be only one foot, measured horizontally, from the body of water, but there would be no hazard to a swimmer or bather. This suggested wording might adequately bridge the prior history and the submitter's concerns.
Panel Meeting Action: Accept in Principle
Revise 680.12 to read as follows:

680.12 Maintenance Disconnecting Means. One or more means to disconnect all ungrounded conductors shall be provided for all utilization equipment other than lighting. Each means shall be readily accessible and within sight from its equipment and shall be located at least 1.5 m (5 ft) horizontally from the inside walls of a pool, spa, or hot tub unless separated from the open water by a permanently installed barrier that provides a 1.5 m (5 ft) reach path or greater. This horzontal distance is to be measured from the water's edge along the shortest path required to reach the disconnect.

Panel Statement: It is the intent of the panel to regulate the locations of disconnects as stated in the panel action text. The panel disagrees with the submitter's substantiation. The scenario suggested would still allow maintenance personnel to come in contact with the water while operating the disconnect.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 Gill, C.

17-72 Log #1951 NEC-P17 **Final Action: Accept**
(680.21)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 17-81
Recommendation: Do not convert any existing text into an exception, nor change the order of any text. Instead, add the following sentence as action text for 680.21(A):

(A) Wiring Methods. The wiring to a pool motor shall comply with (1) unless modified for specific circumstances by (2), (3), (4), or (5).
Substantiation: The proposal submitter is correct in observing that (4) is, in effect, an exception to (1). The problem is that the other numbered paragraphs are as well. The simplest way out is to add the suggested parent text to (1), allowing the succeeding numbered paragraphs to complete the requirements.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 Gill, C.

17-73 Log #2216 NEC-P17 **Final Action: Reject**
(680.21(A)(1) Exception)

Submitter: Jeff Fitzloff, State of Idaho Division of Building Safety
Comment on Proposal No: 17-81
Recommendation: Revise text to read as follows:
680.21 Motors.
(A) Wiring Methods.
(1) General. The branch circuits for pool-associated motors shall be installed in rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, or Type MC cable listed for the location. Other wiring methods and materials shall be permitted in specific locations or applications as covered in this section. Any wiring method employed shall contain an insulated copper equipment grounding conductor sized in accordance with 250.122 but not smaller than 12 AWG.
Exception: In the interior of dwelling units, or in the interior of accessory buildings associated with a dwelling unit, any of the wiring methods recognized in Chapter 3 of this Code that comply with the provisions of this section shall be permitted. Where run in a cable assembly, the copper equipment grounding conductor not smaller than 12 AWG shall be permitted to be uninsulated, but it shall be enclosed within the outer sheath of the cable assembly. [ROP 17-81]
Substantiation: Adding the text will word this section of the code similar to 680.42(C).
Panel Meeting Action: Reject
Panel Statement: The panel has reinstated item (4) of 680.21(A) in the action on Comment 17-72. In addition, the requirement for a copper equipment grounding conductor with a minimum size of 12 AWG is already contained in item (1) of 680.21(A).
Number Eligible to Vote: 11

Ballot Not Returned: 1 Gill, C.

17-75 Log #1663 NEC-P17 **Final Action: Accept**
(680.22)

TCC Action: The Technical Correlating Committee understands that the panel's action to Accept Proposal 17-85 deletes the second sentence of 680.22(A)(5) in the 2005 NEC:
"Receptacles that supply pool pump motors and that are rated 15 or 20 amperes, 125 volts through 250 volts, single phase, shall be provided with GFCI protection."
Submitter: Brian Myers, IBEW Local Union 98
Comment on Proposal No: 17-85
Recommendation: This proposal should have been accepted.
Substantiation: Receptacle fed pump motors are already required to be GFCI protected. Hard wired pump motors present the same hazards due to the highly corrosive atmosphere. Pump motor seals have a limited life due to chlorines corrosive nature.
The stated purpose of the NEC is "the practical safeguarding of persons and property from hazards" it is practical to provide the same level of protection for a hard wired pump motor that is afforded to a cord and plug connected pump motor.
Panel Meeting Action: Accept
Panel Statement: As a part of the panel's consideration of this comment, the panel reviewed a "Compilation of Data from the U.S. Consumer Product Safety Commission National Injury Information Clearinghouse" that was assembled by a task group of the panel.
Note: Supporting material is available for review at NFPA Headquarters.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 8 Negative: 2
Ballot Not Returned: 1 Gill, C.
Explanation of Negative:
HIRSCH, B.: The Panel should reject this comment and this proposal since proper substantiation was not supplied. The data presented at the meeting from the US Consumer Product Safety Commission National Injury Information Clearinghouse shows that of all the incidents on record, only one possible incident is attributable to hard wire pool pump motors and the data available on that incident is too vague to draw a positive conclusion. To implement requirements that cannot be shown to add safety value puts an unnecessary burden on the end use customer and does not meet the "practical safeguarding" purpose of the Code.
RAMIREZ, M.: The 1999 NEC did not require all motors associated with Article 608 to be GFCI protected, in other than dwelling units. Motor, whether cord and plugs connected or directly hard wired, were required to be GFCI protected.
In the 2002 code cycle, the GFCI protection for hard wired (direct connection) was eliminated because there was no substantiation to require it. In the 2005 code cycle, the proposals to reintroduce the GFCI requirement for "hard wired" motors was rejected by the panel and failed to acquire the votes at the general assembly meeting.
For the 2008 code cycle, the only documentation that CPSC had in their files was one incident dating back 20 years to back-up the theory that GFCI protection should also include hard wired motors for pools and spas.
I conclude that, yes, cord and plug connected motors should have GFCI protection due to possible mishandling of the cord and plug by a consumer. There are thousands of hard wired pool associated motors without GFCI protection without an incident including for 3 HP 30 ampere circuits or three phase motors, pool heaters, ground level central A.C. units, swamp coolers, etc. The requirements for a maintenance service disconnect on hard wire equipment meets the code requirement.
Comment on Affirmative:
BLEWITT, T.: The only incident in the "Compilation of Data from the US Consumer Product Safety Commission National Injury Information Clearinghouse" clearly attributed to a permanently connected swimming pool pump indicated the unit had bare wires in the control box ("sparking was observed"), was not grounded at all and had been repeatedly tripping its circuit breaker.
JHONSON, D.: It has come to my attention the panel action to accept Comment 17-75 that adopts Proposal 17-85 has an editorial issue which may need to be addressed by the TCC. The following underlined text is the code change resulting from the panel action. The bold italicized text seems to be redundant and confusing. the intent to protect pool pumps receptacles or outlets with GFCI protection wherever they may be located would be simply accomplished with the remaining text in 680.22(B).
17-85 (680.22)
5) GFCI Protection. all 15- and 20-ampere, single-phase, 125-volt receptacles located within 6.0 m (20 ft) of the inside walls of a pool shall be protected by a ground-fault circuit interrupter. ***Receptacles that supply pool pump motors and that are rated 15 or 20 amperes, 125 volts through 250 volts, single phase, shall be provided with GFCI protection.***
(B) GFCI Protection. Outlets supplying pool pump motors from branch circuits with short-circuit and ground-fault protection rated 15 or 20 amperes, 125 volt or 240volt, single phase, whether by receptacle or direct connection, shall be provided with ground fault circuit-interrupter protection for personnel.
ROCK, B.: NEMA supports this comment. GFCI protection of hard-wired pump motors in the 1999 NEC provides needed safety and these requirements should be reinstated in the 2008 NEC. The fatality cited in US CPSC National Injury Information Clearinghouse data (INDP 990603HCN0217) supports this position.

17-76 Log #2355 NEC-P17 **Final Action: Accept**
(680.22)

TCC Action: The Technical Correlating Committee understands that the panel's action on Comment 17-75 to Accept Proposal 17-85 deletes the second sentence of 680.22(A)(5) in the 2005 NEC:
"Receptacles that supply pool pump motors and that are rated 15 or 20 amperes, 125 volts through 250 volts, single phase, shall be provided with GFCI protection."
Submitter: Alan Manche, Square D Company
Comment on Proposal No: 17-85
Recommendation: Accept the Proposal.
Substantiation: Based on the panel statement and the panel member negatives on this topic, it is clear that protection was clearly reduced from the 1999 NEC to the 2002 NEC. The panel statement indicates that the general assembly rejected this issue on the floor. The issue on the floor had nothing to do with the reinstating GFCI protection but the wording that was being presented. The NFPA Electrical Section supported the reinstatement of GFCI protection on hard-wire pump motors. The wording has been corrected for this cycle and should be accepted. There has been no evidence or substantiation presented that would support removing this protection.
Panel Meeting Action: Accept

(680.22(A)(5))

Submitter: Charles Palmieri, Inspector of Wires Town of Norwell
Comment on Proposal No: 17-91
Recommendation: This Proposal should be reconsidered as Accept in Principle.
Substantiation: Mr. Paul's substantiation (certainly for northern latitude locations) is valid. GFCI protection of permanently wired pumps is currently not required. Internal failure of such equipment is no less a shock hazard when hard wired then a cord connected installation. Possibly, the CMP regards permanently connected pumps as a stable installation which is not subject to periodic movement and relocation such as a cord connected pump may be. In residential applications pump installations may be best served if only cord connected this is especially true for dwellings where there is a heightened likelihood that the homeowner will provide annual maintenance such as assembly and disassembly of the filtration equipment for winter storage. It is very common that during follow up inspections to notice degraded conditions of the wiring, which supply permanently, connected pool pumps. While such conditions are a cause for alarm to professionals in the electrical industry such concern does not always have the same impact or sense of urgency (to repair) that we who install, service, and inspect realize. The deteriorated conditions that my fellow inspectors and I have noted regarding permanently connected pump motors are an accident waiting to happen and, frankly, I am puzzled why the language of the 1999 NEC has not been readopted as mentioned by Mr. Curry in Proposal 17-92.

17-79 Log #2184 NEC-P17 **Final Action: Accept**
(680.22(A)(5))

Submitter: William F. Laidler, Inspector of Wires Town of Hanover
Comment on Proposal No: 17-91
Recommendation: This Proposal should have been Accepted in Principle. The submitter is correct that by not requiring "hardwired" pool pump motors to be GFCI protected is a hazardous situation.
Substantiation: As an inspector of wires, I am often called to make an inspection at a residence where I had previously done an inspection on a swimming pool. In some cases, I have an opportunity to take a look at the wiring of the existing pool and notice that the liquidtight is usually pulled out of the connector exposing the conductors to the elements of the weather and to the possibility of physical damage. In one particular case, I was called out to investigate why people were getting a sensation of "electrical shock" while in the area of the pool equipment. It was noted that the liquidtight had pulled out of the connector and the ungrounded wire was nicked and making intermittent contact with the metallic frame of the pool pump motor. The frame was connected to the equipment grounding connector, but the breaker did not trip due to high resistance. Had the pump motor been GFCI protected, it would have cleared the circuit due to ground current leakage. The installation was repaired and a GFCI breaker was installed and the situation was corrected.
Panel Meeting Action: Accept

(680.22(D))

Submitter: Bryan P. Holland, City of North Port
Comment on Proposal No: 17-96
Recommendation: I continue to support this proposal and the revision made by the Panel.
Substantiation: The 30 volt stipulation in the original proposal was based on the limited shock potential of circuits under 30 volts, however, the panel revision adds an additional level of safety and assured shock prevention from these system types.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 Gill, C.

17-82 Log #1798 NEC-P17 **Final Action: Reject**
(680.22(D))

Submitter: Noel Williams, Herriman, UT
Comment on Proposal No: 17-96
Recommendation: This proposal should have been rejected.
Substantiation: The term "outlet" as used in this proposal is only partially correct, and this proposal does not enhance safety for the types of equipment specifically mentioned. "Outlet" is a defined term; "The point on the wiring system at which current is taken to supply utilization equipment." Thus, for

example, a thermostat or a push-button on a Class 2 circuit is not an outlet and would not be subject to this rule, nor would any junction box. It could be argued that a telephone qualifies as "utilization equipment" as defined and fire alarm "appliances" such as horns or strobes are a form of utilization equipment (which is why they are called appliances). However, "devices" such as switches and smoke detectors that are part of a fire alarm system (not residential smoke alarms) are not utilization equipment, so the locations where such devices are installed are not outlets - by definition. Switching devices (including thermostats, push-buttons and fire alarm pull stations) are already covered under (C), luminaires under (B), and receptacles under (A) so "other outlets" in the proposed (D) dopes not include, in this case, receptacles, lighting outlets, or switching devices. The proposed FPN would then mislead the user to believe that many points on a signaling, fire alarm, remote control, or communications system are outlets. Also, though the 10 ft rule works well for equipment that has a standard cord length, telephones commonly have cords longer than 10 ft so the proposal will not eliminate or reduce the hazard it claims to address. The proposal probably won't hurt much, other than fostering a slew of misinterpretations and creating conflicts with 680.27 where "outlets" are permitted as close as 5 ft or closer for underwater audio, but it won't resolve much easier.

Panel Meeting Action: Reject

Panel Statement: The panel does not agree with the submitter's substantiation. Fire alarm appliances and telephones would be considered as utiliziation equipment since they use electric energy and connect to outlets that supply them. Refer to the definitions of "outlet" and "utilization equipment" in Article 100.

(680.23)

Submitter: Donald W. Zipse, Electrical Forensics, LLC

Comment on Proposal No: 17-99

Recommendation: New text:

Underwater Luminaries shall be NOT be installed in swimming pools, unless the material interfacing with the water is non-conductive.

Substantiation: Electrical safety should be a major concern of this panel. Shocking persons in swimming pools must be stopped and your acceptance of this proposal / comment will be a step in the correct direction and in compliance with NEC 90.1 "**Purpose. The purpose of this Code is the practical safeguarding of PERSONS... from the hazards arising from the use of electricity."**

Since the pole mounted or pad mounted or underground utility transformer has the primary neutral connected directly to the secondary neutral which is brought into the service panel, where the combination messenger / neutral / ground conductor is attached to the neutral bus bar. The equipment grounding conductor is connected to the neutral bus bar and is connected to the metal enclosure of the underwater (light fixture) luminaries. The high voltage electric current can and does now flow directly from the primary high voltage utility neutral directly by way of a copper conductor into the swimming pool water from the conductive surface of the luminaries and from the swimming pool water the high voltage current **MUST** flow through the pool, into the re-bar and into the earth and back to the utility substation completing the high voltage distribution circuit.

Electric current flow through the swimming pool subjects the swimmers to electric shocks.

The electric utilities brain trust is called the Electric Power Research Institute, (EPRI) and they admit that 60 percent of the high voltage electric current flows back to the substation over the earth, ground. The utility's neutral conductor only carries approximately 40 percent of the primary current back on the neutral conductor. (See attached EPRI document.)

The panel replied, "The Code provides for the establishment of an equipotential bonding grid to limit voltage gradients within the pool area." Tests conducted over the past two years have shown that the panel statement is a **figment of the imagination.** Anyone familiar with and knowledgeable about OHMS LAW would realize that current flowing through the swimming pool will generate a voltage and that this voltage due to continuous flow of electric current will generate a voltage. This level of voltage has and is continuing to shock persons in swimming pools.

See the peer reviewed technical paper presented at an IEEE technical conference titled: "Equipotential Planes, A Figment of the Imagination". Although the testing was done on Equipotential Plane found in dairies, the same principle applied to swimming pools.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The panel agrees with the submitter's concerns with electrical safety of underwater luminaires but does not agree with the submitter's substantiation. The existing requirements in the Code already address the hazards of underwater luminaires provided with metallic enclosures and forming shells.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 9 Negative: 1

Ballot Not Returned: 1 Gill, C.

Explanation of Negative:

CRIVELL, P.: 1. This proposal addresses a valid concern. There is a real potential for underwater light fixtures to act as part of the return path for unbalanced utility current.

2. Underwater luminaries should be required to be manufactured or installed in such a way as to eliminate the potential for underwater light fixtures to act as part of the return path for unbalanced utility current (e.g., double insulation or isolation through an isolation transformer).

17-84 Log #406 NEC-P17 **Final Action: Reject**
(680.23(F)(1))

Submitter: Daniel Leaf, Seneca, SC

Comment on Proposal No: 17-104

Recommendation: Revise as follows:

Accept proposal revised:

Branch circuit wiring on the supply side of enclosures and junction boxes connected to conduits run to wet niche and/or niche luminaires (fixtures) shall be installed using rigid metal conduit, intermediate metal conduit, liquidtight flexible nonmetallic conduit, liquidtight flexible metal conduit ~~or~~ rigid nonmetallic conduit, or Type MI cable. Where installed on buildings electrical metallic tubing shall be permitted. For a one-family dwelling the provisions of 680.21(A)(4) shall be permitted.

Exception: Where ~~connecting to~~ liquidtight flexible metal conduit liquidtight flexible nonmetallic conduit, is used for connecting to transformers for pool or fountain lights ~~liquidtight flexible metal conduit or liquidtight flexible nonmetallic conduit shall be permitted~~. Remainder unchanged.

Substantiation: LFMC should be included since 350.10(1) and 350.12(1) permit use where flexibility and protection from liquids or vapors is required and where not subject to physical damage. Panel statement that is subject to physical damage is arbitrary and be judged by the AHJ. Why would LFNC in the same location not automatically be subject to damage? Type MI cable is resistant to physical damage and provides corrosion protection for conductors. Where conditions corrosive to the sheath are present stainless steel or protection (332.12(2)) can be utilized. To automatically conclude the copper sheath will be corroded doesn't correlate with copper bonding jumpers for rebar and pool equipment which are specified and which may be bare. The reference to 680.21(A) is for correlation as this section doesn't exempt single-family dwellings.

Panel Meeting Action: Reject

Panel Statement: The use of MI cable is not suitable for pool use; see 332.12.

The panel agrees with the submitter that the panel statement on Proposal 17-104 regarding physical damage is incorrect. However, LFMC is not suitable for pool locations due to the corrosive environment.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10

Ballot Not Returned: 1 Gill, C.

Comment on Affirmative:

BLEWITT, T.: LFMC is Listed for installations permitted in Article 350. The jackets are suitable for outdoor wet environments and can be obtained marked as suitable for direct burial in earth or concrete. Note that LFMC is permitted on the supply side of a swimming pool transformer per the exception to 680.23(F)(1).

17-85 Log #1130 NEC-P17 **Final Action: Accept in Principle**
(680.23(F)(1))

Submitter: Andre R. Cartal, Princeton Borough Building Dept.

Comment on Proposal No: 17-105

Recommendation: Please review.

Substantiation: I don't understand the Panel comment. The proposal specifically stated that the armored cable would contain an insulated equipment grounding conductor. If the AC cable does not contain an insulated grounding conductor, it can't be used.

Panel Meeting Action: Accept in Principle

Revise the last sentence of 680.23(F)(1) to read as follows:

Where installed on buildings, electrical metallic tubing shall be permitted, and where installed within buildings, electrical nonmetallic tubing, Type MC cable, ~~or~~ electrical metallic tubing, or Type AC cable shall be permitted. In all cases an insulated equipment grounding conductor sized in accordance with Table 250.122 but not less than #12 AWG shall be required.

Panel Statement: The revised text more clearly presents the requirements and meets the intent of the submitter.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10

Ballot Not Returned: 1 Gill, C.

17-86 Log #2046 NEC-P17 **Final Action: Reject**
(680.23(F)(1))

Submitter: Phil Simmons, National Armored Cable Manufacturers Assn.
Comment on Proposal No: 17-106
Recommendation: Revise existing 680.23(F)(1) as follows:
(F) Branch-Circuit Wiring.
(1) Wiring Methods. Branch-circuit wiring on the supply side of enclosures and junction boxes connected to conduits run to wet-niche and no-niche luminaires (fixtures), and the field wiring compartments of dry-niche luminaires (fixtures), shall be installed using rigid metal conduit, intermediate metal conduit, liquidtight flexible nonmetallic conduit, ~~or~~ rigid nonmetallic conduit or listed Type MC cable having an impervious outer nonmetallic jacket. Where installed on buildings, electrical metallic tubing shall be permitted, and where installed within buildings, electrical nonmetallic tubing or electrical metallic tubing shall be permitted.
Exception: Where connecting to transformers for pool lights, liquidtight flexible metal conduit, ~~or~~ liquidtight flexible nonmetallic conduit or listed Type MC cable having an impervious outer nonmetallic jacket shall be permitted. The length shall not exceed 1.8 m (6 ft) for any one length or exceed 3.0 m (10 ft) in total length used. Liquidtight flexible nonmetallic conduit, Type B (LFNC-B), or listed Type MC cable having an impervious outer nonmetallic jacket shall be permitted in lengths longer than 1.8 m (6 ft).
Substantiation: Type MC cable with an impervious nonmetallic outer jacket offers identical protection for these branch circuits as provided by liquidtight flexible metal conduit and should be permitted for use in these applications. The installer should have a choice of installing a proven, safe, listed, cable product or a conduit wiring method.
As Panel member Mr. Blewitt stated in his ballot, "Type MC cable is available with constructions designed to resist the chemical vapors likely in these installations. They are jacketed versions and are marked "Suitable for use in swimming pool motor circuits."
These are safe and proven products and should not be unfairly restricted by the NEC rules.
Panel Meeting Action: Reject
Panel Statement: Type MC cable is not listed for swimming pool luminaires.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 Gill, C.

17-87 Log #456 NEC-P17 **Final Action: Reject**
(680.24(F))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 17-112
Recommendation: Accept proposal revised:
..."shall be ~~grounded~~ connected to the equipment grounding terminal of the panelboard or the metal enclosure of an individual switch or circuit breaker where the circuit originates."
Substantiation: This requirement should also specifically apply where the branch circuit does not originate from a panelboard.
Panel Meeting Action: Reject
Panel Statement: It is the intent of the panel that the connection be made via a continuous equipment grounding conductor in accordance with 680.23(F)(2) terminating at the equipment grounding terminal of the panelboard.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 Gill, C.

17-88 Log #403 NEC-P17 **Final Action: Reject**
(680.25(A))

Submitter: Daniel Leaf, Seneca, SC
Comment on Proposal No: 17-113
Recommendation: Accept proposal inclusion of liquidtight flexible metal conduit.
Substantiation: The panel statement that liquidtight flexible metal conduit is subject to physical damage is arbitrary and should be determined by the AHJ. LFNMC is permitted; why is it not arbitrarily considered subject to physical damage? LFMC is permitted for flexibility and protection from liquids and (nonspecific) vapors. 350.12 does not prohibit use in corrosive environments. 680.42(A)(1) permits LFMC.
Panel Meeting Action: Reject
Panel Statement: The subject conduit is not listed for corrosive environments.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 Gill, C.

Comment on Affirmative:
BLEWITT, T.: LFMC is Listed for installations permitted in Article 350. The jackets are suitable for outdoor wet environments and can be obtained marked as suitable for direct burial in earth or concrete. Note that LFMC is permitted on the supply side of a swimming pool transformer per the exception to 680.23(F)(1).

17-89 Log #2047 NEC-P17 **Final Action: Reject**
(680.25(A))

Submitter: Phil Simmons, National Armored Cable Manufacturers Assn.
Comment on Proposal No: 17-114
Recommendation: Accept the proposal.
Substantiation: Type MC cable having an impervious nonmetallic sheath is manufactured with a polyvinychloride outer jacket that makes the cable suitable for direct earth burial, encasement in concrete and is inherently resistant to chlorine-enriched atmospheres. As with all wiring methods in an chlorine-enriched atmosphere, the manufacturer should be consulted to determine the suitability for a particular atmosphere.
Type MC cable of the interlocked metal armor type is manufactured with either a galvanized steel or aluminum armor. For the galvanized steel product, the steel strip is galvanized before being spiraled around the conductors being protected. This galvanizing ensures the satisfactory performance of the cable and is similar, if not identical in protection, to that provided on electrical metallic tubing that is allowed as a wiring method for feeders.
Panel Meeting Action: Reject
Panel Statement: The subject wiring method is not universally listed for pool environments.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 Gill, C.

17-90 Log #1661 NEC-P17 **Final Action: Accept**

17-92 Log #950 NEC-P17 **Final Action: Accept in Principle (680.26)**

Submitter: Gary L. Siggins, Underwriters Laboratories Inc.
Comment on Proposal No: 17-114a
Recommendation: Revise as follows:

680.26 Equipotential Bonding.

(A) Performance. The equipotential bonding required by this section shall be installed to reduce voltage gradients in the pool area.

(B) Bonded Parts. The parts specified in 680.26(B)(1) through (B)(7) shall be bonded together using solid copper conductors, insulated covered, or bare, not smaller than 8 AWG or with rigid metal conduit of brass or other identified corrosion-resistant metal. Connections to bonded parts shall be made in accordance with 250.8. An 8 AWG or larger solid copper bonding conductor provided to reduce voltage gradients in the pool area shall not be required to be extended or attached to any remote panelboard, to service equipment, or electrodes.

(1) Conductive Pool Shells. Bonding to conductive pool shells shall be provided as specified in 680.26(B)(1)(a) or 680.26(B)(1)(b). Poured concrete, pneumatically applied or sprayed concrete, and concrete block with painted or plastered coatings ~~are~~ shall all be considered conductive materials due to water permeability and porosity. Vinyl liners and fiberglass composite shells ~~are~~ shall be considered to be non-conductive materials.

a. Structural Reinforcing Steel. Unencapsulated structural reinforcing steel (rebar) shall be bonded together by steel tie wires or the equivalent.

FPN: For structural reinforcing steel encapsulated in a nonconductive compound, see 680.26(B)(1)(b).

b. Copper Conductor Grid. A copper conductor grid shall be provided and shall comply with the following conditions:

(1)Be constructed of minimum 8 AWG bare solid copper conductors bonded to each other at all points of crossing.

(2) Conform to the contour of the pool and the pool deck.

(3)Be arranged in a 300 mm (12 in.) by 300 mm (12 in.) network of conductors in a uniformly spaced perpendicular grid pattern with tolerance of 100 mm (4 in.).

(4)Be secured within or under the pool no more than 150 mm (6 in.) from the outer contour of the pool shell.

(2) Perimeter Surfaces. The perimeter surface shall extend~~s~~ for 1 m (3 ft) horizontally beyond the inside walls of the pool. ~~This~~ and shall include~~s~~ unpaved surfaces as well as poured concrete and other types of paving. Bonding to perimeter surfaces shall be provided as specified in 680.26(B)(2)(a) or 680.26(B)(2)(b), and shall be attached to the pool reinforcing steel or copper conductor grid at a minimum of four (4) points uniformly spaced around the perimeter of the pool. For non-conductive pool shells, bonding at four points shall not be required.

(a) Structural Reinforcing Steel. Structural reinforcing steel shall be bonded In accordance with 680.26 (B)(1)(a).

(b) Alternate Means. Where structural reinforcing steel is not available or is encapsulated in a nonconductive compound, copper conductors shall be utilized where the following conditions are met:

(1)At least one minimum 8 AWG bare solid copper conductor ~~is~~ shall be provided.

(2)The conductors shall follow the contour of the perimeter surface.

(3) Approved splices shall be permitted.

(4)If only a single conductor is provided it shall be 450 to 600 mm (18 to 24 inches) from the inside walls of the pool.

(5)Shall be secured within or under the perimeter surface 100 to 150 mm (4 to 6 inches) below the subgrade.

(3) Metallic Components. All metallic parts of the pool structure, including reinforcing metal not addressed in 680.26(1)(a), shall be bonded. Where reinforcing steel is encapsulated with a nonconductive compound, ~~it~~ the reinforcing steel shall not be required to be bonded.

(4) Underwater Lighting. All metal forming shells and mounting brackets of no-niche luminaires (fixtures) shall be bonded.

Exception: Listed low-voltage lighting systems with nonmetallic forming shells shall not require i~~ng~~ bonding.

(5) Metal Fittings. All metal fittings within or attached to the pool structure shall be bonded. Isolated parts, that are not over 100 mm (4 in.) in any dimension and do not penetrate into the pool structure more than 25 mm (1 in.), shall not require bonding.

(6) Electrical Equipment. Metal parts of electrical equipment associated with the pool water circulating system, including pump motors and metal parts of equipment associated with pool covers, including electric motors shall be bonded.

Exception: Metal parts of listed equipment incorporating an approved system of double insulation shall not be bonded.

(a) Double-Insulated Water Pump Motors. Where a double-insulated water-pump motor is installed under the provisions of this rule, a solid 8 AWG copper conductor ~~that is~~ of sufficient length to make a bonding connection to a replacement motor shall be extended from the bonding grid to an accessible point in the ~~motor~~ vicinity of the pool motor. Where there is no connection between the swimming pool bonding grid and the equipment grounding system for the premises, this bonding conductor shall be connected to the equipment grounding conductor of the motor circuit.

(b) Pool Water Heaters. For pool water heaters rated at more than 50 amperes and having specific instructions regarding bonding and grounding, only those parts designated to be bonded shall be bonded and only those parts designated to be grounded shall be grounded.

(7) Metal Wiring Methods and Equipment. Metal-sheathed cables and raceways, metal piping, and all fixed metal parts shall be bonded.

Exception No. 1: Those separated from the pool by a permanent barrier shall not be required to be bonded.

Exception No. 2: Those greater than 1.5 m (5 ft) horizontally of the inside walls of the pool shall not be required to be bonded.

Exception No. 3: Those greater than 3.7 m (12 ft) measured vertically above the maximum water level of the pool, or as measured vertically above any observation stands, towers, or platforms, or any diving structures shall not be required to be bonded.

Substantiation: Per the request of the Technical Correlating Committee in the Report on Proposals, I reviewed the proposal to correct violations to the NEC Style Manual. Detailed below is a summary of the changes.

FPN Nos. 1 and 2 were moved to the end of 680.26(B) as requirements.

Deleted unnecessary words from B(1)(a). No need to mention concrete pools. B(1) already defines conductive pool shells.

New FPN added as an explanatory reference to help quickly locate the requirements for pools with encapsulated rebar.

B(1)(b) was a fragment. It was revised as a complete sentence followed by a List.

B(2)(b) was originally formatted as a fourth level subdivision. Only three are allowed. It was reformatted as a List under Level 3.

B(7)(a) and (b) were fragments. These two items and part of the text of (7) were reformatted as a set of three Exceptions.

Some editorial revisions were made to bring text into compliance with the formatting requirements for mandatory rules (shall, shall be etc.).

Panel Meeting Action: Accept in Principle

Revise as follows:

680.26 Equipotential Bonding.

(A) Performance. The equipotential bonding required by this section shall be installed to reduce voltage gradients in the pool area ~~as prescribed~~.

(B) Bonded Parts. The parts specified in 680.26(B)(1) through (B)(7) shall be bonded together using solid copper conductors, insulated covered, or bare, not smaller than 8 AWG or with rigid metal conduit of brass or other identified corrosion-resistant metal. Connections to bonded parts shall be made in accordance with 250.8. An 8 AWG or larger solid copper bonding conductor provided to reduce voltage gradients in the pool area shall not be required to be extended or attached to any remote panelboard, to service equipment, or electrodes.

(1) Conductive Pool Shells. Bonding to conductive pool shells shall be provided as specified in 680.26(B)(1)(a) or 680.26(B)(1)(b). Poured concrete, pneumatically applied or sprayed concrete, and concrete block with painted or plastered coatings ~~are~~ shall all be considered conductive materials due to water permeability and porosity. Vinyl liners and fiberglass composite shells ~~are~~ shall be considered to be non-conductive materials.

a. Structural Reinforcing Steel. Unencapsulated structural reinforcing steel ~~(rebar)~~ shall be bonded together by steel tie wires or the equivalent. Where ~~For~~ structural reinforcing steel is encapsulated in a nonconductive compound, a copper conductor grid shall be installed in accordance with~~, see~~ 680.26(B)(1)(b).

b. Copper Conductor Grid. A copper conductor grid shall be provided and shall comply with the following conditions:

(1) Be constructed of minimum 8 AWG bare solid copper conductors bonded to each other at all points of crossing.

(2) Conform to the contour of the pool and the pool deck.

(3) Be arranged in a 300 mm (12 in.) by 300 mm (12 in.) network of conductors in a uniformly spaced perpendicular grid pattern with a tolerance of 100 mm (4 in.).

(4) Be secured within or under the pool no more than 150 mm (6 in.) from the outer contour of the pool shell.

(2) Perimeter Surfaces. The perimeter surface shall extend~~s~~ for 1 m (3 ft) horizontally beyond the inside walls of the pool. ~~This~~ and shall include~~s~~ unpaved surfaces as well as poured concrete and other types of paving. Bonding to perimeter surfaces shall be provided as specified in 680.26(B)(2)(a) or 680.26(B)(2)(b), and shall be attached to the pool reinforcing steel or copper conductor grid at a minimum of four (4) points uniformly spaced around the perimeter of the pool. For non-conductive pool shells, bonding at four points shall not be required.

(a) Structural Reinforcing Steel. Structural reinforcing steel shall be bonded In accordance with 680.26 (B)(1)(a).

(b) Alternate Means. Where structural reinforcing steel is not available or is encapsulated in a nonconductive compound, copper conductor(s) shall be utilized where the following conditions are met:

(1) At least one minimum 8 AWG bare solid copper conductor ~~is~~ shall be provided.

(2) The conductor(s) shall follow the contour of the perimeter surface.

(3) Only listed ~~approved~~ splices shall be permitted.
(4) The required ~~If only a single~~ conductor ~~is provided it~~ shall be 450 to 600 mm (18 to 24 in.) from the inside walls of the pool.
(5) The required conductor shall be secured within or under the perimeter surface 100 to 150 mm (4 to 6 in.) below the subgrade.
(3) Metallic Components. All metallic parts of the pool structure, including reinforcing metal not addressed in 680.26(1)(a), shall be bonded. Where reinforcing steel is encapsulated with a nonconductive compound, ~~it~~ the reinforcing steel shall not be required to be bonded.
(4) Underwater Lighting. All metal forming shells and mounting brackets of no-niche luminaires shall be bonded.
Exception: Listed low-voltage lighting systems with nonmetallic forming shells shall not require i~~ng~~ bonding.
(5) Metal Fittings. All metal fittings within or attached to the pool structure shall be bonded. Isolated parts that are not over 100 mm (4 in.) in any dimension and do not penetrate into the pool structure more than 25 mm (1 in.) shall not require bonding.
(6) Electrical Equipment. Metal parts of electrical equipment associated with the pool water circulating system, including pump motors and metal parts of equipment associated with pool covers, including electric motors, shall be bonded.
Exception: Metal parts of listed equipment incorporating an approved system of double insulation shall not be bonded.
(a) Double-Insulated Water Pump Motors. Where a double-insulated water-pump motor is installed under the provisions of this rule, a solid 8 AWG copper conductor ~~that is~~ of sufficient length to make a bonding connection to a replacement motor shall be extended from the bonding grid to an accessible point in the ~~motor~~ vicinity of the pool pump motor. Where there is no connection between the swimming pool bonding grid and the equipment grounding system for the premises, this bonding conductor shall be connected to the equipment grounding conductor of the motor circuit.
(b) Pool Water Heaters. For pool water heaters rated at more than 50 amperes and having specific instructions regarding bonding and grounding, only those parts designated to be bonded shall be bonded and only those parts designated to be grounded shall be grounded.
(7) Metal Wiring Methods and Equipment. Metal-sheathed cables and raceways, metal piping, and all fixed metal parts shall be bonded.
Exception No. 1: Those separated from the pool by a permanent barrier shall not be required to be bonded.
Exception No. 2: Those greater than 1.5 m (5 ft) horizontally of the inside walls of the pool shall not be required to be bonded.
Exception No. 3: Those greater than 3.7 m (12 ft) measured vertically above the maximum water level of the pool, or as measured vertically above any observation stands, towers, or platforms, or any diving structures shall not be required to be bonded.
Panel Statement: The revised text more clearly presents the requirements and meets the intent of the submitter.
The panel has removed the word "(rebar)" from 680.26(B)(1)a to clarify that welded wire mesh can be included in the term "structural reinforcing steel" where acceptable to the authority having jurisdiction.
Number Eligible to Vote: 11

Ballot Not Returned: 1 Gill, C.

17-94 Log #1685 NEC-P17 **Final Action: Reject (680.26)**

Submitter: Donald W. Zipse, Electrical Forensics, LLC
Comment on Proposal No: 17-114a
Recommendation: Remove 680.26 ~~Equipotential~~ Bonding.
~~(A) Performance. The equipotential bonding required by this section shall be installed to reduce voltage gradients in the pool area.~~
Substantiation: See technical paper attached to comment on 17-99 titled: "Equipotential Planes, A Figment of the Imagination"
The Code Making Panel is to be commended on taking steps to make swimming pools safer. However, there needs to be MORE accomplished.
The Panel statement made on Proposal # 17-116 states, "The Code provides for the establishment of an equipotential bonding grid to limit voltage gradients within the pool area. It is not the intent of the equipotential bonding grid to limit voltage gradients to 0 V but to reduce them."
This gives the pool owner a false sense of security. What if the so-called Equipotential Plane still allows a swimmer to receive electric shock? Should there be a voltage level set? I think NOT. The term Equipotential Plane needs to be eliminated.
Cows have approximately the same internal resistance as humans. Wet skin, hand-to-hand 500 ohms or cow's feet to mouth the same 500 ohms. We are measuring sufficient electric current to disrupt milk production when cows are standing on an Equipotential Plane that is suppose to reduce the potential. Ha, Ha!
What justification is there for using the so-called term Equipotential Plane? What testing has been done? Mr. Lawrence C. Neubauer and Donald W. Zipse have tested many dairies – same electrical setup as swimming pools – and have found that Equipotential Plane should be eliminated as the Wisconsin dairymen have done – remove Equipotential Planes from the NEC.
You need to re-think the underwater fixtures, luminaries since if they have a conductive frame and thus are required to be connected to the equipment grounding conductor, the isolation of the Equipotential Plane is thus voided.
Substation can be found in the peer reviewed technical paper referenced above.
Panel Meeting Action: Reject
Panel Statement: The panel does not agree with the submitter's substantiation based on the testing data provided as a part of the substantiation of Comment 17-98.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 Gill, C.
Comment on Affirmative:
CRIVELL, P.: Eliminating voltage gradients by bonding is not technically possible. If there is any current flow across the bonding grid or mat, some voltage gradient will exist.

17-95 Log #1668 NEC-P17 **Final Action: Reject (680.26, FPN 2)**

Submitter: Joseph Mendonca, Rochester, NH
Comment on Proposal No: 17-114a
Recommendation: Revise as follows:
FPN No. 2: Vinyl liners and fiberglass composite shells (which are manufactured with only noncondutive materials)\
~~are considered to be nonconductive materials~~.
Substantiation: Fiberglass composite shells can be made of conductive material as well as nonconductive material.
Panel Meeting Action: Reject
Panel Statement: The current manufactured material is not identified as conductive or nonconductive. The submitter has not provided substantiation as to the existence of conductive material used in the manufacture of vinyl liner or composite shell swimming pools.
Number Eligible to Vote: 11

(680.26(B)(2))

Submitter: Jeff Fitzloff, State of Idaho Division of Building Safety
Comment on Proposal No: 17-114a
Recommendation: Revise text to read as follows:
(2) Perimeter Surfaces. Extends for 1 m (3 ft) horizontally beyond the inside walls of the pool. Includes ~~unpaved surfaces as well as~~ poured concrete and other types of paving. Bonding for perimeter surfaces shall be provided as specified in 680.26(B)(2)(a) or 680.26(B)(2)(b), and attached to the pool reinforcing steel on copper conductor grid. No perimeter areas will require equipotential bonding if the surface of the area is non conductive or encapsulated in epoxy. ~~at a minimum of four (4) points uniformly spaced around the perimeter of the pool. For nonconductive pool shells, bonding at four points shall not be required.~~ [ROP 17-114a]
Substantiation: The wording in the proposal would require that surfaces that would not be conductive have equipotential bonding. The comment that I have supplied would recognize that surfaces can be coated to insulate them and would be similar to double insulated appliances.
Panel Meeting Action: Reject
Panel Statement: The conductivity of a perimeter surface is not dependent entirely on the material. Weather and other conditions can impact the conductivity.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 Gill, C.

17-98 Log #802 NEC-P17 **Final Action: Accept**
(680.26(C) (New))

Submitter: Frank C. Lambert, Georgia Tech/NEETRAC
Comment on Proposal No: 17-122
Recommendation: Proposal 17-122 should have been adopted in its entirety.
Substantiation: Extensive testing clearly substantiates that the potential for voltage gradient is present in pools where the pool water is not bonded via metal parts in the pool. With this knowledge and confirmation of a voltage gradient hazard, the CMP must address the issue. Test results, handed out at the Proposal Meeting, show that the presence of a touch potential exists in all areas of the pool and that the proposed solution for bonding pool water will essentially reduce that potential to zero. While the proposed solution may not be the only solution, it meets the NEC criteria of providing minimum protection for the public. The test report in its entirety has been submitted to this Comment for further review by the Panel Members.
Typically, pool water is considered electrically conductive due to dissolved chemicals. Although the conductivity will vary with the temperature, the change in conductivity for all practical purposes is not a factor in the application of a proposed solution. Again, the proposed solution meets the NEC criteria of providing minimum protection for the public and should be viewed as a protection measure compared to having no protection.
In the proposed solution, the size of bonding conductor is not specified. This is in line with several Bonded Parts described in 680.26(B). In 680.26(B)(1), (B)(2), (B)(3), and (B)(5), use of a minimum of #8 AWG size wire is implied as specified in 680.26(B)(4) and 680.26(C).
In the stray voltage field, ground currents are rarely determined due to measurement difficulties and inaccuracies. On the other hand, resulting voltage gradients (stray voltages), however, are very easy to measure and can be directly used to analyze stray voltage problems and their mitigation. As evidenced by the test report, the proposed solution is based on such stray voltage measurements around a swimming pool.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 9 Negative: 1
Ballot Not Returned: 1 Gill, C.
Explanation of Negative:
CRIVELL, P.: Optimum solution is to eliminate stray currents causing the voltage gradient. Code Panel 17 should address the cause and methods for elimination of stray currents. Conductive metallic objects in chlorinated water will result in electrolytic coupling issues.

17-99 Log #1190 NEC-P17 **Final Action: Accept**
(680.26(C) (New))

Submitter: Neil F. LaBrake, Jr., National Grid / Rep. Edison Electric Insitute-Electric Light & Power Group
Comment on Proposal No: 17-122
Recommendation: Accept Proposal 17-122.
Substantiation: Testing done by a National Laboratory (NEETRAC) clearly substantiates that the potential for shock hazard is present in pools where the pool water is not bonded via metal parts in the pool. With this knowledge and confirmation of a potential shock hazard, CMP-17 must address the issue. NEETRAC, in its proposal, recommended a solution for bonding pool water. The proposed solution was tested and worked successfully. While the proposed solution may not be the only solution, it meets the NEC criteria of providing minimum protection for the public.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 Gill, C.

17-100 Log #1766 NEC-P17 **Final Action: Reject**
(680.26(C) Exception and 680.26(C)(1) Exception)

Submitter: Michael Cole, MRC Electric
Comment on Proposal No: 17-126
Recommendation: Delete this Exception:
~~Exception: The equipotential bonding grid shall not be required to be installed under the bottom of or vertically along the walls of vinyl lined polymer wall, fiberglass composite, or other pools constructed of nonconductive materials.~~
Substantiation: a. ALL insulators, even a perfect insulator, will pass some amount of alternating current because of capacitance and capacitive reactance. In the event of a utility company primary ground fault in the vicinity of a nonmetallic in ground swimming pool, lack of an equipotential grounding and bonding grid around the walls and floor would allow the ground fault to force some amount of alternating current to flow through the capacitive reactance of the swimming pool wall.
If you have to ask how much current, you might as well be asking how much a yellow jacket sting hurts.
A capacitor consists of 2 electrical conductors separated by an insulator. The water inside a nonmetallic pool, the allegedly insulating wall, and the slurry backfill forms such a device. A linear capacitor stores charge in proportion to applied voltage, what is known as capacitance. Since alternating current constantly reverses the voltage charge (current) also flows in constantly reversing direction.
b. Water will increase the capacitance of waterproof insulation to the point that a variable frequency drive will not work. A case in point was a variable frequency drive circuit with THWN wire in PVC conduit for about 30 ft in the ceiling of a food plant. The motor would work fine if the drive was bypassed which proved that the 60 Hertz and direct current insulation resistance was OK. However, at the carrier frequency (such as 2,000 or 4,000 Hertz) the wiring capacitance created a poor excuse for a 480 volt short circuit.
c. I also have first hand experience with the kind of havoc that occurs when a 30 or 40 ft long 120 volt underground electrical line is leaking 7 amperes during a DROUGHT! The result is a nasty tingle voltage of 40 to 80 volts to correctly grounded objects because the current flow partially energized concrete floors and metal drainpipes. Knowing what their electric bills were during wet months, they did not need to install an electric driveway deicing system.
As our electrical infrastructure ages, these kinds of problems will occur more frequently.
d. In his book, Old Electrical Systems, David Eli Shapiro relates how a shower with a nonmetallic drain pipe had electricity flowing through the slime on the inside of the pipe. He never did locate the source of current but there are a number of possible ways for current to enter. One of them is through the joints of clay tile pipe. I also am familiar with a mobile home park that has tree and grass root penetration of the o-ring joints of gasketed 3034 PVC sewer pipe. This means that even with a modern sewer system electricity can enter the drain pipes and that sanitary engineers and districts need to require copper foil around the joints of PVC sewer pipe.
If something CANNOT go wrong, it will go wrong anyways.
e. If this ill advised exception continues into the 2008 National Electrical Code, I will just simply swear off swimming pools.
Panel Meeting Action: Reject
Panel Statement: The panel's intent is not to require an equipotential bonding grid to be installed under the bottom of, or vertically along the walls of vinyl lined polymer walls, fiberglass composite or other pools constructed of nonconductive material. However, the change made by the panel action on Comment 17-98 addresses the submitter's concerns.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 Gill, C.

17-101 Log #1191 NEC-P17 **Final Action: Reject**
(680.32)

Submitter: Neil F. LaBrake, Jr., National Grid / Rep. Edison Electric Insitute-Electric Light & Power Group
Comment on Proposal No: 17-135
Recommendation: Reject Proposal 17-135.
Substantiation: The submitter of the proposal did not provide adequate substantiation for this change. Technical or statistical data was not provided to document the existence of a problem. The current Code wording in 680.22(A)(5) amply covers the GFCI requirements. The change does not offer any additional protection for the public and in the case of pool pumps will require duplicate GFCI protection. In addition, requirements for pool pump

cords should be covered in the appliance standards and not in the NEC.
It is the Edison Electric Institute's (EEI/EL&P) position that the requirements for end-use electrical devices that are not installed as part of the permanent premises wiring system are best covered by appropriate product standards. It is not the National Electrical Code's intent or scope to set requirements for end-use electrical devices that would typically be purchased by the after market consumer. EEI/EL&P supports the entire electrical safety system that integrates product standards, installation standards, product testing and evaluation, electrical inspection, manufacturer's products, qualified electrical installation and maintenance, electric supply system characteristics, and the owner's use and operation. Covering product standards in the National Electrical Code installation standard could negate the responsibility of the appropriate product standard and adversely impact the entire process.

The integrity of the electrical safety system is anchored in the systematic integration of the National Electrical Code, installation inspection, product safety standards and product testing. If non-premises end-use product safety issues are usurped by the National Electrical Code, the product safety standard process will be weakened resulting in the entire process being weakened. In addition, since non-premises end-use products are not normally in place during the inspection process, enforcement of such a requirement under the NEC would be impossible.

Panel Meeting Action: Reject
Panel Statement: The panel intends to protect against shock hazards due to damaged cords in this environment. Since this is for a storable pool pump, there is no guarantee that GFCI protection will be available.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 9 Negative: 1
Ballot Not Returned: 1 Gill, C.
Explanation of Negative:

HIRSCH, B.: The EEI/EL&P Companies believe the current Code wording amply covers the GFCI requirements. The change does not offer any additional protection for the public and in the case of cord and plug connected pool pumps will require the use of duplicate GFCI protection both at the receptacle and in the cord.. The proposal submitter did not provide substantiation for the change but simply that the proposal was placed on hold by the TCC during the 2005 Comment cycle due to being new material. In addition, requirements for pool pump cords should be covered in the appliance standards and not in the NEC.
It is the Edison Electric Institute's position that the requirements for end-use electrical devices that are **not** installed as part of the permanent premises wiring system are best covered by appropriate product standards. It is not the National Electrical Code's intent or scope to set requirements for en
d-use electrical devices that would typically be purchased by the after market consumer.
The Edison Electric Institute supports the entire electrical safety system that integrates product standards, installation standards, product testing and evaluation, electrical inspection, manufacturer's products, qualified electrical installation and maintenance, electric supply system characteristics, and the owner's use and operation. Covering product standards in the National Electrical Code could negate the responsibility of the appropriate product standard and adversely impact the entire process.
The integrity of the electrical safety system is anchored in the systematic integration of the National Electrical Code, installation inspection, product safety standards and product testing. If non-premises end-use product safety issues are usurped by the National Electrical Code, the product safety standard process will be weakened resulting in the entire process being weakened. In addition, since non-premises end-use products are not normally in place during the inspection process, enforcement of such a requirement under the NEC would be impossible.

17-102 Log #607 NEC-P17 **Final Action: Reject**
(680.43(E))

Submitter: Jim Schmer, Boise City Electrical Department
Comment on Proposal No: 17-150
Recommendation: (E) Methods of Bonding.
(3) The provisions of copper bonding jumper, insulated, covered, or bare, not smaller than 8 AWG solid or #6 AWG stranded insulated green in color.
Substantiation: With the amount of vibration from the control panel and motor's and such that goes on, the solid doesn't always have a solid connection and with stranded Insulated conductor the amount of vibration whether small or large would not come loose. Also in the confines of the area of a self-contained Hot tub or Spa there is not enough room to store chlorine under the skirting of the Hot tub. What Chlorine that is in the Hot tub, the fumes would disipate before they got any where anyhow. Besides Chlorine is lighter than air.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its original reason for rejection. The submitter's substantiation has not resolved this concern.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 Gill, C.

17-103 Log #404 NEC-P17 **Final Action: Reject**
(680.43(F)(1) and (2))

Submitter: Daniel Leaf, Seneca, SC
Comment on Proposal No: 17-151
Recommendation: Accept proposal.
Substantiation: The proposal would correlate with 680.55(B) which uses the phrase "exposed noncurrent-carrying metal."
Panel Meeting Action: Reject
Panel Statement: There is no need to correlate with 680.55(B), as 680.43(F)(1) and (F)(2) identify types of equipment to be grounded and 680.55(B) identifies the methods of grounding.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 Gill, C.

17-104 Log #539 NEC-P17 **Final Action: Accept in Principle**
(680.52(B)(2)(b))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 17-157
Recommendation: Accept the proposal as revised:
~~Where the junction box is supported only by the conduit~~ A junction box shall be permitted to be supported in accordance with 314.23(E) and (F). The conduit**s** shall be of...(remainder unchanged).
Substantiation: The word "conduit" is singular and infers enclosures may be supported by one conduit, and since Chapter 6 may modify Chapters 1 through 4 it is unclear whether the requirements of 314.23(E) and (F) are intended to apply.
Panel Meeting Action: Accept in Principle
Revise 680.52(B)(2)(b) to read as follows:
(b) Underwater enclosures shall be firmly attached to the supports or directly to the fountain surface and bonded as required. Where the junction box is supported only by ~~the~~ conduit**s in accordance with 314.23(E) and 314.23(F),** the conduit**s** shall be of copper, brass, stainless steel, or other approved corrosion-resistant metal. Where the box is fed by nonmetallic conduit, it shall have additional supports and fasteners of copper, brass, or other approved corrosion-resistant material.
~~FPN: See 314.23 for support of enclosures.~~
Panel Statement: The revised text more clearly presents the requirement and meets the intent of the submitter. The FPN has been deleted, since the reference in the requirement is more specific.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 Gill, C.

17-105 Log #524 NEC-P17 **Final Action: Reject**
(680.56(D))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 17-161
Recommendation: Accept as revised:
Where permanently connected to supply conductors connections with flexible cords shall be ~~permanent~~ in accordance with 110.14. ~~except that~~ Grounding type attachment plugs and receptacles...(remainder unchanged).
Substantiation: 110.14 is specific. "Permanent connection" is not defined; many permanent installations are cord-and-plug connected.
Panel Meeting Action: Reject
Panel Statement: The submitter's comment and original proposal misses the clear purpose of 680.56(D), as indicated by its title "Terminations" and by its context of precluding disconnection of the conductors of flexible cord from terminals of fixed or stationary cord-and-plug-connected equipment except at the interface subject to frequent handling and potential damage to the grounding path: the attachment plug and receptacle.

The submitter's proposed redirection to 110.14 includes general requirements addressing the coordination and integrity of electrical connections, but not to the capacity to render that connection incapable of separation. Per 110.1, 110.14 general requirements are already inherently applicable; 110.14 applicability is reiterated by 680.3.

Relative to the submitter's perception that "permanent connection" is not defined, the submitter is directed to the Scope of Article 100 regarding commonly defined general terms or commonly defined technical terms. Various terms expressing permanent connection (also including "conductors connected permanently", permanently joined", "connected by a permanent wiring method", "permanent, reliable electrical bond", "permanently attached leads", "permanently wired", etc.) are used throughout the National Electrical Code®.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 Gill, C.

17-106 Log #1660 NEC-P17 **Final Action: Accept (680.71)**

TCC Action: The Technical Correlating Committee understands that the changes made in Comment 17-106 do not alter the changes made by the panel action on Proposal 17-85a with respect to the distance.
Submitter: Brian Myers, IBEW Local Union 98
Comment on Proposal No: 17-165
Recommendation: Continue to accept in principle, revised as follows:
Change 680.71 to read as follows:
Hydromassage bathtubs and their associated electrical components shall be on a ~~dedicated circuit~~ individual branch circuit(s) and protected by a readily accessible ground-fault circuit interrupter. All 125-volt, single-phase receptacles not exceeding 30 amperes and located within 1.5 m (5 ft) measured horizontally of the inside walls of a hydromassage tub shall be protected by a ground-fault circuit interrupter.
Substantiation: The term "dedicated circuit" is not defined in the NEC. However, the term "individual branch circuit" is defined. For example, an installer may interpret "dedicated" as primarily serving the hydromassage bathtub while also providing limited lighting in the area.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 Gill, C.

17-107 Log #1800 NEC-P17 **Final Action: Accept in Principle (680.71)**

Submitter: Noel Williams, Herriman, UT
Comment on Proposal No: 17-165
Recommendation: This proposal should have been accepted in principal and reworded as follows:
"...shall be on a ~~dedicated~~ branch circuit that has no other outlets and shall be protected by a readily accessible ground-fault circuit interrupter."
Substantiation: The term "dedicated circuit" is not defined, and actually means different things to different people - in varying contexts. In other locations in the NEC, such as in 210.11(C) where circuits are intended to be "dedicated" to specific types of equipment, rooms, or areas, the language used is "shall have no other outlets," which is the language upon which the language proposed in this comment is modeled." Article 620 uses the term "separate branch circuit," which is perhaps better than "dedicated branch circuit," but is also not defined. The defined term "individual branch circuit" does not work here unless the tub is completely self-contained and requires only one connection.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Comment 17-106.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 Gill, C.

17-108 Log #1882 NEC-P17 **Final Action: Reject (680.71)**

Submitter: Mike Holt, Mike Holt Enterprises, Inc.
Comment on Proposal No: 17-186
Recommendation: This proposal should be rejected.
Substantiation: The substantiation for this major change is "contractors are tapping in on hallway, living room and/or bedroom circuits without a violation." Well...so what? Is it unsafe? Requirements for circuiting an appliance should be driven by the load of the appliance in accordance with Article 220. Also, what is a dedicated circuit? Does the proponent mean "individual branch circuit"? And, why does the GFCI have to be readily accessible? Are people going to get injured if the GFCI is beneath the tub in an accessible, but not readily accessible, location? If the GFCI trips and the occupant is forced to leave the tub to reset it, isn't that a good thing?
Panel Meeting Action: Reject
Panel Statement: There is no Proposal 17-186, and the panel could not determine the intended proposal.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 Gill, C.

17-109 Log #1953 NEC-P17 **Final Action: Reject (680.71)**

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 17-165
Recommendation: 1. Revise the first sentence as follows:
Hydromassage bathtubs and their associated electrical components shall be on a dedicated circuit and protected by a ground-fault circuit-interrupter.
2. Add the following sentence to 680.73 at the end:
Where the hydromassage bathtub is cord- and plug-connected, the receptacle shall be installed so that its face is within direct view and not more than 300 mm (1 ft) of a service access opening.
Substantiation: The proposed requirement for "readily accessible" is excessive, since this device will not need to be reached in an emergency. On the other hand we routinely see devices so well concealed that two flashlights and a mirror are needed to find them, and a contortionist is required to disconnect the tub. This language refers to a receptacle and not a GFCI device because the issue is the disconnect ability regardless of the type of device. Many tubs are protected by a GFCI circuit breaker, for example.
Panel Meeting Action: Reject
Panel Statement: With regard to the first item, GFCIs are required to be tested on a monthly basis and therefore must be accessible to be tested.
With regard to the second item, the recommendation is not specific as to whether the outlet is located internal or external to the access compartment.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 Gill, C.

17-110 Log #215 NEC-P17 **Final Action: Accept (680.74)**

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 17-166
Recommendation: The Technical Correlating Committee directs that the panel reconsider and clarify the panel action on this proposal by using mandatory language in accordance with the NEC Style Manual. This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Revise 680.74 to read as follows:
680.74 Bonding. All metal piping systems and all grounded metal parts in contact with the circulating water shall be bonded together using a copper bonding jumper, insulated, covered, or bare, not smaller than 8 AWG solid. The bonding jumper shall be connected to the terminal on the circulating pump motor that is intended for this purpose. The bonding jumper shall not be required to be connected to a double insulated circulating pump motor. The 8 AWG or larger solid copper bonding jumper shall be required for equipotential bonding in the area of the hydromasage bathtub and shall not be required to be extended or attached to any remote panelboard, service equipment, or any electrode.
Panel Statement: The panel accepts the direction of the TCC to clarify the panel action and has made the needed changes.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 Gill, C.

ARTICLE 682 — NATURAL AND ARTIFICALLY MADE BODIES OF WATER

17-111 Log #1954 NEC-P17 **Final Action: Hold (682.14)**

TCC Action: The Technical Correlating Committee directs that this comment and Proposal 17-176 be reported as "Hold " consistent with Section 4.4.6.2.2 of the NFPA Regulations Governing Committee Projects. This comment introduces a conflict with 682.13 that attempts to be resolved through a new Exception that has not had adequate public review.
Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 17-176
Recommendation: Accept the proposal in principle. Accept the text as proposed, but insert the phrase "or other outlet" after "marked to designate which receptacle" in proposed (A), and insert an exception ahead of (A) as follows:
Exception: Equipment listed for direct connection and equipment anchored in place and incapable of routine movement caused by water currents or wind shall be permitted to be connected using wiring methods covered in 682.13.
Substantiation: This comment addresses equipment that might not be connected by flexible cord, as was pointed out in the panel statement. It also puts the live parts issue back on the table, as identified in the comment in the voting. The substantiation for the proposal as originally submitted remains valid.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 Gill, C.

17-112 Log #435 NEC-P17 **Final Action: Accept in Principle (682.14(A))**

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 17-177
Recommendation: Accept revised.
The disconnecting means shall ~~be permitted to~~ consist of a circuit breaker, switch, or both, or other approved means, that simultaneously disconnects all ungrounded conductors of the circuit it supplies, and shall be ~~properly~~ suitably identified as to which structure or equipment it controls.

Substantiation: Since the panel rejected the proposal to specify a switch or circuit breaker, the proposed "or other approved means" will permit other types if acceptable to the AHJ. Simultaneous disconnection of ungrounded conductors should be specified so that no inference is made that such requirements elsewhere in the code are modified in this article. The phrase "shall be permitted" doesn't impose any requirement. It is noted that signs and outline lighting in fountains require a switch or circuit breaker disconnect per 600.6.
Panel Meeting Action: Accept in Principle
Revise 682.14(A) to read as follows:
(A) Type. The disconnecting means shall be permitted to consist of a circuit breaker, switch, or both that simultaneously opens all ungrounded circuit conductors, and shall be properly identified as to which structure or equipment it controls.
Panel Statement: The revised text more clearly presents the requirements and meets the intent of the submitter.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 Gill, C.

17-113 Log #538 NEC-P17 **Final Action: Accept in Principle (682.14(A))**

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 17-177
Recommendation: Accept the proposal as revised:
The disconnecting means shall ~~be permitted to~~ consist of a circuit breaker(s), switch(es), or both, or other approved means, that simultaneously disconnects all ungrounded conductors of the circuit it supplies and shall be properly identified as to which structure or equipment it controls.
Substantiation: Since the panel did not want to limit disconnecting means to switches or circuit breakers, other types should be specifically required to be approved. Since Chapter 6 may modify other Code rules for simultaneous disconnection, it should be clearly required in this section.
Panel Meeting Action: Accept in Principle
Panel Statement: Refer to the panel action and statement on Comment 17-112.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 Gill, C.

17-114 Log #1955 NEC-P17 **Final Action: Reject (682.30)**

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 17-178
Recommendation: Accept the proposal as submitted.
Substantiation: The proposal wording brings the relevant requirements forward so the reader does not need to query Part III of Article 553, and then 555.15, in order to know the requirements.
Panel Meeting Action: Reject
Panel Statement: The NEC Manual of Style does not prohibit the revisions made by the panel action on Proposal 17-178.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 Gill, C.

ARTICLE 690 — SOLAR PHOTOVOLTAIC SYSTEMS

13-22 Log #682 NEC-P13 **Final Action: Accept (690)**

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 13-17
Recommendation: I agree with the Panel Action except the word "multi-conductor" should be changed to "multiconductor" in 690.35(D).
Substantiation: This is an editorial correction for consistency. Multiconductor is not hyphenated. In the 2005 NEC, the word "multi-conductor" is only used in Articles 690 and 810 and Annex D. The word "multiconductor" is used in 31 Articles, Chapter 9, and Annex B. In the 2008 preprint, "multi-conductor" only appears 7 times whereas "multiconductor" appears 142 times.
Panel Meeting Action: Accept
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.

13-23 Log #686 NEC-P13 **Final Action: Reject (690)**

TCC Action: The Technical Correlating Committee understands that the panel action to Reject this comment also results in the rejection of Proposal 13-17 as stated in the panel statement in this comment.
Submitter: Timothy M. Croushore, Allegheny Power
Comment on Proposal No: 13-17
Recommendation: These recommended corrections to Article 690 as recommended in the original proposal are intended to comply with the current NEC organization are as follows:
1. Please accept the original proposed modifications to 690.1 Scope as published in the ROP.
2. Please accept the original proposed modified Figure 690.1(N) as published in the ROP.
3. Please delete the definition of Interactive System, as it will now appear in Article 100. Please do not delete the definition of Hybrid System and Electrical Production and Distribution Network as proposed. The last two definitions are needed to explain Figure 690.1(B).
4. Please accept the modifications made in the original proposal to the definitions of Inverter Input Circuit as published in the ROP. The definition of this circuit should apply to Interactive, Hybrid and Stand-alone systems and not just interactive systems. The original definition of Inverter Output Circuit should remain as published in the 2005 NEC.
5. Please accept the modifications made in the original proposal to 690.3 Other Articles to correspond with the rewrite of Article 705. The proposed modifications are published in the ROP.
6. Please accept the modification made in the original proposal to the title of 690.5 DC Ground Fault Protection. Overcurrent Protection. This proposed change is to clarify that the requirement of 690.5 is for DC and not AC Ground Fault protection.
7. Please delete the complete title and text of (D) Utility-Interactive Inverters Mounted in Not-Readily-Accessible Locations of 690.13. All Conductors as recommended in the original proposal to correspond with the rewrite of Article 705.
8. Please delete the complete title and text of 690.54 Interactive System Point of Interconnection as recommended in the original proposal to correspond with the rewrite of Article 705. This information is included in Article 705.
9. Please do not delete the title and text of (B) Facilities with Utility Service and PV Systems of 690.56 Identification of Power Sources as recommended in the original proposal. These requirements should probably remain in Article 690.
10. Please delete all of Part VII. Connection to Other Sources and renumbering Part VIII, Storage Batteries accordingly as recommended in the original proposal to correspond with the rewrite of Article 705. The information on connection to other sources is now included in Article 705.
Substantiation: Code Making Panel 13 is to be commended for the fine job on the work on the rewrite of Article 705 and revision to Article 690 and Article 692 as it appears in the NEC 2008 Draft.
This comment is a companion comment to the comment on Proposal 13-184 dealing with the rewrite of Article 705. There is also a companion comment to the comment on Proposal 13-71 dealing with comment on Article 692. It may be best to review the comment on Article 705, Proposal 13-184 before reviewing this comment and the one on 13-71.
It is recognized that the Solar Photovoltaic community has done great work in promoting and advancing the utility-interactive inverter technology both for photovoltaic installations. However, this technology can also be used for interconnection for other distributed generation sources. While there may be reluctance to remove the utility-interconnection requirements from Article 690 and 692, it is the best organization for the NEC to keep the nonspecific interconnection requirements in Article 705 scoped specifically for the interconnnection of electric power sources and any specific technology installation requirements such as photovoltaic and fuel cells in their separate Articles.
The main purpose of the original proposal is to consolidate nonphotovoltaic utility interconnection issues with distributed generation in Article 705 and photovoltaic-specific technical issues in Article 690. Having non-photovoltaic utility interconnection issues duplicated within Article 690 causes confusion with Article 705 that is intended to deal with utility interconnection issues with all distributed generation sources.
The intent of this comment on the original proposal is to clarify and correct the issues in Article 690 based on the rewrite of Article 705 and on the affirmative comments as published in the Report on Proposals suggested by the members of CMP-13. The original proposal as published in the ROP was used to identify the changes as originally proposed.
Panel Meeting Action: Reject
Panel Statement: The panel rejects the proposal in order to satisfy the intent of the original panel action on the proposal by keeping Article 690 intact while transferring selected language related to interconnection to Article 705.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.

13-24 Log #1178 NEC-P13 **Final Action: Reject**
(690)

TCC Action: The Technical Correlating Committee understands that the panel action to Reject this comment also results in the rejection of Proposal 13-17 as stated in the panel statement in this comment.
Submitter: Neil F. LaBrake, Jr., National Grid / Rep. Edison Electric Insitute-Electric Light & Power Group
Comment on Proposal No: 13-17
Recommendation: Accept Proposal 13-17.
Substantiation: Proposal 13-184 establishes a location in Article 705 to locate the common interconnection requirements that apply to all electric power production sources operating in parallel with a primary source of electricity. These requirements are not unique to photovoltaic systems and should be relocated to Article 705 and removed from Article 690. This action is a necessary step towards standardization of interconnection requirements and improves the usability of the NEC.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 13-23.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.
Comment on Affirmative:
HORNBERGER, B.: I agree with the panel action, however the panel discussed recommending that a Task Group be formed to review the redundant "Point of Connection" requirements for PV in 690, Fuel Cells 692 and Interconnected Electric Power Sources 705. There is no mention of this in the panel statements. The panel harmonized most of these requirements through their actions on comments 13-77, 13-97, and 13-262. Photovoltaic and Fuel Cell systems are "Interconnected Electric Power Sources", when they operate in parallel with another supply source. Article 705 should apply. Point of connection requirements in Articles 690 and 692 should only contain "special" considerations that pertain to the specific power source technology.

13-25 Log #1704 NEC-P13 **Final Action: Accept**
(690)

TCC Action: The Technical Correlating Committee understands that the panel action to Accept this comment also results in the rejection of Proposal 13-17.
Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Comment on Proposal No: 13-17
Recommendation: The PV Industry Forum agrees with the Panel Action to reject the proposal as it applies to Article 690 and also agrees with the Comments by Bower, Kranstins, and Zgonena.
Substantiation: Neither the PV Industry, the electrical installer industry, the inspector community, nor the user community have had time to fully digest and analyze the impacts of this far-reaching proposal. A working group drawn from these groups should be convened to prepare a complete proposal for the 2011 code cycle.
Panel Meeting Action: Accept

(690 and 690.50 (New))

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 13-18
Recommendation: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal since 250.120(C) deals with equipment grounding conductors, not equipment bonding jumpers. This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 13-70.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.
Comment on Affirmative:
BOWER, W.: I refer to my ballot comment on Comment 13-70 to clarify the title of the new 690.46 to read "Array Equipment Grounding Conductors Installation" to agree with the intent and structure of 250.120 titles.

13-28 Log #1706 NEC-P13 **Final Action: Hold**
(690.5)

TCC Action: The Technical Correlating Committee understands that in the panel Statement, Proposal 13-22 was not held.
Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Comment on Proposal No: 13-22
Recommendation: The original Proposal should be accepted as the Panel Action indicates. A revision is made to EX 2 as follows and a FPN is added for clarity:
Exception 2: PV arrays mounted on other than dwelling units shall be permitted without ground-fault protection if each equipment-grounding conductor, the grounded circuit conductor, and the dc grounded conductor-to-ground bonding conductor has an ampacity of at least 2.8 times the module rated short-circuit current. The ampacity in the equipment-grounding conductors shall be adjusted for the conditions of use including temperature and conduit fill where applicable. No increase in size is required if circuit conductors are oversized.
FPN to EX 2. Where the system and equipment does not employ a ground fault detection device that interrupts the fault current, the equipment-grounding conductors, grounded circuit conductors and the dc grounded conductor-to-ground bonding conductor can carry ground-fault currents continuously, and these currents can be insufficient to cause operation of any overcurrent devices. The equipment-grounding conductors should have conditions-of-use adjustment factors applied.
Substantiation: Many systems will employ equipment that meets the basic requirements of 690.5. See attached explanatory materials.
The revision to EX 2 clarifies the exact ampacity requirement of the equipment grounding conductors, grounded circuit conductors, and the dc system ground-bonding conductor as 2.8 times the module rated short-circuit current and points out that the ampacity should be adjusted for conditions of use, since, under fault conditions, they may have to carry the fault currents continuously where the fault currents are insufficient to operate any overcurrent devices. All conductors that may be subject to these higher ground fault currents are required to be oversized. Note this is not an issue of voltage drop or conductor size limiting the operation of overcurrent devices, it is a problem of insufficient, although somewhat larger than normal, over currents. The FPN is added for clarity.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Hold
Panel Statement: This comment was held because it would introduce a concept that has not had public review by being included in a related proposal as published in the Report on Proposals. Proposal 13-22 was not held.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.
Comment on Affirmative:
BOWER, W.: I agree with the proposed changes and new language from CMP 5 as shown in comment 13-29, however the language in (B) still needs minor improvement to avoid ambiguity. See My Affirmative with Comment on 13-29.

13-29 Log #287 NEC-P13 **Final Action: Accept**
(690.5 Exception No. 2, 690.45)

TCC Action: The Technical Correlating Committee understands that the portion of the comment recommendation on 690.45 is a comment on Proposal 13-49.
Submitter: Code-Making Panel 5,
Comment on Proposal No: 13-22
Recommendation: CMP-5 recommends revising Exception No. 2 to reference 690.45 for equipment grounding conductor sizing requirements.

Revise Exception No. 2 to 690.5 as follows:

"Exception No. 2: PV arrays installed at other than dwelling units shall be permitted without ground-fault protection where the equipment grounding conductors are sized in accordance with 690.45."

Revise 690.45 into a list format as follows:

"690.45 Size of Equipment-Grounding Conductor. Equipment grounding conductors for photovoltaic source and photovoltaic output circuits shall be sized in accordance with (A) or (B).

(A) Equipment-grounding conductors in photovoltaic source and photovoltaic output circuits shall be sized in accordance with Table 250.122. When no overcurrent protective device is used in the circuit, an assumed overcurrent device rated at the photovoltaic rated short-circuit current shall be used in Table 250.122. Increases in equipment-grounding conductor size to address voltage drop considerations shall not be required. ~~If equipment grounding conductors sized per 690.5(A) Exception 2 are used, the above sizing requirements are not to be used.~~ The equipment-grounding conductors shall be no smaller than 14 AWG.

(B) For other than dwelling units where ground-fault protection is not provided in accordance with 690.5(A) through (C), each equipment grounding conductor shall have an ampacity of at least two (2) times the temperature and conduit fill corrected circuit conductor ampacity."

Add a new FPN following the revision to this section (B) as follows:
"FPN: The short circuit current of photovoltaic modules and photovoltaic sources is just slightly above the full load normal output rating. In ground fault conditions, these sources are not able to supply the high levels of short-circuit or ground-fault currents necessary to quickly activate overcurrent devices as in typical AC systems. Protection for equipment grounding conductors in photovoltaic systems that are not provided with ground-fault protection is related to size and withstand capability of the equipment grounding conductor, rather than overcurrent device operation."
Substantiation: 690.45 already provides the minimum sizing requirements for equipment grounding conductors. From an NEC usability standpoint, all such sizing requirements should be provided in this section. The proposed Exception No. 2 to 690.5 as adjusted, would provide the necessary correlation with 690.45 that would now include under this revision a sizing requirement that is in excess of current EGC sizing requirements contained in 690.45 and 250.122 for specific reasons related to the performance of this special equipment.
The proposed revisions to 690.45 are also needed for proper correlation.
Substantiation provided indicated that the amount of short-circuit current produced from solar photovoltaic equipment is slightly higher than the normal output current levels. In ground fault conditions, solar photovoltaic equipment is not able to supply the high levels of short-circuit or ground-fault currents necessary to quickly activate overcurrent devices as in typical AC systems. Protection for equipment grounding conductors in photovoltaic systems that are not provided with ground-fault protection is related to size and withstand capability of the equipment grounding conductor, rather than overcurrent device operation. This information is provided in a new FPN following the new equipment grounding conductor sizing provisions. The FPN will provide useful information for users describing the unique conditions that warrant increased equipment grounding conductor sizes where ground-fault protection is not provided.

This comment has been balloted through CMP-5 with the following ballot results:

15 Eligible to Vote
13 Affirmative
1 Negative
1 Not Returned (W. Helfrich)

Mr. D. Mohla voted negatively stating: "Comment on these proposals should be separated as they pertain to different sections of the code and proposals.

I agree with the revised Exception No. 2 proposed by CMP-5 which refers equipment grounding conductor sizes to 690.45, where sizing belongs.

I do not agree with all the revisions to 690.45 proposed by CMP-5.

There is no basis or justification for inclusion of 690.45(B) or a FPN requiring an exception from ground fault protection when equipment grounding conductor size is twice the phase conductors. Please see the objection of the Technical Correlating Committee on Proposal 13-22 (690.5) which reinforced basic requirements contained in 250.122 that EGC sizing is based on overcurrent corrective devices.

See the negative vote by Mr. Swayne on Proposal 13-.22."

Panel Meeting Action: Accept
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.
Comment on Affirmative:

BOWER, W.: I agree with the proposed changes and the new language from CMP 5 however the new language is ambiguous. "For other than dwelling units where ground-fault protection is not provided in accordance with 690.5(A) through (C)." It should be changed to read "For other than dwelling units with rooftop installations where ground-fault protection is not provided in accordance with 690.5(A) through (C)". Without the clarification, the sentence could be interpreted as dwelling units that do not have ground-fault protection. Dwelling units with rooftop installations are required to have GFP.
Also, in Exception 2, change the term "PV" to "Photovoltaic" to be consistent with the rest of the code. Other editorial changes on 690.31(C), 690.56(B) and 690.72(B)(3), the only other places where the term PV is used would remove the undefined term from the code.

ZGONENA, T.: The word "or" needs to be inserted as follows to clarify the intent of Exception (B) as follows:
"For other than dwelling units "or" where ground-fault protection is not provided in accordance with 690.5(A) through (C)." As written this appears to be an "and" function which does not convey the intent. This does not only apply to dwellings without GFDI protection.

13-30 Log #1707 NEC-P13 **Final Action: Accept**
(690.5(A))

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Comment on Proposal No: 13-23
Recommendation: The original proposal should be accepted as submitted. The warning is already required by 690.5(C). Here is the original submission:

690.5(A) Ground-Fault Detection and Interruption. The ground-fault protection device or system shall be capable of detecting a ground-fault current, interrupting the flow of fault current, and providing an indication of the fault. Automatically opening the grounded conductor of the faulted circuit to interrupt the ground-fault current path shall be permitted. If a grounded conductor is opened to interrupt the ground-fault current path, all conductors of the faulted ~~source~~ circuit shall be automatically and simultaneously opened. Manual operation of the main PV dc disconnect shall not activate the ground-fault protection device or result in grounded conductors becoming ungrounded.
Substantiation: The Panel Actions and wording have created a conflict with UL Standard 1741 requirements and created a safety hazard as pointed out by Zgonena. The necessary safety warning is already required by 690.5(C). The original submission should be adopted.
Panel Meeting Action: Accept
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.

13-31 Log #1709 NEC-P13 **Final Action: Accept**
(690.7(A))

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Comment on Proposal No: 13-27
Recommendation: The PV Industry Forum agrees with and supports the Panel Action.
Substantiation: For Swayne: None of the basic PV module data is in the code. It is found on the module labels. Much of the information required to size the ac circuits connected to an inverter is found only in the inverter instruction manuals, not in the code. Inspectors throughout the country are starting to require all necessary information and calculations for code compliance on PV systems to be furnished with the permit applications. Also note that new PV module technologies such as thin films (three currently and more coming) will require that manufacturer's instructions be used to make code-required calculations. These technologies are addressed in the requirement, already in this section, to use the manufacturer's data.
Panel Meeting Action: Accept
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.

13-32 Log #1967 NEC-P13 **Final Action: Reject**
(690.7(A))

Submitter: Elliot Rappaport, Electro Technology Consultants
Comment on Proposal No: 13-27
Recommendation: Reject the proposal.
Substantiation: The proposed wording does not provide information to all who may have a need for it. The AHJ does not have access to instructions and must rely on code. If a module is replaced with one having a different coefficient, the maximum circuit voltage may change.
Panel Meeting Action: Reject
Panel Statement: The NEC recognizes labeling instructions as an enforceable Code requirement.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.

13-34 Log #1711 NEC-P13 **Final Action: Accept in Principle (690.8(A)(1))**

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Comment on Proposal No: 13-28
Recommendation: The PV Industry Forum agrees with and supports the Panel Action.
Substantiation: For Swayne:
Two multiplication factors of 1.25 (125%) are required on the module short-circuit current. The first 690.8(A)(1) deals with the fact that the module short circuit current may exceed the rated value (marked on the back of the PV module) for a period of three hours or more on clear sunny days. The second 125% required by 690.8(B)(1) is required to ensure that this higher current (the value from 690.8(A)(1)) does not result in conductors or overcurrent devices operating at more than 80% of rating.
Panel Meeting Action: Accept in Principle
Add a new FPN following 690.8(A) to read as follows:
FPN: Where the requirements of 690.8(A)(1) and 690.8(B)(1) are both applied, the resulting multiplication factor is 156 percent.
Panel Statement: The double-derating requirement is now clarified and addresses the affirmative comment expressed in the voting.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.

13-33 Log #327 NEC-P13 **Final Action: Reject (690.10(A))**

Submitter: Albert Parry, City of Aspen/Pitkin County
Comment on Proposal No: 13-29
Recommendation: Leave section as originally written.
Substantiation: The code change proposer is stating that the pv alternate stand alone system should not be subject to the requirements of the code as to load capability.
When the system is used in a residential application it should be capable of powering all life safety systems concurrently and the largest piece of equipment as a minimum.
His change would treat off grid 5,000' duplex dwellings the same as a 200' cabin.
There is no sense in allowing the installation of a 13KW double oven on a 7KW system.
Panel Meeting Action: Reject
Panel Statement: The original proposal and the panel action produced identical language except for removal of "that may be." The proposal is to allow the original. The removal of "that may be" removes the future reference. This is not a life-safety issue.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16

Ballot Not Returned: 1 Gustafson, R.

13-36 Log #87 NEC-P13 **Final Action: Accept (690.13)**

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 13-32
Recommendation: The Technical Correlating Committee understands that the Panel Action on Proposal 13-31a modifies the Panel Action on this Proposal. The Technical Correlating Committee directs the panel to reconsider the use of the term "may" to be consistent with the NEC Style Manual. This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Delete the first "may" and change the second "may" to "shall be permitted to." The text now reads: "…if operation of that switch, circuit breaker, or other device ~~may~~ leaves the marked, grounded conductor in an ungrounded and energized state.
Exception: A switch or circuit breaker that is part of a ground-fault detection system required by 690.5 ~~may~~ shall be permitted to open the grounded conductor when that switch or circuit breaker is automatically opened and indicated only as a normal function of the device in responding to ground faults."
Panel Statement: This action is now consistent with the NEC Style Manual.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.

13-37 Log #1712 NEC-P13 **Final Action: Accept (690.13)**

TCC Action: The Technical Correlating Committee understands that the comment addresses a Code-Making Panel 13 proposal, not a Technical Correlating Committee proposal.
Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Comment on Proposal No: 13-31a
Recommendation: The PV Industry Forum proposes that this TCC proposal be rejected in favor of an acceptance of 13-32 (Log #2087).
Substantiation: All current-carrying conductors in a system should have disconnects or it would not be possible to connect or disconnect equipment for additions, repairs, or replacements. Disconnects can be bolted connections or terminals and do not necessarily have to be switches or circuit breakers. User-accessible switched disconnects should not be placed in grounded source circuit conductors.
Panel Meeting Action: Accept
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.

13-38 Log #1714 NEC-P13 **Final Action: Hold (690.13)**

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Comment on Proposal No: 13-32
Recommendation: The PV Industry Forum agrees with and supports the Panel Action without the change suggested by the TCC in 13-31a Log CP 1301. An additional Exception #2 is proposed as follows:
Exception 2: A disconnecting switch shall be permitted in a grounded conductor if it is:
a. used only for PV array maintenance, and
b. accessible only by qualified persons.
Substantiation: The location and correction of ground faults in PV arrays may require that the ungrounded conductor be disconnected from the system and from ground during maintenance operations. This permissive allowance provides that a maintenance-only switch can be added to the system to facilitate such operations.
Panel Meeting Action: Hold
Panel Statement: The commenter has met the intent of Comment 13-37 with this change, but the material is new. The TCC request has been addressed in the panel action of Comment 13-36. This comment was held because it would introduce a concept that has not had public review by being included in a related proposal as published in the Report on Proposals. Only the comment is being held.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.

13-39 Log #1716 NEC-P13 **Final Action: Reject (690.13)**

Submitter: Todd Stafford, IBEW-NJATC / Rep. IBEW
Comment on Proposal No: 13-33
Recommendation: Revise text to read as follows:
690.13 All Conductors. Means shall be provided …and that switch or circuit breaker is automatically opened ~~and indicated~~ as a normal function of the device in responding to ground faults. The switch or circuit breaker shall indicate the presence of a ground fault.
Substantiation: The above revised text would perform the actual function and intent as noted by the panel statement. This action would clearly define that the ground fault would be indicated by the switch or circuit breaker.
Panel Meeting Action: Accept
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.

13-42 Log #1717 NEC-P13 **Final Action: Accept (690.14)**

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Comment on Proposal No: 13-34
Recommendation: After careful review, the PV Industry Forum agrees with the Panel Action to reject the proposal, but for different reasons.
Substantiation: The requirements of 690.14 should apply to any main PV disconnect (either ac or dc) where the PV circuits (either ac or dc) penetrate the structure for the first time. The Code allows PV systems that are entirely outside the structure to penetrate the structure with ac output circuits such as the 690.14(D) systems (remotely mounted inverters) and future groups of AC modules (690.10). It appears that the provisions of 690.14 should, in general, apply to either the main dc PV disconnect or the main ac PV disconnect. Consider the PV system where all dc wiring and the inverter are outside the house, but the backfed load center is inside. This is a common configuration. There is no dc penetration of the house so 690.14 cannot apply to a main PV dc disconnect. However, we do have an ac penetration and 690.14 would apply to the ac disconnect at the point of penetration. The approval of the exact location of the disconnect (inside or outside) is left to the AHJ based on local jurisdictional preferences and usually follows the location of the utility service disconnect.
Panel Meeting Action: Accept

Ballot Not Returned: 1 Gustafson, R.

13-44 Log #2127 NEC-P13 **Final Action: Hold (690.19 (New))**

TCC Action: The Technical Correlating Committee understands that the panel action to "Hold" Comment 13-44 only applies to the Comment and not the Proposal.
Submitter: Robert H. Wills, Intergrid, LLC
Comment on Proposal No: 13-31a
Recommendation: As the submitter of panel actions 13-31a and 13-35a, I request that CMP-13 Reject both actions as they now stand, and also consider modifying 690.13 as follows:
690.13 All Conductors. Means shall be provided to disconnect all current-carrying conductors of a photovoltaic power source from all other conductors in a building or other structure. A switch or circuit breaker shall not be installed in a grounded conductor unless:
(1) ~~that~~ the switch or circuit breaker is part of a ground-fault detection system required by 690.5 and ~~that~~ the switch or circuit breaker is automatically opened and indicated as a normal function of the device in responding to ground faults, or,
(2) an optional switch or circuit breaker is provided in a grounded conductor for maintenance and troubleshooting, and only operable by qualified personnel.
FPN: The grounded conductor may have a bolted or terminal disconnecting means to allow maintenance or troubleshooting by qualified personnel.
Substantiation: I brought up the inconsistency in 690.13 and 690.14(C) that requires means for disconnecting all current-carrying conductors, then go on to say that grounded conductors should not be disconnected.
This resulted in panel actions 13-31a and 13-35a.
Further research has shown that the inconsistency stems from the addition of the second sentence of 690.13 in the 1990s when GFI language was added.
The Fine Print Note: "The grounded conductor may have a bolted or terminal disconnecting means to allow maintenance of troubleshooting by qualified personnel." was added at the same time.
The original version of Article 690 was written for the 1984 code cycle. One of the authors, Tom Key of Sandia Labs (now at EPRIPEAC) wrote in a paper included in the 1985 IEEE PV Specialists Conference Proceedings ("Grounding Considerations for Non-Isolated Photovoltaic Systems"): *Another frequently overlooked requirement is 690.13 which states that "means shall be provided to disconnect all current carrying conductors". This applies to the "grounded" conductor of the PV array whether it be the neutral or negative lead. The disconnecting means, if properly rated, can provide a very effective way to extinguish a line-to-ground fault in the array.*
The paper's Figure 2 showed a 2 pole disconnect opening both current-carrying conductors to the array, with the ground bond being on the inverter side of the switch.
Photovoltaic arrays typically contain many photovoltaic modules and interconnection wiring that can be subject to ground faults.
The requirement has changed over the years form opening all current-carrying conductors to ground fault interruption (which typically opens the grounded conductor) plus a FPN provision for bolted or terminal disconnect.
It is reasonable to consider the GFI equipment as now fulfilling the requirement that grounded conductors be disconnected (if there is a ground fault).
The FPN provision is, however, not a safe or sufficient substitute for a switched disconnect in large-scale photovoltaic systems. If multiple ground faults were to occur on different strings, the grounded conductors of the faulted strings would have to be disconnected in order to find the fault locations.
In doing so, the service person would have to open a bolted connection under load - a potentially hazardous activity.
An optional switched disconnect or circuit breaker in grounded conductors for service use only, and only operable by qualified personnel, satisfies the original intent of this section of the code and allows for the removal of a service hazard in large-scale systems.
Panel Meeting Action: Hold
Panel Statement: This comment was held because it would introduce a concept that has not had public review by being included in a related proposal as published in the Report on Proposals.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.

13-45 Log #290 NEC-P13 **Final Action: Accept**
(690.31(A))

Submitter: Code-Making Panel 3,
Comment on Proposal No: 13-37
Recommendation: CMP-3 recommends accepting the panel action.
Substantiation: Note 4 in Table 11(B) does not require Class 2 circuits installed in a wet location to be in a metallic raceway, but can use any wiring method suitable for a Class 3 circuit in accordance with 725.52(A) or (B). Metallic raceways would provide added physical protection for the Class 2 circuit, as would nonmetallic wiring methods and Class 3 cables insulated at 300 volts in accordance with 725.82(G).

This comment has been balloted through CMP-3 with the following ballot results:

13 Eligible to Vote
10 Affirmative
2 Negative
1 Not Returned (J. Sleights)

Mr. L. Easter voted negatively stating: "This application should not be restricted to metallic raceways only. Nonmetallic raceways are an acceptable wiring method for this use when installed in accordance with their individual articles."

Mr. D. Pace voted negatively stating: "Installation of the cables should be driven by the requirements of the articles in the NEC covering conductors or cables, not by the fact that it is related to equipment under the scope of Article 690. The way the change is worded it would require that all conductors or cables associated with photovoltaic systems to be in a raceway. This would eliminate the use of cable tray, or other methods of installation that are not raceways. There are other circuits operating at similar voltages that do not require raceways. This is an overly restrictive requirement."

Mr. T. Guida voted affirmatively stating: "The actual proposed panel action in the proposal has changed the voltage from "greater than 50 volts" to "greater than 30 volts" and changed the requirement for the "circuit conductors to be installed in a raceway" to "be installed in a metallic raceway." CMP-3 recommends accepting the panel action of CMP-13 since installing circuits that are rated at greater than 30 volts into a metallic raceway is an acceptable method of providing separation and isolation of these circuits in a readily accessible location.

If these circuits were Class 2 (power limited) circuits used for control circuitry or similar uses and located in a wet location, then Note 4 would require the Class 2 circuit to be limited to not more than 30 volts continuous dc or wired with Class 3 wiring methods. Where the dc source is a pulsating dc of 10 to 200 Hz, then the voltage is limited to not more than 12.4 volts peak.

The proposed panel action is specifically stating the voltage is greater than 30 volts dc so installing a metallic raceway would be an acceptable wiring method for these circuits, even where the circuits exceed the values given in Table 11(B). Where the voltage and amperage values of Table 11(B) are exceeded, Class 1 wiring methods, such as metallic raceways, could and often would be an acceptable wiring method."

Mr. M. Sanders voted affirmatively stating: "The affirmative comment by Mr. Bowers should be taken into account, that with the unsubstantiated addition of the term "metallic" to the proposal, it makes the desired interconnections impossible, or at the least very impractical. In addition, the inclusion of the term "metallic" by the CMP-3 Task Group also lacks any technical substantiation, because the comment makes reference to 725.82(G), which contains no requirement in the present section that only metallic raceways to be used. In addition, 725.52,.54,.55,.56,.57, and.58 do not require metallic raceway either which is in accordance with Chapter 9 Table 11(B) asterisk and Note 4 and as stated in the CMP-3 Task Group comment."

Panel Meeting Action: Accept
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.

13-46 Log #1721 NEC-P13 **Final Action: Accept in Principle**
(690.31(A))

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Comment on Proposal No: 13-37
Recommendation: The PV Industry Forum disagrees with the Panel Action. The first two sentences of the section should not be combined as was accomplished by the panel action. They represent two separate requirements and when combined, an improper requirement is created. The new requirement to use metallic raceways in wiring PV modules will create safety issues. The comments by Bower address the issues. PV modules that have conduit-ready junction boxes have those boxes glued to the Tedlar back sheet of the modules. Installing a metallic raceway to such a box would very likely result is a detachment of the box from the module creating exposed conductors and a shock hazard. The module junction box has no equipment-grounding terminals, so it would be very difficult to maintain equipment-grounding for the metallic raceways, creating yet another safety hazard.

The added wording is as follows in its entirety:

Where photovoltaic source and output circuits operating at system voltages greater than 30 volts are installed in readily accessible locations, circuit conductors shall be installed in a ~~metallic~~ raceway.

Substantiation: For safety reasons, when using any photovoltaic module, it is critical that metallic raceways not be required.
Panel Meeting Action: Accept in Principle

In the ROP Draft, revise the second paragraph of 690.31(A) to read as follows: "Where photovoltaic source and output circuits operating at maximum system voltages greater than 30 volts are installed in readily accessible locations, circuit conductors shall be installed in a ~~metallic~~ raceway."

Panel Statement: Added the word "maximum" to clarify the requirement.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 15 Negative: 1
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:

STAFFORD, T.: My panel notes indicated that we talked abut removing the word "metallic" from the sentence, but there was no panel action in the ROC to show the removal of that word or panel statement to show why we should remove that word.

I still think by removing the word "metallic", you rely on an AHJ to interpret what type of raceway can be used in this situation. I think this is an excellent addition to the code, and what makes it important is that it focuses on "readily-accessible areas." These are areas that should have protection. These are areas that will be seen on a continual basis, either by the public, future customers, or installers and to allow a substandard installation does not help grow this industry. One interpretation of the term "readily-accessible" to many AHJs is an installation installed less than 8 ft. This would make the wiring method touchable and visible. This is a great opportunity to allow the installer/integrator/site selection person to make the correct decision;

(1) I can install the panels in a readily accessible location and adequately protect the public from exposure to potential shock, or

(2) I can install the panels in an accessible location out of reach from the public.

The comments about it being impossible to in
stall metallic conduit between panels is false.

There are a number of ways to approach the concern of not being able to ground those short sections of metallic conduit. I, as well as a number of installers that I know, have the ability to perform this task. It is not impossible.

If you do not include the world "metallic", what nonmetallic raceway with an acceptable temperature rating could be installed? This leads to ambiguity in the NEC, not clear concise code. Review comments on ROC 13-45 from CMP-3. ROC 13-45 was accepted at the meeting.

13-47 Log #1281 NEC-P13 **Final Action: Reject**
(690.31(E))

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 13-39
Recommendation: The panel action should be to Accept in Principle in Part.

Add "Type MC cable" to the panel action so the sentence reads:

"...they shall be contained in metallic raceways, metallic enclosures, or Type MC cable, from the point..."

Substantiation: I agree with the Affirmative comment by W. Bower.

Type MC cable is permitted as a wiring method indoors or outdoors [330.10(A)(3)] and exposed or concealed [330.10(A)(4)].

330.118 states "Where Type MC cable is used for equipment grounding, it shall comply with 250.118(10) and 250.122.

Panel Meeting Action: Reject
Panel Statement: Metallic cable assemblies are limited in their rating associated with grounding.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 15 Negative: 1
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:

BOWER, W.: The types of equipment grounding conductors for "Type MC Cable" are sufficiently covered as described in the substantiation of this comment. The panel statement that metallic cable assemblies (that are not part of the comment or the proposed language) are limited in their rating associated with grounding does not appear to be relevant to the proposal.

13-48 Log #1722 NEC-P13 **Final Action: Reject**
(690.31(E))

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Comment on Proposal No: 13-39
Recommendation: The PV Industry Forum supports returning the allowance for **metallic cable assemblies** as originally submitted.
Substantiation: Type MC cable assemblies have uses permitted and not permitted that are less restrictive than those applied to the allowed Type FMC flexible metal conduit (metallic raceway). All the positive benefits of metallic raceways needed for PV source and output circuits are found in metallic cable

assemblies. Each type of raceway has differing installation requirements and limitations, which must be followed. And any raceway used in a particular installation will have to be suited to the environmental factors. Grounding is not an issue since an equipment-grounding conductor is usually used in these circuits and the available ground-fault currents are rarely more than the circuit currents and in systems with ground-fault protection will be limited to 10 amps or less.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 13-47.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 15 Negative: 1

BOWER, W.: See My Explanation of Negative on 13-47.

13-49 Log #1724 NEC-P13 **Final Action: Accept**
(690.31(F))

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Comment on Proposal No: 13-40
Recommendation: The PV Industry agrees with and supports the Panel Action.
Substantiation: With respect to the comment by Nasby: The use of fine-stranded, flexible cables is not required in any commonly used PV system where normal *NEC*-compliant, listed electrical equipment is used. When such cables have been used, they have been improperly terminated because the requirement for proper termination is buried deep in a narrowly-distributed UL Standard. The proper ferrules and crimping tools, while readily available from multiple sources in Europe, are not commonly or readily available in the U.S. Neither the typical electrical supply house nor big-box building centers carry them or the required crimping tools.
Panel Meeting Action: Accept
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.

13-50 Log #1725 NEC-P13 **Final Action: Accept**
(690.33)

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Comment on Proposal No: 13-42
Recommendation: The PV Industry Forum agrees with and supports the Panel Action. The "c C" typo in the first line should be corrected.
Substantiation: None given.
Panel Meeting Action: Accept
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.

13-51 Log #2505 NEC-P13 **Final Action: Accept in Principle**
(690.33(C))

Submitter: Robert H. Wills, Intergrid, LLC
Comment on Proposal No: 13-41
Recommendation: The language proposed for 690.33(C) could be improved:
Existing Proposal:
~~Connectors that are readily accessible in circuits operating at over 50 volts (maximum system voltage for dc circuits or nominal voltage for ac circuits) shall require a tool to open.~~
Revised language:
Connectors that are readily accessible and that are used in circuits operating at over 50 volts nominal maximum system voltage for dc circuits, or 50 volts for ac circuits, shall require a tool for opening.
Substantiation: Revised language is clearer and more readable.
Panel Meeting Action: Accept in Principle
Change 50 volts to 30 volts in both places.
Panel Statement: The action is in accordance with the original panel action on Proposal 13-41.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 15 Negative: 1
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
GALLO, E.: The panel action is technically incorrect. With respect to shock hazard, 30 volt dc is not equivalent to 30 volts nominal for ac circuits. The correct reference for accepted NEC threshold values in wet locations is Note 4 to Table 11(B) for dc voltages and Note 2 to Table 11(A) for ac voltages. The language should be: Connectors that are readily accessible and that are used in circuits operation at over 30 volts nominal maximums system voltage for continuous dc circuits, or 15 volts for sinusoidal ac and 21.2 volts peak for nonsinusoidal ac for ac circuits shall require a tool for openings.
Comment on Affirmative:
ZGONENA, T.: As written the proposed text is an improvement over the previously allowed 50V DC and AC, although the generally accepted limits for accessible circuits in wet location arc 30V DC and 15V AC. We will propose this revision in the 2011 code.

13-52 Log #2130 NEC-P13 **Final Action: Accept in Principle**
(690.33(C))

TCC Action: The Technical Correlating Committee understands that the panel action on the comment modifies the panel action on Comment 13-69.
Submitter: Robert H. Wills, Intergrid, LLC
Comment on Proposal No: 13-53
Recommendation: Change the proposed text for 690.47(D) as follows:
690.47(D) ~~Grounding~~ Additional Electrodes for Array Grounding. Grounding electrodes ~~for equipment grounding~~ shall be installed in accordance with 250.52 at the location of all ground and pole-mounted photovoltaic arrays and as close as possible to the location of roof-mounted photovoltaic arrays. The electrodes shall be connected directly to the array frame(s) or structure and shall be sized according to 250.166. Additional electrodes are not permitted to be used as a substitute for equipment bonding or equipment grounding conductor requirements. The structure of a ground or pole-mounted photovoltaic array can be considered a grounding electrode if it meets the requirements of 250.52. Roof mounted photovoltaic arrays may use the metal frame of a building or structure if the requirements of 250.52~~(3)~~(2) are met.
Exception No. 1: Where the load served by the array is integral with the array.
Exception No. 2: Where the grounding electrode would be adjacent to the main grounding electrode for the building or structure.
Substantiation: ● The title was changed to eliminate redundancy.
● The text "for equipment grounding" was removed per comments from R. Swayne.
● The reference to 250.50 was changed to 250.52 per comments from R. Swayne.
● The word "directly" was added to the second sentence to more clearly state the intent.
● The size of the conductor from electrode to array frame was specified per the requirements for dc grounding electrode conductors (rather than the possible interpretation that equipment grounding conductor sizing could be used).
● The third sentence was added to emphasize R. Swayne's comment that additional electrodes may not be used as a substitute for equipment bonding.
● "for the building or structure" was added to Exception No. 2 to clarify the meaning of "main grounding electrode".
Panel Meeting Action: Accept in Principle
Change "The electrodes shall be connected directly to the array frame(s) or structure and shall be sized according to 250.166" to "The electrodes shall be connected directly to the array frame(s) or structure. The dc grounding electrode conductor shall be sized according to 250.166."
Panel Statement: The text is revised to clarify that sizing referred to the grounding electrode conductor. See panel action and statement on Comment 13-69.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.

13-53 Log #1729 NEC-P13 **Final Action: Accept**
(690.35(C)(3))

TCC Action: The Technical Correlating Committee understands that the panel action to Accept Comment 13-53 applies to 690.35(C)(3) and the remainder of 690.35(C) is not modified.
Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Comment on Proposal No: 13-43
Recommendation: Revise 690.35(C) as follows:
690.35(C). Automatically disconnects all conductors or causes the inverter or charge controller connected to the faulted circuit to automatically cease supplying power to output circuits.
Substantiation: The original proposal followed the NFPA submission guidelines with strikeouts and underlines. Here is the same proposal submitted in a totally rewritten format. The substantiation has not changed: Aligns the text for these ungrounded systems with the text in 690.5 dealing with grounded PV systems. Establishes that the faulted circuit may be isolated by disconnecting the conductors (typically done on low-voltage systems (12, 24, and 48V)) or by causing the connected inverter or charge controller to cease supplying power (typically done on higher voltage systems). Either of these methods serves the purpose of ceasing power production and providing an additional indication that something has happened that needs attention.
Panel Meeting Action: Accept
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.

13-54 Log #683 NEC-P13 **Final Action: Accept in Principle (690.35(D))**

TCC Action: The Technical Correlating Committee understands the panel action Accepts the text in Comment 13-54. The panel action on Comment 13-55 to delete the words "and output" modifies the panel action on this comment.
Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 13-44
Recommendation: The Proposal should have been Accepted in Principle in Part. I agree with the part the Panel did not Accept.
The remainder of the Proposal should have been Accepted in Principle by revising the section to read as follows:
"The photovoltaic source and output conductors shall consist of:
(1) ~~sheathed (jacketed) multi-conductor~~ nonmetallic jacketed multiconductor cables
(2) conductors installed in raceways, or
(3) conductors listed and identified as Photovoltaic (PV) Wire installed as exposed, single conductors ~~single conductor cable~~."
Substantiation: The change to multiconductor is an editorial correction for consistency. Multiconductor is not hyphenated. In the 2005 NEC, the word "multi-conductor" is only used in Articles 690 and 810 and Annex D. The word "multiconductor" is used in 31 Articles, Chapter 9, and Annex B. In the 2008 preprint, "multi-conductor" only appears 7 times whereas "multiconductor" appears 142 times.
The word "sheathed" is normally associated with a metallic sheath whereas a jacket implies a nonmetallic covering over the assembly.
A single conductor is not normally considered a cable. A cable, except for MC and MI cables which have additional layers over the insulated conductor, normally consists of two or more single conductors under a common overall metallic sheath or nonmetallic jacket.
Panel Meeting Action: Accept in Principle
Panel Statement: The term "and output" is removed because the requirement for output conductors does not apply. Also see Comment 13-55. This is in accordance with W. Bower's affirmative comment to Proposal 13-44.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.

13-55 Log #1730 NEC-P13 **Final Action: Accept in Principle (690.35(D))**

TCC Action: The Technical Correlating Committee understands that the panel action to delete the words "and output" modifies Comment 13-54.
Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Comment on Proposal No: 13-44
Recommendation: The original submittal is resubmitted:
690.35(D) The photovoltaic source ~~and output~~ conductors shall consist of (1) sheathed (jacketed) multi-conductor cables, (2) conductors installed in raceways, or (3) conductors listed and identified as Photovoltaic (PV) Wire installed as exposed, single-conductor cable.
Substantiation: The proposal was correct as stated. The intent is to provide additional safety in the PV source-circuit wiring on *ungrounded* PV systems between modules and between the modules and any combining points located in the PV array. These circuits can operate up to 600 volts with exposed, single-conductor wiring in grounded PV systems. PV output circuits (in wording retained by the Panel Action) are typically already made using one of the code-approved wiring methods in Chapter 3, which do not include exposed, single conductor wiring. See accepted revised wording for 690.31(B) (13-38 Log 2070). This proposal parallels the accepted wiring allowance and should be also restricted to PV source circuits. The words "and output" should be deleted.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 13-54.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.

13-56 Log #1731 NEC-P13 **Final Action: Accept in Principle (690.42 Exception)**

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Comment on Proposal No: 13-46
Recommendation: The proposal is resubmitted with a slight revision to increase clarity:
690.42 Point of System Grounding Connection.
Exception: Systems with a 690.5 ground-fault protection device usually have the required grounded conductor-to-ground bond made by the ground-fault protection device. This bond, if internal to the ground-fault equipment, shall not be duplicated with an external connection.
Substantiation: Section 690.5 ground-fault protection devices typically have a grounded conductor-to-ground bond. It is critical, that this bond not be duplicated by installing a second bond. The revised text addresses the TCC Direction concerning the use of the word "may" (it has been eliminated for clarification) and follows the Panel Action or eliminating any unnecessary words. The exact bonding connection has also been clarified. Although using the grounded conductor-to ground bond in the ground-fault device is the most common method, the code does allow other methods to be used, so the words "usually" and "if" are required to address the very rare unconventional system that does not use the bond in the ground-fault protection.
Panel Meeting Action: Accept in Principle
Change the word "usually" to "shall be permitted to." Change "if" to "where."The revised text will read as follows:
Exception: Systems with a 690.5 ground-fault protection device shall be permitted to have the required grounded conductor-to-conductor bond made by the ground-fault protection device. This bond, where internal to the ground-fault equipment, shall not be duplicated with an external connection.
Panel Statement: The changes were made to comply with the NEC Style Manual.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.
Comment on Affirmative:
RAPPAPORT, E.: The original proposal should have been rejected because the existing text already requires only one point for grounding. Addition of wording, such as, "The single point shall be permitted to be internal to a ground fault protection device", in the main text wold be sufficient. I am voting affirmative because the proposed text is better than the original proposal.
STAFFORD, T.: My panel notes indicate that the wording in the exception as published in the ROC does not correspond with what happened at the meeting. The text should read:
Exception: Systems with 690.5 ground-fault protection device shall be permitted to have the required grounded conductor-to-ground bond made by the ground-fault protection device. This bond, where internal to the ground-fault equipment, shall not be duplicated with an external connection.
In the published ROC it says grounded conductor-to-conductor bond...I think that this is an editorial change that has been overlooked.

13-57 Log #88 NEC-P13 **Final Action: Accept (690.43)**

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 13-47
Recommendation: The Technical Correlating Committee directs that the panel reconsider the Action on this Proposal to comply with the NEC Style Manual by changing "are permitted" to "shall be permitted" in both sentences of the new second paragraph and changing
the proposed text from "when required" to "where installed" in the second paragraph of the Proposal which becomes the new third paragraph in the section.
This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.

13-58 Log #89 NEC-P13 **Final Action: Accept (690.43)**

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 13-48
Recommendation: It was the action of the Technical Correlating Committee that the panel reconsider the Panel Action and correct the wording by replacing "is required" with "shall be required" to comply with the NEC Style Manual. This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.

13-59 Log #1732 NEC-P13 **Final Action: Accept in Principle (690.43)**

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Comment on Proposal No: 13-47
Recommendation: The text of the proposal is revised per TCC direction:
Devices listed and identified for grounding the metallic frames of PV modules shall be permitted to ground the exposed metallic frames of PV modules to grounded mounting structures. Devices identified and listed for bonding the metallic frames of PV modules shall be permitted to bond the exposed metallic frames of PV modules to the metallic frames of adjacent PV modules.

Equipment-grounding conductors for the PV array and structure (where installed) shall be contained within the same raceway or cable, or otherwise run with the PV array circuit conductors when those circuit conductors leave the vicinity of the PV array.

Substantiation: Changes directed by the TCC have been made in the original proposal, which was Accepted in Principle. The PV Industry Forum agrees with and supports these changes.

Panel Meeting Action: Accept in Principle

Revise the term "ground" to "bond" in the first sentence.

Panel Statement: This change is made because "ground" is not the appropriate verb. Metallic parts are bonded together.

Number Eligible to Vote: 17

Ballot Results: Affirmative: 16

Ballot Not Returned: 1 Gustafson, R.

13-60 Log #1733 NEC-P13 **Final Action: Accept (690.43)**

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum

Comment on Proposal No: 13-48

Recommendation: The PV Industry Forum agrees with and supports the Panel Action and the TCC direction.

Substantiation: This repeated reference to the requirement is necessary to show a firm need to always install equipment-grounding conductors throughout the system. This is particularly important in PV systems where the ground-fault protection devices require these conductors, and to avoid confusion where multiple grounding-electrodes are installed.

Submitter: Technical Correlating Committee on National Electrical Code

Comment on Proposal No: 13-49

Recommendation: It was the action of the Technical Correlating Committee that the Panel Action be clarified by writing the exception in a complete sentence to comply with the NEC Style Manual.

This action will be considered by the Panel as a Public Comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

Panel Statement: See Comment 13-62 to satisfy and comply with the NEC style manual.

Number Eligible to Vote: 17

Ballot Results: Affirmative: 16

Ballot Not Returned: 1 Gustafson, R.

13-62 Log #1734 NEC-P13 **Final Action: Accept in Principle (690.45)**

TCC Action: The Technical Correlating Committee directs that the Exception to 690.45 be deleted to correlate with the panel action on Comment 13-29 to remove the circular reference.

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum

Comment on Proposal No: 13-49

Recommendation: The PV industry Forum agrees with the Panel Action and has reworded the Exception as a full sentence as directed by the TCC. The wording of the original proposal has been retained as shown and substantiated for clarity.

690.45 Size of Equipment-Grounding Conductor. Equipment-grounding conductors in photovoltaic source and photovoltaic output circuits shall be sized in accordance with Table 250.122. When no overcurrent protective device is used in the circuit, an assumed overcurrent device rated at the photovoltaic rated short-circuit current shall be used in Table 250.122. Increases in equipment-grounding conductor size to address voltage drop considerations shall not be required.

Exception: Where equipment-grounding conductors sized per 690.5(A) Exception 2 are used, the above sizing requirements are not to be used.

Substantiation: This proposal assumes that all PV systems will have a ground fault detection interruption device that interrupts the ground-fault current. In this case, the equipment-grounding conductors will be required to carry very small currents, typically 0.5 amps up to a few tens of amps before the ground fault equipment interrupts the fault current. Sizing at the values of Table 250.122 based on the overcurrent device will give a conductor of more than sufficient size. Where no overcurrent device is used, assuming an overcurrent device equal to short-circuit current and then using Table 250.122 will also give an equipment-grounding conductor that is more than adequate for the low currents being handled. Reference to Table 250.122 a second time is required for clarity. The 125% of the short-circuit current is not needed, short-circuit current alone will suffice.

Panel Meeting Action: Accept in Principle

Change "When" to "Where" in the second sentence to be consistent with the original proposal.

Panel Statement: The text was revised to be consistent with the original proposal.

Number Eligible to Vote: 17

Ballot Results: Affirmative: 16

Ballot Not Returned: 1 Gustafson, R.

Comment on Affirmative:

STAFFORD, T.: Note to the TCC: ROC Comments 13-29 and 13-62 need to be correlated to ensure that the sentence about the minimum size of the 14 AWG conductor is not lost in the correlation. Both comments have the same section 690.45, but one comment has the language and the other doesn't. My panel notes indicate that the sentence was to be included.

13-63 Log #91 NEC-P13 **Final Action: Accept (690.47(C))**

TCC Action: The Technical Correlating Committee understands that the panel action on Comment 13-66 addresses this comment.

Submitter: Technical Correlating Committee on National Electrical Code

Comment on Proposal No: 13-51

Recommendation: The Technical Correlating Committee directs that the Action on this Proposal be rewritten to comply with the NEC Style Manual by replacing "may…" with "shall be permitted to…" in (5) and (6).

The Technical Correlating Committee understands that (3) should read "for equipment bonding jumpers (250.102)" to correlate with the title of 250.102.

These actions will be considered by the panel as a public comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

Number Eligible to Vote: 17

Ballot Results: Affirmative: 16

Ballot Not Returned: 1 Gustafson, R.

13-64 Log #1736 NEC-P13 **Final Action: Accept in Principle (690.47(C))**

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University

Comment on Proposal No: 13-50

Recommendation: I believe that this proposal should be accepted as written. The Panel actions in accepting 13-51 Log 3585 do not address the issues clarified by this proposal. This proposal establishes the requirement (currently missing in the 2005 NEC) for a dc grounding system. It establishes the fact that the ac grounding system will provide grounding for the ac portion of the PV system. It also indicates that these requirements do not apply to ac PV modules. Proposal 13-51 does none of these. This language matches the requirements in UL Standard 1741 for a terminal for a dc grounding electrode conductor in these types of inverters. The proposed language merges well with the remainder of 690. 47. See additional comments on 13-51 Log 3585.

Substantiation: None given.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Comment 13-66.

Ballot Not Returned: 1 Gustafson, R.

13-65 Log #1737 NEC-P13 **Final Action: Reject (690.47(C))**

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum

Comment on Proposal No: 13-51

Recommendation: I believe that this proposal should be considerably modified due to the following reasons: 1. The resulting language does not address any of the items that the original proposal 13-50 Log 2094 addressed and clarified. There is no clarification as to when a system will require dc grounding requirements. There is no clarification that utility-interactive systems will have the ac grounding system provided by the existing ac premises grounding system. 2. There is no definition of what "bonding conductor" is being referred to in (2). The text appears to be saying that all equipment-grounding conductors in both the dc and ac systems shall be sized as the larger requirement (ac or dc). On a large system, the ac equipment-grounding conductor may be 2-4 AWG as determined by 250.122 where as the dc equipment –grounding conductors between the modules on the same system may be a small as 14 AWG from 690.45. It would be nearly impossible to attach 2-4 AWG equipment-grounding conductors to modules and the cost would be prohibitive. 3. Currently available inverters with Ground-Fault Protection circuits make the bond between the grounded conductor and the grounding system internally. With transformer isolation, between the dc grounded conductor and the ac grounded conductor, the dc system must have

a dc grounding electrode conductor that meets minimum code requirements (typically depending on the type of grounding electrode) for such a conductor. Using equipment-grounding conductors that may have numerous splices and may be as small as 14 AWG does not meet these minimum requirements. 4. Aside from current panel actions on 13-53, the adoption of this proposal would endorse grounding PV array frames on small (1-3 kW) residential systems by a conductor as small as 14 AWG routed from the roof, through the dc disconnect, the inverter, the ac disconnect, the ac house panel, and finally to the ac grounding electrode. This path is neither direct, nor free of splices that could deteriorate over time, nor is the small conductor size related to a low-impedance surge path to ground. These systems will be producing hazardous amounts of voltage and current for 40-50 years or more and proper and very reliable grounding will be the last line of defense against fires and shock hazards.
Substantiation: None given.
Panel Meeting Action: Reject
Panel Statement: The submitter does not provide an action to the NEC text or any substantiation.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R

13-66 Log #2129 NEC-P13 **Final Action: Accept in Principle (690.47(C))**

TCC Action: The Technical Correlating Committee understands that the panel action on Comment 13-66 to Accept in Principle included the word "overcurrent" in 690.47(C)(2) as included in the comment and in the panel action on Proposal 13-51.

The Technical Correlating Committee also understands that the addition of the phrase "and the system bonding requirements of 250.28." in 690.47(C)(2) also includes replacing the comma with "or" before "the ac requirements…" and deleting the comma after (...250.122)".

The Technical Correlating Committee has corrected the text in (2) and (3) in the panel action text in the proposal to comply with the NEC Style Manual as follows:

"(2) A bonding conductor between these systems shall be sized as the larger of the dc requirement in accordance with 690.45, (according to 690.45) and the ac requirements, based on the inverter alternating current overcurrent device rating and 250.122, and the system bonding requirements of 250.28.

(3) A conductor that serves as both an equipment grounding conductor and as part of the bond between ac and dc systems for an inverter incorporating dc ground-fault protection shall meet the requirements of equipment grounding bonding jumpers in accordance with 250.102 (250.102) but shall not be subject to the requirements for bonding jumpers in accordance with 250.28 (250.28)."

Submitter: Robert H. Wills, Intergrid, LLC
Comment on Proposal No: 13-51
Recommendation: The new proposed text for 690.47(C) was Accepted in Principle by CMP-13. Input from members of the PV industry has resulted in a request for the following changes. The proposed text for 690.47(C) should be revised as follows:

(C) Systems with Alternating-Current and Direct-Current Grounding Requirements. Systems with alternating-current and direct-current grounding requirements shall comply with items (1) through (7) below:

(1) Where photovoltaic power systems have both alternating-current (ac) and direct-current (dc) grounding requirements, the dc grounding system shall be bonded to the ac grounding system. A grounding system (ac or dc) consists of the various components needed to meet (ac or dc) grounding requirements.

(2) A bonding conductor between these systems ~~and equipment grounding conductors in these systems~~ shall be sized as the larger of the dc requirement (according to 690.45) and the ac requirements (based on the inverter alternating current overcurrent device rating and 250.122).

(3) A conductor that serves as both an equipment grounding conductor and as part of the bond between ac and dc systems for an inverter incorporating dc ground-fault protection shall meet the requirements of equipment ~~grounding~~ bonding jumpers (250.102) but shall not be subject to the requirements for bonding jumpers (250.28). A single conductor shall be permitted to be used to perform the multiple functions of dc grounding, ac grounding and bonding between ac and dc systems.

(4) A bonding conductor or equipment grounding conductor that serves multiple inverters shall be sized based on the sum of applicable maximum currents used in (2).

(5) A common ground bus may be used for both systems.

(6) A common grounding electrode may be used for both systems in which case the grounding electrode conductor shall be connected to the ac ground system bonding point.

(7) Grounding electrode conductor(s) shall be sized to meet the requirements of both 250.66 (ac system) and 250.166 (dc system).

(8) For systems with utility-interactive inverters, the premises grounding system serves as the ac grounding system.

Substantiation: ● The addition to (1) was in response to a comment from a PV manufacturer that pointed out that while ac and dc grounding requirements are defined, the terms "dc grounding system" and "ac grounding system" are not. While somewhat self-evident, some form of definition is warranted. The term "grounding system" is used already elsewhere in the code but is not explicitly defined.

● The deletion in (2) was in response to a response that pointed out that the Equipment Grounding Conductor (EGC) sizing is already covered in 690.45 and that the inclusion of EGC sizing in 690.47(C)(2) would change these requirements.

● The deletion in (3) was in response to the request of the TCC: "The Technical Correlating Committee understands that (3) should read "for equipment bonding jumpers (250.102)" to correlate with the title of 250.102.

● The addition to (3) regarding the use of a single conductor for multiple grounding and bonding functions was in response to a request for clarification from an inverter manufacturer. They were being instructed by inspectors and others to install redundant parallel EGCs in order to meet the various grounding requirements of Article 690.

● (5) and (6) were changed in accordance with the TCC Actions: "The Technical Correlating Committee directs the action on this proposal to be rewritten to comply with the NEC Style Manual by replacing "may..." with "shall be permitted to..." in (5) and (6).

● (8) was added in response to comments from the author of Proposal 13-50 that this point was missing from the final combined/revised text. He also requested that clarification be provided as to when a dc grounding system is required. This has been addressed in (1) by defining a grounding system as the components needed to meet grounding requirements - if there are grounding requirements, a grounding system is needed.

Panel Meeting Action: Accept in Principle

1. In (C)(1), remove the sentence "A grounding system (ac or dc) consists of the various components needed to meet (ac or dc) grounding requirements."
2. Change (2) to read: "A bonding conductor between these systems shall be sized as the larger of the dc requirement (according to 690.45), the ac requirements (based on the inverter alternating current device rating and 250.122), and the system bonding requirements of 250.28.

Panel Statement: The second sentence of (C)(1) was removed because it was obvious and unnecessary. The reference to 250.28 in (C)(2) was added in response to Comment 13-65 and to meet the intent of the original proposal. The 2005 language required that the system bond be sized as a grounding electrode conductor, which was incorrect. The first "and" was removed to correct the grammar.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.
Comment on Affirmative:

BOWER, W.: The term "current" in 690.47(C)(2) should read "overcurrent" under the panel action statement. Additionally, the term "and" after device rating should be removed as stated in the panel statement.

13-67 Log #1738 NEC-P13 **Final Action: Reject (690.47(C)(3))**

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Comment on Proposal No: 13-52
Recommendation: I suggest that the Panel reconsider its vote to reject this proposal. The proposal is technically correct and is not covered by Panel Actions on any other proposal. Here is the proposal:

690.47(C)(3) DC Grounding-Electrode Conductors for Multiple Inverter Installations A single, direct-current common grounding electrode conductor shall be permitted with tap conductors to each separate inverter in grounded, multi-inverter systems. The tap conductors for each inverter and the common-grounding electrode conductor shall each be sized in accordance with 250.166. The taps shall be made with a listed irreversible connector or exothermic welding.

Also: Add the number (3) to the end of 690.47(C) to include this proposal in that list.
Substantiation: Utility interactive PV systems using multiple smaller inverters (i.e. 1000-6000 watts) are frequently installed to provide additive power at much higher levels. Systems with multiple small inverters up to nearly 100 kW have been installed in the US, and larger systems are being planned. Each inverter normally has an internal transformer and, therefore, the dc side of the system must be grounded. Since each PV inverter represents a separate PV system for the building or structure, faults in the dc PV array for one inverter do not affect any of the other inverter systems. For this reason, the size of the common equipment-grounding conductor should be no larger than that required for a single inverter and should be based on 250.166. There is no technical or safety reason to have the common, dc grounding-electrode conductor any larger than the sizes required by 250.166. The larger grounding electrode conductors required for ac multiple separately derived systems in 250.30(A)(4)(a) should not be required for these dc grounding electrode conductors.
Panel Meeting Action: Reject
Panel Statement: The conductors from the grounding system to multiple inverters serve the function of equipment grounding conductors and system bonding conductors. They are not grounding electrode conductors. Additionally, UL 1741 is likely to be revised to clarify grounding requirements and terminology.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.

13-68 Log #92 NEC-P13 **Final Action: Accept**
(690.47(D) (New))

TCC Action: The Technical Correlating Committee understands the panel action on Comment 13-69 addressed this comment.
Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 13-53
Recommendation: The Technical Correlating Committee directs that the Panel reconsider the proposal and clarify the language and the placement of the text. In addition, the text needs to be rewritten to be in compliance with the NEC Style Manual.
This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.

13-69 Log #1739 NEC-P13 **Final Action: Accept in Principle in Part**
(690.47(D))

TCC Action: The Technical Correlating Committee understands that the panel action on Comment 13-52 modifies the action on this comment.
Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Comment on Proposal No: 13-53
Recommendation: The PV Industry Forum agrees with and supports the Panel Action and the TCC directions. It is noted that 250.54 should be referenced instead of 250.50 since these supplementary grounding electrodes are not required to be bonded to any other grounding electrodes. Also, it is noted that the reference to building steel should be 250,52(A)(2) rather than 250.52(A)(3).
It is proposed that the following sentence be added at the end of the changes made by the Panel Action:
The conductor from the grounding electrode to the array frame or structure shall be sized according to 250.166.
Substantiation: The added sentence clarifies the size of the required conductor and indicates that it is a grounding electrode conductor and not an equipment-grounding conductor.
Panel Meeting Action: Accept in Principle in Part
In the first sentence, change the words "close as possible" to "close as practicable."
In the first sentence of the second paragraph, change "can" to "shall be permitted to..." In the last sentence change "may" to "shall be permitted to..." The reference to 250.52(3) should be changed to 250.52(A)(2).
Change the two exceptions to read as follows:
"Exception No.1: Array grounding electrode(s) shall not be required where the load served by the array is integral with the array.
Exception No. 2: Additional array grounding electrode(s) shall not be required if located within 6 feet of the premises wiring electrode."
Panel Statement: The words "can" and "may" were changed to "shall be permitted to" in accordance with the style manual.
The reference to 250.52 was corrected.
The exceptions were revised to be complete sentences.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.

13-70 Log #1705 NEC-P13 **Final Action: Accept in Principle**
(690.50)

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Comment on Proposal No: 13-18
Recommendation: The PV Industry Forum believes that this proposal should be renumbered and modified to better agree with existing code requirements. The grounding conductors attached to the exposed metal frames of PV modules are most properly referred to as equipment-grounding conductors and the electrical size requirements are given in 690.45. Any change in that requirement should properly be placed in 690.45. As a compromise and to meet the intent of the original submission, the following is suggested as a second paragraph in 690.45:
Equipment grounding conductors shall comply with 250.120(C).
Substantiation: As noted by Panel Comments, many PV modules are furnished as a listed product with provisions for connecting equipment-grounding conductors that can be no larger than 12 AWG. The modules are tested for ground-fault currents at no more than 125% of the short-circuit current which is typically less than 10 amps. In many PV installations, the PV module equipment grounding conductors can be routed along module frames and mounting racks to afford the needed physical protection. Where larger conductors are required for physical protection, lay-in lugs can be attached to the module frames.
Panel Meeting Action: Accept in Principle
Create a new Section 690.46 to read as follows:
690.46 Array Equipment Grounding Conductors. Equipment grounding conductors for photovoltaic modules smaller than 6 AWG shall comply with 250.120(C).
Panel Statement: The language in Proposal 13-18 was moved to 690.46, because 690.50 falls in Part VI, Marking. The term "equipment bonding jumpers" was changed to "equipment grounding conductors" per the request of the TCC. Section 250.120(C) refers to conductors smaller than 6 AWG. Without this clarification, Section 690.46 could imply that equipment grounding conductors should be no larger than 6 AWG.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.
Comment on Affirmative:
BOWER, W.: I agree with the Panel Meeting Action to accept 690.46 and place the language in an appropriate section of Article 690. However, the title, "690.46 Array Equipment Grounding Conductors" would be much less ambiguous if it were to read 690.46 "Installation of Array Equipment Grounding Conductors" since this follows 690.45 that reads "Size of Equipment Grounding Conductor" and it would then better match 250.120 that is entitled "Equipment Grounding Conductor Installation".

(690.57)

TCC Action: The Technical Correlating Committee directs that the new 690.57 be located as the first section in Part VII.
Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 13-56
Recommendation: The Technical Correlating Committee directs that the panel reconsider this proposal and clarify where the text is to be placed since 690.57 is in Part VI, dealing with marking.
This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Number Eligible to Vote: 17
Ballot Results: Affirmative: 14 Negative: 2
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
BOWER, W.: As group leader of the Task Group that reviewed all Article 690 comments, I find that the task group recommendation for this proposal was to accept and to change the section number form 690.57 to 690.19 but was based on acceptable language for 690.19. However, it appears that the action is invalid since comment 13-73 was rejected and the earlier panel action to accept in principle the proposal 13-56 introduces technically incorrect requirements. The new proposed language was:
"690.19. Multiple Source Disconnect: Where a circuit or load can receive power from multiple sources and there is no clear indication of the energized status of the circuit or load a single disconnect shall be used to disconnect that circuit or load from all sources of power."
FPN: The required disconnect ensures that the energized condition of the load or circuit is clearly determined where an automatic transfer switch inside or external to other equipment does not indicate the status of its output.
I CAN FIND NO APPARENT AGREED UPON, TECHNICALLY CORRECT, LANGUAGE FOR THE NEW 690.19. THE PANEL ACTION FOR 13-73 SHOULD BE CHANGED FROM REJECT TO ACCEPT. See also comments on 13.73.

A trace of the actions for this proposal shows that the TCC direction (13-72) was for a public comment that was placed on hold in 2004 for the 2005 NEC. THERE ARE NO PANEL CONSENSUS OR PANEL ACTIONS FOR THE 2008 NEC THAT REFLECTS RECONSIDERATION OF THE ORIGINAL PROPOSAL, THE ORIGINAL PUBLIC COMMENT, OR THE TCC DIRECTIVE.

Note that the original proposal was technically incorrect in the inverters are not bypassed when the switch from utility-interactive to stand-alone operation. The panel proposed language was:

"690.57 Load Disconnect. A load disconnect that has multiple sources of power shall disconnect all sources when in the off position."

I believe the public comment 13-73 addresses the intent of the original proposal and is, in my opinion, the same subject matter, does recommend a course of action when there are no external indications and then provides a FPN to explain the possibility of internal disconnects and transfer devices. The Public Comment 13-73 does deviate slightly in that it uses generic terms such as "multiple sources" instead of specific references to inverters, but it does cover the disconnecting means material proposed. It also suggests the move to 690.19. I SEE NO TECHNICAL ISSUES WITH THE PUBLIC COMMENT AT THIS TIME, AND THE LANGUAGE PROVIDES A NECESSARY DEGREE OF SAFETY WHEN MULTIPLE SOURCES OF POWER ARE INSTALLED.

For convenience the original proposal for the 2005 NEC was:
"690.57. Interactive System Point of Interconnection. All interactive system(s) points of interconnection with other sources shall be marked at an accessible location at the disconnecting means as a power source with the maximum ac output operating current and the operating voltage. Where interactive systems may operate as a Stand-Alone System through bypassing the inverter, disconnecting means shall indicate normal and bypass positions."

In commenting on this it is recommended that the reject for Comment 13-73 be changed to ACCEPT. The new language does address the disconnect requirement intent of the original proposal, the language accepted is not new material and inclusion into the NEC will provide the needed installation requirements for safety of personnel.

ZGONENA, T.: There appears to have been an oversight with the panel action to accept in principle, proposal 13-56 that contains technically incorrect requirements. Multiple mode inverters do not bypass the inverter when they switch from utility-interactive to stand-alone operation. The intent of the panel can be addressed and this problem can be corrected by accepting the text in 13-73 Log #1740 NEC-P13 (690.57) that was rejected. In contradiction to the panel statement, the 13-73 proposal text is relevant and it is correct to address this situation.

13-73 Log #1740 NEC-P13 **Final Action: Reject**
(690.57)

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Comment on Proposal No: 13-56
Recommendation: The PV Industry Forum Agrees with the intent of the Panel Action, but suggests that the proposal be renumbered as 690.19, which will place it in Part III where it belongs and addresses the TCC direction and the intent of the original submission.
690.19. Multiple Source Disconnect. Where a circuit or load can receive power from multiple sources and there is no clear indication of the energized status of the circuit or load, a single disconnect shall be used to disconnect that circuit or load from all sources of power.
FPN: The required disconnect ensures that the energized condition of the load or circuit is clearly determined where an automatic transfer switch inside or external to other equipment does not indicate the status of its output.
Substantiation: This proposal meets the requirements of the original submitter to ensure that any load or circuit that can be powered alternatively by more than one source will have single disconnect that cuts off power from any of these sources. This is easily achieved by adding a single disconnect at the origination point for the circuit or as a main disconnect for the load. Circuits or loads supplied by a device providing a clear indication of the load or circuit status would not require any additional device. It places the requirement in the Part III of Article 690 with the other disconnect requirements.
Panel Meeting Action: Reject
Panel Statement: The proposed language is not the same subject matter as Proposal 13-56.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 14 Negative: 2
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
BOWER, W.: The Public Comment should be Accepted in Principle. See my extensive comments on 13-72.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Revise Proposal 13-58 panel action to read as follows: A conductor ~~connection to a single-phase or 3-phase utility-interactive inverter~~ used solely for instrumentation, ~~or~~ voltage detection, or phase detection, and connected to a single phase or 3-phase utility-interactive inverter ~~purposes and not for power transmission~~ shall be permitted to be sized at less than the ampacity of the other current-carrying conductors and shall be sized equal to or larger than the equipment grounding conductor.
Panel Statement: The panel accepts the direction of the TCC to clarify the text to conform to the NEC Style Manual. The last part of the sentence was changed to clarify that smaller conductors are permitted in certain cases.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 15 Negative: 1
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
RAPPAPORT, E.: The original word "neutral" needs to be retained. Without that word, the remaining text could imply that all instrumentation wiring could be smaller than the overcurrent protection would permit.

13-75 Log #1745 NEC-P13 **Final Action: Accept in Part**
(690.64(A))

TCC Action: The Technical Correlating Committee directs that the sentence added to 690.64(A)(2) in the accepted text in Comment 13-77 from Comment 13-75 read as follows:
"In systems with ~~series-connected~~ panelboards connected in series, ~~panel-boards or sub-panels~~ the rating of the first overcurrent device directly connected to the output of a utility-interactive inverter(s) shall be used in the calculations for all busbars and conductors."
Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Comment on Proposal No: 13-59
Recommendation: The PV Industry Forum withdraws this proposal in favor of the CMP 9 rewrite of the entire Section 690.64. Two deviations from the CMP-9 submittal are underlined and explained below. This is the entire Section as submitted with the two revisions shown underlined. ALL TEXT IS NEW and REPLACES THE EXISTING 690.64:
690.64 Point of Connection. The output of a utility-interactive inverter shall be connected as specified in either 690.64(A) or 690.64(B).
(A) Supply Side. The output of a utility-interactive inverter shall be permitted to be connected to the supply side of the service disconnecting means as permitted in 230.82(6).
(B) Load Side. The output of a utility interactive inverter shall be permitted to be connected to the load side of the service disconnecting means of the other source(s) at any distribution equipment on the premises, provided that all of the conditions in (C) are met.
(C) Interconnection Limitations for Distribution Equipment. Where distribution equipment, including switchboards and panel boards, is fed simultaneously by a primary source(s) of electricity and one or more utility-interactive inverters, and where this distribution equipment is capable of supplying multiple branch circuits or feeders or both, the interconnection provisions for the utility-interactive inverter(s) shall comply with (1) through (7).
(1) Dedicated Overcurrent and Disconnect. Each source interconnection shall be made at a dedicated circuit breaker or fusible disconnecting means.
(2) Bus or Conductor Rating. The sum of the ampere ratings of overcurrent devices in circuits supplying power to a busbar or conductor shall not exceed 120 percent of the rating of the busbar or conductor. In systems with series-connected panel boards or subpanels, the rating of the first overcurrent device directly connected to the output of a utility-interactive inverter(s) shall be used in the calculations for all busbars and conductors.
(3) Ground-Fault Protection. The interconnection point shall be on the line side of all ground-fault protection equipment.
Exception: Connections shall be permitted to be made to the load side of ground-fault protection equipment, provided that there is ground fault protection for equipment from all ground-fault current sources. Ground-fault protection devices used with supplies connected to the load-side terminals shall be identified and listed as suitable for backfeeding.
(4) Marking. Equipment containing overcurrent devices in circuits supplying power to a busbar or conductor supplied from multiple sources shall be marked to indicate the presence of all sources.
(5) Suitable for Back Feed. Circuit breakers, if backfed, shall be suitable for such operation.
FPN: Circuit breakers that are marked "Line" and "Load" have been evaluated only in the direction marked. Circuit breakers without "Line" and "Load " markings are evaluated in both directions.

(6) Fastening. Listed, plug-in type circuit breakers backfed from utility-interactive inverters complying with 690.60 shall be permitted to omit the additional fastener required by 408.36(F) for such applications.

(7) Opposite-End Connections. Where the bus or conductor rating is less than sum of the ampere ratings of all overcurrent devices supplying it, then connection(s) from the output of utility-interactive inverter(s) shall be positioned at the opposite (load) end from the feeder location or main circuit location. Where such opposite-end connections are required, a permanent warning label shall be applied to the distribution equipment with the following or equivalent wording:

WARNING
PHOTOVOLTAIC SYSTEM SOURCE OUTPUT
DO NOT RELOCATE THIS OVERCURRENT DEVICE

Substantiation: The revisions to the CMP-9 submittal are as follows:
1) In 690.64(C)(2), a second sentence was added to address the frequent situation where there are multiple series-connected panel boards in a system. For example, a 15-amp backfed breaker in a 100-amp panel might allow the connection of a utility-interactive inverter on the 10th floor of a building. That 100-amp panel is fed by a 100-amp breaker in a 400-amp panel in the middle of the building which, in turn, is fed by a 400-amp breaker in a 1000- amp service entrance panel. At the 1000-amp service panel, the existing wording of 690.64 (as interpreted by inspectors and previous CMPs) requires that the 400-amps be counted as the backfed breaker in this 1000-amp panel, not the 15-amp breaker attached to and limiting the backfed current from the inverter. The added sentence clarifies that the first breaker (15-amps) attached to the inverter output is to be used in the calculation. Explanatory diagrams are attached.
2). The title on 690.64(C)(7) was changed to "Opposite-End Connections" to avoid duplicating the title on 690.64(C)(2).

The PV Industry Forum requests clarification and confirmation of the CMP 9 calculation of a 4% possible added heating due a potential 120% increase in load currents. Other calculations indicate that the potential heating may be as high as 44%. Other panel board manufacturers have indicated that the overheating is not an issue as long as the panel is fed at opposite ends..

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Part

Add the following sentence to 690.64(B)(2) in the action for Comment 13-77: "In systems with series-connected panel boards or subpanels, the rating of the first overcurrent device directly connected to the output of a utility-interactive inverter(s) shall be used in the calculations for all busbars and conductors."

Panel Statement: This information provides clarification for determining bus or conductor ratings.

Number Eligible to Vote: 17

Ballot Results: Affirmative: 15 Negative: 1

Ballot Not Returned: 1 Gustafson, R.

Explanation of Negative:

STAFFORD, T.: Even though the added sentence would be good to have in the 2008 NEC, it is material that has not had public review, and is considered new material and should be held for the public comment IAW Section 4-4.6.2.2 of NFPA Regulations Governing Committee Projects. NEMA manufacturers of panelboards, switchboards, overcurrent devices, (both fuses and circuit breakers) would probably be interested in the additional requirements that this new wording places into effect.

13-76 Log #1746 NEC-P13 **Final Action: Accept in Principle (690.64(A))**

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum

Comment on Proposal No: 13-60

Recommendation: The PV Industry Forum withdraws this proposal in favor of the CMP-9 submittal of a revision to the entire 690.64. See 13-59 Log 2100.

The PV Industry Forum requests clarification and confirmation of the CMP 9 calculation of a 4% possible added heating due a potential 120% increase in load currents. Other calculations indicate that the potential heating may be as high as 44%. Other panel board manufacturers have indicated that the overheating is not an issue as long as the panel is fed at opposite ends.

Substantiation: None given.

Panel Meeting Action: Accept in Principle

Panel Statement: See the panel action on Comment 13-77.

Number Eligible to Vote: 17

Ballot Results: Affirmative: 16

Ballot Not Returned: 1 Gustafson, R.

13-77 Log #311 NEC-P13 **Final Action: Accept in Principle (690.64(B))**

TCC Action: The Technical Correlating Committee directs that the phrase "shall have been sized" be changed to "shall be sized" to comply with the NEC Style Manual.

Submitter: Code-Making Panel 9,

Comment on Proposal No: 13-61

Recommendation: Revise the panel action on this proposal as modified by the action on Proposal 13-69 to read as follows (legislative formatting in this comment applies to differences from the CMP-13 action text, and not in respect to the 2005 NEC):

690.64 Point of Connection. The output of a utility-interactive inverter shall be connected as specified in 690.64(A) or 690.64(B).

(A) Supply Side. The output of a utility-interactive inverter shall be permitted to be connected to the supply side of the service disconnecting means as permitted in 230.82(6).

(B) Load Side. The output of a utility-interactive inverter shall be permitted to be connected to the load side of the service disconnecting means of the other source(s) at any distribution equipment on the premises, provided that ~~either condition (1) or~~ all of the conditions ~~(2) through (6)~~ in (C) are met.

(C) Interconnection Limitations for Distribution Equipment. Where distribution equipment, including switchboards, and panelboards, is fed simultaneously by a primary source(s) of electricity and one or more utility-interactive inverters, and where this distribution equipment is capable of supplying multiple branch circuits or feeders or both, the interconnecting provisions for the utility-interactive inverter(s) shall comply with (1) through (7).

~~(1) The PV supply overcorrect/disconnect device shall be installed in a panelboard and positioned farthest from the feeder or service connection.~~

~~(2) Each source interconnection shall be made at a dedicated circuit breaker or fusible disconnecting means.~~

~~(3) the interconnection point shall be on the line side of all ground-fault protection equipment.~~

~~Exception: connection shall be permitted to be made to the load side of ground-fault protection, provided that there is ground-fault protection for equipment from all ground-fault current sources. Ground-fault protection devices used with supplies connected to the load side terminals shall be identified and listed as suitable for backfeeding.~~

~~(4) Equipment containing more than one circuit supplying power to a busbar or conductor shall be marked at the overcorrect device for each supply.~~

~~(5) Circuit Breakers, if backfed, shall be identified for such operation. Dedicated circuit breakers backfed from listed utility-interactive inverters complying with 690.60 shall not be required to be individually clamped to the panelboard busbars. A front panel shall clamp all circuit breakers to the panelboard busbars. Main circuit breakers connecte d directly to energized feeders shall also be individually clamped.~~

~~FPN: Circuit breakers that are marked "Line" and "Load" are not identified as suitable for backfeeding.~~

~~(6) The rating of the bus or conductor to which the utility interactive inverter breaker or fusible disconnect is connected shall meet all of the conditions in 690.65(B)(6)(a) or 690.65(B)(6)(b).~~

~~(a) Where connected at other than the opposite (farthest) end of the busbar from the feeder or service, the sum of all overcorrect devices supplying the busbar or conductor shall not exceed the rating of the busbar or conductor, except in dwelling unit installations where the sum of all overcorrect devices supplying the busbar or conductor shall not exceed 120 percent of the busbar or conductor rating.~~

~~(b) Where connected at the opposite (farthest) end of the busbar from the feeder or service, the sum of ampere rating of the backfed PV supply overcorrect/disconnect device(s) shall not exceed the rating of the busbar or conductor. The following permanent plaque shall be installed at the PV supply connection or circuit breaker location:~~

~~WARNING: THIS PV SUPPLY CONNECTION MUST REMAIN CONNECTED OR INSTALLED AT THIS LOCATION, WHICH IS FARTHEST FROM THE FEEDER OR SERVICE CONNECTION.~~

(1) Dedicated Overcurrent and Disconnect. Each source interconnection shall be made at a dedicated circuit breaker or fusible disconnecting means.

(2) Bus or Conductor Rating. The sum of the ampere ratings of overcurrent devices in circuits supplying power to a busbar or conductor shall not exceed 120 percent of the rating of the busbar or conductor.

(3) Ground Fault Protection. The interconnection point shall be on the line side of all ground-fault protection equipment.

Exception: Connection shall be permitted to be made to the load side of ground-fault protection, provided that there is ground-fault protection for equipment from all ground-fault current sources. Ground-fault protection devices used with supplies connected to the load-side terminals shall be identified and listed as suitable for backfeeding.

(4) Marking. Equipment containing overcorrect devices in circuits supplying power to a busbar or conductor supplied from multiple sources shall be marked to indicate the presence of all sources.

(5) Suitable for Back Feed. Circuit breakers, if backfed, shall be suitable for such operation.

FPN: Circuit breakers that are marked "Line" and "Load" have been evaluated only in the direction marked. Circuit breakers without "Line" and "Load" have been evaluated in both directions.

(6) Fastening. Listed plug-in type circuit breakers backfed from utility-interactive inverters complying with 690.60 shall be permitted to omit the additional fastener normally required by 408.36(F) for such applications.
(7) Bus or Conductor Rating. Unless the panelboard is rated not less than the sum of the ampere ratings of all overcurrent devices supplying it, a connection in a panelboard shall be positioned at the opposite (load) end from the input feeder location or main circuit location. A permanent warning label shall be applied to the distribution equipment with the following or equivalent wording:
WARNING
PHOTOVOLTAIC SYSTEM SOURCE OUTPUT
DO NOT RELOCATE THIS OVERCURRENT DEVICE

Substantiation: Although the Technical Correlating Committee requested that CMP-9 comment on Proposal 13-61, and by this comment the panel has done so, the technical issues raised in that and in the associated proposals apply to all systems capable of interconnection and parallel operation using multiple sources. Ror this reason, CMP-9 believes that the CMP-13 actions in Articles 690, 692, and 705 must be correlated in this respect, and is providing comments to the comparable proposals and panel actions in all of these articles. In addition, the layout and content of this comment reflect a consistency of approach that assures correlation with the corresponding language in Articles 692 and 705.

CMP-9 agrees that it is possible to assure that the busbars of panelboards receiving supply current from two sources can be arranged so the busbars will not exceed their ampacity (the "opposite end" scenario accepted under this proposal), however, CMP-9 points out that such an arrangement allows for up to double the amount of load to be taken from the panel for indefinite periods of time. Current product standards do not anticipate the effect of I2R heating losses under these conditions, which could severely impact the performance of essential components within the distribution equipment. Before the NEC recognizes this type of connection, it is essential that careful testing be carried out to determine the acceptable parameters that should be applied in these cases.

For example, if a large PV system provides 100 amperes of power to a panel in an interactive system rated 100 amperes, and this panel is supplied by a normal utility supply of 100 amperes, the branch circuit and feeder loads supplied by this panel could total 200 amperes. Although such a load should not exist due to required sizing rules relative to Article 220 calculations, the requirement for individual protection for panelboards (now set to apply to all panelboards by virtue of CMP-9 action in this cycle) anticipates that these load calculations are easily circumvented given the relative ease of circuit modifications.

CMP-9 is suggesting revisions to the backfeed allowance that more closely track the actual provision in Article 408 that is intended to be varied in this Chapter 6 article. Our wording also omits the deadfront clamping language in the proposal because such construction is clearly required by the product standard and pointless here; furthermore, the deadfront does not actually "clamp all circuit breakers to the panelboard busbars." In addition, we are offering a different version of the fine print note to address concerns raised in the voting. CMP-9 understands that CMP-13 was using the term (identified) in its Article 100 sense and not in the sense of a marking, however, this wording avoids any confusion. Other changes are editorial and in the interest of correlation, where technically appropriate, with other interactive articles.

CMP-9 expresses its willingness to assign a task group to work with CMP-13 and other industry parties to provide a carefully substantiated global approach to double-fed distribution equipment applied in interactive settings for the 2011 NEC. This might include specially targeted allowances for equipment listings that would cover such interconnections. In the mean time, this comment does broaden the 120 percent allowance from dwellings to all occupancies. Because of the I2R relationship, an allowance for an an additional 20% loading (one fifth) would only increase the heating losses by 4% (one twenty fifth), which should be tolerated by existing equipment designs even if the interconnection does not occur at the opposite end of the bus from the normal supply. This comment incorporates the opposite-end rule from the CMP-13 action on this proposal as a trade-off for the occupancy expansion, thereby ensuring that an overloaded busbar does not exacerbate the heating problem.

This comment has been balloted through CMP-9 with the following balloting results:
11 Eligible to Vote
10 Affirmative
1 Not Returned (H. deVega)

Panel Meeting Action: Accept in Principle
Revise CMP-9's 690.64(B) and (C) as follows:
690.64 Point of Connection. The output of a utility-interactive inverter shall be connected as specified in 690.64(A) or 690.64(B).
(A) Supply Side. The output of a utility-interactive inverter shall be permitted to be connected to the supply side of the service disconnecting means as permitted in 230.82(6).
(B) Load Side. The output of a utility-interactive inverter shall be permitted to be connected to the load side of the service disconnecting means of the other source(s) at any distribution equipment on the premises. Where distribution equipment, including switchboards and panelboards, is fed simultaneously by a primary source(s) of electricity and one or more utility-interactive inverters, and where this distribution equipment is capable of supplying multiple branch circuits or feeders or both, the interconnecting provisions for the utility-interactive inverter(s) shall comply with (1) through (7):
[(1) through (6) as in last ed.]
(7) Inverter Output Connection. Unless the paneboard is rated not less than the sum of the ampere ratings of all overcurrent devices supplying it, a connection in a panelboard shall be positioned at the opposite (load) end from the input feeder location or main circuit location. The bus or conductor rating shall have been sized for the loads connected in accordance with Articel 220. A permanent warning label shall be applied to the distribution equipment with the following or evuivalent working:

WARNING
INVERTER OUTPUT CONNECTION
DO NOT RELOCATE THIS OVERCURRENT DEVICE

Panel Statement: The panel corrected the spelling of "overcorrect" to "overcurrent"; reorganized (B) and (C) into a single section (B) for user-friendliness. Added "The bus or conductor rating shall have been sized for the loads connected in accordance with Article 220." to (7) to satisfy intent of Comment 13-78. Revised the heading for (7) to eliminate duplication.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.
Comment on Affirmative:
BOWER, W.: The CMP 9 reviews and suggested changes were extensive and comprehensive, and the panel is to be commended on a job well done. My comments for this Public Comment are editorial in nature as below:
Note that the panel reorganized (B) and (C) into a single section (B) but that is not reflected in the report.
In 690.64(C)(3) the term "Ground Fault" in the title should be changed to "Ground-fault".
In 690.64(C)(4) the term "overcorrect" should be changed to "overcurrent".
In 690.64(C)(7) the term "paneboard" should be changed to "panelboard", the spelling of "Articel" should be changed to "Article", the word "evuivalent" should be changed to "equivalent" and the last word "working" should be changed to "marking".

13-78 Log #1179 NEC-P13 **Final Action: Accept in Principle (690.64(B))**

Submitter: Neil F. LaBrake, Jr., National Grid / Rep. Edison Electric Insitute-Electric Light & Power Group
Comment on Proposal No: 13-61
Recommendation: Revise the wording of the Panel action for 690.64(B)(5)(b) per Mr. Hornberger's comment, as follows:
690.64(B)(5)(b) End Feed Connection. Where the utility-interactive inverter breaker or fusible disconnect is connected in the distribution equipment at the opposite (load) end from the input feeder connection or main circuit location, the bus or conductor rating shall be equal to or larger than the sum of the ampere ratings of all overcurrent devices connecting premise electric power production sources to the bus or conductor. The bus or conductor rating shall have been sized for the loads connected, in accordance with Article 220. A permanent warning label shall be applied to the distribution equipment with the following or equivalent:

WARNING
ELECTRIC POWER PRODUCTION SOURCE OUTPUT
DO NOT RELOCATE THIS OVERCURRENT DEVICE.

Substantiation: The Panel's rewording of 690.64(B)(5)(b) will permit the sum of the overcurrent devices supplying current to a bus or conductor to exceed the ampacity rating of the bus or conductor by 200%. If the bus or conductor is not sized for the loads served, in accordance with Article 220, an overload condition may exist on the bus or conductor that would not be detected by any of the overcurrent devices supplying current to the system. In addition, this is a "generic" requirement for utility interactive inverters and not specifically a photovoltaic system issue. Please see recommended rewording and relocation as part of Mr. Hornberger's comment on Proposal 13-184 to incorporate a reference to Article 220 and move the text to Article 705.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Comment 13-77.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.

13-79 Log #1324 NEC-P13 **Final Action: Accept in Principle (690.64(B))**

Submitter: Vincent J. Saporita, Cooper Bussmann
Comment on Proposal No: 13-61
Recommendation: Replace the phrase "circuit breaker" with the phrase "disconnecting means" in the proposed last sentence of (5)(b).
)b) Where connected at the opposite (farthest) end of the busbar from the feeder or service, the sum of ampere rating of the backfed PV supply overcurrent/disconnect device(s) shall not exceed the rating of the busbar or conductor. The following permanent plaque shall be installed at the PV supply connection or ~~circuit breaker~~ disconnecting means location:
Substantiation: As written, the user might be led to think that only a circuit breaker could be utilized. This suggested change would make it clear that circuit breakers are not the only types of disconnecting means to be allowed. For example, a fusible switch could be utilized as the disconnecting means.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Comment 13-77.

13-83 Log #1748 NEC-P13 **Final Action: Accept in Principle (690.64(B)(1) Exception)**

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Comment on Proposal No: 13-61a
Recommendation: The PV Industry Forum proposes that this proposal should be rejected. The proposal imposes a complex set of five requirements that are not easily understood. The existing provisions of Article 690 adequately address the connection of utility-interactive inverters to dedicated circuits. Converting the branch circuit to a feeder by adding a subpanel would also address the need. Branch circuits with permanently connected loads like outside air conditioner compressors and other large motor loads are typically specified with very definite overcurrent devices based on the running and locked rotor amps of such units. To connect a PV inverter to such a circuit would significantly complicate those well-established calculations and requirements. Furthermore, the starting surge, voltage drops associated with such loads could possibly cause any PV inverter to trip off line as required by UL Standard 1741.
Code making actions this cycle with increased requirements for AFCI and GFCI protection of nearly all branch circuits would make the connections allowed by this proposal unworkable and could create safety hazards if GFCI and AFCI equipment were backfed.
Substantiation: None given.
Panel Meeting Action: Accept in Principle

13-84 Log #2295 NEC-P13 **Final Action: Accept (690.64(B)(1) Exception)**

Submitter: Todd Stafford, IBEW-NJATC / Rep. IBEW
Comment on Proposal No: 13-61a
Recommendation: Delete proposed 690.64(B)(1) Exception.
Substantiation: The panel action was incorrect in allowing the connection of a utility interactive inverter to a dedicated branch circuit serving permanently connected loads. See panel action taken on 13-63 which specifies why connection to branch circuits is not allowed. The connection of a utility interactive inverter is the cause of the potential lack of overcurrent protection, not the issue of it being cord and plug connected as stated in 13-63. The result is the same, an overcurrent condition without protection from an overcurrent protection device.
Panel Meeting Action: Accept
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.

13-85 Log #1180 NEC-P13 **Final Action: Accept in Principle (690.64(B)(2))**

Submitter: Neil F. LaBrake, Jr., National Grid / Rep. Edison Electric Insitute-Electric Light & Power Group
Comment on Proposal No: 13-64
Recommendation: Revise the wording of the Panel action for 690.64(B)(5)(b) in Proposal 13-61 per Mr. Hornberger's comment as follows:
690.64(B)(5)(b) End Feed Connection. Where the utility-interactive inverter breaker or fusible disconnect is connected in the distribution equipment at the opposite (load) end from the input feeder connection or main circuit location, the bus or conductor rating shall be equal to or larger than the sum of the ampere ratings of all overcurrent devices connecting premise electric power production sources to the bus or conductor. The bus or conductor rating shall have been sized for the loads connected, in accordance with Article 220. A permanent warning label shall be applied to the distribution equipment with the following or equivalent:

WARNING
ELECTRIC POWER PRODUCTION SOURCE OUTPUT
DO NOT RELOCATE THIS OVERCURRENT DEVICE.

Substantiation: The Panel's rewording of 690.64(B)(5)(b) in Proposal 13-61 will permit the sum of the overcurrent devices supplying current to a bus or conductor to exceed the ampacity rating of the bus or conductor by 200%. If the bus or conductor is not sized for the loads served, in accordance with Article 220, an overload condition may exist on the bus or conductor that would not be detected by any of the overcurrent devices supplying current to the system. In addition, this is a "generic" requirement for utility interactive inverters and not specifically a photovoltaic system issue. Please see recommended rewording and relocation as part of Mr. Hornberger's comment on Proposal 13-184 to incorporate a reference to Article 220 and move the text to Article 705.

13-87 Log #1750 NEC-P13 **Final Action: Accept in Principle (690.64(B)(2) Exception No. 2)**

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Comment on Proposal No: 13-65
Recommendation: The PV Industry Forum believes the intent of this proposal is covered by the CMP-9 submittal of a revision to the entire 690.64. See 13-59 Log 2100. If the CMP-9 revision with slight changes proposed in 13-59 is not accepted, then this proposal should be revisited.
The PV Industry Forum requests clarification and confirmation of the CMP 9 calculation of a 4% possible added heating due a potential 120% increase in load currents. Other calculations indicate that the potential heating may be as high as 44%. Other panel board manufacturers have indicated that the overheating is not an issue as long as the panel is fed at opposite ends.
Substantiation: None given.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Comment 13-77.
Number Eligible to Vote: 17

Submitter: Neil F. LaBrake, Jr., National Grid / Rep. Edison Electric Insitute-Electric Light & Power Group
Comment on Proposal No: 13-69
Recommendation: Revise the wording of the Panel action for 690.64(B)(5)(b) in Proposal 13-61 per Mr. Hornberger's comment as follows:
690.64(B)(5)(b) End Feed Connection. Where the utility-interactive inverter breaker or fusible disconnect is connected in the distribution equipment at the opposite (load) end from the input feeder connection or main circuit location, the bus or conductor rating shall be equal to or larger than the sum of the ampere ratings of all overcurrent devices connecting premise electric power production sources to the bus or conductor. The bus or conductor rating shall have been sized for the loads connected, in accordance with Article 220. A permanent warning label shall be applied to the distribution equipment with the following or equivalent:

WARNING
ELECTRIC POWER PRODUCTION SOURCE OUTPUT
DO NOT RELOCATE THIS OVERCURRENT DEVICE.

Substantiation: The Panel's rewording of 690.64(B)(5)(b) in Proposal 13-61 will permit the sum of the overcurrent devices supplying current to a bus or conductor to exceed the ampacity rating of the bus or conductor by 200%. If the bus or conductor is not sized for the loads served, in accordance with Article 220, an overload condition may exist on the bus or conductor that would not be detected by any of the overcurrent devices supplying current to the system. In addition, this is a "generic" requirement for utility interactive inverters and not specifically a photovoltaic system issue. Please see recommended rewording and relocation as part of Mr. Hornberger's comment on Proposal 13-184 to incorporate a reference to Article 220 and move the text to Article 705.

ARTICLE 692 — FUEL CELL SYSTEMS

13-93 Log #754 NEC-P13 **Final Action: Reject**
(692)

Submitter: Timothy M. Croushore, Allegheny Power
Comment on Proposal No: 13-71
Recommendation: These recommended corrections to Article 692 as recommended in the original proposal are intended to comply with the current NEC organization are as follows:

1. Please accept the original proposed modifications in 692.1 Scope as published in the ROP.
2. Please delete the definition of Interactive System, as it will now appear in Article 100. Please delete the title and definition of Point of Common Coupling. Please do not delete the title of the definition of Maximum System Voltage and the title of the definition of Stand-Alone System as published in the ROP.
3. Please accept the modifications made in the original proposal to 692.3 Other Articles to correspond with the rewrite of Article 705. The proposed added and deleted text for this section is published in the ROP on page 70-750.
4. Please delete the complete title and text of 692.62 Loss of Interactive System Power as recommended in the original proposal to correspond with the rewrite of Article 705. This information is now included in Article 705.
9. Please delete the title and text of 692.64 Unbalanced Interconnections as recommended in the original proposal. This information corresponds with the rewrite of Article 705 and is now included there.
10. Please delete the title and text of 692.65 Point of Connection as recommended in the original proposal. This information corresponds with the rewrite of Article 705 and is now included there.

Substantiation: Code Making Panel 13 is to be commended for the fine job on the work on the rewrite of Article 705 and revision to Article 690 and Article 692 as it appears in the NEC 2008 Draft.

This comment is a companion comment to the comment on Proposal 13-184 dealing with the rewrite of Article 705. There is also a companion comment to the comment on Proposal 13-17 dealing with comment on Article 690. It may be best to review the comment on Article 705, proposal 13-184 before reviewing this comment and the one on 13-17.

It is recognized that the Fuel Cell community has done great work in promoting and advancing the fuel cell technology for electric power production. While there may be reluctance to remove the utility-interconnection requirements from both Articles 692 and 690, it is the best organization for the NEC to keep the nonspecific interconnection requirements in Article 705 scoped specifically for the interconnection of electric power sources and any specific technology installation requirements such as photovoltaic and fuel cells in their separate articles.

The main purpose of the original proposal is to consolidate non-photovoltaic utility interconnection issues with distributed generation in Article 705 and photovoltaic-specific technical issues in Article 690. Having nonphotovoltaic utility interconnection issues duplicated within Article 692 causes confusion with Article 705 that is intended to deal with utility interconnection issues with all distributed generation sources.

The intent of this comment on the original proposal is to clarify and correct the issues in Article 692 based on the rewrite of Article 705 and on the affirmative comments as published in the Report on Proposals suggested by the members of CMP-13. The original proposal as published in the ROP was used to identify the changes as originally proposed.

Panel Meeting Action: Reject
Panel Statement: The panel rejects the proposal in order to satisfy the intent of the original panel action on the proposal by keeping Article 692 intact while transferring selected language related to interconnection to Article 705.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.

13-94 Log #1182 NEC-P13 **Final Action: Reject**
(692)

Submitter: Neil F. LaBrake, Jr., National Grid / Rep. Edison Electric Insitute-Electric Light & Power Group
Comment on Proposal No: 13-71
Recommendation: Accept Proposal 13-71.
Substantiation: Proposal 13-184 establishes a location in Article 705 to locate the common interconnection requirements that apply to all electric power production sources operating in parallel with a primary source of electricity. These requirements are not unique to fuel cell systems and should be relocated to Article 705 and removed from Article 692. This action is a necessary step towards standardization of interconnection requirements and improves the usability of the NEC.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 13-93.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.

Comment on Affirmative:
HORNBERGER, B.: I agree with the panel action, however the panel discussed recommending that a Task Group be formed to review the redundant "Point of Connection" requirements for PV in 690, Fuel Cells 692 and Interconnected Electric Power Sources 705. There is no mention of this in the panel statements. The panel harmonized most of these requirements through their actions on comments 13-77, 13-97, and 13-262. Photovoltaic and Fuel Cell systems are "Interconnected Electric Power Sources", when they operate in parallel with another supply source. Article 705 should apply. Point of connection requirements in Articles 690 and 692 should only contain "special" considerations that pertain to the specific power source technology.

13-95 Log #2197 NEC-P13 **Final Action: Accept**
(692)

Submitter: Kenneth Krastins, Plug Power, Inc. / Rep. US Fuel Cell Council
Comment on Proposal No: 13-71
Recommendation: Reject the proposed change.
Substantiation: The panel acknowledged the value of such a proposal and accepted this proposal in principle to permit public comment of the proposal. Comments have been received and will be reviewed further at the CMP-13 ROC meeting in November. But, feedback to this point indicates that to adequately address the concerns of a change of this magnitude and craft language that will neither omit nor introduce wording that will compromise safety for the affected industries that a working group will need to convene to provide a comprehensive proposal for the 2011 NEC. The proposal should be rejected by the panel to ensure that the changes indicated in the 2008 NEC ROP are not inadvertently included in the final publication.

(692.65)

TCC Action: The Technical Correlating Committee directs that the phrase "shall have been sized" be changed to read "shall be sized" to comply with 3.3.1 of the NEC Style Manual.
Submitter: Code-Making Panel 9,
Comment on Proposal No: 13-74
Recommendation: Modify the panel action as follows (legislative formatting in this comment applies to differences from the CMP-13 action text, and not in respect to the 2005 NEC):

692.65 Utility-Interactive Point of Connection. The output of a utility interactive inverter shall be connected as specified in 692.65(A) or 692.65(B). Distribution equipment fed by both primary and electric power production sources shall also comply with (C).

(A) Supply Side. A utility-interactive inverter shall be permitted to be connected to the supply side of the service disconnecting means as permitted in 230.82(6).

(B) Load Side. A utility-interactive inverter shall be permitted to be connected to the load side of the service disconnecting means of the other source(s) at any distribution equipment on the premises, provided that all of the ~~following~~ conditions ~~of 692.62(B)(1) through 692.65(B)(5)~~ in (C) are met:

C) Interconnection Limitations for Distribution Equipment. Where distribution equipment, including switchboards and panelboards, is fed simultaneously by a primary source(s) of electricity and one or more fuel cell system power sources, and where this distribution equipment is capable of supplying multiple branch circuits or feeders or both, the interconnecting provisions for the fuel cell system power sources shall comply with (1) through (6).

(1) Dedicated Overcurrent and Disconnect. Each source interconnection shall be made at a dedicated circuit breaker or fusible disconnecting means.

(2) Ground Fault Protection. The interconnection point shall be on the line side of all ground-fault protection equipment.

Exception: Connection shall be permitted to be made to the load side of ground-fault protection, provided that there is a ground-fault protection for equipment from all ground-fault current sources. Ground-fault protection devices used with supplies connected to the load-side terminals shall be identified and listed as suitable for backfeeding.

(3) Marking. Equipment containing overcurrent devices in circuits supplying power to a busbar or conductor shall be marked to indicate the presence of all sources.

(4) Suitable for Back Feed. Equipment such as circuit breakers, if backfed, shall be identified for such operation.

(5) Bus or Conductor Rating. ~~The rating of the bus or conductor to which the utility interactive inverter breaker or fusible disconnect is connected shall meet all of the conditions in 692.65(B)(5)(a) or 692.65(B)(5)(b).~~ Unless the panelboardis rated not less than the sum of the ampere ratings of all overcurrent devices supplying it, a connection in a panelboard shall be positioned at the opposite (load) end from the input feeder location or main circuit location.

~~(a) End Feed Connection. Where the utility interactive inverter breaker or fusible disconnect is connected in the distribution equipment at the opposite (load) end from the input feeder connection or main circuit location, the bus or conductor rating shall be equal to or larger than the sum of the ampere ratings of all overcurrent devices connecting premise electric power production sources to the bus or conductor.~~ A permanent warning label shall be applied to the distribution equipment with the following or equivalent:

WARNING
ELECTRIC POWER PRODUCTION SOURCE OUTPUT
DO NOT RELOCATE THIS OVERCURRENT DEVICE

~~(b) General Connection. Where the utility interactive inverter breaker or fusible disconnect is not end fed, the bus or conductor rating shall be equal to or larger than the sum of the ampere ratings of overcurrent devices in circuits supplying owner to the busbar or conductor. Exception: For a dwelling unit, the sum of the ampere ratings of the overcurrent devices shall not exceed 120 percent of the rating of the busbar or conductor.~~

Substantiation: Although the Technical Correlating Committee requested CMP-9 to comment on Proposal 13-61, and the panel has done so, the technical issues raised in that and in the associated proposals apply to all systems capable of interconnection and parallel operation using multiple sources. For this reason, CMP-9 believes that the CMP-13 actions in Articles 690, 692, and 705 must be correlated in this respect, and is providing comments to the comparable proposals and panel actions in all of these articles. For example, the ground-fault exception presented here correlates with the approach in Proposal 13-61.

CMP-9 agrees that it is possible to assure that the busbars of panelboards receiving supply current from two sources can be arranged so the busbars will not exceed their ampacity (the "opposite end" scenario accepted under this proposal), however, CMP-9 points out that such an arrangement allows for up to double the amount of load to be taken from the panel for indefinite periods of time. Current product standards do not anticipate the effect of I2R heating losses under these conditions, which could severely impact the performance of essential components within the distribution equipment. Before the NEC recognizes this type of connection, it is essential that careful testing be carried out to determine the acceptable parameters that should be applied in these cases.

For example, if a fuel cell system provides 100 amperes of power to a panel in an interactive system rated 100 amperes, and this panel is supplied by a normal utility supply of 100 amperes, the branch circuit and feeder loads supplied by this panel could total 200 amperes. Although such a load should not exist due to required sizing rules relative to Article 220 calculations, the requirement for individual protection for panelboards (now set to apply to all panelboards by virtue of CMP-9 action in this cycle) anticipates that these load calculations are easily circumvented given the relative ease of circuit modifications.

CMP-9 expresses its willingness to assign a task group to work with CMP-13 and other interested industry parties to provide a carefully substantiated global approach to double-fed distribution equipment applied in interactive settings for the 2011 NEC. This might include specially targeted allowances for equipment listings that would cover such interconnections. In the mean time, this comment does broaden the 120 percent allowance from dwellings to all occupancies. Because of the I2R relationship, an allowance for an additional 20 percent loading (one fifth) would only increase the heating losses by 4 percent (one twenty fifth), which should be tolerated by existing equipment designs even if the interconnection does not occur at the opposite end of the bus from the normal supply. This comment incorporates the opposite-end rule from the CMP-13 action on this proposal as a trade-off for the occupancy expansion, thereby ensuring that an overloaded busbar does not exacerbate the heating problem.

This comment has been balloted through CMP-9 with the following balloting results:

11 Eligible to Vote
10 Affirmative
1 Not Returned (H. deVega)

Panel Meeting Action: Accept in Principle
Revise CMP-9's 692.65(B) and (C) as follows:

692.65 Point of Connection. The output of a utility-interactive inverter shall be connected as specified in 692.65(A) or 692.65(B).

(A) Supply Side. The output of a utility-interactive inverter shall be permitted to be connected to the supply side of the service disconnecting means as permitted in 230.82(6).

(B) Load Side. The output of a utility-interactive inverter shall be permitted to be connected to the load side of the service disconnecting means of the other source(s) at any distribution equipment on the premises**.** Where distribution equipment including switchboards and panelboards is fed simultaneously by a primary source(s) of electricity and one or more utility-interactive inverters, and where this distribution equipment is capable of supplying multiple branch circuits or feeders or both, the interconnecting provisions for the utility-interactive inverter(s) shall comply with (1) through (7).

(1) Dedicated Overcurrent and Disconnect. Each source interconnection shall be made at a dedicated circuit breaker or fusible disconnecting means.

(2) Bus or Conductor Rating. The sum of the ampere ratings of overcurrent devices in circuits supplying power to a busbar or conductor shall not exceed 120 percent of the rating of the busbar or conductor.

(3) Ground Fault Protection. The interconnection point shall be on the line side of all ground-fault protection equipment.

Exception: Connection shall be permitted to be made to the load side of ground-fault protection, provided that there is ground-fault protection for equipment from all ground-fault current sources. Ground-fault protection devices used with supplies connected to the load-side terminals shall be identified and listed as suitable for backfeeding.

(4) Marking. Equipment containing overcurrent devices in circuits supplying power to a busbar or conductor supplied from multiple sources shall be marked to indicate the presence of all sources.

(5) Suitable for Back Feed. Circuit breakers, if backfed, shall be suitable for such operation.

FPN: Circuit breakers that are marked "Line" and "Load" have been evaluated only in the direction marked. Circuit breakers without "Line" and "Load" have been evaluated in both directions.

(6) Fastening. Listed plug-in type circuit breakers backfed from utility-interactive inverters complying with 692.60 shall be permitted to omit the additional fastener normally required by 408.36(F) for such applications.

(7) Inverter Output Connection. Unless the panelboard is rated not less than the sum of the ampere ratings of all overcurrent devices supplying it, a connection in a panelboard shall be positioned at the opposite (load) end from the input feeder location or main circuit location. The bus or conductor rating shall have been sized for the loads connected in accordance with Article 220. A permanent warning label shall be applied to the distribution equipment with the following or equivalent wording:

WARNING
INVERTER OUTPUT CONNECTION
DO NOT RELOCATE THIS OVERCURRENT DEVICE

Panel Statement: The panel reorganized (B) and (C) into a single section (B) for user-friendliness and added "The bus or conductor rating shall have been sized for the loads connected in accordance with Article 220" to (7) to satisfy intent of Comment 13-78. The panel revised the heading for (7) to eliminate duplication, then added (2) and (6) from CMP-9's recommendation in Comment 13-77, Point of Connection for PV systems. Inverter interconnection requirements for PV and fuel cell systems are similar and should be harmonized.

Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.
Comment on Affirmative:

BOWER, W.: In 692(B)(3), the term "Ground Fault" in the title should be changed to "Ground-fault".

13-98 Log #2196 NEC-P13 **Final Action: Accept in Principle (692.65(B)(2))**

Submitter: Kenneth Krastins, Plug Power, Inc. / Rep. US Fuel Cell Council
Comment on Proposal No: 13-74
Recommendation: Modify the proposed wording to conform with the 8/1/2006 memorandum from CMP-9 on this proposal and the follow-up comments from the PV Industry Forum to Proposal 13-61. Add the comment to permit the 120 percent allowance substantiated in the CMP-9 memorandum and included in their comments to Proposal 13-61.
Substantiation: Although it could be argued that circumventing the language of the NEC will necessarily introduce hazards, this writer concedes that the relative ease of circumventing the rules of Article 220 make it prudent at this time to revise the text as recommended by CMP-9 and the PV Industry Forum. The above comment will address this concern as well as provide consistency between Articles 690 and 692. The recommendation to add the 120 percent allowance is also made for consistency, as it has been included in the CMP-9 recommendation for Proposal 13-61 as well as the substantiation section for Proposal 13-74, but it has been omitted from their text of the revised, proposed wording for Proposal 13-74.

Panel Meeting Action: Accept in Principle

ARTICLE 695 — FIRE PUMPS

13-102 Log #98 NEC-P13 **Final Action: Accept (695)**

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 13-77
Recommendation: It was the action of the Technical Correlating Committee that this Proposal be reported as "Reject" because of the number of technical inconsistencies, style manual issues, and the inclusion of material outside the scope and purpose of Article 695.

It was the action of the Technical Correlating Committee that this proposal be reconsidered by the panel and that the panel limit the requirements to those within the scope of those necessary for a safe electrical installation. The Technical Correlating Committee agrees with the negative commenters that much of the material added by the panel is inappropriate for the NEC. The panel should not attempt to recreate NFPA 20 in the NEC. In addition, the panel is directed to address the large number of style manual issues noted in Mr. Nasby's negative comment. This action shall be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

13-103 Log #1037 NEC-P13 **Final Action: Hold (695)**

The Technical Correlating Committee directs that the panel action on Comment 13-103 be reported as "Hold" consistent with Section 4.4.6.2.2 of the NFPA Regulations Governing Committee Projects.

In reviewing Comment 13-103, the Technical Correlating Committee found a significant number of correlation, style and technical issues that make the rewrite of Article 695 unacceptable. These issues include, but are not limited to:

1.References to material within Article 695 that are incorrect

2. Addition of material from NFPA 20 that is not appropriate for Article 695

3. Requirements added that are outside the scope of Article 695

4. Deletion of text that was not substantiated by any proposal or comment

5. FPNs that contain requirement and intent statements

6. Redundant text that is already covered by 90.3

Through this Technical Correlating Committee action, Article 695 will appear as it did in the Report on Proposals draft as modified by Comments 13-113 and 13-134.

Although the Technical Correlating Committee is concerned with the fact that there may be valid proposals and comments that will not move forward, the panel's attempt to rewrite the entire Article without acting on the individual proposals and comments creates technical issues that cannot move forward and cannot be corrected by the Technical Correlating Committee.

Submitter: James S. Nasby, Master Control Systems, Inc.
Comment on Proposal No: 13-77
Recommendation: Revise the text of the TCC write-up in the A2007 ROP to read as follows.
Revisions to the ROP Version of

Article 695 for the
2008 Edition of NFPA-70
ARTICLE 695 Fire Pumps

FPN: Rules that are followed by a reference in brackets contain text that has been extracted from NFPA 20-2006, Standard for the Installation of Stationary Pumps for Fire Protection. Only editorial changes were made to the extracted text to make it consistent with this Code.

695.1 Scope.

(A) Covered. This article covers the installation of the following:
(1) Electric power sources and interconnecting circuits
(2) Switching and control equipment dedicated to fire pump drivers
(3) Associated fire pump accessory equipment

(B) Not Covered. This article does not cover the performance, maintenance, and acceptance testing of the fire pump system, and the internal wiring of the components of the system.

FPN: See NFPA 20-2006, Standard for the Installation of Stationary Pumps for Fire Protection, for further information.

695.2 Definitions.

Fault Tolerant External Control Circuit. Those control circuits entering or leaving the fire pump controller enclosure, which if broken, disconnected, or shorted will not prevent the controller from starting the fire pump from all

other internal or external means and may cause the controller to start the pump under these conditions.

On-Site Power Production Facility. The normal supply of electric power for the site that is expected to be constantly producing power.

On-Site Standby Generator. A facility producing electric power on site as the alternate supply of electric power. It differs from an on-site power production facility, in that it is not constantly producing power.

695.3 Power Source(s) for Electric Motor-Driven Fire Pumps.

Electric motor-driven fire pumps shall have a reliable source of power.

FPN: NFPA 20-2006, *Standard for the Installation of Stationary Pumps for Fire Protection,* covers characteristics of reliable of reliable sources. Also see the cross-reference in Annex J.

(A) Scope. This section covers the minimum performance and testing requirements of the sources and transmission of electrical power to motors driving fire pumps.

(B) Equipment. Also covered are the minimum performance requirements of all intermediate equipment between the source(s) and the pump, including the motor(s) but excepting the electric fire pump controller, transfer switch, and accessories

FPN: See Chapter 10 of NFPA 20.

(C) General. All electrical equipment and installation methods shall comply with this Code except as modified by Article 695.

(D) Hazards. All power supplies shall be located and arranged to protect against damage by fire from within the premises and exposing hazards.

FPN: Where the power supply involves an on-site power production facility, the protection is required for the facility in addition to the wiring and equipment.

(E) Continuous Duty. All power supplies shall have the capacity to run the fire pump on a continuous basis.

(F) Voltage Drop. All power supplies shall comply with the voltage drop requirements of Section 695.8

(G) Phase Converters. Phase converters shall not be permitted to be used for fire pump service.

695.4 Continuity of Power.

(A) Continuously Available. An electric motor driven fire pump shall be provided with a normal source of power as a continually available source.

(B) Arrangement. The normal source of power required in 695.4(A) and its routing shall be arranged in accordance with one of the following:

(1) Service connection dedicated to the fire pump installation.

(2) On-site power production facility connection dedicated to the fire pump installation.

(3) A dedicated feeder connection derived directly from the dedicated service to the fire pump installation.

(4) As a feeder connection where all of the following conditions are met:

a. The protected facility is part of a multi-building campus style arrangement.

b. A back-up source of power is provided from a source independent of the normal source of power

.c. It is impractical to supply the normal source of power through arrangement 695.4(B)(1), 695.4(B)(2), 695.4(B)(3) or 695.4(B)(5).

d. The arrangement is acceptable to the authority having jurisdiction.

e. The overcurrent protection device(s) in each disconnecting means shall be selectively coordinated with any other supply side overcurrent protective device(s).

(5) A dedicated transformer connection directly from the service meeting the requirements of Article 695.6.

(C) Connections. For fire pump installations using the arrangement of 695.4(B)(1), 695.4(B)(2), 695.4(B)(3), 695.4(B)(5) for the normal source of power, no more than one disconnecting means and associated overcurrent protection device shall be installed in the power supply to the fire pump controller.

(D) Disconnecting Means. Where the disconnecting means permitted by 695.4(C) is installed, the disconnecting means shall meet all of the following:

(1) Identified as being suitable for use as service equipment.

(2) Lockable in the closed position.

(3) Located remote from other building disconnecting means.

FPN: This is to avoid the inadvertent simultaneous operation of the building and fire pump disconnect switches.

(4) Located remote from other fire pump source disconnecting means.

FPN: This is to avoid the inadvertent simultaneous operation of the disconnect switches of other fire pumps. (5) Marked "Fire Pump Disconnecting Means" in letters that are no less than one inch (25 mm) in height and that can be seen without opening enclosure doors or covers.

(E) Placard. Where the disconnecting means permitted by 695.4(C) is installed, a placard shall be placed adjacent to the fire pump controller stating the location of this disconnection means and the location of any key needed to unlock the disconnect.

(F) Supervision. Where the disconnecting means permitted by 695.4(C) is installed, the disconnect shall be supervised in the closed position by one of the following methods:

(1) Central station, proprietary or remote station signal device

(2) Local signaling service that will cause the sounding of an audible signal at a constantly attended location

(3) Locking the disconnecting means in the closed position

(4) Sealing of disconnecting means and approved weekly recorded inspections where the disconnecting means are located within fenced enclosures or in buildings under the control of the owner

(G) Overcurrent Protection Where the overcurrent protection permitted by 695.4(C) is installed, the overcurrent protection device shall be selected or set to carry indefinitely the sum of the locked-rotor current of the fire pump motor(s) and the pressure maintenance pump motor(s) and the full-load current of the associated fire pump accessory equipment. The next standard overcurrent device shall be used in accordance with 240.6. The requirement to carry the locked-rotor currents indefinitely shall not apply to conductors or devices other than overcurrent devices in the fire pump motor circuit(s).

695.5 Alternate Power.

(A) When Required. Except for an arrangement described in 695.5(C), at least one alternate source of power shall be provided when the height of the structure is beyond the pumping capacity of the fire department apparatus or when required by the AHJ. The alternate source shall, as a minimum, comply with the requirements of this section.

FPN: Local codes and/or AHJ often require alternate power for certain occupancies, such as high rise buildings, places of assembly and etc. These alternate power sources are considered to be the Emergency Source of Power for a motor driven fire pump as opposed to the Normal Source of Power.

(B) Unreliable Source. Except for an arrangement described in 695.5(C), at least one alternate source of power shall be provided where the normal source is not reliable.

FPN See Alternate Power, Other Sources in NFPA-20, *Standard for the Installation of Stationary Pumps for Fire Protection*, for specifics.

(C) Back-up Pump. An alternate source of power is not required where a back-up engine driven or back-up steam turbine driven fire pump is installed in accordance with this standard.

FPN: See NFPA-20 for requirements of engine driven or steam turbine fire pumps. In either case, operation of the pump is intended to be independent of the source of electrical power.

(D) Alternate Source. When provided, the alternate source of power shall be supplied from one of the following sources:

(1) A generator installed in accordance with 695.9.

(2) One of the sources identified in 695.4(B)(1); 695.4(B)(2); 695.4(B)(3); or 695.4(B)(5) when the power is provided independent of the normal source of power.

(E) Overhead Lines. When provided, the alternate supply shall be arranged so that the power to the fire pump is not disrupted when overhead lines are de-energized for fire department operations.

695.6 Transformers. Where the service or system voltage is different from the utilization voltage of the fire pump motor, transformer(s) protected by disconnecting means and overcurrent protective devices shall be permitted to be installed between the system supply and the fire pump controller in accordance with 695.6(A) and (B), or (C). Only transformers covered in 695.6(C) shall be permitted to supply loads not directly associated with the fire pump system.

FPN: This may apply to low voltage and medium voltage installations as well as when the service is high voltage.

(A) Size. Where a transformer supplies an electric motor-driven fire pump, it shall be rated at a minimum of 125 percent of the sum of the fire pump motor(s) and pressure maintenance pump(s) motor loads, and 100 percent of the associated fire pump accessory equipment supplied by the transformer.

(B) Overcurrent Protection. The primary overcurrent protective device(s) shall be selected or set to carry indefinitely the sum of the locked-rotor current of the fire pump motor(s) and the pressure maintenance pump motor(s) and the full-load current of the associated fire pump accessory equipment when connected to this power supply. Secondary overcurrent protection shall not be permitted. The requirement to carry the locked-rotor currents indefinitely shall not apply to conductors or devices other than overcurrent devices in the fire pump motor circuit(s).

(C) Feeder Source. Where a feeder source is provided in accordance with 695.4(B)(4), transformers supplying the fire pump system shall be permitted to supply other loads. All other loads shall be calculated in accordance with Article 220, including demand factors as applicable.

(1) Size. Transformers shall be rated at a minimum of 125 percent of the sum of the fire pump motor(s) and pressure maintenance pump(s) motor loads, and 100 percent of the remaining load supplied by the transformer.

(2) Overcurrent Protection. The transformer size, the feeder size, and the overcurrent protective device(s) shall be coordinated such that overcurrent protection is provided for the transformer in accordance with 450.3 and for the feeder in accordance with 215.3, and such that the overcurrent protective device(s) is selected or set to carry indefinitely the sum of the locked-rotor current of the fire pump motor(s), the pressure maintenance pump motor(s), the full-load current of the associated fire pump accessory equipment, and 100 percent of the remaining loads supplied by the transformer. The requirement to carry the locked-rotor currents indefinitely shall not apply to conductors or devices other than overcurrent devices in the fire pump motor circuit(s).

695.7 Power Wiring. Power circuits and wiring methods shall comply with the requirements in 695.7(A) through (H), and as permitted in 230.90(A), Exception No. 4; 230.94, Exception No. 4; 230.95, Exception No. 2; 240.13; 230.208; 240.4(A); and 430.31.

(A) Supply Conductors.

(1) Services and On-Site Power Production Facility. Service conductors and conductors supplied by an on-site power production facility shall be physically routed outside a building(s) and shall be installed as service conductors in accordance with Part III and Part IV of Article 230. Where supply conductors cannot be physically routed outside of buildings, they shall be permitted to be routed through the building(s) where installed in accordance with 230.6(1) or 230.6(2).

(2) Multi-Building Campus Style Complexes. Where a fire pump is wired under the provisions of 695.4(B)(4), all supply conductors on the load side of the service disconnecting means that constitute the normal source of supply to that fire pump shall be physically routed outside a building(s) and shall be installed

as outside feeder conductors in accordance with Article 225. Where the feeder conductors cannot be physically routed outside of buildings, they shall be permitted to be routed through the building(s) where installed in accordance with 230.6(1) or 230.6(2).

Exception to (A) (2): Where there are multiple sources of supply with means for automatic connection from one source to the other, the requirement for routing outside of the building(s) shall apply only to those conductors on the load side of that point automatic connection between sources.

(3) Supervised or On-Site Standby Generator Connections. Fire pump supply conductors on the load side of the final disconnecting means and overcurrent device(s) permitted by 695.4(C) or conductors that connect directly to an on-site generator shall comply with all of the following:

a. Independent Routing. The conductors shall be kept entirely independent of all other
wiring.

b. Associated Fire Pump Loads. The conductors shall supply only loads that are directly associated with the fire pump system.

c. Protection from Potential Damage. The conductors shall be protected to resist potential damage by fire, structural failure, or operational accident.

d. Inside a Building. When routed through a building, the conductors shall be installed using one of the following methods;

(1) Be encased in a minimum 50 mm (2 in.) of concrete

(2) Be protected by a fire-rated assembly listed to achieve a minimum fire rating of 2-hour and dedicated to the fire pump circuit(s).

(3) Be a listed electrical circuit protective system with a minimum 2-hour fire rating

FPN: UL guide information for electrical circuit protective systems (FHIT) contains information on proper installation requirements to maintain fire rating.

Exception to (3)(d): The supply conductors located in the electrical equipment room where they originate and in the fire pump room shall not be required to have the minimum 1-hour fire separation or fire resistance rating, unless otherwise required by
700. 9(D) of this Code.

(B) Conductor Size.

(1) Fire Pump Motors and Other Equipment. Conductors supplying a fire pump motor(s), pressure maintenance pumps, and associated fire pump accessory equipment shall have a rating not less than 125 percent of the sum of the fire pump motor(s) and pressure maintenance motor(s) full-load current(s), and 100 percent of the associated fire pump accessory equipment.

(2) Fire Pump Motors Only. Conductors supplying only a fire pump motor shall have a minimum ampacity in accordance with 430.22 and shall comply with the voltage drop requirements in 695.8.

(C) Overload Protection. Power circuits shall not have automatic protection against overloads. Except for protection of transformer primaries provided in 695.6(C)(2), branch-circuit and feeder conductors shall be protected against short circuit only. Where a tap is made to supply a fire pump, the wiring shall be treated as service conductors in accordance with 230.6. The applicable distance and size restrictions in 240.21 shall not apply.

Exception No. 1: Conductors between storage batteries and the engine shall not require overcurrent protection or disconnecting means.

Exception No. 2: For on-site standby generator(s) rated to produce continuous current in excess of 225 percent of the full-load amperes of the fire pump motor, the conductors between the on-site generator(s) and the combination fire pump transfer switch controller or separately mounted transfer switch shall be installed in accordance with 695.7(A)(3)d.

The protection provided shall be in accordance with the short-circuit current rating of the combination fire pump transfer switch controller or separately mounted transfer switch.

(D) Pump Wiring. All wiring from the controllers to the pump motors shall be in rigid metal conduit, intermediate metal conduit, liquidtight flexible metal conduit, or liquidtight flexible nonmetallic conduit Type LFNC-B, listed Type MC cable with an impervious covering, or Type MI cable.

(E) Junction Points. Where wire connectors are used in the fire pump circuit, the connectors shall be listed. A fire pump controller or fire pump power transfer switch, where provided, shall not be used as a junction box to supply other equipment, including a pressure maintenance (jockey) pump(s). A fire pump controller and fire pump power transfer switch, where provided, shall not serve any load other than the fire pump for which it is intended.

(F) Mechanical Protection. All wiring from engine controllers and batteries shall be protected against physical damage and shall be installed in accordance with the controller and engine manufacturer's instructions.

(G) Ground Fault Protection of Equipment. Ground fault protection of equipment shall not be permitted for fire pumps.

(H) Onsite Standby Generator Disconnecting Means. Where the power source is supplied by on-site generator(s), the supply conductors shall connect to a generator disconnecting means dedicated for the purpose of serving the fire pump. The disconnecting means shall be located in a separate enclosure from other generator disconnecting means.

695.8 Voltage Drop.

(A) Starting Voltage Drop. The voltage at the controller line terminals shall not drop more than 15 percent below normal (controller-rated voltage) under motor starting conditions.

(B) Mechanical Operator. The requirements of 695.8(A) shall not apply to emergency- run mechanical starting.

(C) Running Voltage Drop. The voltage at the motor terminals shall not drop more than 5 percent below the voltage rating of the motor when the motor is operating at 115 percent of the full-load current rating of the motor.

695.9 On-Site Standby Generator Systems.

(A) Capacity.

(1) Where on-site generator systems are used to supply power to fire pump motors to meet the requirements of 695.5(B), they shall be of sufficient capacity to allow normal starting and rung of the motor(s) driving the fire pump(s) while supplying all other simultaneously operated load(s) while meeting the requirements of 695.8

(2) A tap ahead of the on-site generator disconnecting means shall not be required.

(B) Power Sources.

These power sources shall comply with 695.8 and shall meet the requirements of Level 1 , Type 10 emergency power systems. .

FPN: Type 10 systems are required to make emergency power available in 10 or less seconds. See NFPA-110 *Standard for Emergency and Standby Power Systems* for definition of Level 1Emergency Power System. See NFPA-20 for fuel capacity requirements.

(C) Sequencing. Automatic sequencing of the fire pumps shall be permitted as a means of meeting the voltage drop requirements of 695.8.

(D) Transfer of Power. Transfer of power to the fire pump controller between the normal supply and one alternate supply shall take place within the pump room.

(E) Protective Devices. Where protective devices are installed in the on-site power source circuits at the generator, such devices shall allow instantaneous pickup of the full pump room load

FPN: This is to prevent any Generator Protective Devices from tripping when the fire pump load is transferred to the generator. The generator will instantaneous pickup the full pump room load, including the staring any and all connected fire pumps in the across-the-line (direct on line) full voltage staring mode. This is always the case when the fire pump(s) is running by use of the Emergency Mechanical Operator of the fire pump controller(s). (See NFPA-20 9.6 On-Site Standby Generator Systems.).

695.10 Junction Boxes. Where fire pump wiring to or from a fire pump controller is routed through a junction box, the following requirements shall be met.

(A) Mounting. The junction box shall be securely mounted.

(B) Controller Enclosure Integrity. Mounting and installing of a junction box shall not violate the enclosure type (NEMA) rating of the fire pump controller(s).

(C) Controller Short Circuit Rating Integrity. Mounting and installing of a junction box shall not violate the integrity of the fire pump controller(s) and shall not affect the
short-circuit rating of the controller(s).

(D) Type Rating. As a minimum, a Type 2, dripproof enclosure (junction box) shall be used. The enclosure shall be listed for the subject to match the fire pump controller enclosure Type rating.

FPN See Article 430.91 Motor Controller Enclosure Types for further information. See UL-250, *Standard for Enclosures for Electrical Equipment*, for requirements.

(E) Terminals. Terminals, junction blocks, splices, and the like, when used, shall be listed.

695.11 Listed Electrical Circuit Protective System to Controller Wiring.

(A) Single Conductors. Where single conductors (individual conductors) are used, they shall be terminated in a separate junction box and in accordance with this code.

FPN This is to avoid violating the enclosure type rating, and/or the controller short-circuit (withstand) rating. See also 300.20 and Article 322.

(B) Single conductors (individual conductors) shall not enter the fire pump enclosure separately.

(C) Smoke Seal. Where required by the listing of the electrical circuit protective system, the raceway between a junction box and the fire pump controller shall be sealed at the junction box end as required and per the instructions of the manufacturer or listing agency.

FPN When so required, this seal is to prevent flammable gases from entering into the fire pump controller.

(D) Standard wiring between junction box and controller is acceptable.

695.12 Raceway Terminations.

(A) Hubs. Listed conduit hubs shall be used to terminate raceway (conduit) to the fire pump controller.

(B) Type Rating. The NEMA Type rating of the conduit hub(s) shall be at least equal to that of the fire pump controller.

(C) Installation. The installation instructions of the manufacturer of the fire pump controller shall be followed.

(D) Controller Alterations. No alterations to the fire pump controller, other than conduit entry as allowed by this code, shall be made without the approval of the authority having jurisdiction.

695.13 Listed Equipment. Diesel engine fire pump controllers, electric fire pump controllers, electric motors, fire pump power transfer switches, foam pump controllers, and limited service controllers shall be listed for fire pump service. [NFPA 20:9.5.1.1, 10.1.2.1, 12.1.3.1]

695.14 Equipment Location.

(A) Controllers and Transfer Switches. Electric motor-driven fire pump controllers and power transfer switches shall be located as close as practicable to, and within sight of, the motors that they control.

(B) Engine-Drive Controllers. Engine-drive fire pump controllers shall be located as close as is practical to, and within sight of, the engines that they control.

(C) Storage Batteries. Storage batteries for fire pump engine drives shall be supported above the floor, secured against displacement, and located where they are not subject to physical damage, flooding with water, excessive temperature, or excessive vibration.

(D) Energized Equipment. All energized equipment parts shall be located at least 300 mm (12 in.) above the floor level.

(E) Protection Against Pump Water. Fire pump controllers and power transfer switches shall be located or protected so that they are not damaged by water escaping from pumps or pump connections.

(F) Mounting. All fire pump control equipment shall be mounted in a substantial manner on noncombustible supporting structures.

695.15 Control Wiring.

(A) Control Circuit Failures. External control circuits that extend outside the fire pump room shall be arranged so that failure of any external circuit (open or short circuit) shall not prevent the operation of a pump(s) from all other internal or external means. Breakage, disconnecting, shorting of the wires, or loss of power to these circuits could cause continuous running of the fire pump but shall not prevent the controller(s) from starting the fire pump(s) due to causes other than these external control circuits. All control conductors within the fire pump room that are not fault tolerant shall be protected against physical damage. [NFPA 20:10.5.2.6, 12.5.2.5]

(B) Sensor Functioning. No undervoltage, phase-loss, frequency-sensitive, or other sensor(s) shall be installed that automatically or manually prohibit actuation of the motor contactor. [NFPA 20:10.4.5.6]

Exception: A phase loss sensor(s) shall be permitted only as a part of a listed fire pump controller.

(C) Remote Device(s). No remote device(s) shall be installed that will prevent automatic operation of the transfer switch. [NFPA 20:10.8.1.3]

(D) Engine-Drive Control Wiring. All wiring between the controller and the diesel engine shall be stranded and sized to continuously carry the charging or control currents as required by the controller manufacturer. Such wiring shall be protected against physical damage. Controller manufacturer's specifications for distance and wire size shall be followed. [NFPA 20:12.3.5.1]

(E) Electric Fire Pump Control Wiring Methods. All electric motor-driven fire pump control wiring shall be in rigid metal conduit, intermediate metal conduit, liquidtight flexible metal conduit, liquidtight flexible nonmetallic conduit Type B (LFNC-B), listed Type MC cable with an impervious covering, or Type MI cable.

(F) Generator Control Wiring Methods. Control conductors installed between the fire pump power transfer switch and the standby generator supplying the fire pump during normal power loss shall be kept entirely independent of all other wiring. They shall be protected to resist potential damage by fire or structural failure. They shall be permitted to be routed through a building(s) encased in 50 mm (2 in.) of concrete or within enclosed construction dedicated to the fire pump circuits and having a minimum 1-hour fire resistance rating, or circuit protective systems with a minimum of 1-hour fire resistance. The installation shall comply with any restrictions provided in the listing of the electrical circuit protective system used.

Substantiation: The recommended text is based upon the TCC write-up in the A2007 ROP.

Revisions are also per the NEMA Explanation of Negative Vote Comments printed in the NEC ROP.

Revisions are also per R. Swayne's Explanation as follows:

Revisions to the ROP Version of
Article 695 for the
2008 Edition of NFPA-70
ARTICLE 695 Fire Pumps
Responses to Explanations of Negative Vote Comments

NEMA C & S Rejection Text:

NASBY, J.: NEMA disagrees with the rewrite outlined in this proposal. The arrangement of the material introduces new confusion to an Article that was already not clear in its intent. In addition, the revision adds material that is in NFPA 20 and should remain in NFPA 20. The responsibility of the NEC is for the installation requirements for the fire pump. Design requirements related to performance should not be moved to the NEC. An example of this problem is in proposed 695.5(A) to require an alternate source when the pumping capacity is beyond that of fire department apparatus. This is not an installation requirement, but is information that should remain in NFPA 20 only. -- Text of 695.5(A) revised. Also, Fine Print Note (FPN) added to 695.5(A) and 695.5(C). Also corrected some missed spelling and typo. errors. In addition, the revisions add a number of Fine Print Notes that are unacceptable and in violation of the NEC Style Manual. Examples of these notes include:

1. 695.4(D)(3) FPN – Contains a recommendation -- Done.
2. 695.4(D)(4) FPN – Contains a recommendation -- Done.
3. 695.5(B) FPN – Contains recommendations as well as an attempted interpretation of the requirement -- Done.
4. 695.9(E) FPN – contains recommendations -- Done.
5. 695.11(E) FPN – deals with warranty issues and is inappropriate in the NEC and in a FPN -- Done.

Other technical issues include (but are not limited to):

1. 695.6(I) – does not recognize installations where large generator sets are paralleled and supply switchboards or switchgear that then serves the various connected loads. -- There is no clause "695.6(I)".
2. 695.4(C) – limits the installation to one disconnect between the source and the controller. Should a transfer switch be installed ahead of the controller, another disconnect would not be permitted. This is contrary to typical installation where a remote disconnect is applied at the normal source of supply and then supplies the transfer switch. -- Correct. Only a single disconnect and OCPD is allowed ahead of the Normal Source and the fire pump controller. This is illustrated in NFPA-20 FIGURE A.9.3.2 "Typical Power Supply Arrangements from Source to Motor" " Arrangement B" and in FIGURE A.10.8 "Typical Fire Pump Controller and Transfer Switch Arrangements" " ARRANGEMENT II". A single disconnect (with or without OCPD) is allowed ahead of an upstream transfer switch.
3. 695.4(D) – it would appear that the requirement to not locate the disconnecting means in with other equipment has been lost in the revision without any substantiation. -- Noted. The only four connections allowed are (#1) Direct Connection via: Dedicated Service (695.4(B)(1), On-Site Power Plant (695.4(B)(2), Dedicated Fire Pump Feeder(695.4(B)(3); #2 Campus style feeder (695.4(B)(4); #3 Supervised Connection (695.4(D); and Transformer Connection (695.4(B)(5). Made editorial correction to incorrect reference to 695.4(A) which should be 695.4(C). Done.
4. 695.4(B)(4)(e) – the requirement for selective coordination creates significant technical concern. It may be impossible to design a system where the overcurrent protection for the fire pump circuit (size very large to carry locked rotor current) could be selectively coordinated with an upstream device that is part of the normal distribution system protection. It may also end up causing the other parts of the distribution system equipment to be oversized to simply accomplish the selectivity requirement. This is not justified or substantiated and decreases safety because of the increase in arc flash hazard. This is part of the requirements for mulit-building campus style connection where allowed. Fire pump equipment is considered expendable while fighting a fire. The equipment is designed to and intended to run to destruction. No other loads are allowed to pose a hazard to the power supply for a fire pump or pumps. Arc-flash protection is part of NFPA-70E. Fire pump controllers very often have high short circuit current rating with 100,000 Amp Symmetrical be the most common. This is due to their use in large buildings or facilities. **[Thru buildings clause missing?]**

Other requirements that are inappropriate for the NEC include:

1. 695.9(A)(1) – a direct mandatory reference to NFPA 110, which is prohibited by the NEC Style Manual -- Done. Moved reference to new FPN.
2. 695.9(B)(2) – requirements for fuel supply capacity for a generator which is not an NEC installation issue -- Done. Deleted. Moved reference to NFPA-20 to new FPN.
3. 695.10(D) – A mandatory reference to NEMA Type 2 – which is reference to another standard that is prohibited by the NEC Style Manual. -- Done. Moved to new FPN.
4. 695.12(D) – is in conflict with the provisions of 90.4 -- Done. Wording was incorrect.
5. 695.3(C) – this material is redundant with 90.3 -- Clause isn't redundant with 90.3. This clause is for inspection and enforcement agencies to prevent installation materials and equipment not complying with this standard. This is important for both low voltage and medium voltage installations since auxiliary and ancillary equipment is often installed in the power path or signal paths. Said equipment varies widely.The complete concept of this revision needs to be addressed in the comment phase with the objective of keeping Article 695 limited to installation requirements necessary for the application of the NEC. -- Done.

Swane Rejection Text:

SWAYNE, R.: This proposal should be rejected for many reasons. NFPA 20 has its place and Article 695 has its place, the two should not become one. The Scope of Article 695 covers the installation of power sources and interconnecting units and the installation of switching and control equipment dedicated to fire pump drives. It does not cover performance, maintenance, and testing of the fire pump system. The Scope of NFPA 20 covers minimum performance and testing requirements of the sources and transmission of electric power to motors driving fire pumps. The two scopes are not the same and each is necessary. -- Noted. Note that these installations are usually reviewed by at least two plan approval agencies and two inspection groups, namely electrical and fire prevention. This section (695) has carried the power supply extracted text from NFPA-20 since the NFPA-70 (NEC®) has wider circulation than NFPA-20, the extracted text helps prevent rejections and delays and unreliable installations. The wholesale replacement of one standard by another will leave electricians and Authorities Having Jurisdiction without the guidance necessary to provide safe installations of fire pumps. If it is felt that Article 695 is lacking in some of the requirements that NFPA 20 indicates as being important, then a paragraph by paragraph review should be performed. In this way, there will not be any danger in deleting any of the safe practices that exist today. -- Also noted. This is the purpose of Article 695. The purpose is not to replicate NFPA-20; but, to carry over only those clauses pertinant to plan approval agencies, installers, and inspectors.

As examples of where the proposed action is deficient:

1) Section 695.3(G) prohibits phase converters which was not accepted by NFPA 20 as documented in the substantiation to Proposal 13-81. See Negative Comment on Proposal 13-81. -- See the somewhat confusing history of this topic in NFPA-20 copied below. At this time, Phase Converters are not allowed by the NFPA-20 Technical Committee.

20-71 Log #59 Final Action: Reject
(9.2.1.1)

SUBMITTER: Kevin J. Kelly, National Fire Sprinkler Association
RECOMMENDATION: State whether or not phase converters are allowed where a 3-phase motor is being used for the fire pump, but three-phase electricity isn't available.
SUBSTANTIATION: The users of NFPA 20 need guidance on whether or not the use of phase converters constitutes "a reliable source" of power. The situation occurs frequently where three-phase power is not available. How is this problem intended to be addressed?
Is there a need to list phase converters for fire pump service? Is there a need to regulate how phase reversal will be monitored and annunciated?
Users of the standard need answers to these questions.
COMMITTEE MEETING ACTION: Reject
COMMITTEE STATEMENT: Performance of this equipment is not suitable for this service.
NUMBER ELIGIBLE TO VOTE: 27
BALLOT RESULTS: Affirmative: 24 Negative: 1
BALLOT NOT RETURNED: 2 LEICHT, MEZSICK
EXPLANATION OF NEGATIVE:
HAAGENSEN: If the Committee strongly considers that phase converters are not suitable for this purpose, then the provisions of NFPA 20 should clearly state that sentiment.

20- 8 Log #38 Final Action: Accept in Principle
(9.2.1)

Submitter: Jon Nisja, Northcentral Regional Fire Code Development Committee
Comment on Proposal No: 20-71
Recommendation: Add a new section to read:
9.2.x Phase converters shall not be permitted to be used for fire pump service.
Substantiation: Based on the committee statement to the proposal and the negative comment of Mr. Haagensen we have submitted a comment to include the prohibition of the converters to clarify the issue.
Committee Meeting Action: Accept in Principle
See Committee Action and Statement on 20-42 (Log #37).
Committee Statement: See Committee Action and Statement on 20-42 (Log #37).
Number Eligible to Vote: 27
Ballot Results: Affirmative: 26
Ballot Not Returned: Mezsick, S.

20-42 Log #37 Final Action: Accept
(A.9.2.1.1)

Submitter: Kenneth E. Isman, National Fire Sprinkler Association
Comment on Proposal No: 20-71
Recommendation: Add an annex note to 9.2. . as follows:
A.9.2 Phase converters that take single phase power and convert it to three phase power for the use of fire pump motors are not recommended because of the imbalance in the voltage between the phases when there is no load on the equipment. If the power utility installs a phase converters in their own power transmission lines, such phase converters are outside the scope of this standard and need to be evaluated by the AHJ to determine the reliability of the electric supply.
Substantiation: This was our understanding from the discussion at the ROP meeting as to the reason for the rejection of our proposal. If this information is true, it should be recorded in the annex.
Committee Meeting Action: Accept
Number Eligible to Vote: 27
Ballot Results: Affirmative: 26
Ballot Not Returned: Mezsick, S.

---

2) Section 695.4(B)(4)(c) refers to itself as being impractical. -- Done. Clause corrected. This is a numbering error carried forward.

3) Section 695.4(B)(5) refers to "service" whereas the facility does not have to be a campus to have a primary service with a low voltage supply feeding the building or structure. -- Although place last, this clause, 695.4(B)(5) does not relate to the campus style method of 695.4(B)(4). It also applies service at low voltage, medium voltage or high voltage. For example: 480 Vac to 208 Vac, 7,000 Vac to 480 Vac or 13.8 KVac to 240 Vac.

4) Section 695.4(F)(4) refers to weekly recorded inspections which are proper for NFPA 20, but not for NFPA 70 which is an installation code. -- Although periodic inspections and maintenance are generally covered in NFPA-25 for sprinkler systems, this clause is separate and does not fall in the realm of normal inspection of fire pumps or sprinkler systems. It applies directly to the assurance of power being available for the fire pump. This is important to plan approval agencies, installers and inspectors to know of this provision along with the other electrical requirements so that provisions can be made.

5) Section 695.5(A) is a new requirement that may be enforced by the Fire Marshal, but not by the electrical AHJ. Noted. Clause revised.

6) Section 695.5(B) requires an alternate source when the normal source is not reliable without defining "reliable". "Reliable" is not defined in Article 100 and the attempt to define it by the unenforceable FPN is confusing. Noted. Clause modified.

7) Section 695.5(B), FPN No. 4 refers to conditions that are not permitted. This may signal the installer that it may not be permitted, but you can do it anyway if you provide an alternate source. This sends the wrong signal. Noted. FPN deleted.

8) Editorially, "when" should be replaced by "where" in several locations to meet the Style Manual. -- Noted. I'm asking for direction from NFPA staff I'm trying to minimize differences in extracted text compared to the source document.

9) It is not apparent what is included in Section 695.7(A) and what is in Section 695.7(B). -- Corrected spelling error and missing text in title of 695.7 and sub-clause (A). Proposed 695.7 [Power Wiring] (A) [Supply Conductors] is essentially similar to extant [2005] 695.6 [Power Wiring] sub-clauses (A) [Service Conductors] and (B) [Circuit Conductors]. 695.7(B) [Conductor Sizes] is essentially similar to extant 695.6(C) [Conductor Size].

10) Section 695.7(A)(B)(3) refers to load side of the "service" disconnecting means. A multi-building campus or a facility with a primary service generally does not have a "service" to each of its buildings. -- Acknowledge. The term "service" here means the campus service equipment, such as double ended switchgear (main-tie-main). A FPN may be in order to help clarify since the campus distribution, while typically medium voltage, is also typically down stream of transformers, and where the primary side, the secondary side, or both may be arranged as double ended.

11) Section 695.7(A)(B)(3) refers to disconnecting means and overcurrent devices permitted by Section 695.4(B). Section 695.4(B) does not cover these items. -- Correct. Corrected reference to read "695.4(C)".

This proposal is premature and should be rejected. The Proposer should come back with a detailed comparison for consideration. Noted. Revisions made accordingly with appreciation for these observations and corrections.

Panel Meeting Action: Accept in Principle in Part

Revise Article 695 to read as follows:

ARTICLE 695 Fire Pumps

FPN: Rules that are followed by a reference in brackets contain text that has been extracted from NFPA 20-2007 ~~3~~, *Standard for the Installation of Stationary Pumps for Fire Protection*. Only editorial changes were made to the extracted text to make it consistent with this *Code*.

695.1 Scope.

(A) Covered. This article covers the installation of the following:

(1) Electric power sources and interconnecting circuits

(2) Switching and control equipment dedicated to fire pump drivers

(3) Associated fire pump accessory equipment, which includes wiring and overcurrent protection of other loads connected to the power supply.

(B) Not Covered. This article does not cover the following:

(1) The performance, maintenance, and acceptance testing of the fire pump system, and the internal wiring of the components of the system

(2) Pressure maintenance (jockey or makeup) pumps

FPN: See NFPA 20-~~2003~~ 2007, *Standard for the Installation of Stationary Pumps for Fire Protection*, for further information.

695.2 Definitions.

Fault Tolerant External Control Circuits. Those control circuits either entering or leaving the fire pump controller enclosure, which if broken, disconnected, or shorted will not prevent the controller from starting the fire pump from all other internal or external means and may cause the controller to start the pump under these conditions.

On-Site Power Production Facility. The normal supply of electric power for the site that is expected to be constantly producing power.

On-Site Standby Generator. A facility producing electric power on site as the alternate supply of electric power. It differs from an on-site power production facility, in that it is not constantly producing power.

695.3 Power Source(s) for Electric Motor-Driven Fire Pumps.

Electric motor-driven fire pumps shall have a reliable source of power.

FPN: NFPA 20-2007, *Standard for the Installation of Stationary Pumps for Fire Protection*, covers characteristics of reliable of reliable sources. Also see the cross-reference table in Annex J.

(A) Individual Sources. Where reliable, and where capable of carrying indefinitely the sum of the locked-rotor current of the fire pump motor(s) and the pressure maintenance pump motor(s) and the full-load current of the associated fire pump accessory equipment when connected to this power supply, the power source for an electric motor-driven fire pump shall be one or more of the following.

(1) Electric Utility Service Connection. A fire pump shall be permitted to be supplied by a separate service, or from a connection located ahead of and not within the same cabinet, enclosure, or vertical switchboard section as the service disconnecting means. The connection shall be located and arranged so as to minimize the possibility of damage by fire from within the premises and from exposing hazards. A tap ahead of the service disconnecting means shall comply with 230.82(5). The service equipment shall comply with the labeling requirements in 230.2 and the location requirements in 230.72(B). [NFPA 20:9.2.2]

(2) On-Site Power Production Facility. A fire pump shall be permitted to be supplied by an on-site power production facility. The source facility shall be located and protected to minimize the possibility of damage by fire. [NFPA 20:9.2.3]

(3) Dedicated Feeder. A dedicated feeder shall be permitted where it is derived from a service connection as described in 695.3(A)(1).
(B) Multiple Sources. Where reliable power cannot be obtained from a source described in 695.3(A), power shall be supplied one of the following:
(1) Two Individual Sources. ~~from a~~ An approved combination of two or more of ~~either of such sources~~ the sources from 695.3(A).
(2) Individual Source and Generator. An approved combination of one or more of the sources in 695.3(A) and an on-site generator complying with 695.3(D). ~~or from an approved combination of feeders constituting two or more power sources as covered in 695.3(B)(2), or from an approved combination of one or more of such power sources in combination with an on-site standby generator complying with 695.3(B)(1) and (B)(3).~~
(C) Multibuilding Campus-Style Complexes. Where the sources in 695.3(A) are not practicable and the installation is part of a multibuilding campus style complex, feeder sources shall be permitted where approved by the authority having jurisdiction and installed in accordance with (1) or (2).
(1) Two Feeder Sources. Two feeders shall be permitted as more than one power source where such feeders are connected to or derived from separate utility services. The connection(s), overcurrent protective device(s), and disconnecting means for such feeders shall meet the requirements of 695.4(B).
(2) Feeder and Alternate Source. A feeder shall be permitted as a normal source of power when an alternate source of power independent from the feeder is provided. The connection(s), overcurrent protective device(s), and disconnecting means for such feeders shall meet the requirements of 695.4(B).
~~**(1) Generator Capacity.** An on-site generator(s) used to comply with this section shall be of sufficient capacity to allow normal starting and running of the motor(s) driving the fire pump(s) while supplying all other simultaneously operated load. Automatic shedding of one or more optional standby loads in order to comply with this capacity requirement shall be permitted. A tap ahead of the on-site generator disconnecting means shall not be required. The requirements of 430.113 shall not apply. [NFPA 20:9.6.1]~~
~~**(2) Feeder Sources.** This section applies to multibuilding campus-style complexes with fire pumps at one or more buildings. Where sources in 695.3(A) are not practicable, and with the approval of the authority having jurisdiction, two or more feeder sources shall be permitted as one power source or as more than one power source where such feeders are connected to or derived from separate utility services. The connection(s), overcurrent protective device(s), and disconnecting means for such feeders shall meet the requirements of 695.4(B). [NFPA 20:9.2.5.3]~~
~~**(3) Arrangement.** The power sources shall be arranged so that a fire at one source will not cause an interruption at the other source. [NFPA 20:9.2.5.1]~~
(~~1~~D) Generator ~~Capacity~~ as Alternate Source. ~~An~~ Where an on-site generator(s) is used ~~to comply with this section~~ as an alternate source of power. The following shall apply:
(1) Capacity. The generator shall have ~~shall be of~~ sufficient capacity to allow normal starting and running of the motor(s) driving the fire pump(s) while supplying all other simultaneously operated load. Automatic shedding of one or more optional standby loads in order to comply with this capacity requirement shall be permitted.
(2) Connection. A tap ahead of the on-site generator disconnecting means shall not be required.
(3) Adjacent Disconnects. The requirements of 430.113 shall not apply.
(4) Phase Converters. Phase converters shall not be permitted to be used in the fire pump circuit.
~~**(3)** **(E) Arrangement.** The power sources shall be arranged so that a fire at one source will not cause an interruption at the other source. [NFPA 20:9.2.5.1]~~
The normal source of power required in 695.4(A) and its routing shall be arranged in accordance with one of the following:
(1) Service connection dedicated to the fire pump installation.
(2) On-site power production facility connection dedicated to the fire pump installation.
(3) A dedicated feeder connection derived directly from the dedicated service to the fire pump installation.
(4) As a feeder connection where all of the following conditions are met:
a. The protected facility is part of a multi-building campus style arrangement.
b. A back-up source of power is provided from a source independent of the normal source of power.
c. It is impractical to supply the normal source of power through arrangement 695.3(E)(4)(a), 695.3(E)(4)(b), 695.3(C)(4)(c) or 695.3(E)(4)(e).
d. The arrangement is acceptable to the authority having jurisdiction.
e. The overcurrent protection device(s) in each disconnecting means shall be selectively coordinated with any other supply side overcurrent protective device(s).
(5) A dedicated transformer connection directly from the service meetin g the requirements of Article 695.5.

695.4 Continuity of Power.
Circuits that supply electric motor-driven fire pumps shall be supervised from inadvertent disconnection as covered in 695.4(A) or 695.4(B).
~~(A) Direct Connection. The supply conductors shall directly connect the power source to either a listed fire pump controller or listed combination fire pump controller and power transfer switch. [NFPA 20:9.3.2.2.2]~~
(A) Continuously Available. An electric motor driven fire pump shall be provided with a normal source of power as a continually available source.
(B) Supervised Connection. A single disconnecting means and associated overcurrent protective device(s) shall be permitted to be installed between a remote power source and one of the following:
(1) A listed fire pump controller
(2) A listed fire pump power transfer switch
(3) A listed combination fire pump controller and power transfer switch

For systems installed under the provisions of 695.3(B)(2) only, such additional disconnecting means and associated overcurrent protective device(s) shall be permitted as required to comply with other provisions of this *Code*. Overcurrent protective devices between an on-site standby generator and a fire pump controller shall be selected and sized according to 430.62 to provide short-circuit protection only. All disconnecting devices and overcurrent protective devices that are unique to the fire pump loads shall comply with 695.4(B)(1) and 695.4(B)(2). ~~through (B)(5).~~
(1) Overcurrent Device Selection. The overcurrent protective device(s) shall be selected or set to carry indefinitely the sum of the locked-rotor current of the fire pump motor(s) and the pressure maintenance pump motor(s) and the full-load current of the associated fire pump accessory equipment when connected to this power supply. The requirement to carry the locked-rotor currents indefinitely shall not apply to conductors or devices other than overcurrent devices in the fire pump motor circuit(s).
~~**(2)** Disconnecting Means. The disconnecting means shall comply with all the following:~~
~~**(1)** Be identified as suitable for use as service equipment~~
~~**(2)** Be lockable in the closed position~~
~~**(3)** Not be located within equipment that feeds loads other then the fire pump~~
~~**(4)** Be located sufficiently remote from other building or other fire pump source disconnecting means such that inadvertent contemporaneous operation would be unlikely~~
~~**(3)** Disconnect Marking. The disconnecting means shall be marked "Fire Pump Disconnecting Means." The letters shall be at least 25 mm (1 in.) in height, and they shall be visible without opening enclosure doors or covers.~~
~~**(4)** Controller Marking. A placard shall be placed adjacent o the fire pump controller, stating the location of this disconnecting means and the location of the key (if the disconnecting means is locked).~~
(2) ~~**(5)**~~ **Supervision.** The disconnecting means shall be supervised in the closed position by one of the following methods:
(1) Central station, proprietary, or remote station signal device
(2) Local signaling service that causes the sounding of an audible signal at a constantly attended point
(3) Locking the disconnecting means in the closed position
(4) Sealing of disconnecting means and approved weekly recorded inspections when the disconnecting means are located within fenced enclosures or in buildings under the control of the owner. [NFPA 20:9.3.2.2.3]
(C) Connections. For fire pump installations using the arrangement of 695.3(E)(4)(a), 695.3(E)(4)(b), 695.3(E)(4)(c), and 695.3(E)(4)(e), for the normal source of power, no more than one disconnecting means and associated overcurrent protection device shall be installed in the power supply to the fire pump controller.
(D) Disconnecting Means. Where the disconnecting means permitted by 695.4(C) is installed, the disconnecting means shall meet all of the following:
(1) Identified as being suitable for use as service equipment.
(2) Lockable in the closed position.
(3) Located remote from other building disconnecting means.
FPN: This is to avoid the inadvertent simultaneous operation of the building and fire pump disconnect switches.
(4) Located remote from other fire pump source disconnecting means.
FPN: This is to avoid the inadvertent simultaneous operation of the disconnect switches of other fire pumps.
(5) Marked "Fire Pump Disconnecting Means" in letters that are no less than 1 inch (25 mm) in height and that can be seen without opening enclosure doors or covers.
(E) Placard. Where the disconnecting means permitted by 695.4(C) is installed, a placard shall be placed adjacent to the fire pump controller stating the location of this disconnection means and the location of any key needed to unlock the disconnect.
(F) Supervision. Where the disconnecting means permitted by 695.4(C) is installed, the disconnect shall be supervised in the closed position by one of the following methods:
(1) Central station, proprietary or remote station signal device
(2) Local signaling service that will cause the sounding of an audible signal at a constantly attended location
(3) Locking the disconnecting means in the closed position
(4) Sealing of disconnecting means and approved weekly recorded inspections where the disconnecting means are located within fenced enclosures or in buildings under the control of the owner
(G) Overcurrent Protection. Where the overcurrent protection permitted by 695.4(C) is installed, the overcurrent protection device shall be selected or set to carry indefinitely the sum of the locked-rotor current of the fire pump motor(s) and the pressure maintenance pump motor(s) and the full-load current of the associated fire pump accessory equipment. The next standard overcurrent device shall be used in accordance with 240.6. The requirement to carry the locked-rotor currents indefinitely shall not apply to conductors or devices other than overcurrent devices in the fire pump motor circuit(s).
695.5 Transformers. Where the service or system voltage is different from the utilization voltage of the fire pump motor, transformer(s) protected by disconnecting means and overcurrent protective devices shall be permitted to be installed between the system supply and the fire pump controller in accordance with 695.5(A) and (B), or (C). Only transformers covered in 695.5(C) shall be permitted to supply loads not directly associated with the fire pump system.
(A) Size. Where a transformer supplies an electric motor-driven fire pump, it shall be rated at a minimum of 125 percent of the sum of the fire pump motor(s) and pressure maintenance pump(s) motor loads, and 100 percent of the associated fire pump accessory equipment supplied by the transformer.
(B) Overcurrent Protection. The primary overcurrent protective device(s)

shall be selected or set to carry indefinitely the sum of the locked-rotor current of the fire pump motor(s) and the pressure maintenance pump motor(s) and the full-load current of the associated fire pump accessory equipment when connected to this power supply. Secondary overcurrent protection shall not be permitted. The requirement to carry the locked-rotor currents indefinitely shall not apply to conductors or devices other than overcurrent devices in the fire pump motor circuit(s).

(C) Feeder Source. Where a feeder source is provided in accordance with 695.3(B)(2), transformers supplying the fire pump system shall be permitted to supply other loads. All other loads shall be calculated in accordance with Article 220, including demand factors as applicable.

(1) Size. Transformers shall be rated at a minimum of 125 percent of the sum of the fire pump motor(s) and pressure maintenance pump(s) motor loads, and 100 percent of the remaining load supplied by the transformer.

(2) Overcurrent Protection. The transformer size, the feeder size, and the overcurrent protective device(s) shall be coordinated such that overcurrent protection is provided for the transformer in accordance with 450.3 and for the feeder in accordance with 215.3, and such that the overcurrent protective device(s) is selected or set to carry indefinitely the sum of the locked-rotor current of the fire pump motor(s), the pressure maintenance pump motor(s), the full-load current of the associated fire pump accessory equipment, and 100 percent of the remaining loads supplied by the transformer. The requirement to carry the locked-rotor currents indefinitely shall not apply to conductors or devices other than overcurrent devices in the fire pump motor circuit(s).

695.6 Power Wiring.

Power circuits and wiring methods shall comply with the requirements in 695.6(A) through (H), and as permitted in 230.90(A), Exception No. 4; 230.94, Exception No. 4; 230.95, Exception No. 2; 240.13; 230.208; 240.4(A); and 430.31.

(A) ~~Service~~ Supply Conductors. ~~Supply conductors shall be physically routed outside a building(s) and shall be installed as service entrance conductors in accordance with Article 230. Where supply conductors cannot be physically routed outside buildings, they shall be permitted to be routed through buildings where installed in accordance with 230.6(1) or 230.6(2). Where a fire pump is wired under the provisions of 695.3(B)(2), this requirement shall apply to all supply conductors on the load side of the service disconnecting means that constitute the normal source of supply to that fire pump.~~

(1) Services and On-Site Power Production Facility. Service conductors and conductors supplied by an on-site power production facility shall be physically routed outside a building(s) and shall be installed as service conductors in accordance with 230.6, 230.9 and Part III and Part IV of Article 230. Where supply conductors cannot be physically routed outside of buildings, they shall be permitted to be routed through the building(s) where installed in accordance with 230.6(1) or 230.6(2).

(2) Multi-Building Campus Style Complexes. Where a fire pump is wired under the provisions of 695.4(B)(4), all supply conductors on the load side of the service disconnecting means that constitute the normal source of supply to that fire pump shall be physically routed outside a building(s) and shall be installed as outside feeder conductors in accordance with Article 225. Where the feeder conductors cannot be physically routed outside of buildings, they shall be permitted to be routed through the building(s) where installed in accordance with 230.6(1) or 230.6(2).

Exception: Where there are multiple sources of supply with means for automatic connection from one source to the other, the requirement shall apply only to those conductors on the load side of that point of automatic connection between sources.

(3) ~~(B) **Circuit Conductors.**~~ **Supervised or On-Site Standby Generator Connections.** Fire pump supply conductors on the load side of the final disconnecting means and overcurrent device(s) permitted by 695.4(B) or conductors that connect directly to an onsite generator shall comply with all the following:

a. Independent Routing. The conductors shall be kept entirely independent of all other wiring.

b. Associated Fire Pump Loads. The conductors ~~They~~ shall supply only loads that are directly associated with the fire pump system.

c. Protection From Potential Damage. The conductors ~~and they~~ shall be protected to resist potential damage by fire, structural failure, or operational accident.

d. Inside a Building. When routed through a building, the conductors ~~They~~ shall be ~~permitted~~ installed and routed ~~through a building(s)~~ using one of the following methods:

(1) Be encased in a minimum 50 mm (2 in.) of concrete

(2) Be ~~within an enclosed construction~~ protected by a fire rated assembly listed to achieve a minimum fire rating of 2 hours and dedicated to the fire pump circuit(s). ~~and having a minimum of a 1 hour fire resistive rating~~

(3) Be a listed electrical circuit protective system with a minimum ~~1~~ 2-hour fire rating

Exception: The supply conductors located in the electrical equipment room where they originate and in the fire pump room shall not be required to have the minimum ~~1~~ 2-hour fire separation or fire resistance rating, unless otherwise required by 700.9(D) of this Code.

FPN: UL guide information for electrical circuit protective systems (FHIT) contains information on proper installation requirements to maintain the fire rating.

~~(C)~~ (B) Conductor Size.

(1) Fire Pump Motors and Other Equipment. Conductors supplying a fire pump motor(s), pressure maintenance pumps, and associated fire pump accessory equipment shall have a rating not less than 125 percent of the sum of the fire pump motor(s) and pressure maintenance motor(s) full-load current(s), and 100 percent of the associated fire pump accessory equipment.

(2) Fire Pump Motors Only. Conductors supplying only a fire pump motor shall have a minimum ampacity in accordance with 430.22 and shall comply with the voltage drop requirements in 695.7.

~~(D)~~ (C) Overload Protection. Power circuits shall not have automatic protection against overloads. Except for protection of transformer primaries provided in 695.5(C)(2), ~~Branch~~ branch-circuit and feeder conductors shall be protected against short circuit only. Where a tap is made to supply a fire pump, the wiring shall be treated as service conductors in accordance with 230.6. The applicable distance and size restrictions in 240.21 shall not apply.

Exception No. 1: Conductors between storage batteries and the engine shall not require overcurrent protection or disconnecting means.

Exception No. 2: For on-site standby generator(s) rated to produce continuous current in excess of 225 percent of the full-load amperes of the fire pump motor, the conductors between the on-site generator(s) and the combination fire pump transfer switch controller or separately mounted transfer switch shall be installed in accordance with 695.6(B). ~~or protected in accordance with 430.52.~~The protection provided shall be in accordance with the short-circuit current rating of the combination fire pump transfer switch controller or separately mounted transfer switch.

~~(E)~~ (D) Pump Wiring. All wiring from the controllers to the pump motors shall be in rigid metal conduit, intermediate metal conduit, liquidtight flexible metal conduit, or liquidtight flexible nonmetallic conduit Type LFNC-B, listed Type MC cable with an impervious covering, or Type MI cable.

~~(F)~~ (E) Junction Points. Where wire connectors are used in the fire pump circuit, the connectors shall be listed. A fire pump controller or fire pump power transfer switch, where provided, shall not be used as a junction box to supply other equipment, including a pressure maintenance (jockey) pump(s). A fire pump controller and fire pump power transfer switch, where provided, shall not serve any load other than the fire pump for which it is intended.

~~(G)~~ (F) Mechanical Protection. All wiring from engine controllers and batteries shall be protected against physical damage and shall be installed in accordance with the controller and engine manufacturer's instructions.

~~(H)~~ (G) Ground Fault Protection of Equipment. Ground fault protection of equipment shall not be permitted for fire pumps.

(H) Onsite Standby Generator Disconnecting Means. Where the power source is supplied by on-site generator(s), the supply conductors shall connect to a generator disconnecting means dedicated for the purpose of serving the fire pump. The disconnecting means shall be located in a separate enclosure from other generator disconnecting means.

695.7 Voltage Drop.

~~The voltage at the controller line terminals shall not drop more than 15 percent below normal (controller-rated voltage) under motor starting conditions. The voltage at the motor terminals shall not drop more than 5 percent below the voltage rating of the motor when the motor is operating at 115 percent of the full-load current rating of the motor.~~

~~*Exception: This limitation shall not apply for emergency run mechanical starting. [NFPA 20:9.4]*~~

(A) Starting Voltage Drop. The voltage at the controller line terminals shall not drop more than 15 percent below normal (controller-rated voltage) under motor starting conditions.

(B) Mechanical Operator. The requirements of 695.7(A) shall not apply to emergency- run mechanical starting.

(C) Running Voltage Drop. The voltage at the motor terminals shall not drop more than 5 percent below the voltage rating of the motor when the motor is operating at 115 percent of the full-load current rating of the motor.

695.10 Listed Equipment.

Diesel engine fire pump controllers, electric fire pump controllers, electric motors, fire pump power transfer switches, foam pump controllers, and limited service controllers shall be listed for fire pump service. [NFPA 20:9.5.1.1, 10.1.2.1, 12.1.3.1]

695.11 Listed Electrical Circuit Protective System to Controller Wiring.

(A) Single Conductors. Where single conductors (individual conductors) are used, they shall be terminated in a separate junction box in accordance with this Code.

FPN This is to avoid violating the enclosure-type rating and/or the controller short-circuit (withstand) rating. See also 300.20 and Article 322.

(B) Single conductors (individual conductors) shall not enter the fire pump enclosure separately.

(C) Smoke Seal. Where required by the listing of the electrical circuit protective system, the raceway between a junction box and the fire pump controller shall be sealed at the junction box end as required and per the instructions of the manufacturer or listing agency.

FPN: When so required, this seal is to prevent flammable gases from entering into the fire pump controller.

(D) Standard wiring between junction box and controller is acceptable.

695.12 Equipment Location.

(A) Controllers and Transfer Switches. Electric motor-driven fire pump controllers and power transfer switches shall be located as close as practicable to, and within sight of, the motors that they control.

(B) Engine-Drive Controllers. Engine-drive fire pump controllers shall be located as close as is practicable to, and within sight of, the engines that they control.

(C) Storage Batteries. Storage batteries for fire pump engine drives shall be supported above the floor, secured against displacement, and located where they are not subject to physical damage, flooding with water, excessive temperature, or excessive vibration.

(D) Energized Equipment. All energized equipment parts shall be located at least 300 mm (12 in.) above the floor level.

(E) Protection Against Pump Water. Fire pump controllers and power transfer switches shall be located or protected so that they are not damaged by water escaping from pumps or pump connections.
(F) Mounting. All fire pump control equipment shall be mounted in a substantial manner on noncombustible supporting structures.
695.14 Control Wiring.
(A) Control Circuit Failures. External control circuits that extend outside the fire pump room shall be arranged so that failure of any external circuit (open or short circuit) shall not prevent the operation of a pump(s) from all other internal or external means. Breakage, disconnecting, shorting of the wires, or loss of power to these circuits could cause continuous running of the fire pump but shall not prevent the controller(s) from starting the fire pump(s) due to causes other than these external control circuits. All control conductors within the fire pump room that are not fault tolerant shall be protected against physical damage. [NFPA 20:10.5.2.6, 12.5.2.5]
(B) Sensor Functioning. No undervoltage, phase-loss, frequency-sensitive, or other sensor(s) shall be installed that automatically or manually prohibit actuation of the motor contactor. [NFPA 20:10.4.5.6]
Exception: A phase loss sensor(s) shall be permitted only as a part of a listed fire pump controller.
(C) Remote Device(s). No remote device(s) shall be installed that will prevent automatic operation of the transfer switch. [NFPA 20:10.8.1.3]
(D) Engine-Drive Control Wiring. All wiring between the controller and the diesel engine shall be stranded and sized to continuously carry the charging or control currents as required by the controller manufacturer. Such wiring shall be protected against physical damage. Controller manufacturer's specifications for distance and wire size shall be followed. [NFPA 20:12.3.5.1]
(E) Electric Fire Pump Control Wiring Methods. All electric motor-driven fire pump control wiring shall be in rigid metal conduit, intermediate metal conduit, liquidtight flexible metal conduit, liquidtight flexible nonmetallic conduit Type B (LFNC-B), listed Type MC cable with an impervious covering, or Type MI cable.
(F) Generator Control Wiring Methods. Control conductors installed between the fire pump power transfer switch and the standby generator supplying the fire pump during normal power loss shall be kept entirely independent of all other wiring. They shall be protected to resist potential damage by fire or structural failure. They shall be permitted to be routed through a building(s) encased in 50 mm (2 in.) of concrete or within enclosed construction dedicated to the fire pump circuits and having a minimum 1-hour fire resistance rating, or circuit protective systems with a minimum of 1-hour fire resistance. The installation shall comply with any restrictions provided in the listing of the electrical circuit protective system used.
695. 15 Alternate Power.
(A) When Required. Except for an arrangement described in 695.15(C), at least one alternate source of power shall be provided when the height of the structure is beyond the pumping capacity of the fire department apparatus or when required by the AHJ. The alternate source shall, as a minimum, comply with the requirements of this section.
FPN: Local codes and/or AHJ often require alternate power for certain occupancies, such as high rise buildings, places of assembly, etc. These alternate power sources are considered to be the Emergency Source of Power for a motor driven fire pump as opposed to the Normal Source of Power.
(B) Unreliable Source. Except for an arrangement described in 695.15(C), at least one alternate source of power shall be provided where the normal source is not reliable.
FPN: See Alternate Power, Other Sources in NFPA-20, *Standard for the Installation of Stationary Pumps for Fire Protection*, for specifics.
(C) Back-up Pump. An alternate source of power is not required where a back-up engine driven or back-up steam turbine driven fire pump is installed in accordance with this standard.
FPN: See NFPA-20 for requirements on engine-driven or steam turbine fire pumps. In either case, operation of the pump is intended to be independent of the source of electrical power.
(D) Alternate Source. When provided, the alternate source of power shall be supplied from one of the following sources:
(1) A generator installed in accordance with 695.16.
(2) One of the sources identified in 695.3(E)(4)(a), 695.3(E)(4)(b), 695.3(E)(4)(c) or 695.3(E)(4)(e) when the power is provided independent of the normal source of power.
(E) Overhead Lines. When provided, the alternate supply shall be arranged so that the power to the fire pump is not disrupted when overhead lines are de-energized for fire department operations.
695.16 On-Site Standby Generator Systems.
(A) Capacity.
(1) Where on-site generator systems are used to supply power to fire pump motors to meet the requirements of 695.15(B), they shall be of sufficient capacity to allow normal starting and running of the motor(s) driving the fire pump(s) while supplying all other simultaneously operated load(s) while meeting the requirements of 695.7
(2) A tap ahead of the on-site generator disconnecting means shall not be required.
(B) Power Sources.
These power sources shall comply with 695.7 and shall meet the requirements of Level 1, Type 10 emergency power systems.
FPN: Type 10 systems are required to make emergency power available in 10 or less seconds. See NFPA-110 *Standard for Emergency and Standby Power Systems*, for definition of Level 1 Emergency Power System. See NFPA 20 for fuel capacity requirements.
(C) Sequencing. Automatic sequencing of the fire pumps shall be permitted as a means of meeting the voltage drop requirements of 695.7.
(D) Transfer of Power. Transfer of power to the fire pump controller between the normal supply and one alternate supply shall take place within the pump room.
(E) Protective Devices. Where protective devices are installed in the on-site power source circuits at the generator, such devices shall allow instantaneous pickup of the full pump room load.
FPN: This is to prevent any generator protective devices from tripping when the fire pump load is transferred to the generator. The generator will instantaneous pick up the full pump room load, including the starting of any and all connected fire pumps in the across-the-line (direct on line) full voltage starting mode. This is always the case when the fire pump(s) is running by use of the emergency mechanical operator of the fire pump controller(s). (See NFPA 20, 9.6 On-Site Standby Generator Systems).
695.17 Junction Boxes. Where fire pump wiring to or from a fire pump controller is routed through a junction box, the following requirements shall be met.
(A) Mounting. The junction box shall be securely mounted.
(B) Controller Enclosure Integrity. Mounting and installing of a junction box shall not violate the enclosure type (NEMA) rating of the fire pump controller(s).
(C) Controller Short-Circuit Rating Integrity. Mounting and installing of a junction box shall not violate the integrity of the fire pump controller(s) and shall not affect theshort-circuit rating of the controller(s).
(D) Type Rating. As a minimum, a Type 2, dripproof enclosure (junction box) shall be used. The enclosure shall be listed for the subject to match the fire pump controller enclosure-type rating.
FPN See Article 430.91, Motor Controller Enclosure Types for further information. See UL-50, *Standard for Enclosures for Electrical Equipment*, for requirements.
(E) Terminals. Terminals, junction blocks, splices, and the like, when used, shall be listed.
695.18 Raceway Terminations.
(A) Hubs. Listed conduit hubs shall be used to terminate raceway (conduit) to the fire pump controller.
(B) Type Rating. The type rating of the conduit hub(s) shall be at least equal to that of the fire pump controller.
(C) Installation. The installation instructions of the manufacturer of the fire pump controller shall be followed.
(D) Controller Alterations. No alterations other than installation of raceway(s) and multiconductor cable(s) shall be made to the fire pump controller.
Panel Statement: Changes were made to comply with the TCC direction. This panel action incorporates the following comments: 13-105, 13-107, 13-109, 13-111, 13-112, 13-113, 13-114, 13-115, 13-116, 13-117, 13-118, 13-119, 13-121, 13-122, 13-126, 13-128, 13-129, 13-133, 13-134, 13-135, 13-138, 13-139, 13-144, 13-145, 13-146, 13-147, 13-148, 13-149, 13-151, 13-153.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 1
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
RAPPAPORT, E.: The panel action to add NFPA 20 extract material has added numerous new, changed, and deleted sections into Article 695 without documentation. The comment is new material as a result of the TCC rejection of the original proposal. The attempt to integrate this new material into the existing text has resulted in numerous errors and inconsistencies that indicate that the panel action is not in a form to be included in the 2008 NEC. Some examples from the panel actions are as follows:
1) 695.3(A)(3) is new material.
2) 695.3(B)(2) Individual Source and Generator is changed from the previous text without justification.
3) 695.3(D)(4) Phase Converters are prohibited with no justification from NFPA 20.
See Negative vote on Comment 13-117 for evidence.
4) 695.3(E)(1), (2), and (3) is a repeat of 695.3(A)(1), (2) and (3).
5) 695.3(E)(4)(a), (b), and (c) are covered in 695.3(C)(1) and (2).
6) 695.4(A) is a new requirement.
7) There are two 695.4(B)(1) and (2).
8) 695.4 requires compliance with (A) and (B) but there is no tie into (C), (D), and (E).
9) 695.6(A)(2) refers to service disconnecting means for a multi-building campus whereas there would not be a "service" to the building but a feeder.
10) 695.6(A)(3)(d) requires a 2 hour fire rating for the supply conductors but the exception does not require the 2 hour rating in the fire pump room even though NFPA 20 requires the room to have a 2 hour rating.
11) 695.14 Alternate Power is new text and is a rehash of the requirements in 695.3.
12) 695.16(B) requires compliance with "Level 1, Type 10 emergency power" with no definition other than an FPN note reference to NFPA 110.
The present Comment 13-103 is new material that was not contained in the original proposal, has not had public review, and requires considerable editing.
Comment on Affirmative:
FLACH, G.: Change "when" to "where" in a few places. Remove "etc.". Change the language in the FPN by removing "required" in the FPN following 695.16(B). References must be corrected in 695.3(E)(4)(C).

13-104 Log #1038 NEC-P13 **Final Action: Reject**
(695)

TCC Action:It was the action of the Technical Correlating Committee that this comment be reported as "Reject". The Technical Correlating Committee does not agree with the placement of a cross-reference in the Annex. The objective of the extract identification requirements of the Style Manual make a cross-reference unnecessary.
Submitter: James S. Nasby, Master Control Systems, Inc.
Comment on Proposal No: 13-78
Recommendation: Do not reject the proposal. Revise the table content as shown below:

Note: "N/A" - Not Applicable (Not Extract Text).

Substantiation: This cross reference table is needed since the revised Manual of Style of NFPA 70 makes it difficult to tell which exact clauses are extract text or not. E.g.: The stars are no longer used. As a result, a number of Public Proposals and Public Comments have been rejected by the Panel for scope which delays NFPA action on said Proposals and Comments until the next cycle of NFPA 20. This has already resulted in five year delays for Final Action on submitted Proposals and Comments. It's important for prospective submitters of Public Proposals or Public Comments to know where to send them or (Which standard) and/or for NFPA staff to help submitters re-direct said proposals and comments to avoid the cycle delay for consideration and action to occur. Note that this submitter has worked with NFPA staff at length before proposing this cross reference table to NFPA 70 and to take this step to reduce the delays that have occurred. This is the best solution known at this time. Also note that a cross reference table does already exists in NFPA 70 Annex "F".

Revised content per the Negative Vote Explanation suggestion of Robert Swayne.

Panel Meeting Action: Accept in Principle

Due to changes made in Comment 13-103, create a new annex, Annex J, "NFPA 70 Article 695 (Fire Pumps) Extract Material From NFPA 20" to read as shown following

Panel Statement: CMP-13 desires that a cross-reference table be placed in Annex J and revised per action on Comment 13-103. See panel action and statement on Comment 13-103.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 12 Negative: 1

Ballot Not Returned: 1 Gustafson, R.

Explanation of Negative:

RAPPAPORT, E.: See my explanation of negative vote on Comment 13-103.

13-105 Log #1091 NEC-P13 **Final Action: Hold**
(695)

TCC Action: See the Technical Correlating Committee action on Comment 13-103.
Submitter: Jim Pauley, Square D Company
Comment on Proposal No: 13-77
Recommendation: This Proposal should remain Rejected.
Substantiation: The TCC was correct to return this proposal back to the panel. It has so many problems introduced by the revision that the panel should not try to salvage any type of significant rewrite during the comment phase. The panel should revisit the individual proposals for Article 695 and review each one based on its merit for inclusion in Article 695. The revision proposed by Proposal 13-77 is completely unacceptable for the NEC.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

(Note: The sequence no. 13-106 was not used)

TCC Action: See the Technical Correlating Committee action on Comment 13-103.
Submitter: James S. Nasby, Master Control Systems, Inc.
Comment on Proposal No: 13-79
Recommendation: Suggested revision:
Replace (3) with "Wiring, Overcurrent Protection and other aspects of loads connected to the power supply or interconnecting circuits."
Substantiation: Direction of the TCC to clarify panel action. Suggested wording.
The intent is to indicate that there is proscriptive code regarding other connected loads, but, not the loads themselves. Also note that most, but not all, fire pump systems have pressure maintenance (jockey) pumps which may or may not be connected to the fire pump power supply.
Panel Meeting Action: Accept in Principle
695.1 Scope
(A) Covered. This article covers the installation of the following:
(1) Electric power sources and interconnecting circuits.
(2) Switching and control equipment dedicated to fire pump drivers.
(3) Associated fire pump accessory equipment which includes wiring and overcurrent protection of other loads connected to the power supply.
(B) Not Covered. This article does not cover the following:
(1) The performance, maintenance, and acceptance testing of the fire pump system, and the internal wiring of the components of the system
(2) Performance maintenance (jockey or makeup) pumps.
FPN: See NFPA 20-2007, Standard for the Installation of Stationary Pumps for Fire Protection, for further information.
Panel Statement: A new (3) was added to clarify the panel action on Proposal 13-79 and under the direction of the TCC. The FPN reference document was updated to the latest edition.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 1
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
RAPPAPORT, E.: See my explanation of negative vote on Comment 13-103.

13-110 Log #619 NEC-P13 **Final Action: Hold**
(695.1(A) and (B))

TCC Action: See the Technical Correlating Committee action on Comment 13-103.
Submitter: Joseph C. Warren, Joseph C. Warren Electrical Consulting Services
Comment on Proposal No: 13-79
Recommendation: Revise text to read as follows:
695.1 Scope.
(A) Covered. This article covers the installation of the following:
(1) Electric power sources and interconnecting circuits.
(2) Switching and control equipment dedicated to fire pump drivers.
(3) Pressure maintenance (jockey or makeup) pumps.
(4) Associated fire pump accessory equipment for alarms that signal an alarm for improper conditions that exist in a fire pump.
(B) Not Covered. This article does not cover the following:
(1) The performance, maintenance, and acceptance testing of the fire pump system, and the internal wiring of the components of the system
~~(2) Pressure maintenance (jockey or makeup) pumps.~~
Substantiation: We DO need to state that jockey or makeup pump motors are covered because they do exist in fire pump installations. The present language, by not including them, is a very bad format even if we do go to Article 430 for jockey pumps. Accessory equipment also needs to be covered because the alarms that are part of the fire pump installation indicate improper conditions in fire pump equipment if something occurs that is wrong. 695.5(A), (B), and (C)(2) tell us to include jockey and makeup pumps in load calculations.
Panel Meeting Action: Reject
Panel Statement: See panel action on Comment 13-109.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 1
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
RAPPAPORT, E.: See my explanation of negative vote on Comment 13-103.
Comment on Affirmative:
ZGONENA, T.: To clarify the panel action, item (3) was rejected as the requirements for jockey or makeup pump motors are within the scope of Article 430, not Article 695.

13-111 Log #1154 NEC-P13 **Final Action: Hold**

(695.3)

TCC Action: See the Technical Correlating Committee action on Comment 13-103.
Submitter: Jim Pauley, Square D Company
Comment on Proposal No: 13-77
Recommendation: Revise 695.3 from the ROP Draft to read as follows:
695.3 Power Source(s) for Electric Motor-Driven Fire Pumps. Electric motor-driven fire pumps shall have a reliable source of power.

(A) Individual Sources. Where reliable, and where capable of carrying indefinitely the sum of the locked-rotor current of the fire pump motor(s) and the pressure maintenance pump motor(s) and the full-load current of the associated fire pump accessory equipment when connected to this power supply, the power source for an electric motor driven fire pump shall be one or more of the following.

(1) Electric Utility Service Connection. A fire pump shall be permitted to be supplied by a separate service, or from a connection located ahead of and not within the same cabinet, enclosure, or vertical switchboard section as the service disconnecting means. The connection shall be located and arranged so as to minimize the possibility of damage by fire from within the premises and from exposing hazards. A tap ahead of the service disconnecting means shall comply with 230.82(5). The service equipment shall comply with the labeling requirements in 230.2 and the location requirements in 230.72(B). [NFPA 20:9.2.2]

(2) On-Site Power Production Facility. A fire pump shall be permitted to be supplied by an on-site power production facility. The source facility shall be located and protected to minimize the possibility of damage by fire. [NFPA 20:9.2.3]

(3) Dedicated Feeder. A dedicated feeder shall be permitted where it is derived from a service connection as described in 695.3(A)(1).

(B) Multiple Sources. Where reliable power cannot be obtained from a source described in 695.3(A), power shall be supplied one of the following:

(1) Two Individual Sources. ~~from a~~ An approved combination of two or more of ~~either of such sources~~ the sources from 695.3(A).

(2) Individual Source and Generator. An approved combination of one or more of the sources in 695.3(A) and an on-site generator complying with 695.3(D). ~~or from an approved combination of feeders constituting two or more power sources as covered in 695.3(B)(2), or from an approved combination of one or more of such power sources in combination with an on-site standby generator complying with 695.3(B)(1) and (B)(3).~~

(C) Multibuilding Campus-Style Complexes. Where the sources in 695.3(A) are not practicable and the installation is part of a multibuilding campus style complex, feeder sources shall be permitted where approved by the authority having jurisdiction and installed in accordance with (1) or (2).

(1) Two Feeder Sources. Two feeders shall be permitted as more than one power source where such feeders are connected to or derived from separate utility services. The connection(s), overcurrent protective device(s), and disconnecting means for such feeders shall meet the requirements of 695.4(B).

(2) Feeder and Alternate Source. A feeder shall be permitted as a normal source of power when an alternate source of power independent from the feeder is provided. The connection(s), overcurrent protective device(s), and disconnecting means for such feeders shall meet the requirements of 695.4(B).

~~**(1) Generator Capacity.** An on-site generator(s) used to comply with this section shall be of sufficient capacity to allow normal starting and running of the motor(s) driving the fire pump(s) while supplying all other simultaneously operated load. Automatic shedding of one or more optional standby loads in order to comply with this capacity requirement shall be permitted. A tap ahead of the on-site generator disconnecting means shall not be required. The requirements of 430.113 shall not apply. [NFPA 20:9.6.1]~~

~~**(2) Feeder Sources.** This section applies to multibuilding campus-style complexes with fire pumps at one or more buildings. Where sources in 695.3(A) are not practicable, and with the approval of the authority having jurisdiction, two or more feeder sources shall be permitted as one power source or as more than one power source where such feeders are connected to or derived from separate utility services. The connection(s), overcurrent protective device(s), and disconnecting means for such feeders shall meet the requirements of 695.4(B). [NFPA 20:9.2.5.3]~~

~~**(3) Arrangement.** The power sources shall be arranged so that a fire at one source will not cause an interruption at the other source. [NFPA 20:9.2.5.1]~~

~~(1~~D) Generator ~~Capacity~~ as Alternate Source. ~~An~~ Where an on-site generator(s) is used ~~to comply with this section~~ as an alternate source of power. The following shall apply:

(1) Capacity. The generator shall have ~~shall be of~~ sufficient capacity to allow normal starting and running of the motor(s) driving the fire pump(s) while supplying all other simultaneously operated load. Automatic shedding of one or more optional standby loads in order to comply with this capacity requirement shall be permitted.

(2) Connection. A tap ahead of the on-site generator disconnecting means shall not be required.

(3) Adjacent Disconnects. The requirements of 430.113 shall not apply.

~~**(3)**~~ **(E) Arrangement.** The power sources shall be arranged so that a fire at one source will not cause an interruption at the other source. [NFPA 20:9.2.5.1]
Substantiation: This comment is to revise the layout and arrangement of 695.3 to provide a more logical approach to the power sources. The following list explains each of the revisions:
1. 695.3(A)(1) and (2) are unchanged from the present text
2. 695.3(A)(3) is new and intended to pick up the provision that recognizes a feeder derived from a service connection. The reference to 695.3(A)(1) would recognize that the feeder may come from a dedicated service (but the service conductors don't go directly to the FP controller) or from a tap ahead of the main. This is the same provision accepted by the panel in Proposal 13-77 as 695.4(B)(3)

3. 695.3(B) is rearranged to create a list of the two provisions dealing with combinations of sources. Item 1 captures the combination of two of the sources recognized in 695.3(A). Item 2 captures the basic combination of a 695.3(A) source and an on-site generator. The provisions for the generator are moved to create a new 695.3(D), so that reference is given here. These two provisions of this list are recognized in the current text of 695.3(B).
4. 695.3(C) is a new section to cover the multi-building campus installations with more clarity. The intro paragraph captures the three requirements in the present text that the sources in 695.3(A) are not practicable, that the AHJ approve the use of the feeder source and that you have a multi-building campus application. The paragraph then allows either of two options to be used
a. Item (1) covers the application of two feeder sources. This provision is already allowed in the current 695.3(B) and recognizes that you can utilize two feeders from separate utility services as more than one power source. The provision that any disconnects and overcurrent devices comply with 695.4(B) is captured.
b. Item (2) will recognize a feeder along with an alternate source. This provision was accepted by the panel in Proposal 13-77 as section 695.4(B)(4). This addition will correct what has been a significant issue in Article 695 since the present article did not recognize a feeder and on-site generator as an acceptable combination. It should be noted that the text maintains the panel accepted text (from Proposal 13-77) of "alternate power source independent of the feeder" instead of referencing an on-site generator specifically.
c. It is also important to point out that the provision from Proposal 13-77 regarding selective coordination of the overcurrent devices is specifically omitted. This provision (regardless of whether it is in NFPA 20 or not) creates significant technical concern. Keep in mind that the overcurrent devices in the fire pump feeder must be capable of carrying locked rotor current. So a 100A fire pump would have a 600A overcurrent device upstream. If for example, this were an 800A service, the next feeder device upstream (which may be shared with other parts of the system) may have to be 1200A to gain pure selectivity. This could potentially require that the entire system be much larger than needed for the installation, just to accomplish selective coordination. There is no technical basis for requiring that the fire pump feeder be selectively coordinated.
5. The "Generator Capacity" section is moved from 695.3(B)(1) to become 695.3(D). This section is also editorially rearranged to break the three requirements of the generator into three sections titled "Capacity", "Connection" and "Adjacent Disconnects".
695.3(E) is the old 695.3(B)(3) regarding arrangement of the power sources. This placement will allow it to apply to the multiple sources of both (B) and (C).

13-117 Log #1137 NEC-P13 **Final Action: Hold**
(695.3)

TCC Action: See the Technical Correlating Committee action on Comment 13-103.
Submitter: James S. Nasby, Master Control Systems, Inc.
Comment on Proposal No: 13-81
Recommendation: Continue to Accept the Proposal to prohibit phase converters.
Substantiation: Phase converters are prohibited by NFPA-20. My substantiation is confusing; but, the NFPA-20 Technical Committee via Action on Proposal 20-71 (Log #59) and on Comments 20-8 (Log #38) and 20-42 Log #37 prohibits phase converters as unsuitable for fire pump service. One reason is imbalances that occur with varying loads. Another is adding another energy converter in the critical path. Another problem is keeping the controller energized at all times.
This is consistent with Panel Action on Proposal 13-77 and also with my Comment suggesting revisions to 13-77.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 1
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
RAPPAPORT, E.: The substantiation for prohibiting phase converters for fire pump service is erroneous and misleading. None of the NFPA 20 proposals cited in the substantiation prohibit phase converters. NFPA 20 Proposal 20-71 is a request that phase converters be either permitted or prohibited in the text. This proposal was REJECTED. NFPA 20 Proposal 20-8 provided specific wording to prohibit phase converters and the committee action was to refer to the action on Proposal 20-42. NFPA 20 Proposal 20-42, which was accepted, added a note in the Annex (not enforceable) indicating that phase converters are not recommended for fire pump motors. The note left it open for the AHJ to determine the reliability of the electric supply.
There does not appear to be any substantiation to prohibit the use of phase converters. It should be left up to the AHJ since phase converter operation may be the best alternative to provide fire protection where three phase power is not available. If phase converters are to be prohibited, it should be done by NFPA 20 and they have, at present, declined to do so.

(Note: The sequence no. 13-118 was not used)

13-119 Log #101 NEC-P13 **Final Action: Hold**

Submitter: James S. Nasby, Master Control Systems, Inc.
Comment on Proposal No: 13-83
Recommendation: Continue to Accept in Principle Public Proposal 13-83.
Substantiation: At the risk of a small amount of redundancy, this reference back to NFPA-20 on characteristics of a "reliable power source" is vital and a source of daily confusion and conflicts. The intent is to aid plan approval and inspection agencies and other AHJs in resolving conflicts. Note that the submitter of Proposal 13-81, F. Hartwelll, is both an AHJ and is also very familiar with fire pump installations; but, is seeking this additional guidance. This is also important since NFPA-70 has far wider distribution than NFPA-20. Hopefully, this reference will lead readers to NFPA-20 clause A.9.3.2 which has several paragraphs of guidance on this topic.
Panel Meeting Action: Reject
Panel Statement: A fine print note is available and presently exists above the scope of Article 695.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

13-121 Log #1139 NEC-P13 **Final Action: Hold**
(695.3(A)(3) (New))

TCC Action: See the Technical Correlating Committee action on Comment 13-103.
Submitter: James S. Nasby, Master Control Systems, Inc.
Comment on Proposal No: 13-84
Recommendation: Continue to Reject this proposal.
Substantiation: This is extract text from NFPA-20. The proposal should go to the NFPA-20 Technical Committee.
Five methods are now allowed for supplying fire pump controllers. Included is the transformer connection which can be and is used at low voltage, medium voltage and high voltage.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 1
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
ELKINS, D.: The panel action on these comments ignores the needs of large industrial concerns who purchase power at a high voltage where a second disconnect and transformer for a fire pump service is impractical. Large industrial concerns should be permitted to provide service to fire water pumps which is identical physically to that used by users which purchase power at a medium voltage. Since power purchased at higher voltage is generally more reliable and the additional high voltage disconnect and transformer are not required, the installation would actually be more reliable than what is now permitted.

13-122 Log #1140 NEC-P13 **Final Action: Hold**
(695.3(A)(3) (New))

TCC Action: See the Technical Correlating Committee action on Comment 13-103.
Submitter: James S. Nasby, Master Control Systems, Inc.
Comment on Proposal No: 13-85
Recommendation: Continue to Reject this proposal.
Substantiation: This is extract text from NFPA-20. The proposal should go to the NFPA-20 Technical Committee.
Five methods are now allowed for supplying fire pump controllers. Included is the transformer connection which can be and is used at low voltage, medium voltage and high voltage.

The issue of deviation being justified by a redundant pump is proper matter for the AHJ and the specific installation.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 11 Negative: 2
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
ELKINS, D.: See My Explanation of Negative on Comment 13-121.
RAPPAPORT, E.: The proposal is correct and is contained in NFPA 20-9.3.3. It is desirable to have this exemption in NFPA 70 so that an AHJ will not require alternate power if a redundant diesel fire pump is installed.

13-123 Log #1866 NEC-P13 **Final Action: Hold**
(695.3(A)(3) (New))

TCC Action: See the Technical Correlating Committee action on Comment 13-103.
Submitter: Michael Walls, American Chemistry Council
Comment on Proposal No: 13-84
Recommendation: Add text to read as follows:
695.3(A)(3) In industrial establishments only, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, a fire pump controller shall be permitted to be supplied power by a single feeder from disconnect dedicated to the fire water pump in a site-wide power distribution system located sufficiently remote from the facilities served as to minimize the possibility of damage to the fire pump service by fire from within the facilities.
Substantiation: This comment modifies the original proposal to address comments concerning security, segregation and safety of the feeder to the fire pump controller during a fire. The intent of this change is to address the needs of large industrial concerns which purchase power at a high voltage where a second disconnect and transformer for a fire pump service as required 695.3(A)(1) is impractical while still maintaining the ability of the fire fighters to quickly isolate power to the facility on fire while retaining a power supply to the fire pumps. This proposal permits these large industrial concerns to provide service to fire water pumps which is identical physically to that used by concerns which purchase power at a medium voltage. This modified proposal adds the requirement that the service be separate from the disconnect for power to the facilities and is sufficiently remote from the facilities to not be at risk of damage by the fire. Since power purchased at higher voltage is generally more reliable and the additional high voltage disconnect and transformer are not required, this installation is actually more reliable than what is permitted.
Panel Meeting Action: Reject
Panel Statement: The submitter does not provide sufficient conditions whereby a single feeder constitutes a reliable source.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 1
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
ELKINS, D.: See My Explanation of Negative on Comment 13-121.

13-124 Log #1867 NEC-P13 **Final Action: Hold**
(695.3(A)(3) (New))

TCC Action: See the Technical Correlating Committee action on Comment 13-103.
Submitter: Michael Walls, American Chemistry Council
Comment on Proposal No: 13-85
Recommendation: Add text to read as follows:
695.3 (A)(3) An alternative source of power to the electric fire pump motor is not required where a back-up engine or back-up steam turbine driven fire pump is installed. [NFPA 20:9.3.3]
Substantiation: The revised wording is a direct quote from NFPA 20 and addresses part of the intent of the original proposal.
Panel Meeting Action: Reject
Panel Statement: The submitter does not provide a valid reason for extracting text from NFPA 20. Also, the revised wording is not a direct quote from NFPA 20, and there are other permitted arrangements where an alternate source of power to the electric fire pump motor is not required that the submitter has not extracted.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 11 Negative: 2
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
ELKINS, D.: This comment should have been accepted by the panel. The panel action rejected proposed wording which is a direct quote from NFPA 20 which permits a simpler supply to a fire water pump motor which has a turbine or diesel motor driven pump backup.
RAPPAPORT, E.: See my explanation of negative vote on Comment 13-122.

13-125 Log #2182 NEC-P13 **Final Action: Hold**
(695.3(B))

TCC Action: See the Technical Correlating Committee action on Comment 13-103.
Submitter: Patrick Gaffney, Ronk Electrical Industries, Inc.
Comment on Proposal No: 13-95
Recommendation: New text as proposed in Proposal 13-95 should be Accepted. “Reliable” sources are defined in 695.3(A). All other sources by definition, are not “reliable”, and, therefore, require multiple sources. If no utility supplied three-phase source is available but a single-phase source is, a phase converter could be utilized as one of the “unreliable” multiple sources, either as back-up or primary to the generator source(s). Many rural or suburban areas do not have readily available three-phase sources of utility power available, and at least with a phase converter, they would have a utility supplied source available. Also, the proposal limits their use, by stating “where the only source of utility power is a single-phase source,...”.
Substantiation: Generators, unless considered an “on-site power production facility” [per 695.3(A)], are also considered “unreliable” by definition. If multiple sources are required, wouldn’t a utility supplied source be preferable to multiple generators? Maintenance of generator systems is not always as it should be, and even if it is, that is not always a guarantee of proper performance. Phase converters at least give the option of using a utility supplied source as either a back-up (or primary) source to a generator system. Phase converters have been utilized in many pumping systems, including fire pumps, for many decades with success, and are a recognized part of the code (Article 455).
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 13-95.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 1
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
RAPPAPORT, E.: See my explanation of negative vote on Comment 13-117.

13-126 Log #102 NEC-P13 **Final Action: Hold**
(695.4(B))

TCC Action: See the Technical Correlating Committee action on Comment 13-103.
Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 13-89
Recommendation: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the Technical Correlating Committee action on Proposal 13-77.
This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

13-127 Log #1092 NEC-P13 **Final Action: Hold**
(695.4(B))

TCC Action: See the Technical Correlating Committee action on Comment 13-103.
Submitter: Jim Pauley, Square D Company
Comment on Proposal No: 13-89
Recommendation: Accept the Proposal as submitted.
Substantiation: Rather than attempt to rewrite the entire article through a panel proposal or comment, the panel should accept proposals that were submitted to correct deficiencies in the current Article. Proposal 13-89 provides a logical rearrangement of the current text to make the article easier to use and to remove some ambiguity in the text. The substantiation to make these changes is well detailed.
Panel Meeting Action: Reject
Panel Statement: The original proposal was accepted in principle. However, extracted text cannot be modified by this panel.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

13-128 Log #1488 NEC-P13 **Final Action: Hold**
(695.4(B))

TCC Action: See the Technical Correlating Committee action on Comment 13-103.
Submitter: James S. Nasby, Master Control Systems, Inc.
Comment on Proposal No: 13-89
Recommendation: Continue to Accept in Principle Public Proposal 13-89.
Substantiation: The Proposer, J. Pauley proposes clarification of extant Article 695.4(B) "Supervised Connection." However, this is extracted text and is part of the Power Supply section which has been completely re-written and submitted as Proposal 13-77. My Public Comment in P13-77 hopes to clarify the new text sufficiently to satisfy the proposer.
Panel Meeting Action: Accept
