Technical Correlating Committee on National Electrical Code®

James W. Carpenter, *Chair*
International Association of Electrical Inspectors, TX [E]

Mark W. Earley, *Nonvoting Secretary*
National Fire Protection Association, MA

Jean A. O'Connor, *Recording Secretary*
National Fire Protection Association, MA

James E. Brunssen, Telcordia, NJ [UT]
Rep. Alliance for Telecommunications Industry Solutions
Merton W. Bunker, Jr., US Department of State, VA [U]
(VL to Document: 110, Document: 111, Document: 70, Document: 70B, Document: 70E, Document: 79)
William R. Drake, Marinco, CA [M]
Palmer L. Hickman, National Joint Apprentice & Training Committee, MD [L]
Rep. International Brotherhood of Electrical Workers
John R. Kovacik, Underwriters Laboratories Inc., IL [RT]
William M. Lewis, Martinsville, IN [U]
Rep. American Chemistry Council
Jim Pauley, Square D Company/Schneider Electric, KY [M]
Rep. National Electrical Manufacturers Association
Michael D. Toman, MEGA Power Electrical Services, Inc., MD [IM]
Rep. National Electrical Contractors Association
John W. Troglia, Edison Electric Institute, WI [UT]
Rep. Electric Light & Power Group/EEI
Robert G. Wilkinson, IEC Texas Gulf Coast, TX [IM]
Rep. Independent Electrical Contractors, Inc.

Alternates

Jeffrey Boksiner, Telcordia Technologies, Inc., NJ [UT]
(Alt. to James E. Brunssen)
James M. Daly, General Cable, NJ [M]
(Alt. to Jim Pauley)
Stanley J. Folz, Morse Electric Company, NV [IM]
(Alt. to Michael D. Toman)
David L. Hittinger, IEC of Greater Cincinnati, OH [IM]
(Alt. to Robert G. Wilkinson)
Neil F. LaBrake, Jr., National Grid, NY [UT]
(Alt. to John W. Troglia)
Danny Liggett, Dupont Company, TX [U]
(Alt. to William M. Lewis)
Mark C. Ode, Underwriters Laboratories Inc., NC [RT]
(Alt. to John R. Kovacik)
Richard P. Owen, City of St. Paul, MN [E]
(Alt. to James W. Carpenter)

Nonvoting

David Mascarenhas, Canadian Standards Association, Canada [RT]
Richard G. Biermann, Biermann Electric Company, Inc., IA [IM]
(Member Emeritus)
D. Harold Ware, Libra Electric Company, OK [IM]
(Member Emeritus)

Mark W. Earley, NFPA Staff Liaison

Code-Making Panel 1
Articles 90, 100, 110, Annex A, Annex G

John D Minick, *Chair*
National Electrical Manufacturers Association, TX [M]

Michael A Anthony, University of Michigan, MI [U]
Rep. Association of Higher Education Facilities Officers
Louis A Barrios, Shell Global Solutions, TX [U]
Rep. American Chemistry Council
Kenneth P Boyce, Underwriters Laboratories Inc., IL [RT]
William T Fiske, Intertek Testing Services NA, Inc., NY [RT]
H. Landis Floyd, The DuPont Company, DE [U]
Rep. Institute of Electrical & Electronics Engineers, Inc.
Palmer L Hickman, National Joint Apprentice & Training Committee, MD [L]
Rep. International Brotherhood of Electrical Workers
David L Hittinger, IEC of Greater Cincinnati, OH [IM]
Rep. Independent Electrical Contractors, Inc.
Neil F LaBrake, Jr., National Grid, NY [UT]
Rep. Electric Light & Power Group/EEI
Randall R McCarver, Telcordia Technologies, Inc., NJ [U]
Rep. Alliance for Telecommunications Industry Solutions
Lanny G McMahill, City of Phoenix, AZ [E]
Rep. International Association of Electrical Inspectors
H. Brooke Stauffer, National Electrical Contractors Association, MD [IM]

Alternates

Mark Christian, IBEW Local Union 175, TN [L]
(Alt. to Palmer L Hickman)
Benjamin F Dunford, Ben Dunford Electric Company Inc., TN [IM]
(Alt. to David L Hittinger)
Ernest J Gallo, Telcordia Technologies, Inc., NJ [U]
(Alt. to Randall R McCarver)
Russell J Helmick, Jr., Orange, CA [E]
(Alt. to Lanny G McMahill)
Donald H McCullough, II, Washington Savannah River Company, SC [U]
(Alt. to H. Landis Floyd)
Gil Moniz, National Electrical Manufacturers Association, MA [M]
(Alt. to John D Minick)
Alfredo M Ramirez, Underwriters Laboratories Inc., IL [RT]
(Alt. to Kenneth P Boyce)
John W Troglia, Edison Electric Institute, WI [UT]
(Alt. to Neil F LaBrake, Jr.)

Nonvoting

Ark Tsisserev, City of Vancouver, Canada
Rep. CSA/Canadian Electrical Code Committee

Mark W Earley, NFPA Staff Liaison

Code-Making Panel 2
Articles 210, 215, 220, Annex D
Chapter 9 Examples 1 through 6

Raymond W Weber, *Chair*
State of Wisconsin, WI [E]
Rep. International Association of Electrical Inspectors

Richard W Becker, Engineered Electrical Systems, Inc., WA [U]
Rep. Institute of Electrical & Electronics Engineers, Inc.
Lawrence Brown, National Association of Home Builders, DC [U]
Frank Coluccio, New York City Department of Buildings, NY [E]
Thomas L Harman, University of Houston-Clear Lake, TX [SE]
Donald M King, IBEW Local Union 313, DE [L]
Rep. International Brotherhood of Electrical Workers
Robert L LaRocca, Underwriters Laboratories Inc., NY [RT]
Brian J Nenninger, The Dow Chemical Company, TX [U]
Rep. American Chemistry Council
Jim Pauley, Square D Company/Schneider Electric, KY [M]
Rep. National Electrical Manufacturers Association
Ronald L Purvis, Sharpsburg, GA [UT]
Rep. Electric Light & Power Group/EEI
Michael D Toman, MEGA Power Electrical Services, Inc., MD [IM]
Rep. National Electrical Contractors Association
Robert G Wilkinson, IEC Texas Gulf Coast, TX [IM]
Rep. Independent Electrical Contractors, Inc.

Alternates

James E Degnan, Sparling, WA [U]
(Alt. to Richard W Becker)
David A Dini, Underwriters Laboratories Inc., IL [RT]
(Alt. to Robert L LaRocca)
Daniel J Kissane, Pass & Seymour/Legrand, NY [M]
(Alt. to Jim Pauley)
William Ross McCorcle, American Electric Power, OK [UT]
(Alt. to Ronald L Purvis)
William J McGovern, City of Plano, TX [E]
(Alt. to Raymond W Weber)
Clifford L Rediger, Independent Electrical Contractors Training Fund, CO [IM]
(Alt. to Robert G Wilkinson)
Janet D Skipper, IBEW Local Union 606, FL [L]
(Alt. to Donald M King)
Joseph E Wiehagen, National Association of Home Builders, MD [U]
(Alt. to Lawrence Brown)

Nonvoting

William Burr, Canadian Standards Association, Canada [RT]
Douglas A Lee, US Consumer Product Safety Commission, MD [C]
Andrew M Trotta, US Consumer Product Safety Commission, MD [C]

Mark W Earley, NFPA Staff Liaison

Code-Making Panel 3
Articles 300, 590, 720, 725, 727, 760, Chapter 9, Tables 11(A) and (B), and Tables 12(A) and (B)

Richard P Owen, *Chair*
City of St. Paul, MN [E]
Rep. International Association of Electrical Inspectors

Lawrence S Ayer, Biz Com Electric, Inc., OH [IM]
Rep. Independent Electrical Contractors, Inc.
Paul J Casparro, Scranton Electricians JATC, PA [L]
Rep. International Brotherhood of Electrical Workers
Les Easter, Allied Tube and Conduit, IL [M]
Rep. National Electrical Manufacturers Association
Sanford E Egesdal, Egesdal Associates PLC, MN [M]
Rep. Automatic Fire Alarm Association, Inc.
Thomas J Guida, Underwriters Laboratories Inc., NY [RT]
Ray R. R Keden, ERICO, Inc., CA [M]
Rep. Building Industry Consulting Services International
Ronald E Maassen, Lemberg Electric Company, Inc., WI [IM]
Rep. National Electrical Contractors Association
Juan C Menendez, Southern California Edison Company, CA [UT]
Rep. Electric Light & Power Group/EEI
Steven J Owen, Steven J. Owen, Inc., AL [IM]
Rep. Associated Builders & Contractors, Inc.
David A Pace, Olin Corporation, AL [U]
Rep. American Chemistry Council
Melvin K Sanders, Things Electrical Co., Inc. (TECo., Inc.), IA [U]
Rep. Institute of Electrical & Electronics Engineers, Inc.
John E Sleights, St. Paul Travelers, CT [I]

Alternates

Shane M Clary, Bay Alarm Company, CA [M]
(Alt. to Sanford E Egesdal)
Adam D Corbin, Corbin Electrical Services, Inc., NJ [IM]
(Alt. to Lawrence S Ayer)
Danny Liggett, Dupont Company, TX [U]
(Alt. to David A Pace)
T. David Mills, Bechtel Savannah River, Inc., SC [U]
(Alt. to Melvin K Sanders)
Mark C Ode, Underwriters Laboratories Inc., NC [RT]
(Alt. to Thomas J Guida)
Roger S Passmore, Davis Electrical Constructors, Inc., SC [IM]
(Alt. to Steven J Owen)
Marty L Riesberg, IBEW Local Union 22, MD [L]
(Alt. to Paul J Casparro)
George A Straniero, Tyco/AFC Cable Systems, Inc., NJ [M]
(Alt. to Les Easter)
Robert J Walsh, City of Hayward, CA [E]
(Alt. to Richard P Owen)

Nonvoting

Edward C Lawry, Oregon, WI [E] (Member Emeritus)

Mark W Earley, NFPA Staff Liaison

Code-Making Panel 4
Articles 225, 230

James M Naughton, *Chair*
IBEW Local Union 103, MA [L]
Rep. International Brotherhood of Electrical Workers

Thomas L Adams, Exelon Corporation, IL [UT]
Rep. Electric Light & Power Group/EEI
Malcolm Allison, Ferraz Shawmut, MA [M]
Robert J Deaton, The Dow Chemical Company, TX [U]
Rep. Institute of Electrical & Electronics Engineers, Inc.
Howard D Hughes, Hughes Electric Company Inc., AR [IM]
Rep. National Electrical Contractors Association
Mark C Ode, Underwriters Laboratories Inc., NC [RT]
James J Rogers, Towns of Oak Bluffs, Tisbury, West Tisbury, MA [E]
Rep. International Association of Electrical Inspectors
John A Sigmund, PPG Industries, Inc., LA [U]
Rep. American Chemistry Council
John W Young, Siemens Energy & Automation, Inc., GA [M]
Rep. National Electrical Manufacturers Association
Vincent Zinnante, Advantage Electric, Inc., TX [IM]
Rep. Independent Electrical Contractors, Inc.

Alternates

Paul D Barnhart, Underwriters Laboratories Inc., NC [RT]
(Alt. to Mark C Ode)

NFPA Electrical Engineering Division Technical Staff

Mark W. Earley, Assistant Vice President/Chief Electrical Engineer
Ernest W. Buss, Senior Electrical Engineer
Mark Cloutier, Senior Electrical Engineer
Jean A. O'Connor, Electrical Project Specialist/Support Supervisor
Lee F. Richardson, Senior Electrical Engineer
Richard J. Roux, Senior Electrical Specialist
Jeffrey S. Sargent, Senior Electrical Specialist
Joseph V. Sheehan, Principal Electrical Engineer

These lists represent the membership at the time each Committee was balloted on the text of this report. Since that time, changes in the membership may have occurred. A key to classifications is found at the front of the document.

Committee Scope: This Committee shall have primary responsibility for documents on minimizing the risk of electricity as a source of electric shock and as a potential ignition source of fires and explosions. It shall also be responsible for text to minimize the propagation of fire and explosions due to electrical installations.

The National Electrical Code Committee proposes for adoption its Report on Comments to NFPA 70, *National Electrical Code*. NFPA 70-2008 is published in Volume 4 of the 2007 National Fire Codes and is in separate pamphlet form.
This Report has been submitted to letter ballot of the Code-Making Panels of the National Electric Code Committee and the results of the ballot can be found in the Report.
This Report has also been submitted to letter ballot of the Technical Correlating Committee which consists of 11 voting members. It was voted unanimously affirmative to release this Report.

Key to Comment Headings

The first line of every proposal includes the following information:

Document No.	Proposal No.	Log No.	Paragraph Reference	Committee Action
101	6	38	3.4	Accept

Example: 101-6 Log #38 **Final Action: Accept (3.4)**

TYPES OF ACTION

P Partial Revision **C** Complete Revision **N** New Document **R** Reconfirmation **W** Withdrawal

The following classifications apply to Committee members and represent their principal interest in the activity of the Committee.

1. M Manufacturer: A representative of a maker or marketer of a product, assembly, or system, or portion thereof, that is affected by the standard.

2. U User: A representative of an entity that is subject to the provisions of the standard or that voluntarily uses the standard.

3. IM Installer/Maintainer: A representative of an entity that is in the business of installing or maintaining a product, assembly, or system affected by the standard.

4. L Labor: A labor representative or employee concerned with safety in the workplace.

5. RT Applied Research/Testing Laboratory: A representative of an independent testing laboratory or independent applied research organization that promulgates and/or enforces standards.

6. E Enforcing Authority: A representative of an agency or an organization that promulgates and/or enforces standards.

7. I Insurance: A representative of an insurance company, broker, agent, bureau, or inspection agency.

8. C Consumer: A person who is or represents the ultimate purchaser of a product, system, or service affected by the standard, but who is not included in (2).

9. SE Special Expert: A person not representing (1) through (8) and who has special expertise in the scope of the standard or portion thereof.

NOTE 1: “Standard” connotes code, standard, recommended practice, or guide.

NOTE 2: A representative includes an employee.

NOTE 3: While these classifications will be used by the Standards Council to achieve a balance for Technical Committees, the Standards Council may determine that new classifications of member or unique interests need representation in order to foster the best possible Committee deliberations on any project. In this connection, the Standards Council may make such appointments as it deems appropriate in the public interest, such as the classification of “Utilities” in the National Electrical Code Committee.

NOTE 4: Representatives of subsidiaries of any group are generally considered to have the same classification as the parent organization.

FORM FOR FILING NEC® NOTICE OF INTENT TO MAKE A MOTION (NITMAM) AT AN ASSOCIATION TECHNICAL MEETING 2007 ANNUAL REVISION CYCLE

FINAL DATE FOR RECEIPT OF NEC® NITMAM: 5:00 pm EDST, May 4, 2007 (NEC only)

If you have questions about filling out or filing the NEC® NITMAM, please contact the Codes and Standards Administration at 617-984-7249

For further information on the Codes- and Standards-Making Process see the NFPA website (www.nfpa.org)

Sequence of Events Leading to Issuance of an NFPA Committee Document

Step 1 Call for Proposals

▼ Proposed new document or new edition of an existing document is entered into one of two yearly revision cycles, and a Call for Proposals is published.

Step 2 Report on Proposals (ROP)

▼ Committee meets to act on Proposals, to develop its own Proposals, and to prepare its Report.

▼ Committee votes by written ballot on Proposals. If two-thirds approve, Report goes forward. Lacking two-thirds approval, Report returns to Committee.

▼ Report on Proposals (ROP) is published for public review and comment.

Step 3 Report on Comments (ROC)

▼ Committee meets to act on Public Comments to develop its own Comments, and to prepare its report.

▼ Committee votes by written ballot on Comments. If two-thirds approve, Reports goes forward. Lacking two-thirds approval, Report returns to Committee.

▼ Report on Comments (ROC) is published for public review.

Step 4 Technical Committee Report Session

▼ *"Notices of intent to make a motion"* are filed, are reviewed, and valid motions are certified for presentation at the Technical Committee Report Session. ("Consent Documents" that have no certified motions bypass the Technical Committee Report Session and proceed to the Standards Council for issuance.)

▼ NFPA membership meets each June at the Annual Meeting Technical Committee Report Session and acts on Technical Committee Reports (ROP and ROC) for documents with "certified amending motions."

▼ Committee(s) vote on any amendments to Report approved at NFPA Annual Membership Meeting.

Step 5 Standards Council Issuance

▼ Notification of intent to file an appeal to the Standards Council on Association action must be filed within 20 days of the NFPA Annual Membership Meeting.

▼ Standards Council decides, based on all evidence, whether or not to issue document or to take other action, including hearing any appeals.

The Technical Committee Report Session of the NFPA Annual Meeting

The process of public input and review does not end with the publication of the ROP and ROC. Following the completion of the Proposal and Comment periods, there is yet a further opportunity for debate and discussion through the Technical Committee Report Sessions that take place at the NFPA Annual Meeting.

The Technical Committee Report Session provides an opportunity for the final Technical Committee Report (i.e., the ROP and ROC) on each proposed new or revised code or standard to be presented to the NFPA membership for the debate and consideration of motions to amend the Report. The specific rules for the types of motions that can be made and who can make them are set forth in NFPA's rules, which should always be consulted by those wishing to bring an issue before the membership at a Technical Committee Report Session. The following presents some of the main features of how a Report is handled.

What Amending Motions Are Allowed. The Technical Committee Reports contain many Proposals and Comments that the Technical Committee has rejected or revised in whole or in part. Actions of the Technical Committee published in the ROP may also eventually be rejected or revised by the Technical Committee during the development of its ROC. The motions allowed by NFPA rules provide the opportunity to propose amendments to the text of a proposed code or standard based on these published Proposals, Comments, and Committee actions. Thus, the list of allowable motions include motions to accept Proposals and Comments in whole or in part as submitted or as modified by a Technical Committee action. Motions are also available to reject an accepted Comment in whole or part. In addition, Motions can be made to return an entire Technical Committee Report or a portion of the Report to the Technical Committee for further study.

The NFPA Annual Meeting, also known as the NFPA World Safety Conference & Exposition®, takes place in June of each year. A second Fall membership meeting was discontinued in 2004, so the NFPA Technical Committee Report Session now runs once each year at the Annual Meeting in June.

Who Can Make Amending Motions. NFPA rules also define those authorized to make amending motions. In many cases, the maker of the motion is limited by NFPA rules to the original submitter of the Proposal or Comment or his or her duly authorized representative. In other cases, such as a Motion to Reject an accepted Comment, or to Return a Technical Committee Report or a portion of a Technical Committee Report for Further Study, anyone can make these motions. For a complete explanation, NFPA rules should be consulted.

The Filing of a Notice of Intent to Make a Motion. Before making an allowable motion at a Technical Report Session, the intended maker of the motion must file, in advance of the session, and within the published deadline, a Notice of Intent to Make a Motion. A Motions Committee appointed by the Standards Council then reviews all notices and certifies all amending motions that are proper. The Motions Committee can also, in consultation with the makers of the motions, clarify the intent of the motions and, in certain circumstances, combine motions that are dependent on each other together so that they can be made in one single motion. A Motions Committee report is then made available in advance of the meeting listing all certified motions. Only these Certified Amending Motions, together with certain allowable Follow-Up Motions (that is, motions that have become necessary as a result of previous successful amending motions) will be allowed at the Technical Committee Report Session.

Consent Documents. Often there are codes and standards up for consideration by the membership that will be noncontroversial and no proper Notices of Intent to Make a Motion will be filed. These "Consent Documents" will bypass the Technical Committee Report Session and head straight to the Standards Council for issuance. The remaining Documents are then forwarded to the Technical Committee Report Session for consideration of the NFPA membership.

Important Note: *The filing of a Notice of Intent to Make a Motion is a new requirement that took effect beginning with the Fall 2005 revision cycle. For the most up-to-date information on the codes and standards process, see the Rules and Regulations on the NFPA website at www.nfpa.org.*

Action on Motions at the Technical Committee Report Session. In order to actually make a Certified Amending Motion at the Technical Committee Report Session, the maker of the motion must sign in at least an hour before the session begins. In this way a final list of motions can be set in advance of the session. At the session, each proposed document up for consideration is presented by a motion to adopt the Technical Committee Report on the document. Following each such motion, the presiding officer in charge of the session opens the floor to motions on the document from the final list of Certified Amending Motions followed by any permissible Follow-Up Motions. Debate and voting on each motion proceeds in accordance with NFPA rules. NFPA membership is not required in order to make or speak to a motion, but voting is limited to NFPA members who have joined at least 180 days prior to the session and have registered for the meeting. At the close of debate on each motion, voting takes place, and the motion requires a majority vote to carry. In order to amend a Technical Committee Report, successful amending motions must be confirmed by the responsible Technical Committee, which conducts a written ballot on all successful amending motions following the meeting and prior to the Document being forwarded to the Standards Council for issuance.

Standards Council Issuance

One of the primary responsibilities of the NFPA Standards Council, as the overseer of the NFPA codes and standards development process, is to act as the official issuer of all NFPA codes and standards. When it convenes to issue NFPA documents, it also hears any appeals related to the document. Appeals are an important part of assuring that all NFPA rules have been followed and that due process and fairness have been upheld throughout the codes and standards development process. The Council considers appeals both in writing and through the conduct of hearings at which all interested parties can participate. It decides appeals based on the entire record of the process as well as all submissions on the appeal. After deciding all appeals related to a document before it, the Council, if appropriate, proceeds to issue the document as an official NFPA code or standard. Subject only to limited review by the NFPA Board of Directors, the decision of the Standards Council is final, and the new NFPA code or standard becomes effective twenty days after Standards Council issuance.

5-1 Log #990 NEC-P05 **Final Action: Reject**
(Entire Document)

Submitter: David Shapiro, Accurate & Intriguing Writing & Editing
Comment on Proposal No: 5-1
Recommendation: Mr. Ziessniss had it right; the proposal should be accepted as written.
Substantiation: I have looked at the changes accepted as alternatives to this broader change; they do not correct the misleading implication of various uses of "grounding." In fact, by redefining "ground" as "earth" - I don't have a problem with that, if they think the dictionary won't do the job - the CMP may push some people's assumption further toward the idea that "equipment grounding" may be accomplished by connection to a local ground reference. The present use of "grounding" is hallowed in tradition. However, if we can suck it up and accept the fact that chapters are moved around and given new numbers, we can accept the use of a more-appropriate term. Also, the "we" who are accustomed to the present usage are aging, and newer users may be more-easily misled. They certainly are less likely to be disconcerted by the new language.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its initial action and position on Proposal 5-1 (Log No. 160) to reject changing the term "equipment grounding conductor" to the term "equipment bonding conductor" throughout the NEC. The work the TCC-assigned task group on grounding and bonding determined through a consensus process that changing the term would not result in an adequate solution for the identified problems in Code-wide grounding and bonding definitions and terminology that resulted from Proposal 5-1 (Log No. 2453e) in the 2004 Committee Report on Proposals. The revisions to the definition of the term "equipment grounding conductor" and the associated fine print notes together with additional Code-wide revisions where the term is used, are consistent with the objectives and responsibilities of the TCC assigned Task Group on Grounding and Bonding. See the panel action and statement on Proposal 5-1 (Log No. 160).

ARTICLE 90 — INTRODUCTION

1-1 Log #832 NEC-P01 **Final Action: Accept**
(90.2(A)(2))

Submitter: Jim Pauley, Square D Company
Comment on Proposal No: 1-4
Recommendation: Accept the Proposal.
Substantiation: The submitter is correct. The FPN does add confusion when one considers that the NEC is an enforcement document that is adopted by practically all jurisdictions in the US.

The NESC does indeed contain provisions that are in conflict with the NEC. Should users decide to utilize the NESC for installations covered by the NEC, the conflicts place the AHJ in a very difficult position. Although the NESC may be useful for some engineering design information, its reference as a source from the NEC implies that it is capable of being used without interfering with the use of the NEC. The code loses nothing by deleting the reference, but has increased confusion/conflict with the reference included.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:

ANTHONY, M.: Our interest group is interested in the outcome of Proposal 1-4 because many colleges and universities have power plants and utility distribution systems that operate much like utilities.

We believe that the NEC loses a great deal with the deletion of a reference (to the NESC) which has been present for many code cycles. Much of the credibility of the NEC arises from the fact that it is referenced in so many other legal documents and references so many related documents within it. No doubt these references add to the bulk of the NEC but you cannot sustain credibility by not acknowledging the single most important document that governs the construction and operation of equipment at brings electric energy from the power plant to the power outlet. Knowledge of the operating characteristics of upstream equipment, for example, is important for the design and operation of emergency switchgear within the building premises (coordinating utility reclosers with transfer switches, for example).

Some of the confusion may arise from the similarity in the titles of the NEC and the NESC. Perhaps something should be done about re-naming the NESC. In the intervening time the NEC and the NESC should continue to refer to each other. If, indeed, the NEC is a document to be used by trained persons only, as described in 90.1(C), then that training should ameliorate the confusion.

LABRAKE, JR., N.: This comment and Proposal 1-4 should be rejected and the FPN needs to be retained. The Fine Print Note (FPN) in the scope of the NEC referencing ANSI C2, National Electrical Safety Code (NESC) provides a desirable correlation with a similar note in the Scope of the NESC explaining that, whereas, the NESC covers utility facilities and functions up to the Service Point, the NEC covers utilization wiring requirements beyond the Service Point. It is noted that the definition of "Service Point" is identical in both documents. The two codes interface at the Service Point and it is proper that each code reference the other to avoid confusion. Provisions of the NESC described in the FPN may be considered in the design and installation of electric supply facilities on the load side of the service point where the NEC is silent, or where not in conflict with the provisions of the NEC. It is also noted that in some jurisdictions, the Authority enforcing the NEC also has authority to enforce the provisions of the NESC in these instances. The FPN is also important to the application to 90.2(C) Special Permission. In addition, refer to my affirmative statement in Comment 1-44a (1-34a; CC1-101), NEC Section 110.7 Title.

1-2 Log #2027 NEC-P01 **Final Action: Accept**
(90.2(A)(2), FPN 2)

Submitter: Donald Cook, Shelby County Building Inspections
Comment on Proposal No: 1-4
Recommendation: Delete this FPN completely.
Substantiation: The panel statement indicates the FPN provides Code users with an applicable resource that can be adopted by governmental bodies to cover industrial substations or multibuilding complexes. If adoption of two standards is required or needed for governmental bodies to regulate the installations in the panel statement, it seems the NEC should remove those installations from it's scope and remove the uncertainty of responsibility for these installations. If the NEC continues to claim responsibility for the installations, a complete set of requirements should be established and references to another document in FPN's should be removed. In the enforcement of the NEC, the NEC references to the NESC cause regular debate and challenge from designers that attempt to use the NEC for pole line distribution on the secondary of the service point. The purpose for this proposal and comment is not to change the requirements that govern the installations, but to clarify which code or standard is responsible for installations on the customer side of the service point. Confusion can not enhance safety. See CMP-1 action on Proposal 1-145.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:

ANTHONY, M.: See my explanation of negative vote on Comment 1-1.

LABRAKE, JR., N.: This comment and Proposal 1-4 should be rejected. Refer to my negative ballot statement on Comment 1-1.

1-3 Log #985 NEC-P01 **Final Action: Accept**
(90.2(B)(5))

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 1-5
Recommendation: This proposal should be Accepted.
Substantiation: The use of the term "or by other agreements" is in essence, a total exemption of the NEC for utilities. The Panel statement by CMP-1 on the action to reject this proposal clearly recognizes that when and where utilities desire to enter into an agreement with an owner, municipality, school district or other party, the NEC no longer applies, the NESC becomes the installation standard of choice. Additionally, now that the utility is doing the installation, no permit is required, no license is required and no inspection is necessary.

Inspectors are no longer needed. Product standards are no longer necessary. No equipment grounding conductors and no overcurrent protection will be installed.

The panel statement reads as follows:
"The text "or by other agreements" allows for the installation of utility facilities directed by their regulatory commissions on other than easements or right of ways through applications executed for service to the premise. These facilities include private area lighting, the safety of which is covered through utility conformance with the requirements of the authorities having jurisdiction over the utility."
Note that the statement clearly recognizes "private area lighting" but does not limit in any way the scope of work permitted to ignore the NEC. This statement also recognizes that such installations are "safe" through utility conformance with the requirements of the authorities having jurisdiction over the utility. There is no AHJ for the utility.
If the utility company chooses to do "private area lighting," or any other work for private consumption, they should be licensed, obtain a permit, be required to meet the minimum requirements of the NEC, and have the installation inspected.

CMP-1 however, in this 2008 ROP stage has gone on record, with a clear statement to allow the utilities to ignore the safety driven provisions of the NEC, product standards and the inspection process.

It is interesting to note that the scope of the NESC is limited to the "service point." The NESC does not apply downstream of the service point. CMP-1 has

given permission to the utilities to ignore the NEC and the scope of the NESC ends at the service point. No code or standard applies when the utility enters into "other agreements." This situation is further complicated by the utility interpretation of the term "service point." The utility interpretation of "service point" is as follows:

(1) The service point is a "moving target" subject to each individual installation.

(2) If the serving utility brings only a service drop to a building, the "service point" is outside of the structure at the point the service drop conductors meet the premises wiring.

(3) If the serving utility enters into "other agreements" and provides service equipment, transformers, buss duct, feeders and panelboards, the service point is at the load side of the branch circuit overcurrent protective device.

It is interesting to note that all organizations represented on CMP-1 other than IBEW and IEC agree that utilities may completely ignore the NEC.

The solution offered by the utilities is a simple one, broaden the scope of the NESC, eliminate the NEC, eliminate inspectors and eliminate contractors. I disagree.

The utility exclusion should be limited to generation, transmission and distribution. Any entity installing conductors or equipment, in, on or outdoors of any building or structure for utilization of electrical energy, should be required to follow the safety driven provisions of the NEC. Mr. Hittinger clarifies this issue in the first sentence of his negative statement. The question is not, "who will do the work?" The question is, "which code or standard will apply?"

Panel Meeting Action: Accept

Panel Statement: The panel does not necessarily agree with all of the commentors substantiation.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 8 Negative: 4

Explanation of Negative:

ANTHONY, M.: Our interest group is interested in the outcome of Proposal 1-5 because many colleges and universities have power plants and utility distribution systems that operate much like utilities. I see the point and I hear the passion of the submitter and the interest group. But I have not seen evidence that utility-like "entities" are using the flexibility the existing language allows to permit hazards. Some common practices -- such as allowing overhead transformers to overload to destruction -- have been safely managed in the past and are built into the transformer construction itself. Rare are the utilities that can afford to avoid the more rigorous standard. Indeed, the risk management offices are busy making sure litigation risk is a minimum.

In town-gown site-lighting relationships, for example, the term "other agreements" allows for flexibility--even the application of a more rigorous standard if the AHJ determines it is necessary.

The panel statement indicates that the panel did "necessarily" agree with all of the commenters substantiation; but apparently the evidence presented was sufficient. Respectfully speaking: I do not believe sufficient evidence has been presented.

FISKE, W.: The panel action at the ROP stage to reject Proposal 1-5 was correct and should be maintained. Easements and rights-of-way are not the only means by which utilities can exercise exclusive control over electric installations. Those are specific legally-defined terms which relate to areas with boundaries that can be plotted on survey maps. There are other instruments that authorize utilities to maintain certain electric installations. Those instruments are the "other agreements" to which the 2002 and 2005 editions of the NEC refer.

The 1999 and earlier editions of the NEC said, "outdoors on private property by established rights such as easements." Note "such as," indicating that easements are simply examples of the "established rights." The text of 90.2(B)(5)b, "in legally established easements, rights-of-way, or by other agreements", conveys fundamentally the same meaning as the language in the 1999 NEC. Accepting Proposal 1-5 would fundamentally change the meaning, in that ONLY easements or rights-of-way could be used to enable electric utilities to establish and maintain electric installations. Neither the submitter of Proposal 1-5 nor the submitter of Comment 1-3 has offered a technical substantiation for limiting instruments of authorization to easements and rights-of-way.

Comments made in voting indicate that some code panel members think the fundamental issue is whether installation and maintenance is performed by electric utilities or private contractors (or other organizations), and other members think the issue is whether the NEC or the NESC shall be the governing document. We conclude that nether of these issues is directly relevant to 90.2(B)(5)b. Where a utility has been granted authority to install or maintain an installation, the utility can do the work with its own personnel, or contract it out to a private I & M firm. Similarly, the "other agreements" in 90.2(B)(5)b may stipulate that NESC, NEC, or some other specification shall govern any given electric installation.

The question is "not who does the work?", and it is not, "which code shall be used?" The question is, "when utilities are authorized to operate on property they do not own, what legal instruments will grant such authorization?"

LABRAKE, JR., N.: This comment and Proposal 1-5 should be rejected. 90.2(B)(5)(b) describes the location of utility facilities on private property that are covered by the NESC including those locations covered by "other agreements" in lieu of easements or rights-of way. The submitter improperly extrapolates this location agreement to suggest it would permit the application of the NESC to utilization wiring. Deleting the text "or by other agreements" will cause a conflict with existing governing laws; i.e., local, state, federal that regulate utility installations under their exclusive control on private property. This action will require utilities to obtain easements for all of their equipment on private property where contractual service agreements of their regulated tariffs have been adequate. Requiring unnecessary easements will increase costs to all utility customers and possibly impact installation schedules without benefit to anyone. No fact found evidence has been presented that the existence of a recorded easement has any bearing on the safety of the installation. No technical justification has been presented for a requirement that a utility installation on private property, made solely for the supply of service to that property, needs to be covered by an easement to be considered as not covered by the NEC. An easement for utility facilities on private property assures the utility can meet its obligation to supply all of its customers served through those facilities. No such assurance is generally needed from a property owner for facilities installed on and serving only that property.

Further addressing the Submitter's substantiation, EEI notes the following:

1. The statement "No code or standard applies when the utility enters into "other agreements."" is not accurate. When a utility enters into deregulated activity, they are bound to the same local laws and ordinances as would contractors.

There is no "exemption" for utilities contained in the NEC. 90.2(A)(4) describes those utility installations that are covered and 90.2(B)(5) describes those utility installations that are not covered. Utility installations described in 90.2(B)(5) and not under their exclusive control are covered by the NEC regardless of whether they are a part of a premises wiring system or not. Utility installations under their exclusive control and on the supply side of the service point are under the jurisdiction of their regulatory authorities, typically Public Service Commissions, who are the AHJ's and prescribe the appropriate safety standards, generally ANSI C2, National Electrical Safety Code (NESC). The Scope of the NESC clearly states that it covers utility facilities and functions up to the Service Point and that the NEC covers utilization wiring requirements beyond the Service Point. Therefore any "other agreements" would preclude the installations of utilization wiring on the load side of the service point not in conformance with the NEC.

2. The NESC covers area lighting of utilities on the supply side of the service point of a premises wiring system. In response to each of 57 comments recorded on pages 12 to 37 of the 1998 NEC Committee Report on Comments, the Panel is on record as stating that "no evidence was submitted that installations performed by utilities in accordance with the NESC are unsafe". This statement continues to be true.

3. The term "Service Point" is clearly defined and correlated in both the NEC and NESC and is not subject to "utility interpretation". For example, the service point could be on the supply side of a transformer whose installation must conform to the requirements of the NEC, or it could be on the secondary side of the transformer whose installation must be under the exclusive control of the utility and conform to the requirements of the NESC as well as being subject to the location provisions of 90.2(B)(5)(b). The service point cannot be located such that utilization wiring outside the scope of the NESC would exist on its supply side.

4. The statement that utilities completely ignore the NEC is inaccurate. The utilities cannot ignore the NEC as it is essential to the acceptance of premises wiring for energization at the service point. And regarding the statement as to which code applies, utilities operate under the rules of the NESC for their generation, transmission, and distribution supply facilities and under the NEC for any utilization wiring as part of a premises wiring system.

The Panel members are encouraged to reconsider their action in revising the text in 90.2(B)(5)b for the unintended consequences and reject Comment 1-3 and Proposal 1-5.

MCCARVER, R.: The comment should have been rejected and the Code text left unchanged. The commenter's claim that "the use of the term "or by other agreement' is in essence, a total exemption of the NEC for utilities" is not true. The agreements referred to are either designated by or recognized by public service commissions, utility commissions or other regulatory agencies having jurisdiction for such installations. Such agreements are necessary in order for a utility to provide service to a location that does not have a specific easement.

1-4 Log #992 NEC-P01 **Final Action: Reject**
(90.2(B)(5)(b))

Submitter: David Shapiro, Accurate & Intriguing Writing & Editing
Comment on Proposal No: 1-5
Recommendation: Revise text to read as follows:

Are located in legally established easements, rights-of-way, or by other agreements ~~either~~ designated by ~~or recognized by~~ the public service commissions, utility commissions, or other regulatory agencies having jurisdiction for such installations.

Substantiation: If the CMP believes it important from a legal standpoint that these public agencies be able to make other types of agreement that put installations outside the purview of the AHJ enforcing the NEC, let's at least require the exceptions to be designated rather than merely "recognized."

Panel Meeting Action: Reject
Panel Statement: The panel concludes that the term "other agreements" is vague and should be eliminated. See Panel Action on Comment 1-3.

The panel does not necessarily agree with all of the commentor's substantiation.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

LABRAKE, JR., N.: This comment and Proposal 1-5 should be rejected. Refer to my negative ballot statement on Comment 1-3.

1-5 Log #1046 NEC-P01 **Final Action: Accept in Part**
(90.2(B)(5)(b))

Submitter: Gilbert L. Thompson, MEIA Codes and Standards
Comment on Proposal No: 1-5
Recommendation: The Panel should reconsider their action and accept, not reject, this proposal.

After removing the words "or by other agreements" from Part (b) our inspectors feel that Section 90.2(B)(5) should be rearranged so that the wording in Part c comes first in the listing of things not covered rather than last.

The inspectors associations wholeheartedly agrees with Mr. Robinson's substantiation and the negative comments expressed by Mr. Hickman and Mr. Hittenger that the proposal should be accepted.

Substantiation: The affirmative comment by Mr. LaBrake is not valid, really, as electrical ordinances or laws of AHJ always exempt electric utilities when they provide the "service or service point" to local, state and federal properties because they are regulated by the National Electrical Safety Code. The expansion of the scope of work by electric utilities in providing installations on public and private premises without complying with NEC rules and then circumventing the permit and inspection process by "having some agreement" is in direct conflict with Section 90.2(A)(1)(2). Electric utilities have enough work, control, responsibility and accountability in providing the generation, transmission, distribution and maintenance of wiring on the "service" part of any installation. If they want to expand in other areas, then they should do like everyone else does by complying with local laws and the NEC.
Panel Meeting Action: Accept in Part

The panel accepts only the first sentence of the commentors recommendation which results in removing the words "or by other agreements either" and rejects the second and third sentences of the commentors recommendation.
Panel Statement: The panel concludes that the commentor's recommendation in sentence 2 does not add clarity and that the existing order is correct. Sentence 3 in the recommendation contains no recommended action. The panel does not necessarily agree with all of the commentor's substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 3
Explanation of Negative:

ANTHONY, M.: See my explanation of negative vote on Comment 1-3.

LABRAKE, JR., N.: This comment and Proposal 1-5 should be rejected. Refer to my negative ballot statement on Comment 1-3.

MCCARVER, R.: Please see my Explanation of Negative Vote on Comment 1-3.

1-6 Log #1667 NEC-P01 **Final Action: Accept in Principle**
(90.2(B)(5)(b))

Submitter: Philip Denault, Bear Electric
Comment on Proposal No: 1-5
Recommendation: Revise as follows:

Are located in legally established easements, rights-of-way, ~~or by other agreements either~~ designated by or recognized by the public service commissions, utility commissions, or other regulatory agencies having jurisdiction for such installations.

Substantiation: The words chosen, other agreements, is not specific and may create a lot of gray areas. Removing these words can prevent future issues by utilities interpreting them the way they see fit. It is important to stay code compliant anywhere electricity is in use. Seeing how some of these other agreements are taking place on private property, the owner or other persons may get injured or worse thinking it's ok to service equipment on this type of property. Having a guideline permits, and inspections will prevent liability problems.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 1-3. The panel does not necessarily agree with all of the commentor's substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:

ANTHONY, M.: See my explanation of negative vote on Comment 1-3.

LABRAKE, JR., N.: This comment and Proposal 1-5 should be rejected. Refer to my negative ballot statement on Comment 1-3.

1-7 Log #991 NEC-P01 **Final Action: Reject**
(90.2(D)and (E) (New))

Submitter: David Shapiro, Accurate & Intriguing Writing & Editing
Comment on Proposal No: 1-2
Recommendation: Revise text to read as follows:

...Additions, alterations, installations, or repairs shall not cause an existing building to become unsafe or ~~to~~ adversely affect the performance of the building, as determined by the authority having jurisdiction. When e~~E~~lectrical wiring is added to an existing service, feeder, or branch circuit, the ~~shall not~~ resulting ~~in an~~ installation ~~that~~ shall not violate~~s~~ the provisions of the code in force at the time the additions are made...

Substantiation: The NEC addresses grandfathering rarely, but does address it. This leaves contractors and inspectors up in the air. It will be a far greater service to include some kind of mandatory language on grandfathering, which jurisdictions can remove if they choose, than to leave it up to them to add something. This way it gets refined through the international Code process. My proposed modifications correct grammar or clarify language.
Panel Meeting Action: Reject
Panel Statement: It is unclear as to what the submitter is recommending for revision as Proposal 1-2 was rejected by CMP-1. The proposed text does not provide substantiation or justification to change CMP-1's position on retroactive application of the NEC. Further, CMP-1 does not agree that the revised text corrects grammar or clarifies language.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-8 Log #448 NEC-P01 **Final Action: Accept**
(90.3)

Submitter: Allen C. Weidman, The Society of the Plastics Industry, Inc.
Comment on Proposal No: 1-7
Recommendation: Continue to reject this proposal.
Substantiation: Code-Making Panel 16, in developing requirements for optical fiber and communications systems, takes into account applicable requirements in other areas of the NEC, and specifically references them where appropriate. An example is the grounding requirements of Article 250 (Chapter 5) that have been referenced over many Code cycles, and are now excerpted, as applicable, in Article 770. Requiring that Chapter 8 be "... subject to the requirements of Chapters 1 through 7 unless the requirements are specifically excluded in Chapter 8", will require a tremendous, unnecessary reworking of the NEC.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-9 Log #664 NEC-P01 **Final Action: Reject**
(90.3)

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 1-7
Recommendation: The proposal should be Accepted in Principle by editorially modifying 90.3 to read as shown in the panel statement:

90.3 Code Arrangement. This Code is divided into the introduction and nine chapters, as shown in Figure 90.3. Chapters 1, 2, 3, and 4 apply generally; Chapters 5, 6, 7, and 8 apply to special occupancies, special equipment, special conditions, or communications systems. These latter chapters supplement or modify the general rules. Chapters 1 through 4 apply except as amended by Chapters 5, 6, 7, and 8 for the particular conditions.

Delete the existing second paragraph of 90.3.

The last two paragraphs of 90.3 are unchanged from the 2005 Code.

Revise Figure 90.3 as follows:

Under the box containing the text "Chapter 7 - Special Conditions", add an additional box containing the text "Chapter 8 - Communications Systems" and include this additional box within the parenthesis on the left so the parenthesis includes Chapters 5, 6, 7, and 8.

Delete the box, on the lower left side of the Figure, containing the text "Chapter 8 - Communications Systems", the parenthesis to the right of the box, and the text "Chapter 8 is not subject to the requirements of Chapters 1 through 7 except where the requirements are specifically referenced in Chapter 8."

The remainder of the Figure would be unchanged from the 2005 Code.

Substantiation: I agree with the Panel's conclusion that the intent of the submitter would be met by this editorial modification.

The submitter correctly pointed out that when Chapter 8 was initially created (more than 40 years ago), it addressed low voltage wiring normally associated with the telephone communications systems in existence at that time and did not anticipate the phenomenal growth and changes in communications that would develop during the subsequent years. The changes in communications technology have also resulted in the increasing use of power and control cables

with communications systems. These are exactly the same cables used in residential, commercial and industrial occupancies and, therefore, should be subject to the same installation requirements of Chapters 1 through 4 that apply to other installations unless there is a valid technical reason to supplement or modify those requirements in Chapter 8.

The rapid expansion of communications systems and the ever-increasing demands for more power make it imperative that Chapter 8 comply with the requirements of Chapters 1 through 4 to ensure compliance with the purpose of the Code as stated in 90.1(A).

Panel Meeting Action: Reject

Panel Statement: CMP-1 rejected Proposal 1-7 as it was incomplete. In addition, the recommendations in Proposal 1-7 would have a major impact on other code panels and create potential conflicts with existing code requirements. Obviously, companion proposals would need to be submitted to address those potential conflicts. Since Proposal 1-7 was lengthy, CMP-1 editorially modified the submitter's proposal for clarification purposes, ease in understanding the intent, and referral to the Technical Correlating Committee. CMP-1 reiterates to the submitter that Proposal 1-7 was rejected.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-10 Log #993 NEC-P01 **Final Action: Reject**
(90.4)

Submitter: David Shapiro, Accurate & Intriguing Writing & Editing

Comment on Proposal No: 1-8

Recommendation: Revise text to read as follows:

"...having jurisdiction ~~of~~ for enforcement...".

Substantiation: I know of a number of jurisdictions that have decided to restrict certain uses despite their NRTL Listing. Mr. Stolz's amendment will not prevent them from doing so, but will increase the pressure on them to adopt formal Local Amendments when adding such rules. This is a greatly desirable outcome from the standpoint of fair enforcement. One minor grammatical tweak.

Panel Meeting Action: Reject

Panel Statement: The Panel reaffirms its statement on Proposal 1-8. The commentor has not addressed the issues presented in that statement. Any suggestion of automatic approval of equipment and materials would usurp the AHJ's responsibility and be in direct conflict with the provisions of Section 90.4.

Number Eligible to Vote: 12

(100. Bedroom)

Submitter: Code-Making Panel 2,

Comment on Proposal No: 1-17

Recommendation: Reject the proposal.

Substantiation: The definition proposed by the submitter is unenforceable. The NEC Style Manual, in 3.3.4, requires that words and terms used in the NEC shall be specific and clear in meaning. The wording "which are, or could be used" is too vague.

This comment was balloted through CMP-2 with the following results:

12 Eligible to Vote

11 Affirmative

1 Not Returned (B. Nenninger)

Mr. J. Pauley voted affirmatively stating: "For clarity, item 3 of the comment form should have the "deleted text" box checked and should state "CMP-2 recommends that CMP-1 reject the proposal."

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Abstain: 1

Explanation of Abstention:

ANTHONY, M.: Our interest group has an interest in this proposal because of its implications for the design of student housing. An imperfect definition now would be better than an perfect one later.

I do not agree that with CMP's conclusion that this language is a violation of the clarity rules of the NEC Manual of Style in the use of the term "or could be" any more than "likely to be serviced" is clear in the flash protection requirements. Ultimately, the submitter is trying to stop installers or designers from avoiding the AFCI rules by changing the name or nature of the room. (See my Comment on the Affirmative on Proposal -- Log 3411).

As the writers of the Life Safety Code have long recognized, sleeping/bedroom units are places where people stay for 1/3 of their lives while unconscious. Writers of the NEC need to define bedroom now because it is a key criterion in the application of AFCI protection. In future code cycles we should work harder to correlate language of the NEC with the terms sleeping areas as used in the Life Safety Code.

1-12 Log #994 NEC-P01 **Final Action: Reject**
(100. Bedroom)

Submitter: David Shapiro, Accurate & Intriguing Writing & Editing

Comment on Proposal No: 1-17

Recommendation: Revise the definition to read as follows:

Bedroom. An area ~~separated by walls or partitions from other similar parts of the structure or building which are, or could be,~~ that is being used, or whose design or layout lends itself to being used, primarily for sleeping.

Substantiation: It is indeed worth our while to clarify this issue, to enhance safety. However, in some apartments, and even houses, the presence of walls or partitions is not key. Furthermore, "could be used" seems too broad a characterization. A grammatical quibble: it is preferable to have agreement between the singular word "area" and the verb, originally the plural, "are".

Panel Meeting Action: Reject

Panel Statement: The proposed revisions do not improve clarity. In particular, "lends itself to being used, primarily for sleeping," is a vague or unenforceable phrase, and thus prohibited by 3.2.1 of the NEC Style Manual. See panel action on Comment 1-11.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Abstain: 1

Explanation of Abstention:

ANTHONY, M.: See my explanation of abstention on Comment 1-11.

2-2 Log #513 NEC-P02 **Final Action: Reject**
(100. Branch Circuit Individual)

Submitter: Dan Leaf, Seneca, SC

Comment on Proposal No: 2-2

Recommendation: Accept the proposal.

Substantiation: Panel statement indicates an individual branch circuit may supply a multiple receptacle. However, a 20 ampere circuit supplying a multiple receptacle is limited to a 12 ampere load for a 15 ampere multiple receptacle and 16 amperes for a 20 ampere multiple receptacle. Such a circuit could not supply a 20 ampere load in accordance with 210.23 for individual branch circuits.

Panel Meeting Action: Reject
Panel Statement: The submitter's substantiation does not address the panel statement from the proposal. The panel statement was clear that the configuration or arrangement of the equipment could be used to limit the load to a single utilization equipment.

The submitter presumes that all installations will be for equipment that has a current rating that is equal to the receptacle rating. That is not always the case. For example, a refrigerator could be supplied from a duplex receptacle and be within the appropriate ratings and still be a single utilization equipment, provided the arrangement of the receptacle is such that it will limit the application to only the refrigerator.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-1 Log #1416 NEC-P10 **Final Action: Reject**
(100. Branch Circuit Overcurrent Device)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 10-1a
Recommendation: The panel should reconsider the action taken on this proposal and Reject the Proposal.
Substantiation: The proposed definition of a Branch-Circuit Overcurrent Device establishes unnecessary confusion. Instead of focusing on branch circuit protection the definition also deals with service and feeder protection. In addition to being confusing, the proposed definition is also incorrect. For example, Branch-Circuit Overcurrent Devices may not provide protection of service equipment over the full range of overcurrents described in the NEC definition of overcurrent: overload, short circuit, or ground fault. Thus, at 1000 amperes or more, service equipment protection involves the additional feature of ground fault protection (240.13). Does this definition, with its reference to service equipment, require ground fault protection for all overcurrent devices of 1000 amperes or more? The new definition also states that the Branch-Circuit Overcurrent Device will protect "equipment". However, a review of the equipment definition in Article 100 shows that equipment includes such items as appliances. But, the Branch-Circuit Overcurrent device is neither evaluated for, or intended for, appliance protection. That can be the role of supplementary overcurrent protective devices. The proposed definition raises additional questions. Does a listed self-protected combination motor controller fit within this definition? These devices are evaluated for branch circuit protection in a motor circuit. Does this definition give credence to using such devices in areas other than a motor circuit? Is the self-protected combination motor controller suitable for use to protect feeders or service conductors? That application was never intended as it is specific to Article 430. However, a listed self-protected combination motor controller fits the proposed definition.
Panel Meeting Action: Reject
Panel Statement: The proposed definition does not establish unnecessary confusion. On the contrary, the definition clarifies that a branch-circuit overcurrent protective device is a full-range overcurrent protective device and is required to provide protection for service, feeder and branch circuit conductors, and equipment. Further, the definition improves safety by identifying the performance characteristics of a branch-circuit overcurrent protective device, thereby eliminating confusion, especially where supplementary and non-full-range overcurrent protective devices are misapplied.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

KIMBLIN, C.: The accepted definition remains confusing. In particular, the definition deals with a branch-circuit overcurrent protection device. The first sentence of that definition, however, immediately discusses service and feeder applications in addition to branch circuit applications. Since the proposed definition is intended to distinguish between branch circuit overcurrent devices and supplementary overcurrent protective devices, the TCC should review the definition of a branch circuit. For clarity, the TCC could consider inserting "branch circuit" between the words "final" and "overcurrent device" in that definition. This would make sure that the user does not misinterpret the branch circuits being the conductors between a supplementary overcurrent protective device and the outlet.

10-1a Log #995 NEC-P10 **Final Action: Reject**
(100. Branch Circuit Overcurrent Device)

Submitter: David Shapiro, Accurate & Intriguing Writing & Editing
Comment on Proposal No: 10-1a
Recommendation: I agree with Mr. Clive Kimblin that this definition is unnecessary.
Substantiation: I would rather look in the White Book for definitions and applications of equipment. I also consider it quite unfortunate to create a new definition where the wording of the term, "branch circuit," and the definition, being more inclusive, clash.

Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Comment 10-1.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

KIMBLIN, C.: NEMA opposes the panel action for the reason expressed with Comment 10-1.

1-13 Log #3 NEC-P01 **Final Action: Accept**
(100. Bundled)

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 1-19
Recommendation: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the TCC's recommendation directing further consideration of the comments expressed in the ROP voting. Comments 1-16 from CMP-6, 1-17 from CMP-7, and 1-14 from CMP-12 accept the term moved to Article 100, but CMP-15 in Comment 1-15 rejects the move since the term is unique in Article 520.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-14 Log #288 NEC-P01 **Final Action: Reject**
(100. Bundled)

Submitter: Code-Making Panel 12,
Comment on Proposal No: 1-19
Recommendation: Code-Making Panel 12 agrees that the definition for "Bundled" in Article 520 is applicable to 640.8 and that the definition can be moved to Article 100.
Substantiation: The term is used in 310.15(B)(2), 334.80, 520.53(M)(2), 520.53(M)(3), 520.53(M)(4), and 640.8, and according to the NEC Style Manual Article 100 should contain definitions of terms used in two or more articles of the NEC.

This comment was balloted through CMP-12 with the following ballot results:

15 Eligible to Vote
11 Affirmative
3 Negative
1 Not Returned (D. Quave)

Mr. K. Givens voted negatively stating: "The Aluminum Association agrees with the Explanations of Negative Vote provided by Messrs. N. LaBrake and J. Minick on Proposal 1-19."

Mr. R. Jones voted negatively stating: "The definition of "bundled" in 520.2 is specific to Article 520. If that definition is moved to Article 100 then the requirement of 310.15(B)(2) could not be enforced unless the cables where physically tied together. For instance, several nonmetallic-sheathed cables (romex) could be installed horizontally through framing members and not be physically bound together. The framing members would provide the required support, provided they are less than 54 in. apart, and cable ties would not be required. The bundled cables would be more than 24 in. in length but since they are not physically bound together the requirement for derating would not apply.

Section 310.15(B)(2) also uses the term "stacked" however that term might be difficult to enforce using a general English language dictionary definition."

Mr. K. White voted negatively stating: "This proposal should be Rejected. There is not a clear understanding of what definition will be in Article 100, as what was proposed in 520.2 is not satisfactory and adding "during installations" does not clarify the definition."
Panel Meeting Action: Reject
Panel Statement: The Panel concludes from CMP-15's substantiation and the Panel action on Comment 1-15 that Proposal 1-19 is rejected, since the term "bundled" as used in Articles 520 and 640 is specific.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

MCMAHILL, L.: For consistency and ease in understanding code requirements, CMP-1 should have accepted a standard definition for the term "bundled." There is no logical reason for the term "Bundled" to be unique in various code articles. A standard definition should suffice throughout the NEC and can be modified with the use of adverbs as necessary. It should be noted that CMP's, 6, 7 and 12 support placing the definition of "Bundled" in Article 100.

1-15 Log #295 NEC-P01 **Final Action: Accept**
(100. Bundled)

Submitter: Code-Making Panel 15,
Comment on Proposal No: 1-19
Recommendation: Reject Proposal 1-19.
Substantiation: A task group comprised of members of CMP-15, on Proposal 1-19 recommends this proposal be rejected. This is consistent with the Final Action taken by CMP-15 on comment 15-56 at the Report on Comments meeting in December 2004 on a similar proposal. As used in 520.53(H)(2), the term "bundled" is unique and the definition should remain in 520.2. Task group member Eddie Kramer has prepared a comprehensive background of past proposals and panel actions that is provided with this comment for CMP-1's information.

1-16 Log #317 NEC-P01 **Final Action: Reject**
(100. Bundled)

Submitter: Code-Making Panel 6,
Comment on Proposal No: 1-19
Recommendation: The definition in Article 100 should read: "Bundled. Cables or conductors that are physically tied, wrapped, taped or otherwise periodically bound together during installation."
Substantiation: Discussions during CMP-6's proposal stage raised the issue that the use of the word "bundled" was not necessarily clear. A code-wide definition in Article 100 should clarify the intent and limits of its use, making it less ambiguous.
The 2005 520.2 definition is: "Cables or conductors that are physically tied, wrapped, taped or otherwise periodically bound together." "Bundling" is but one condition which places conductors in close proximity. The use of "bundled" does not preclude imposing other conditions with additional text.
"Bundled" certainly should not apply to an individual Triplexed or Quadruplexed construction, nor to any individual multi-conductor cable. The words "during installation" need to be added at the end of the 520.2 definition to clarify that manufactured "bundling" is not involved.
The word, as it pertains to use within Article 310, has to do with the decrease in cooling effect which some types of conductor grouping causes. The number of cables or conductors involved is clarified. The uses of "bundled" in 310.15(B)(2) correlate to the definition. Its application is further clarified as only to lengths over 600 mm (24 in.). The condition where close proximity occurs simply due to conditions of installation (stacked) without intentional bundling is separately addressed. Conditions which are not "bundling", but which should qualify for deration, can be similarly addressed in any other section.
This comment was balloted through CMP-6 with the following ballot results:
11 Eligible to Vote
6 Affirmative
5 Negative
Mr. S. Friedman voted negatively stating: "CMP-6 did not agree that one definition for bundling covers all. In this case, I do not agree that bundling in Article 310 requires that the conductors be "periodically bound". Bundling could also mean in close proximity, which is the intent of CMP 6." CMP-6's comment should be "CMP-6 does not support CMP-1's action on Proposal 1-19."
Mr. R. Huddleston voted negatively stating: "Definition of "bundled" not needed. Addition of the phrase "during installation" only adds more confusion to an unneeded definition."
Mr. P. Picard voted negatively stating: "The proposed definition for "bundled" does not meet the use of the term as used in the 2005 NEC 310.15(B)(2)(a)."
Mr. C. Wall voted negatively stating: "This comment should be rejected. The definition of "bundled" in 520.2 is appropriate to the use of the term in Article 520, but it is not necessarily suitable for application in other sections. The addition of the term "during installation" does not make the term suitable for application and use in other articles."
Mr. J. Zimnock voted negatively stating: "The CMP-6 comment should be: "CMP-6 does not support the CMP-1 action to Accept Proposal 1-19 to move the definition of "Bundled" from 520.2 to Article 100 Definitions."
The definition of "Bundled" should not be moved from Article 520 to Article 100.
The definition of "Bundled" in 520.2 is very explicit in that it specifies "cables or conductors that are physically tied, wrapped, taped, or otherwise periodically bound together."
The term "Bundled" as used by CMP-6 in 310.15(B)(2)(a), and Exception No. 5(3), including the last paragraph, does not require that the cables or conductors be physically bound together and the installation would not comply with the definition in 502.2 and, therefore, Table 310.15(B)(2)(a) would not apply; this is not the intent of CMP-6.
The term "Bundled" as used by CMP-6 applies to conductors or cables in close proximity "without maintaining spacing and are not installed in raceways," such as through holes in framing materials. There is no requirement for them to be "physically bound together." It was not the intent of CMP-6 that "Bundling" required that the conductors or cables be "physically bound together." The definition of "Bundled" should remain in 502.2 since it appears to specifically convey the intent of CMP-15 as used in Article 502."
Panel Meeting Action: Reject

8 Affirmative
5 Negative
1 Not Returned (W. Crist)
Mr. J. Daly voted negatively stating: "The CMP-7 comment should be: "CMP-7 does not support the CMP-1 action to accept Proposal 1-19 to move the definition of "Bundled" from 520.2 to Article 100 definitions.
Reasons: The definition of "Bundled" should not be moved from Article 520 to Article 100.
I agree with the Explanation of Negative Votes on Proposal 1-19 by CMP-1 members N. LaBrake and John Minick.
The definition of "Bundled" in 520.2 is very explicit in that it specifies "Cables or conductors that are physically tied, wrapped, taped, or otherwise periodically bound together."
The term "bundled" as used by CMP-7 applies to cables in close proximity "without maintaining spacing and are not installed in raceways," such as through holes in framing materials. It was not the intent of CMP-7 that "bundling" required that the cables be "physically bound together."
CMP-7 Accepted in Principle Proposal 7-72 and stated in the Panel Statement: "The Panel agrees that "bundled" is not defined, and the revised wording more accurately describes the installation." This action removed the only instance where "bundled" was used in Article 334. The panel action to accept Proposal 7-74 also resulted in the term "bundled" not being used. "the term "bundled" will no longer appear in Article 334.
The definition of "Bundled" should remain in 502.2 since it appears to specifically convey the intent of CMP-15 as used in Article 502."
Mr. D. Nielsen voted negatively stating: "The use of the word "Bundled" is specific to the application. The substantiation does not provide a technical basis for clarifying all applications and or functional arrangements. The use of the word should remain in the article specific to the application."
Mr. P. Pollak voted negatively stating: "The Aluminum Association agrees with the Explanation of Negative provided by Messrs. Labrake and Minick on Proposal 1-19."
Mr. J. Ray voted negatively stating: "This proposal should be rejected. The definition of "Bundled" in Article 520 is a general definition applicable to the wiring methods in that article. However, this definition is not necessarily suitable for the other sections referenced in the proposal."
Mr. G. Strainiero voted negatively stating: "While CDA agrees that a definition of "Bundled" could be placed in Article 100, we, however, support the negative comments that were cast on the proposal which must be addressed before adding a definition."
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 1-14.
Number Eligible to Vote: 12

Explanation of Negative:
MCMAHILL, L.: See my explanation of negative vote on Comment 1-14.

1-18 Log #340 NEC-P01 **Final Action: Reject**
(100. Bundled)

Submitter: Bryan P. Holland, City of North Port
Comment on Proposal No: 1-19
Recommendation: I continue to support this proposal.
Substantiation: I have found the enforcement of ampacity derating due to required adjustments when cables and conductors are bundled varies widely among jurisdictions and AHJs. This change will, in the least, provide guidance for proper enforcement within the intent of the NEC. The terms "periodically bound together" can include bundling that does not have a "physical" means of bounding the cables and conductors such as multiple cables passed through a single hole or notch in a framing member.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 1-14.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
MCMAHILL, L.: See my explanation of negative vote on Comment 1-14.

1-19 Log #665 NEC-P01 **Final Action: Accept**
(100. Bundled)

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 1-19
Recommendation: Proposal 1-19 should be Rejected.
Substantiation: The definition of "Bundled" in 520.2 is very explicit in that it specifies "Cables or conductors that are physically tied, wrapped, taped, or otherwise periodically bound together."

The use of the term "bundled" as used by CMP 6 and CMP 7 does not require that the cables or conductors be "physically bound together"; it applies to conductors or cables where spacing is not maintained.

Therefore, if the 502.2 definition of "bundling" is included in Article 100, Table 310.15(B)(2)(a) would no longer apply since the conductors or cables are not required to be physically bound together, and the installation would not comply with the definition proposed for Article 100. Also, 2.2.2 of the NEC Style Manual stipulates that "Definitions shall not contain requirements or recommendations."

The term "bundled" as used by CMP 6 in 310.15(B)(2)(a) applies "...where single conductors or multiconductor cables are stacked or bundled longer than 600 mm (24 in.) without maintaining spacing and are not installed in raceways...". 310.15(B)(2)(a) Exception No. 5(3), including the last paragraph, does not require that the cables or conductors be physically bound together.

In the 2005 NEC, the term "bundled" as used by CMP 7 in the second paragraph of 334.80 reads: "...are bundled together and pass through wood framing..." applies to cables in close proximity such as through holes in framing materials. There is no requirement that the cables be "physically bound together."

CMP 7 Accepted in Principle Proposal 7-72 and stated in the panel statement, "The panel agrees that "bundled" is not defined, and the revised wording more accurately describes the installation." This action removed the only instance where "bundled" was used in Article 334. The panel action to Accept Proposal 7-74 also resulted in the term "bundled" not being used. The term "bundled" will no longer appear in Article 334.

640.8 Grouping of Conductors, states: "Insulated conductors of different systems grouped or bundled so as to be in close physical contact with each other in the same raceway or other enclosure, or in portable cords or cables, shall comply with 300.3(C)(1)." 300.3(C)(1) stipulates that it only applies where the insulated conductors, rated 600 V or less, are installed in the same raceway or enclosure, or in portable cords or cables, and does not include the requirements of 520.2 that the cables or conductors be "physically tied, wrapped, taped or otherwise periodically bound together."

Also, Proposal 16-290, which was Rejected, included in the first paragraph of the substantiation, a reference to "...NEC 830 provided guidelines for many aspects of delivering bundled services." Article 830 covers Network-Powered Broadband Communications Systems and the use of "bundled" in this instance is clearly not within the definition of "bundled" as defined in 520.2.

The definition of "bundled" as it appears in 520.2 appears to be specifically applicable to Article 520 and not applicable to 310.15(B)(2) or Articles 334 and 640. Therefore, since the proposed definition specifically applies to only one Article, it should remain in 520.2 and not be included in Article 100.

I agree that there is confusion regarding the use of the term "bundled" as evidenced by the various interpretations that currently exist, but this confusion can easily be resolved by replacing the term "bundled" with text specifically defining the exact installation conditions where 310.15(B)(2)(a) applies or does not apply, such as CMP 7 has done in 334.80.

1-20 Log #1895 NEC-P01 **Final Action: Accept**
(100. Bundled)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 1-19
Recommendation: The proposal should be rejected.
Substantiation: The word must be free to assume subtle differences in meaning as used in different places in the NEC. The most troublesome of the proposed is the physical binding attribute. This is appropriate in Article 520, but not in Article 334, for example, where it is clear that running multiple cables through a single set of holes in succeeding framing members will create the objectionable condition addressed in the rule, even though the cables are not tie-wrapped together.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
MCMAHILL, L.: For clarity and consistency, definitions should be clear, concise and unambiguous. By accepting the submitter's comment, CMP-1 superficially supports an NEC term that is "free to assume subtle differences in meaning." This is contrary to the NEC Style Manual Sections 1.1 and 3.3. See my explanation of negative vote on Comment 1-14.

1-21 Log #996 NEC-P01 **Final Action: Reject**
(100. Clothes Closet (New))

Submitter: David Shapiro, Accurate & Intriguing Writing & Editing
Comment on Proposal No: 1-20
Recommendation: Revise the definition to read as follows:

Clothes Closet. A small room, chamber, or area used primarily for storage of clothes and not designed for nor, in normal circumstances lending itself to, uses other than storage.

Substantiation: I believe that Mr. Johnston's new text should be accepted without the CMP's proposed modification. The manual's warning against circular definitions is not at issue, and the CMP's circumlocution adds nothing.

However, I've seen bedrooms, bathrooms, even stairways that were given over to piles of clothing. His definition technically would include them, and I doubt that is anybody's intention. It's far better to say this clearly than to rely on "You know what we mean." I thought twice about suggesting the phrase, "in normal circumstances," but scenarios came to mind making it worthwhile. For example, an inspector shows up and finds boxes piled in an area while construction work is being performed in the next room
.**Panel Meeting Action: Reject**
Panel Statement: The recommendation does not add clarity to the definition as accepted by the Panel on Proposal 1-20.

Ballot Results: Affirmative: 12

1-22 Log #2099 NEC-P01 **Final Action: Accept in Principle**
(100. Clothes Closet (New))

TCC Action: The Technical Correlating Committee notes that the action on this comment does not result in a change to the panel action on the proposal.
Submitter: James H. Maxfield, Dover, NH
Comment on Proposal No: 1-20
Recommendation: Add:

A new habitable room or space intended primarily for storage of garments and apparel.

Substantiation: The definition of clothes closet should be added to Article 100 as revised by CMP 1 because of the facts outlined in the original submitter's proposal, CMP-1 definition includes the term "non-habitable room" which should assist the industry in classifying these areas, which have an infinite number of design possibilities whether located indoors or out. The addition of this definition will help achieve the minimum standards of NFPA 70.
Panel Meeting Action: Accept in Principle
Add:

A ~~new~~ non-habitable room or space intended primarily for storage of garments and apparel.

Panel Statement: CMP-1 concurs with the submitter's comments and suggestion to accept (add) the revised definition as noted in Panel action in Proposal 1-20. CMP-1 concludes that the submitter meant to use the word "non" as opposed to "new" in the recommended text.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-23 Log #2113 NEC-P01 **Final Action: Accept in Principle**
(100. Clothes Closet (New))

Submitter: Michael Estes, Barrington, NH
Comment on Proposal No: 1-20
Recommendation: Add a new definition to read as follows:
Clothes Closet. A small room, chamber, or area used primarily for storage of clothes.
Substantiation: Defining an area as a clothes closet will address the problems associated with general requirements for wiring walk-in type closets and closets with windows. [410.8, 240.24(D), and 550.11(A) – vs. – 210.52, 210.70, and 210.12].
Panel Meeting Action: Accept in Principle
Panel Statement: The Panel Action on Proposal 1-20 addresses the concern of the submitter.

Ballot Results: Affirmative: 12

5-2 Log #1026 NEC-P05 **Final Action: Reject**
(100. Commercial Occupancy (New))

Submitter: David Shapiro, Safety First Electrical Contracting Consulting & Safety Education
Comment on Proposal No: 5-146
Recommendation: Add a new definition to read as follows:
Commercial Occupancy. An area consisting of a structure or structures, outdoor areas, or portions of structures separated by suitable firewalls, not devoted to residential, agricultural or industrial use, but including other uses such as institutions.
Substantiation: Two members of CMP 5 considered Proposal 5-146 material for Article 100. Along with the proposer and two CMP members, I see problems with the use of the terms, "commercial and industrial" when many, albeit not all, institutional occupancies may warrant similar treatment, and may even be intended to be covered by the terms, "commercial and industrial." If this wording does not suit, or if it seems appropriate to define other occupancies at the same time, perhaps a task group could be established to examine the matter.
Panel Meeting Action: Reject
Panel Statement: The definition is not clear, since it defines what the area is not devoted to. There are numerous items that are not identified in the list that are not commercial occupancies, such as penitentiary and institutional. This definition may need to be submitted to CMP-1.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

1-24 Log #1438 NEC-P01 **Final Action: Reject**
(100. Concealed Space)

Submitter: Allen C. Weidman, The Society of the Plastics Industry, Inc.
Comment on Proposal No: 1-23
Recommendation: Accept this proposal in principle by accepting the proposed definition of concealed space and also modifying the definition of "concealed" as shown below:
Concealed Space. That portion(s) of a building behind walls, over suspended ceilings, in pipe chases, attics, and in whose size might normally range from 44.45 mm (1 3/4 in.) stud spaces to 2.44 m (8 ft) interstitial truss spaces and that might contain combustible materials such as building structural members, thermal and/or electrical insulation, and ducting. [NFPA 96:3.3.42.1]
Concealed (as applied to wiring methods). Rendered inaccessible by the structure or finish of the building. Wires in concealed raceways are considered concealed, even though they may become accessible by withdrawing them.
Substantiation: The proposal cited the following uses of the term concealed space in the NEC:
320.30(D)(1)
(D) Unsupported Cables. Type AC cable shall be permitted to be unsupported where the cable complies with any of the following:
(1) Is fished between access points through **concealed spaces** in finished buildings or structures and supporting is impracticable
330.30(D)(1)
(D) Unsupported Cables. Type MC cable shall be permitted to be unsupported where the cable:
(1) Is fished between access points through **concealed spaces** in finished buildings or structures and supporting is impractical; or
332.30(B)
332.30 Securing and Supporting. Type MI cable shall be supported and secured by staples, straps, hangers, or similar fittings, designed and installed so as not to damage the cable, at intervals not exceeding 1.8 m (6 ft).
(A) Horizontal Runs Through Holes and Notches. In other than vertical runs, cables installed in accordance with 300.4 shall be considered supported and secured where such support does not exceed 1.8 m (6 ft) intervals.
(B) Unsupported Cable. Type MI cable shall be permitted to be unsupported where the cable is fished between access points through **concealed spaces** in finished buildings or structures and supporting is impracticable.
334.30(B)
(B) Unsupported Cables. Nonmetallic-sheathed cable shall be permitted to be unsupported where the cable:
(1) Is fished between access points through **concealed spaces** in finished buildings or structures and supporting is impracticable.
376.10
376.10 Uses Permitted. The use of metal wireways shall be permitted in the following:
(1) For exposed work
(2) In **concealed spaces** as permitted in 376.10(4)
604.4,
604.4 Uses Permitted. Manufactured wiring systems shall be permitted in accessible and dry locations and in ducts, plenums, and other air-handling spaces where listed for this application and installed in accordance with 300.22.
Exception No. 1: In **concealed spaces**, one end of tapped cable shall be permitted to extend into hollow walls for direct termination at switch and outlet points.
760.30(A)(1)
760.30 Multiconductor NPLFA Cables. Multiconductor non–power-limited fire alarm cables that meet the requirements of 760.81 shall be permitted to be used on fire alarm circuits operating at 150 volts or less and shall be installed in accordance with 760.30(A) and 760.30(B).
(A) NPLFA Wiring Method. Multiconductor non–power-limited fire alarm circuit cables shall be installed in accordance with 760.30(A)(1), (A)(2), and (A)(3).
(1) Exposed or Fished in **Concealed Spaces**. In raceway or exposed on surface of ceiling and sidewalls or fished in **concealed spaces**. Cable splices or terminations shall be made in listed fittings, boxes, enclosures, fire alarm devices, or utilization equipment. Where installed exposed, cables shall be adequately supported and installed in such a way that maximum protection against physical damage is afforded by building construction such as baseboards, door frames, ledges, and so forth. Where located within 2.1 m (7 ft) of the floor, cables shall be securely fastened in an approved manner at intervals of not more than 450 mm (18 in.).
760.52(B)(1)
(B) PLFA Wiring Methods and Materials. Power-limited fire alarm conductors and cables described in 760.82 shall be installed as detailed in 760.52(B)(1), (B)(2), or (B)(3) of this section. Devices shall be installed in accordance with 110.3(B), 300.11(A), and 300.15.
(1) Exposed or Fished in **Concealed Spaces**. In raceway or exposed on the surface of ceiling and sidewalls or fished in **concealed spaces**. Cable splices or terminations shall be made in listed fittings, boxes, enclosures, fire alarm devices, or utilization equipment. Where installed exposed, cables shall be adequately supported and installed in such a way that maximum protection against physical damage is afforded by building construction such as baseboards, door frames, ledges, and so forth. Where located within 2.1 m (7 ft) of the floor, cables shall be securely fastened in an approved manner at intervals of not more than 450 mm (18 in.).
770.154(A) FPN
Nonconductive and conductive optical fiber cables shall comply with any of the requirements given in 770.154(A) through 770.154(E) or where cable substitutions are made as shown in 770.154(F).
(A) Plenums. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type OFNP or OFCP. Abandoned cables shall not be permitted to remain. Types OFNR, OFCR, OFNG, OFN, OFCG, and OFC cables installed in compliance with 300.22 shall be permitted. Listed plenum optical fiber raceways shall be permitted to be installed in ducts and plenums as described in 300.22(B) and in other spaces used for environmental air as described in 300.22(C). Only type OFNP and OFCP cables shall be permitted to be installed in these raceways.
FPN: See 8.14.1 of NFPA 13 (2002), Installation of Sprinkler Systems, for requirements for sprinklers in **concealed spaces** containing exposed combustibles.
800.154(A) FPN
(A) Plenum. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type CMP. Abandoned cables shall not be permitted to remain. Types CMP, CMR, CMG, CM, and CMX and communications wire installed in compliance with 300.22 shall be permitted. Listed plenum communications raceways shall be permitted to be installed in ducts and plenums as described in 300.22(B) and in other spaces used for environmental air as described in 300.22(C). Only Type CMP cable shall be permitted to be installed in raceways.
FPN: See 8.14.1 of NFPA 13-2002, Installation of Sprinkler Systems, for requirements for sprinklers in **concealed spaces** containing exposed combustibles.
820.154(A)FPN

(A) Plenums. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type CATVP. Abandoned cables shall not be permitted to remain. Types CATVP, CATVR, CATV, and CATVX cables installed in compliance with 300.22 shall be permitted. Listed plenum CATV raceways shall be permitted to be installed in ducts and plenums as described in 300.22(B) and in other spaces used for environmental air as described in 300.22(C). Only Type CATVP cable shall be permitted to be installed in these raceways.
FPN: See 8.14.1 of NFPA 13-2002, Installation of Sprinkler Systems, for requirements for sprinklers in **concealed spaces** containing exposed combustibles.
The panel rejected the proposal because of the Standards Council directive to maintain the status quo on issues related to plenum cables. The panel should reconsider its position relative to the applicability of the standards council directive to this proposal.

Clearly, the use term "concealed spaces" in Articles 320, 330, 332, 334, 376, 604 and 760 has no relation to plenum cables.

The use of the term "concealed spaces" in the plenum cable applications sections of Articles 770, 800 and 820 is in nonmandatory fine print notes. Defining the a term in a fine print note does not change plenum cable requirements because the fine print note is for information only; it is not a mandatory requirement.

This definition is an extract from NFPA 96, Standard for Ventilation Control and Fire Protection of Commercial Cooking Operations. It is the only definition of concealed space in the NFPA Glossary.

The definition of "Concealed" currently in the NEC is:

"Concealed. Rendered inaccessible by the structure or finish of the building. Wires in concealed raceways are considered concealed, even though they may become accessible by withdrawing them."

The recommended change to the definition of "Concealed" will clarify that the current definition deals with wiring methods just as one of the definitions of "Accessible" applies to wiring methods.

"Accessible (as applied to equipment). Admitting close approach; not guarded by locked doors, elevation, or other effective means.

Accessible **(as applied to wiring methods)**. Capable of being removed or exposed without damaging the building structure or finish or not permanently closed in by the structure or finish of the building.
Accessible, Readily (Readily Accessible). Capable of being reached quickly for operation, renewal, or inspections without requiring those to whom ready access is requisite to climb over or remove obstacles or to resort to portable ladders, and so forth."
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its statement on proposal 1-23.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-25 Log #1606 NEC-P01 **Final Action: Reject**
(100. Concealed Space)

Submitter: Allen C. Weidman, Society of the Plastics Industry, Inc.
Comment on Proposal No: 1-23
Recommendation: Accept this proposal in principle by accepting the proposed definition of concealed space and also modifying the definition of "concealed" as shown below:
Concealed Space. That portion(s) of a building behind walls, over suspended ceilings, in pipe chases, attics, and in whose size might normally range from 44.45 mm (1 3/4 in.) stud spaces to 2.44 m (8 ft) interstitial truss spaces and that might contain combustible materials such as building structural members, thermal and/or electrical insulation, and ducting. [NFPA 96:3.3.42.1]
Concealed (as applied to wiring methods). Rendered inaccessible by the structure or finish of the building. Wires in concealed raceways are considered concealed, even though they may become accessible by withdrawing them.
Substantiation: The proposal cited the following uses of the term concealed space in the NEC:
320.30(D)(1)
(D) Unsupported Cables. Type AC cable shall be permitted to be unsupported where the cable complies with any of the following:
(1) Is fished between access points through **concealed spaces** in finished buildings or structures and supporting is impracticable
330.30(D)(1)
(D) Unsupported Cables. Type MC cable shall be permitted to be unsupported where the cable:
(1) Is fished between access points through **concealed spaces** in finished buildings or structures and supporting is impractical; or
332.30(B)
332.30 Securing and Supporting. Type MI cable shall be supported and secured by staples, straps, hangers, or similar fittings, designed and installed so as not to damage the cable, at intervals not exceeding 1.8 m (6 ft).
(A) Horizontal Runs Through Holes and Notches. In other than vertical runs, cables installed in accordance with 300.4 shall be considered supported and secured where such support does not exceed 1.8 m (6 ft) intervals.
(B) Unsupported Cable. Type MI cable shall be permitted to be unsupported where the cable is fished between access points through **concealed spaces** in finished buildings or structures and supporting is impracticable.
334.30(B)
(B) Unsupported Cables. Nonmetallic-sheathed cable shall be permitted to be unsupported where the cable:
(1) Is fished between access points through **concealed spaces** in finished buildings or structures and supporting is impracticable.
376.10

Where located within 2.1 m (7 ft) of the floor, cables shall be securely fastened in an approved manner at intervals of not more than 450 mm (18 in.).
770.154(A) FPN
Nonconductive and conductive optical fiber cables shall comply with any of the requirements given in 770.154(A) through 770.154(E) or where cable substitutions are made as shown in 770.154(F).
(A) Plenums. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type OFNP or OFCP. Abandoned cables shall not be permitted to remain. Types OFNR, OFCR, OFNG, OFN, OFCG, and OFC cables installed in compliance with 300.22 shall be permitted. Listed plenum optical fiber raceways shall be permitted to be installed in ducts and plenums as described in 300.22(B) and in other spaces used for environmental air as described in 300.22(C). Only type OFNP and OFCP cables shall be permitted to be installed in these raceways.
FPN: See 8.14.1 of NFPA 13 (2002), Installation of Sprinkler Systems, for requirements for sprinklers in **concealed spaces** containing exposed combustibles.
800.154(A) FPN
(A) Plenum. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type CMP. Abandoned cables shall not be permitted to remain. Types CMP, CMR, CMG, CM, and CMX and communications wire installed in compliance with 300.22 shall be permitted. Listed plenum communications raceways shall be permitted to be installed in ducts and plenums as described in 300.22(B) and in other spaces used for environmental air as described in 300.22(C). Only Type CMP cable shall be permitted to be installed in raceways.
FPN: See 8.14.1 of NFPA 13-2002, Installation of Sprinkler Systems, for requirements for sprinklers in **concealed spaces** containing exposed combustibles.
820.154(A)FPN

(A) Plenums. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type CATVP. Abandoned cables shall not be permitted to remain. Types CATVP, CATVR, CATV, and CATVX cables installed in compliance with 300.22 shall be permitted. Listed plenum CATV raceways shall be permitted to be installed in ducts and plenums as described in 300.22(B) and in other spaces used for environmental air as described in 300.22(C). Only Type CATVP cable shall be permitted to be installed in these raceways.
FPN: See 8.14.1 of NFPA 13-2002, Installation of Sprinkler Systems, for requirements for sprinklers in **concealed spaces** containing exposed combustibles.

The panel rejected the proposal because of the Standards Council directive to maintain the status quo on issues related to plenum cables. The panel should reconsider its position relative to the applicability of the standards council directive to this proposal.

Clearly, the use term "concealed spaces" in Articles 320, 330, 332, 334, 376, 604 and 760 has no relation to plenum cables.

The use of the term "concealed spaces" in the plenum cable applications sections of Articles 770, 800 and 820 is in nonmandatory fine print notes. Defining the a term in a fine print note does not change plenum cable requirements because the fine print note is for information only; it is not a mandatory requirement.

This definition is an extract from NFPA 96, Standard for Ventilation Control and Fire Protection of Commercial Cooking Operations. It is the only definition of concealed space in the NFPA Glossary.

The definition of "Concealed" currently in the NEC is:

"Concealed. Rendered inaccessible by the structure or finish of the building. Wires in concealed raceways are considered concealed, even though they may become accessible by withdrawing them."

The recommended change to the definition of "Concealed" will clarify that the current definition deals with wiring methods just as one of the definitions of "Accessible" applies to wiring methods.

"Accessible (as applied to equipment). Admitting close approach; not guarded by locked doors, elevation, or other effective means.
Accessible **(as applied to wiring methods)**. Capable of being removed or exposed without damaging the building structure or finish or not permanently closed in by the structure or finish of the building.

Accessible, Readily (Readily Accessible). Capable of being reached quickly for operation, renewal, or inspections without requiring those to whom ready access is requisite to climb over or remove obstacles or to resort to portable ladders, and so forth."

Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its statement on proposal 1-23.

(100. Conductor, open, Cable, open multiconductor)

TCC Action: The Technical Correlating Committee understands that the action on Proposal 6-2 occurs in Comment 4-2a.
Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 6-2
Recommendation: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panel 4 for action in Article 225. This action will be considered by Code-Making Panel 4 as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-2 Log #34 NEC-P04 **Final Action: Accept**
(100. Conductor, open, Cable, open multiconductor)

TCC Action: The Technical Correlating Committee understands that the action on Proposal 6-2 occurs in Comment 4-2b.
Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 6-3
Recommendation: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panel 4 for action in Article 225. This action will be considered by Code-Making Panel 4 as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-2a Log #CC400 NEC-P04 **Final Action: Accept**
(100. Conductor, open, Cable, open multiconductor)

Submitter: Code-Making Panel 4,
Comment on Proposal No: 4-1
Recommendation: Reject proposal 6-2
Substantiation: The two proposed definitions are very generic definitions where a general dictionary definition for "open" can be used without inserting this definition into Article 100 or into Article 225. There was a concentrated effort during the 2005 NEC cycle to clarify the differences between "open" conductors and "exposed" conductors. The usage of "open" in Article 225 is dealing with the general dictionary definition of being open or exposed. Inserting these definitions into Article 100 or into Article 225 could also be confusing to the user of the NEC since Article 398 addresses Open Wiring on Insulators.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-2b Log #CC401 NEC-P04 **Final Action: Accept**
(100.Conductor, open, Cable, open multiconductor)

Submitter: Code-Making Panel 4,
Comment on Proposal No: 4-2
Recommendation: Reject proposal 6-3
Substantiation: The two proposed definitions are very generic definitions where a general dictionary definition for "open" can be used without inserting this definition into Article 100 or into Article 225. There was a concentrated effort during the 2005 NEC cycle to clarify the differences between "open" conductors and "exposed" conductors. The usage of "open" in Article 225 is dealing with the general dictionary definition of being open or exposed. Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

9-1 Log #541 NEC-P09 **Final Action: Reject**
(100. Conduit Body)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 9-2
Recommendation: Accept the proposal.
Substantiation: Conduit bodies are not restricted to conduit or tubing systems. "Proper" use by attachment to a raceway is not mandated by Code. A cord or cable could enter a properly supported conduit body for purpose of splicing, or where the conduit body is attached to a cabinet, box, enclosure, or housing of equipment with a chase nipple (a fitting not conduit or tubing). A conduit body supporting a floodlight lampholder and connected to a box with a chase nipple has no conduit or tubing involved.
Panel Meeting Action: Reject
Panel Statement: For the purposes of this definition, a chase nipple is both a fitting as well as an element of a raceway. The definition of the term raceway includes, but is "not limited to" various Chapter 3 methods. There is no evidence that the existing definition is causing confusion in the field.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

2-3 Log #508 NEC-P02 **Final Action: Reject**
(100. Connected Load (New))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 2-3
Recommendation: Accept the proposal.
Substantiation: "Calculated" load is well defined by tables, va/sq ft, va per outlet, demand factors, etc. An unconnected calculated load is not the same as a connected load since no equipment is necessarily connected. 210.11(B) uses the terms "calculated load" and "connected load" which infers a difference.
Panel Meeting Action: Reject
Panel Statement: As with the original proposal, the submitter has not presented substantiation that the term "connected load" needs to be specifically defined. The term is well understood within the context of how it is used.
Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-26 Log #419 NEC-P01 **Final Action: Reject**
(100. Connection, Permanent (Direct) Connection, Cord-and-Plug (new))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 1-24
Recommendation: Accept revised:
Conductors that are connected by means other than attachment plug, receptacle. Cord connector body, or motor base inlet, such as lugs, terminals. Wire connectors, clamps, solder, screws, and the like.
Substantiation: A definition for permanently connected is useful and has nothing to do whether permanently installed equipment is cord and plug connected, whether portable or fixed. This would also apply to equipment permitted to be cord connected without a plug/receptacle such as elevators, motors, etc. The perception of some code users is that all cord wiring is not "permanently installed" or "fixed wiring" or "permanently connected".
Panel Meeting Action: Reject
Panel Statement: The term being defined is not used in the Code and the proposal is not consistent with NEC Style Manual 2.2.2.1.
CMP-1 is not totally clear on what the submitter of this comment is recommending. Regardless, the revised text proposed in this comment does not change CMP-1's position on accepting a new definition (see CMP-1's panel statement during the Proposal stage). CMP-1 suggests that the submitter of this comment see the NEC Style Manual Section 2.2.2 - definitions shall not contain the term being defined. In addition the comment lacks simple declarative sentence structure as required by 3.3.1.2.2 of the NEC Style Manual.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-27 Log #540 NEC-P01 **Final Action: Reject**
(100. Disconnecting Means)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 1-26
Recommendation: Accept the proposal.
Substantiation: The proposal is no more a "requirement" than that of other definitions, e.g., "accessible" (wiring methods) "without damaging the building structure or finish"; "cabinet" "provided with a frame"; "in sight from" "visible and not more than 15 m (50 ft) distant"; "rainproof" "constructed protected or treated"; "switch, general use snap" "constructed so that it can be installed"; switch. Motor circuit "rated in horsepower that is capable of"; ventilated "provided with a means".
Panel Meeting Action: Reject
Panel Statement: The substantiation for submitter's original proposal (1-26) describes devices which de-energize circuits. They do not disconnect conductors from their source of supply. Only disconnecting means do that. Neither the original proposal nor the comment indicates that Code users are confused by the existing definition of Disconnecting Means.
The Panel reaffirms its statement on Proposal 1-26. The Proposal clearly, and improperly, adds a requirement to the definition. Such a requirement, if necessary, could be requested by the submitter for inclusion in the appropriate Code Sections through proposals for the 2011 NEC.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-28 Log #689 NEC-P01 **Final Action: Hold**
(100. Dwelling Unit)

TCC Action: After reviewing the entire record, including the existing rules in 210.18 and 210.60, the Technical Correlating Committee directs that Comment 1-28 and Proposal 1-27 be reported as "Hold" for review during the 2011 revision cycle. Although the revised definition is suitable for application in NFPA 101 and 5000, the lack of other occupancies being defined in the NEC (such as dormitories, rooming houses, etc.) creates a concern for how the definition will be applied in the application of the NEC.
Submitter: Timothy M. Croushore, Allegheny Power
Comment on Proposal No: 1-27
Recommendation: Please reject the original proposal.
Substantiation: The proposed statement in the substantiation that "the definition does not change the intent of any of the codes..." is not correct. Rather, adding the new term "housekeeping purposes" introduces a new concept that is not currently in any of the NFPA standards. Deleting the term "permanent provisions for..." eliminates a long standing clarification for cooking between a portable microwave oven and an installed cook-top in a counter top. Also, the revised definition would now have all guest rooms of hotels and motels and college dormitories as dwelling units. The revised definition does not add clarity to the definition of dwelling unit. Rather, it changes the definition.
Panel Meeting Action: Reject
Panel Statement: The panel is eliminating the distinction between portable microwave ovens (as well as toaster-ovens and similar appliances) and installed cooktops, as many dwelling units do not contain permanent cooking appliances. The panel is also including those hotel rooms and dormitory rooms that meet the proposed definition among "dwelling units".
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-29 Log #1859 NEC-P01 **Final Action: Reject**
(100. Dwelling Unit)

Submitter: Mike Holt, Mike Holt Enterprises, Inc.
Comment on Proposal No: 1-27
Recommendation: Include the word "permanent", as follows:
Dwelling Unit. One or more rooms arranged for complete independent housekeeping purposes, with space for eating, living, and sleeping, permanent facilities for cooking, and provisions for sanitation.
Substantiation: Accepting this change as proposed would make any guest room or guest suite containing a microwave a dwelling unit. The proponent did not include any technical data that would justify incorporating the dwelling unit provisions into hotel/motel applications, such as AFCIs, GFCIs, receptacle placements, and so forth.
Panel Meeting Action: Reject
Panel Statement: See CMP-1's action and statement on Comment 1-28.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

13-1 Log #4 NEC-P13 **Final Action: Accept**
(100. Electrical Power Production and Distribution Network)

TCC Action: The Technical Correlating Committee notes that the direction given to the panel is addressed by their action on Comment 13-2.
Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 1-28
Recommendation: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 13 for action. This action will be considered by Code-Making Panel 13 as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

13-2 Log #768 NEC-P13 **Final Action: Accept**
(100. Electrical Power Production and Distribution Network)

Submitter: Louis A. Barrios, Shell Global Solutions
Comment on Proposal No: 1-28
Recommendation: Editorial change to revise text as follows:
Power production, distribution, and utilization equipment and facilities, such as ~~a~~ electric utility systems that deliver electric power to the connected loads, that are ~~is~~ external to and not controlled by an interactive system.
Substantiation: Editorial change on original panel action to improve grammar of definition. Refer also to Mr. Barrios' affirmative comment.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

5-3 Log #1671 NEC-P05 **Final Action: Accept**
(100. Equipment Grounding Conductor (EGC))

Submitter: Phil Simmons, Olympia, WA
Comment on Proposal No: 5-6
Recommendation: Revise the definition to read as follows:
Equipment Grounding Conductor (EGC). The conductive path installed to connect normally non-current-carrying metal parts of equipment together and to the system grounded conductor or to the grounding electrode conductor, or both.
Retain the two FPNs.
Substantiation: The words "or both" should be added to the end of the definition to recognize that in many cases, the equipment grounding conductor is connected to both the system grounded conductor and to the grounding electrode.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

13-3 Log #85 NEC-P13 **Final Action: Accept**
(100. Fault Tolerant External Control Circuit (GOT))

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 13-1
Recommendation: The Technical Correlating Committee understands that the Panel Action was to accept the proposed secondary definition which is the same text that appears in the 2005 Code.
The Technical Correlating Committee directs that the definition remain in 695.2, since it is only used in Article 695.
This action will be considered by the Panel as a Public Comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

3-2 Log #449 NEC-P03 **Final Action: Reject**
(100. Fire Stop)

Submitter: Allen C. Weidman, The Society of the Plastics Industry, Inc.
Comment on Proposal No: 3-2
Recommendation: Accept this proposal.
Substantiation: 300.21 uses the term "firestopped" with an additional FPN. It seems reasonable to include a definition of "fire stop," considering the importance of firestopping identified in 300.21.

Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any technical substantiation in his comment to justify adding this definition to the NEC. This term is only used once in the NEC, in Section 300.21, and generally a definition is only placed in Article 100 where that term is used in two or more articles of the Code. The panel reaffirms the panel statement from the proposal as follows: "Fire Stop" is a common phrase used in the building industry, similar to "fire rating" and "fire resistance" used in various sections in the NEC, that does not require a definition be inserted into Article 100 for the user of the NEC. Where these terms are used, the user of the Code can access other documents, such as NFPA 914 and the various building codes, to determine the meaning of these terms if he or she doesn't already know the definition. Inserting all the building code definitions would make Article 100 totally unwieldy and difficult to use.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

5-4 Log #1853 NEC-P05 **Final Action: Accept**
(100. Ground)

Submitter: Mike Holt, Mike Holt Enterprises, Inc.
Comment on Proposal No: 5-8
Recommendation: Continue to Accept this Proposal as submitted.
Substantiation: The deletion of the unnecessary text will provide clarity to a widely misunderstood topic.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

2-4 Log #1886 NEC-P02 **Final Action: Reject**
(100. Ground-Fault Circuit Interrupter)

Submitter: Paul S. Hamer, Richmond, CA
Comment on Proposal No: 2-6
Recommendation: This proposal (and its companion Proposals 2-88, 2-285, 11-48 and 11-49 - Comments submitted separately) should be accepted. Add to the end of the proposed wording: <u>This definition shall become effective January 1, 2011.</u> This aligns with Mr. Weber's Explanation of Negative for Proposal 2-88 regarding the development of new, life-saving concepts. Adding the delayed effective date would provide the incentive and the necessary time for the Three-Phase Ground-Fault Circuit-Interrupter System (GFCIS-3Ph) to be further developed and commercialized.
Substantiation: The Panel Statement of Proposal 2-88 (referred to in this Panel Statement) includes "...The submitter's substantiation notes that the hazard is when unqualified persons work on equipment without taking the appropriate precautions to deenergize the circuit and verify that circuit is disconnected...". There are numerous instances where unqualified persons were electrocuted by faulty or defective equipment (see the supporting material submitted with the proposals), and these people may have been protected from electrocution by the proposed GFCIS-3Ph. See also the Explanation of Negatives of Mr. King and Mr. Weber for Proposal 2-88. The patent applications are pending for the GFCIS-3Ph as of this date, but further field measurements made since the Proposal submittal date indicate that the distributed phase capacitances on an actual installed three-phase 480 volt power system are balanced enough to permit the sensitivity described in the proposals.
Panel Meeting Action: Reject
Panel Statement: The panel does not agree with the addition of the system as proposed in Comment 2-62, and as such the definition is not added because it is not used in the NEC. See the panel action and statement on Comment 2-62.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
KING, D.: Panel 2 should give further consideration to this proposed system. See my explanation of negative on Comment 2-62.

5-5 Log #1221 NEC-P05 **Final Action: Accept**
(100. Grounded)

Submitter: Neil F. LaBrake, Jr., Syracuse, NY
Comment on Proposal No: 5-9
Recommendation: The TCC Grounding and Bonding Task Group recommends that CMP-5 continue to Accept in Principle Proposal 5-9.
Substantiation: The TCC Grounding and Bonding Task Group agrees with the CMP-5 editorial revision to the Definition of the word "Grounded".
This Comment was developed by a Task Group assigned by the NEC Technical Correlating Committee to address actions that were other than "accept" taken by Code-Making Panels on proposals from the TCC to resolve 2005 NEC Proposal 5-1 and Comment 5-1. Members of the Task Group on Grounding and Bonding for this Comment included: C. Douglas White; Michael Johnston; Jeffrey Boksiner; Daleep Mohla; Phil Simmons; Christopher Hutchings; James Carroll; Alan Rebeck; Richard Loyd; Paul Dobrowsky; and Neil F. LaBrake, Jr.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-7 Log #2074 NEC-P05 **Final Action: Reject**
(100. Grounding Conductor)

Submitter: Chuck Mello, Underwriters Laboratories
Comment on Proposal No: 5-11
Recommendation: Revise definition to read as follows:
Grounding Conductor. ~~A conductor used to connect equipment or the grounded circuit of a wiring system to a grounding electrode or electrodes~~ A general term used to include all conductors that connect equipment or systems to ground and that connect normally non-current carrying metal parts of equipment together.
FPN: Grounding electrode conductors, bonding conductors, and equipment grounding conductors all are types of grounding conductors.
Substantiation: The actions of the panel were correct to reject the deletion of this definition. After the full deliberations it appears the definition of "grounding conductor" should be considered for revision to ensure the concept of being all-inclusive. The proposed text clarifies that a "grounding conductor" would include grounding electrode conductors, equipment grounding conductors and bonding conductors. The term "grounding conductor" Is still used many times in various articles of the 2008 Draft NEC and the context has different meanings that would be covered by this revised definition.
Panel Meeting Action: Reject
Panel Statement: The panel affirms that the original objectives of the TCC assigned Grounding and Bonding Task Group were to provide more accurate and specific definitions for words and terms related to grounding and bonding. This type of proposed generalization of the term "grounding conductor" reintroduces some of the inaccuracies and vagueness that the work of the grounding and bonding task group was responsible for reducing. The term "Grounding Conductor" is presently used in Articles 800, 810, 820, and 830 to identify the conductor that connects the communications system grounding conductors to a grounding electrode. Changing the term to include equipment grounding conductors would add confusion.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:
BOKSINER, J.: This comment should be accepted or accepted in principle. As a result of the change to the definition of "Grounding Electrode Conductor," the definition of "Grounding Electrode Conductor" and "Grounding Conductor" are almost identical. With the change in definitions, the term "Grounding Conductor," as presently defined, has become superfluous. The definition of "Grounding Conductor" should be revised to describe the full set of grounding conductors including equipment grounding conductors and grounding electrode conductors. Otherwise, this term should be deleted from the NEC.
BRETT, JR., M.: I am voting negative, I agree with the negative vote. The proposed definitions do not add clarity to the NE,. The definition of "Grounding Coductor" should be deleted.
The defined conductors, such as, the Equipment Grounding Conductor, the Grounding Electrode Conductor and even the Grounded Conductor (Neutral), have been referred to as a grounding conductor.

5-8 Log #1223 NEC-P05 **Final Action: Accept**
(100. Grounding Electrode)

Submitter: Neil F. LaBrake, Jr., Syracuse, NY
Comment on Proposal No: 5-14
Recommendation: The TCC Grounding and Bonding Task Group recommends that CMP-5 continue to Accept in Principle Proposal 5-14.
Substantiation: The TCC Grounding and Bonding Task Group agrees with the CMP-5 editorial revision to the Definition of the word "Grounding Electrode".

This Comment was developed by a Task Group assigned by the NEC Technical Correlating Committee to address actions that were other than "accept" taken by Code-Making Panels on proposals from the TCC to resolve 2005 NEC Proposal 5-1 and Comment 5-1. Members of the Task Group on Grounding and Bonding for this Comment included: C. Douglas White; Michael Johnston; Jeffrey Boksiner; Daleep Mohla; Phil Simmons; Christopher Hutchings; James Carroll; Alan Rebeck; Richard Loyd; Paul Dobrowsky; and Neil F. LaBrake, Jr.

Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-6 Log #2079 NEC-P05 **Final Action: Accept**
(100.Grounding Electrode Conductor)

Submitter: Chuck Mello, Underwriters Laboratories
Comment on Proposal No: 5-18
Recommendation: Revise proposed definition to read as follows:
Grounding Electrode Conductor. A conductor used to connect the system grounded conductor or the equipment to a grounding electrode or to a point on the grounding electrode system.
Substantiation: The definition in the proposal effectively prevents the connection of the grounding electrode conductor to the building "master" or "central" ground bus that is specifically permitted in 250.64(C) and 250.64(F). Under the revised definition the ends of the grounding electrode conductor can terminate only either on a grounding electrode, defined in Article 100 and specified in 250.52, or on a system conductor, to establish a system grounded conductor, or on equipment enclosures. A better definition would be as stated above so as to not limit the terminations that are allowed by prescriptive text.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-9 Log #30 NEC-P05 **Final Action: Accept**
(100. Grounding Electrode Conductor)

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 5-18
Recommendation: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the Code-Making Panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the direction of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. See panel action on Comment 5-6.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

15-1 Log #542 NEC-P15 **Final Action: Reject**
(100. Hospital Grade Receptacles)

Submitter: Deborah J. Mann, Debbie Mann Consulting, Inc.
Comment on Proposal No: 15-34
Recommendation: Define "Hospital Grade Receptacles" and place the term in the Index. It is currently used in regard to patient bed areas, but is not defined or referenced in the index.
Substantiation: I asked ten people, including two inspectors, what a hospital grade receptacle actually is and nobody knew correctly. Several people thought it was an insulated ground receptacle, including an electrical inspector.
Panel Meeting Action: Reject
Panel Statement: The term "Hospital Grade" used in reference to a receptacle refers to a standard of device manufacture and performance. Article 100 Definitions describe general conditions or installation considerations rather than device specifications.

In addition, the submitter did not provide a specific recommendation for action on Proposal 15-34.

Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

5-10 Log #671 NEC-P05 **Final Action: Reject**
(100. Intersystem Bonding Termination)

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 5-20
Recommendation: The proposal as modified by the Panel Action should be Rejected.
Substantiation: The Panel Action to Accept in Principle by accepting the term "Intersystem Bonding Termination" into Article 100 is not in accordance with 2.2.2.1 of the NEC Style Manual which states that Article 100 shall contain definitions of terms that appear in two or more other articles of the NEC. The term "intersystem bonding termination" appears 6 times in the 2008 draft of the Code, once in Article 100 and the other 5 in 250.94. The definition of "intersystem bonding termination" may be included in 250.2 until such time as it appears in additional articles.

The definition "Intersystem Grounding Termination" in the original proposal could be accepted into Article 100 since it is used 33 times in 770.100, 800.100, 810.21, 820.100, and 830.100.

This Proposal should be correlated with Proposals 16-167 [800.100(B)], 16-236 [810.21(F)], 16-299 [820.100(B)], and 16-395 [830.100(B)] that address the use of the term "intersystem grounding termination" in those articles.
Panel Meeting Action: Reject
Panel Statement: The panel concludes that the term "Intersystem Bonding Termination" is in fact the correct terminology for this connection and that where the term "Intersystem Grounding Termination" appears in Articles 770, 800, 810, 820, and 830 it should be changed to "Intersystem Bonding Termination" to be consistent with the proposed definition and 250.94. The panel requests that the TCC correlate the terminology as indicated here.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:

BOKSINER, J.: I support the panel action but would like to point out that the necessary correlation has already been accomplished. See CMP 16 actions on Comments 16-18, 16-43, 16-128, 16-130, 16-187, 16-190, 16-231, 16-234, 16-308, 16-310.

5-11 Log #1670 NEC-P05 **Final Action: Accept in Principle**
(100. Intersystem Bonding Termination)

Submitter: Phil Simmons, Olympia, WA
Comment on Proposal No: 5-20
Recommendation: Revise the definition to read as follows:

Intersystem Bonding Termination. A device that provides a means of connecting ~~bonding~~ communications system(s) grounding conductor(s) ~~equipment~~ at the service equipment or at the disconnecting means for ~~any additional~~ buildings or structures supplied by a feeder or branch circuit.
Substantiation: The revised wording uses terms CMP-5 has chosen to be more descriptive in Article 250 and to rely less on definitions. Article 800 uses the term "grounding conductor" in 800.100. The Intersystem Bonding Termination device is intended to provide a means of connecting these grounding conductors to the service, building or structure grounding electrode system.
Panel Meeting Action: Accept in Principle

Revise the definition to read as follows:

Intersystem Bonding Termination. A device that provides a means ~~of~~ for connecting ~~bonding~~ communications system(s) grounding conductor(s) and bonding conductor(s) ~~equipment~~ at the service equipment or at the disconnecting means for ~~any additional~~ buildings or structures supplied by a feeder or branch circuit.
Panel Statement: The panel accepts the comment and revises the proposal further by adding the words "and bonding conductors" after the words "system(s) grounding conductors." The terms "grounding conductors" and "bonding conductors" are both used in the Chapter 8 articles and would be required to terminate on this same equipment to meet the requirements in those rules.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

2-5 Log #5 NEC-P02 **Final Action: Accept**
(100. Kitchen (New))

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 1-36
Recommendation: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 2 for action. This action will be considered by Code-Making Panel 2 as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept

Accept Proposal 1-36, and, in addition, delete the words "for the purposes of this requirement, a kitchen is defined as an area with a sink and permanent facilities for food preparation and cooking" from 210.8(B)(2).
Panel Statement: The panel agrees with adding the term to Article 100 and has deleted the same material from 210.8(B)(2) to avoid the definition appearing in two places.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-30 Log #303 NEC-P01 **Final Action: Accept in Part**
(100. Lighting Outlet)

Submitter: Code-Making Panel 18,
Comment on Proposal No: 1-39
Recommendation: Change the definition of "Lighting Outlet" in Article 100 as follows:

"Lighting Outlet. An outlet intended for the direct connection of a lampholder~~,~~ or luminaire (lighting fixture), ~~or a pendant cord terminating in a lampholder.~~

FPN: A receptacle outlet, switched or unswitched, is never by definition a lighting outlet, even if the receptacle is dedicated solely to lighting service as in 410.30(C)(1). A receptacle outlet may be counted in lieu of a required outlet as permitted by Exception No. 1 to 210.70(A)(1).

Substantiation: The submitter of Proposal 1-39 is incorrect in stating that the existing definition of "lighting outlet" could be interpreted to disallow the installation of a luminaire as described in 410.30(C)(1). Section 410.30 does not state that the receptacle to which the electric-discharge fixture is connected by cord and plug is a "lighting outlet". This outlet is, in fact, a switched receptacle outlet. But the outlet could be converted to a "lighting outlet" by removing the receptacle and directly wiring the luminaire to the branch circuit at that point. Nowhere in the code is it stated that a luminaire must be connected to a lighting outlet, nor does it state or imply that connecting a luminaire with a cord and plug to a receptacle converts the receptacle to a lighting outlet. An outlet becomes a lighting outlet when a luminaire is directly wired to the branch circuit at the outlet, i.e., not connected to the branch circuit through a plug/receptacle connection.

The submitter's statement: "This would also negate Exception No. 1 of 210.70(A)(1)" is confusing since the definition of "this" is unclear. 210.70(A)(1) requires a switched lighting outlet in all habitable rooms in a dwelling unit. Exception No. 1 permits a switched receptacle to be counted as the required lighting outlet in all of the habitable spaces except the bathroom and kitchen. These switched receptacles are still receptacle outlets, they are just permitted to be counted as the required lighting outlet by the code, but there is no guarantee that a luminaire will be plugged into it. The requirement for direct-wired luminaires in bathrooms and kitchens is a safety issue that assures lighting for the bath and kitchen can be made available without having to resort to cord and plug connected luminaires in zones around bathtubs and sinks. Whichever way we interpret the submitter's statement, the proposed modification to the definition of lighting outlet would not change the meaning or the application of this exception in the code, nor does the definition as it exists now negate the need for this exception.

CMP-1 erred in deleting the word "direct" from the definition of "lighting outlet." This change does not fix the problem that the submitter believes is present, and introduces conflict in other portions of the code that would have to be repaired. For example, this change would permit any switched receptacle outlet in a dwelling unit with a cord and plug connected luminaire connected to it, to qualify as a lighting outlet. A code-compliant dwelling could be constructed without having any luminaires installed.

The submitter's concerns seem to revolve around confusion, especially among inspectors and electrical contractors, regarding the meaning of the term "lighting outlet". The proposer's fix, and the CMP-1 fix, seem to cause more problems than they correct. This confusion could simply be cleared up by adding a fine print note to the definition in Article 100. This would clarify the meaning of the definition without introducing changes that would impact other code sections.

CMP-18 also recommends removing the phrase "or a pendant cord terminating in a lampholder" from the definition. There are no listed cord-connected lampholders. There are "cord-connected luminaires," but these are covered by the definition of "luminaire" and do not need to be specifically addressed in the definition of "lighting outlet."

This comment was balloted through CMP-18 with the following ballot results:

14 Eligible to Vote
14 Affirmative

Panel Meeting Action: Accept in Part
The panel accepted the definition of "Lighting Outlet" in Article 100, with a minor editorial change,as submitted by CMP-18 as follows:

"Lighting Outlet. An outlet intended for the direct connection of a lampholder or luminaire (lighting fixture)."

The panel rejects the inclusion of the FPN.
Panel Statement: The panel accepts the revised definition, but rejects the addition of the FPN because it contains a requirement which is not allowed in 3.1.3 of the NEC Style Manual.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

MCMAHILL, L.: I concur with the removal of the FPN; however, I disagree with CMP-1's action of adding the word "direct" to the definition and deleting "or a pendant cord terminating in a lampholder" from the definition. An "Outlet" is defined as "A point on the wiring system at which current is taken to supply utilization equipment." Lampholders and luminaires are utilization equipment. Utilization equipment can be permanently connected or cord- and plug- connected to the wiring system. Adding the word "direct" appears to negate the use of a cord- and plug connection allowed by Section 410.30(C)(1), Exception. In addition, deletion of "or a pendant cord terminating in a lampholder" appears to prohibit field installed pendant lampholders. I doubt that this was the intent of CMP-1

1-31 Log #320 NEC-P01 **Final Action: Reject**
(100. Lighting Outlet)

Submitter: Code-Making Panel 2,
Comment on Proposal No: 1-39
Recommendation: Accept the proposal in principle. Revise the definition to read as follows:

Lighting Outlet. An outlet intended for the connection of a lampholder, luminaire (lighting fixture), or a pendent cord terminating in a lampholder.

Substantiation: The Task Group agrees this action meets the intent of the submitter. The submitter of this change was concerned that the existing definition would not allow a receptacle to be used to supply a cord and plug luminaire allowed by 210.70(A)(1) Exception No. 1. In the future, possibly moving Exception No. 1 up into the main body of the text may put this section into a more positive language. The Task Group disagrees that the existing wording negates the exception allowed in 210.70(A)(1).

This comment was balloted through CMP-2 with the following ballot results:

12 Eligible to Vote
10 Affirmative
1 Negative
1 Not Returned (B. Nenninger)

Mr. J. Pauley voted negatively stating: "I do not agree with the Task Group action to support the proposal. The revision by CMP-1 creates an unintended conflict with the provisions in Article 210 that require lighting outlets. 210.70 requires specific lighting outlets in dwelling units and habitable rooms to have wall switched controlled lighting outlets. The revision to the definition by CMP-1 would allow a switched receptacle to be used as a lighting outlet in all cases (instead of those limited by the exception) because any receptacle could be "intended for the connection of a luminaire." The use of the definition in Article 210 relies on the provision that these outlets are intended for direct connection of a luminaire. I do agree with CMP-1 that the submitter is incorrect in claiming that the current definition negates 210.70(A)(1), Exception No. 1. That exception is specific to note that the provision to use a switched receptacle is in lieu of a lighting outlet. CMP-1 should consider different language to accommodate the 410.30(C) concern without deleting the "direct connect" provision.

Panel Meeting Action: Reject
Panel Statement: The Panel concludes that "pendant cord terminating in a lampholder" is extraneous and inclusion of "direct" connection is appropriate. See panel action and statement on Comment 1-30.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

MCMAHILL, L.: See my explanation of negative vote on Comment 1-30.

1-32 Log #833 NEC-P01 **Final Action: Accept in Principle**
(100. Lighting Outlet)

Submitter: Jim Pauley, Square D Company
Comment on Proposal No: 1-39
Recommendation: Reject the Proposal.
Substantiation: The revision by CMP 1 creates an unintended conflict with the provisions in Article 210 that require lighting outlets. NEC 210.70 requires specific lighting outlets in dwelling units and habitable rooms to have wall switched controlled lighting outlets. The revision to the definition by CMP 1 would allow a switched receptacle to be used as a lighting outlet in all cases (instead of those limited by the exception) because any receptacle could be "intended for the connection of a luminaire". The use of the definition in Article 210 relies on the provision that these outlets are intended for direct connection of a luminaire. I do agree with CMP 1 that the submitter is incorrect in claiming that the current definition negates 210.70(A)(1) Exception No. 1. That exception is specific to note that the provision to use a switched receptacle is in lieu of a lighting outlet. CMP 1 should consider different language to accommodate the 410.30(C) concern without deleting the "direct connection" provision.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 1-30.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

MCMAHILL, L.: Removing the word "direct" does not "allow a switched receptacle to be used as a lighting outlet in all cases" as the submitter has noted. Section 210.70(A)(1), Exception 1 specifica
lly allows switched receptacles controlled by a wall switch in lieu of lighting outlets - an exception to the rule. In addition, and unlike a portable lamp,

a luminaire (fixture) is a complete lighting unit generally intended to be permanently connected to the premises wiring system. The use of a receptacle and cord and plug to connect a luminaire is an exception to the rule. Also see my explanation of negative vote on Comment 1-30.

19-1 Log #223 NEC-P19 **Final Action: Accept**
(100.Manufactured Home)

TCC Action: The Technical Correlating Committee understands that through this panel action, the sentence "For the purpose of this Code and unless otherwise indicated, the term mobile home includes manufactured homes." will become the second paragraph to the definition of "Manufactured Home".

The Technical Correlating Committee also understands that the two FPNs from the 2005 NEC will remain in the definition.

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 19-1
Recommendation: It was the action of the Technical Correlating Committee that the panel reconsider the proposal and make clear the intended status of the existing second paragraph. This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
The panel accepts the recommendation of the Technical Correlating Committee to reconsider the proposal and retains the existing second paragraph.
Panel Statement: The panel reaffirms its position that the second paragraph adds clarity and correlates with the definition of Mobile Home.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-2 Log #958 NEC-P19 **Final Action: Accept**
(100. Manufactured Home)

Submitter: Mark C. Ode, Underwriters Laboratories Inc.
Comment on Proposal No: 19-1
Recommendation: Use non-mandatory text in the definition text that has been added to the existing definition as follows: "The term manufactured home includes any structure that meets all the provisions of this paragraph except the size requirements and with respect to which the manufacturer voluntarily files a certification required by the regulatory agency, and except that such term does shall not include any self-propelled recreational vehicle."

In addition, redo the metric measurements first with English method within parenthesis as follows: "A structure, transportable in one or more sections, that, in the traveling mode, is 2.4 m (8 body-ft) (2.4 m) ~~(2.5m)~~ or more in width or 12.2 m (40 body-ft) ~~(12.2 m)~~ ~~(12 m)~~ or more in length or, when erected on site, is 29.7 m2 (320 ft2) ~~(29.7 m2)~~ or more".
Substantiation: Definitions cannot contain mandatory text. Measurements in the NEC must have the metric measurements first with the English measurements in parentheses. These two issues have been corrected by this comment.
Panel Meeting Action: Accept
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

9-2 Log #1482 NEC-P09 **Final Action: Reject**
(100. Metal Enclosed Power Switchgear)

Submitter: Charles Ball, S & C Electric Company
Comment on Proposal No: 9-6
Recommendation: Add a new FPN to the definition of metal-enclosed power switchgear.

FPN: Medium-voltage (1,000-38,000 volts) Metal-Enclosed Power Switchgear is available with arc-resistant construction. Arc-resistant switchgear provides extra protection for personnel from the effects of an internal fault.
Substantiation: Some companies have decided to use arc-resistant equipment to provide additional protection for personnel. Their reason may be high fault current levels or that the switchgear is installed indoors. Motor control centers as well as medium-voltage metal-clad and metal-enclosed switchgear with arc-resistant construction are commonly available. The NEC needs to acknowledge the existence of this type of switchgear so it can make its readers aware of additional considerations such as required clearances for proper venting.
Panel Meeting Action: Reject
Panel Statement: Metal enclosed power switchgear should not be just medium voltage. The text added from Proposal 9-6 adequately identifies that arc-resistant type switchgear is available. The NEC should not be used as a design guide by identifying potential applications for certain types of equipment. The second sentence in the proposed FPN does not further define the term; instead it describes performance attributes of the product. It does not belong in Article 100.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

5-12 Log #1896 NEC-P05 **Final Action: Reject**
(100. Neutral (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 5-24
Recommendation: Accept the proposal as written.
Substantiation: A major focus of effort recently has been the effort to make the NEC a truly international document, in order to better assure its long term success. I have no additional arguments to offer in support of my entry in the define a neutral contest, except this: I am very worried that the neutral definition settled on by CMP 5, squarely based as it is in trade slang and not technical rigor, will diminish the credibility of the overall document. Canada does not use the CMP 5 approach; the IEC does not use the CMP 5 approach; the IEEE does not use the CMP 5 approach; and our own utilities do not use the CMP 5 approach. I have grave doubts as to how this will all play out down the road. CMP 5 is a great panel; where we ended up on the great equipment grounding vs bonding brouhaha was panel and task group work at its finest and the result was excellent. But I just can't get my head around where we are headed with the new neutral definition.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its actions and statement on Proposal 5-36 that resulted in the new definition. After reviewing the task group report, CMP-5 concludes that there is no single unique definition for the term "neutral conductor" in the electrical industry. The definition adopted by CMP-5 serves the needs of the NEC and is fully consistent with the IEC definition (see IEV 195-02-06) and is largely consistent with the NESC definition.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-13 Log #1036 NEC-P05 **Final Action: Reject**
(100. Neutral Conductor)

Submitter: Charles M. Trout, Maron Electric Co. Inc.
Comment on Proposal No: 5-28
Recommendation: This proposal should be Accepted. This proposal properly defines the neutral conductor as the common conductor in a multiwire circuit that carries the current caused by an unbalance of the load on the phase conductors of a multiwire circuit. It does not suggest, as the accepted Proposal 5-36 does, that an unbalanced load is a normal condition and, therefore, a presumably correct wiring design. It also maintains the technical correctness that a two wire circuit cannot contain a neutral conductor. It does not pretend that because a conductor is connected to the neutral point of a system that it is a neutral conductor anymore than trying to say that a grounding electrode conductor is a neutral conductor because it is connected to the neutral bar. A neutral conductor must function as a neutral conductor and carry only the unbalanced load in multiwire circuits and remain noncurrent-carrying in multiwire circuits supplying balanced loads.
Substantiation: See above.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 5-12.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-14 Log #1676 NEC-P05 **Final Action: Reject**
(100. Neutral Conductor)

Submitter: Charles M. Trout, Maron Electric Co. Inc.
Comment on Proposal No: 5-36
Recommendation: This Proposal should be Rejected.
Substantiation: The proposal suggests that the neutral conductor is intended to carry current under normal conditions. What are normal conditions? Is a balanced multiwire circuit a normal condition? Is an unbalanced multiwire circuit a normal condition? The substantiation suggests that a conductor can be neutral even though it does not function as a neutral conductor. This doesn't make sense and will only confuse the issue more.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comments 5-12 and 5-17.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-15 Log #1829 NEC-P05 **Final Action: Reject**
(100. Neutral Conductor)

Submitter: Fred W. Brown, HI Electron
Comment on Proposal No: 5-21
Recommendation: Add a new definition:

Neutral Conductor. A grounded conductor that is connected to the neutral point of a symmetrical electrical system and carries the vectorial summation currents of the ungrounded to grounded conductor loads in multiwire branch circuit, feeder, and service entrance conductors.

Substantiation: It is important for the National Electrical Code (NEC) to be technically correct. The current excepted definition of Neutral Conductor (Proposal 5-36 Log #1554) may lend itself to miss application of some of the NEC. By the present accepted definition, when looking at the application of 310.15(B)(4) a neutral conductor may never be counted as a current-carrying conductor.

NEC Panel 2 has found it important to require the grouping and identification of the grouping for ungrounded and grounded conductors of each multiwire branch circuit (Proposal 2-17 Log #3378). The importance of this is found in my definition of neutral conductor, not in fact that the conductor is grounded.

I would encourage the committee to accept this comment.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Comment 5-12.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-16 Log #1960 NEC-P05 **Final Action: Reject**

(100. Neutral Conductor)

Submitter: Noel Williams, Herriman, UT

Comment on Proposal No: 5-36

Recommendation: This Proposal should have been Accept in Principle with additional modification of the definition of Neutral Conductor as follows:

"Neutral Conductor. The conductor connected to the neutral point of a system that is intended to carry unbalanced current under normal conditions and may carry fault current or unbalanced current under abnormal conditions."

Substantiation: Unfortunately, the accepted definition does not accomplish all of the clarifications needed, and so it is not technically accurate. As noted in the panel statement, the neutral conductor will carry current "under some normal conditions", but that does not mean all normal conditions. For example, a neutral conductor in a three-phase wye system that supplies only three phase loads will never carry current under normal conditions. However, a neutral conductor will carry any unbalanced current in the system that may occur normally if there are connected single phase loads, or abnormally because of some phase failure conditions. The neutral service conductor or the neutral conductor ahead of the bonding point of a separately derived system will also be called on to carry fault current - also not normal conditions. In addition, this definition does not address the neutrals of impedance-grounded systems that carry current only under abnormal conditions.

Panel Meeting Action: Reject

Panel Statement: The additional wording does not add clarity. The neutral conductor can carry current other than unbalanced current, e.g. nonlinear loads. The term "unbalanced" is not defined. The panel reaffirms its actions and statement on Proposal 5-36 that resulted in the new definition.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-17 Log #2139 NEC-P05 **Final Action: Reject**

(100. Neutral Conductor)

Submitter: Ryan Jackson, West Valley City, UT

Comment on Proposal No: 5-36

Recommendation: Accept the Proposal with the following change:

Neutral Conductor. The conductor connected to the neutral point of a system.

Neutral Point. Unchanged.

FPN: Unchanged.

Substantiation: The condition that the defined conductor "is intended to carry current under normal conditions" makes the existing language in 250.36 a discrepancy. The conductor between XO and the impedance of an impedance grounded system is currently referred to as a neutral conductor. This conductor does not carry current under normal conditions, but does carry current under fault conditions.

A similar comment is being made to the proposed change in 250.36 (5-133) that would allow the technical committees to change all of the language in 250.36 so that it doesn't conflict with all of section 250.36. These two comments should be correlated so the discrepancy between 250.36 and the definition does not occur.

Panel Meeting Action: Reject

Panel Statement: The phrase "is intended to carry current under normal conditions" is needed to differentiate the neutral conductor from the equipment grounding conductor.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-18 Log #1501 NEC-P05 **Final Action: Accept**

(100.Neutral Conductor and Neutral Point)

Submitter: Jeffrey Boksiner, Telcordia Technologies, Inc

Comment on Proposal No: 5-36

Recommendation: Technical Correlating Committee Task Group on the definition of "Neutral Conductor" concurs with the panel action on this proposal.

Substantiation: This comment was developed by the Technical Correlating Committee (TCC) Task Group (TG) on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6). The TCC directed that the action on this proposal be sent to the TG for review and comment.

Panel Meeting Action: Accept

1-33 Log #769 NEC-P01 **Final Action: Reject**

(100. Premises Wiring (System))

Submitter: Louis A. Barrios, Shell Global Solutions

Comment on Proposal No: 1-43

Recommendation: The panel action should have been to "accept" rather than "accept in principle."

Substantiation: The Panel's revised definition changes the intent of the submitter's proposal, which was to eliminate the list of "separately derived systems", does not add clarity to the original proposal and may introduce more confusion.

Panel Meeting Action: Reject

Panel Statement: The Proposal was modified by the Panel so as to be technically correct.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

MCMAHILL, L.: Proposal 1-43 should have been accept as submitted - the substantiation justified the change. The proposal simply recommended eliminating the list of "source of power" examples and use the definition of "separately derived system" in place of the examples. The revised definition simply adds further confusion. CMP-1 noted that "premises wiring can exist on the supply side of a separately derived system." This is a true statement; however, "where there is no service point" premise wiring is typically supplied by a separately derived system. A separately derived system being "a source of electric energy or equipment other than a service."

1-34 Log #1851 NEC-P01 **Final Action: Reject**

(100. Premises Wiring (System))

Submitter: Mike Holt, Mike Holt Enterprises, Inc.

Comment on Proposal No: 1-43

Recommendation: The Proposal should be Accepted as originally proposed.

Substantiation: The intent of this proposal was to make this definition simpler. The changes proposed by the panel simply make this definition more difficult, without adding any benefit to the code user.

Panel Meeting Action: Reject

Panel Statement: The Proposal was modified by the Panel so as to be technically correct.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

MCMAHILL, L.: See my explanation of negative vote on Comment 1-33.

8-1 Log #536 NEC-P08 **Final Action: Reject**

(100. Raceway)

Submitter: Dan Leaf, Seneca, SC

Comment on Proposal No: 8-1

Recommendation: Accept the proposal or alternatively add:

"Cablebus and auxiliary gutters are not considered raceways."

Substantiation: Cable bus and auxiliary gutters are also designed to hold wires and cables. Though cablebus is not completely enclosed neither is lighting or trolley busway. Auxiliary gutters are usually listed also as wireways; does use determine if it is a raceway? "Not limited to" appears to leave an option for the AHJ to consider them as raceways as there is no specific prohibition against considering them as such.

Panel Meeting Action: Reject

Panel Statement: While the panel agrees cablebus and auxiliary gutters are not raceways, there is no justification for placing electrical products that are not raceways in this definition.

The Panel reiterates that cablebus and auxiliary gutters are used in some ways similarly to raceways. The restrictive of use of cablebus and auxiliary gutters prevents them from being grouped with raceways. Cablebus is an assembly of components furnished or specified by the manufacturer. Auxiliary gutters are permitted to supplement wiring spaces at meter centers, distribution centers, switchboards, and similar points of wiring systems.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

8-2 Log #1377 NEC-P08 **Final Action: Reject**
(100. Rigid Nonmetallic Conduit (RNC))

Submitter: William Wagner, Certification Solutions
Comment on Proposal No: 8-2
Recommendation: This Proposal should be Accepted in the form originally proposed.

Rigid Nonmetallic Conduit (RNC). A non-flexible thermoplastic or thermosetting resin raceway of circular cross section, with integral or associated couplings, connectors, and fittings for the installation of electrical conductors and cables. Includes Rigid Polyvinyl Chloride Conduit (Type PVC), High Density Polyethylene Conduit (Type HDPE), and Reinforced Thermosetting Resin Conduit (Type RTRC).

Substantiation: The definition of what constitutes Rigid Nonmetallic Conduit (RNC) is needed in Article 100, as can be seen from the Panel statement that "The panel took exception to including HDPE as RNC." The 1993 - 2002 NECs clearly indicated that HDPE was covered by Articles 347 and 352, and, therefore, a form of RNC. If this is a point of contention among the CMP itself, it will present even more of a problem for the casual user of the Code.

While it is true that no other raceway has its definition in Article 100, it is necessary for RNC. Throughout the NEC there are repeated references to RNC, a designation that will disappear from the heading of Code Article 352. While it is true that CMP-8 is recommending the inclusion of text indicating that rigid PVC conduit (Article 352) and RTRC (Article 355) are forms of RNC, it should not be necessary for the user to read each individual Code Article to determine whether or not this designation applies. It would be much more "user friendly" to have a single location within Article 100 to rely on for determining what types of conduit this designation applies to.
Panel Meeting Action: Reject
Panel Statement: The definitions for specific wiring methods are found in XXX.2 of each article. There's no justification for defining rigid nonmetallic conduit since the individual types are specifically defined with each having differing permitted application allowances. The use of RNC (rigid nonmetallic conduit) throughout the Code should be reviewed and replaced by the properly identified types of raceways or conduits prior to adding RNC to the definition of Type HDPE Conduit.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 110 — REQUIREMENTS FOR ELECTRICAL INSTALLATIONS

1-35 Log #333 NEC-P01 **Final Action: Reject**
(110.3(A)(6))

Submitter: Don Lucy, IBEW-L.U. 295-LRJATC Instructor
Comment on Proposal No: 1-51
Recommendation: This proposal should be accepted in principle with the proposed FPN relocated in 110.16 - Flash Protection as a new FPN No. 3.
Substantiation: The submitter has demonstrated the need for this information, however, he has submitted it to the wrong section. Designers, Installers, and Maintenance/Operators should be informed to the degree of Arc protection of the equipment. This information regarding a standard with information on the availability and performance of "arc resistant switchgear" is essential to the code user. This proposed change would be better suited in 110.16 as FPN No. 3.
Panel Meeting Action: Reject
Panel Statement: CMP-1 had considered the addition of this same text as an FPN to 110.16 under Proposal 1-88. The Panel continues to conclude that such an FPN would not explain the application of the marking requirement of 110.16.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
HICKMAN, P.: We are voting in the negative to the panel action to reject Comment 1-35. This comment should have been accepted. We feel this comment is related to arc-flash hazard and,therefore, should be included as a FPN under the Section 110.16 Flash Protection. A FPN referring users of the NEC to IEEE C37.20.7 for description and testing of listed arc-resistant switchgear designed and tested to withstand the effects of internal arcing faults is appropriate. The addition of this FPN would greatly enhance worker safety by improving the awareness of this type of equipment.
Comment on Affirmative:
FLOYD, H.: The application of Arc Resistant Switchgear in US markets has grown over the past decade, to the point that all major manufacturers now offer this design. Experience in installations in the US and longer-term experience in other global regions demonstrate that arc resistant designs can reduce the frequency of personnel exposure to hazardous arcing faults. While I support the concept of recognizing this type of equipment in the NEC, I agree with the panel action.

1-36 Log #703 NEC-P01 **Final Action: Reject**
(110.3(B))

Submitter: Edward G. Kroth, Westphal & Company Electrical Construction
Comment on Proposal No: 1-52
Recommendation: Revise as follows:
Listed or labeled equipment shall be installed and used in accordance with any instructions included with the listing and labeling, provided the instructions, listing or labeling do not conflict with this code.
Substantiation: I agree with the Panel's rejections of Proposals 1-52 and 1-53, however, I will take this opportunity to address another problem with 110.3(B) that I have come across. Over the years I've seen various instructions from manufacturers that have contradicted some code article or section. I have provided the latest one that I recently came upon. Note that the manufacturer on page 3 of their instructions have figures 3 and 4 incorrect and instruct the installer to violate section 110.15 (High leg marking) of the NEC. The above added portion of 110.3(B) relieves me of the conflict of following the instructions [present 110.3(B)], but violating 110.15. This may seem to be a minor error on the manufacturer's part, but could become a safety (or legal) issue when someone goes to service the item and does not realize that things are not as they should be according to the code.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: Listed and labeled equipment is clearly identified for installation in accordance with applicable Codes including the NEC. Instructions for listed and labeled equipment are reviewed for compatibility with the NEC. Code users are never "required" to violate Code requirements and 90.4, 110.2 and 110.3(A) clearly support this. In the event an error in instructions is identified, it should be brought to the attention of the manufacturer, the listing or labeling body and the standards developing organization using dedicated processes.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-37 Log #808 NEC-P01 **Final Action: Reject**
(110.3(B))

Submitter: Joseph A. Hertel, Safety and Buildings
Comment on Proposal No: 1-53
Recommendation: Revise text to read:
(B) Installation and Use. Listed or labeled equipment shall be installed or used, or both, in accordance with any instructions included in the listing and labeling, provided the instructions, listing or labeling do not conflict with this code.
Substantiation: Not all listed and labeled equipment is installed and used. In some cases, it is one or the other. The additional statement "provided the instructions, listing or labeling do not conflict with this Code" is necessary to rule out the use of products that are listed and used in ways other than intended by the listing or appropriate standard to which they were evaluated. As an example, cabinets for health care offices such as dental clinics where the cabinets were supplied with receptacles supplied through cords. While they were listed, they could not be used in the intended location without the redundant equipment ground required in 517.13.
Panel Meeting Action: Reject
Panel Statement: Listed and labeled equipment is clearly identified for installation in accordance with applicable Codes including the NEC. Rejection of listed or labeled equipment that is being used in a manner inconsistent with its listing or labeling is already addressed in 110.3 and the additional proposed text is not necessary for this instance.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-38 Log #283 NEC-P01 **Final Action: Accept in Principle**
(110.7)

Submitter: Code-Making Panel 5,
Comment on Proposal No: 1-58
Recommendation: It is recommended that CMP-1 accept the proposal as submitted.
Substantiation: The revised text proposed is technically correct. The revision in this section is also consistent with current proposed and accepted revisions to the definition of the word "ground" as "the earth". See CMP-5 action and statement on Proposal 5-8 (Log #1515). The submitter clearly indicated that the proposal was part of a larger effort to clarify the use of words and terms related to grounding and bonding. The word "ground" is one such word. The word "grounds" was also used in three other sections of the 2005 edition and previous editions of the NEC where the words "ground fault" or "ground faults" should be used. The proposals submitted to CMP-11 to revise those sections where the undefined word "grounds" is used were accepted as they

add clarity and consistency in the use of a defined term. See panel actions and statements on Proposal 11-39 (Log #409) and 11-97 (Log #412). For for reasons of consistency, correlation, and technical accuracy it is recommended that CMP-1 consider accepting this proposal.

This comment has been balloted through CMP-5 with the following ballot results:

15 Eligible to Vote
14 Affirmative
1 Not Returned (W. Helfrich)

Mr. J. Boksiner voted affirmatively stating: "Generally, I support the CMP-5 comment and the original proposal. However, editorially, I believe the phrase "in Article 250" is no longer necessary as this is already covered by the phrase "elsewhere in the Code."

Panel Meeting Action: Accept in Principle
Panel Statement: The panel concludes that the revised text meets the intent of the commentor. The panel concludes that the phrase " elsewhere in the code" includes Article 250 and is in accordance with 4.1.1 of the NEC Style Manual. See panel action and statement on Comment 1-39 and Comment 1-39a (Log #CC100).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-39 Log #770 NEC-P01 **Final Action: Accept in Principle (110.7)**

Submitter: Louis A. Barrios, Shell Global Solutions
Comment on Proposal No: 1-58
Recommendation: The panel action should have been to "accept in principle" rather than "accept in principle in part" with proposed changes as suggested in Mr. Barrio's negative ROP ballot comment shown below.

110.7 Insulation Integrity. Completed wiring installations shall be free from short circuits and ~~from grounds~~ ground faults and from any connections to ground other than as required or permitted ~~in Article 250~~ elsewhere in the Code.

Substantiation: CMP-1 should have accepted the submitter's intent to clarify the term "grounds". The following wording is proposed which should meet the submitter's intent and eliminate the redundancy of referencing Article 250 and "elsewhere in the Code."
Panel Meeting Action: Accept in Principle

Revise the commentors recommendation to read as follows:

110.7 Insulation Integrity. Completed wiring installations shall be free from short circuits, ground faults, or any connections to ground other than as required or permitted elsewhere in this Code.

Panel Statement: The panel concludes that the revised text more clearly explains three conditions in 110.7. The panel also concludes that the revisions satisfy the commentors concerns.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-39a Log #CC100 NEC-P01 **Final Action: Accept (110.7 (Title))**

Submitter: Code-Making Panel 1,
Comment on Proposal No: 1-58
Recommendation: Change the title of 110.7 from "Insulation Integrity" to "Wiring Integrity".
Substantiation: The panel concludes that this revision more accurately describes the subject matter of this section.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-40 Log #1321 NEC-P01 **Final Action: Reject (110.9)**

Submitter: Vincent J. Saporita, Cooper Bussmann
Comment on Proposal No: 1-60
Recommendation: The panel should accept a modified version of the original proposal and place it as the new third paragraph of 110.9. Modify the proposal to read:

An enclosure containing main or feeder overcurrent protective devices shall be field marked with the available short-circuit current.

Substantiation: The proposal change in this comment limits the marking requirement to enclosures for main and feeder overcurrent protective devices, where there is a greater chance that 110.9 will be violated.

The panel statement given for rejecting the original proposal was basically that the available fault current was dependent upon the utility and utility systems change, so the available short-circuit current would change. Therefore, it would be misleading. I've heard that logic compared to a doctor's office refusing to take a patient's blood pressure "because it will surely change", and "that could be misleading". It's far better (and safer) for an electrician to know the available short-circuit current at one time in the past than not to have any clue as to the available short-circuit current. Yes, the value can and likely will change over time, it could go up or down. But, isn't it better to have a baseline with which to operate than to have no clue at all. Let's give future electricians the extra degree of safety that we can by informing them of the available short-circuit current so that they can make the most intelligent decisions possible.

Gathering this information is already a requirement in order to comply with 110.9, so it's not a matter of creating a lot of extra work. Once the values are obtained, it becomes a simple task to mark the enclosure.

Panel Meeting Action: Reject
Panel Statement: The Panel reaffirms its statement on Proposal 1-60. Although at the time of installation, utility available fault currents are provided so that adequate equipment can be installed, those values may be conservative so as to allow for anticipated or possible future system changes. From a personnel protection standpoint, it would be misleading to base PPE requirements on either the rating of the equipment or the actual fault current at the time of installation. To be sure proper PPE is selected, the system parameters must be known and the available fault current calculated at the time work is performed.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:

HICKMAN, P.: We are voting negative to the panel action to reject Comment 1-40. Our explanation is as follows: The comment should have been accepted. Accepting this comment will, in our opinion, greatly enhance electrical safety. We feel the submitter's comment is a reasonable recommendation and we agree with the submitter that this will help ensure compliance with 110.9. In addition, we strongly disagree with the panel reaffirming its statement on Proposal 1-60 and the additional statement offered on Comment 1-40. We submit that the statement "marking of the equipment with actual fault current would be misleading" is not accurate. Clearly, the actual fault current is not static. However, if the intent of this panel statement is to convey to those who look to the written record for guidance of what a code panel meant when they wrote a rule, then this panel statement could be sending a message that evaluating series combination systems and determining motor contribution is not achievable. The industry simply cannot continue to hide behind this argument and not move to help inspectors, electricians, and others who maintain and install electrical equipment.

MCMAHILL, L.: To an extent, I concur with CMP-1's action on Proposal 1-60. I agree, "The actual fault current at an installation is a variable"; however, I disagree that it "must be determined with knowledge of the system parameters (including those of the utility supply system) at any given time." If this were truly the case, it would be difficult to design an electrical installation in compliance with NEC Sections 110.9 and 10. Generally, the available-fault current is a fixed value at the power source. This fixed value is provided by the utility company or calculated by the electrical engineer. The available fault-current value can vary; however, not to the extreme that it would need to be calculated "at any given time." If it did, it would be difficult to design a series-rated circuit breaker system. In addition, I disagree that "Marking of the equipment with "actual" fault current would be misleading." It is perhaps more misleading not to provide such information. Where additional equipment is to be installed, should one be expected to do the fault current calculation every time? I think not. Field marking the equipment with the available fault-current is important for the installer and inspector. It provides necessary information for selecting the appropriate interrupting devices, equipment short-circuit current rating, and withstand rating of conductors. At the minimum, CMP-1 should have considered a starting point for marking equipment with the available fault-current. As an example, a code requirement that "Equipment rated 1200 amperes or more that contains overcurrent devices shall be field marked with the available short-circuit current." 1200A is a reasonable starting point as it correlates with existing requirements in Section 110.26(C)(2) for large equipment. Such requirement could do much to enhance installation and worker safety. See my comments on Proposal 1-59 (Log 2846), as they are valid here.

1-41 Log #300 NEC-P01 **Final Action: Accept (110.11)**

Submitter: Code-Making Panel 11,
Comment on Proposal No: 1-61
Recommendation: Continue to accept Proposal 1-61.
Substantiation: It was the action of the Technical Correlating Committee that Proposal 1-61 be referred to CMP-11 for comment. This comment is the result of that request. CMP-11 supports the continued acceptance of Proposal 1-61. This is in addition to the continued support of Proposal 1-95, which provides requirements for all types of enclosures, not just for motor controller enclosures as is currently found in 430.91. Proposal 11-55, a companion proposal which deletes similar requirements as they apply specifically to motor controller enclosures, was passed by a vote of 15 to 0 by CMP-11.

This comment has been balloted through CMP-11 with the following ballot results:

15 Eligible to Vote
14 Affirmative
1 Not Returned (R. Widup)

Mr. J. Caccamese voted affirmatively stating: "Acceptance of Proposal 1-61 is consistent with my previous comment to the affirmative for Proposal 11-55 by addressing my concern to ensure that both Panel 1 and Panel 11 are in agreement."

Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-42 Log #1512 NEC-P01 **Final Action: Accept**
(110.11)

Submitter: James Wiseman, Schneider Electric / Square D
Comment on Proposal No: 1-61
Recommendation: The Panel should continue to accept Proposal 1-61.
Substantiation: This revision will significantly ease the determination of which enclosures require protection against permanent damage from the weather during building construction.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-43 Log #997 NEC-P01 **Final Action: Reject**
(110.12)

Submitter: David Shapiro, Accurate & Intriguing Writing & Editing
Comment on Proposal No: 1-62
Recommendation: Revise text to read as follows:

Electrical equipment shall be installed in a manner consistent with ~~the requirements of this code and~~ accepted industry practices.

Substantiation: I agree with Mr. Lanny McMahill that it is well worth our while to rephrase this, as the submitter, Mr. Young, proposed, so as to make compliance and enforcement easier. It would be tautological to say that this code requires compliance with this code, and the issue of incorporating specific other standards by reference also is valid. However, removing the term "neat" as a global requirement is important, because too many undertrained enforcement personnel fall back on this characteristic where it is irrelevant to safety. Neatness has nothing to do with practical safeguarding. Workmanship is an issue of following accepted industry practices. The term, "accepted practices" is consistent with other NEC usage. I have seen, for example, many a panel installation with conductors ever-so-neatly trained and lined up perfectly parallel where they leave the breakers-but two grounded conductors in one terminal opening, or grounded and grounding conductors sharing a terminal in the grounding bar. I'd rather see the workmanlike practice of following the instructions on the schematic, and forget neatness, leave the conductors all calliwampus.
Panel Meeting Action: Reject
Panel Statement: If the comment were accepted, Section 110.12 would allow "accepted industry practices" to override any Code requirement.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

MCMAHILL, L.: CMP-1 should have accepted this comment. CMP-1's statement that accepting this comment would "override any Code requirement" is incorrect. Section 110.12 is titled "Mechanical Execution of Work." "Mechanical Execution of Work" is not intended to override minimum code requirements. No different than "installed in a neat and workman like manner" is. See my comment on Proposal 1-62.

1-44 Log #1790 NEC-P01 **Final Action: Reject**
(110.12)

Submitter: John P. Masarick, Independent Electrical Contractors Inc.
Comment on Proposal No: 1-65
Recommendation: The panel is encouraged to accept proposal 1-65 for the following reasons.
Substantiation: 1) The trend by the CMPs over the last several code cycles has been to limit the use of FPNs.

2) There is also a correlation issue. There is a conflict between those panels that accepted the proposal and those that rejected the proposal.

3) The FPN should not be accepted because numerous standards and installation manuals exist and to only mention one does not adequately inform the public about accepted industry practices. The NEC is not intended to be an instruction manual for untrained persons. If the FPNs are allowed to reference these standards, then they should list all applicable standards.

4) Since the referenced installation standards are intentionally general to cover different models of equipment, approval of the FPN may lead many to believe these standards can be used instead of listed or labeled manufacturer's instructions which would be in violation of 110.3(B).

5) If the CMP would like to include the reference, it should be placed in the Annex with the other references.

Panel Meeting Action: Reject
Panel Statement: The panel concludes that the FPN reference to ANSI/NECA 1-2006 is both appropriate and useful, and responds to the submitter's concerns as follows:

1) The submitter does not document his assertion that CMPs have acted over the last several Code cycles to limit the use of FPNs, and no such injunction appears in 3.1.3 of the NEC Style Manual.

2) The submitter does not document "correlation issues," and the panel is not aware that proposal 1-65 was submitted to multiple Code panels.

3) The panel concurs that the Code is not intended to be an instruction manual for untrained persons. The scope of ANSI/NECA 1-2006 specifically states that only qualified persons should perform the work described in it. In addition, ANSI-approved standards, like the Code itself, are seen as representing broad consensus and are developed with participation from many industry interests (including CMPs). Other types of standards and installation manuals may not represent this level of electrical industry consensus.

4) FPNs are informational in nature, and not enforceable requirements of the Code. Further, the scope of ANSI/NECA 1-2006 specifically states that all electrical products and systems should be installed in accordance with manufacturers' instructions.

5) Annex A contains only product listing standards. Many other standards referenced in Fine Print Notes throughout the Code are not included in Annex A. See the FPNs to 450.9 and 505.4(B), among many others.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:

HITTINGER, D.: We do not agree with the panel action and statement. However, we do agree with the panel Comment 1-44(a) Log #CC101 NEC-P01 recommending that a new Annex "X" be created for all standards currently referenced in the NEC FPNs, other than product safety standards which are already located in Annex A, be moved to the new annex. This would provide a useful resource to users of the code.

MINICK, J.: Comment 1-44 to delete this FPN should have been accepted as the FPN to 110.12 references "other ANSI-approved installation standards" that are of unknown content and of unknown publication dates. CMP-1 considered accepting Proposal 1-63 that would have deleted the FPN but the vote was 6-6. The accept motion on Proposal 1-63 to delete the FPN was because the standard publication, ANSI/NECA 1-2006, was not ready for distribution and thus review by CMP-1. CMP-1 then, after much discussion, finally accepted Proposal 1-64 that requested updating the publication date of the referenced standard without CMP-1 review by a vote of 7-5. However that vote changed in the ballot vote to 10-2 in favor of accepting the new publication date of 1-2006. It is now disingenous that CMP-1 would accept referencing "other ANSI approved installation standards" without knowing the content of those standards and their publication date.

Comment on Affirmative:

ANTHONY, M.: Fine Print Notes are essentially hyperlinks (tags) we put at critical points in the NEC where we sustain the NEC's place at the center of world wide electrical safety practice. We should anticipate using more of them in the future as the world markets become more interconnected and our technology permits us to use the code in delivery formats other than the printed page. We should not be taking them out but reserving them for the future and working harder to get codes and standards to agree as they evolve.

1-44a Log #CC101 NEC-P01 **Final Action: Reject**
(110, FPN)

TCC Action: The Technical Correlating Committee advises that creation of a new annex is the responsibility of the Technical Correlating Committee and the Technical Correlating Committee rejects the panel action. Location of all references in an Annex does not enhance usability.
Submitter: Code-Making Panel 1
Comment on Proposal No: 1-165
Recommendation: The panel recognizes that the TCC has purview over the creation of a new annex. The panel recommends that a new Annex "X", be created in accordance with the 2003 NFPA Manual of Style, sections 1.9.1.10 & 11 and 3.6.4, and that all standards currently referenced in the NEC FPNs, other than product safety standards which are already located in Annex A, be moved to the new annex. The panel notes that the 2003 NEC Style Manual section 4.2, requires that references to other Standards shall be in the FPNs.
Substantiation: The panel concludes that item #5 in the substantiation of Comment 1-44 has merit. Locating all referenced documents in an annex is intended to enhance usability.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

BARRIOS, L.: The present format of using FPNs immediately following the applicable sections to reference standards containing supplemental information should be retained. Moving all references to standards from existing Fine Print Notes (FPNs) to a single annex at the end of the code will make the code less user friendly. For example, FPNs No. 1 and 2 in Section 110.16 refer the code reader to NFPA 70E and ANSI Z535.4 for additional information on arc flash hazards and equipment labeling. Moving these two references to an Annex, would essentially have the same effect as removing the references altogether. The typical code user is not going to flip to an annex to see what standards may be applicable to a given section.

STAUFFER, H.: I am voting against this recommendation to the Technical Correlating Commitee, and feel that references to industry standards other than product safety standards should remain in Fine Print Notes for two reasons:

1. Usability - Having references to industry standards located near the NEC rules to which they apply is more convenient for users. Segregating these references in an annex at the back of the Code book decreases the chance that users will be aware of them.

2. Copyright protection - having more FPNs in the NEC helps protect NFPA's intellectual property. There is continuing debate about whether, when states and local jurisdictions adopt the Code into law, the resulting document is still a copyrighted NFPA publication, or whether it enters the public domain. However, state and local governments typically adopt only the mandatory text of the NEC, not including explanatory information in FPNs and annexes. Since annexes come at the end of the Code book, they can be deleted without affecting the main NEC text. However, the existence of the Fine Print Notes located within the mandatory text of the Code helps differentiate the NEC-as-published-by-NFPA from the NEC -as-adopted-into-law. For this reason, keeping more FPNs, rather than consolidating the same information in an annex, helps protect the copyright of the National Electrical Code.

Comment on Affirmative:

LABRAKE, JR., N.: EEI agrees with the Panel that an Annex would provide user friendliness of this Code. It is recommended that the TCC include in the Annex a list of standards required and a list for further information based on the FPNs throughout this Code. In the text of the Code, a footprint item should refer the reader to the Annex for the expanded description of the referenced material. EEI supports the listing of ANSI C2 the National Electrical Safety Code in the Annex with its reference to 2005 NEC Sections 90.2(A), FPN and 110.31(C)(1), FPN for example.

1-45 Log #738 NEC-P01 **Final Action: Reject**
(110.12, FPN)

Submitter: Robert Kelleher, Paramount Electrical Services
Comment on Proposal No: 1-64
Recommendation: The action should be to delete this Fine Print Note.
Substantiation: The addition of these NECA Fine Print Notes, serves no benefit to the user of the National Electrical Code. These are not standards, they are a compilation of generic information and do not serve as information to the user. These must be purchased through NECA. This FPN as written is nothing more than free advertisement, for generic, readily available, information, which must be purchased by the code user. Code Making Panel 1 should consider taking an action to delete this FPN to coordinate with the other technical committees in the NEC project. A total of seventeen new Fine Print Notes were proposed to reference NECA standards. Sixteen were unanimously rejected. Inclusion of this Fine Print Note is in direct conflict with 90.1(C). In the action to reject proposal 8-3, one technical committee member promotes NECA standards as "….a tool to assist untrained electricians to make safer and better installations." The TCC should intervene, uphold the provisions of 90.1(C) and prohibit these types of Fine Print Notes. CMP1 should reject this FPN. Failure to do so will mean adding Fine Print Notes for IEC, EEI, IBEW, IAEI, ACC, NETA, NEI, SEIA, AISI, API, ASHE, AHAM, ICEAI, NYBFU and dozens of others when they decide to develop income through generic standards development. If CMP 1 continues to accept this Fine Print Note in any form an Annex should be included with coupons for the code user. If the NEC is to be used for advertisement purposes, coupons should be included.

1-48 Log #777 NEC-P01 **Final Action: Reject**
(110.12, FPN)

Submitter: Danny Grant, National Electric Company
Comment on Proposal No: 1-63
Recommendation: This Proposal should have been Accepted to delete the FPN:
FPN: ~~Accepted industry practices are described in ANSI/NECA 1 2000, Standard Practices for Good Workmanship in Electrical Contracting and other ANSI approved installation standards.~~

Substantiation: I agree with Mr. Miller's substantiation in Proposal 1-63 which states: "this is one more example of extra material which does not benefit the NEC or its user". Not only does it not benefit the NEC, it contradicts what is already mandatory and also causes confusion. In addition, it is an unnecessary burden for the industry to have to purchase a copy of a standard at significant cost for each installer that tells us little beyond what we already know and that is already readily available for free from various sources.

For example, in Section 3 of the Standard (General Requirements), it states that neat and workmanlike manner shall be apparent. The word "shall" constitutes mandatory language which, coupled with the word apparent, is likely not enforceable, is subjective, and, therefore, may be unattainable. A Standard that requires neat and workmanlike to be "apparent" is not appropriate for inclusion, even as a fine print note, into the NEC.

In addition to requiring something that is unenforceable, vague, and ambiguous, the scope of the document tells installers that they should follow the NEC. While this standard requires me to do something that is vague and unenforceable, it also tells me that following the NEC is optional.

Those are just two examples of problems I see in this document. Even the title suggests that these rules are only for contractors (Good Workmanship in Electrical Contracting). What about work done by the maintenance staffs in facilities? Do these rules not apply to them? Do these rules only apply to contractors?

I, as a NECA contractor, along with very knowledgeable inspectors, have never had a problem understanding what a neat and workmanlike installation is. I wonder why NECA chooses to engage in the publishing business when there are real challenges facing contractors in today's market.

Panel Meeting Action: Reject

1-49 Log #308 NEC-P01 **Final Action: Accept in Principle**
(110.12(A))

Submitter: Code-Making Panel 9,
Comment on Proposal No: 1-71
Recommendation: Accept the proposal as originally submitted.
Substantiation: The panel action unnecessarily broadens this requirement without technical merit. The panel text does not address one of the key reasons CMP-9 used the "cable or raceway" qualification when it had jurisdiction over this topic, namely, the desire to allow weep holes in outdoor equipment. The original proposal correctly incorporated this concept. CMP-9 is also uncertain as to whether the phrase "operation of equipment" would be enforced consistently.

NEMA comment on ROC 1-201 from the last cycle is still relevant and read:

"There is no need to expand the list of unused openings that must be closed. The wording is clear that unused openings be effectively closed to provide substantially equivalent protection to that of the original enclosure. UL or equivalent standards development organizations develop the required product standards to ensure that the intent of the code is met. This ensures that all new products meet the intent of the code without having to continuously revise the code for every new product that is introduced.

This comment has been balloted through CMP-9 with the following balloting results:

11 Eligible to Vote
10 Affirmative
1 Not Returned (H. deVega)

Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Comment 1-50 which the panel concludes meets the commentors intent.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-50 Log #834 NEC-P01 **Final Action: Accept**
(110.12(A))

Submitter: Jim Pauley, Square D Company
Comment on Proposal No: 1-70
Recommendation: Revise text to read as follows:

(A) Unused Openings. Unused openings, other than those intended for the operation of equipment, intended ~~or~~ for mounting purposes or permitted as part of the design for listed equipment, shall be closed to afford protection substantially equivalent to the wall of the equipment. Where metallic plugs or plates are used with nonmetallic enclosures, they shall be recessed at least 6 mm (1⁄4 in.) from the outer surface of the enclosure.

Substantiation: The text accepted by the panel continues to create concern for manufacturers of equipment enclosures. This comment is to fix two significant areas of concern:

1) The addition of "intended" to the panel text is to make it clear that there may be openings that are there, but not necessarily used as part of that particular installation. A good example is drainage openings in a 3R enclosure that is installed indoors. Clearly the openings are there, but they are not used in that application. Another example is mounting holes that are in the back of the enclosure, but are not used because the enclosure is mounted from its side.

2) The new words "or permitted as part of the design for listed equipment" is intended to address a conflict that is created by the proposed wording and the product standards. For example, UL 50 – Standard for Enclosures has specific allowances for additional (albeit small) openings in an enclosure. These openings may have been necessary for the manufacturing process (such as drain openings for paint during the painting process) and have no application in the final use of the product.

It is important that this language be adjusted to avoid contractors having to find ways to fill openings that were intended by design and by allowance in the product standard to remain open.

Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:

MCMAHILL, L.: I concur with CMP-1's action; however, to simplify the section it may have been appropriate to say, "Unused openings, other than those intended for operation or mounting purpose, or those permitted as part of the design of the equipment, shall be closed..."

1-51 Log #627 NEC-P01 **Final Action: Reject**
(110.16)

Submitter: Phillip Goehring, Jr., Electrical Inspectors, Inc.
Comment on Proposal No: 1-84, 1-82
Recommendation: Revise text to read as follows:

Labels should be placed by the manufacturers on all switchboards, panelboards, industrial control panels, meter socket enclosures, and motor control centers that are likely to require examination, adjustment, servicing, or maintenance while energized. The marking shall warn that only qualified person(s) should access the equipment and warn of the potential electric arc flash hazard. The marking shall be located so as to be clearly visible to any person before examination, adjustment, servicing, maintenance or the installation of the equipment.

Substantiation: It should be noted that in many states home owners are legally allowed to work on electrical equipment in their own homes. These warnings should be in place for their protection, and to make them aware that a qualified person should be doing the work.

Panel Meeting Action: Reject
Panel Statement: The marking is intended to be field applied. It would be difficult for the manufacturer to know where to apply the label and to what equipment. In addition, CMP-1 notes that NEC text must be written as mandatory requirements – see the NEC Style Manual, Section 1.3 - Regulatory Adoption.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-52 Log #787 NEC-P01 **Final Action: Reject**
(110.16)

Submitter: C. E. Gibson, III, Lawson Electric Company Inc.
Comment on Proposal No: 1-85
Recommendation: Revise proposed 110.16 to read:

Switchboards, panelboards, industrial control panels, meter socket enclosures, and motor control centers that are in other than dwelling occupancies and are likely to require examination, adjustment, servicing, or maintenance while energized shall be field marked to warn qualified persons of potential electric arc hazards. The marking shall indicate the available fault current. The marking shall reflect the date the calculations for available fault current was performed and ~~The marking~~ shall be clearly visible to qualified persons before examination, adjustment, servicing, or maintenance of the equipment.

Substantiation: This proposal should have been Accepted in Part. While I agree somewhat that the marking of the shock protection boundary and flash protection boundary would be more of an electrically related safe work practice suited more for NFPA 70E, the marking of the available fault current is an installation requirement. The available fault current is a vital part in establishing the design and engineering criteria for switchgear and service equipment in all installations. Posting this information would be a tremendous aid to the installer/maintainer to determine the proper rating and sizing of replacement parts and the selection of the proper personal protective equipment to be used. I agree completely
with Mr. Hickman's comment stating the industry cannot continue to hide behind the argument "actual fault current is not fixed". Using this rationale, the conscientious and painstaking chore of designing and engineering service equipment and switchgear to fall within the limits of a given fault

current would be a fruitless task, as the fault current could change before the equipment is energized. This would render the new equipment unsafe from the outset. As Mr. Floyd stated in his comment to the affirmative, there are "other approaches" that may be more useful. By including the date on the marking requirement, would aid the installer/maintainer in making the proper choices as they enter into the equipment. As I stated in my substantiation on Proposal 1-85, "clearly, labels would need to be updated when changes are made in the system".

Panel Meeting Action: Reject

Panel Statement: The Panel reaffirms its statement on Proposal 1-85. Available fault current is necessary but not all the information needed to establish PPE levels.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

HICKMAN, P.: We are voting negative to the panel action to reject Comment 1-52. Our explanation is as follows: The comment should have been accepted. Accepting this comment will, in our opinion, greatly enhance electrical safety. Knowledge of the available fault current is absolutely necessary for proper compliance with 110.9 and 110.10. In addition, we strongly disagree with the panel reaffirming its statement on Proposal 1-85. We submit that the statement "marking of the equipment with actual fault current would be misleading" is not accurate. We recognize the actual fault current is not fixed. The industry simply cannot continue to hide behind this argument and not move to help inspectors, electricians, and others who maintain and install electrical equipment.

The concept recommended here in this comment is simply asking for documentation of something that has been required by the NEC for a number of years and a crucial piece of information necessary to help protect workers from arc flash and arc blast.

Comment on Affirmative:

FLOYD, H.: I am in support of the concept of providing more information to people who are at risk of exposure to arc flash hazards; however, there are other approaches that may be more useful in that they are less dependent on variations in available short circuit current. For example, if the label were to indicate the performance rating of personal protective equipment required, it cold be specified to cover anticipated variations in the available short circuit current.

1-53 Log #788 NEC-P01 **Final Action: Reject**
(110.16)

1-54 Log #835 NEC-P01 **Final Action: Accept**
(110.16)

Submitter: Jim Pauley, Square D Company

Comment on Proposal No: 1-82

Recommendation: Reject this Proposal.

Substantiation: Both the submitter's language and that accepted by the panel is unnecessary. The current text of the NEC exempts the equipment in the dwelling occupancy. Even in a multi-family installation, the panel that is within the occupancy itself is not a significant arc flash concern. The current NEC language would still apply the requirement to the service equipment (meter center, switchboard, etc.) that supplies the dwelling unit panelboards.

Although many panelboards used even in dwelling units already have a marking that warns against an arc flash hazard. Adding a specific requirement to this section could encourage some AHJs to require a separate and distinct label on the front of the enclosure. Given that these are often installed in the living space, we are simply inviting the resident to paint over the label or remove it because of the unpleasant aesthetics. The label adds no value in these applications.

Panel Meeting Action: Accept

Panel Statement: The panel does not necessarily agree with all of the submitters substantiation.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

HICKMAN, P.: We are voting negative to the panel action to accept Comment 1-54. Our explanation is as follows: The comment should have been rejected. We support the panel action on Proposal 1-82 as written. The submitter's substantiation for Proposal 1-82 states: "Many dwellings have services that are 400 amperes or more, and some services are located within commercial occupancies where there are stores and dwelling units served by the same electrical system." We agree that the available fault currents in multifamily dwellings could very well rival fault currents found in many commercial and industrial applications. We feel that adding the 110.16 marking requirements would greatly enhance worker safety and awareness of potential arc-flash hazards.

The substantiation provided in Comment 1-54 states: "many panelboards used in dwelling units already have a marking that warns against an arc-flash hazard." We feel that marking the rest of the panelboards (other than the "many" the submitter has identified as already being marked) makes sense. Someone has already seen the need to do it. It makes sense to be consistent and require that they all be marked, not just the ones that the comment submitter recognizes as being done voluntarily.

The argument has been raised that adding an arc flash label on equipment would diminish awareness because the labels would become commonplace and, therefore, be ignored. I offer the analogy of a speed odometer in a vehicle. While it could be argued that we should not bother to put speed odometers in vehicles because they are ignored, it could also be argued that they are nice to have when you need them.

Adding a label is inexpensive in both terms of cost of the label and manpower to apply it. With such a huge upside for safety, there seems little reason not to add this requirement.

1-55 Log #836 NEC-P01 **Final Action: Reject**
(110.16)

Submitter: Jim Pauley, Square D Company

Comment on Proposal No: 1-84

Recommendation: Reject this Proposal.

Substantiation: The panel needs to reconsider the words that expand this to an infinite list. Mr. Minick's comments are correct that the addition actually makes the section more ambiguous. NEC 110.16 has accomplished its original intended goal which was to increase the awareness and understanding of the arc flash hazard. The existing list of equipment does provide the most likely products where the hazard will be present. However, as pointed out by Mr. Minick, should the 30A GD switch installed in a barn really have an arc flash marking by itself?

The panel should also be aware that some manufacturers have integrated arc flash into their normal warning labels on products. This increases the needed awareness and does so without a burden on the installing contractor or user. Leave 110.16 as it is and allow it to continue to do the job of increasing awareness.

Panel Meeting Action: Reject

Panel Statement: CMP-1 disagrees that the revised text expands the list to "an infinite list" and that it "actually makes the section more ambiguous." The text uses the words "such as" to give examples of what equipment requires the arc flash marking. A 30A General Duty switch installed in a barn is not such equipment. Without such change, the NEC currently worded has no requirement to mark an 800A fusible switch mounted on a wall.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:
BARRIOS, L.: The panel action should have been to accept this comment, rejecting Proposal 1-84. The panel action expands the present clearly identified list to equipment subject to the interpretation of the AHJ.

1-56 Log #998 NEC-P01 **Final Action: Reject**
(110.16)

Submitter: David Shapiro, Accurate & Intriguing Writing & Editing
Comment on Proposal No: 1-85
Recommendation: Revise text to read as follows:
The marking shall include the date when these characteristics were calculated.
Substantiation: Mr. Gibson, Mr. Hickman, and others have an inarguable point that it is far more effective to provide specific warnings, detailing the precise danger and the protective measures, than to paste a general caution on equipment. At the same time, the CMP and others have a valid point that outdated warnings could mislead. Dated warnings, especially ones of the format, "As of 8/20/06, the incident energy available..." will put people on alert that these characteristics may have changed. The characteristics of Listed equipment installations change over time.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 1-52.
Number Eligible to Vote: 12

Explanation of Negative:
HICKMAN, P.: See our explanation of negative vote on Comment 1-52.

1-57 Log #1323 NEC-P01 **Final Action: Reject**
(110.16)

Submitter: Vincent J. Saporita, Cooper Bussmann
Comment on Proposal No: 1-85
Recommendation: Remove the requirement for marking the shock protection boundary, and make minor changes to the wording. Replace the original proposed wording with:
The marking shall additionally indicate the incident energy and the flash protection boundary.
Substantiation: The Panel was correct in its statement that the shock protection boundaries are outside the scope of 110.16. However, the Panel may wish to reconsider its position relative to not marking the incident energy and arc-flash boundary. It is agreed that the available short-circuit current will and does change with time, and that translates into a change in the incident energy and arc-flash boundary. But, isn't it better and safer to provide the electrical worker with the values at some point in time than to provide nothing at all. If you were an electrical worker that was called out at 2:00 AM to get a motor control center back up and running, wouldn't you like to know the incident energy and arc-flash boundary, even if it was calculated several years ago. If there is no marking on the equipment, the electrical worker is left with nothing but the tables in NFPA 70E, and they have to know the available short-circuit current and opening time of the upstream overcurrent protective device in order to apply the tables. At 2:00 AM, you are not going to be able to find the available short circuit and opening time of the overcurrent protective device. You need to take some voltage measurements. What do you do? Now, if the MCC were marked with the incident energy and flash protection boundary, even though it was obtained years before, you have a basis to make an intelligent decision. Yes, you are taking a risk that the fault current may have gone up or down and that the incident energy and flash protection boundary may have increased, but you are certainly better off than not knowing anything about the hazard level that exists. I urge the panel to pass this one for the safety of the electrical workers that are putting their health and lives at risk while most of the rest of the country sleeps.
Panel Meeting Action: Reject
Panel Statement: What the submitter is proposing is a work practice issue. Such information does not belong in an installation code. More appropriately, it belongs in NFPA 70E - Standard for Electrical Safety in the Workplace. Additionally, the incident energy and flash protection boundary should be determined prior to working on or near energized electrical equipment.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
HICKMAN, P.: See our explanation of negative vote on Comment 1-52.
Comment on Affirmative:
ANTHONY, M.: Our industry has had an abiding interest in this issue because it cares about electrician safety. We have considered it carefully over the past three code cycles. Our abstention remains unchanged since the proposal stage (See 2008 ROP Log # 2672). Organizations need to find ways to de-energize electrical equipment first. We look forward to a development in materials technology that will improve PPE such that necessary protection can be achieved with lighter weight materials permitting greater flexibility over a greater range. This is a challenge to the materials industry innovators and product development specialists to simplify PPE selection and with improvements in material technology.

1-58 Log #1857 NEC-P01 **Final Action: Reject**
(110.16)

Submitter: Mike Holt, Mike Holt Enterprises, Inc.
Comment on Proposal No: 1-84
Recommendation: Delete the word "socket" from the term "meter socket enclosures" in the proposed text.
Substantiation: Deleting the word socket makes it clear that CT meter enclosures are to be included. This also creates a parallel with Proposal 5-294 of this cycle.
Panel Meeting Action: Reject
Panel Statement: The panel concludes that the comment would significantly expand the equipment covered by this requirement beyond that covered by the term "meter socket enclosure" without adequate technical substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-59 Log #582 NEC-P01 **Final Action: Reject**
(110.17)

Submitter: Russell LeBlanc, Peterson School of Engineering
Comment on Proposal No: 1-89
Recommendation: This proposal needs to be accepted in an effort to increase electrical worker safety.
Substantiation: Disappearing work spaces put workers in peril. As the panel's statement indicates maybe a warning sign won't help the problem...but maybe, just maybe, it may prevent even one incident from happening. We should be proactive with this problem. We should not wait for even one incident which would make us be reactive.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 1-60.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
ANTHONY, M.: While the Proposal 1-89 has merit that panel I agree with the panel's action. The submitter did not provide new substantiation in the comment phase. I disagree, however, that the original proposal does not meet the requirements for clarity asserted in the 3.2.1 in the NEC Manual of Style. Clarity can be very subjective.

1-60 Log #999 NEC-P01 **Final Action: Reject**
(110.17)

Submitter: David Shapiro, Accurate & Intriguing Writing & Editing
Comment on Proposal No: 1-89
Recommendation: Accept, but add:
Infringement on this working space could endanger workers requiring clear access to the equipment.
Substantiation: Mr. LeBlanc is correct that this requirement would reduce hazard. It is puzzling that in rejecting the proposal the CMP offers the correct statement that it may, in fact it will, not prevent infringement on the working space. Compliance with Code rules provides no guarantees, but an increased chance of safety at small cost is well worth our while.
The change I propose is due to the fact that warning signs ideally not only catch the attention and instruct their readers, but also specify the nature of the hazards/consequences.
Panel Meeting Action: Reject
Panel Statement: The Panel reaffirms its statement on Proposal 1-89. The submitter's substantiation does not address the expressed Panel concerns.

1-63 Log #309 NEC-P01 **Final Action: Reject**
(110.20 (New))

Submitter: Code-Making Panel 9,
Comment on Proposal No: 1-95
Recommendation: Make the following changes in the panel action text:

1. Locate the new table in Chapter 9, perhaps using the now unused position of Table 3. If this is accepted, the FPN in 110.11 as revised by Proposal 1-61 will need to be correlated.

2. Change the note to the Table to read as follows:

Table 3 ~~110.20~~ provides the basis for selecting ~~the above~~ enclosures for ~~use in~~ certain equipment for which specific protection from various environmental conditions is required in other than hazardous (classified) locations. The enclosures are not intended to protect against conditions such as condensation, icing, corrosion, or contamination that may occur within the enclosure or enter via the conduit or unsealed openings.

FPN: The term raintight is typically used in conjunction with Enclosure Types 3, 3S, 3SX, 3X, 4, 4X, 6, and 6P. The term rainproof is typically used in conjunction with Enclosure Types 3R and 3RX. The term watertight is typically used in conjunction with Enclosure Types 4, 4X, 6, and 6P. The term driptight is typically used in conjunction with Enclosure Types 2, 5, 12, 12K, and 13. The term dusttight is typically used in conjunction with Enclosure Types 3, 3S, 3SX, 3X, 5, 12, 12K, 13.

3. Relocate the requirement as 110.28, as follows:

110.28 Enclosure Types, Not Over 600 Volts, Nominal. Enclosures of all switchboards, panelboards, industrial control panels, meter sockets, motor control centers, enclosed switches, enclosed circuit breakers, transformers, motor controllers, and other equipment enclosures required to be identified as being suitable for the specific environmental conditions that apply at their location, shall be marked with a type number marked on the enclosure by their manufacturer in accordance with Table 3 in Chapter 9.

4. Revise the "Notes to Tables" located after Chapter 9, Table 1 to read: "Notes to Tables 1, 4, 5 and 5A."

Substantiation: This comment raises issues presented in the CMP-9 Proposal 1-94 that were not addressed in the panel action to accept in principle. CMP-9 respectfully requests that CMP-1 revisit the technical issues raised in its proposal, as follows:

1. The Chapter 9 location has the virtue of being immune from the Chapter 5 modification provisions of 90.3. This will then allow the inclusion of NEMA 7, 8, and 9 enclosures in a future code cycle, providing a single location for all the enclosure types, which would be very useful for code users. In fact, this location could also include IEC ingress protection tables as well.

2. To correlate with this suggested location, the operational text has been modified to say, "for which specific protection from various environmental conditions is required". This wording allows the various code making panels to decide whether to implicitly (or explicitly) reference the new table in the future. In addition, this comment retains the present FPN to Table 430.91 that appears to have been omitted in the CMP-1 action on this proposal, although it may be in the portion of the table that apparently truncated due to possible processing error in the Report on Proposals.

3. The requirement relocation to Section 28 moves the rule from the general part of the article, which might be interpreted to apply over 600 volts, to Part II of the article that only applies to 600V and below systems. This is the appropriate location based on the actual text of the rule. In addition, the text suggested here includes other enclosures for which the type designation is routinely applied, and for which no substantiation was provided to omit.

4. The Final Action suggested in this comment corrects an error in the present Chapter 9 table notes that only became worse after the inclusion of the new Table 2 in the 2005 cycle.

This comment has been balloted through CMP-9 with the following balloting results:

11 Eligible to Vote
10 Affirmative
1 Not Returned (H. deVega)

Panel Meeting Action: Reject
Panel Statement: The Panel concludes that the proposed table should be included in Article 110 to enhance usability. The reasons expressed in the Comment to relocate the table to Chapter 9 while retaining the requirement in Article 110 are not persuasive.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-64 Log #976 NEC-P01 **Final Action: Accept in Principle in Part**
(110.20 (New))

Submitter: Mark C. Ode, Underwriters Laboratories Inc.
Comment on Proposal No: 1-95
Recommendation: Revise text to read as follows:

110.20 Enclosure Types. Enclosures (other than surrounding fences or walls) of switchboards, panelboards, industrial control panels, motor control centers, meter sockets, and motor controllers, rated not over 600 volts nominal and intended for such locations, shall be marked with an Enclosure Type number as shown in Table 0.20.

Table 110.20 ~~provides the basis~~ shall be used for selecting the above enclosures for use in specific locations, other than hazardous (classified) locations. The enclosures ~~are~~ shall not be intended to protect against conditions, such as condensation, icing, corrosion, or contamination that may occur within the enclosure or enter via the conduit or unsealed openings.

Substantiation: The accepted text in the proposal does not comply with the NEC Style Manual and Section 90.5(A) to use mandatory language. The suggested text in this comment will provide the mandatory text necessary to comply with 90.5(A) and the NEC Style Manual.
Panel Meeting Action: Accept in Principle in Part

The panel accepts the change to the 1st sentence of the second paragraph, but rejects the change to the 2nd sentence. The panel accepts in principle aligning the text with the NEC Style manual so that the paragraph reads:

"Table 110.20 shall be used for selecting enclosures for use in specific locations other than hazardous (classified) locations. The enclosures are not intended to protect against conditions such as condensation, icing, corrosion, or contamination that may occur within the enclosure or enter via the conduit or unsealed openings."

Panel Statement: In accordance with the NEC Style Manual, Section 3.1.1, CMP-1 concurs with the submitter that using the mandatory code language "shall be used" in lieu of "provides the basis" is appropriate. CMP-1, however, disagrees with changing the words "are not intended" to "shall not be intended." In the context of the sentence, there is no need for this sentence to be written as mandatory code language. CMP-1 has also removed the words "the above" as they are unnecessary and in violation of NEC Style Manual, Section 3.3.4 – Word Clarity.
Number Eligible to Vote: 12

1-66 Log #1097 NEC-P01 **Final Action: Reject**
(110.21)

Submitter: Michael Thibeau, Bear Electric
Comment on Proposal No: 1-96
Recommendation: Revise text to read as follows:
(a) Minimum Space. Switchboards, panel boards, disconnects, panels, meter~~-mains~~ enclosures, and any electrical cabinet or, enclosure that may require ~~any~~ examination, adjustment, service, or ~~reset~~, maintenance shall be field marked: [Warning: minimum ~~3~~ (x) ft. clearance required by NEC code] (x) shall be derived from table 110.26(A)(1). Field marking shall not be required if the equipment is accessible only to qualified personnel.
Substantiation: This submission was edited to more fully comply with the style manual, specifically 2.1.5.2, 3.2.4, and 3.3.5. I also completely agree with the submitter, Donald Wiess that this simple signage would of significant benefit. I believe that although many unqualified persons may be aware of electrical hazards, many are unaware of the space requirements set forth in 110.26 not only in dwelling units but commercial/retail spaces as well. This will not only serve as a deterrent towards encroaching miscellaneous storage, but also as a reminder to other tradesmen making installations around electrical equipment about NEC space requirements. In one instance, an oil tank was installed directly in front of a panel that needed to be worked on.
Panel Meeting Action: Reject
Panel Statement: The Panel reaffirms its statement on Proposal 1-96 as the comment does not provide any additional information to address the Panel's expressed concern.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
ANTHONY, M.: We agree with the substantiation presented by Mr. Hickman in the proposal stage. We do not want to "oversign" an already oversigned world but we need something to keep stuff in front of electrical panels. The proposed marking would serve as a deterrent to unqualified persons and an important reminder to qualified persons.
HICKMAN, P.: We are voting negative to the panel action to reject Comment 1-66. Our explanation is as follows: We do not necessarily agree with the panel statement on Comment 1-66 which reaffirms its panel statement on Proposal 1-96. We still maintain the proposed marking would serve as a deterrent to unqualified persons. We do not agree with the panel statement which states: "such marking would be of little benefit."

1-67 Log #1001 NEC-P01 **Final Action: Reject**
(110.21(A))

Submitter: David Shapiro, Accurate & Intriguing Writing & Editing
Comment on Proposal No: 1-96
Recommendation: Accept, but add:
Infringement on this working space could endanger workers requiring clear access to the equipment.
Substantiation: Mr. Weiss is correct that this requirement would prevent costly mistakes and even deaths. What the CMP asserts in rejecting the proposal is puzzling. By definition of "qualified," a qualified person would know the rule, but there are a great many more non-qualified working around electrical equipment, and some of them do heed signs. Otherwise, why would we bother with "Danger! Shock hazard-keep out."?
The change I propose is due to the fact that warning signs ideally not only catch the attention and instruct their readers, but also specify the nature of the hazards/consequences.
Panel Meeting Action: Reject

(110.22)

Submitter: John D. Minick, Grand Prairie, TX
Comment on Proposal No: 1-98
Recommendation: Revise Proposal 1-98 as accepted by Code-Making Panel 1 as shown below:
110.22 Identification of Disconnecting Means.
(A) General. Each disconnecting means shall be legibly marked to indicate its purpose unless located and arranged so the purpose is evident. The marking shall be of sufficient durability to withstand the environment involved.
(B) Engineered Series Combination Systems. Where circuit breakers or fuses are applied in compliance with the series combination ratings selected under engineering supervision and marked on the equipment as directed by the engineer, the equipment enclosure(s) shall be legibly marked in the field to indicate the equipment has been applied with a series combination rating. The marking shall be readily visible and state the following:
CAUTION — ENGINEERED SERIES COMBINATION SYSTEM RATED ____ AMPERES. IDENTIFIED REPLACEMENT COMPONENTS REQUIRED.
FPN: See 240.86(A) for ~~interrupting rating marking for end-use equipment~~ requirements for Engineered Series Combination Systems.
(C) Tested Series Combination Systems. Where circuit breakers or fuses are applied in compliance with the series combination ratings marked on the equipment by the manufacturer, the equipment enclosure(s) shall be legibly marked in the field to indicate the equipment has been applied with a series combination rating. The marking shall be readily visible and state the following:
CAUTION — SERIES COMBINATION SYSTEM RATED ____ AMPERES. IDENTIFIED REPLACEMENT COMPONENTS REQUIRED.
FPN: See 240.86(B) for ~~interrupting rating marking for end-use equipment~~ requirements for Tested Series Combination Systems.
Substantiation: This Comment was developed by a Task Group of CMP-1 members while reviewing actions taken by CMP-10 on Proposal 10-52, which was referred to CMP-1 by CMP-10. Members of the Task Group included Louis Barrios, Jr., Kenneth Boyce, Mark Christian, Neil LaBrake, Lanny McMahill, Gil Moniz, and John Minick. The developed Comment to CMP-10 states CMP-1 agrees that markings are required for Engineered Series Combination Systems (240.86(A)). However the specifics of the marking should appear in 110.22 that already contains marking requirements for Tested Combinations (240.86(B)). CMP-1 considers that Proposal 1-98 as modified by this comment meets the intent of 10-52 relative to specific markings associated with 240.86(A). Additionally, CMP-1 suggested that CMP-10 add a FPN to 240.86 that would state - FPN: See 110.22 for marking requirements for Series Combination Systems.
The added (A), (B), (C) paragraph style proposed as a revision to the accepted Proposal 1-98 is intended to separate and clarify the three main requirements contained in 110.22. The revision of the fine print notes accepted by CMP-1 in Proposal 1-98 are necessary in that the current fine print notes appear to reference markings in 240.86 and that may in fact confuse NEC users.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Comment 1-70.

(110.22)

Submitter: Code-Making Panel 10,
Comment on Proposal No: 1-98
Recommendation: This proposal should be Accepted in Principle, and modified as follows:
110.22 Identification of Disconnecting Means.
(A) General. Each disconnecting means shall be legibly marked to indicate its purpose unless located and arranged so the purpose is evident. The marking shall be of sufficient durability to withstand the environment involved.
(B) Engineered Series Combination Systems. Where circuit breakers or fuses are applied in compliance with the series combination ratings selected under engineering supervision and marked on the equipment as directed by the engineer, the equipment enclosure(s) shall be legibly marked in the field to indicate the equipment has been applied with a series combination rating. The marking shall be readily visible and state the following:

CAUTION — ENGINEERED SERIES COMBINATION SYSTEM RATED AMPERES IDENTIFIED REPLACEMENT COMPONENTS REQUIRED.

FPN: See 240.86(A) for Engineered Series Combination systems.

(C) Tested Series Combination Systems. Where circuit breakers or fuses are applied in compliance with the series combination ratings marked on the equipment by the manufacturer, the equipment enclosure(s) shall be legibly marked in the field to indicate the equipment has been applied with a series combination rating. The marking shall be readily visible and state the following:

CAUTION — SERIES COMBINATION SYSTEM RATED _____ AMPERES IDENTIFIED

REPLACEMENT COMPONENTS REQUIRED.

FPN: See 240.86(B) for Tested Series Combination Systems. ~~interrupting rating marking for end-use equipment~~.

Substantiation: This comment was developed by a task group comprised of the following members of CMP-10 James Dollard, Chair; Charles Blizzard; Dennis Darling; Charles Eldridge; Carl Fredericks; Clive Kimblin; John Kovacik; Frank Ladonne; George Ockuly; Gerald Williams; Alan Manche and Vince Saporita.

This proposed revision is modeled after the preliminary work of a CMP-1 Task Group developing a comment on Proposal 1-98.

The intent of the submitter is met in this revision. In order to improve clarity and usability, the proposed revision of the requirements of 110.22 are separated into three first level subdivisions. The existing requirements of 110.22 as seen in the 2005 NEC are editorially separated into two first level subdivisions titled, "(A) General)" and "(C) Tested Series Combination Systems." The proposed additional text accepted in Proposal 1-98 by CMP-1 is editorially placed in first level subdivision titled "(B) Engineered Series Combination Systems." This separation of requirements provides additional clarity, is user friendly, and in compliance with the NEC Manual of Style.

The Fine Print Note referencing 240.86(A) as accepted by CMP-1 in Proposal 1-98 has been modified to provide additional clarity. The revised FPN does not contain a requirement and is in compliance with the NEC Manual of Style. The existing FPN which is editorially moved to a new first level subdivision 110.22(C) has been modified for consistency with the proposed FPN in a new first level subdivision 110.22(B).

Requirements for marking of engineered series rated systems should be found in the same place as those for tested series rated systems. As such, they should be located in 110.22, not Article 240. CMP-10 considers that Proposal 1-98 as modified by this comment meets the intent of Proposal 10-52 relative to specific markings associated with 240.86(A).

This comment was balloted through CMP-10 with the following ballot results:

12 Eligible to Vote

11 Affirmative

1 Not Returned (R. Sobel)

1-71 Log #1672 NEC-P01 **Final Action: Accept in Principle**
(110.25 (New))

TCC Action: The Technical Correlating Committee understands that the panel action deletes the last sentence in the opening paragraph of 110.26 and adds a new 110.26(G).

Submitter: Phil Simmons, Olympia, WA

Comment on Proposal No: 1-100

Recommendation: Delete the last sentence of 110.26 opening paragraph and create a new 110.25 (or other appropriate location) with the concepts included in the existing rule.

110.25 Locked Rooms or Equipment. Rooms ~~or enclosures housing~~ containing overcurrent protective devices or disconnecting means and enclosures for overcurrent protective devices or disconnecting means shall be permitted to be locked provided those to whom access is necessary have a key or other means to open the lock(s) ~~electrical apparatus that are controlled by lock and key shall be considered accessible to qualified persons~~.

Substantiation: As stated in the substantiation for the Proposal, the sentence that is the subject of the Proposal has everything to do with access to equipment or to the room housing the electrical equipment and nothing to do with providing working space about electrical equipment. Working space is a cube-shaped space generally located in front of electrical equipment with a specific width, depth and height. Those working spaces are never locked (unless, of course, the room exactly matches the dimensions of the working space which is unlikely).

To accomplish the relocation needed, this Comment suggests the concepts included in this sentence be relocated to a new section. Section 110.25 is proposed, but another section at the discretion of the Panel is certainly acceptable.

Proposal 4-81 to add the language from 110.26 to 230.92 was rejected by CMP-4 with the thought that language to regulate access to equipment, if applicable to more than one article, should be in Article 110. Locked equipment is presently covered in not less than the following 20 articles: 110, 230, 240, 410, 422, 424, 430, 440, 450, 490, 514, 520, 600, 610, 620, 625, 647, 665, 675, and 695.

Panel member Mr.McMahill states in his negative vote, "The proposal should have been accepted as the submitter's substantiation justifies deletion of the text. I agree with the submitter that this sentence does not belong in this section and removing it will improve usability of the code. The panel statement notes that, "The submitter has not provided adequate technical substantiation that a problem exists." I believe the submitter has provided reasonable substantiation for the change. Section 110.26 addresses "Spaces About Electrical Equipment." A lock and key has nothing to do with these spaces. The sentence more appropriately belongs somewhere else in the code. At the minimum, CMP-1 should have accepted the proposed deletion of the sentence contingent on CMP-4 and 10's positive action on the submitter's companion proposals. CMP-1 should reconsider the action on this proposal." I agree with Panel member Mr.McMahill!

Moving this sentence to a new and appropriate location will not introduce a new concept not covered in the NEC, but will improve the organization and user-friendliness of the Code.

Panel Meeting Action: Accept in Principle

Create new section 110.26 (G) that reads:

110.26 (G) Locked Electrical Equipment Rooms or Enclosures. Electrical equipment rooms or enclosures housing electrical apparatus that are controlled by a lock(s) shall be considered accessible to qualified persons.

Panel Statement: CMP-1 accepts the recommendation to delete the text from Section 110.26 regarding "Enclosures housing electrical apparatus that are controlled by a lock(s)...." and create a new section 110.26(G). CMP-1 has created a new title for 110.26(G) - Locked Electrical Equipment Rooms or Enclosures. The deleted text from Section 110.26(A) has been relocated to this new section and slightly modified for clarity of the intent.

1-72 Log #1003 NEC-P01 **Final Action: Reject**
(110.26 (New))

Submitter: David Shapiro, Accurate & Intriguing Writing & Editing

Comment on Proposal No: 1-103

Recommendation: Accept as written.

Substantiation: The CMP's comments appear to overlook a special characteristic of many metering devices. Utility meters most commonly serve as customer demarcation points, remaining under utility control. At least in part because of this, the utility, not the AHJ, approves the location of the meter can. Then electricians-our peers-as well as lineworkers need access after these are energized, for instance when performing service changes.

Panel Meeting Action: Reject

Panel Statement: Working space is required about all electrical equipment. Clearly this includes "metering devices".

Comment on Proposal No: 1-101

Recommendation: Accept the Proposal. New Text from ROP is repeated here:

1-101 Log #3082 NEC-P01 **Final Action: Reject**
(110.26)

Submitter: Michael A. Anthony, University of Michigan Business & Finance / Rep. Association of Higher Education Facilities Officers

Recommendation: Add text to read as follows:

11 0.26(D) (NEW) Emergency Illumination. The area around all service panels in non-dwelling unit occupancies 200 amperes and above shall be automatically illuminated upon loss of power. For a period of 90 minute illumination levels shall be

(1) One footcandle (1-fc) along the floor to the established building emergency egress path.

(2) Two footcandles (2-fc) at all vertical surfaces where surface switchgear, permanent service directory, emergency transfer switches, or standby power switches are located.

Substantiation: Proposal 1-101, Log #3801 should be accepted. This proposal aligns with the work of the panel that crafted new Article 585 (Critical Operations Power Systems) because it a necessary part of the foundation we are building for power security. It should be intuitively understood that emergency lighting is needed at the electric service equipment in order for an electrical professional--or non-electrical professional--to at least determine the nature of the outage and take appropriate action.

Some NEC requirements ought to come from gut-level understanding that emergency lighting at the service equipment is important enough that it should not lie in the gap in coverage of the Life Safety Code (typically enforced by the local fire marshal) and the electrical inspector enforcing the National Electric

Code. A great deal of the Life Safety Code covers egress; everything is about getting people out of the building. But during a power outage everybody else may be leaving the building while the electrician or fire fighter is obliged to go in the opposite direction.

In the 2006 Life Safety Code you will get 30 hits on the word "emergency lighting", 10 hits on the word "emergency power", 38 hits on the word "illumination" and 3 hits on the word "ingress". Look at them all carefully in the context of how an Architect constructs an egress path and then tell me that there is not a gap between these two codes that leaves the electrician in the dark.

The following selections from the Life Safety Code may help friends of the NEC who do not have access to the NFPA code subscription service that makes it so easy to compare codes and standards.

7.8 Illumination of Means of Egress.

7.8.1 General.

7.8.1.1* Illumination of means of egress shall be provided in accordance with Section 7.8 for every building and structure where required in Chapter 11 through Chapter 42.

The Life Safety Code is silent over the issue of whether service equipment needs to be on the egress entry, egress path, or egress exit. The Life Safety Code fails to assure that the path to or from the electric service equipment is obvious and direct. (I acknowledge the hidden assumption that transfer equipment is located near the service point) Good engineers and architects can, and should, provide for such illumination in the design stage but a large class of electrical service equipment areas are not guided by designers. Even with good designers on the job the concept of "ingress toward the electric service equipment" doesn't even seem to show up between the lines of the Life Safety Code. The equivalency of ingress (or partial ingress), as the reverse of egress, for example, may not be assured.

7.9.2.3* The emergency lighting system shall be arranged to provide the required illumination automatically in the event of any interruption of normal lighting due to any of the following:

(1) Failure of a public utility or other outside electrical power supply
(2) Opening of a circuit breaker or fuse
(3) Manual act(s), including accidental opening of a switch controlling normal lighting facilities

Note that the only facility classes that explicitly require illumination at anything resembling the service point, are storage and detention facilities.

22.5.1.2 Alarms, emergency communications systems, and the illumination of generator set locations shall be provided with emergency power in accordance with NFPA 70, National Electrical Code.

From this sample of passages it should be plain that, without an explicit requirement for emergency illumination at the service equipment as a Chapter 1 general requirement, we put the Fire Marshall and the Electrical Inspector in a position where each looks to the other as the person responsible for verifying that the installation meets service equipment emergency lighting requirements that do not now exist. Getting this language into the NEC, or a version of it that matches its intent, will change that.

We should take comfort in the fact that mounting a spec grade emergency lighting unit and pointing its beam at the service equipment can cost as little as $100--installed. While it is true that loss data has not been presented to the committee, the lack of hard data accompanying this proposal is not much different than the lack of data presented to the committee governing the controversial selectivity requirements in Articles 700 and 701. A great deal of the NEC has come down to us from uncounted, unclassified experience. We should let common sense be the guide in the acceptance of Proposal 1-101. It's a start.

Panel Meeting Action: Reject

Panel Statement: The Panel reaffirms its statement on Proposal 1-101. The panel recommends that the submitter submit this proposal to the NFPA 101 & 5000 committees. The panel notes that what the submitter is suggesting is not prohibited by the NEC.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

ANTHONY, M.: I appreciate the respectful discussion of this issue by my colleagues on Panel 1 at the December 2006 ROC panel meeting. Perhaps this proposal is one of many that are presented to NEC committees that take a while "getting used to" or may be too far ahead of its time. Nevertheless, I maintain that emergency illumination for service switchgear--especially switchgear that controls emergency power--should be a general requirement for electrical installations; much as working/clearance/dedicated space, and panic hardware is a general requirement. Electrical people should be looking after their own in this regard; not leaving the issue to the architectural trades that dominate the code panels in the Life Safety Code.

1-74 Log #1004 NEC-P01 **Final Action: Reject**
(110.26(A))

Submitter: David Shapiro, Accurate & Intriguing Writing & Editing
Comment on Proposal No: 1-106
Recommendation: Accept, adding: To the extent practicable, in front of Mr. Schwan's proposed new text.
Substantiation: What has been proposed is an important concept, one that often is enforced now, and that should be incorporated into the Code. It addresses issues raised also in Proposals 1-113, 114, and 115, and 10-40-the latter being a case where three CMP members say that the working space in front of panelboards should not require workers to stand on two levels. Equipment on a roof may not have a flat surface in front of it, as the CMP points out, but this is not in conflict: roofs are sloped when, as Mr. Schwan's wording acknowledges, they must be arranged to drain.

Furthermore, if a roof is so steep as to exceed a reasonable slope for drainage, perhaps anyone requiring the installation of electrical equipment requiring testing or service on such as surface ought to supply a working platform in front of it, for worker safety. OSHA statistics on falls by construction workers are well-known. While this is partly due to the nature of the sites-holes, uneven ground, elevations-I believe you will agree that it also is partly due to the distracting nature of the work. When the stumble would cause shock or worse, adding a simple requirement such as Mr. Schwan's is especially worthwhile.

The words I propose adding will make it easier for AHJs to accommodate special cases without having to provide formal written permission per 90.4.

Panel Meeting Action: Reject

Panel Statement: The Panel concludes that the proposed text suggested by the comment does not ameliorate the concerns expressed in the panel statement on Proposal 1-106.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

ANTHONY, M.: I disagree with the panel statement that this language fails to clear up the problem of working spaces on unlevel surfaces. Electrical designers, among others, need to be made to work harder to keep electrical equipment out of stairways and other unlevel surfaces. Very often a stairway is the only egress path and switchgear should not be permitted to be installed in such locations.

MCMAHILL, L.: CMP-1 should have accepted this comment in principle with the following revised wording: "To the extent practicable, the standing surface shall be horizontal, flat, and level, except where necessarily sloped to drain." The revised text would more closely reflect the intent of the original submitter. Using the generic term "standing surface" eliminates the need for a type of surface, such as grade, floor or platform. Use of the term "to the extent practicable" (feasible) is appropriate code language - it meets the NEC Style Manual syntax requirements. The revised text will allow the AHJ flexibility in code enforcement and provide a tool to be used for attaining compliance with this section.

1-76 Log #837 NEC-P01 **Final Action: Accept**
(110.26(A)(1)(a))

Submitter: Jim Pauley, Square D Company
Comment on Proposal No: 1-111
Recommendation: Continue to reject the proposal.
Substantiation: Although this proposal was rejected by a significant margin, the comments on voting deserve some additional explanation. The problem with using the term "de-energized" introduces exactly the issue that existed in the 1999 NEC. You must read the wording carefully because using that term stated "de-energized parts on the back of enclosed equipment". Nobody could explain what a de-energized part would be that is ON the back of a piece of equipment. The panel was correct to change the wording to "non-electrical". A couple of examples of what may be included in this wording are items such as filters for air circulation systems that are part of the equipment or a transformer throat connection that needs some mechanical (not electrical) work.

Furthermore, if the expectation was for de-energized parts then you may still need the normal working space in order to verify that these are "de-energized" (as pointed out by Mr. Barrios). The 30" provision allows for reduced space to allow access and perform work that is not related to the electrical aspects of the equipment.

Mr. Barrios is correct that the way to resolve the inconsistency is to fix 110.34(A) exception to match 110.26.
Panel Meeting Action: Accept
Panel Statement: The panel does not necessarily agree with all of the submitter's substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

MCMAHILL, L.: Code-Making Panel 1 should have reverted back to the original code language to mirror the requirements of 110.34, Exception. The term "de-energized" has been long standing in the code with no reports of problems or concerns. Use of the term "nonelectrical" now requires a judgment call on the part of the AHJ to determine if working space is or is not required for rear access. De-energized terminals on the rear of a switchboard generally do not require examination, adjustment, servicing, or maintenance while energized. Therefore, is working space per 110.26(A) required, or does compliance with 110.26, Spaces About Electrical Equipment, suffice? The term nonelectrical is vague and unenforceable code language. This change now requires a minimum horizontal working space on the back of enclosed equipment for nonelectrical parts, yet requires no minimum working space for electrical parts. It is more appropriate to require a minimum horizontal working space for deenergized electrical parts not likely to require examination, adjustment, servicing, or maintenance while energized, than for nonelectrical parts.

1-77 Log #1796 NEC-P01 **Final Action: Hold**
(110.26(A)(1)(a) and 110.34.(A))

Submitter: Michael Walls, American Chemistry Council
Comment on Proposal No: 1-111
Recommendation: Modify 110.34(A)Exception as shown below.
110.34 Work Space and Guarding.

(A) Working Space. Except as elsewhere required or permitted in this Code, the minimum clear working space in the direction of access to live parts of electrical equipment shall not be less than specified in Table 110.34(A). Distances shall be measured from the live parts, if such are exposed, or from the enclosure front or opening if such are enclosed.
Exception: Working space shall not be required in back of equipment such as dead-front switchboards or control assemblies
where there are no renewable or adjustable parts (such as fuses or switches) on the back and where all connections are accessible from locations other than the back. Where rear access is required to work on non-electrical ~~de-energized~~ parts on the back of enclosed equipment, a minimum working space of 750 mm (30 in.) horizontally shall be provided.
Substantiation: The panel action should continue to be Reject on Proposal 1-111 because Condition 1, 2, or 3 working clearances may still be needed on de-energized equipment for tasks such as testing for the absence of voltage as noted in Mr. Barrios' ROP affirmative ballot comment. Also as noted in Mr. Barrios' ballot comment, "de-energized parts" in 110.34(A) Exception should be changed to "non-electrical parts" as shown above so that the requirements in 110.26(A)(1)(a) and 110.34(A) are consistent. Failure to modify 110.34(A) will continue the inconsistency between the low voltage and medium voltage clearance requirements behind dead front equipment for another code cycle. This action should not be considered as new material since the proposed changes in 110.34 (A) Exception appeared in the ROP.
Panel Meeting Action: Hold
Panel Statement: This comment was held because it would introduce a concept that has not had public review by being included in a related proposal as published in the Report on Proposals.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:

BARRIOS, L.: The panel should have accepted this comment and not placed it on hold for the 2011 code cycle. Comment 1-77 recommends changing "de-energized parts" to "non-electrical parts" in the 110.34(A) Exception in order to make the requirements the same for LV and MV equipment. I also made this recommendation in my affirmative ballot comment on Proposal 1-111 in the 2008 ROP. Since similar language appears in the ROP, the proposed change has had public review and should not have been considered new material. The submitter of Comment 1-76 acknowledged the proposed change in my ROP comment by stating "Mr. Barrios is correct that the way to resolve the inconsistency is to fix the110.34(A) exception to match 110.26."

HITTINGER, D.: I am voting negative on the panel action to hold Comment 1-77. Our explanation is as follows: "This comment did have public review as noted in Mr. Barrios' ROP ballot comment. The panel should accept this comment that would modify the text to make the requirements in 110.26(A)(1)(a) and 110.34(A) consistent."

1-78 Log #6 NEC-P01 **Final Action: Accept**
(110.26(A)(3))

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 1-117
Recommendation: The Technical Correlating Committee directs the panel to reconsider their action relative to the necessity of a soft conversion. This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the TCC's direction to reconsider action on Proposal 1-117. As 90.9(D) states that compliance with either SI measurements or inch-pound measurements shall constitute compliance with NEC, and 6 inches is a greater distance than 150 mm, 90.9(C)(4) would not apply. The panel concludes that the use of 150mm is appropriate.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-79 Log #935 NEC-P01 **Final Action: Reject**
(110.26(A)(3))

Submitter: Robert G. Fahey, City of Evansville
Comment on Proposal No: 1-116
Recommendation: I would support the new wording proposed for this section as proposed in NEC Proposal 1-115 (Log #1892).

The new 2nd sentence in (A)(3):

"Stairs or stair treads shall not be permitted as the grade floor or platform as referred to in this section."
Substantiation: I am not aware of any incidents where a worker has been hurt by working on a stairs or uneven floor surfaces. As an electrician and an electrical inspector, it is very apparent to me it would be very easy to loose your balance while working on a panelboard located on a stair tread or uneven surface. I would doubt if any electrician in my area would take the time to build a level platform in order to work on the equipment. Providing a level working area in front of electrical equipment will enhance the safety of the installation, allowing an uneven area created by steps in front of electrical equipment provides an unsafe workplace. As the NEC is presently written, new electrical panelboards are allowed to be installed in these unsafe areas, there would typically be minimal or
no additional cost to install these panelboards in a safe, level work space, this might save an electrician from being injured or shocked sometime in the future. I inspected an installation where the panelboard was installed on a stairway and found it to be unfortunate that the National Electrical Code did not prohibit this type of unsafe installation. I would encourage the Code Panel to look at this additional sentence and embrace this as another step in making it safer for workers who must in some instances (actually many instances) work on this equipment energized. This would, in my mind, be logical move forward in creating a safer work area for all electricians and maintenance personnel.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its statement on Proposal 1-115. The panel understands that this comment is in reference to proposal 1-115 rather than the linked proposal 1-116.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

HICKMAN, P.: We are voting negative to the panel action to reject Comment 1-79. Our explanation is as follows: This comment should have been accepted. We disagree with the panel statement which reaffirms the action and statement on Proposal 1-115. We disagree the proposed recommendation is restrictive and unnecessary. We recognize that there may be many cases where working from an uneven work surface may be unnecessary. However, designing or condoning this type of installation does not seem prudent.

1-80 Log #1404 NEC-P01 **Final Action: Reject**
(110.26(A)(3))

Submitter: Noel Williams, Noel Williams Consulting
Comment on Proposal No: 1-116
Recommendation: Revise text to read as follows:

This proposal should have been accepted. Alternatively the proposal should have been accepted in principal with the wording changed to read "...to the height required by 110.26(E) or to the top of the equipment and not less than 2.0 m (6-1/2 ft) where a minimum height is not specified by 110.26(E)."
Substantiation: According to the panel statement, "the submitter's intent is met by the reference to 110.26(E) height requirement in 110.26(A)." This is false. The submitters intent is not met by the existing language of 110.26(E). It may be true that the panel's intent is met by this reference, however, that would mean that the panel's intent is that there would be no minimum height requirement for equipment such as safety switches, combination motor controllers, control panels, or the like, since 110.26(E) does not provide a height requirement for such equipment. 110.26(A)(3) says the height shall be "...the height required by 110.26(E)." 110.26(E) provides a height requirement only for "service equipment, switchboards, panelboards, or motor control centers," and provides no requirement for other equipment that may require "examination, adjustment, servicing, or maintenance while energized." I doubt very much that that is the panel's intent, but that is what the section says. If the panel intends that a height requirement apply to equipment other than that to which 110.26(E) clearly limits itself, then the proposal should have been accepted. Otherwise other types of equipment will have specified width and depth requirements but no height so the working space for such equipment will have an area, but no volume. A more user-friendly approach would be to state the requirement in 110.26(A)(3) rather than referring to another subsection. If the panel intends that the minimum height requirements be 6-1/2 ft in all cases except for in existing dwelling units, the alternative wording suggested above should be accepted and the original proposal should have been accepted in principal.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its statement on Proposal 1-116. 110.26(A)(3) references the height requirements (dimensions) contained in 110.26(E) for the equipment addressed in 110.26(A). It does not limit the working space height to the specific equipment addressed in 110.26(E).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:

HITTINGER, D.: I am voting negative on the panel action to reject Comment 1-80 with the following explanation: The submitter has identified a problem with determining the height of working space and headroom requirements as found in 110.26(A)(3) that references 110.26(E). The list in 110.26(E) only references service equipment switchboards, panelboards and motor control centers so there is no requirement for equipment not mentioned in the list. Inserting the proposed text into 110.26(A)(3), would provide users of the code the necessary language to install and enforce height requirements for all electrical equipment.

MCMAHILL, L.: The submitter's comment that "there would be no minimum height requirement for equipment such as safety switches, combination motor controllers, control panels, or the like" is correct. Section 110.26(E) is specific to "service equipment, switchboards, panelboards, or motor control centers." This is a minor oversight that may need to be clarified during the 2011 NEC cycle by deleting "about service equipment, switchboards, panelboards, or motor control centers" from Section 110.26(E). This would likely meet the intent of the submitter and the code.

TCC Action: The Technical Correlating Committee understands that the panel action is further modified by the addition of the text "and over 1.8 m (6 ft) wide" in accordance with the panel actions on Comment 1-86 and Proposal 1-127.
Submitter: James K. Lathrop, Koffel Assoc., Inc.
Comment on Proposal No: 1-119
Recommendation: Further revise the text of 110.26(C) from that made at the ROP stage as follows:
(C) Entrance to and Egress fromWorking Space.

(1) Minimum Required. At least one entrance of sufficient area shall be provided to give access to and egress from working space about electrical equipment.
(2) Large Equipment. For equipment rated 1200 amperes or more that contains overcurrent devices, switching devices, or control devices, there shall be one entrance to and egress from the required working space not less than 610 mm (24 in.) wide and 2.0 m (6½ ft) high at each end of the working space. Where the entrance has a personnel door(s), the door(s) shall open in the direction of egress and be equipped with panic bars, pressure plates, or other devices that are normally latched but open under simple pressure.

A single entrance to and egress from the required working space shall be permitted where either of the conditions in 110.26(C)(2)(a) or (C)(2)(b) is met.

(a) Unobstructed Egress ~~Exit~~. Where the location permits a continuous and unobstructed way of egress ~~exit~~ travel, a single entrance to the working space shall be permitted.

(b) Extra Working Space. Where the depth of the working space is twice that required by 110.26(A)(1), a single entrance shall be permitted. It shall be located so that the distance from the equipment to the nearest edge of the entrance is not less than the minimum clear distance specified in Table 110.26(A)(1) for equipment operating at that voltage and in that condition.
Substantiation: I serve as chairman of the NFPA 101 and NFPA 5000 Means of Egress Technical Committee (MEA). NFPA 101 and NFPA 5000 are in the June 2008 revision cycle. The MEA committee developed committee proposals to reference NFPA 70 110.33(A). Users of NFPA 101/5000 have followed the criteria of those codes only to find that the design was deficient from the requirements of NFPA 70. By referencing NFPA 70 110.33(A), the user of NFPA 101/5000 will be warned that the related provisions from NFPA 70 apply. However, some of the terminology used in 110.26(C) is inconsistent with that in NFPA 101/5000.

(1) With respect to the addition of the words "and egress from" in (C)(2), this is a correction to what was reported in the ROP. It appears the submitter of the proposal included the addition of those words, but they were not underscored and went unnoticed. Thus, the committee action on NEC Proposal 1-119 should have read: "The panel accepts only the submitter's recommendation to insert 'and egress from' in four ~~three~~ places."

(2) With respect to the replacement of the word "exit" with the word "egress" in two places in (C)(2)(a), the word "exit" has a special meaning in NFPA 101/5000 which can be generalized to mean the final door reached to the outside. Other travel across floors and through doors encountered along the egress path is part of the exit access. So in describing the route to the exit, the term "egress" is more correct.

Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-85 Log #652 NEC-P01 **Final Action: Reject**
(110.26(C)(2))

Submitter: Michael Cole, MRC Electric
Comment on Proposal No: 1-127
Recommendation: Change the first paragraph of 110.26(C)(2) as follows, which is slightly different than the original proposal by Alan Manche. This proposal needs to be Accepted in Part, but modified in part.

(2) Large Equipment. For equipment rated 1200 amperes or more or over 1.8 m (6 ft) overall width that contains overcurrent devices, switching devices, or control devices, there shall be one entrance to the required working space not less than 610 mm (24 in.) wide and 2.0 m (6 1/2 ft) high at each end of the working space. In new installations where equipment can be installed on both sides of the working space condition 3 in Table 110.26(A)(1) shall be applied with a reasonable depth allowance for future equipment.

Add fine print note:

FPN: A double width working space minimizes installation and maintenance labor and allows workers to more readily and safely work when there are ladders, wire reels, and so forth in the working space. A working space with both double space and double exits provides both superior safety and greatly reduces labor for installation and maintenance.

Substantiation: a. Equipment that is over 6 ft wide regardless of ampere capacity presents several headaches with respect to safety, installation, and maintenance. A single width double exit working space no longer has 2 exits when somebody is working on a ladder. Also, for equipment that is over 6 ft wide there needs to be extra room and/or exits such that 2 or more people can work in there. One such instance is when OSHA or insurance regulations require that there be 2 people working together in the room.

b. Another instance where double space and/or exits is needed is that having 2 or more electrical workers in the room minimizes installation time and optimizes installation labor. The less frustrated people are the more likely that they will work safely and efficiently. Also, the most efficient way to pull multiple general purpose branch circuits into raceways is to put the wire reels in the electrical closet and pull all of the home runs from there to the first box.

Allocating a double width working space is NOT a waste of resources - it can actually save money as well as enhancing safety. For that matter, it PAYS to use 2.5 in. schedule 80 PVC conduit for a 200 amp residential underground electrical service because of the savings on wire pulling labor. If you have a 4 person crew and no place to hook up a wire pulling winch or a forklift truck, the wire pull needs to be really easy. See Chapter 9, Fine Print Note No. 2 for jamming criteria when pulling wires around a conduit bend.

c. Oftentimes, equipment that is over 6 ft wide requires double width working space an/or double exits just to be able to get the equipment into the electrical room.

d. Not being able to install equipment on both sides of an electrical closet is a constraint that nobody likes to see.

Panel Meeting Action: Reject
Panel Statement: As stated in 90.1(C), the Code is not a design specification or a manual for untrained persons. The submitter's recommendation contains language that is vague and unenforceable.

The substantiation does not supply technical justification to require two means of access/egress or double the working space where equipment of any rating exceeds 6 ft.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-86 Log #892 NEC-P01 **Final Action: Reject**
(110.26(C)(2))

Submitter: Michael P. O'Quinn, MOGO Enterprises, Inc.
Comment on Proposal No: 1-127
Recommendation: Reject this proposal. Restore wording to 2005 NEC language.
Substantiation: The proposal appears to use the logic that providing 2 methods of egress for electrical equipment with "increased hazard" is too difficult or confusing. If this is the case, this is not a good reason for a change in the wording of this section.

As both Mr. Hickman and Mr. McMahill pointed out in their Explanation of Negative, the two means of egress about this equipment is for worker safety. Modern electrical equipment, especially at the 480-volt nominal range, can provide tremendous levels of arc flash and blast. The size of modern equipment is getting smaller with increasing levels of electrical energy, and also being placed more often in rooms to prevent the unqualified from exposure. Without adequate egress from this level of danger, extra exposure time to the arc flash increases the level of danger to the worker, even with proper PPE protection.

As the proposal's submitter states: "The arc blast or incident energy at a location is based on the voltage, available short circuit current, separation between the electrodes (phases), the distance a worker's body parts are from the arcing fault, and the duration of the fault."

Panel Meeting Action: Reject
Panel Statement: The Comment does not provide any new information and the Panel reaffirms its action based on the substantiation contained in Proposal 1-127.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 3
Explanation of Negative:

HICKMAN, P.: We are voting negative to the panel action to reject Comment 1-86. Our explanation is as follows: This comment should have been accepted to maintain the direction the panel took on this issue last cycle. Clearly, equipment much smaller than 6 ft can be extremely dangerous and would warrant the protection afforded by the requirements of 110.26(C)(2). As we stated in our comment to the negative during the ROP, we point to the substantiation provided by Mr. Ray Jones, current chairman of the NFPA 70E Technical Committee. The submitted IEEE paper entitled Staged Tests Increase Awareness of Arc-flash Hazards in Electrical Equipment (Paper no. PCIC 97-34, which was published in the IEEE Transactions on Industry Applications in 1998 we point to Test #4 of Table 1 on page 3. This test shows a Size 1 combination starter with a 30 ampere fused switch and protected by a 640 ampere power circuit breaker that did not open when a line side phase-to-ground fault was created. Clearly, a Size 1 combination starter is smaller than 6 ft, however, the ensuing arc-fault and blast was quite substantial with 22,000 amps available on a 640 ampere device.

HITTINGER, D.: I am voting negative on the panel action to reject Comment 1-86 with the following explanation: The panel action during the ROP Proposal 1-127(Log #3487), was to put the 6 foot requirement back in the code. However, there are several reasons that were considered by the panel when we removed this requirement that involves worker safety. It is essential to provide sufficient work space for a field worker when considering potential arc-flash hazards. The physical size of equipment enclosure has been reduced, but the hazards still exist. Removal of the 6 foot requirement made interpreting and enforcement easier when considering how to apply the rule to individual sections of gear or to a complete assembly. Installers could easily avoid the rule by placing individual sections and place them end to end that would exceed the 6 foot rule. I believe Panel 1 did the correct thing when we removed this requirement and should maintain their original action.

MCMAHILL, L.: CMP-1 should have maintained the language from the '05 NEC as requested by several comments submitted. By adding "and over 1.8 m (6 ft) wide" to the equipment requirement simply adds confusion. For example, does the requirement apply to the individual pieces of equipment or to an assembly only? Is the hazard less where a 4 ft wide 3000A switchboard is installed compared to an 8 ft wide 1200A switchboard? The change to the '05 NEC was to eliminate this confusion and to clarify the intent. In addition, the width of the equipment should have no bearing on the hazard. If anything, the rating of the equipment is of greater importance.

Comment on Affirmative:

BARRIOS, L.: CMP 1 did the right thing to reinstate the 6 foot wide requirement for requiring multiple means of egress. Physical size of the equipment should continue to be a criteria used to determine the amount of entrances needed for safe egress from an electrical equipment room or building. It is the physical size and placement of the equipment inside a room which creates barriers and obstructions for safe egress, not the equipment's continuous current rating alone. This is not solely an arc blast issue. The issue is providing an unobstructed path for persons to exit the area not only under equipment fault conditions, but also including fire and other events requiring emergency egress. The 6 foot wide equipment criteria has been in the NEC since 1978 (increased from 4-foot prior to that). Providing unobstructed paths is based on the physical size and location of the equipment and the size of the area in which the equipment is installed. It should not be based solely on the continuous current rating of the equipment.

LABRAKE, JR., N.: EEI agrees with the Panel's action on this Comment and Proposal 1-127, which restores the 6 ft. requirement. EEI further agrees with the Panel's statement on Proposal 1-125, which states "The panel rejects the concept of basing exiting requirements on incident energy levels. This section primarily deals with working space for large equipment rather than arc flash boundaries."

1-87 Log #986 NEC-P01 **Final Action: Accept in Principle**
(110.26(C)(2))

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 1-127
Recommendation: This proposal should be Accepted in Principle as follows:
110.26 Spaces About Electrical Equipment
(C) Entrance to Working Space
(1) Minimum Required. At least one entrance of sufficient area shall be provided to give access to working space about electrical equipment.
(2) Large Equipment.
(a) Entrance and Egress. For equipment rated 1200 amperes or more and over 1.8 m (6 ft) wide that contains overcurrent devices, switching devices, or control devices, there shall be one entrance to the required working space not less than 610 mm (24 in.) wide and 2.0 m (6 1/ 2 ft) high at each end of the working space. A single entrance to and egress from the required working space shall be permitted where either of the conditions in 110.26(C)(2)(a)(1) or (C)(2)(a)(2) is met.
(1) Unobstructed Exit. Where the location permits a continuous and unobstructed way of exit travel, a single entrance to the working space shall be permitted.
(2) Extra Working Space. Where the depth of the working space is twice that required by 110.26(A)(1), a single entrance shall be permitted. It shall be located so that the distance from the equipment to the nearest edge of the entrance is not less than the minimum clear distance specified in Table 110.26(A)(1) for equipment operating at that voltage and in that condition.
(b) Personnel Doors. Where the entrance to equipment rated 1200 amperes or more has a personnel door(s) that is less than 15 m (50 ft) from the working space, the door(s) shall open in the direction of egress and be equipped with panic bars, pressure plates, or other devices that are normally latched but open under simple pressure.
~~A single entrance to the required working space shall be permitted where either of the conditions in 110.26(C)(2)(a) or (C)(2)(b) is met.~~
~~(a) Unobstructed Exit. Where the location permits a continuous and unobstructed way of exit travel, a single entrance to the working space shall be permitted.~~
~~(b) Extra Working Space. Where the depth of the working space is twice that required by 110.26(A)(1), a single entrance shall be permitted. It shall be located so that the distance from the equipment to the nearest edge of the entrance is not less than the minimum clear distance specified in Table 110.26(A)(1) for equipment operating at that voltage and in that condition.~~
Substantiation: The intent of this comment is to preserve the requirement for doors to swing in the direction of egress with panic hardware when required. The action in the proposal stage to replace the six foot dimension for equipment achieves the intent of the submitter, but inadvertently eliminates doors in the direction of egress, and panic hardware where equipment is rated 1200 amps or more but is less than six feet in width. The width of the equipment does not affect in any way, the incident energy created in an arc flash/blast. Retaining this requirement is essential for the safety of all installers and maintainers of electrical equipment.
The revision is editorial in nature. Rearranging the requirements of 110.26(C)(2) in two new third level subdivisions, (a) Entrance and Egress and (b) Personnel Doors, is user friendly as it separates the two requirements for clarity. This separation of requirements allows for the six foot dimension which is reinstated, to apply only to the requirements addressing two doors and not the requirement for door swing and panic hardware.
Other changes accepted by CMP-1 are included in this text for clarity. The distance of six feet accepted in proposal 1-123 is revised to 15 m (50 ft) to coordinate with a sister comment to modify 1-123.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel actions and statements on Comments 1-86 and 1-92. The panel concludes that 25 ft is an adequate distance. The panel does not necessarily agree with all of the submitter's substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
LABRAKE, JR., N.: This comment should be rejected and accept Proposal 1-127. The Panel reversed its position from their statement on Proposal 1-125, whereby the Panel rejected the concept of basing exiting requirements on incident energy levels. This section primarily deals with working space for large equipment rather than arc flash boundaries. A requirement for "panic hardware" and outward exit swing for all doors within 25 feet of the workspace for equipment rated 1200 amperes or more is considered excessive and unjustified. The Comment offers no fact finding report in the technical substantiation that the work space shall be larger, but has based the change on work rules found typically in NFPA 70E, which is outside of the scope of this installation Code.
Although EEI strongly supports safe installations for the use of electricity, strong evidence from a fact finding report is needed to establish changes to the distance to doors requiring panic hardware. The door criterion of 6 ft. in Proposal 1-123 was primarily to prevent a door swing interfering with the work space.
MCMAHILL, L.: Increasing the personnel door(s) distance from 6 ft to 25 ft is over restrictive. The 6 ft determination was based on double the minimum working space requirement. This was a reasonable distance and was intended to clarify the requirement for the personnel door(s). Some were enforcing the requirement where the doors were a considerable distance from the working space. Since the requirement is specific to personnel door(s), the 25 ft distance in essence penalizes a designer that wishes to place the electrical equipment in a room instead of a space. CMP-1 should keep in mind that where the electrical equipment is installed on a mezzanine, in an underground vault, or on a rooftop there may not be a personnel door. In these instances access may be via a hatch and ladder that is less than 25 ft from the working space.
Comment on Affirmative:
ANTHONY, M.: It is refreshing to consider a proposal that is data driven. We agree that this is a good start at securing space for an area of refuge and/or to stage an electrician recovery effort. But working space is an issue that involves owners and other trades and we should not be surprised that the practical implementation of this requirement in existing buildings will complicate architectural issues with respect to panic hardware on doors, openings, enclosures, intervening or absence of walls.

1-88 Log #987 NEC-P01 **Final Action: Accept in Principle**
(110.26(C)(2))

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 1-127
Recommendation: This proposal should be ACCEPTED IN PRINCIPAL as follows:
Where the entrance has a personnel door(s) that is less than 15 m (50 ft) from the working space, the door(s) shall open in the direction of egress and be equipped with panic bars, pressure plates, or other devices that are normally latched but open under simple pressure.
Substantiation: The substantiation provided states that a six foot distance is "reasonable" and provides for "safe egress" from the area. Six feet is not reasonable, six feet does not provide for safe egress in the event of an arcing fault, the distance must be significantly increased to allow safe egress for electrical workers in the event of an arcing fault.
The submitter is correct in his attempt to provide clarity to this requirement; however the distance must be significantly increased. As pointed out in a white paper presented by Dennis K. Neitzel at the 2006 IEEE IAS Electrical Safety Workshop, there are multiple different issues to be considered in an arcing fault, all of which require panic hardware and doors which swing in the direction of egress. There is no limit to the amount of studies and technical papers written to substantiate that a distance of six feet is not adequate. The white paper referenced above is included as additional information, thousands of additional pages of studies and technical papers to support significantly larger distances are available.
Allowing the immediate exit of persons from the room is imperative. This distance should be increased to fifty feet. This dimension does not represent a burden to building owners. It is beneficial to building owners, as it will allow their own employees to egress the room in the event of an arc fault. Doors will be put on these rooms and the door swing does not impact cost. The cost of the panic hardware is insignificant when one considers that standard hardware would be required in any situation.
The arc temperature, incident energy and pressure developed in an arcing fault present serious safety hazards. The temperature of the arc is recognized to be up to 35,000º F with some studies reporting temperatures over 60,000º F. An exposure of 203 º F for one tenth of a second (6 cycles) creates an incurable third degree burn. Non fire-rated clothing is ignited and burns fiercely. Copper expands by a factor of 67,000 times when it vaporizes. Together with superheated air from the arc itself a tremendous blast is created. One square inch of copper, when vaporized, becomes almost 1 ½ square yards of conductive plasma fireball. The toxic gases created will fill the room. Vision is compromised due to the arc flash and the fact that the room is filled with toxic gases.
We need to provide persons working in these equipment rooms with a means of immediate egress. Placing a 50-foot dimension is necessary for the safety of all persons.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action and statement on Comment 1-92. The panel concludes that 25 ft is an adequate distance. The panel does not necessarily agree with all of the submitter's substantiation.

Comment on Affirmative:
ANTHONY, M.: See my explanation of affirmative vote on Comment 1-87.

1-89 Log #1333 NEC-P01 **Final Action: Accept in Principle**
(110.26(C)(2))

Submitter: Ken Borgwald, Cooper Bussman
Comment on Proposal No: 1-123
Recommendation: This proposal should be accepted in principle as follows:
Where the entrance has a personnel door(s) that is less than 22.5 m (75 ft) from the working space, the door(s) shall open in the direction of egress and be equipped with panic bars, pressure plates, or other devices that are normally latched but open under simple pressure.
Substantiation: This requirement for doors to open in the direction of egress and panic hardware is designed to provide electrical workers with the ability to quickly exit a room after and perhaps during an arcing fault event. I manage the Gubany Center in St. Louis, MO. It is a high current testing facility where we create short circuits on purpose, every day. Most testing is set up for bolted short circuits, but the last decade or so we have been setting up tests that involve arcing faults. These arcing faults are hard to imagine-the sheer power, deafening explosion, huge fireball, molten metal and huge clouds of thick acrid smoke are something to behold for all of the senses. Standing 75 feet away, behind protective bulletproof glass, you can feel the concussion. If it were not for huge purge fans our entire facility would be filled with smoke. I cannot imagine what it would be like to be in a small equipment room when an arcing fault occurs. An individual would be immediately in a state of shock from the deafening explosion. It would be like standing next to a hand grenade. The smoke could easily block the worker's vision for over 75 feet. An individual burned in the event would suffer even more trauma. The first instinct would be to exit the room. The smoke alone would not permit you to see the door and the eyes may be blinded from the flash. Anyone in the room will most likely be unable to exit without doors that open in the direction of egress and panic hardware. Because I have seen the results of the smoke at 75 feet, I am recommending that the distance be at least 75 feet. There could be a need for an even greater distance. I am just not familiar with distances beyond 75 feet.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action and statement on Comment 1-92. The panel concludes that 25 ft is an adequate distance. The panel does not necessarily agree with all of the submitter's substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2

1-92 Log #2330 NEC-P01 **Final Action: Accept in Principle in Part**
(110.26(C)(2) and (3))

TCC Action: It is the understanding of the Technical Correlating Committee that the panel action is to delete the last sentence in 110.26(C)(2), and add a new item 110.26(C)(3) as shown in the panel action.
Submitter: Alan Manche, Square D Company
Comment on Proposal No: 1-127
Recommendation: Delete the following text from 110.26(C)(2):
~~Where the entrance has a personnel door(s) that is less than 1.8 m (6 ft) from the working space, the door(s) shall open in the direction of egress and be equipped with panic bars, pressure plates, or other devices that are normally latched but open under simple pressure.~~
And add a new item (3) to 110.26(C) that reads as follows:
(3) Personnel Doors. Where equipment rated 1200A or more is installed ~~the entrance has~~ and there is a personnel door(s) that is less than ~~1.8~~ 7.6 m (~~6~~ 25 ft) from the nearest edge of the working space, the door(s) shall open in the direction of egress and be equipped with panic bars, pressure plates, or other devices that are normally latched but open under simple pressure.
Substantiation: This proposal is to accomplish three objectives:
1) The addition of the "over 6 ft" language back into 110.26(C)(2) was the proper action for the panel. However, since the panel has now added a dimension of measurement to apply to the door(s) to the room, the paragraph needs to be broken into two parts. This comment moves the text associated with the door and creates a new item (3) where the text can stand on its own. This makes the requirement much easier to apply.
2) The driver language for the door requirement in the new (3) is proposed to be based only on the "rated 1200A or more" without the 6 ft being a part of that requirement. This is logical since the need to have the panic hardware on the door is independent of the two exits from the working space.
3) The comment also adds text to make it clear that the 6 ft measurement for the personnel door is measured from the nearest edge of the working space. The language is also revised to remove the text "the entrance has" and replace it with "and there is". This is to avoid the confusion of the use of the term "entrance". In (C)(2), the use of the term "entrance" is to describe entering the working space and not necessarily the room. Using the term again to describe the personnel door implies that the door is truly the entrance to the working space, when in fact it may be located up beyond the working space.
We also recognize the 6 ft distance between the working space and the personnel door was a value proposed by the panel looking for further feedback. Based on our discussion with others in the industry it is evident there is support for a distance much larger than 6 ft based on the idea that if someone is injured it doesn't matter if the equipment is in a small room or large room, that person will needs to exit the room in order to remove himself from further danger to the environment within the room where the equipment is installed. Based on the environmental conditions witnessed in our large testing labs after an arc-flash demonstration, it would be prudent to consider extending the 6 ft distance to at least 25 ft in order to include appropriate hardware on exits doors for the room in which the equipment is located.
Panel Meeting Action: Accept in Principle in Part
The panel does not accept the deletion of the struck-through text of the first paragraph of the recommended wording, and concludes that it will be relocated into a new second level subdivision (3).
And add a new item (3) to 110.26(C) that reads as follows:
"(3) Personnel Doors. Where equipment rated 1200A or more that contains overcurrent devices, switching devices, or control devices is installed and there is a personnel door(s) intended for entrance to and egress from the working space less than 7.6 m (25 ft) from the nearest edge of the working space, the door(s) shall open in the direction of egress and be equipped with panic bars, pressure plates, or other devices that are normally latched but open under simple pressure."
Panel Statement: The panel does not accept the deletion of the struck-through text of the first paragraph of the recommended wording, and concludes that it will be relocated into a new second level subdivision (3).
The phrase "that is" was removed to editorially simplify the statement.
The phrase "intended for entrance to and egress from the working space" was added to clarify the personnel doors intended to be covered by this requirement.
The panel does not necessarily agree with all of the submitter's substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2

Comment on Affirmative:
ANTHONY, M.: See my explanation of affirmative vote on Comment 1-87.

1-93 Log #523 NEC-P01 **Final Action: Reject**
(110.26(D))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 1-129
Recommendation: Accept the proposal.
Substantiation: 90.1(A) and (B) indicates the NEC is a safety code. It is difficult to discern why outdoor equipment does not merit an illumination requirement. 110.34(D) requires illumination for over 600 volt equipment indoors or outdoors. While the potential hazard may be greater, there is also a potential hazard from 600 volt and less equipment. The term "equipment" in 110.34(D) as defined in Article 100 includes material, fittings and the like (such as raceways) which literally require provision for illumination.
Panel Meeting Action: Reject
Panel Statement: The comment does not provide any new information, and the panel reaffirms its action and statement on Proposal 1-129.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
HICKMAN, P.: We agree the submitter does not provide any new information or technical substantiation. However, as we stated in our comment during the ROP, we join the submitter in wondering why illumination is not required for outdoor installations but only when installed indoors.

1-94 Log #305 NEC-P01 **Final Action: Hold**
(110.26(F))

TCC Action:The Technical Correlating Committee directs that this comment and Proposal 1-135 be reported as "Hold" in accordance with 4.4.6.2.2 of the Regulations Governing Committee Projects because it involves something that could not be properly handled within the time frame for processing the report, and directs that this comment be referred **to Code-Making Panel 9 for action during the 2011 revision cycle.**
Submitter: Code-Making Panel 19,
Comment on Proposal No: 1-135
Recommendation: The following is the final action of a task group appointed to review Proposal 1-135. CMP-19 recommends accepting this proposal.
Substantiation: CMP-19 agrees that the NEC does not define distribution board and that a distribution board is considered a type of panelboard. Removing the words "distribution boards" from 110.26(F) may alleviate the submitter's concern, while maintaining the requirement for dedicated equipment space for all types of panelboards. This change will not impact the articles under the purview of CMP-19.
This comment was balloted through CMP-19 with the following results:
14 Eligible to Vote
12 Affirmative
2 Not Returned (W. Bowman and R. Carlson)
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Comment 1-95.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-95 Log #310 NEC-P01 **Final Action: Hold**
(110.26(F))

TCC Action: The Technical Correlating Committee directs that this comment and Proposal 1-135 be reported as "Hold" in accordance with 4.4.6.2.2 of the Regulations Governing Committee Projects because it involves something that could not be properly handled within the time frame for processing the report, and directs that this comment be referred to Code-Making Panel 9 for action during the 2011 revision cycle.
Submitter: Code-Making Panel 9,
Comment on Proposal No: 1-135
Recommendation: Recommend the proposal be held for study.
Substantiation: CMP-9 believes the proposal has merit, however, it needs to be correlated with Article 408, which uses the phrase "switchboards, panelboards, and distribution boards" units scope. The current text in 110.26(F) simply repeats that scope information so as not to inadvertently change the application of 110.26(F), which originated within what is now Article 408 in the 1981 cycle and remained there for almost twenty years. CMP-9 will review the scope statement in 408.1 during the 2011 code cycle, and the text of 408.1 and 110.26(F) can be correlated during that cycle. CMP-9 understands that scope statements are under the purview of the Technical Correlating Committee.
This comment has been balloted through CMP-9 with the following balloting results.
11 Eligible to Vote
10 Affirmative
1 Not Returned (H. deVega)
Panel Meeting Action: Accept
Panel Statement: The panel understands that the action on this comment "holds" this comment and Proposal 1-135 for action by Code-Making Panel 9 in the 2011 Code revision cycle.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-96 Log #1483 NEC-P01 **Final Action: Hold**
(110.26(F)(3))

Submitter: Charles Ball, S & C Electric Company
Comment on Proposal No: 1-135
Recommendation: Add a new section to 110.26(F)(3):
110.26(F)(3): Arc-Resistant Switchgear. Provide clear space in accordance with the manufacturer's recommendations. No obstructions such as foreign systems, suspended ceilings, piping, dusts or structures shall be located within the required clear space for indoor or outdoor installations. Exceptions listed in 110.26(F)(1) and 110.26(F)(2) are not allowed when the switchgear is arc resistant.
Substantiation: Arc-resistant switchgear is often designed to direct the exhaust from an internal fault away from areas where personnel could be standing. Unobstructed space is required for the equipment to vent properly. Obstructions could impede or prevent proper venting and result in hot gasses being released toward personnel. The NEC should not allow exceptions such as suspended ceilings, that conflict with the requirements of this type of switchgear and cause an unexpected hazard.
Panel Meeting Action: Hold
Panel Statement: The comment offers new material that has not had public review and is to be held for the next revision cycle in accordance with 4.4.6.2.2(a) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
MINICK, J.: Comment 1-96 listed Proposal 1-135 as the proposal being commented on of which Proposal 1-135 addressed only the deletion of the term "distribution boards" from 110.26(F). The subject matter submitted in Comment 1-96 is to provide a new subsection 110.26(F)(3) regarding arc-resistant switchgear. The subject of Comment 1-96 has nothing to do with Section 110.26(F), which is the NEC section addressed by Proposal 1-135. This comment is in violation of 4.4.5, item (b) of the Regulations Governing Committee Projects which states: " "Each comment shall include the following:..Identification of the document, proposal number to which the comment is directed, and the paragraph of the document to which the comment is directed." The comment is indeed new material but it is more importantly trying to create a new subsection part to subsection 110.26(F) through the backdoor using Proposal 1-135 as its catalyst. This comment should have been rejected.

1-97 Log #1799 NEC-P01 **Final Action: Reject**
(110.27)

Submitter: Michael Walls, American Chemistry Council
Comment on Proposal No: 1-139
Recommendation: The panel action should have been "accept in principle" rather than "reject". The ACC provides optional language to the original proposal that meets the submitter's intent and addresses the ballot comments.
110.27 Guarding of Live Parts.
(A) Live Parts Guarded Against Accidental Contact.
Except as elsewhere required or permitted by this Code,live parts of electrical equipment operating at 50 volts or more shall be guarded against accidental contact by ~~approved enclosures or by~~ any of the following means:
(1) By approved enclosures.
(~~1~~2) By location in a room, vault, or similar enclosure that is accessible only to qualified persons.
(~~2~~3) By suitable permanent, substantial partitions or screens arranged so that only qualified persons have access to the space within reach of the live parts. Any openings in such partitions or screens shall be sized and located so that persons are not likely to come into accidental contact with the live parts or to bring conducting objects into contact with them.
(~~3~~4) By location on a suitable balcony, gallery, or platform elevated and arranged so as to exclude unqualified persons.
(~~4~~5) By elevation of 2.5 m (8 ft) or more above the floor or other working surface.
(6) By suitable barriers within enclosures containing live parts requiring examination, adjustment, servicing or maintenance while energized.
(7) By limiting the size of openings to live parts within enclosures requiring examination, adjustment, servicing or maintenance while energized that will not permit the entry of a 12.5 mm (0.5 in.) diameter rod.
Substantiation: The submitter does not agree with the panel statement, "The current NEC language provides sufficient guarding of
live parts from accidental contact regardless of the qualification status of the person." Each of the provisions in 110.27 address enclosing, locating, partitioning, screening and elevating live parts to keep them away from unqualified persons. 110.27 does not address the potential exposure electricians face every day when examining, adjusting, servicing or troubleshooting live parts within enclosures. The submitter also does not agree with the panel statement, "Given the type of work that occurs inside of a piece of equipment,

the definition of what constitutes 'accidental contact' is extremely broad and unclear." The phrase "accidental contact" is already used in the existing 110.27 three times, including the title. The use of the phrase is already broad and unclear. And while the submitter concurs with the panel that "the only positive way to ensure that accidental contact with live parts does not occur is to deenergize the equipment prior to working on it", equipment designs today continue to require examination and troubleshooting while energized. Also, the act of establishing an electrically safe working condition, which includes verifying a de-energized state using test equipment, requires a qualified person to assume the equipment is energized.

The separate sections for "qualified" and "unqualified" persons were removed from the original proposal in order to satisfy the panel statement. "Approved enclosures" was relocated to the first option in the listing and does not change the original intent of the section. The originally proposed Part B in proposal 1-139 was re-written and added as options 6 and 7 as suggested by Mr. Floyd's affirmative ballot comment.

Panel Meeting Action: Reject

Panel Statement: The panel concludes that new Items (6)and (7) suggested in the comment relate to live parts within approved enclosures and are not alternatives to Items (1) through (5) as would be implied by the text of 110.27(A).

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

BARRIOS, L.: In its Proposal 1-139 and subsequent Comment 1-97, the ACC was attempting to provide protection to qualified persons who may be exposed to live parts when working inside enclosures. The ACC concludes that 110.27(A), Live Parts Guarded Against Accidental Contact,still does not address these hazards.

FLOYD, H.: CMP 1 should have accepted this comment. Touch safe shrouded terminals provide an inherently safer design that reduces the risk of inadvertent contact having the risk of electric shock or initiation of an arc flash. The NEC should acknowledge that the application of touch safe shrouded terminals provide a safer work environment for both qualified as well as unqualified personnel. These types of designs are widely used outside of the US and significantly reduce the risk of inadvertent personnel contact in industrial control panels and other equipment. The requirement for touch safe shrouded terminals designs has proven both acceptable and reasonable in installations outside the US. I would encourage the submitter to resubmit the proposal for the 2011 NEC.

1-98 Log #7 NEC-P01 **Final Action: Accept**
(110.32)

Submitter: Technical Correlating Committee on National Electrical Code

Comment on Proposal No: 1-146

Recommendation: The Technical Correlating Committee directs the panel to reconsider their action relative to the necessity of a soft conversion. This action will be considered by the panel as a public comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

The panel accepts the direction of the Technical Correlating Committee.

Panel Statement: The panel continues to accept the recommendation as submitted in Proposal 1-146 for working space about equipment; safety is a prime consideration, and 90.9(C)(4) applies.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-99 Log #2332 NEC-P01 **Final Action: Accept in Principle in Part**
(110.33(A))

TCC Action: It is the understanding of the Technical Correlating Committee that the panel action is to delete the last sentence in 110.33(A)(2) and adds a new item 110.33(A)(3) as shown in the panel action.

Submitter: Alan Manche, Square D Company

Comment on Proposal No: 1-148

Recommendation: Delete the following text from 110.33(A):

~~Where the entrance has a personnel door(s) that is less than 3.7 m (12 ft) from the working space, the door(s) shall open in the direction of egress and be equipped with panic bars, pressure plates, or other devices that are normally latched but open under simple pressure.~~

Add a new 110.33(A)(3) to read:

(3) Personnel Doors. Where there is ~~the entrance has~~ a personnel door(s) that is ~~that is~~ less than ~~3.7~~ 7.6 m (~~12~~ 25 ft) from the nearest edge of the working space, the door(s) shall open in the direction of egress and be equipped with panic bars, pressure plates, or other devices that are normally latched but open under simple pressure.

Substantiation: The text associated with personnel doors needs to be relocated to its own subsection. The problem with the current ROP language is that the location creates confusion about applying the door requirements because of the way the term "entrance" is used in 110.33(A). It's assumed that the panel intends to apply the requirements for the door to any door that is located within 12 ft of the working space. As arranged in the ROP, one could easily interpret that a door added under the provisions of 110.33(A)(1) would not need to comply with the requirement to open outward and have panic hardware.

This comment relocates the door requirement to its own subsection (3) and makes it clear that any door located within 12 feet of the working space must comply. Text is also added to make it clear that the measurement of the 12 feet is to the nearest edge of the working space.

We also recognize the 12 ft distance between the working space and the personnel door was a value proposed by the panel looking for further feedback. Based on our discussion with others in the industry it is evident there is support for a distance much larger than 12 ft based on the idea that if someone is injured it doesn't matter if the equipment is in a small room or large room, that person will needs to exit the room in order to remove himself from further danger to the environment within the room where the equipment is installed. Based on the environmental conditions witnessed in our large testing labs after an arc-flash demonstration, it would be prudent to consider extending the 12 ft distance to at least 25 ft in order to include appropriate hardware on exits doors for the room in which the equipment is located.

Panel Meeting Action: Accept in Principle in Part

The panel does not accept the deletion of the struck-through text of the first paragraph of the recommended wording, and concludes that it will be relocated into a new second level subdivision (3).

The panel revises the recommended wording of (3) to read as follows:

(3) Personnel Doors. Where there is a personnel door(s) intended for entrance to and egress from the working space less than 7.6 m (25 ft) from the nearest edge of the working space, the door(s) shall open in the direction of egress and be equipped with panic bars, pressure plates, or other devices that are normally latched, but open under simple pressure.

Panel Statement: The panel does not accept the deletion of the struck-through text of the first paragraph of the recommended wording, and concludes that it will be relocated into a new second level subdivision (3).

The phrase "that is" was removed to editorially simplify the statement.

The phrase "intended for entrance to and egress from the working space" was added to clarify the personnel doors intended to be covered by this requirement.

The panel does not necessarily agree with all of the submitter's substantiation.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

LABRAKE, JR., N.: This comment should be rejected and accept Proposal 1-148. The Panel reversed its position from their statement on Proposal 1-125, whereby the Panel rejected the concept of basing exiting requirements on incident energy levels. This section primarily deals with working space for large equipment rather than arc flash boundaries. A requirement for "panic hardware" and outward exit swing for all doors within 25 feet of the workspace for equipment rated above 600 volts is considered excessive and unjustified. The Comment offers no fact finding report in the technical substantiation that the work space shall be larger, but has based the change on work rules found typically in NFPA 70E, which is outside of the scope of this installation Code.

Although EEI strongly supports safe installations for the use of electricity, strong evidence from a fact finding report is needed to establish changes to the distance to doors requiring panic hardware. The door criterion of 12 ft. in Proposal 1-148 was primarily to prevent a door swing interfering with the work space.

MCMAHILL, L.: See my explanation of negative vote on Comments 1-86 and 1-87. They are applicable here too.

1-100 Log #390 NEC-P01 **Final Action: Reject**
(110.33(A) and (B))

Submitter: James K. Lathrop, Koffel Assoc., Inc.

Comment on Proposal No: 1-147

Recommendation: Further revise the text of 110.33(A) and (B) from that made at the ROP stage as follows:

110.33 Entrance to <u>and Egress from</u> Enclosures and Access to Working Space.

(A) Entrance. At least one entrance to enclosures for electrical installations as described in 110.31 not less than 610 mm (24 in.) wide and 2.0 m (6½ ft) high shall be provided to give access to <u>and egress from</u> the working space about electric equipment. Where the entrance has a personnel door(s), the door(s) shall open in the direction of egress and be equipped with panic bars, pressure plates, or other devices that are normally latched but open under simple pressure.

(1) Large Equipment. On switchboard and control panels exceeding 1.8 m (6 ft) in width, there shall be one entrance at each end of the equipment. A single entrance to <u>and egress from</u> the required working space shall be permitted where either of the conditions in 110.33(A)(1)(a) or (A)(1)(b) is met.

(a) Unobstructed Egress ~~Exit~~. Where the location permits a continuous and unobstructed way of egress ~~exit~~ travel, a single entrance to the working space shall be permitted.

(b) Extra Working Space. Where the depth of the working space is twice that required by 110.34(A), a single entrance shall be permitted. It shall be located so that the distance from the equipment to the nearest edge of the entrance is not less than the minimum clear distance specified in Table 110.34(A) for equipment operating at that voltage and in that condition.

(2) Guarding. Where bare energized parts at any voltage or insulated energized parts above 600 volts, nominal, to ground are located adjacent to such entrance, they shall be suitably guarded.

(B) Access. Permanent ladders or stairways shall be provided to give safe access to and egress from the working space around electric equipment installed on platforms, balconies, or mezzanine floors or in attic or roof rooms or spaces.

Substantiation: I serve as chairman of the NFPA 101 and NFPA 5000 Means of Egress Technical Committee (MEA). NFPA 101 and NFPA 5000 are in the June 2008 revision cycle. The MEA committee developed committee proposals to reference NFPA 70 110.33(A). Users of NFPA 101/5000 have followed the criteria of those codes only to find that the design was deficient from the requirements of NFPA 70. By referencing NFPA 70 110.33(A), the user of NFPA 101/5000 will be warned that the related provisions from NFPA 70 apply. However, some of the terminology used in 110.33(A) is inconsistent with that in NFPA 101/5000.

(1) With respect to the addition of the words “and egress from” in 110.33 title, 110.33(A), 110.33(A)(1), and 110.33(B), these changes are for consistency with the action taken in NEC Proposal 1-119 on 110.26(C). The subjects of 110.26(C) and 110.33(A) and (B) are related, and should be handled consistently.

(2) With respect to the replacement of the word “exit” with the word “egress” in two places in (A)(1)(a), the word “exit” has a special meaning in NFPA 101/5000 which can be generalized to mean the final door reached to the outside. Other travel across floors and through doors encountered along the egress path is part of the exit access. So, in describing the route to the exit, the term “egress” is more correct.

Panel Meeting Action: Reject

Panel Statement: The content of the comment does not address the subject matter of Proposal 1-147.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-101 Log #8 NEC-P01 **Final Action: Accept**
(110.34(A))

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 1-151
Recommendation: The Technical Correlating Committee directs the panel to reconsider their action relative to the necessity of a soft conversion. This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept

The panel accepts the direction of the Technical Correlating Committee.

Panel Statement: The panel continues to accept the recommendation as submitted in Proposal 1-151 for working space about equipment; safety is a prime consideration, and 90.9(C)(4) applies.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-102 Log #816 NEC-P01 **Final Action: Reject**
(110.81)

Submitter: John Whitney, Newtown Square, PA
Comment on Proposal No: 1-160 Log
Recommendation: Revise text:

Unused openings shall be effectively closed.

Substantiation: Unused openings in underground enclosures permit ingress of ground water which carries soils into the enclosure. Over time, the accumulation of soils will completely engulf the electrical facilities within the enclosure. Accumulation of soils concealing electrical cables and equipment within the space introduces additional hazards into the already hazardous environment of the space. Soils can conceal damaged cables or equipment and clearing the soils from concealed cables and equipment requires extreme care not to damage the facilities. Underground enclosures by their location are expected to be subject to ground water ingress, however, the simple requirement to effectively close unused openings will limit or eliminate soils accumulation within underground enclosures resulting in safer installation and maintenance of the electrical facilities therein.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms their panel action and panel statement on Proposal 1-160.

In addition, the submitter has not provided any specific instances where this situation has been shown to be a problem.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-103 Log #822 NEC-P01 **Final Action: Reject**
(110.82 (New))

Submitter: John Whitney, Newtown Square, PA
Comment on Proposal No: 1-161
Recommendation: Add a new section:

Protection Against Corrosion and Deterioration. Equipment, cable racks, cable rack arms, other appurtenances and all supporting hardware shall be corrosion resistant and of materials suitable for the environment in which they are to be installed.

Substantiation: The NEC recognizes the detrimental effects of corrosion on electrical facilities in many
more than 100 instances throughout the code and prescribes constraints on materials and methods to assure safe and reliable electrical facilities. In the preponderance of code articles addressing corrosion, the mere suggestion of no more than dampness instantly constrains materials to a corrosion resistance requirement. Manholes and underground enclosures intended for personnel entry are quite possibly one of the most corrosive environments where electrical facilities are intended to be installed. Underground enclosures are expected to be a wet environment and are in fact often flooded continuously with water. When non-corrosion resistant materials such as cable racks, hardware, ladders, pulling irons, etc. are applied in underground enclosures, the materials soon corrode and fail to provide their intended function in support of the facilities installed within the space. Cable racks and hardware supporting the racks which corrode will fail to support the cables and can actually cause damage to cables when the racks break free due to failure of the anchoring system and the weight of the racks is imposed on the cables. Failure of a fixed ladder or the ladder support and anchoring system introduces the obvious hazard to entrants as well. In fact, NEC Article 110.79 requires corrosion resistance for fixed ladders installed in vaults and tunnels. To assure safe and reliable operation and maintenance of electrical facilities installed in manholes and other underground enclosures intended for personnel entry, all materials applied within the space shall be suitable for continuous submersion in water. The simple extension of the many more than 100 commonsense materials corrosion resistance requirements throughout the National Electrical Code to include the damp and wet spaces within Manholes and Other Electric Enclosures Intended for Personnel Entry will reduce equipment failures due to collapsed support structures and eliminate the hazards introduced by such structural failures.
Panel Meeting Action: Reject
Panel Statement: The panel concludes that this material is already covered in the 110.11 FPN that refers the reader to 300.6.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

(110.83 (New))

Submitter: John Whitney, Newtown Square, PA
Comment on Proposal No: 1-162
Recommendation: Add a new section:

Cable Seals. All cables and conductors entering underground enclosures shall be effectively sealed.

Substantiation: Underground conduit systems are commonly subject to settlement, subsidence, and undermining as well as other unintended compromises due to careless excavation and inadequate repairs. Damage to underground conduits connected to underground enclosures permits ingress of ground water which carries soils into the enclosure. Over time, the accumulation of soils will completely engulf the electrical facilities within the enclosure. Accumulation of soils concealing electrical cables and equipment within the space introduces additional hazards into the already hazardous environment of the space. Soils can conceal damaged cables or equipment and often render the equipment inoperable. Clearing soils from concealed electrical cables and equipment is a hazardous activity and requires extreme care not to damage the facilities. Underground enclosures by their location are expected to be subject to ground water ingress, however, the simple requirement to effectively close occupied conduits with cable seals will limit or eliminate soils accumulation within underground enclosures resulting in safer installation and maintenance of the electrical facilities therein.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its action and statement on Proposal 1-162.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-105 Log #815 NEC-P01 **Final Action: Reject**
(110.84 (New))

Submitter: John Whitney, Newtown Square, PA
Comment on Proposal No: 1-163
Recommendation: Add a new section:

Non-Electrical Facilities. Non electric conduits, pipes, hoses, etc. transmitting or containing fluids or gases shall not be installed within or through electric duct banks, manholes and other electric enclosures intended for personnel entry.

Substantiation: Regarding my recommendation 1-163 Log #2356 NEC-P01 (110.84 (New)) for a new section titled Non-Electrical Facilities. - Non electric conduits, pipes, hoses, etc. transmitting or containing fluids or gases shall not be installed within or through electric duct banks, manholes and other electric enclosures intended for personnel entry. I respectfully request that the panel review the following comments and consider accepting my recommendation:

NEC Article 110 part V is titled "Manholes and Other Electric Enclosures Intended for Personnel Entry, All Voltages". The title designates these enclosures as electric enclosures, therefore, it would be unreasonable to expect foreign equipment placed within these enclosures.

Electrical enclosures intended for personnel entry expose entrants to complex electrical and confined space hazards, the intentional introduction of additional hazards associated with non-electrical facilities increases the complexity of hazard mitigation and will impact the reliability of both systems. Article 110.75(E) recognizes these additional hazards by requiring marking to prominently indicate the function of manholes. This requirement clearly exhibits the intention to isolate foreign systems from electrical facilities within manholes and other electric enclosures intended for personnel entry.

In addition to the hazards non-electrical facilities pose to personnel within the space, introduction of non-electrical facilities into electrical enclosures will result in unintended exposure of electrical facilities within those enclosures to fluids/gases that have not been assessed as to compatibility with conductor insulation and jacket materials. This unintended exposure will most likely result in deterioration of materials and the eventual failure of the electrical facilities. Materials intended for application to electrical facilities are evaluated to assess their compatibility with those facilities. Refer to article 110-11 regarding conductor exposure to deteriorating agents.

Non electrical facilities at pressure have the potential to instantly flood the electrical enclosure with fluids/gases thereby engulfing entrants. Personnel and electrical facilities within the enclosure exposed to fluids/gases at elevated pressure and/or elevated temperatures would be injured or damaged by unintended/accidental release.

Fixed facilities for ventilation and de-watering the enclosure shall be permitted.

Article 300.8 prohibits raceways and cable trays from containing any service other than electrical, why would we accept anything less for enclosures intended for personnel entry?

Panel Meeting Action: Reject
Panel Statement: The text recommended by the comment would preclude the installation of a sump pump and associated piping for draining the manhole. The substantiation submitted is insufficient to justify this restrictive requirement.

The panel reaffirms its statement on Proposal 1-163.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-106 Log #824 NEC-P01 **Final Action: Reject**
(110.85 (New))

Submitter: John Whitney, Newtown Square, PA
Comment on Proposal No: 1-164
Recommendation: Add a new section:

Identification of Cables and Conductors. Cables and conductors within enclosures intended for personnel entry shall be permanently and legibly tagged or labeled to indicate the owner, application, and the line or circuit number such as "METRO Electric Co. Circuit #123 15KV". Tags, labels and their attachments shall be durable and of materials suitable to withstand the environment in which they are installed.

Substantiation: This proposal should be accepted. Identifying cables and conductors at the time of installation is relatively inexpensive and simple to achieve and could hardly be considered restrictive. Cost relative to benefit analysis of applying identification to cables and conductors will prove this proposal to be one of the most cost effective methods to significantly increase the level of safety for personnel required to enter manholes and other electric enclosures intended for personnel entry. One incident of unintended interruption of service, damage to electrical facilities, or injury to personnel would immediately demonstrate how insignificant the cost or difficulty of identifying cables and conductors is when compared to costs associated with the unintended event. Certainly anyone experiencing such an event would testify that given the opportunity they would have marked the cables and conductors to prevent the incident.

Although there are certainly other opportunities for cable identification in other sections of the NEC, this proposal specifically addresses a need to mitigate electrical hazard exposure to personnel working within enclosures intended for personnel entry and as such, belongs in Article 110, paragraph V.

Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its action and statement on Proposal 1-164.

The proposed text is overly restrictive in that it would require identification of all cables in all manholes, even though the cables may all be power circuits under the ownership and control of a single entity.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 3
Explanation of Negative:

ANTHONY, M.: Our interest group is interested in the outcome of Proposal 1-164 because many colleges and universities have power plants and utility distribution systems that operate much like utilities. Some have power distribution networks that share poles with telecommunication cabling and municipal signaling systems.

Further discussion within our interest group indicates that this is a reasonable proposal that should have been accepted at the proposal stage. We agree with Mr. Hickman and Mr. Hittenger's substantiation negative votes in the proposal stage (Log #2357). I would like to add that OSHA looks to the NEC for safety rules and identification of a hazard is one of the most basic. OSHA's general purpose clauses, as well as the specific ones regarding enclosed spaces and locking ought to be supplemented with specific NEC language that this proposal provides.

HICKMAN, P.: We are voting negative to the panel action to reject Comment 1-106. Our explanation is as follows: This comment should have been accepted. We reaffirm our position from the ROP which states the submitter has identified and provided a solution to a serious safety issue. As Mr. Hittinger stated in his explanation of negative in the ROP: "Identification of cables and conductors within enclosures would benefit personnel that must perform maintenance duties within the enclosure". The marking of cables within enclosures would be a step in the right direction for safety of personnel and property due to misidentification of cables being cut by mistake.

HITTINGER, D.: I am voting negative on the panel action to reject Comment 1-106 with the following explanation: We reaffirm our position from the ROP stating the submitter has identified and provided a solution to serious safety issue. A properly labeled system would be a benefit to the owner and provide the necessary information to a field worker. There are similar requirements in 408.4: Circuit Directory or Circuit Identification. Every circuit and circuit modification shall be legibly identified as to its clear, evident and specific purpose or use. The identification shall include sufficient detail to allow each circuit to be distinguished from all others. The identification shall be included in a circuit directory that is located on the face or inside of the panel door in the case of a panelboard, and located at each switch on a switchboard.

This requirement has worked well for years and is helpful to owners and workers and does provide a level of safety.

The proposed new section 110.85 would benefit worker safety when asked to enter enclosures to work on these systems.

ARTICLE 200 — USE AND IDENTIFICATION OF GROUNDED CONDUCTORS

5-19 Log #271 NEC-P05 **Final Action: Reject**
(200.6(A) and 200.6 (B))

Submitter: Dennis Downer, Morrisville, VT
Comment on Proposal No: 5-44
Recommendation: Revise text to read as follows:

200.6 Means of Identifying Grounded Conductors.

(A) ~~Sizes 6 AWG or Smaller.~~ An insulated grounded conductor ~~of 6 AWG or smaller~~ shall be identified by a continuous white or gray outer finish or by three continuous white stripes on other than green insulation along its entire length. Wires that have their outer covering finished to show a white or gray color but have colored tracer threads in the braid identifying the source of manufacture shall be considered as meeting the provisions of this section. Insulated grounded conductors shall also be permitted to be identified as follows:

(1) The grounded conductor of a mineral-insulated, metal-sheathed cable shall be identified at the time of installation by distinctive marking at its terminations.

(2) A single-conductor, sunlight-resistant, outdoor-rated cable used as a grounded conductor in photovoltaic power systems as permitted by 690.31 shall be identified at the time of installation by distinctive white marking at all terminations.

(3) Fixture wire shall comply with the requirements for grounded conductor identification as specified in 402.8.

(4) For aerial cable, the identification shall be as above, or by means of a ridge located on the exterior of the cable so as to identify it.

Change the title of 200.6(B) and text to the following:

200.6(B) Sizes larger than ~~6 AWG~~ Conductors 4 AWG or Larger. An insulated grounded conductor 4 AWG or larger ~~than 6 AWG~~ shall be identified by one of the following means:

Substantiation: This will make the language the same as 250.119. As an electrical inspector, I cannot remember the number of times I have written this up because people can not read. I think that changing the language from Sizes Larger than 6 AWG to Sizes 4 AWG or Larger will leave no room for misreading the title, is 6 AWG included or is it larger than 6?

Panel Meeting Action: Reject

Panel Statement: The proposed change would create a violation of the NEC Style Manual as it deletes the boldfaced title of the section. The present Code language is precise in covering the conductors 6 AWG and smaller as well as conductors larger than 6 AWG.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-20 Log #272 NEC-P05 **Final Action: Reject**
(200.6(B))

Submitter: Dennis Downer, Morrisville, VT

Comment on Proposal No: 5-45

Recommendation: Change the title of 200.6(B) and language to the following:

200.6(B) ~~Sizes Larger than 6 AWG~~ Sizes 4 AWG or Larger. An insulated grounded conductor 4 AWG or larger ~~than 6 AWG~~ shall be identified by one of the following means:

Substantiation: As an electrical inspector, I cannot remember the number of times I have written this up because people cannot read. I think that changing the language from Sizes Larger than 6 AWG to Sizes 4 AWG or Larger will leave no room for misreading the title is 6 AWG included or is it larger than 6. It will also now be the same format as 200.6(A) Sizes 6 AWG or smaller.

Panel Meeting Action: Reject

Panel Statement: The present Code language is precise in covering the conductors 6 AWG and smaller as well as conductors larger than 6 AWG.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-21 Log #825 NEC-P05 **Final Action: Accept**
(200.6(B))

Submitter: Tom Studer, Electric Inspection agency

Comment on Proposal No: 5-45

Recommendation: Reject proposal.

Substantiation: This proposal should have been rejected. The proposer referenced 250.119(A)(1), where the rule requires marking of a grounding conductor at each end and at every point where the conductor is accessible. 200.6(B)(3) simply requires the conductor to be marked at its terminations. No where in this rule is there a requirement to mark the grounded conductor where the conductor is accessible, such as conduit bodies or pull boxes. Since there is no requirement to mark a grounded conductor in conduit bodies where the grounded conductor is not terminated, adding an exception to specifically permit a grounded conductor to not be marked where that conductor is not terminated serves no purpose other than to add confusion. i.e. This is an exception to a rule where the rule does not exist.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-22 Log #507 NEC-P05 **Final Action: Reject**
(200.11)

Submitter: Dan Leaf, Seneca, SC

Comment on Proposal No: 5-47

Recommendation: Accept the proposal.

Substantiation: Since the polarity of ac circuits regularly reverse there is no designated “polarity” for a grounded conductor terminal or lead. The proposal has nothing to do with limiting “polarity” to only dc circuits.

Panel Meeting Action: Reject

Panel Statement: “Polarity” in general means the relationship between two opposite attributes. Looking at other NEC uses of this word, that is the idea that applies. The submitter has provided no technical substantiation to support narrowing the view of this term to apply only to dc.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

2-6 Log #1344 NEC-P02 **Final Action: Accept**
(210.4)

Submitter: Donald M. King, Wilmington, DE

Comment on Proposal No: 2-10

Recommendation: Continue to accept this proposal in principle.

Substantiation: Panel 2 has reviewed, over several code cycles, numerous proposals that substantiate the hazards that exist for qualified persons working on multiwire branch circuits. This change will aid in the positive identification of multiwire branch circuits and ensure that all ungrounded conductors of the circuit is de-energized before work begins. This change will greatly increase the level of safety for qualified persons working multiwire branch circuits.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-7 Log #1855 NEC-P02 **Final Action: Reject**
(210.4)

Submitter: Mike Holt, Mike Holt Enterprises, Inc.

Comment on Proposal No: 2-10

Recommendation: Continue to Accept in Principle, but delete Exception No. 2.

Substantiation: Exception No. 2 becomes unnecessary with the new code language.

Panel Meeting Action: Reject

Panel Statement: Exception No. 2 to 210.4(C) continues to be necessary. The exception allows a multiwire branch circuit to supply multiple line-to-line connected utilization equipment, provided the overcurrent device will open all ungrounded conductors. This exception is specific to the overcurrent device, not the disconnecting means. If the exception is deleted, multiwire branch circuits would be limited to line-to-neutral connected loads only or to single utilization equipment.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-8 Log #1996 NEC-P02 **Final Action: Accept**
(210.4(A), FPN)

Submitter: Lawrence Brown, National Association of Home Builders (NAHB)

Comment on Proposal No: 2-11

Recommendation: Revise as follows:

FPN: A 3-phase, 4-wire, wye connected power system used to supply power to nonlinear loads may necessitate that the power system design allow for the possibility of high harmonic currents on the neutral-conductor ~~currents~~.

Substantiation: To reflect the correct use of terms related to this situation.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-9 Log #2160 NEC-P02 **Final Action: Reject**
(210.4(D) (New))

Submitter: Michael L. Last, Na’alehu, HI

Comment on Proposal No: 2-16

Recommendation: Add new text to read as follows:

At all locations where it is possible to interrupt the integrity of the grounded (neutral) conductor of a multiwire branch circuit, means shall be made to identify said grounded conductor with its associated ungrounded conductors.

Substantiation: When the integrity of the grounded (neutral) conductor is compromised, a serious voltage imbalance can occur. A similar condition exists and is addressed in 300.13(B) wherein identical hazards and concerns are lessened. This proposal would promote consistency among various articles.

Panel Meeting Action: Reject

Panel Statement: Section 300.13 already addresses the issue of interruption of the grounded conductor by removal of devices. The submitter’s suggestion that the grounded conductor be identified at every point where it could be interrrupted is too broad, given that the conductor could be cut or spliced at any point.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:
KING, D.: This Comment should have been accepted. The panel reference to the requirements found in section 300.13 do not fully address the Submitter's concerns. There are many instances where grounded conductor splices can be disconnected, that are not associated with the removal of a device. Proper identification of the grounded conductor at a junction or outlet box will aid the qualified person in determining if the grounded conductor is part of a multiwire branch circuit thus avoiding the hazard of electrical shock and damage to the equipment.

2-10 Log #641 NEC-P02 **Final Action: Accept**
(210.4(E) (New))

Submitter: Mark Shapiro, Farmington Hills, MI
Comment on Proposal No: 2-16
Recommendation: Reject the proposed new subsection.
Substantiation: This is one of three proposals that have been accepted to modify this section, to help identify the conductors in multiwire branch-circuits. With the acceptance of either of the other 2, this one is unnecessary.
Some form of flagging out multiwire branch-circuits is good. In addition to the reasons given in the ROP, my own experience is that there are too many multiwire branch-circuits that are not properly balanced or "phased out" in electrical panels. Requiring grouping or identifying will make it easier to keep track of them.
But, assuming the passage of the latest proposals, we're already identifying conductors by voltage system, and soon by phase [210.5(C)]. We're remarking the white conductor in switch legs [200.(C)] Assuming the passage of either of the other proposals in 210.4 we've done enough.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
KING, D.: This comment should have been rejected. Accurate identification of the grounded conductor that is associated with a multiwire branch circuit will prevent the unintentional removal of a multiwire branch circuit grounded conductor when service work is being performed in an electrical panel. Grounded conductor terminal strips are commonly located in the branch-circuit panel board away from the ungrounded circuit conductor termination points. In many cases it is very difficult if not impossible to trace the grounded conductor of a multiwire branch circuit, once it is separated from its associated ungrounded conductors, to its final termination point. Identification of Ungrounded and Associated Grounded Conductors at the branch circuit panelboard will aid the qualified person servicing multiwire branch circuits.

2-11 Log #653 NEC-P02 **Final Action: Reject**
(210.4(E) (New))

Submitter: Michael Cole, MRC Electric
Comment on Proposal No: 2-16
Recommendation: Add to the new text that Mr. Michael L. Last proposed:
(E) Anonymous shared conductor circuits also known as haywire circuits. A load shall not be supplied by tapping one or more conductors of 1 2-wire or multiwire branch circuit and 1 or more conductors of another 2-wire or multiwire branch circuit. Such circuits create disconnection problems and are a potential source of electrical injury to people or equipment and create nuisance tripping of AFCI and GFCI devices.
Substantiation: a. In Summit County, Ohio, residential electricians are still using the old knob-and-tube practice (but with nonmetallic sheathed cable and boxes) of tapping any hot wire on the first floor and then tapping any neutral on the second floor to supply 3-way switches for a stairway. This is also sometimes done with ceiling lights in bedrooms where a receptacle hot lead on the first floor and a neutral on the second floor is used to supply a ceiling light. In one such instance the installation used more wire and more labor than doing things by the book.
This creates a number of problems in addition to nuisance tripping of AFCI and GFCI circuit breakers necessitating some rewiring, when a neutral of an allegedly deenergized 2-wire circuit is interrupted, the neutral sometimes becomes hot. Tracking down which additional circuit breaker(s) to achieve full disconnection is a pain. In some instances, the open neutral does not become hot until a table lamp or some other load is turned on. Also, splices do not last forever and I know someone who needs to have copper oxide removed from the wire splices in a 20 year old house. I should NOT need to use hot line gloves to do that.
The claim is that it is more efficient to use 2-wire with ground cable instead of using 3-wire or 4-wire with ground cable. It is also more efficient to do splices outside of boxes like in knob-and-tube days or to let drywallers bury junction boxes or to otherwise not do things the right way. Why not do things the right way?
b. In a commercial installation in Cleveland, Ohio, I installed some hot and neutral pigtails in a ceiling junction box for future addition of some ceiling lights on the same circuit as some wall lights and a future receptacle for a garage door operator on a different circuit. The 2 lighting circuits share 1 neutral and the 2 receptacle circuits share a different neutral. The 2 neutrals are colored white for neutral 1 and gray aka slate for neutral 2. I taped together the neutral and hot pigtails for the future ceiling receptacle and separately taped together the hot and neutral pigtails for the future lighting. Nevertheless, a garage door technician hooked up a new receptacle to the WRONG neutral. Now, when I go to work on this installation, I have to turn off 4 circuit breakers instead of 2 which makes temporary lighting a bit difficult to hook up.
c. Some explanatory text that this hazard exits and why haywiring MUST NOT be done does not hurt.
Panel Meeting Action: Reject
Panel Statement: The text of 210.4 deals with multiwire branch circuits, and as such, the submitter's recommendations regarding two 2-wire circuits are not relevant. In addition, for multiwire branch circuits, the current text of the NEC already prohibits the connections described in the submitter's substantiation [see 300.3 and 210.4(B)].
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-12 Log #839 NEC-P02 **Final Action: Accept**
(210.4(E) (New))

Submitter: Jim Pauley, Square D Company
Comment on Proposal No: 2-16
Recommendation: The Panel should reconsider and reject the proposal.
Substantiation: It would appear that the panel has implemented redundant provisions for the multi-wire branch circuits. With the addition of the grouping requirement in 210.4(D), the identification requirement in (E) would seem to be redundant. The grouping aspect will make it obvious as to which ungrounded conductors a particular grounded conductor is associated with. There is no need to also have to tag or mark the conductors since the provision written by the panel only applies to the marking or tagging at the panelboard only.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
KING, D.: See my explanation of negative on Comment 2-10.

2-13 Log #1345 NEC-P02 **Final Action: Reject**
(210.4(E) (New))

Submitter: Donald M. King, Wilmington, DE
Comment on Proposal No: 2-16
Recommendation: Continue to accept this proposal in principle in part.
Substantiation: Positive identification of the grounded conductor of a multiwire branch circuit at the branch circuit panel board will reduce the hazard of electrical shock and electrocution. It will be also reduce the potential of damage to equipment due to the misidentification and disconnecting of grounded conductors while the associated ungrounded conductors remain energized and supply equipment.
Panel Meeting Action: Reject
Panel Statement: The requirements for common disconnect and grouping of conductors are adequate to address the issues raised for multiwire branch circuits. The requirement to also identify each grounded conductor is redundant to the requirement for grouping in 210.4(D).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
KING, D.: See my explanation of negative on Comment 2-10.

2-14 Log #695 NEC-P02 **Final Action: Reject**
(210.5 (New))

Submitter: Jamie McNamara, Hastings, MN
Comment on Proposal No: 6-33
Recommendation: Panel 2 should consider this proposal and accept it as a FPN to 210.5.
Substantiation: This was originally proposed to Panel 6 as a FPN to 310.5 and was referred to Panel 2 by the TCC (Technical Correlating Committee).
See the original Proposal 6-33.
Panel Meeting Action: Reject
Panel Statement: The panel does not agree with the addition of the FPN for the same reasons that a specific color coding is not specified in the NEC. The color code is not consistently applied (particularly where the color gray is used), and the FPN can be misleading because the systems are identified in this manner.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
KING, D.: This Comment should be given further consideration. The submitter has presented Panel 2 with a standard color code that is commonly used for electrical systems in commercial applications today. The inclusion of this color coding system in the Code in the form of a FPN will aid in providing a consistent identification of 277/480 and 208/120 volt systems, without initiating language into the main text that may be too restrictive for certain applications. I disagree with the Panel statement that the proposed FPN can be misleading. FPN's are only intended to inform the code user of a practical and commonly used means to meet the requirements of a particular section. The benefit of moving to a more consistent identification of conductors for a widely used voltage system in future installations warrants further consideration of this Comment by Panel 2.

2-15 Log #9 NEC-P02 **Final Action: Accept**
(210.5(C))

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 2-23
Recommendation: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting related to the use of possibly unenforceable and vague terms.
This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
The panel accepts the Technical Correlating Committee direction to reconsider the proposal and the terminology used. The panel continues to Accept the text as stated in its panel action in the ROP.
Panel Statement: The term "readily available" is neither vague nor unenforceable. For very large and complex systems, the ability to have the conductor ID scheme outlined in system diagrams and documentation is critical. In these systems, it is likely that this information will be kept more up-to-date than some type of legend located at each panelboard.

Ballot Results: Affirmative: 12

2-16 Log #511 NEC-P02 **Final Action: Reject**
(210.5(C))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 2-24
Recommendation: Reject.
Substantiation: Phase ID is not practical; phase meters would be required to reliably ensure proper ID. More importantly there is no requirement to maintain the same type of ID throughout the entire premises wiring system, which would result in confusion where the system is very extended such as a high-rise or large industrial plant. Red could be a color code for Phase A of one system but is not prohibited from being any phase of another system if tagging or tape is used. Tagging and tape are not as reliable as color for ID. Posting of various means of ID at panelboards would be confusing. If phase ID is for safety, should not DC systems be included? The substantiation is not adequate to justify phase ID. This requirement also applies to control and signal circuits which may be wholly installed in the same raceway, cable, or enclosure with power or lighting circuits. Wiring for fire alarm and emergency systems already have ID requirements. It is impractical to identify conductors in lighting, trolley, and power busways which are continuously or frequently accessible. "Where accessible" in effect limits ID to color coding for messenger supported wiring, open wiring on insulators, outside open conductors of Article 225 (which in effect prohibits bare conductors permitted by 225.4), Type FC cable, Type FCC cable.
Panel Meeting Action: Reject
Panel Statement: The panel does not agree that phase ID is not practical. It was previously required when the text applied to multiwire branch circuits. Removing the requirement to ID the phase would allow the same ID to be used for all three phases of one system, which has the potential to introduce greater confusion.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-17 Log #1343 NEC-P02 **Final Action: Reject**
(210.5(C))

Submitter: Janet D. Skipper, Ocoee, FL
Comment on Proposal No: 2-23
Recommendation: Continue to delete the last sentence that was proposed by the submitter. In addition, delete the proposed text: "The means of identification shall be documented in a manner that is readily available or." The revised section should read as follows:
210.5 Identification for branch Circuits
(C) Ungrounded Conductors. Where the premises wiring system has branch circuits supplied from more than one nominal voltage system, each ungrounded conductor of a branch circuit, ~~where accessible,~~ shall be identified by system at all termination, connection and splice points. This means of identification shall be permitted to be by separate color coding, marking tape, tagging, or other approved means~~. The means of identification shall be documented to a manner that is readily available or~~ and shall be permanently posted at each branch-circuit panelboard or similar branch-circuit distribution equipment. ~~In industrial occupancies, where conditions of maintenance and supervision ensure that only qualified persons service the installation, a cable and conductor numbering system shall be permitted to meet this requirement.~~
Substantiation: I concur with the negative explanation that Mr. Weber has submitted. 210.23 applies generally to all types of occupancies, therefore, there is assurance that a qualified person will update or maintain files or be available at the time when the documents will need to be accessible to the Authority Having Jurisdiction or qualified person servicing the equipment. I also agree with the negative explanation submitted by Mr. King. The proposed text is vague and unenforceable and does not include prescriptive language that would ensure that the intent of this section would be satisfied.
Panel Meeting Action: Reject
Panel Statement: The term "readily available" is neither vague nor unenforceable. For very large and complex systems, the ability to have the conductor ID scheme outlined in system diagrams and documentation is critical. In these systems, it is likely that this information will be kept more up-to-date than some type of legend located at each panelboard.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
KING, D.: The use of the term "readily available" allows for a broad interpretation of the location where the documentation for system identification is to be kept. There are no requirements in the proposed text to ensure that these documents will be properly updated and maintained by a qualified person. As building ownership changes much of this important documentation can be lost. Requiring system identification to be at the Panelboard location gives prescriptive requirements that can be more easily enforced by the authority having jurisdiction and is always available to those servicing the electrical equipment.

2-18 Log #1897 NEC-P02 **Final Action: Accept in Principle**
(210.5(C))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 2-24
Recommendation: I. Rephrase the additional text as "phase or line and".
II. Split the second sentence into two sentences, revised to read as follows:
The means of identification shall be permitted to be by separate color coding, marking tape, tagging, or other approved means. The method utilized for conductors originating within each branch-circuit panelboard or similar branch-circuit distribution equipment shall be permanently posted on the equipment.
Substantiation: I. The rule will also apply to single-phase distributions, where both ungrounded conductors are of the same phase but with a potential difference between them. The panel action incorrectly implies that these conductors are of differing phases, which is not the case. This wording makes the rule technically correct.
II. At every seminar I give on the 2005 NEC, someone and usually more than one, asks whether the panelboard labeling rule covers the conductors originating at that panel, or whether the rule is a reciprocal rule requiring every panel to list every identification scheme for every system in the building. The words in the NEC will support both interpretations. When I raised this at the Eastern Section IAEI meeting, the speakers had no idea either, and suggested I address it with a comment. This wording supposes the intent is the former; if I guessed wrong, then please put contrary wording in the book. It does seem that when you get a number of systems you would need a huge amount of real estate to list all the options, so I hope I guessed correctly.

Panel Meeting Action: Accept in Principle

The panel accepts the submitter's revision to change "phase and" to "phase or line and."

Revise the last sentence of 210.5(C) of the ROP text to read as follows:

"The method utilized for conductors originating within each branch-circuit panelboard or similar branch-circuit distribution equipment shall be documented in a manner that is readily available or shall be permanently posted at each branch-circuit panelboard or similar branch-circuit distribution equipment."

Panel Statement: The panel has accepted the addition of the words to apply to phase or line conductors. The panel agrees with the intent of the submitter that the identification is required to identify the conductors that originate at that panelboard. To accomplish that intent, the panel has revised the words from the ROP to state the identification (whether documentation or posting) before the conductors at that panelboard.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-19 Log #522 NEC-P02 **Final Action: Reject**

(210.5(C) and Exceptions)

Submitter: Dan Leaf, Seneca, SC

Comment on Proposal No: 2-27

Recommendation: Accept the proposal as revised:

Where the wiring system has branch circuits supplied from more than one ~~nominal voltage~~ system with different characteristics such as voltage frequency, phases, ac or dc, or supplied from different services, or separately derived systems, shall be identified by system at all terminations, connections, and supply points. The means of identification shall be posted where the branch circuit receives its supply.

Exception No. 1: Conductors for fire alarm circuits.

Exception No. 2: Conductors for emergency systems.

Exception No. 3: The enclosures for busway conductors shall be identified in an approved manner.

Exception No. 4: Flat Cable Assemblies Type FC shall only be required to be identified at the point of supply and in junction boxes.

Exception No. 5: Flat Conductor Cable Type FCC shall only be required to be identified at the point of supply.

Exception No. 6: Control and signal circuit conductors installed in the same raceway, cable or enclosure with power or lighting circuits.

Exception No. 7: Where the authority having jurisdiction determines that a system is sufficiently limited or separated from other systems identification shall not be required.

Substantiation: This section only applies to different voltage systems. Interconnection or misconnection of conductors with different characteristics other than voltage, such as ac and dc, grounded and ungrounded, different services, or separately derived can also be hazardous; currents may be improperly divided; backfeed to disconnected circuits may occur. Wiring for fire alarm and emergency systems are required to be identified in their respective articles. It is impractical to identify conductors in power, lighting, and trolley busway, Type FC and FCC cableseat all connections and supply points of devices. Present text can require Class 1 circuits installed with power supply circuits to be identified. A limited system which is separated from other systems such as a service supplying only a fire pump room does not warrant identification.

Panel Meeting Action: Reject

Panel Statement: The submitter has not provided substantiation that the requirement should be extended beyond identification of different voltage systems. The original substantiation dealt with the need being associated with voltage systems. The exceptions are unnecessary for the following reasons:

(1) Fire alarm circuits are not covered by Article 210. The branch circuit supplying the fire alarm equipment is covered, but the fire alarm circuits themselves are not.

(2) Emergency systems - the emergency system should be identified in compliance with 210.5 in order to identify which system it is supplied from.

(3) Busway - It is unnecessary to add an exception for busways since the identification means is typically already in place.

(4) FC and FCC Cable - There is no basis to not ID FC cable at its accessible points. For FCC cable, 324.120(B) already requires compliance with 310.12 which requires compliance with 210.5(C).

(5) Control and signal conductors are not always Article 210 Branch Circuits. In cases where they are, they should comply with 210.5(C), in other instances the ID requirements would not apply.

(6) A specific exception for the AHJ to omit the ID requirement is not needed since the current text of 210.5(C) allows "other approved means" and since 90.4 would allow the AHJ to permit different methods.

Ballot Results: Affirmative: 12

2-20 Log #2126 NEC-P02 **Final Action: Accept in Part**

(210.6(D))

Submitter: Robert H. Wills, Intergrid, LLC

Comment on Proposal No: 2-32

Recommendation: I request that the panel reconsider it's reject vote with the following language substituted for that of the original proposal:

Add a Part (3) and Exception (3) to 210.6(D) Branch-Circuit Voltage Limitations, 600 Volts Between Conductors so that the complete section reads as follows:

(D) 600 Volts Between Conductors. Circuits exceeding 277 volts, nominal, to ground and not exceeding 600 volts, nominal, between conductors shall be permitted to supply the following:

(1) The auxiliary equipment of electric-discharge lamps mounted in permanently installed luminaires (fixtures) where the luminaires (fixtures) are mounted in accordance with one of the following:

a. Not less than a height of 6.7 m (22 ft) on poles or similar structures for the illumination of outdoor areas such as highways, roads, bridges, athletic fields, or parking lots

b. Not less than a height of 5.5 m (18 ft) on other structures such as tunnels

(2) Cord-and-plug-connected or permanently connected utilization equipment other than luminaires (fixtures)

(3) Luminaires powered from direct current systems where the luminaire contains a listed, dc-rated ballast that provides isolation between the dc power source and the lamp circuit and protection from electric shock when changing lamps.

FPN: See 410.78 for auxiliary equipment limitations.

Exception No. 1 to (B), (C), and (D): For lampholders of infrared industrial heating appliances as provided in 422.14.

Exception No. 2 to (B), (C), and (D): For railway properties as described in 110.19.

Exception No. 3 to (D): Luminaires in installations where conditions of maintenance and supervision ensure that only qualified persons service the installation.

Substantiation: A. The panel rejected previous submissions on this topic due to the following:

The recommendation proposed would allow a luminaire with up to 430 V to be installed in a location where it could be easily accessed for changing lamps, etc. This defeats the intent of the requirement which is to require luminaires with voltage supplies higher than 277 V to be limited to very specific installation as described in 210.6(D)(1). There is no substantiation to allow luminaires supplied from PV systems to be treated any differently than luminaires power by AC line power.

1. The requirements of 210.6(D) are intended to protect non-qualified persons from the risk of electric shock while changing lamps, etc.

2. The use of listed electronic light ballasts that provide isolation between the ac or dc power source and the lamp circuit, and protection against electric shock are an alternate means of achieving this intent.

3. The proposed new language for 210.6(D)(3) would allow connection of listed, dc-rated ballasts to dc circuits operating between 277 and 600 V. Fluorescent lamp ballasts are listed under UL 935 which tests for and protects against the potential for electric shock when changing lamps. UL 935 applies to both ac and dc powered ballasts. UL 1029 applies to high intensity discharge ballasts and has similar provisions for the prevention of electric shock.

4. Most electronic ballasts can operate on both ac and dc as the internal electronics converts incoming power to dc before inverting to lamp voltage. Many are listed for both ac and dc use. A ballast connected to a 277 V ac nominal circuit will be subject to 392 V peak and 431 V peak at (+10%) ac high line. The internal DC bus of the ballast will be charged to the same (392 V dc) level whether the ballast is connected to 277 V ac or 392 V dc. The lamp is then supplied via an isolated high-frequency inverter circuit. The voltages available in the ballast and the risk of electric shock when changing bulbs are identical.

5. The potential risk to a person changing a ballast is a separate issue which is addressed by the new requirements of 410.73(G) requiring a ballast disconnect switch: "The luminaire will contain a disconnect means internal or external to itself or the luminaire will be cord and plug wired with UL rated hardware". Ballast replacement is also an activity normally performed by qualified personnel.

6. Comments from luminaire manufacturers (in the 2005 ROP) in response to the changes in the 2005 code that excluded luminaires from operating at over 277 V stated that this change was occurring without justification - no problems or cases of electric shock had been reported for lighting systems operating at over 277 V.

B. The new Exception (3) to 210.6(D) provides consistency between under 600 V and over 600 V requirements:

210.6(E) (Over 600 Volts Between Conductors) states: "Circuits exceeding 600 volts, nominal, between conductors shall be permitted to supply utilization equipment in installations where conditions of maintenance and supervision ensure that only qualified persons service the installation."

This provision for over 600 V between conductors is also appropriate for the voltage range 277 to 600 V where the general use of luminaires was prohibited in the 2005 code. This exception would allow the use of luminaires operating above 277 V ac and dc where conditions of maintenance and supervision ensure that only qualified persons service the installation.

C. Industry and Societal Impact. DC assisted lighting systems work by supplying rectified ac power to new and existing lighting installations, with additional power provided (directly via diode coupling) from dc sources such as photovoltaics, fuel cells and wind-generators.

DC lighting systems of this type have been researched and operating reliably for more than 20 years. The first such system (a photovoltaic-assisted lighting system in a department store in Massachusetts) was installed by UMass Lowell and is still operating.

The change to the 2005 NEC to 210.6(D)(2) that excluded luminaires from supply voltages above 277 V has (perhaps inadvertently) made DC assisted lighting systems illegal, but DC assisted lighting systems for commercial and industrial buildings have the potential to significantly reduce US energy consumption.

There are more than 100 billion square feet of commercial and industrial space in the USA that is lit with fluorescent and HID lighting. Typical lighting density is 2 W/square foot (a total electric demand of about 200 GW - about 20% of the total generating capacity).

The advantage of these systems are:

1. Efficiency - energy from the dc power source is used directly without conversion to ac and back to dc again

2. Cost - the cost of inverters is eliminated

3. Interconnection barriers - there is no possibility of back-feeding the electric grid, and so there are no interconnection issues.

The inclusion of this proposal, or equivalent language, is important for the preservation of an existing, growing segment of the renewable-energy industry that can provide significant reductions in US energy demand. It is important for the future of our country.

Panel Meeting Action: Accept in Part

The panel accepts the submitter's recommendation to add item (3) to 210.6(D).

The panel rejects the submitter's recommendation to add a new Exception No. 3.

Panel Statement: The panel agrees with the specific language to allow the DC rated luminaire with the limitations as stated in the submitter's recommendation.

The panel does not agree with adding a general exception that would allow luminaires to generally be applied above 277V. The limitations in 210.6(E) for qualified persons are specific to the limited application of the over 600 volt systems in branch-circuit applications. Applying this broadly to allow higher voltage luminaires in under 600V systems is not justified.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-21 Log #1044 NEC-P02 **Final Action: Reject**
(210.8(A))

Submitter: Gilbert L. Thompson, MEIA Codes and Standards

Comment on Proposal No: 2-40

Recommendation: The Panel should reconsider their action and reject not accept this proposal.

The exemptions that now appear in the 2005 NEC should remain and the new wording proposed by the panel added. However, an "s" should be inserted after the word exception in that new wording proposed by the panel.

Substantiation: Our inspectors associations agree with the negative comments of Mr. Brown and Mr. Purvis that the proposal should be rejected. We also agree that sufficient substantiation was not provided to expand the requirements for this section and are also concerned just the same as Mr. Brown regarding the problems that could be generated by nuisance tripping. We feel there could also be enforcement headaches created as to the dates that would be certifying when GFCI protection was installed or have circuits and receptacles been changed because they would not function properly.

Panel Meeting Action: Reject

The submitter has not provided any additional substantiation that the claims regarding nuisance tripping are associated with the GFCIs and appliances that have been in production over the past decade. The product standards include specific requirements for limitations on appliance leakage current (not more than 0.75#ma for a fixed cord and plug connected appliance) and the GFCIs have a minimum trip level of 4/mA. In addition, the removal of the exceptions avoids a potential conflict when the receptacles are located within 6ft of a utility sink that is in a garage.

(210.8(A))

Submitter: Neil F. LaBrake, Jr., National Grid / Rep. Edison Electric Insitute-Electric Light & Power Group

Comment on Proposal No: 2-40

Recommendation: Reject Proposal 2-40 in its entirety.

Substantiation: Proposal 2-40 should be rejected due to the incorrect assumption that all refrigerators and freezers will operate on GFCI protected circuits/receptacles. Potential loss of food in refrigerators and freezers is still a major problem. Also, some refrigerators are still being sold with a warning label to not install the refrigerator on a GFCI protected circuit. See copy of a label below from a Frigidaire Upright Freezer tag.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The product standard for refrigerators and freezers (UL 250) includes specific requirements for leakage current tests and limits the leakage current to.75mA. If there are situations where the appliance is leaking more than 5 times its permitted current to trip a GFCI, the condition with the appliance should be corrected. Relative to the "tags" mentioned in the substantiation, there is no evidence that these types of markings are not related to the historical issues associated with higher leakage currents and lower GFCI trip thresholds.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

PURVIS, R.: Comment 2-22 should be accepted. Neither the submitter of Proposal 2-40, nor the members of CMP 2 submitted sufficient substantiation for the need to require GFCI protection for dedicated appliances in garages and basements. However, various comments submitted pointed out potential problems with nuisance trips due to lightning, leakage or whatever for refrigerators and freezers that could result in food loss. If these exceptions are eliminated, there is a real possibility that electrical contractors will later remove the GFCI (after inspection) or somehow make doubly sure that refrigerators and freezers are not on a GFCI protected circuit or receptacle.

2-23 Log #1346 NEC-P02 **Final Action: Reject**
(210.8(A)(B))

Submitter: Donald M. King, Wilmington, DE

Comment on Proposal No: 2-42

Recommendation: This proposal should have been accepted.

Substantiation: The hazards associated with the use of electricity in close proximity of a sink have been adequately substantiated by numerous proposals that have been submitted to Panel 2 in past Code cycles. Panel 2 has recognized these hazards in this code cycle with the panel action on Proposal 2-81. Proposal 2-81 revises 210.8(B)(5) to require GFCI protection for all receptacles installed within 6 feet of a sink in other than dwelling units. The same level of protection should be required for similar installations in dwelling units. The same electrical hazards exist where electricity is used in close proximity of a sink regardless of the type of occupancy.

Panel Meeting Action: Reject

Panel Statement: The revision to 210.8(A)(7) and 210.8(B)(5) cover the situation related to receptacles installed within 6 ft of sinks. The wording in the proposal relative to "tubs" is already covered through the bathroom requirement for GFCI protection. The wording "other body of water" in the proposal is too broad.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

KING, D.: The Panel action and statement does not satisfy the submitter's concerns. With the present Code language in 210.8(A)(6) and 210.8(A)(7) it is possible in a dwelling unit to have a receptacle installed in a peninsular wall located more than 12 inches below the countertop surface and not have that receptacle be required to be GFCI protected. If a sink were installed in the countertop surface above the receptacle it is likely that the receptacle would be within 6 ft of the sink and the receptacle under the present code text would still not require GFCI protection. In the above scenario it is possible to utilize the receptacle for cord and plug connected equipment to be placed on the

countertop adjacent to the sink creating an unsafe condition for anyone using the electrical equipment. Accepting in Part the submitter's original Proposal to require GFCI protection within 6 ft of any sink would have required GFCI protection for the installation above and satisfied the submitter's concerns. I agree with the Panel that the wording in the Proposal "other body of water" is too broad but maintain my position that GFCI protection should be provided for all receptacles installed within 6 ft of any sink in a dwelling unit.

2-24 Log #1406 NEC-P02 **Final Action: Reject**
(210.8(A) Exception No. 2 to (2) and Exception No.2 to (5).)

Submitter: Noel Williams, Herriman, UT
Comment on Proposal No: 2-40
Recommendation: Revise text to read as follows:
These proposals should have been rejected. The exceptions should remain for existing older appliances.
Substantiation: Nuisance tripping of the GFCI is not the only real issue here. The proposals also refer to leakage current in the appliances and state that appliances should not have this much leakage current. However, earlier NEMA guides stated that some appliances do have higher leakage currents and should not be used with GFCIs. Although the product standards have since changed and do not permit the higher leakage currents, many of the appliances listed under previous products standards are still in use and have not been shown by any substantiation to present a significant shock hazard to their users. The acceptance of this proposal seems to be based on the assumption that all appliances used in newer homes are listed under the newer standards. This is highly presumptuous. In effect, the acceptance of this rule says to all buyers of homes built after 2008 that they must replace their older appliances without regard to their ability to pay or the continued usability of those appliances. The author of this comment agrees that "readily accessible" is vague and no longer a valid reason for an exception, but the consumers should be able to continue to use major appliances until the useful life of the appliance is over.
Panel Meeting Action: Reject
Panel Statement: The requirements for limited leakage current are not a recent change and have been in the appliance standards for a number of years. The submitter also overlooks the fact that if the appliance has significant leakage current, it is a hazard and should be replaced.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

(210.8(A)(1))

Submitter: David Shapiro, Accurate & Intriguing Writing & Editing
Comment on Proposal No: 2-45
Recommendation: Revise text to read as follows:
(1) Bathrooms. The ground fault circuit interrupter receptacle or device, protecting a bathroom shall be located in the bathroom being protected or in a panelboard.
Substantiation: Mr. Jones' and others' argument that there is a problem with multiple bathrooms being served by one GFCI is born out of experience. I have seen homeowners bring in extension cords to serve a bathroom because it didn't contain the GFCI serving it and they didn't know where to go to restore power. Trusting in the power of the market to convince builders eventually to provide adequate circuiting and location is a crapshoot. The proposed modification to the wording of Mr. Dewey's proposal is a compromise. It also avoids summarily overruling those designers and installers who believe they have good reason to prefer circuit breaker-type GFCIs over unit devices.
Panel Meeting Action: Reject
Panel Statement: A GFCI located in one bathroom and protecting receptacles in another bathroom is a proper application and will provide the needed GFCI protection. The convenience concerns associated with the location of the GFCI can be addressed by good design practices.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-26 Log #1675 NEC-P02 **Final Action: Reject**
(210.8(A)(1))

Submitter: Joseph Linteau, Greg Brooks Electric
Comment on Proposal No: 2-46
Recommendation: Add new text:
All general-purpose receptacles shall be GFCI protected in bathrooms. This does not include laundry equipment such as washers and dryers.
Substantiation: Presently, there is relief for basements and garages, I believe this relief should apply to bathrooms. This change would also prevent nuisance tripping.
Panel Meeting Action: Reject
Panel Statement: The panel does not agree that the appliances located in a bathroom should be exempt from GFCI protection. These appliances are compatible with GFCI, and if they are tripping the GFCI, they have leakage current that is in excess of acceptable levels. The submitter has not substantiated his statement regarding nuisance tripping.

Ballot Results: Affirmative: 12

2-27 Log #1052 NEC-P02 **Final Action: Reject**
(210.8(A)(2))

Submitter: Andre R. Cartal, Princeton Borough Building Dept.
Comment on Proposal No: 2-41
Recommendation: The Panel should reconsider their action to accept this proposal.
Substantiation: The statement that "readily accessible is too vague" is bogus, and has the panel considered that the garage door operation is essential to many disabled persons as well as a vital part of home security and a ready and easy fire exit. These openers are listed and are equipped with 3-wire attachment caps. I thought it was necessary to provide substantiation for a NEC change. I see none. In addition, the exception that permits fire and burglar alarm systems to be supplied from a non-GFCI circuit remains, Why? The only reason would be "nuisance tripping" which is a concern for the garage door opener.
Panel Meeting Action: Rej
ect
Panel Statement: The panel does not agree with exempting receptacles at elevated locations from GFCI protection. In many cases, these receptacles supply equipment that is located in a readily accessible location of a garage that should require GFCI protection. There is no incompatability between garage door openers and GFCIs.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
PURVIS, R.: Comment 2-27 should be accepted. Neither the submitter of Proposal 2-41, nor the members of CMP 2 submitted sufficient substantiation for the need to require GFCI protection for receptacles that are not accessible (garage door opener for example). However, the comment submitted pointed out valid potential life safety problems with requiring GFCI protection due to nuisance trips.

2-28 Log #2031 NEC-P02 **Final Action: Accept**

Recommendation: I support the panel action on this proposal.
Substantiation: A circuit with potentially lethal leakage current capable of opening a GFCI protective device, should not be considered a "nuisance trip" by the electrical industry.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
PURVIS, R.: Comment 2-28 should be rejected. Neither the submitter of Proposal 2-50, nor the members of CMP 2 submitted sufficient substantiation for the need to require GFCI protection for receptacles that are not accessible (garage door opener for example). However, Comment 2-27 pointed out valid potential life safety problems with requiring GFCI protection due to nuisance trips.

2-29 Log #896 NEC-P02 **Final Action: Reject**
(210.8(A)(2) Exception No. 1 and 210.8(A)(5) Exception No. 1)

Submitter: Michael P. O'Quinn, MOGO Enterprises, Inc.
Comment on Proposal No: 2-41
Recommendation: Reject this proposal: restore wording to 2005 NEC language.
Substantiation: The proposal submitter states that "readily accessible" can mean different things based upon the height of the person. But the wording of 210.8(A)(2) Exception No. 1 and 210.8(A)(5) Exception No. 1 is referring to not readily accessible, which is something quite different.
"Readily accessible" refers to the ability of anyone, regardless of height or mobility, to access the equipment or device in question. This term needs to be vague to allow or require items to be at the height of the user. This is why the definition of readily accessible in Article 100 has remained unchanged during several Code cycles.

The intent of the phrase "not readily accessible" was to prevent anyone from reaching equipment or a device without resorting to ladders to achieve the height. It, therefore, is directed at the nominal height of a person, and in several locations such as 240.24(A) has been placed at no less than 6 ft 7 in. above the floor. This was thought to be a practical height to require those to who ready access is required to resort to ladders to achieve this height, even though persons of greater height could reach it without aid.

See 210.8(A)(3) Exception, which permits the elimination of GFCI protection for receptacles feeding electric snow-melting equipment. In order to follow 426.28, ground-fault protection devices (not GFCI) would trip at about 30 ma, providing shock hazard to anyone coming in contact with the receptacle, but providing proper protection for the snow-melting system. The intent of this "not readily accessible" requirement though no height is mentioned, expects this to be at the roof line where the average person would not be exposed to possible deadly current.

In 110.34(E) we use specific heights based upon the voltage level to prevent access by unqualified persons from unguarded voltages above 600V. There is no adjustment in these distances based upon the height of the person because of this non readily accessible height should provide "...practical safeguarding from the hazards arising from the use of electricity" [90.1(A)].

Panel Meeting Action: Reject
Panel Statement: See action and statement on Comment 2-27.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

PURVIS, R.: Comment 2-29 on Proposal 2-41 should be accepted for the same reason that Comment 2-27 should have been accepted.

2-30 Log #2132 NEC-P02 **Final Action: Reject**
(210.8(A)(2) Exception No. 1 and No. 2)

Submitter: Michael R. Fisher, Bluhm Electric Inc.
Comment on Proposal No: 2-50
Recommendation: Exception No. 1 to (2) Receptacles that are not readily accessible.
Substantiation: As the proposer talks about leakage current for appliances. But does not address the issue of lightning. In Colorado, we are second in lightning strikes which will trip AFCI receptacles. Do we want to be responsible for the loss of food in freezers or refrigerators in garages. Also new spec's on refrigerator recommend that these appliances not be put on AFCI receptacles.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Comment 2-27. GFCIs produced in recent years under the revised standards are much more resistant to lightning as a cause for unwanted tripping. In addition, there are actions such as freezer temperature alarms and similar devices that could be used to warn of a power outage for any reason (not just a GFCI opening).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

PURVIS, R.: Comment 2-30 should be accepted which would reject Proposal 2-50. The need for GFCI protection was not substantiated. Many new homeowners would not be aware that they might have to purchase some type of warning device for power loss due to false trips from lightning etc. if GFCI protection is required on these circuits.

2-31 Log #2030 NEC-P02 **Final Action: Accept**
(210.8(A)(2) Exception No. 2)

Submitter: Donald Cook, Shelby County Building Inspections
Comment on Proposal No: 2-51
Recommendation: I support the panel action on this proposal.
Substantiation: A circuit with potentially lethal leakage current capable of opening a GFCI protective device, should not be considered a "nuisance trip" by the electrical industry.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

PURVIS, R.: Comment 2-31 on Proposal 2-51 should be rejected. Neither the submitter of the proposal, nor the members of CMP 2 submitted sufficient substantiation for the need to require GFCI protection for dedicated appliances in garages. However, various comments submitted pointed out potential problems with nuisance trips due to lightning, leakage or whatever for refrigerators and freezers that could result in food loss. If these exceptions are eliminated, there is a real possibility that electrical contractors will later remove the GFCI (after inspection) or somehow make doubly sure that refrigerators and freezers are not on a GFCI protected circuit or receptacle.

2-32 Log #2029 NEC-P02 **Final Action: Accept**
(210.8(A)(5) Exception No. 1 to (5))

Submitter: Donald Cook, Shelby County Building Inspections
Comment on Proposal No: 2-58
Recommendation: I support the panel action on this proposal.
Substantiation: A circuit with potentially lethal leakage current capable of opening a GFCI protective device, should not be considered a "nuisance trip" by the electrical industry.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-33 Log #2028 NEC-P02 **Final Action: Accept**
(210.8(A)(5) Exception No. 2 to (5))

Submitter: Donald Cook, Shelby County Building Inspections
Comment on Proposal No: 2-57
Recommendation: I support the panel action on this proposal.
Substantiation: A circuit with potentially lethal leakage current capable of opening a GFCI protective device, should not be considered a "nuisance trip" by the electrical industry.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

PURVIS, R.: Comment 2-33 on Proposal 2-57 should be rejected. Neither the submitter of the proposal, nor the members of CMP 2 submitted sufficient substantiation for the need to require GFCI protection for dedicated appliances in basements. However, various comments submitted pointed out potential problems with nuisance trips due to lightning, leakage, or whatever for refrigerators and freezers that could result in food loss. If these exceptions are eliminated, there is a real possibility that electrical contractors will later remove the GFCI (after inspection) or somehow make doubly sure that refrigerators and freezers are not on a GFCI protected circuit or receptacle.

2-34 Log #1997 NEC-P02 **Final Action: Accept in Principle**
(210.8(A)(5) Exception No. 3)

Submitter: Lawrence Brown, National Association of Home Builders (NAHB)
Comment on Proposal No: 2-58
Recommendation: Accept the proposed change.
Substantiation: It may be advisable to include this cross-reference FPN in Chapter 2 as most electricians who wire one- and two-family dwellings and low-rise multifamily buildings very rarely use the provisions of Chapter 7. In addition, NAHB would like to make sure this important information is included in the electrical provisions of the ICC International Residential Code (IRC).
Panel Meeting Action: Accept in Principle

Add an FPN to 210.8(A)(5) following the exception that reads:

"FPN: See 760.41(B) and 760.121(B) for power supply requirements for fire alarm systems."

Panel Statement: The panel accepts the recommendation to add the FPN and has reworded the FPN to reference the correct sections and make the FPN generic relative to power supply requirements.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-35 Log #809 NEC-P02 **Final Action: Hold**
(210.8(A)(7))

TCC Action: The Technical Correlating Committee directs that this comment be reported as "Hold" since the revision to 210.8(A)(7) is new material that has not had adequate public review and the Technical Correlating Committee directs that only Comment 2-35 be held.
Submitter: Joseph A. Hertel, Safety and Buildings
Comment on Proposal No: 2-40
Recommendation: Revise text to read:

(7) Laundry, utility, bedroom and wet bar sinks, where the receptacles are installed within 1.8 m (6 ft) of the outside edge of the sink.

Substantiation: Bedroom sinks are quite common in current construction where a vanity with sink is installed in addition to a bathroom for a master bedroom. It can be argued that the sink is in the bathroom area or can be used as a wet bar but the addition of the word bedroom would eliminate the question.
Panel Meeting Action: Accept in Principle

Reword 210.8(A)(7) from the ROP text to read as follows:

"(7) Laundry, utility, wet bar and similar sinks -- where the receptacles are installed within 1.8 m (6 ft) of the outside edge of the sink."

Panel Statement: The panel has revised the language to include "similar sinks" to address the submitter's concern. The proposed text of "bedroom sink" is not a common term. The language in the panel action text will make the requirement inclusive of all sinks other than those covered by the bathroom and kitchen provisions of 210.8(2) and (A)(6).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-36 Log #11 NEC-P02 **Final Action: Accept**
(210.8(A)(7) Exception)

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 2-66
Recommendation: It was the action of the Technical Correlating Committee that this Proposal be reconsidered since the acceptance of two other proposals is not a technical reason for rejecting this proposal in accordance with the 4.3.5.1 of the NFPA Regulations Governing Committee Projects.
This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the Technical Correlating Committee direction to reconsider the proposal. The panel continues to reject the proposal. The panel does not agree that the exceptions should be added for equipment located in the areas covered by the requirements. The panel notes that the submitter's original substantiation was simply that the exception exists in other 210.8 locations and should be added here. This substantiation is insufficient to expand the use of the exceptions.
Number Eligible to Vote: 12

2-39 Log #13 NEC-P02 **Final Action: Accept**
(210.8(B))

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 2-70
Recommendation: The Technical Correlating Committee understands that the Panel Action on this Proposal retained "(3) Rooftops"; revised (4) to read "(4) Outdoors", deleted the existing text in (4), changed the existing "Exception to (3) and (4)" to "Exception No. 1 to (3) and (4)", and added the proposed "Exception to (3)" as "Exception No. 2 to (4)"; and deleted (5).
The Technical Correlating Committee directs that the Action on this Proposal be rewritten to comply with 4.1.1 of the NEC Style Manual. This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
The panel accepts the direction of the Technical Correlating Committee as follows:
Revise Exception No.1 to (3) and (4) to read as follows: "Exception No. 1 to (3) and (4): Receptacles that are not readily accessible and are supplied from a dedicated branch circuit for electric snow-melting or deicing equipment shall be permitted to be installed without GFCI protection."
Panel Statement: The panel agrees that the recommendation properly expresses the arrangement of the exceptions. To address the issue of the reference to the entire article, the panel deleted the reference since all electric snow--melting or deicing equipment must be installed according to the NEC requirements and more specifically Article 426.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-40 Log #1347 NEC-P02 **Final Action: Accept in Principle in Part**
(210.8(B))

Submitter: Donald M. King, Wilmington, DE
Comment on Proposal No: 2-70
Recommendation: Delete the proposed industrial exception as recommended by Panel 2, add specific section references to the exception to (3) to satisfy the TCC action and revise the submitter's recommended text to read as follows:
(B) Other Than Dwelling Units. All 125-volt, single-phase, 15- and 20-ampere receptacles installed in the locations specified in (1) though (5) shall have ground-fault circuit-interrupter protection for personnel:
(1) Bathrooms
(2) Commercial and institutional kitchens for the purposes of this section, a kitchen is an area with a sink and permanent facilities for food preparation and cooking.
(3) Rooftops
~~(4) Outdoors in public spaces for the purposes of this section a public space is defined as any space that is for use by, or is accessible to, the public~~
~~Exception to (3) and (4): Receptacle that are not readily accessible and are supplied from a dedicated branch circuit for electric snow melting or deicing equipment shall be permitted to be installed in accordance with the applicable provisions of Article 426.~~
~~(5) Outdoors where installed to comply with 210.63~~
(4) Outdoors.
Exception to (3) and (4) Receptacles that are not readily accessible and are supplied from a dedicated branch circuit for electric snow-melting or deicing equipment shall be permitted to be installed in accordance with the applicable provisions of Part I of Article 426.
Substantiation: The addition of an industrial exception by Panel 2 that allows an assured equipment grounding program to be used in lieu of GFCI protection was done without reviewing any technical data that would indicate that an assured equipment grounding program would provide the same level of shock protection as GFCI protection. Industrial establishments present some of the most adverse conditions and environments for persons who are required to operate cord and plug connected equipment. Oftentimes, workers are required to work outside in inclement weather for extended periods of time while utilizing portable cord and plug connected electrical equipment, exposing them to the hazard of electric shock or electrocution. There are also many situations that require workers at industrial facilities to work in areas that are below grade, such as manholes and cable vaults, further subjecting them to risk of electrical shock or electrocutions. The use of GFCI protected devices would greatly reduce the hazard of electrical shock or electrocution in these areas. GFCI protected devices have a proven history of saving lives and should be required for all 125 volt 15 and 20 ampere receptacle outlets installed outdoors including those installed in Industrial establishments.

Panel Meeting Action: Accept in Principle in Part

The panel rejects the recommendation to delete Exception No. 2 to 210.8(B)(4) of the ROP text.

The panel accepts in principle the recommendation to reword Exception No. 1 to (3) and (4) of 210.8(B)(4) of the ROP text to not reference the entire article. The panel action on Comment 2-39 accomplishes this objective.

Panel Statement: The panel does not agree with the deletion of Exception No. 2 from the ROP text. The assured equipment grounding conductor program is recognized by OSHA as well as the NEC in Article 590. See the panel action on Comment 2-41 that futher limits the exception to the text used in 590.6(A) Exception.

See panel action and statement on Comment 2-39 for the revision of Exception No. 1. The panel has removed the entire reference to Article 426, since the article would apply to the equipment regardless of the reference.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

NENNINGER, B.: In keeping an industrial exception for outdoor receptacles, Panel 2 has appropriately recognized specific industrial situations exist in which a "greater hazard" could result from the loss of power. Examples of such situations include: receptacles for equipment supplying breathing air during confined space entry, air evacuation/supply where gases may be present, and equipment held in place using electro-magnetic technology such as magnetic drills.

2-41 Log #1358 NEC-P02 **Final Action: Accept in Principle in Part (210.8(B))**

TCC Action: The Technical Correlating Committee understands that the panel action did not Accept the deletion of "Exception No. 1 to (3) and (4)".

Submitter: Michael P. O'Quinn, MOGO Enterprises, Inc.

Comment on Proposal No: 2-70

Recommendation: Revise text to read as follows:

(B) Other Than Dwelling Units. All 125-volt, single-phase, 15- and 20-ampere receptacles installed in the locations specified in (1) through (5) shall have ground-fault circuit-interrupter protection for personnel:

(1) Bathrooms

(2) Commercial and institutional kitchens—for the purposes of this section, a kitchen is an area with a sink and permanent facilities for food preparation and cooking

~~(3) Rooftops~~

~~(4) Outdoors in Public Spaces. For the purpose of this section a public space is defined as any space that is for use by, or is accessible to, the public~~

~~Exception to (3) and (4): Receptacles that are not readily accessible and are supplied from a dedicated branch circuit for electric snow melting or dicing equipment shall be permitted to be installed in accordance with the applicable provisions of Article 426.~~

~~(5)~~ (3) Outdoors, ~~where~~ including receptacles installed to comply with 210.63

Exception to (3): Receptacles that are not readily accessible and are supplied from a dedicated branch circuit for electric snow-melting or deicing equipment shall be permitted to be installed in accordance with the applicable provisions of Article 426.

[Panel Action] Exception No. 2 to (4): In industrial establishments only, where conditions of maintenance and supervision ensure that only qualified personnel are involved, GFCI protection shall not be required on receptacles that are limited in use to those receptacles listed in 590.6(A) Exception ~~equipment qualified under an assured equipment grounding conductor program as specified in 590.6(B)(2)~~.

Substantiation: I agree with the inclusion of all 125-volt, 15- and 20-ampere receptacles installed outdoors with GFCI protection. I do not agree that "rooftops" is not "outdoors", but the added wording "including receptacles installed to comply with 210.63" should cover the problem addressed in the panel statement.

The panel action that added 210.8(B)(4) Exception No. 2 should refer to 590.6(A) Exception. 590.6(A) Exception allows an assured equipment grounding conductor program only if the receptacle is 125-volt, 15-, 20-, or 30-ampere that "...would create a greater hazard if power was interrupted or having a design that is not compatible with GFCI protection". This follows the intent of 590.6(A) Exception in that it protects persons using electricity with almost all temporary wiring. 590.6(B) gives an option for receptacles other than 125-volt, 15-, 20-, or 30-ampere to use either GFCI protection or an assured equipment grounding conductor program.

590.6(A) Exception refers to 590.6(B)(2) for the requirements of the assured equipment grounding conductor program, not which receptacles would be covered.

There does not appear to be a substantiation for exempting all 125-volt, 15- and 20-ampere receptacles in industrial establishments from GFCI protection by merely using an assured equipment grounding conductor program.

Panel Meeting Action: Accept in Principle in Part

The panel accepts in principle the revision to Exception No. 2 by rewording as follows: "Exception No. 2 to (4): In industrial establishments only, where conditions of maintenance and supervision ensure that only qualified personnel are involved, an assured equipment grounding conductor program as specified in 590.6(B)(2) shall be permitted for only those receptacle outlets used to supply equipment that would create a greater hazard if power is interrupted or having a design that is not compatible with GFCI protection."

The panel rejects the recommendation to delete rooftops.

The panel rejects the recommendation to include the reference to 210.63 in the outdoor requirement.

Panel Statement: The panel has revised Exception No. 2 to mirror the language used in 590.6(A) Exception. This will accomplish the objective of the submitter to make the use of the assured equipment grounding conductor program consistent.

The panel does not accept the deletion of rooftops because there may be receptacles installed on a rooftop (such as those in a penthouse) that are rooftop receptacles but are not located outdoors. In addition, those receptacles may not be for compliance of 210.63, so the use of that reference may again leave gaps in the intended protection.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-42 Log #1801 NEC-P02 **Final Action: Accept in Principle (210.8(B))**

Submitter: Michael Walls, American Chemistry Council

Comment on Proposal No: 2-71

Recommendation: The panel should amend its action and reject the expansion of GFCI's to sinks in "industrial laboratories" by adding an exception to the newly accepted text, "(5) Sinks – where receptacles are installed within 1.8 m (6 ft) of the outside edge of sink" as follows: Exception: Receptacles in industrial laboratories.

It should be noted the new text was offered by panel 2 in proposal 2-81 and referenced by the panel to address in principal in part the submitters request in proposal 2-71.

Substantiation: The blanket reference to all sinks including industrial laboratory facilities is of concern due to a potential loss of power to critical lab equipment used to control (cool, heat, stir/agitate) process reactions and evacuate process gases. Loss of power to such equipment either from a nuisance or intentional GFCI trip may result in significant run-away reaction hazards depending on the process characteristics and/or gases produced. These hazards include fire for those hood installations classified as division 2. In addition, leaving the text "industrial laboratories" out does not preclude the use of GFCI in such locations where they do not contribute to the hazards referenced above.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Comment 2-44.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

KING, D.: See my explanation of negative on Comment 2-44.

Comment on Affirmative:

NENNINGER, B.: By accepting an exception covering sinks in industrial laboratories, Panel 2 has appropriately recognized situations where "greater hazards" exist in the event power is lost to critical lab equipment used in proximity to sinks. Examples of such equipment include devices designed to control process reactions and evacuate process gases. In these cases, a GFCI trip (nuisance or intentional) could result in significant run-away reaction hazards depending on the process characteristics and/or gases produced.

2-43 Log #1849 NEC-P02 **Final Action: Reject (210.8(B))**

Submitter: Mike Holt, Mike Holt Enterprises, Inc.

Comment on Proposal No: 2-70

Recommendation: Accept the Proposal as originally submitted.

Substantiation: I agree with Mr. Weber's comment. Industrial workers are often exposed to the same hazards as non-industrial workers. Considering the fact that the performance requirements of the assured program are seldom adhered to, we are putting our industrial workforce in an unnecessary danger by accepting the Panel's proposed exception.

Panel Meeting Action: Reject

Panel Statement: The panel does not agree that the permission to use the assured equipment grounding conductor program should be removed. This program is still recognized by OSHA as acceptable if properly applied. The panel has revised the exception to be consistent with the wording of 590.6(A) Exception, which further limits the use of the exception. See the panel action and statement on Comment 2-41.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:
KING, D.: I agree with the submitter's substantiation. The level of safety afforded by the use of GFCI protection far exceeds that provided by an assured equipment grounding program. Protection of persons from electrical shock and electrocution should be of the highest priority for Panel 2 when permitting exceptions for GFCI protection. The Panel should reconsider whether this exception is warranted.

2-44 Log #571 NEC-P02 **Final Action: Accept in Principle**
(210.8(B) Exception (New))

TCC Action: The Technical Correlating Committee directs that the new Exception added in the panel action be identified as "Exception No. 1 to (5)" to correlate with the Technical Correlating Committee action on Comment 2-57.

The Technical Correlating Committee understands that the panel action on Comment 2-57 modifies this panel action.

Submitter: William M. Lewis, Martinsville, IN
Comment on Proposal No: 2-71
Recommendation: The additional requirement for GFCI protection should be accompanied by the following exception:

Exception: Where loss of power could lead to more serious consequences than electrical shock, such as runaway reactions endangering multiple personnel or buildings, GFCI protection shall not be required.

Substantiation: Reasoning for this exception is obvious. It has long been the standard of the company from which I retired, to install GFCIs where employees request them, but not routinely in lab hoods or near lab sinks. Sometimes reliability and safety for the masses, outweighs individual safety.
Panel Meeting Action: Accept in Principle

Add a new exception to 210.8(B)(5) of the ROP text to read as follows:

"In industrial laboratories, receptacles used to supply equipment where removal of power would introduce a greater hazard shall be permitted to be installed without GFCI protection."

Panel Statement: The panel has added wording that is more consistent with code language and meets the intent of the submitter.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
KING, D.: The hazards which are described in the submitter's substantiation would require back up power sources to prevent "a dangerous runaway reaction" regardless of whether GFCI Protection is used or not. The submitter has not substantiated that there is a compatibility issue with electrical equipment used in labs and listed GFCI devices. Panel 2 should have requested to see more technical data before adding this exception.
Comment on Affirmative:
NENNINGER, B.: See my explanation given in Comment 2-42.

2-45 Log #1765 NEC-P02 **Final Action: Reject**
(210.8(B) Exception and 210.8(C) Exception (New))

Submitter: Michael Cole, MRC Electric
Comment on Proposal No: 2-70
Recommendation: Add an Exception to read as follows:

Exception e to 210.8(B) and 210.8(C): For loads that are incompatible with GFCI protection for people such as truck engine block heaters, older refrigerators, older vending machines, older boat hoists, large boat hoists, and similar loads a combination ground fault/ground check relay of the type that is used for protection of cords and machines in mines shall be permitted. The ground fault trip of such a device shall be permitted to be adjustable from 0.1 amperes to 10 amperes and shall be adjusted to the lowest level that tolerates normal leakage current of the appliance or machine. The ground check circuit shall be able to detect both an open equipment grounding conductor and ground fault of the ground check conductor.

For cords that do not lie on the floor or when bridge crane runway conductors or festoon cords are used to supply an appliance or machine, the power circuit shall be solidly grounded or resistance grounded and the cord shall be permitted to be unshielded for voltages of 600 volts or less. If the power circuit is solidly grounded, the ground check relay shall be protected from the voltage drop in the equipment grounding conductor that occurs during a ground fault by means of a fused communications protector block. This method of protection shall also be permitted for cords that lie on indoor floors that are not subject to flooding, washdown while the cord is in use, or presence of sharp objects. This method shall also be permitted for outdoor cords that do not lie on the floor and supply an appliance or machine that is stationary when in use. Where a cord lies on the floor and is subject to flooding, washdown, or sharp objects the cord power and ground check conductors shall be shielded regardless of voltage and the power source shall be resistance grounded regardless of voltage or number of phases.

Substantiation: a. One of the problems with the engine block heaters in diesel trucks is that at 55 miles per hour salt water will force its way into the wiring causing a leakage current that will trip a ground fault circuit interrupter for people protection. This is no more of a hazard than how if you do not ground a 15 horsepower hoist motor the hoist ropes will have a nasty tingle voltage regardless of how good the insulation is.

b. The method that is used in surface mines and underground mines for voltages up to 13,800 volts resistance grounded is to use continuous monitoring of the equipment ground which allows ground fault protection to be set to trip at much higher levels than 6 milliamperes.

The combination of resistance grounding and shielding of cord conductors protects against cord cuts and broken wire strands working their way through insulation to the surface (causing and electrocution) or to the other conductor (causing a fire). Resistance grounding makes the ground fault almost totally nonincendive and allows the ground fault relays and electricians to locate and clear a ground fault. This cause of electrocutions and fires was determined by the British National Coal Board among other regulatory agencies. The British have not had an electrocution in their underground coal mines since 1964 and they have 1,100 volt and 3,300 volt extension cords so they must be doing something right. The only electrical fires that they have had since then have been due to an operator of a machine running over the machine's supply cord.

Resistance ground also provides substantially reduced arc flash hazard. There still is a way to have a phase to phase arcing ground fault but such a fault almost always branches to ground which would trip ground fault protection that is set for 10 amperes or less.

A company in Pennsylvania named Bender does this technology up to 4,160 volts resistance grounded. Bender has been advertising in the online e-mail newsletter from Electrical Construction and Maintenance magazine. A company in West Virginia named Service Machine Corporation does this technology up to 13,800 volts resistance grounded. There really is such a thing as a 400 ampere 13,800 volt extension cord that is electrocution proof and fire proof and as safe as breakfast food as long as nobody runs over it with a mining machine. But then, you could choke on your breakfast food.

c. The present generation of ground fault/ground check relays are not listed for use on solidly grounded electrical systems but that problem can be fudged using a fused communication protector block. This gives a way to do a simpler power system for machines in areas where cords are not abused or subject to moisture that could lead to electrocution.

Panel Meeting Action: Reject
Panel Statement: The submitter's concept that an adjustable relay of 0.1 to 10 amperes be used as a substitute for GFCI protection at 120 V is technically flawed. The research associated with protection from electrocution is well established, and the panel notes that ground fault currents above 10 mA are above the let-go threshold and currents up to 50 mA induce ventricular fibrillation. Equipment that is leaking current in the ranges stated by the submitter can pose a significant hazard to persons.

In addition, the main requirement is to provide GFCI protection of the 15 and 20 ampere receptacles. The submitter's concept is dependent upon special cord sets (many of which would not be cord and plug connected to a 15 or 20/A receptacle), and there is no way to limit the receptacle to those applications.

2-46 Log #940 NEC-P02 **Final Action: Reject**
(210.8(B) Exception No. 2)

Submitter: Robert G. Fahey, City of Evansville
Comment on Proposal No: 2-70
Recommendation: Delete the following text:

~~Exception No. 2: In industrial establishments only, where the conditions of maintenance and supervision ensure that only qualified personnel are involved, GFCI protection shall not be required on receptacles that are limited to use with equipment qualified under an assured equipment grounding conductor program as specified in 590.6(B)(2).~~

Substantiation: I believe the proposed new Exception No. 2 should be omitted from the 2008 NEC. I have inspected industrial plants where the maintenance is, in fact, done by qualified people, but I have not noticed the assured equipment grounding program utilized, most cords used do not have the color coded tape as required by OSHA. I believe the GFCI protection is a better, more assured method of protecting the workers in all facilities, therefore, I believe the qualified personnel in the industrial establishments deserve the same protection as every other person. Leave the safety in the NEC and industrial facilities and take Exception No. 2 to 210.8(B) out of the NEC.
Panel Meeting Action: Reject

Ballot Results: Affirmative: 12

2-55 Log #2102 NEC-P02 **Final Action: Accept in Principle**
(210.8(B)(5) (New))

Submitter: Stephen J. Grose, The Washington State Society for Healthcare Engineering
Comment on Proposal No: 2-81
Recommendation: Add an Exception to proposed (5) to read:
In patient care areas of health care facilities. (See Article 517 for the definition).
Substantiation: Best practices for healthcare infection control and current code requires hand washing sinks be located in the patient room. The closer to the point of use the more frequently the sink will be used. This requirement would cause healthcare organizations to place GFCI's on their emergency outlets. Placing an electromechanical device in-line with emergency power prior to the point of equipment use only compounds the probability of device failure and adds one more successive check in and emergency. If the healthcare organization was to design the room with the hand sink out of the way then the staff would be less likely to utilize the sink as frequently. I would challenge the NFPA to review the relative risk from patient room water hazard and compare the data to GFCI failure ratios and the spread of hospital acquired infection due to poor hand hygiene standards. The results will become self evident. This exception applies to new item (5) only and would not apply to patient bathrooms.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 2-57.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

(210.8(B)(5) (New))

Submitter: Nate Schoff, York, ME
Comment on Proposal No: 2-81
Recommendation: Add:
(5) Laundry, utility, and wet bar sinks - where the receptacles are installed with 6 ft of the outside edge of the sink.
Substantiation: Number 6 should be added because the risk of electrical shock around water still exits in this situation regardless of if it is in or outside of a dwelling unit.
Panel Meeting Action: Reject
Panel Statement: The submitter's recommendation is unclear. The recommended language is from the ROP text, but the substantiation indicates that a "Number 6" should be added.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-57 Log #796 NEC-P02 **Final Action: Accept in Principle**
(210.8(B)(5) Exception (New))

TCC Action: The Technical Correlating Committee directs that the new Exception added in the panel action be identified as "Exception No. 2 to (5)" to correlate with the Technical Correlating Committee action on Comment 2-44.
Submitter: Douglas S. Erickson, American Society for Healthcare Engineering (ASHE)
Comment on Proposal No: 2-81
Recommendation: Add an exception to proposed (5). In patient care areas of health care facilities. (See Article 517 for definition).
Substantiation: Handwashing sinks are typically located within 6 ft of the patient bed, exam table, gurney location, or treatment facility and this new language would require receptacles serving patient care life support, monitoring, and other portable patient care equipment to be on GFCI. The risk to a patient's life and/or the treatment being rendered could be severely jeopardized by having an interruption of electrical power.
Sinks for clinical staff handwashing are required in all patient rooms, treatment rooms and areas, and exam facilities by federal, state and local standards.
This exception applies to new item (5) only and would not apply to patient bathrooms.
Panel Meeting Action: Accept in Principle
Add a new Exception No. 2 to 210.8(B)(5) of the ROP text to read:
"Exception: For receptacles located in patient care areas of health care facilities, other than those covered under 210.8(B)(1), GFCI protection shall not be required."
Panel Statement: The panel has added an exception for receptacles in patient care areas of health care facilities, but has provided wording that receptacles considered to be part of the bathroom area under 210.8(B)(1) are still required to be GFCI protected. This exception addresses the submitter's concern that receptacles at the bedside that may be supplying critical equipment not be included in the requirement for GFCI protection within 6 ft of the sink.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-61 Log #2134 NEC-P02 **Final Action: Reject**
(210.8(B)(6))

Submitter: Geoffrey Wood, Hampton, NH
Comment on Proposal No: 2-81
Recommendation: Add new text to read as follows:
Janitorial, Services and Utility Closets. For the purpose of this section a janitorial service or utility closet, is a closet which contains a floor level mop basin (slop sink) wall mounted mop basin or any other basin.
Substantiation: I think you should have to put a GFCI in janitorial closets or utility closets. The potential for electrical shock is the same as if you were in a kitchen or bathroom, etc. They should be treated the same.
Panel Meeting Action: Reject
Panel Statement: The provisions described by the submitter are already covered in the requirement for 210.8(B)(5) that receptacles within 6 ft. of a sink be GFCI protected. This would include sinks in janitorial closets.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-62 Log #1887 NEC-P02 **Final Action: Reject**
(210.8(D) (New))

Submitter: Paul S. Hamer, Richmond, CA
Comment on Proposal No: 2-88
Recommendation: This proposal (and its companion Proposals 2-6, 2-285, 11-48 and 11-49 - Comments submitted separately) should be accepted. Add to the end of the proposed wording: This requirement shall become effective January 1, 2011. This aligns with Mr. Weber's Explanation of Negative for Proposal 2-88 regarding the development of new, life-saving concepts. Adding the delayed effective date would provide the incentive and the necessary time for the Three-Phase Ground-Fault Circuit-Interrupter System (GFCIS-3Ph) to be further developed and commercialized.
Substantiation: The Panel Statement includes "...The submitter's substantiation notes that the hazard is when unqualified persons work on equipment without taking the appropriate precautions to deenergize the circuit and verify that circuit is disconnected...". There are numerous instances where unqualified persons were electrocuted by faulty or defective equipment (see the supporting material submitted with the proposals), and these people may have been protected from electrocution by the proposed GFCIS-3Ph. See also the Explanation of Negatives of Mr. King and Mr. Weber for this Proposal. The patent applications are pending for the GFCIS-3Ph as of this date, but further field measurements made since the Proposal submittal date indicate that the distributed phase capacitances on an actual installed three-phase 480 volt power system are balanced enough to permit the sensitivity described in the proposals.
Panel Meeting Action: Reject
Panel Statement: The panel disagrees that there is sufficient substantiation for supporting a mandatory requirement for GFCI protection of 277V lighting systems. The submitter's substantiation pointed to the material submitted with the original proposal. In reviewing the data, it is evident that well over 90% of the instances cited are related to improper work practice and work on energized equipment. In a significant number of those instances, the revision to the NEC for a disconnect on each luminaire [as required by 410.73(G)] will resolve the issue. There are also a number of instances cited that do not necessarily fit the submitter's claim relative to 277 V lighting. These include ungrounded 480V luminaires and circuits that may not even be lighting related. The panel also expresses concern that the submitter's approach to the code language is focused on a proprietary system, which may not be the only solution to the problem if one is substantiated.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
KING, D.: The life saving benefits of this new technology warrants further review by panel 2. Although the Panel assessment of the submitter's data may be that over 90% of the instances were related to improper work practices, the Panel needs to recognize that the implementation of this technology would have prevented many of the incidences sited. There are many factors which contribute to the alarming statistics of electric shocks and electrocutions involving 277/480 volt systems. Some electric shocks are a result of human error but the fact remains that these incidences occur at a rate that is unacceptable. The ability to significantly reduce the number of electrical shocks on 277/480 volt systems should be the focus of Panel 2. Panel support for the advancement of this technology would be a positive step to providing a much safer working environment for all who work in the electrical industry.

2-63 Log #1899 NEC-P02 **Final Action: Accept**
(210.9 Exception No. 2)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 2-89
Recommendation: Continue to reject the proposal.
Substantiation: As the submitter of the series of proposals and comments over several cycles that finally inserted this exception into the NEC, I thought some historical background was in order. I did a great deal of my initial trade work in a number of heavy industrial occupancies, all of whom were running at 600V ungrounded. It was common practice to bring in machinery rated for 480 volts, and I would be assigned the task of wiring it. I quickly discovered that there were no 600V/480V two-winding transformers commercially available. However, a 480V/120V two-winding transformer connected as an autotransformer worked very well, and saved the enormous expense and labor involved in the only alternative, two sets of two-winding transformers. Since the potential hazard in this situation consists of the equipment running at some voltage to ground greater than 480V but in this case not much more, not over 600V, and since that is well within the equipment parameters, the code making panel made a reasonable assessment and allowed it to go forward. It should continue until and unless the industry is willing to make two-winding transformers available for this duty.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
KING, D.: Section 210.9 Exception No. 2 allows for an installation practice at a reduced level of safety than what the general rule permits. The submitter of the original proposal is concerned with the absence of prescriptive requirements that ensure that a qualified person will always be present where this exception is applied. The submitter of this comment has not addressed that concern. Nor has he substantiated that an equivalent level of safety is afforded with the implementation of this exception. Panel 2 should require clear and complete prescriptive requirements for the authority having jurisdiction to follow when allowing an exception of this type to be applied.

2-64 Log #2105 NEC-P02 **Final Action: Reject**
(210.9 Exception No. 2)

Submitter: Charles M. Trout, Maron Electric Co. Inc.
Comment on Proposal No: 2-90
Recommendation: This Proposal should be Accepted.
Substantiation: This exception is a performance requirement. The NEC is a prescriptive document. The panel statement leaves the prescriptive requirements up to the authority having jurisdiction. The requirements of the Code should be expressly defined and not left up to the discretion of the AHJ.
Panel Meeting Action: Reject
Panel Statement: The exception language is specific to allow a particular arrangmenent under specified conditions of maintenance and supervision. The panel reiterates its statement that the authority having jurisdiction has the responsibility to evaluate whether persons responsible for the supervision and maintenance are qualified before permitting such installations. This is no different from determining whether the applicability of other provisions of the code use similar limitations.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
KING, D.: This Comment should have been accepted. See my explanation of negative on Comment 2-63.
Comment on Affirmative:
BROWN, L.: 1: The device installed in dwelling units to announce the presence of smoke and a possible fire situation is called a "smoke alarm". They can be ei
ther the single-station or multi-station type.
2: NEC Code Making Panel 2, nor any Panel of the NEC (NFPA 70), has jurisdiction over the installation of fire notification equipment in any occupancy of a standard developed by NFPA. That is the responsibility of the occupancy Technical Committees of NFPA 101, Life Safety Code. A proposed change of this type should be submitted to the Technical Committee on Residential Occupancies.

2-65 Log #509 NEC-P02 **Final Action: Reject**
(210.11(B))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 2-93
Recommendation: Accept the proposal revised:

Where the load is calculated on a volt/ampere per square meter or square ft basis, the wiring system up to and including the branch circuit ~~panelboard~~ overcurrent device(s) shall be provided to serve not less than the calculated load. The load shall be evenly proportioned ~~among multioutlet branch circuits in the panelboard~~ as much as practical between the ungrounded feeder and service conductors where the feeder or service conductors consist of two or more ungrounded conductors. ~~Branch circuit overcurrent devices and circuits shall only be required to serve the connected load.~~

Substantiation: Panel statement that "panelboard" is correct infers that a single individual fused switch or circuit breaker cannot supply a branch circuit. Reference to feeder and service conductors is not inappropriate since the first sentence "The wiring system up to and including the branch circuit panelboard" certainly includes any feeder or service conductors. "Connected" load is not defined; the first sentence indicates the system (including overcurrent devices) shall serve the calculated load; the last sentence only requires overcurrent devices and circuits for a connected load which infers a difference. This is a superfluous requirement since if there is a connected or calculated load to be supplied it inherently requires overcurrent devices and circuits. Requiring the load (sq ft area) to be evenly apportioned among multioutlet circuits precludes installation of a 20-ampere circuit to serve an 800 sq. ft area (2400 va) and a 15-ampere circuit from serving a 600 sq. ft area (1500 va) since the calculated load is not evenly proportioned. It also precludes a circuit supplying two or more outlets in close proximity for a limited area at a computer desk or entertainment center unless all other circuits supply an equal area (load). I don't believe the Code elsewhere requires balanced loads between branch circuits; what purpose does it serve? Balanced loads on branch circuits are not relevant. Each circuit may serve a maximum sq. ft area or less than the maximum sq ft area. Present wording requires each circuit to serve an equally proportioned load (sq ft area) which requires equal circuit ratings. Balanced loads of branch circuits are relevant to feeder and service conductors that consist of more than two conductors but not when the feeder or service is two-wire.
Panel Meeting Action: Reject
Panel Statement: The submitter is attempting to change the entire intent of the section. The objective of 210.11(B) is to make sure that the load that is calculated on a VA/sq ft basis is evenly proportioned among the branch circuits used to supply that load. The submitter is attempting to change the provision to a requirement to simply "balance the load" among the phase or line conductors. The purpose is to balance the load among the multi-outlet branch circuits that supply the VA/sq ft load.

The term "branch circuit panelboard" was included in the 1981 NEC. In the context of applying the requirement among multioutlet branch circuits, the reference to a panelboard is correct.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-66 Log #441 NEC-P02 **Final Action: Reject**
(210.11(C))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 2-101
Recommendation: Accept proposal.
Substantiation: The panel cited several code sections which are exactly the basis for the proposal. Many hair blow dryers and portable electric heaters have current (wattage) ratings that exceed 80 percent of a 15 ampere rated multiple receptacle, but are factory equipped with a 15 ampere plug and listed. Apparently, testing agencies conclude a 15 ampere receptacle is rated to carry 15 amperes.
Panel Meeting Action: Reject
Panel Statement: The panel has been clear in its statements regarding load limitations on cord caps and multioutlet branch circuits. The panel has no control over a testing agency's "conclusions." There are far more appliances in compliance with the limitations that are used in bathrooms and as such the provision to have a 15 or 20 A receptacle is acceptable.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-67 Log #1117 NEC-P02 **Final Action: Reject**
(210.11(C)(2))

Submitter: Andre R. Cartal, Princeton Borough Building Dept.
Comment on Proposal No: 2-96
Recommendation: Reconsider and accept the proposal.
Substantiation: More and more we are seeing laundry SPACES, not laundry ROOMS, these spaces are often just alcoves along a wall and the laundry appliances occupy the entire space. There is no reason torequire a 120V laundry circuit for this SPACE. If it was a ROOM as indicated on the plans the receptacle would continue to make sense.

For example, if an electric range is installed there is no NEC requirement that a 120V receptacle to be provided in the range space for a FUTURE gas range, so if the laundry equipment is the 240V type, why must we have a different rule? Let's be consistent.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The panel disagrees with the submitter that the rules are inconsistent. There is no limitation in the proposal that only a stacked washer/dryer would be used. As the occupant of the premises changes, it is common to move the laundry equipment and as such the requirement for the laundry circuit is appropriate. The comparison to a range is incorrect since the range is generally not moved from one location to another.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-68 Log #1687 NEC-P02 **Final Action: Reject**
(210.11(C)(3))

Submitter: Christopher Couillard, Rochester, NH
Comment on Proposal No: 2-102
Recommendation: Revise as follows:

Such circuits shall supply no more than two bathrooms and shall have no other outlets.

Substantiation: The comment of affirmative written by Brown, L. states that if there is a problem with overcurrent devices tripping, then the builders shall address the situation. Why do we have codes such as 230.79(C)? If this code was left up to the home builders, they could take the cheap way out and put in smaller services that would just meet requirements. With the high potential of overloading the bathroom circuit, it should not be left up to the home builder.
Panel Meeting Action: Reject
Panel Statement: The current language reflects the minimum intended requirement. The submitter expresses a concern with loading, but even two bathrooms would result in the same concern if multiple pieces of equipment were used at once. The current rules provide a balance that accomplishes the objective of reasonable capacity under the majority of circumstances.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

KING, D.: I disagree with the Panel that "the current rules provide a balance that accomplishes the objective of reasonable capacity under the majority of circumstances." Discussion held during the ROC meeting determined that the Panel has recognized that there is a problem with circuit loading in dwelling unit bathrooms. The Panel has acted to address this problem with the addition of subdivision (3) in the 1999 code to require a 20 ampere circuit for bathrooms. A better balance as is desired by the panel would be achieved by accepting this comment.

2-69 Log #804 NEC-P02 **Final Action: Reject**
(210.11(C)(4))

Submitter: John Kincaid, Systimax Solutions
Comment on Proposal No: 2-104
Recommendation: Accept this proposal in principle in part by accepting the following text:

210.11(C)(4). Communications Branch Circuits. In newly constructed one-family dwellings, other than a home covered by Article 550, with over 3000 square feet of habitable living space, at least one 15-ampere branch circuit shall be provided to supply power for communications circuits. An outlet shall be provided within 6 feet of the point of entrance or anticipated point of entrance of the optical fiber cable (Article 770) or communications cable (Article 800) cable or CATV coaxial cable (Article 820).

FPN No. 1: See 770.2 for the definition of point of entrance of optical fiber cable.

FPN No. 2: See 800.2 for the definition of point of entrance of communications cable.

FPN No. 3: See 820.2 for the definition of point of entrance of CATV coaxial cable.

Substantiation: We agree with the panel statement concerning all dwelling units. While traditional telephone services have been network-powered, many new homes are "wired" with optical fiber cable which has no provision for powering. This new service is primarily offered in new subdivisions of upscale housing.
Panel Meeting Action: Reject
Panel Statement: The panel does not agree with adding a communications circuit that will, in the majority of cases, not be applicable. If the home is being wired with optical fiber, it is up to the communications installer to ensure that appropriate power is available for the installed system.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
KING, D.: This Comment should be given further consideration by Panel 2. At a minimum the Panel should require a 15 ampere communication branch circuit to be installed within 6 feet of the entrance to a dwelling where non-network powered communication systems are installed regardless of the square footage of the structure. This could have been accomplished by accepting this Comment in Principal in Part and revising the first sentence to read as follows: 210.11(C)(4) Communications Branch Circuits. In newly constructed one-family dwellings, at least one 15-ampere branch circuit shall be provided to supply power for non-network powered communications circuits.
This minimum requirement would eliminate the use of extension cords to supply power for non-network powered Communications systems.

2-70 Log #1770 NEC-P02 **Final Action: Reject**
(210.11(C)(4))

Submitter: Robert W. Jensen, dbi
Comment on Proposal No: 2-104
Recommendation: Accept this proposal in principle in part by accepting the following text:

210.11(C)(4). Communications Branch Circuits. In newly constructed one-family dwellings, other than a home covered by Article 550, an indoor receptacle(s) on a 15-ampere dedicated branch circuit shall be provided within 6 feet of the communications point of entrance or anticipated point of entrance.

FPN No. 1: See 770.2 for the definition of point of entrance of optical fiber cable.
FPN No. 2: See 800.2 for the definition of point of entrance of communications cable.
FPN No. 3: See 820.2 for the definition of point of entrance of CATV coaxial cable.

Substantiation: This comment only affects newly constructed one-family dwelling units. Telephone systems are used for emergency services such as a call for police, fire or rescue squad. Traditional telephone services are networked powered. Today, telephone services are also delivered via coaxial systems and optical fiber systems which require local power.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 2-69. In addition, the submitter's substantiation that the systems are used for emergency services is not relevant, because the installation of the circuit does not change whether or not the system is used. If the system is going to be installed at time of construction, a circuit can be installed to power the system. If the system is installed after the home is constructed, the circuit would be installed as required at that time.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
KING, D.: See explanation of negative on Comment 2-69.

Submitter: Joe Tedesco, Boston, MA
Comment on Proposal No: 2-119
Recommendation: Continue to accept the following Proposals 2-119, 105, 142, 111, 118a, 143, 147, and 137.
Substantiation: Consumer Product Safety Commission
Preventing Home Fires: Arc Fault Circuit Interrupters (AFCIs)
Problems in home wiring, like arcing and sparking, are associated with more than 40,000 home fires each year. These fires claim over 350 lives and injure 1,400 victims annually.
A new electrical safety device for homes, called an arc fault circuit interrupter or AFCI, is expected to provide enhanced protection from fires resulting from these unsafe home wiring conditions.
Typical household fuses and circuit breakers do not respond to early arcing and sparking conditions in home wiring. By the time a fuse or circuit breaker opens a circuit to defuse these conditions, a fire may already have begun.
Several years ago, a CPSC study identified arc fault detection as a promising new technology. Since then, CPSC electrical engineers have tested the new AFCIs on the market and found these products to be effective.
Requiring AFCIs
AFCIs are already recognized for their effectiveness in preventing fires. The most recent edition of the National Electrical Code, the widely-adopted model code for electrical wiring, will require AFCIs for bedroom circuits in new residential construction, effective January 2002.
Future editions of the code, which is updated every three years, could expand coverage.
AFCIs vs. GFCIs
AFCIs should not be confused with ground fault circuit interrupters or GFCIs. The popular GFCI devices are designed to provide protection from the serious consequences of electric shock.
While both AFCIs and GFCIs are important safety devices, they have different functions. AFCIs are intended to address fire hazards; GFCIs address shock hazards. Combination devices that include both AFCI and GFCI protection in one unit will become available soon.
AFCIs can be installed in any 15 or 20-ampere branch circuit in homes today and are currently available as circuit breakers with built-in AFCI features. In the near future, other types of devices with AFCI protection will be available.
Should You Install AFCIs?
You may want to consider adding AFCI protection for both new and existing homes. Older homes with ordinary circuit breakers especially may benefit from the added protection against the arcing faults that can occur in aging wiring systems.
For more information about AFCIs, contact an electrical supply store, an electrician, or the manufacturer of the circuit breakers already installed in your home. Sometimes these components can be replaced with AFCIs in the existing electrical panel box.
Be sure to have a qualified electrician install AFCIs; do not attempt this work yourself. The installation involves working within electrical panel boxes that are usually electrically live, even with the main circuit breakers turned off.
This document is in the public domain. It may be reproduced without change in part or whole by an individual or organization without permission. If it is reproduced, however, the Commission would appreciate knowing how it is used. Write the U.S. Consumer Product Safety Commission, Office of Information and Public Affairs, 4330 East West Highway, Bethesda, MD 20814 or send an e-mail to info@cpsc.gov.
The U.S. Consumer Product Safety Commission is charged with protecting the public from unreasonable risks of serious injury or death from more than 15,000 types of consumer products under the agency's jurisdiction. Deaths, injuries and property damage from consumer product incidents cost the nation more than $700 billion annually. The CPSC is committed to protecting consumers and families from products that pose a fire, electrical, chemical, or mechanical hazard or can injure children. The CPSC's work to ensure the safety of consumer products - such as toys, cribs, power tools, cigarette lighters, and household chemicals - contributed significantly to the 30 percent decline in the rate of deaths and injuries associated with consumer products over the past 30 years.

2-72 Log #705 NEC-P02 **Final Action: Reject**
(210.12)

Submitter: Steve Campolo, Leviton Manufacturing Co., Inc.
Comment on Proposal No: 2-105
Recommendation: Panel should reject original proposal as suggested by Mr. Nenninger or set an effective date one full code cycle after commercial availability of combination type AFCI's and hold off expansion.
Substantiation: Mr. Nenninger pointed out that as of 2006, combination devices were not available. Even at this date (10/06) they are not available. The manufacturer indicated that they would be available for widespread use and evaluation long ago; yet they are not. The Panel jumped the gun on combustion AFCIs and AFCI expansion. Give the technology a chance to develop and become acceptable in the field.
Panel Meeting Action: Reject
Panel Statement: The panel action on the original proposal was based on the commercial availability of AFCI devices in January 2008. The submitter of this comment has not provided Code-Making Panel 2 with any data that would indicate that Combination Type AFCI devices will not be commercially available at that time.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
NENNINGER, B.: It is premature to expand the requirement for AFCI technology beyond the bedrooms in dwelling units. The combination type AFCI has only been commercially available since October, 2006. This said, the requirement to expand the use of AFCI's in 2008 is premature as the market

will not have sufficient experience with the newer combination type AFCI technology. It is more appropriate to leave the current code as written and gain experience with the combination type AFCI's in bedrooms only. Based on the outcome of this experience further expansion can be considered for the 2011 code.

PURVIS, R.: Comment 2-72 on Proposal 2-105 should be accepted. AFCI requirements should not be considered for expansion until the combination type AFCIs have had one code cycle of experience along with further substantiation of the need to expand AFCI requirements beyond bedrooms.

Comment on Affirmative:

BROWN, L.: Please see NAHB's Ballot Comment on Comments 2-79 and 2-95.

2-73 Log #1408 NEC-P02 **Final Action: Reject**
(210.12)

Submitter: Noel Williams, Herriman, UT
Comment on Proposal No: 2-105
Recommendation: These proposals to expand the use of an untested (in the field) type of AFCI to all areas of dwelling units should have been rejected. The panel should reconsider the Comments on Negative, especially that by Mr. Nenninger.
Substantiation: Contrary to the statement in Proposal 2-142, the type of AFCI that is being applied here does not "have an excellent track record in the field." As noted in the comment by Mr. Nenninger, these devices have barely touched the market and are not required at all until 2008. Considering the controversy that has surrounded the current AFCI requirement, extending this requirement to most outlets in dwelling units is not likely to be accepted by a large portion of the jurisdictions that adopt and enforce the NEC. This proposal would add (conservatively) at least $600 to $800 to the cost of a small home, probably much more in many cases. The likely outcome if this proposal continues to be accepted is that large numbers of jurisdictions will not adopt the 2008 NEC or they will amend this provision out. Experience with the combination-type devices is needed before their use is expanded so drastically.
Panel Meeting Action: Reject
Panel Statement: The tests in UL1699 confirm the capabilities of AFCIs for arc mitigation and resistance to unwanted tripping. The panel has been provided with information stating that combination AFCIs have been beta tested and have been made commercially available for field installation.
Number Eligible to Vote: 12

Explanation of Negative:

BROWN, L.: Please see NAHB's Ballot Comment on Comments 2-79 and 2-95.

NENNINGER, B.: See my Negative Explanation given in Comment 2-72.

PURVIS, R.: Comment 2-73 on Proposals 2-105 and 2-142 should be accepted. AFCI requirements should not be considered for expansion until the combination type AFCIs have had one code cycle of experience along with further substantiation of the need to expand AFCI requirements beyond bedrooms.

2-74 Log #1759 NEC-P02 **Final Action: Reject**
(210.12)

Submitter: Michael Cole, MRC Electric
Comment on Proposal No: 2-111
Recommendation: Add to Article 590:

Branch circuits that are rated 120 volts or 240 volts or 120/240 volts single phase 10 amperes through 30 amperes on construction sites shall be equipped with arc fault circuit interrupter protection.

Add to both Article 590 and 210.12:

Exception No. b: Oil burning heating equipment, spark ignition gas burning equipment, electrostatic air cleaners, welders, plasma cutters, and other equipment that normally or deliberately produces sparks. For dwellings, exempted branch circuits shall use the combination of metal enclosed wiring and ground fault protection for equipment in place of AFCI protection.

Exception No. c: Permanently installed heating, ventilation, and freeze protection equipment including accessories for heating, ventilation, and air conditioning equipment such as humidifiers and dampers. An indicator light that such equipment is energized shall be included in this exception. For dwellings, exempted branch circuit shall use the combination of metal enclosed wiring and ground fault protection for equipment in place of AFCI protection.

Exception No. c: Sump pumps and other equipment that is vital to protection of property. For dwellings, exempted branch circuits shall use the combination of metal enclosed wiring and ground fault protection for equipment in place of AFCI protection.

Substantiation: a. The next generation of AFCIs are supposed to be more sensitive to arcing faults but I do not see how more sensitive can be compatible with oil burners or electrostatic air cleaners. These types of appliances do not create extra fire hazard because of their sparking. I have an electrostatic air cleaner in my bedroom yet the main problem with using it when trying to sleep is that the low speed for the fan still generates too much noise.

There are also some arc welders and plasma cutters that will run on a 20-amp 120-volt circuit. I do not see how these things can be compatible with AFCI.

The combination of metal enclosed wiring and equipment ground fault protection will provide just as much or even more protection against nail penetrations. There is also NOT a way to prove that the equipment ground fault protection in an AFCI is what is really protecting against nail penetrations particularly those nail penetrations that are creating an arc that is only a few amperes.

b. I can agree with extending AFCI protection to include living rooms, dining rooms, and similar areas where cords can be trapped underneath furniture feet or trampled underfoot. At one rooming house where I lived one of the other tenants kept knocking out the power because he was parking his bar stool on top of extension cords. He was so heavy that he would crunch the hollow metal legs of his barstool right through the rubber feet and then into the extension cord.

This also requires coordination with the manufacturers of bar stools and step stools to the effect that a metal plate needs to be welded to the bottom of hollow metal legs to avoid this kind of problem.

c. Where AFCI protection is also needed is on construction sites as an additional protection against cord cuts, cord pinches, and cord crushing.

d. The cost of additional AFCI protection could bring us back to the days when an upscale suburban house had only 10 120-volt branch circuits. Fewer branch circuits results in heavier loading of each branch circuit resulting in more heat resulting in more net fire hazard. Likewise, people who have older houses could be deterred form having service upgrades and replacements done.

I recently replaced the service cable and meter socket for a single family dwelling where a previous electrician had run aluminum SEU cable from a meter socket with brass terminals to a new service panelboard. Worse, he did not use any antioxidant compound on this work. That was a fire hazard!

e. Ban 16 gauge and 14 gauge junior grade e.g., SJTW consumer grade cords. These things are junk and are a fire hazard if someone hooks up an electric heater to them. 16 gauge and 14 gauge extension cords that are oil resistant industrial grade extra hard usage would still be OK. Those people who want the extra insulation thickness and crush resistance of an SOOWA cord need to trade off some of the copper weight when taking these things up ladders and are the kind of people who know what constitutes an overload.

f. Ban the use of 15-ampere wiring to supply receptacles in dwellings. This would save on extra heat generation not to mention that a 1500-watt 120-volt electric heater is theoretically illegal on a 15-ampere branch circuit. About half the jurisdictions (cities) around where I live have banned 15-amp wiring.

g. An uninterruptible power supply nullifies AFCI protection. If we are going to connect a secondary power supply such as a UPS to a smoke alarm circuit, why even have the AFCI upstream?

h. 240-volt outlets all over the house might get to be popular. Theoretically, a 1500-watt comfort heater that is cord and plug connected can be 240 volts in a dwelling but there is no AFCI requirement. Theoretically, a fixed electric heater in a dwelling can be 277 volts!

i. Connecting a furnace or a sump pump to an AFCI could create a flood. Likewise for antifreeze tapes for water and sewer pipe. There is not a whole lot of evidence that these kind of appliances will present the kind of hazard where an AFCI would provide additional protection. The antifreeze tapes that have a grounded shield and are self regulating have an excellent safety record, particularly when equipment ground fault protection or GFCI protection for people is used. When furnaces go bad they either short circuit, stop working, or release carbon monoxide into the air. When sump pumps go bad they either short circuit or stop working. For both furnaces and sump pumps an AFCI would not provide worthwhile additional protection for the appliance.

j. Has anybody tested AFCIs for compatibility with OLD refrigerators or any other old equipment? Some of these things have a life of 40 years yet can have goofy characteristics. Old refrigerators tend to trip GFCI receptacles because among other things the motor insulation is rather cheap. There are also instances where when the starting switch of a cheap split phase motor opens the circuit inductance forces a phantom ground fault to flow through the insulation capacitance ground which trips a GFCI or AFCI. Since the motor runs fine on a standard circuit breaker the problem cannot be inrush or locked rotor current but rather the transient response during the starting sequence.
Panel Meeting Action: Reject
Panel Statement: Listed AFCI devices are evaluated for unwanted tripping per UL 1699. The submitter has not provided any substantiation that the equipment noted is incompatible with AFC's. The panel also notes that the recommended change to Article 590 is not under the jurisdiction of this panel.

BROWN, L.: Please see NAHB's Ballot Comment on Comments 2-79 and 2-95.

2-75 Log #1760 NEC-P02 **Final Action: Reject**
(210.12)

Submitter: Michael Cole, MRC Electric
Comment on Proposal No: 2-132
Recommendation: Extending AFCI protection to more branch circuits needs to be done with caution. Panelboard stuffing could create fires!

Also add to the proposal offered by Mr. John Fiorello:

Maybe this should be placed elsewhere in the NEC but here it is:

No more than 12 AFCI or GFCI circuit breakers shall be installed in a panelboard that is less than 457 mm (18 in.) wide.

Substantiation:

a. This and similar proposals could cause residential panelboards to catch on fire. The first problem is that AFCI and GFCI circuit breakers approximately double or triple the number of wires in the panelboard gutter(s). Unlike column width panelboards in factories, residential panelboards are sometimes surrounded on 1, 4, or 5 sides by thermal insulation or thermal insulation that is used for soundproofing purposes. Some residential panelboards are not surrounded by thermal insulation but have heat dissipation problems because there is a wooden door over the panelboard that restricts air circulation.

I am not trying to be a smart alec, I am just trying to point out a potential gotcha.

The reason why this has not occurred with GFCI circuit breakers is that GFCI receptacles are cheaper which limits the use of GFCI circuit breakers to instances where light switches, swimming pool pumps, and so forth need protection.

The reason why this problem has not occurred with equipment ground fault protection for roof deicing systems is that EGFP circuit breakers need to be located close to the start of the roof deicing tapes to reduce nuisance tripping. Also, in large buildings it is more effective and economical to control voltage drop by using oversized feeder wires and smaller panelboards located more frequently than to use oversized branch circuit wires.

The present generation of 14 in. wide residential panelboards needs to be investigated for heat generation and cold flow of electrical insulation when 20 or 30 AFCI circuit breakers are stuffed into a panelboard.

In the case of Seimens, AFCI circuit breakers, the circuit breaker extends a short extra distance into the wiring gutter so as to cover the neutral terminals. This is a potential installation and maintenance headache.

Even worse, Square D AFCI circuit breakers stick an extra 1.5 in. into the wiring gutter which makes an overcrowded situation worse. Sticking 4 SquareD Q0115AFI circuit breakers into a 40 slot 14 in. wide created a nightmare with one installation. This was even though the electric cooking and clothes dryer circuit went out the bottom of the panelboard that I installed and into a separate wireway which contained current transformers and current relays for demand management.

There are some solutions to this. One of them would be panelboards and circuit breakers that connect to the neutral bus without a neutral pigtail but rather with an extra jaw on the back of the circuit breaker. Besides AFCI and GFCI circuit breakers such a panelboard would be more practical for neutral switching circuit breakers that supply circuits in areas that have hazardous atmospheres.

Panel Meeting Action: Reject
Panel Statement: The submitter has not provided the panel with adequate technical data to support his recommendation. The panelboards are designed to accept a full complement of circuit breakers, including AFCI and GFCI circuit breakers without creating an overheating condition. With regard to the gutter space, the requirements of Article 312 continue to apply.

BROWN, L.: Please see NAHB's Ballot Comment on Comments 2-79 and 2-95.

2-76 Log #1761 NEC-P02 **Final Action: Reject**
(210.12)

Submitter: Michael Cole, MRC Electric
Comment on Proposal No: 2-142
Recommendation: Add to Article 240:

Arc Fault Circuit Interrupter, Ground Fault Circuit Interrupter, and Equipment Ground Fault Protection Circuit Breakers. Branch circuit breakers that provide arc fault circuit interrupter protection, GFCI protection for people, and/or equipment ground fault protection shall provide separate indication of arc fault trip and separate indication of ground fault trip from the trip indication for overloads and short circuits. The indication shall be a display of a number, illumination of different color light emitting diodes, or the number of blinks of a light emitting diode and such indication shall be standardized for all manufacturers. Such circuit breakers shall be permitted to have a universal serial bus port for uploading current and voltage data during the period immediately prior to the trip provided that such a port can only be accessed by removing the circuit breaker.

Substantiation: a. An indicator as to trip initiation for AFCI, GFCI, and EGFP (Equipment Ground Fault Protection) circuit breakers will aid troubleshooting and prove or disprove that AFCI protection is providing any useful protection. For instance, the equipment ground fault protection that is built into an AFCI is probably what is sensing and disconnecting nail penetrations particularly those nail penetrations that draw only a few amperes.

b. A suggested standardization for a numeric display or the number of blinks of a light emitting diode would be:

1. for overload trip or optionally overload or short circuit trip,
2. optionally for short circuit trip,
3. for ground fault trip that is not a short circuit,
4. for arc fault trip,
5. for short circuit level ground fault,
6. tripped by means of the test button,
7. circuit breaker needs to be replaced, and 8. and 9. reserved for future use

There is no reason why these electronic devices cannot be made just a little smarter which will help us troubleshoot electrical problems.

c. One problem that some of my buddies have encountered is that when a load is turned off or when the starting switch of a 120 volt single phase motor cuts off the starting winding, a GFCI or AFCI will nuisance trip. What causes this is that circuit inductance forces a phantom ground fault to flow through the insulation capacitance to ground. Since 120 volt single phase split phase motors are built as cheaply as possible, the windings will have more than their fair share of insulation capacitance to ground. If say 0.16 percent of the starting current of a 1/2 horsepower 120 volt split phase motor diverts into the motor frame when the starting switch opens, an AFCI will read that as a ground fault and trip. This is particularly so when motors are old and very little if any compatibility testing has been done using OLD electrical equipment.

For GFCI protection, the problem is much worse. In one instance, a fellow electrical contractor had a commercial bathroom light wired to a GFCI receptacle for extra safety and the wiring method was EMT or Type MC cable. Every once in a while when the light was turned off the GFCI receptacle would nuisance trip. Wiring capacitance that is upstream of the GFCI, particularly the neutral wire capacitance, contributes to this and certain magic circuit lengths are more troublesome. The problem is not with steady state capacitance but with transient response to ballast inductance and wiring capacitance.

d. I am also suspicious that some people play with the test button of a GFCI receptacle or even deliberately plug themselves in just to see if it will stop them from being electrocuted.

Panel Meeting Action: Reject
Panel Statement: The submitter's recommendation is a product feature that does not directly enhance performance or safety. The substantiation is also anecdotal in nature and lacks the necessary technical data to support his recommendation.

Comment on Affirmative:

BROWN, L.: Please see NAHB's Ballot Comment on Comments 2-79 and 2-95.

2-77 Log #1763 NEC-P02 **Final Action: Reject**
(210.12)

Submitter: Michael Cole, MRC Electric
Comment on Proposal No: 2-142
Recommendation: Add the following text:

Rooms that have 1 or more lighting circuits including switched and nonswitched receptacles and fixed lighting that are supplied by AFCI or GFCI devices shall have 1 or more emergency lights arranged so that failure of any circuit will activate the emergency lights. Interposing relays for 1 emergency luminaire or individual emergency luminaires shall be permitted where there are 2 or more AFCI or GFCI protected lighting circuits in a room. The luminaire shall contain or have attached to it an audible alarm. The receptacles required by 210.11(C) shall not be required to have emergency luminaires, but shall be required to have monitoring for tripping of an AFCI and/or GFCI receptacle, device, or circuit breaker. Where a burglar alarm or fire alarm system is installed, this system shall monitor all AFCI, GFCI or people protection, and ground fault protection for equipment for tripping of such protective devices and shall be permitted to serve as the power failure alarm.

Substantiation:

a. We are forgetting that when an AFCI or GFCI trips, people might need to be evacuated and there needs to be egress lighting. An AFCI trips in response to a possible spark which means that a fire could still be starting - the AFCI only removes an accelerant. An AFCI does NOT prevent a fire, it just prevents the fire from growing. Similarly, a GFCI does not stop you from getting shocked, it only stops the shock from killing.

Therefore, emergency lighting and a power failure alarm is needed for each AFCI protected circuit. This should also be linked into fire alarm and burglar alarm systems. Without a power failure alarm, a small spark could trip an AFCI and start a small fire. Waiting for the fire to get bigger for an alarm to ring is a bit asinine.

b. Something can be said in favor of installing a REAL fire alarm system instead of Mickey Mousing things with 120 volt smoke alarms. These systems can also be combination fire alarm, burglar alarm, furnace failure, flooding, refrigeration failure, and power failure systems.

Panel Meeting Action: Reject

Panel Statement: NFPA 70 does not contain requirements for emergency egress lighting. NFPA 101 addresses emergency egress lighting.

PURVIS, R.: Comment 2-78 on Proposal 2-105 should be accepted. AFCI requirements should not be considered for expansion until the combination type AFCIs have had one code cycle of experience along with further substantiation of the need to expand AFCI requirements beyond bedrooms.

2-79 Log #1998 NEC-P02 **Final Action: Reject (210.12)**

Submitter: Lawrence Brown, National Association of Home Builders (NAHB)

Comment on Proposal No: 2-105

Recommendation: Reject the proposal.

Substantiation: Let's get to the bottom line on this matter - There is absolutely no fire data that can be used to support the expansion of AFCIs to all receptacles, let alone the mandatory installation of AFCIs in bedrooms.

Looking at the latest data from NFPA in the report "The U.S. Home Product Report (Appliances and Equipment Involved in Fires)", by John R. Hall, Jr., of the Fire Analysis and Research Division of NFPA dated November 2005, the report shows that the annual average number of home fires is 372,900, with direct property damage of $443,000.000. Of this number 32,000 (or 9% = $39,870,000) of these fires are caused by "electrical distribution equipment." Of that 9%, only 14,500 (or 4% = $17,720,000) of those fires are attributed to "fixed wiring, switches, outlets, and receptacles." And, there is no data or study to support that of these 14,500 fires and the installation of an AFCI device would have prevented the fire.

Using the U.S. Census Bureau data on building permits for 2004 (Table (S-3) Final) shows 1,656,413 one- and two-family dwelling units and 413,664 multifamily units for that year.

There are typically 20 (twenty) 20-volt, single phase, 15- and 20-ampere branch circuits in each one- and two-family dwelling unit, and 10 in each multifamily dwelling unit. Using these numbers, there will be 33,128,260 AFCIs in OTFDs and 4,136,640 for multifamily units, for a total of 37,264,900 AFCIs.

Using a wholesale cost of $34.00 per breaker, marked-up the industry standard percentage of 66 percent, produces a cost per breaker of $56.44 to the homeowner.

In all, the average annual total cost to the public for the mandatory installation of AFCIs will be $2,103,230.956 ($1,267,006,600 wholesale). That is 2 BILLION, 130 MILLION, 230 THOUSAND AND 956 DOLLARS.

Using current fire loss data, society will be spending $2,103,230.956 per year to cover losses of only $39,870,000. That means spending 52 times the amount of money that would be lost if the devices were not installed and that is if the devices work 100% of the time. If you use the losses relating only to "fixed wiring, switches, outlets, and receptacles" (the part of the wiring that is claimed to be protected by AFCI breakers) the ratio to money spent relative to monetary loss ($17,720,000) is 119 times, again, if they work 100% of the time.

In addition to the submitter's substantiation, there is no data to support the contention of a neither "excellent track record", nor information that these "installations have found numerous wiring errors" or "they have found wiring damage and equipment damage that could have been a potential source of fire". That statement alone provides no correlation between the purported problems and the use of AFCIs.

It should also be noted that it appears the method used to certify these devices actually only tests to make sure the device will not cause an electrical shock or fire problem. IT DOES NOT TEST THE DEVICE TO ENSURE IT WILL PREVENT A FIRE CAUSED BY THE MANY SITUATIONS OF ELECTRICAL ARCING THAT COULD CAUSE A FIRE.

IN OTHER WORDS, NO ONE CAN PROVE THESE DEVICES WILL HAVE ANY COST-BENEFIT TO SOCIETY.

The Panel needs to reconsider the mandatory installation of AFCIs, let alone the expansion of requiring these devices for all 120-volt, single phase, 15- and 20-ampere branch circuits in dwelling units. Until true field test data on the efficacy of AFCIs can be directly related to saving society monetary loss there is no cost-benefit in this provision.

Panel Meeting Action: Reject

Panel Statement: The cost benefit analysis included in the submitter's substantiation does not include the benefit of lives saved due to AFCI devices ability to reduce the number of electrically oriented fires. Comparable studies presented to Panel 2 over several code cycles show a positive cost benefit with the use of these devices. The panel disagrees with the submitter of this comment that there are no fire data available to support the requirement for AFCI devices in dwelling units. The portion of the substantiation regarding certification of AFCIs is incorrect, since UL1699, standard for Arc Fault Circuit Interrupters, includes arc detection test sequence.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 9 Negative: 3

Explanation of Negative:

BROWN, L.: The Panel's Action to not require AFCI protection only for the receptacles that typically require GFCI protection is backtracking from the Panel Actions and Statements shown in the Report on Proposals (ROP). If they felt the entire house should be protected what relevant fire data changed their minds? Please read NAHB's Ballot Comment 2-95. Calling this a "limited approach to the expansion of AFCI" still results in no cost-benefit for society, it just needlessly increases the costs of housing. No jurisdiction should burden its citizens with this unneeded expense. There was never any fire study or cost-benefit study to support installing these devices only for bedrooms in the 1999 NEC. Since then NO data or study has ever been assembled to support the expansion to the whole house. The fact still remains that home buyers in the U.S. will spend approximately 2 BILLION, 130 MILLION, 230 THOUSAND, and 956 DOLLARS per year to cover losses of only $17,720,000. That is a ratio of 119 times the money spent relative to the monetary loss of $17,720,000. And, that is if the devices work 100 percent of the time. If you break that down by each state, that lack of a cost-benefit becomes apparently clear. All jurisdictions that contemplate adopting the 2008 NEC, especially those jurisdiction that by law must show a cost-benefit in the adoption, should look closely at this cost-benefit fact and not adopt the 2008 NEC until all provisions requiring AFCIs is stricken (Section 210.12).

NENNINGER, B.: See my Negative Explanation given in Comment 2-72.

PURVIS, R.: Comment 2-79 on Proposal 2-105 should be accepted. AFCI requirements should not be considered for expansion until the combination type AFCIs have had one code cycle of experience along with further substantiation of the need to expand AFCI requirements beyond bedrooms.

2-84 Log #2131 NEC-P02 **Final Action: Reject**
(210.12)

Submitter: Keith Wallace, SE & D Electric
Comment on Proposal No: 2-157
Recommendation: Revise text to read as follows:
Arc fault protection on every general purpose branch circuit.
Substantiation: I feel this is a bad idea because of nuisance tripping. I fe el this would happen frequently due equipment that requires ballast home entertainment, etc.
Panel Meeting Action: Reject
Panel Statement: The submitter's intent is not clear. The proposal referenced deals with the use of smoke detectors on AFCI protected circuits. The recommendation is to provide AFCI on every branch circuit and the substantiation implies there is a concern with having AFCIs on all branch circuits due to nuisance tripping. The submitter of this comment has not provided Panel 2 with any technical data that would indicate that there is a compatibility issue with listed AFCI devices and listed electrical equipment.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
BROWN, L.: Please see NAHB's Ballot Comment on Comments 2-79 and 2-95.

2-85 Log #2153 NEC-P02 **Final Action: Accept in Principle in Part**
(210.12)

Submitter: Chris Simpson, Sensata Technologies
Comment on Proposal No: 2-105
Recommendation: The Code Making Panel should continue to "Accept in Principle in Part" this revised text. We agree with the code making panel's decision to reject the deletion of "combination type" devices.
Substantiation: Combination type AFCI technology is available from Sensata Technologies and we are pursuing UL listing for the circuit breaker application before the end of 2006. Sensata has brought this technology to market in the form of a plug cap for the RAC application in 2004. We're entering field trials with our combination type product for the circuit breaker application in November 2006 and will be making commercial shipments in early 3Q07.
Panel Meeting Action: Accept in Principle in Part
The panel is accepting a portion of the proposal that expands the requirement for AFCIs in a more limited fashion. The panel is not accepting the expansion to all 15- and 20-ampere branch circuits.
Panel Statement: See panel action and statement on Comment 2-95.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
BROWN, L.: Please see NAHB's Ballot Comment on Comments 2-79 and 2-95.

PURVIS, R.: Comment 2-85 should be rejected. Even this "limited" expansion should be reevaluated the next code cycle after additional field experience with the new combination type AFCI is available for review along with further substantiation of the need to expand AFCI requirements beyond bedrooms.
Comment on Affirmative:
KING, D.: See my Affirmative with Comment on Comment 2-95.

2-86 Log #2219 NEC-P02 **Final Action: Reject**
(210.12)

Submitter: Richard W. Becker, Engineered Electrical Systems, Inc.
Comment on Proposal No: 2-113
Recommendation: Delete this section.
Substantiation: The panel statement claims documentation that supports the panel's position; the documentation referenced does not distinguish between "arcing" and "joule heating". As a result, there is no compelling basis for this device.
Panel Meeting Action: Reject
Panel Statement: The panel has concluded that arcing faults contribute significantly to electrical fires. The submitter has not provided adequate substantiation to support his position that arcing is not a substantial cause of electrical fires.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
BECKER, R.: The panel conclusion that arcing faults contribute signifcantly to electrical fires is not supported by the susbstantiation that has been submitted to and on file at NFPA.

BROWN, L.: Please see NAHB's Ballot Comment on Comments 2-79 and 2-95.

2-87 Log #2333 NEC-P02 **Final Action: Accept in Principle in Part**
(210.12)

Submitter: Alan Manche, Square D Company
Comment on Proposal No: 2-142
Recommendation: Continue to Accept the Proposal.
Substantiation: We continue to support expanding AFCI protection to all 125V, 15 and 20A circuits. The action taken by the panel is clearly understood and has been expected by the industry. Square D introduced a Listed Combination AFCI circuit breaker for sale on October 1, 2006, well over a year in advance of the present NEC requirement for Combination AFCI on January 1, 2008. Our Combination AFCIs have thousands of hours of successful field experience and many thousands more in laboratory testing of various loads.

The panel should continue to support protection of the entire branch circuit. We have investigated multiple home fires that originated in a homerun. Compromising AFCI protection on the homerun is as fundamental as forgoing overload or short circuit protection on that branch circuit.

I would like to share a personal story with regard to AFCI protection for those that remain skeptical of the benefit. I moved into a new construction home in February 2004 that had AFCI protection in accordance with NEC on the bedroom circuits. Shortly after occupancy, the AFCI tripped in my daughter's bedroom. After a short investigation, I found a can light where the wire insulation had been compromised within the can itself. A couple of weeks later and the AFCI tripped in the master bedroom, once again, the AFCI found a recessed light where the wire insulation had been compromised within the can itself. Concerned with the can lights at this point, I reviewed all 31 recessed lights in my new house and found one more with a similar wire insulation issue. There are numerous stories similar to this one where a standard overcurrent device would have permitted a potential fire ignition source to persist. Beyond a shadow of a doubt, AFCIs are finding issues in the electrical system that are potential ignition sources.

2-273 Log #1762 NEC-P02 **Final Action: Reject**
(210.12 and Article 240 (New))

Submitter: Michael Cole, MRC Electric
Comment on Proposal No: 2-142
Recommendation: Add the following text to 300.4(A):

Wiring shall not be installed in exterior wood frame walls until after installation of exterior building finish. This requirement shall apply to nonflexible steel raceways as well as any other wiring methods and shall apply regardless of wiring spacing from exterior building finish.

Substantiation: a. One of the sources of nail penetrations is that alleged carpenters like to use framing nail guns to install sheathing and siding. This is so that they only have to own and maintain 1 nail gun. Worse, these people sometimes miss the 2x4s or 2x6s with the result that a conventional antinailing plate does NOT work as advertised.

Also, nail guns can drive a framing nail into steel EMT. Somebody I know told me that when he was working as an electrician for his dad in Canada somebody else drove a big nail right through EMT when putting up the drywall. This incident occurred BEFORE nail guns.

I can actually be glad that one of my customers had to wait a year in order to be able to afford to have me install nonmetallic sheathed cable in a commercial wood framed room.
Panel Meeting Action: Reject
Panel Statement: The submitter's recommendation does not correspond to the original proposal number. Additionally, it is not the intent of the code to attempt to control the sequence of construction.
Number Eligible to Vote: 12

2-88 Log #1764 NEC-P02 **Final Action: Reject**
(210.12 Exception (New))

Submitter: Michael Cole, MRC Electric
Comment on Proposal No: 2-142
Recommendation: Add an Exception to read as follows:

Exception No. a: Where an automatic fire suppression system e.g., sprinkler system is installed in all habitable rooms including rooms finishable for future use and a fire alarm system is installed rooms that are not bedrooms shall be permitted to not have AFCI protection. If the fire suppression system uses water there shall be a locking receptacle with pilot light and without AFCI or GFCI protection for the purpose of supplying a dry pipe air compressor. A fire extinguishing agent that displaces oxygen shall not be used.

Substantiation: a. Arguably, a homeowner will get more antibang for the buck from a fire suppressive sprinkler system. CHILDREN playing with matches as well as careless smokers cause more fires than electrical systems. Simply put, sprinkler systems will save more lives than expanded AFCI requirements will.

I also know someone who died while smoking and subsequently burned down her house. That was not the way to save on cremation and burial expenses! A sprinkler system protects against this kind of hazard and AFCI just does not provide any protection.

The sprinkler system interests have spent a kajillion dollars on low water consumption sprinkler heads for residential use on typical residential water services and water wells. Some of these sprinkler heads shut themselves off after the fire goes out. There have also been some experiments with sprinkler system construction using plastic pipe to lower construction costs.

I am just trying to point out that a different set of gadgetry will provide more protection.

b. The cost of additional AFCI protection could bring us back to the days when an upscale suburban house had only 10 120-volt branch circuits. Fewer branch circuits results in heavier loading of each branch circuit resulting in more heat resulting in more net fire hazard. Likewise, people who have older houses could be deterred from having service upgrades and replacements done.

I recently replaced the service cable and meter socket for a single family dwelling where a previous electrician had run aluminum SEU cable from a meter socket with brass terminals to a new service panelboard. Worse, he did not use any antioxidant compound on this work. That was a fire hazard! And, AFCIs would do nothing to stop this kind of electrical hazard.

c. In proposal 2-154 (Log #1721) NEC-P02, Mr. Michael McQuade quotes the Consumer Product Safety Commission estimate of 890,000 unreported home electrical fires as being even more concerning. This is a misleading and self defeating argument in 2 ways. First, this number was derived from the precision engineering formula G=U-E+SxS. Second, electrical fires go unreported precisely because a conventional stopped the fire. This statement on the part of the Consumer Product Safety Commission works against increased AFCI protection.

d. What is hard to distinguish in this debate is the problem that Federal Pacific, Wadsworth, and Zinsco (including the Zinsco clones made by Sylvania) alleged circuit breakers develop arthritis after a few years and provide essentially ZERO overcurrent protection. Dr. Jesse Aronstein is one of the people who has investigated this problem and has some documents onhis website at www.inspect-ny.com. The argument by Consumer Product Safety Commission that AFCIs will provide greater protection does NOT state how many fires were caused by conventional circuit breakers that refuse to work correctly after a few years. That is, AFCI protection seems to be overkill for a problem that would be correctly solved by installing newer and better thermal magnetic circuit breakers.

My experience with Federal Pacific circuit breakers is that turning off the circuit breaker and then turning it back on restores normal operation for a while. Then, the customer discovers that they have 30 or 35 amperes of load on a 20 ampere circuit. Even SquareD, which is the best in the business, recommends exercising circuit breakers once per year.
Panel Meeting Action: Reject
Panel Statement: Panel 2 recognizes that all fires that occur in dwelling units are not the result of electrical arcing and supports the use of fire suppression systems to extinguish these fires. The benefit of AFCI protection is that arcing faults are mitigated before surrounding combustible surfaces can be ignited, thus saving many lives and the costs associated with property damage due to electrically oriented fires.

2-89 Log #18 NEC-P02 **Final Action: Accept**
(210.12(A))

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 2-119
Recommendation: The Technical Correlating Committee understands that the Panel Action on this Proposal modifies the Panel Action on Proposal 2-105.

The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal to revise the definition to comply with 2.2.2 of the NEC Style Manual by deleting the term within the definition.

This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept

Revise the definition to read as follows:

"Arc-Fault Circuit Interrupter (AFCI): A device intended to provide protection from the effects of arc faults by recognizing characteristics unique to arcing and by functioning to de-energize the circuit when an arc fault is detected."
Panel Statement: The panel action satisfies the directive of the Technical Correlating Committee.
Number Eligible to Vote: 12

BROWN, L.: Please see NAHB's Ballot Comment on Comments 2-79 and 2-95.

2-91 Log #912 NEC-P02 **Final Action: Reject**
(210.12(A) and 210.12(B))

Submitter: Aaron B. Chase, Leviton Mfg. Co. Inc.
Comment on Proposal No: 2-105
Recommendation: I agree with the Panel's action in 210.12(A), but strongly disagree with the deletion of the word "bedrooms" in 210.12(B).

The Panel should reject Proposal 2-105.
Substantiation: In support of my comment to reject the expansion of combination AFCIs to all dwelling unit circuits is the fact that as of October 13, 2006 there are no commercially available units. With no real world experience on any circuit, it would not be prudent to jump forward from no circuits to all dwelling unit circuits.

I concur with Mr. Nenninger's negative vote and comments and concerns that he supplied which state as follows:

"The proposal should be rejected at this time, and the installation of AFCI should be limited to bedrooms only. The use of combination type AFCIs will be a requirement in 2008. However, they will not be commercially available until the summer of 2006. The requirement to expand an AFCI product beyond bedrooms to all dwelling unit locations in 2008 is premature as the market will not have sufficient experience with the newer combination type AFCI technology. It is more important to leave the current code as written and gain experience with the combination type in bedrooms only. Based on the outcome of this experience, further expansion can be considered for the 2011 code".

Mr. Nenninger's concerns are only amplified by the fact that the summer of 2006 has come and gone without these products being made commercially available.

As a representative of a large manufacturer of products used in the infrastructure, I am extremely concerned over how these devices will react with our products as well as the multitude of loads that can be found on any given branch circuit.

This is not like a case of expanding a known technology that has "X" number of units out in the field operating for "Y" number of hours. This is not expansion, but unknown introduction. This is a tremendous leap of faith to go from zero units to what could possibly be at least twenty, thirty, forty million, or more units **annually!**

I, again, implore the panel to please reconsider the expansion until we have some sound proven technical data.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Comment 2-72.

Explanation of Negative:

BROWN, L.: Please see NAHB's Ballot Comment on Comments 2-79 and 2-95.

NENNINGER, B.: See my Negative Explanation given in Comment 2-72.

PURVIS, R.: Comment 2-91 on Proposal 2-105 should be accepted. AFCI requirements should not be considered for expansion until the combination type AFCIs have had one code cycle of experience along with further substantiation of the need to expand AFCI requirements beyond bedrooms.

2-92 Log #398 NEC-P02 **Final Action: Reject**
(210.12(B))

Submitter: Greg Fretwell, Blue Light Inspection Services
Comment on Proposal No: 2-142
Recommendation: Reject the proposal entirely.
Substantiation: In addition to the remarks of Mr. Weber, Mr. Purvis, Mr. Brown and Mr. Becker, I also question the thermal implications of adding 20 AFCI breakers to a panel that can be in an unair-conditioned space which may have ambients in the 35-38c range. The addition of 20 AFCI breakers could easily take the panel out of the 40c range that the breakers are rated for. If nothing else, this could shorten the life of the electronics in the AFCI breakers and it could also cause problems with the trip range of the standard breakers.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any technical data to support his substantiation. The problem outlined in the substantiation is a product design issue and needs to be addressed through the applicable product standards.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 3
Explanation of Negative:

BROWN, L.: Please see NAHB's Ballot Comment on Comments 2-79 and 2-95.

NENNINGER, B.: See my Negative Explanation given in Comment 2-72.

PURVIS, R.: Comment 2-92 on Proposal 2-142 should be accepted. AFCI requirements should not be considered for expansion until the combination type AFCIs have had one code cycle of experience along with further substantiation of the need to expand AFCI requirements beyond bedrooms.

2-93 Log #534 NEC-P02 **Final Action: Reject**
(210.12(B))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 2-128
Recommendation: Accept as revised:

Add: "and dormitory" after "dwelling unit" in the text and heading.
Substantiation: Bedrooms in dormitories in colleges, penal institutions, recreational camps, etc. should merit AFCI protection. If without permanent provisions for cooking they are not dwelling units, per definition.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided substantiation to support the expansion of AFCI devices to dormitories.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

KING, D.: The discussion at the ROC meeting concluded that the use of the term dormitories is too broad and would implement a requirement that is impractical in certain applications. The intent of this comment is to provide AFCI Protection in occupancies that are similar to dwelling units. The same hazards from the use of electricity exists in dormitories that exist in dwelling units and in many incidences the hazards are compounded by the number of occupants required to share the same room. The Panel should have accepted this Comment in Principal and revised the submitter's recommended text to read as follows:
"and in dormitories in colleges, penal institutions, recreational camps, etc." after "dwelling unit" in the text and heading.

The revised text would add clarity as to where and when AFCI protection would be required in dormitories along with satisfying the submitter's intent.
Comment on Affirmative:
BROWN, L.: Please see NAHB's Ballot Comment on Comments 2-79 and 2-95.

2-94 Log #697 NEC-P02 **Final Action: Reject**
(210.12(B))

Submitter: Steve Campolo, Leviton Manufacturing Co., Inc.
Comment on Proposal No: 2-134
Recommendation: Panel 2 should have accepted the original proposal. Availability is an issue. How can I substitute a negative (none available)?
Substantiation: As of today (10/4/06) No combination type AFCIs are available at New York Electrical Supply houses in my area. Panel 2 was assured that these devices would be available for wide field and pre testing. They are not. Postponing all expansion and combination types for at least one more cycle (2 yrs) is not an option.
Panel Meeting Action: Reject

2-95 Log #757 NEC-P02 **Final Action: Accept in Principle**
(210.12(B))

Submitter: Jack Wells, Pass & Seymour/Legrand
Comment on Proposal No: 2-142
Recommendation: The Panel should accept in principle and revise 210.12(B) as follows:
(B) Dwelling Units. All 120-volt, single phase, 15- and 20-ampere branch circuits ~~supplying outlets~~ installed in dwelling unit bedrooms, family rooms, living rooms, parlors, libraries, dens, sun rooms, recreation rooms or similar rooms shall be protected by a listed arc-fault circuit interrupter, combination type installed to provide protection of the branch circuit. ~~Branch/feeder AFCIs shall be permitted to be used to meet the requirements of 210.12(B) until January 1, 2008.~~
Substantiation: Accepting Proposal 2-142 made two significant changes in the requirements for the installation of AFCIs. 210.12(B) will now require:
- AFCI protection for all branch circuits in dwelling units instead of only bedroom branch circuits
- Combination AFCIs are to provide this protection instead of branch/feeder AFCIs

Based on the requirements in the UL1699, the standard for AFCIs, and information provided to the panel during previous code cycles, it is apparent that the panel made the appropriate decision to require combination AFCIs as the means of protection for branch circuits. Combination AFCIs provide protection that is superior to branch/feeder AFCIs by detecting both series and parallel arcs. There should be little debate that the superior means of protection should be mandated by the code.
The panel made the correct decision in the 2005 NEC by first requiring the "combination type" AFCI before expanding the requirements. It should not waver from this decision.
However, accepting this proposal couples the introduction of Combination AFCI technology that has little or not field history with the expansion of AFCI protection to a significantly greater number of branch circuits.
The current requirement for AFCI protection of bedroom branch circuits most likely involves 3, 4, or 5 branch circuits in a typical dwelling unit. The acceptance of this proposal may increase the number of circuits requiring AFCI protection to upwards of 30 branch circuits in a dwelling unit. Many of these additional branch circuits will be used with equipment that is not found in bedrooms. This may introduce an additional element of nuisance tripping due to the unknown affect of these products on the operation of the relatively new technology of the Combination AFCI which has not been exposed to these conditions in the field. This is especially true in locations such as kitchens, garages, and outdoors where many different appliances and electric tools are used.
Accepting this proposal seems to be a departure from the code Panel's previously well justified approach of limiting the expansion of the AFCI requirement until there is sufficient information available for the panel to determine that such an expansion is adequately supported by data. The substantiation for the proposal states that AFCIs have an excellent track record in the field. This may be true for Branch/feeder AFCIs but there is no substantiation provided to indicate that this same track record has been established for Combination AFCIs. It will take time to develop the same data for Combination AFCIs that supported the Panel's consideration for expansion of the Branch/feeder AFCI requirements.
We believe "combination type" AFCIs can be made that will function satisfactorily on a branch circuit without excessive nuisance tripping. However, we believe it is prudent to be cautious and permit "combination technology" to be introduced gradually.
Accepting the proposal to require Combination AFCIs is an important first step in providing the best arc fault protection that current technology has to offer. However, the Combination AFCI should be given the opportunity to develop a field proven track record before expansion to all branch circuits is accepted. Accepting this comment will allow a significant but limited expansion of AFCIs which will allow such a field track record to be developed for the Combination AFCI.
Panel Meeting Action: Accept in Principle
The panel revised the wording in the recommendation of the comment to read as follows:
"(B) Dwelling Units. All 120-volt, single-phase, 15- and 20-ampere branch circuits supplying outlets installed in dwelling unit family rooms, dining rooms, living rooms, parlors, libraries, dens, bedrooms, sun rooms, recreation rooms, closets, hallways, or similar rooms or areas shall be protected by a listed arc-fault circuit interrupter, combination-type, installed to provide protection of the branch circuit."
Panel Statement: The panel accepts the submitter's concept of a more limited approach to the expansion of AFCI. The panel has used language that is arranged in a manner that parallels the language in 210.52(A) and has also included hallways and closets to address previous proposals about those areas. The panel did not accept the submitter's deletion of the words "supplying outlets," because it would introduce confusion regarding branch circuits that passed through these areas but did not supply any outlets in the area.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 8 Negative: 4
Explanation of Negative:
BECKER, R.: Expansion of AFCI protection is not supported by the substantiation that has been submitted to and that is on file at NFPA.
BROWN, L.: The Panel's Action to not require AFCI protection only for the receptacles that typically require GFCI protection is backtracking from the Panel's Actions and Statements shown in the Report on Proposals (ROP). If they felt the entire house should be protected what relevant fire data changed their minds? Please read NAHB's Comment 2-79. Calling this a "limited approach to the expansion of AFCI" still results in no cost-benefit for society, it just needlessly increases the costs of housing. No jurisdiction should burden its citizens with this unneeded expense. There was never any fire study or cost-benefit study to support installing these devices only for bedrooms in the 1999 NEC. Since then NO data or study has ever been assembled to support the expansion to the whole house. The fact still remains that home buyers in the U. S. will spend approximately 2 BILLION, 130 MILLION, 230 THOUSAND, and 956 DOLLARS per year to cover losses of only $17,720,000. That is a ratio of 119 times the money spent relative to the monetary loss of $17,720,000.
And, that is if the devices work 100 percent of the time. If you break that down by each state, that lack of a cost-benefit becomes apparently clear. All jurisdictions that contemplate adopting the 2008 NEC, especially those jurisdiction that by law must show a cost-benefit in the adoption, are encouraged to look closely at this cost-benefit fact and not adopt the 2008 NEC until all provisions requiring AFCIs is stricken (Section 210.12).
NENNINGER, B.: See my Negative Explanation given in Comment 2-72.
PURVIS, R.: Comment 2-95 should be rejected. Even this "limited" expansion should be reevaluated the next code cycle after additional field experience with the new combination type AFCI is available for review along with further substantiation of the need to expand AFCI requirements beyond bedrooms.
Comment on Affirmative:
KING, D.: I commend Panel 2 on their decision to expand the requirement for AFCI protection to a significantly larger portion of dwelling units. Although I still support expansion of this requirement to the entire dwelling unit as originally proposed, I recognize the value and benefit of a larger Panel consensus in advancing this life saving technology both today and in the future. I am confident that future field data will continue to reflect the reliability and life saving benefit of these devices.

2-96 Log #893 NEC-P02 **Final Action: Accept in Principle in Part**
(210.12(B))

Submitter: Michael P. O'Quinn, MOGO Enterprises, Inc.
Comment on Proposal No: 2-126
Recommendation: Revise as follows:
(B) Dwelling Unit Bedrooms. All 120-volt, single phase, 15- and 20-ampere branch circuits supplying outlets installed in dwelling unit bedrooms shall be protected by a listed arc-fault circuit interrupter in accordance with 210.12(B)(1), (B)(2), or (B)(3) ~~combination type installed to provide protection of the branch circuit.~~

~~Branch/feeder AFCIs shall be permitted to be used to meet the requirements of 210.12(B) until January 1, 2008.~~

FPN: For information on types of arc-fault circuit interrupters, see UL 1699-1999, Standard for Arc-Fault Circuit Interrupters.

(1) For outlets installed using noncombustible construction methods and employing metallic raceways or metal-sheathed cab arc-fault protection shall only be required to protect appliances or equipment connected to the outlet.

FPN: For a listing of construction type, see Annex E.

(2) For outlets not covered in 210.12(B)(1), arc-fault protection shall be of the combination type provided to protect the entire circuit.

Substantiation: As Mr. Becker stated in his Explanation of Negative, there is no substantiation of combustion risk when wiring is enclosed in metallic raceways or metal-sheath cable. Even though no technical data was provided with the proposal, consider the following:

A. 250.118 allows the use of metallic raceways, with some limitations, to be used as an equipment grounding conductor providing an "effective ground-fault current path". If arcing occurs within the metal raceway or metal-jacketed cable, the low impedance path of the raceway or cable will facilitate the opening of the overcurrent device to de-energize the circuit, complying with 110.10 and 250.4(A)(5).

B. 310.15(A)(2) Exception allows the use of the higher of two different ambient temperature-based ampacities for a conductor when the higher temperature is a small portion of the circuit length (just as an arc-fault) because of the dissipation of heat through the metallic raceway or conductor.

This means the use of metallic-based products (metal raceways or metallic-sheathed cables) acts as a heat sink, similar to the cooling effect metal enclosures afford, dissipating any heat connected to an arc-fault until the overcurrent device trips.

C. If the metal raceway or metallic-sheathed cable is installed in noncombustible walls, there is nothing to burn/cause a fire during the time the arc-fault occurs until the overcurrent device trips under "A" above.

This proposal does focus on the major cause of arc-fires - those caused by supply cords and equipment failure - by requiring arc-fault protection for cords and equipment regardless of the raceway/cable or wall construction. This could be in the form of the presently required combination-type AFCI device (UL AWAH), or the outlet type (UL AWBZ or AWZGC)!

Panel Meeting Action: Accept in Principle in Part

The panel rejects the submitter's proposed deletion of "combination type AFCIs" in item (1) and accepts in principle the use of metal raceways for physical protection to the first outlet device.

Panel Statement: The submitter has not provided any substantiation to support his recommendation to delete the requirement for combination-type devices. Metal raceways are acceptable independent of the type of construction. The remainder of the recommendation is addressed with the panel action on Comment 2-129. See panel action and statement on Comment 2-129.

BROWN, L.: Please see NAHB's Ballot Comment on Comments 2-79 and 2-95.

2-97 Log #894 NEC-P02 **Final Action: Reject (210.12(B))**

Submitter: Michael P. O'Quinn, MOGO Enterprises, Inc.

Comment on Proposal No: 2-142

Recommendation: Reject proposal and reinstate previous wording.

Substantiation: Expansion of the arc-fault circuit-interrupter protection to all 125-volt, 15- and 20-ampere outlets in a dwelling should be rejected at this time due to several reasons:

A. As Mr. Nenninger pointed out in his Explanation of Negative on Proposal 2-105, combination-type AFCI devices will not be commercially available until later this year and no data is available to recognize its practical use. It would be wise to use studies conducted after these new types of devices have been installed to determine expansion of the AFCI technology.

B. As Mr. Becker points out in his Explanation of Negative on Proposal 2-142, there is no data on the field performance of these devices - whether they actually prevented arc-fault initiated fires. Test data in a laboratory and actual performance in the field can be (and actually is) quite different. Expansion of untested technology is not prudent.

C. It would appear the provisions of 300.4 "Protection Against Physical Damage" would sufficiently protect dwelling wiring installations from arc-faults in the wiring from the panelboard to the outlet(s). Add to that 334.15(B) "Protection From Physical Damage" and 334.15(C) "In Unfinished Basements" and it would seem any dwelling installation following these requirements could have arc-faults originating only from appliance cords or the appliances themselves. This would then be best protected by either AFCI devices at the receptacle location (UL AWBZ or AWCG), or product standards requiring the installation of AFCI protection within the last 12 inches of the supply cord.

D. The only proven benefit, according to field data, of AFCI devices (Branch/Feeder type) is the ability to detect wiring errors, such as loose connections. This seems a costly requirement to detect violations of 110.12 and 110.10.

F. In the NFPA report, "The U.S. Home Product Report (Appliances and Equipment Involved in Fires)", there is no breakdown of the number or percentage of fires based on the age of the dwelling. It would be expected that a greater number of these fires reported were involved with older dwellings - those without the benefit of increased wiring safety afforded by new code requirements in Articles 300 and 334. At the present time, there is no enforcement of newer wiring requirements on existing dwellings unless a municipal permit is taken out, leaving the most possible source of branch-circuit wiring unprotected against arc-faults.

Panel Meeting Action: Reject

Panel Statement: The submitter's concept that it must be proven how many fires were "not started" is an attempt to prove a negative. The fact that a fire did not occur is not reported. However, there has been extensive review of data and studies associated with AFCI, and the panel supports their continued use as well as expansion. See the panel statement on Comment 2-72, which addresses the submitter's concerns about the availability of these devices.

Number Eligible to Vote: 12

Explanation of Negative:

BROWN, L.: Please see NAHB's Ballot Comment on Comments 2-79 and 2-95.

NENNINGER, B.: See my Negative Explanation given in Comment 2-72.

PURVIS, R.: Comment 2-97on Proposal 2-142 should be accepted. AFCI requirements should not be considered for expansion until the combination type AFCIs have had one code cycle of experience along with further substantiation of the need to expand AFCI requirements beyond bedrooms.

2-98 Log #910 NEC-P02 **Final Action: Reject (210.12(B))**

Submitter: Aaron B. Chase, Leviton Mfg. Co. Inc.

Comment on Proposal No: 2-142

Recommendation: I strongly disagree with the Panel's acceptance of the modifications proposed by the submitter. I would recommend reinstating the words "supplying outlets" and "bedrooms". I do support the deletion of the reference to branch feeder AFCIs.

Reject Proposal 2-142.

Substantiation: Proposal 2-142 should be rejected based on the lack of availability of the combination type devices. In essence, the submitter of Proposal 2-142 has recommended that the panel so called "expand" the use of a technology which has no field history and at the time of writing this comment (October 16, 2006) the product cannot be found for sale in the market. This proposal is not an expansion, but rather a "full blown" introduction of an unproven technology on a very grand scale.

During the last code cycle, the panel made it clear that this was the technology (combination type) they wanted all along and put an effective date to convert over to this technology to gain some field experience.

At the ROP stage, of the present code cycle the panel again reiterated its support for the combination type technology only and expressed their desire to be made commercially available now. The panel was promised this by the Square D presenter at the Hilton Head meetings. However, after persistent visits to this company's electrical distributors the product has never been able to be purchased. As a last resort, the Square D tech line was contacted on October 11th through October 13th as to where the product could be purchased and we were advised that it would not be available until the first quarter of 2007.

The concern over availability relates to performance. In theory, the concept of a combination type AFCI is one that I wholeheartedly support, since my belief is that the superior wiring methods in new home construction are not what really needs to be protected as much as the exposed extended wiring such as extension cords; appliance cords; etc. that are subject to physical damage. However, in order to provide this well justified protection (combination type) the technology is much more sensitive by the very nature of the level of protection it is providing over a branch feeder AFCI. As such, it was expected that we would learn how this unknown technology would perform in real world environments interacting with other products comprising of or utilizing our electrical infrastructure. With no knowledge, I implore the panel members to reconsider expanding the use of this new technology until we have some field experience.

If we leave the current code text to require the use of combination type AFCIs only on bedroom circuits, we will gain the experience and correct any pitfalls that may be encountered before we embark on requiring their use on all branch circuits.

If the product had a proven track record, expansion would be justified. Without any record, we ask that the panel move judiciously until we have some experience.

The unfortunate history originally with GFCIs should not be lost as a reminder as to what can happen if we push technology before it is ready.

Panel Meeting Action: Reject
Panel Statement: The panel action on the original proposal was based on the commercial availability of AFCI devices in January 2008. The submitter of this comment has not provided Panel 2 with any data that would indicate that combination-type AFCI devices will not be commercially available at that time. The tests in UL1699 confirm the capabilities of AFCIs for arc mitigation and resistance to unwanted tripping. The panel has been provided with information stating that combination AFCIs have been beta tested and have been made commercially available for field installation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 3
Explanation of Negative:
BROWN, L.: Please see NAHB's Ballot Comment on Comments 2-79 and 2-95.
NENNINGER, B.: See my Negative Explanation given in Comment 2-72.
PURVIS, R.: Comment 2-98 on Proposal 2-142 should be accepted. AFCI requirements should not be considered for expansion until the combination type AFCIs have had one code cycle of experience along with further substantiation of the need to expand AFCI requirements beyond bedrooms.

2-99 Log #913 NEC-P02 **Final Action: Reject**
(210.12(B))

Submitter: Aaron B. Chase, Leviton Mfg. Co. Inc.
Comment on Proposal No: 2-111
Recommendation: I strongly disagree with the panel accepting the deletion of "bedrooms" in 210.12(B) but I am in support of rejecting the deletion of "combination-type" in the same paragraph.
Substantiation: The submitter of this comment support the panel's position not to accept branch feeder AFCIs as an acceptable alternative to combination type AFCIs as recommended in the original proposal.
Conversely, the submitter of this comment does not agree with the panel's position to expand combination type AFCI protection to all dwelling unit circuits.
The panel should accept the existing text of the code (combination type on bedroom circuits) with the reference to branch feeders AFCIs deleted.
Substantiation:
Justification for branch feeder AFCI protection in new construction does not correlate to the original data presented. The data strongly suggests that branch feeder AFCIs are warranted on older existing dwellings, but since the level of protection they provide can be provided by combination types, their need in older homes would fail to address the extended wiring too.
Protecting the branch circuit conductors is appropriate and enhances the safety of the electrical distribution system in older existing dwellings, but we must not forget the weakest element of today's system which is frequently the supply cord or extension cord to the utilization equipment. This is the component that is most likely to be subjected to physical damage and provide a source of ignition to nearby products of combustion. This comment ensures that the benefits of the AFCI protection are encouraged and extended to the weakest component in the electrical system that is subject to many abuses while gaining valuable field experience.
While the effectiveness of a combination device and its functionality in real world applications is unknown, an appropriate validation of such technology would be to require its sole use only on bedroom circuits and not permit branch feeder types to be used alternatively. Not only will this encourage the introduction of combination type AFCIs, but valuable field experience will be gained.
New construction per today's codes has excellent premises wiring requirements. However, occupants of these new dwellings can be expected to use utilization equipment that has old and/or damaged supply cords. Further, even new utilization cords are openly exposed to many types of damage that may result in conditions leading to electrical fires.
The original data presented to CMP-2 to justify branch circuit AFCIs were based on trailing data; not current data dealing with older homes. A good example is a staff report by the CPSC in 1987 entitled "Residential Electric Distribution Fires" which provided evidence that fires originating in branch circuit wiring predominately occurred in dwellings over 20 years old with the highest rate of fires occurring in dwellings over 40 years old. Based on this, the residential wiring systems were far inferior in the dwellings from that time period as to what is constructed today. During that span prevalent wiring systems were knob and tube wiring and old style cloth NM cable. Much of the more recent data could be attributed to aluminum wiring. In light of this the use of Branch Feeder AFCIs in new construction would be moot.
With the improvements in today's wiring systems and code adoption, branch feeders AFCIs would have been better suited for service change outs in older homes although the philosophy behind combination types are superior. Combination type, once available and proven (perhaps in a cycle or two from now) will serve any unlikely damage to branch circuit conductors while serving to protect the exposed extended wiring that is subject to abuse where the vast majority of electrical fires in new dwellings can be expected.
Panel Meeting Action: Reject
Panel Statement: No specific recommendation has been made. The comment does not comply with Section 4.3.3(c) of the NFPA Regulations Governing Committee Projects.

2-100 Log #1008 NEC-P02 **Final Action: Reject**
(210.12(B))

Submitter: David Shapiro, Accurate & Intriguing Writing & Editing
Comment on Proposal No: 2-142
Recommendation: Revise text to read as follows:
(B) Dwelling Units. ~~All~~ Every 120-volt, single phase, 15- and 20-ampere branch circuit~~s~~ supplying outlets installed in dwelling unit bedrooms shall be protected by a...
Substantiation: A minor grammatical fiddle, to restore correspondence of number. If "all" circuits must be protected by "a" GFCI, literally, we're shifting to the British system of having a single Earth Leakage device protecting the entire panelboard. I believe it is preferable that the Code not require reinterpretation, generally: "I know what it means to say, and that's what I'm going to enforce; don't come at me with what it says." The enforcement of this section, as written, by a literalist would be worse yet.
Panel Meeting Action: Reject
Panel Statement: The present use of the term "all" is clear in its intent.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-102 Log #1041 NEC-P02 **Final Action: Reject**
(210.12(B))

Submitter: Gilbert L. Thompson, MEIA Codes and Standards
Comment on Proposal No: 2-142
Recommendation: The Panel should reconsider their action and reject this proposal. The wording should remain the same as is now found in Section 210.12(B) of the 2005 NEC. The inspector's association agrees with the four negative comments by Mr. Becker, Mr. Brown, Mr. Nenninger, and Mr. Purvis that the proposal should be rejected. Note: Not all enforcement jurisdictions have adopted the 2005 NEC or the requirement for combination AFCI protection. This new proposal sets no time table to allow for any other type of protection other than just combination type breakers. And again, it is an industry proposed change.
Substantiation: Mr. Nenninger's comments on Proposal 2-105 are right on target, especially since the tripping values have been adjusted by UL for the combination type AFCI. There have been recent reports of some nuisance tripping that result in the removal of this protective device and then replacing it with general use breakers. To allow for more research and development of

other possible methods of protecting circuit conductors, we feel it is more appropriate to leave the current code as written and then gain experience with AFCIs in bedrooms circuits only. Further expansion could then be considered for the 2011 code after other data is supplied and experience gained.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Comment 2-98.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 3

BROWN, L.: Please see NAHB's Ballot Comment on Comments 2-79 and 2-95.
NENNINGER, B.: See my Negative Explanation given in Comment 2-72.
PURVIS, R.: Comment 2-102 on Proposal 2-142 should be accepted. AFCI requirements should not be considered for expansion until the combination type AFCIs have had one code cycle of experience along with further substantiation of the need to expand AFCI requirements beyond bedrooms.

2-103 Log #1043 NEC-P02 **Final Action: Reject**
(210.12(B))

Submitter: Gilbert L. Thompson, MEIA Codes and Standards
Comment on Proposal No: 2-127
Recommendation: The Panel should reconsider their action and accept this proposal with the following words added to the heading:
Dwelling units/and structures with similar sleeping accommodation usage
Building codes, zoning regulations, and fire codes have different definitions for structures that house people, but the same electrical conditions exist when persons are allowed to use their own personal appliances, devices, accessories and equipment in these type sleeping quarters.
Substantiation: Our inspectors associations agree with Mr. Mettalo's substantiation and especially the negative comments made by Mr. Brown, Mr. King, and Mr. Weber in support of his proposal. This change would allow for the expansion of AFCI protection to many structures that have similarities to dwelling unit bedrooms. It would also allow the industry the opportunity to gain experience and data as AFCIs would provide protection to a greater number of occupants. In the 2005 code, it requires by January 1, 2008 that combination AFCIs be used so this would give a great deal of experience and data allowances.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided substantiation to support the expansion of AFCI devices to other structures.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
KING, D.: I agree with the submitter's substantiation. The life saving benefit afforded by this technology should be expanded to include all occupancies that are similar to and function as dwelling units. See my explanation of negative on Comment 2-93.
Comment on Affirmative:
BROWN, L.: Please see NAHB's Ballot Comment on Comments 2-79 and 2-95.

2-104 Log #1147 NEC-P02 **Final Action: Reject**
(210.12(B))

Submitter: Neil F. LaBrake, Jr., National Grid / Rep. Edison Electric Insitute-Electric Light & Power Group
Comment on Proposal No: 2-125
Recommendation: Reject Proposal 2-125 in its entirety.
Substantiation: Proposal 2-125 should be rejected since the data does not support the expansion of the use of present AFCI technology to the entire dwelling unit. Present AFCIs (available to purchase today) have not been proven to reliably protect against series arcs in extension cords. The combination type AFCIs have not been installed and proven to work in the field at this time. There has been a lot of discussion about protecting building wiring with the circuit breaker type AFCI. EEI supports the concept of protection of wiring in older homes. However, wiring properly installed in new homes in accordance with the requirements of the NEC does not require the additional level of protection for branch circuit wiring by AFCIs.
Panel Meeting Action: Reject
Panel Statement: The tests in UL1699 confirm the capabilities of combination-type AFCIs for series arc mitigation. The panel has been provided with information stating that combination AFCIs have been beta tested and have been made commercially available for field installation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 3
Explanation of Negative:
BROWN, L.: Please see NAHB's Ballot Comment on Comments 2-79 and 2-95.
NENNINGER, B.: See my Negative Explanation given in Comment 2-72.
PURVIS, R.: Comment 2-104 on Proposal 2-125should be accepted. AFCI requirements should not be considered for expansion until the combination type AFCIs have had one code cycle of experience along with further substantiation of the need to expand AFCI requirements beyond bedrooms.

2-105 Log #1314 NEC-P02 **Final Action: Accept in Principle in Part**
(210.12(B))

Submitter: Herbert S. Pharo, Cape May, NJ
Comment on Proposal No: 2-126
Recommendation: This Proposal should be Accept in Principle as follows:
210.12 Arc-Fault Circuit-Interrupter Protection
(B) Dwelling Units ~~Bedrooms~~.
(1) 120-Volt, 15 and 20-Ampere Branch Circuits. All 120-volt, single phase, 15- and 20-ampere ~~branch circuits supplying~~ outlets installed in dwelling units ~~bedrooms~~ shall be protected by a listed arc-fault circuit interrupter, combination type installed in accordance with one of the following: ~~to provide protection of the branch circuit.~~
(1) All 120-volt, single phase, 15- and 20-ampere branch circuits shall be protected. All other circuits shall be installed in:
a. EMT or
b. Type AC cable with a steel a outer jacket and a copper equipment grounding conductor
(2) All 120-volt, single phase, 15- and 20-ampere outlets and branch circuit conductors shall be protected at, and downstream of the first outlet, in accordance with the following:
a. Branch circuit conductors to the first outlet of all 120-volt, single phase, 15- and 20-ampere circuits are installed in EMT or type AC cable with a steel a outer jacket and a copper equipment grounding conductor and
b. All other circuits shall be installed in EMT or type AC cable with a steel a outer jacket and a copper equipment grounding conductor .....
~~Branch/feeder AFCIs shall be permitted to be used to meet the requirements of 210.12(B) until January 1, 2008.~~
~~FPN: For information on types of arc-fault circuit interrupters, see UL 1699-1999, Standard for Arc-Fault Circuit Interrupters.~~
~~Exception: The location of the arc-fault circuit interrupter shall be permitted to be at other than the origination of the branch circuit in compliance with (a) and (b):~~
~~(a) The arc-fault circuit interrupter installed within 1.8 m (6 ft) of the branch circuit overcurrent device as measured along the branch circuit conductors.~~
~~(b) The circuit conductors between the branch circuit overcurrent device and the arc-fault circuit interrupter shall be installed in a metal raceway or a cable with a metallic sheath.~~
Substantiation: The AFCI debate can be quite controversial. A significant amount of data has been accumulated with respect to electrically related fires in dwelling units. No one can dispute the fact that the electrical industry must take steps reduce the fires in dwelling units which are started through the use of electricity in the home. The data on which these changes are based is sometimes lost in the discussion. To some degree it seems we are attempting to develop an electronic fire extinguisher without eliminating the root cause of the problem. The AFCI is and will continue to be a LIFE SAVING device. I fully support requirements for AFCI protection in dwelling units. That said, let's look at where these fires start and what is causing or contributing to these fires. The following discussion is based on the most recent data that I could find. In November of 2005 the CPSC released the "1999 Revised – 2002 Residential Fire Loss Estimates." Table 4a on page 17 outlines the number of fires for different types of electrical equipment in residential structures. Table 1a outlines the total number of fires. This report is included for the members of CMP-2. The entire report is available online at http://www.cpsc.gov/library/fire02.pdf
In order for one to objectively review the 2002 fire data, with respect to the proposed AFCI requirements, we must identify where and at what voltages fires are occurring. Please read the note at the bottom of table 4a. As fire statistics are rounded off to the nearest 100, adding the individual categories for fires will not equal the column total. Adding the individual categories for 2002 comes to a total of 82,400.

Total Electrical Fires	**82,400**	**100%**
Electrical Fires not mitigated by AFCI	**[,900**	**2%**
Upstream, Panelboards, meters		
Other, torch?		
Over 120-volts, not mitigated by AFCI	**41,500**	**50%**
Central & fixed heating, water heater,		
Fixed central AC, range/oven/hood,		
Clothes dryer		
Note that the fire may have been in the branch		
circuit or in the equipment		
Note that the total cooking equipment fires are		
listed on table 1a at 117,700 and table 4a lists		
35,500 electrical cooking equipment fires at		
Note that the total heating and cooling fires are		
listed on table 1a at 55,800 and table 4a lists		
13,200 electrical heating and cooling		
Installed Wiring	**81,100**	**10%**
Note that not all installed wiring will be at		
120-volt, single phase, 15- and 20-ampere		
And may not be AFCI protected		
Load side of Outlet	**30,900**	**38%**
This includes all other selected electrical		
equipment on table 4a		

No data exists in this or in any report I have seen to differentiate between fires which were started due to an "arcing fault" or a fire started due to misapplication or user error. The data does reveal significant problems. One may argue that the cooking, heating and cooling fires are incorrectly listed as electrical. Please note that table 1a lists total fires and 4a lists electrical fires. Total heating and cooling fires were 55,800 on table 1a and heating and cooling fires electrical in nature were 13,200 on table 4a. Total cooking equipment fires were 117,700 on table 1a and cooking fires electrical in nature were 35,500. One may also argue that some of the "other" categories may not fall into the "load side" category. The data as outlined represents the CPSC findings and is extremely interesting.

It is extremely disturbing to see that undeniably 50% of electrical residential fires occur with equipment not protected at 120-volt, single phase, 15- and 20-amps. Did these fire start in the equipment or on the load outlet? Could AFCI protection have prevented these fires? Protection of these branch circuits must be considered by CMP-2. EMT is proposed as it would offer significant protection. Type AC cable with a steel outer jacket is proposed as it would also provide necessary protection. It is also proposed to use a copper equipment grounding conductor as the intended purpose of the steel jacket in this comment is for protection only. Type AC cable is required to be constructed with an outer jacket of at least 25 mils. The jacket of most MC cable is NOT recognized as a fault return path and the jacket is permitted to be significantly thinner.

Regardless of how this data is interpreted there are two issues CMP-2 must focus on, fixed wiring and load side of the outlet.

Fixed wiring

Depending upon which report you are reading, fixed wiring causes between 10% and 35% of electrical fires. This problem can be fixed by providing protection of the wiring method. The wiring method of choice in a dwelling unit is type NM. This wiring method is easily damaged and pierced by screws or nails. We could eliminate a significant number of residential fires if we were to eliminate type NM cable from all dwelling units.

Load side of the outlet

AFCI protection will always be necessary to provide protection from arcing faults on the load side of an outlet. Allowing the protection at the first outlet provides protection for all outlets and fixed wiring downstream of AFCI protection at the first outlet. Requiring EMT or type AC cable with a steel outer jacket to the first outlet will provide adequate protection of the home run.

Note: Supporting Material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle in Part

The panel rejects the addition of subdivision (1).

Panel Statement: The data provided in the proposed subdivision (1) does not clearly indicate that the fires that occurred in circuits over 15- and 20- amp, 120 volt would have been prevented by installing the conductors in metal raceways and cables. The panel notes that the proposed subdivision (1) introduces new material. The remainder of the recommendation is addressed by the panel action on Comment 2-129. See panel action and statement on Comment 2-129.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

BROWN, L.: Please see NAHB's Ballot Comment on Comments 2-79 and 2-95.

KING, D.: Panel 2 should have given further consideration to the submitter's substantiation regarding fires that occur in fixed wiring circuits rated over 120 volts. The data provided by the submitter from the Consumer Product Safety Commission illustrates an alarming number of electrically oriented fires in circuits rated above 120 volts that are not protected by the requirements of 210.12(B) as presently written. Panel 2 should have addressed these unprotected circuits by accepting in principle this comment with the following revised text:

Revise Subdivision (1)(A) to read as follows: EMT, Rigid Metal Conduit, Intermediate Metal Conduit or...

Revise Subdivision (2)(A) to read as follows:

Branch circuit conductors to the first outlet of all 120-volt, single phase, 15-and 20-ampere circuits are installed in EMT, Rigid Metal Conduit, Intermediate Metal Conduit or type AC with a steel outer jacket and a copper equipment grounding conductor and...

(B) all other circuits shall be installed in EMT, Rigid Metal Conduit, Intermediate Metal Conduit or Type AC cable with a steel outer jacket and a copper equipment grounding conductor.

The revised text includes other types of metal raceway that would provide an equivalent level of protection for the portion of branch circuit wiring t hat is not protected by an AFCI device.

Although I applaud the advancements in safety made by the Panel action on Comment 2-129, a much greater level of safety would have been achieved through my recommended Panel action on this Comment.

2-106 Log #1325 NEC-P02 **Final Action: Reject**
(210.12(B))

Submitter: David R. Carpenter, Florence, AL
Comment on Proposal No: 2-142
Recommendation: This proposal and the expansion of requirements for AFCIs in dwelling units should be rejected.
Substantiation: Replacing the term "All 120-volt, single phase, 15- and 20-ampere branch circuit supply outlets installed in dwelling units bedrooms" with the term "All 120-volts, single phase, 15- and 20-ampere branch circuits" is a huge and far reaching change without substantiation. The submitter convinced the panel with knee jerk logic, but has provided no substantiation for this change. Nothing has been presented that proves AFCIs have reduced loss of property or life. The AFCI is not a "Catch All" breaker that can eliminate every fault signature hazard. The present technology is based on certain frequencies of an arc.

As an inspector, I find it very difficult to defend this code requirement to my constituents. I see no justification by the submitter based on history of an unsafe condition nor do I see any technical data to back the claim. Without proper justification, it appears the code is being used as a tool simply to sell products and not to prevent shock and fire hazards as in the stated purposed 90.1.

Panel Meeting Action: Reject
Panel Statement: Based on data submitted over several code cycles, The panel continues to support the belief that AFCIs provide a significantly improved level of protection for the electrical system.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 3
Explanation of Negative:

BROWN, L.: Please see NAHB's Ballot Comment on Comments 2-79 and 2-95.

NENNINGER, B.: See my Negative Explanation given in Comment 2-72.

PURVIS, R.: Comment 2-106 on Proposal 2-142 should be accepted. AFCI requirements should not be considered for expansion until the combination type AFCIs have had one code cycle of experience along with further substantiation of the need to expand AFCI requirements beyond bedrooms.

2-107 Log #1405 NEC-P02 **Final Action: Accept in Principle in Part**
(210.12(B))

Submitter: J.A. Wafer, Eaton Electrical
Comment on Proposal No: 2-142
Recommendation: Continue to Accept the Proposal as submitted.
Substantiation: This comment is intended to confirm Eaton Electrical's support for the Panel action. There is no question that the 1999 Code provided a significant improvement in residential electrical safety by requiring AFCI protection for dwelling unit bedroom circuits, effective January 1, 2002. The Panel's acceptance of this proposal will further increase this level of safety. As noted in the submitter's substantiation to Proposal 2-142, "...it is an appropriate time to expand AFCIs to all 15 and 20 ampere branch circuits in the dwelling." In particular, the increased fire protection by AFCIs should not be limited to the branch circuits supplying outlets in dwelling unit bedrooms.

Panel Meeting Action: Accept in Principle in Part
Panel Statement: See panel action and statement on Comment 2-85.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 3
Explanation of Negative:
BROWN, L.: Please see NAHB's Ballot Comment on Comments 2-79 and 2-95.
NENNINGER, B.: See my Negative Explanation given in Comment 2-72.
PURVIS, R.: Comment 2-107 should be rejected. Even this "limited" expansion should be reevaluated the next code cycle after additional field experience with the new combination type AFCI is available for review along with further substantiation of the need to expand AFCI requirements beyond bedrooms.

2-108 Log #1480 NEC-P02 **Final Action: Reject**
(210.12(B))

Submitter: James Murphy, Lawrence Berkeley National Laboratory
Comment on Proposal No: 2-142
Recommendation: Reject this proposal.
Substantiation: Expanding the use of AFCIs to all 15 and 20 amp circuits installed in dwelling units is unsubstantiated and entirely too far-reaching a proposal. The fire statistics and other material that have been presented as substantiation for expanding AFCIs deal largely with fires occurring in one and two family dwellings. According to NFPA's U.S. Fires in Selected Occupancies (March 2006) which lists the leading causes of structure fires, fires caused by electrical distribution or lighting equipment in one and two family homes represent 10 percent of the total while they represent only 5 percent of the total in apartments. As the report states: "The systems that tend to be centrally installed, maintained and supervised in apartment buildings, such as heating and electrical distribution equipment, cause a smaller share of the fires in apartments than they do in dwellings."

This proposal would apply to any type of dwelling unit, whether a single family home or a condominium in a 60 story hi-rise that would have fire-resistant construction, sprinklers, and more robust wiring methods than those typically used in single family homes. The requirement for AFCIs in these dwelling units is an unnecessary feature and is not justified when more stringent building and electrical safety requirements already are mandated by Codes.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The panel does not agree that multi-family dwelling units should have a different level of protection than single family dwellings. See panel statement on Comment 2-106.
Number Eligible to Vote: 12

PURVIS, R.: Comment 2-108 on Proposal 2-142 should be accepted. AFCI requirements should not be considered for expansion until the combination type AFCIs have had one code cycle of experience along with further substantiation of the need to expand AFCI requirements beyond bedrooms.

2-109 Log #1781 NEC-P02 **Final Action: Reject**
(210.12(B))

Submitter: Joseph A. Hertel, Safety and Buildings
Comment on Proposal No: 2-142
Recommendation: The text should remain as written in the 2005 NEC until such time as there is data to support the expansion of AFCI technology.
Substantiation: The substantiation provided to the panel is a statement that the CMP has reviewed extensive amounts of data and information pertaining to the benefit of AFCIs for the protection of dwelling unit branch circuits. If the CMP has been provided significant amounts of information and data is this information and data available to the public? Anyone is free to install AFCI protection for any and all circuits they desire without a mandate in the NEC. The NEC is by its own intention not a design manual. As a member of the public and NFPA, I follow literature and have not seen data that indicate the fire rates in dwelling units have been affected by the installation of AFCI devices.
Panel Meeting Action: Reject
Panel Statement: The panel has reviewed adequate substantiation that supports AFCI technology and its ability to mitigate arcing faults that can ignite surrounding combustible material. This information is available at NFPA Headquarters. Additional information attesting to the reliability of these devices is available at NFPA Headquarters and was reviewed by the Panel. Actual fire data that reflect the benefit of these devices will not be available until they are required to be used in broader applications in the field.
Number Eligible to Vote: 12

Explanation of Negative:
BROWN, L.: Please see NAHB's Ballot Comment on Comments 2-79 and 2-95.
NENNINGER, B.: See my Negative Explanation given in Comment 2-72.
PURVIS, R.: Comment 2-109 on Proposal 2-142 should be accepted. AFCI requirements should not be considered for expansion until the combination type AFCIs have had one code cycle of experience along with further substantiation of the need to expand AFCI requirements beyond bedrooms.

2-110 Log #2006 NEC-P02 **Final Action: Reject**
(210.12(B))

Submitter: Lawrence Brown, National Association of Home Builders (NAHB)
Comment on Proposal No: 2-121
Recommendation: Reject the proposal.
Substantiation: Let's get to the bottom line on this matter - There is absolutely no fire data that can be used to support the expansion of AFCIs to all receptacles, let alone the mandatory installation of AFCIs in bedrooms.

Looking at the latest data from NFPA in the report "The U.S. Home Product Report (Appliances and Equipment Involved in Fires)", by John R. Hall, Jr., of the Fire Analysis and Research Division of NFPA dated November 2005, the report shows that the annual average number of home fires is 372,900, with direct property damage of $443,000.000. Of this number 32,000 (or 9% = $39,870,000) of these fires are caused by "electrical distribution equipment." Of that 9%, only 14,500 (or 4% = $17,720,000) of those fires are attributed to "fixed wiring, switches, outlets, and receptacles." And, there is no data or study to support that of these 14,500 fires and the installation of an AFCI device would have prevented the fire.

Using the U.S. Census Bureau data on building permits for 2004 (Table (S-3) Final) shows 1,656,413 one- and two-family dwelling units and 413,664 multifamily units for that year.

There are typically 20 (twenty) 20-volt, single phase, 15- and 20-ampere branch circuits in each one- and two-family dwelling unit, and 10 in each multifamily dwelling unit. Using these numbers, there will be 33,128,260 AFCIs in OTFDs and 4,136,640 for multifamily units, for a total of 37,264,900 AFCIs.

Using a wholesale cost of $34.00 per breaker, marked-up the industry standard percentage of 66 percent, produces a cost per breaker of $56.44 to the homeowner.

In all, the average annual total cost to the public for the mandatory installation of AFCIs will be $2,103,230.956 ($1,267,006,600 wholesale). That is 2 BILLION, 130 MILLION, 230 THOUSAND AND 956 DOLLARS.

Using current fire loss data, society will be spending $2,103,230.956 per year to cover losses of only $39,870,000. That means spending 52 times the amount of money that would be lost if the devices were not installed and that is if the devices work 100% of the time. If you use the losses relating only to "fixed wiring, switches, outlets, and receptacles" (the part of the wiring that is claimed to be protected by AFCI breakers) the ratio to money spent relative to monetary loss ($17,720,000) is 119 times, again, if they work 100% of the time.

In addition to the submitter's substantiation, there is no data to support the contention of a neither "excellent track record", nor information that these "installations have found numerous wiring errors" or "they have found wiring damage and equipment damage that could have been a potential source of fire". That statement alone provides no correlation between the purported problems and the use of AFCIs.

It should also be noted that it appears the method used to certify these devices actually only tests to make sure the device will not cause an electrical shock or fire problem. IT DOES NOT TEST THE DEVICE TO ENSURE IT WILL PREVENT A FIRE CAUSED BY THE MANY SITUATIONS OF ELECTRICAL ARCING THAT COULD CAUSE A FIRE.

IN OTHER WORDS, NO ONE CAN PROVE THESE DEVICES WILL HAVE ANY COST-BENEFIT TO SOCIETY.

The Panel needs to reconsider the mandatory installation of AFCIs, let alone the expansion of requiring these devices for all 120-volt, single phase, 15- and 20-ampere branch circuits in dwelling units. Until true field test data on the efficacy of AFCIs can be directly related to saving society monetary loss there is no cost-benefit in this provision.

NENNINGER, B.: See my Negative Explanation given in Comment 2-72.

PURVIS, R.: Comment 2-115 on Proposal 2-142 should be rejected. Even this "limited" expansion should be reevaluated the next code cycle after additional field experience with the new combination type AFCI is available for review along with further substantiation of the need to expand AFCI requirements beyond bedrooms.

2-116 Log #2140 NEC-P02 **Final Action: Reject**
(210.12(B))

Submitter: David R Carpenter, Florence, AL
Comment on Proposal No: 2-142
Recommendation: This Proposal and all expansion of requirements for AFCIs in dwelling units should be Rejected.
Substantiation: Replacing the term "All 120-volt, single phase, 15- and 20-ampere branch circuits supplying outlets installed in dwelling units bedrooms" with the term "All 120-volt, single phase, 15- and 20-ampere branch circuits" is a huge and far reaching change without substantiation. The submitter convinced the panel with knee jerk logic, but has provided no substantiation for this change. None of the "Fire Cause" sections described on NFPA and CPSC websites concern branch circuits except bedrooms.

Nothing has been presented that proves AFCIs have reduced loss of property or life. The AFCI is not a "catch all" breaker that can eliminate every fault signature hazard. The present technology is based on certain frequencies of an arc but not all that could occur. See "Leading Causes of Structure Fires in Homes" on NFPA's website.

As an inspector, I find it very difficult to defend this code requirement. The past justification was based on CPSC findings of high rates of fire in bedrooms, I see no justification by the submitter based on history of an unsafe condition nor do I see any technical data to back the claim. Without proper justification it appears the code is being used as a tool simply to sell products and not to prevent shock and fire hazard as is the stated purpose of the NEC in 90.1.

2-119 Log #2192 NEC-P02 **Final Action: Accept in Principle in Part**
(210.12(B))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 2-142
Recommendation: Continue to Accept the Proposal as submitted.
Substantiation: As noted in the substantiation, it is time to expand the use of AFCI. This comment is intended to address the comments with the negative votes by Mr. Becker, Mr. Brown, Mr. Nenninger, and Mr. Purvis.

Mr. Becker questions the reliability of AFCIs and whether there is enough data on the effectiveness of AFCI to justify expansion. There are over 20,000,000 AFCI in service and the number grows daily. This is a large base and manufacturers are not aware of reliability issues and Mr. Becker does not present any data supporting his claim of a reliability issue nor has he provided any information to the manufacturers supporting this claim.

Relative to the effectiveness of AFCI, there are situations where AFCIs are detecting arcing situations and protecting the circuit. The devices are functioning and are effective.

Mr. Becker states that substantiation must provide a demonstrable link between the present installation of AFCIs in bedrooms and a reduction of fires before expansion. The effort to quantify a reduction in fires and the use of AFCI will forever be difficult (as it would be with other products) and code making bodies have been careful over the years not to withhold advancements in safety for this type of justification. AFCIs do detect arcing situations that if not detected could develop into dangerous situations where a fire could occur. The branch/feeder devices introduced in the 2002 Code provided a significant improvement in safety and the change to combination devices in 2008 will increase this safety level further. AFCI technology is relatively new and will continue to develop and increase the level of safety.

Mr. Becker questions whether AFCIs provide any protection beyond that provided by a standard circuit breaker. AFCI devices function in a range of protection outside of that provided by standard circuit breakers so there is no question that there is additional protection beyond what is provided by a standard circuit breaker. Combination devices function to detect arcing situations well below the handle rating of the circuit breaker.

Mr. Becker raised a question about installing GFCIs on branch circuits protected by AFCIs but it is unknown what the issue or question is. GFCIs can be, and have been, installed on the same circuit since AFCIs were introduced. There is no issue and, indeed, some AFCIs have been designed to include 5ma GFCI protection.

Mr. Brown's negative comments indicate that the issue is purely dollars and cents. He does not seem to question that AFCIs provide additional safety, but questions whether the increased safety is worth the cost.

It should be noted that home builders took similar positions when GFCI and smoke alarm requirements were introduced. The same argument is occurring presently with sprinkler protection for dwellings. If all of these issues were viewed only as a dollars and cents issues, we would not have many of the safety improvements we have today. If one applied this same type of analysis as justification for overcurrent protection of circuits, you would arrive at the conclusion that there is no justification for having any overcurrent protection - fuse or circuit breaker - on every circuit. A circuit breaker trip in a dwelling is relatively rare and the number of trips relative to the number installed is infinitesimally low.

The same type of dollars and cents analysis would likely show that GFCI and smoke detectors were not justified. If homeowner's insurance was evaluated on the same basis that Mr. Brown uses, the numbers would probably indicate that the cost of insurance far exceeds the losses and, therefore, no one should purchase insurance.

Mr. Brown notes that until data is available to indicate that AFCIs are directly related to saving society monetary loss that AFCIs should not be required. That logic would result in codes and standards that would have no safety provisions.

Mr. Nenninger questions the timing of expansion. AFCIs have been required in the 2002 and 2005 Code so there is significant experience with the devices (20,000,000+ installed). It is true that the 2008 Code will require a new type of device with expanded safety, but that does not justify not moving forward with expansion of AFCI.

Mr. Purvis comments that field problems, manufacturer recalls, nuisance trips, and lack of support are reasons to not include AFCI in the NEC.

● Relative to field problems there have been some trips with AFCI and while many of these were due to actual arc faults there have been some trips that can be attributed to improper wiring or a specific issue with a connected load. In the instances where there was a question about utilization equipment, AFCI manufacturers have responded to these and made adjustments to the AFCI, if possible and warranted, and the result has been that there are few actual unwanted trip issues reported today. When GFCIs were first introduced, there were numerous complaints of nuisance trips (any trip is a nuisance and many of these were valid trips due to ground faults) but what if GFCI were never added to the Code because of perceived nuisance tripping issues?

● Relative to recalls, there was a single AFCI recall from one manufacturer. Although this was due to the specific performance of a component and not the AFCI design, the manufacturer responded quickly and effectively. It should also be noted that in this instance the push-to-test function of the AFCI did exactly as it was supposed to do and indicated that the device had a problem with the arc detection function. The idea that a product recall means that the concept should be removed from the market is not logical. None of us would have an automobile today under this concept.

● The issue of local adoption is indicated as lack of support and, therefore, somehow important in including this in the Code. Local adoption is many times driven for reasons other than safety - e.g., politics - and should not be an issue in what the NEC does. It is also noteworthy that far more jurisdictions have adopted AFCI than those that have not.

The need for AFCI in new houses is questioned because of improvements in wiring. Wiring practices do continue to improve, but unintended things happen in new installations. Systems also continue to age and they are often modified. A perfect installation where nothing goes wrong with the wiring and the loads would not need a circuit breaker or fuse to protect the circuit, but it is understood that the system needs protection against various modes of faults that can occur. The AFCI is an extension of this safety.

Panel Meeting Action: Accept in Principle in Part
Panel Statement: See panel action and statement on Comment 2-85.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 3
Explanation of Negative:

BROWN, L.: Please see NAHB's Ballot Comment on Comments 2-79 and 2-95.

NENNINGER, B.: See my Negative Explanation given in Comment 2-72.

PURVIS, R.: Comment 2-119 should be rejected. Even this "limited" expansion should be reevaluated the next code cycle after additional field experience with the new combination type AFCI is available for review along with further substantiation of the need to expand AFCI requirements beyond bedrooms.

Comment on Affirmative:

PAULEY, J.: The panel statement should reference Comment 2-95 instead of Comment 2-85.

2-120 Log #2215 NEC-P02 **Final Action: Reject**
(210.12(B))

Submitter: Jeff Fitzloff, State of Idaho Division of Building Safety
Comment on Proposal No: 2-105
Recommendation: Revise text to read as follows:

210.12 Arc-Fault Circuit-Interrupter Protection.

(A) Definition: Arc-Fault Circuit Interrupter (AFCI). An arc-fault circuit interrupter is a device intended to provide protection from the effects of arc faults by recognizing characteristics unique to arcing and by functioning to deenergize the circuit when an arc fault is detected. [ROP 2-119].

(B) Dwelling Units. All 120-volt, single phase, 15- and 20-ampere branch circuits installed in dwelling sleeping rooms ~~units~~ shall be protected by a listed arc-fault circuit interrupter, combination type installed to provide protection of the branch circuit.

Substantiation: At this time, I am receiving overwhelming resistance to this change with recommendations to not adopt the 2008 NEC.
Panel Meeting Action: Reject
Panel Statement: The submitter of this comment has not provided adequate substantiation to support his recommendation to limit the requirements for AFCI devices to sleeping areas. The use of the term "sleeping rooms" is vague and unenforceable.

(210.12(B))

Submitter: Randy Dollar, Siemens Energy & Automation
Comment on Proposal No: 2-142
Recommendation: Continue to Accept the Proposal as submitted.
Substantiation: Fire data historically takes years of data analysis to show trends in any direction. As an example, the most recent home structure fire statistics information on the NFPA website (dated April 2006) only uses data collected and analyzed through 2002.

The AFCI, combination type, provides an expanded level of protection over the branch/feeder type. To wait the necessary years for fire data analysis to indicate the benefit of AFCIs in bedroom circuits before expanding to all 120V, 15 and 20 ampere circuits is unnecessarily subjecting unwary homeowners to risks.

An example already exits today against the argument of cost considerations used by Mr. Becker in his explanation. Homeowners pay significantly more than the stated "$250 to $500 per dwelling unit" in homeowners insurance each year, not just as a one time purchase as with the AFCI. However, the typical homeowner never files a claim in excess of that amount. The explanation by Mr. Brown is essentially the same as that provided by Mr. Becker, only using the total numbers as opposed to the "per house" numbers. In addition, the numbers used by Mr. Brown only indicate the direct property damage. It does not take any consideration for the cost of human lives, irreplaceable personal items, lost work, time and wages, temporary housing costs, etc.

(210.12(B))

Submitter: Douglas A. Lee, U.S. Consumer Product Safety Commission
Comment on Proposal No: 2-138
Recommendation: Reconsider Proposal 2-138 changing "circuit" to "overcurrent". The revised new text shall read as follows:

These requirements shall also apply to existing installations whenever the overcurrent protection device is replaced as part of a service capacity upgrade or renovation.

Substantiation: I agree with the negative comments of Messrs. King, LaRocca, and Weber. All available information indicates that AFCIs are compatible with older wiring systems. Furthermore, Technology for Detecting and Monitoring Conditions that Could Cause Electrical Wiring System Fires (Underwriters Laboratories, September 1995) indicates that installing AFCIs in older homes will help mitigate fires, thus saving lives. The Panel's progressive approach in adopting requirements for AFCIs in the 1999 NEC is commendable but subsequently falls short of making a major impact on reduction of fire losses by rejecting inclusion into existing homes. Regardless of Panel 2s action on Proposal 2-142 and the availability of combination-type AFCIs, there should be no further delay in requiring AFCIs to be installed to supply bedroom circuits when a panelboard is replaced and existing wiring is used.

Comment on Proposal No: 2-142
Recommendation: Proposal should be rejected.
Substantiation: 1. At this point and time there are no combination type AFCIs (series and parallel fault) devices on the market. Manufacturers have had years to produce a product for sale, for commercial use and testing since the original inception of AFCIs and have not. To install this protection using the existing technology would not be in the public's best interest. They would only be getting an AFCI with series protection instead of combination type protection (series and parallel). Many areas where this device can be helpful are on older parallel wiring circuits.

2. Even though this may be a step in the right direction, with the existing technology still in its infancy, this board should require that additional testing be done under the existing NEC code, before having consumers spend BILLIONS of dollars on installing AFCI protection that will be changing or advancing by the 2011 code cycle. It is in the consumer's best interest to only have to pay once for this to be done and not a second time after the manufacturers finally make advances to meet the code requirements.

3. There is not enough data to support any possible issues that may arise with the use of AFCIs in conjunction with GFCIs which are common throughout dwelling unit living areas. Until additional equipment is available, you may not be able to meet the requirement of the proposed code for every application that may arise.

4. Most AFCIs over the last 2 years have been installed in new dwelling units which on a normal basis would not have any problems with these arc faults for quite a few years, if at all, unless there was an installation error. This alone would make the data and research results supplied by the manufacturers unreliable. There must be more time allowed to evaluate the true safety factor that these provide.
Panel Meeting Action: Reject
Panel Statement: The panel action on the original proposal was based on the commercial availability of AFCI devices in January 2008. The submitter of this comment has not provided Panel 2 with any data that would indicate that combination -type AFCI devices will not be commercially available at that time. The submitter has not substantiated that listed combination-type AFCI devices are not compatible with listed GFCI devices.
Number Eligible to Vote: 12

Explanation of Negative:
BROWN, L.: Please see NAHB's Ballot Comment on Comments 2-79 and 2-95.
NENNINGER, B.: See my Negative Explanation given in Comment 2-72.
PURVIS, R.: Comment 2-123 on Proposal 2-142 should be accepted. AFCI requirements should not be considered for expansion until the combination type AFCIs have had one code cycle of experience along with further substantiation of the need to expand AFCI requirements beyond bedrooms.

2-124 Log #2245 NEC-P02 **Final Action: Reject**
(210.12(B))

Submitter: Donald A. Ganiere, Ottawa, IL
Comment on Proposal No: 2-142
Recommendation: This proposal should be rejected.
Substantiation: There is not an AFCI device on the market that can do what the original proposals, some 13 years ago, said that the AFCI device could do. The manufactures have not been able to make a product that fulfills the promises made in the original proposals and now they want to require more sales of this uncompleted product so that they can force the consumer to pay the additional research and development costs that are needed to make a workable product. These costs should come from the stockholders, not the consumer. This proposal should be rejected until such time as there is a product that does what they promised it could. At this point in time the available AFCI provides so little protection that it is almost worthless.
Panel Meeting Action: Reject
Panel Statement: The submitter of this comment has not provided any documentation to support his claim that AFCI devices do not function as intended to mitigate arcing faults.
Number Eligible to Vote: 12

BROWN, L.: Please see NAHB's Ballot Comment on Comments 2-79 and 2-95.
NENNINGER, B.: See my Negative Explanation given in Comment 2-72.
PURVIS, R.: Comment 2-124 on Proposal 2-142 should be accepted. AFCI requirements should not be considered for expansion until the combination type AFCIs have had one code cycle of experience along with further substantiation of the need to expand AFCI requirements beyond bedrooms.

2-125 Log #2264 NEC-P02 **Final Action: Reject**
(210.12(B))

Submitter: Michael Beanland, Vancouver, WA
Comment on Proposal No: 2-142
Recommendation: Delete entire section 210.12(B).
Substantiation: AFCI devices are a nice "concept." Manufacturers cannot provide assurance that the devices will provide reliable (~100%) and secure (no false operation) parallel and series arc detection. Though UL tests are valuable, they do not represent the real world and do not test for proper performance, only basic operation & non-failure. Independent testing has shown that

overcurrent and GFCI devices provide equivalent protection to AFCI. This rule will require significant added construction expense with no substantial improvement in safety and the possible significant degradation in reliability. Unless manufacturers can be held to substantial performance criteria by NFPA rule, the blanket requirement for AFCI is not justified.
Panel Meeting Action: Reject
Panel Statement: The panel does not agree with the submitter's assertion that the UL standard only evaluates for "basic operation". The submitter has not presented any substantiation that "overcurrent and GFCI devices provide equivalent protection to AFCI", given that neither of these devices address low-level arcing conditions in multiple modes.

Explanation of Negative:
BROWN, L.: Please see NAHB's Ballot Comment on Comments 2-79 and 2-95.

2-127 Log #558 NEC-P02 **Final Action: Accept in Principle**
(210.12(B) Exception)

Submitter: Steve Campolo, Leviton Manufacturing Company, Inc.
Comment on Proposal No: 2-144
Recommendation: The Technical Correlating Committee action was correct in accepting Proposal 2-144 in Part and correlating it with Proposal 2-147. The Panel should modify the proposal to bring the action closer to being even-handed and promoting new technologies and installation practices without requiring ONLY circuit breaker AFCIs to meet the code rule. Parts (a) and (b) of the exception should, indeed, be removed and the exception modified as follows:
Exception: The location of the arc fault circuit interrupter shall be permitted to be at other than the origination of the branch circuit. ~~in compliance with (a) and (b)~~ A Listed combination type receptacle AFCI shall be permitted provided it is installed as the first outlet on the branch circuit and the branch circuit wiring is continuous from the service panel to the AFCI receptacle.
Substantiation: By removing (a) and (b) and modifying the exception, this will allow competitive AFCIs namely receptacle types, to be installed and help level the playing field while giving users a choice and placing the reset convenience closer to the living area as opposed to a service panel typically located in a basement, garage or outdoor location. This will also facilitate easier troubleshooting when the AFCI detects an arc and trips. After repeated requests, no data was presented originally, or later, that substantiates AFCI protection on the "home run" portion of the branch circuit. The data was clear in indicating arcs at receptacles and in branch circuit extensions.
Panel Meeting Action: Accept in Principle
Panel Statement: The submitter's recommendation would remove AFCI protection from a significant portion of the branch circuit. Given that 210.12 is intended to provide protection for the branch circuit, the exception is in conflict with the basic intent. The submitter's claim that "the data was clear in indicating arcs at receptacles and in branch circuit extensions" is not supported since a significant percentage of the fires are estimated to be in the distribution system itself and not just in extension and appliance cords. The panel has added language that would permit a relocation of the AFCI where metal conduit or steel "Type AC cable" is installed. See panel action and statement on Comment 2-129.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
BROWN, L.: Please see NAHB's Ballot Comment on Comments 2-79 and 2-95.

2-128 Log #755 NEC-P02 **Final Action: Accept in Principle**
(210.12(B) Exception)

Submitter: Jack Wells, Pass & Seymour/Legrand
Comment on Proposal No: 2-147
Recommendation: Continue to accept in principle but revise the text adopted in the panel meeting action to read as follows:
Exception: The location of the arc-fault circuit interrupter shall be permitted to be at other than the origination of the branch circuit where the arc-fault circuit interrupter is installed ~~within 1.8 m (6 ft)~~ at the first outlet of the branch circuit ~~overcurrent device as measured along the branch circuit conductors.~~
Substantiation: Permitting the arc-fault circuit interrupter to be installed at the first outlet of the branch circuit will allow the introduction of receptacle type AFCIs into the market. The technology for receptacle type Combination AFCIs is well developed, but without a clearly defined application for the receptacle AFCIs in the NEC it is unlikely that any manufacturer of these products will undertake the production of receptacle AFCIs. Accepting this comment will allow the continued development of AFCI technology and provide the consumer an alternate product for providing AFCI protection.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel statement on Comment 2-127.
Number Eligible to Vote: 12

Explanation of Negative:
BROWN, L.: Please see NAHB's Ballot Comment on Comments 2-79 and 2-95.

2-129 Log #797 NEC-P02 **Final Action: Accept in Principle in Part**
(210.12(B) Exception)

Submitter: Richard E. Loyd, Sun Lakes, AZ
Comment on Proposal No: 2-126
Recommendation: Revise text to read as follows:
~~Exception: The location of the arc-fault circuit interrupter shall be permitted to be at other than the origination of the branch circuit where the arc-fault circuit interrupter is installed within 1.8 m (6 ft) of the branch circuit overcurrent device as measured along the branch circuit conductors.~~
Exception No 1: Where RMC, IMC or EMT and metal outlet and junction boxes are installed for the branch circuit wiring, it shall be permitted to provide outlet-type or combination-type AFCI protection for each outlet in the branch circuit.
Exception No. 2: Where RMC, IMC or EMT using metal outlet and junction boxes is installed for the portion of the branch circuit between the branch circuit overcurrent device and the first outlet, it shall be permitted to install a combination AFCI at the first outlet to provide protection for the remaining portion of the branch circuit. The AFCI installed at the first outlet shall also provide protection for any equipment connected to that outlet.
Substantiation: This comment would accomplish the objective of allowing an outlet AFCI to be used where the entire branch circuit is in metal conduit and would allow the combination AFCI to be relocated to the first outlet if steel conduit is used for the portion of the circuit between the panelboard and the first outlet.
The submitter of Proposal 2-126 makes a valid point about the need to have different rules for AFCI protection when metal conduit used a branch circuit wiring method. This comment rewords 210.12(B) to include that concept and allow for the location of the AFCI to be different than the panelboard if metal conduit is used.
The steel conduit industry worked with Georgia Tech a number of years ago to develop software that analyzes the effectiveness of steel raceways used as an equipment grounding conductor. An analysis of residential branch circuits shows that the fault current levels available in 15 and 20 ampere branch circuits are not sufficient enough to damage the metal raceway to the point igniting combustibles external to the conduit. In looking at the history the need for AFCI protection, it has been focused around wiring methods other than steel raceways.
It is important for the panel to recognize that this is intended to be limited to RMC, IMC and EMT conduits. There is no data available that would extend this same logic to metal sheathed cables (that do not provide the same level of physical protection) or to other wiring methods (such as flexible metal conduit) that do not provide a suitable ground fault return path.
The existing exception that provides for a 6' allowance is deleted. This revision is because the new provisions for metal conduit provide for the necessary allowance in all cases without a 6' limitation. In essence, if you want to relocate the AFCI out of the panelboard, it is the metal conduit provisions that allow it to be located at any point downstream to the first outlet. This will also make the panels approach very consis
tent in that any trade off in AFCI location is fully based on the ability of the branch circuit to have sufficient physical protection, a suitable return path for fault current and be of sufficient material to contain any internal fault. The limited length approach does not provide as much flexibility and it ignores that the 6 feet of wiring could be the point of failure.

This approach provides the installer and user with multiple options in providing AFCI protection. Nothing is lost through these provisions and the trade-off between the AFCI and the metal conduit has valid technical merit without sacrificing the expected levels of protection of the branch circuit wiring.

This also gives greater flexibility in a number of hi-rise and large multi-family installations as well as some hotel/motel installations where the individual units are defined as dwelling unit rules via 210.18 but are wired with metal raceways.

Panel Meeting Action: Accept in Principle in Part

The panel rejects adding the proposed Exception No.1, deletes the last sentence in Exception No. 2, deletes "No.(2)" of Exception No. 2, and adds to the new exception the following wording: "or steel armored cable, Type AC, meeting the requirements of 250.118," after the word "EMT."

Also, delete the word "or" before "EMT".

Panel Statement: The panel accepts the deletion of the 6 ft rule.

The panel rejects adding the proposed Exception No.1 because combination-type AFCIs are required, and Exception No. 2 covers the approach of using steel conduit and cables in a more general manner.

The panel has deleted the last sentence in Exception No. 2 because combination devices protect the branch circuit downstream and, therefore, the sentence is unnecessary.

The panel has deleted "No. (2)" from Exception No. 2 and added to the new exception the following wording, "or steel armored cable, Type AC, meeting the requirements of 250.118." after the word "EMT" based on the substantiation provided with Comment 2-105.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

BROWN, L.: Please see NAHB's Ballot Comment on Comments 2-79 and 2-95.

Comment on Affirmative:

KING, D.: I applaud the Panel action on this Comment. Adequate physical protection of conductors will provide an acceptable level of safety for that portion of the branch circuit that does not have AFCI protection. It will also allow for the installation of AFCI devices in many applications where it would have been difficult with the present language of 210.12(B). Further protection could have been achieved through a different Panel action on Comment 2-105. The circuits left unprotected as outlined by the submitter of Comment 2-105 cannot be ignored and must be addressed by Panel 2. See my explanation on negative on Comment 2-105.

2-130 Log #842 NEC-P02 **Final Action: Accept in Principle**
(210.12(B) Exception)

Submitter: Jim Pauley, Square D Company
Comment on Proposal No: 2-147
Recommendation: Reject the Proposal.
Substantiation: The panel should reconsider and reject the proposal. Elimination of this physical protection for the branch circuit should not go forward. The entire approach would be better served by the panel requiring the use of EMT, RMC or IMC for any tradeoff in the location of an AFCI. In fact, the panel could take the approach that a combination AFCI be permitted at the first outlet if metal conduit were the installed wiring system. The panel should not ignore any portion of the branch circuit that doesn't have metal conduit for the physical protection.

The submitters approach in the substantiation that the exception somehow limits technological advances is a statement made in a vacuum of history and reality. The original intended purpose of AFCI protection is for the branch circuit wiring. It appears that he is claiming that the purpose should simply be ignored to allow some unstated or undemonstrated "advancement". No portion of the branch circuit wiring should be ignored relative to the need for AFCI protection. All of the installed system is equally susceptible to being an ignition source and unless the physical protection of the steel conduit system is provided, none of it should be exempted.

Panel Meeting Action: Accept in Principle
Panel Statement: The panel has accepted the requirement of branch circuit conductors in metal raceway through the panel action on Comment 2-129. See panel action and statement on Comment 2-129.
Number Eligible to Vote: 12

2-131 Log #895 NEC-P02 **Final Action: Accept in Principle**
(210.12(B) Exception)

Submitter: Michael P. O'Quinn, MOGO Enterprises, Inc.
Comment on Proposal No: 2-147
Recommendation: Revise as follows:

Exception: The location of the arc-fault circuit interrupter shall be permitted to be at other than the origination of the branch circuit. ~~in compliance with (a) and (b).~~

~~(a) The arc fault circuit-interrupter installed within 1.8 m (6 ft) of the branch circuit overcurrent device as measured along the branch circuit conductors.~~

~~(b) The circuit conductor between the branch circuit overcurrent device and the arc fault circuit interrupter shall be installed in a metal raceway or a cable with a metallic sheath.~~

Substantiation: Mr. Chase's substantiation seems to point not to the elimination of 210.12(B) Exception (b), but to 210.12(B) Exception (a) - the elimination of the 6 foot allowance between the overcurrent device and the AFCI device.

I agree with the elimination of the 6 ft rule and the substantiation for the following reasons:

A. Even though 210.12(A) requires arc-fault protection "...to de-energize the circuit when an arc fault is detected", and 210.12(B) requires the arc-fault protection "...to provide protection of the branch circuit", this does not necessarily mean the protection/deenergization device must be at the origination of the circuit.

Arcing can only occur when current is flowing, indicating a complete circuit. When no load is present because a device has opened the circuit, no current is flowing, stopping the arc. In an open circuit, there is also no voltage difference at the point of an arc source, hence any arcing stops. This is basic electrical theory.

Even though the intent of 210.12 at the adoption in the 1999 NEC was for arc-fault devices to be in the panelboard, equivalent safety can be accomplished by a device placed anywhere in the circuit.

B. Mr. Chase rightly points out that the majority of arc-fires are due to supply cord and equipment damage. If arc-fault protection was at the receptacle location, either a combination type (UL AWAH) or receptacle type (UL AWBZ or AWCG) arc-fault device, the focus would be on protecting, the circuit from the source of the majority of arc-fires, as well as opening the circuit when an arc-fault is detected.

It would appear the provisions of 300.4 "Protection Against Physical Damage", along with 334.15(B) "Protection From Physical Damage" and 334.15(C) "In Unfinished Basements", would sufficiently protect dwelling wiring installations from arc-faults in the wiring from the panelboard to the outlet(s).

By retaining the original wording of the exception, protection for arc-faults following 210.12(A) and 210.12(B) would be followed. Eliminating the restrictions would clarify that protection can be achieved by any type of combination-type arc-fault device.

2-132 Log #1741 NEC-P02 **Final Action: Accept in Principle**
(210.12(B) Exception)

Submitter: Timothy Arendt, Shamrock Electric Co.
Comment on Proposal No: 2-142
Recommendation: Replace the existing exception with the following revised language.

Exception: AFCI protection shall not be required for that portion of the branch circuit continuously enclosed in metal raceway with metal outlet and junction boxes. Outlet-type or combination-type AFCI protection shall be required for that portion of the branch circuit not enclosed in metal raceway.

Substantiation: The action of CMP 2 to require AFCIs on all dwelling unit branch circuits is too broad and will lead to a move away from a "without amendments" use of the NEC. The term "dwelling unit" includes not only one and two family homes but also condominiums and apartments. Dwelling units in condominiums and apartments - especially in hi-rises - usually have fire resistive construction and more stringent wiring method requirements which override the need for whatever benefit combination type AFCIs may provide. My experience as past Chief Electrical Inspector for the City of Chicago leads me to believe that an exception where metal raceway is used would be appropriate and would provide an option that may make this requirement easier for jurisdictions to accept.

In Chicago for the past 50 plus years 100% of legally constructed dwelling type structures have used metal raceway and metal boxes as the wiring method for the fixed wiring in dwellings. I have attached substantiation in the form of NIFRS Data that compares Chicago vs National residential electrical fires. The data shows that Chicago, which uses metal raceway exclusively for dwelling occupancies, has (4) times fewer residential electrical fires as a percentage of total residential fires, than found nationally. Moreover, there are nearly (3) times fewer fires caused by the distribution, which includes the fixed or installed wiring. The requirement for AFCI protection where NM Cable is used will certainly lead to a reduction in fires. Unlike arc faults in combustible NM cable, arc faults either series or parallel within non-combustible steel raceway become enclosed short-circuits and ground faults. These short circuits and ground faults are completely isolated from the fuel load and are handled very well by conventional circuit breakers or fuses. The cost of requiring AFCI protection to circuits already protected by non-combustible steel raceway is

not warranted. In fact, my fear would be that the additional AFCI cost would result in less use of metal raceway, which is a superior wiring method for dwellings. All of the benefits of being able to add circuits or replace damaged or aged conductors would be lost. The benefits of metal raceway in reducing dwelling electrical fires was documented at the October 18-19, 2006 NFPRF Symposium on Aging Electrical Wiring Systems.

This revised exception would also have the much desired effect of encouraging device manufacturers to develop and reintroduce their outlet-type AFCIs for protecting extensions to the fixed branch circuits. The combination of metal raceway with outlet-type AFCIs should be an option for those desiring this increased level of safety and protection.

Note: Supporting material is available for review at NFPA Headquarters.

2-136 Log #559 NEC-P02 **Final Action: Accept in Principle**
(210.12(B) Exception (b))

Submitter: Steve Campolo, Leviton Manufacturing Company, Inc.
Comment on Proposal No: 2-147
Recommendation: The panel should modify the proposal to bring the action closer to being even-handed and promoting new technologies and installation practices without requiring (essentially) ONLY circuit breaker AFCIs to meet the code rule. By adding unnecessary impediments in order to use a receptacle, clearly steers an installer to the circuit breaker. Not only Part (b) but in addition Part (a) of the exception should, indeed, be removed and the exception modified as follows:

Exception: The location of the arc fault circuit interrupter shall be permitted to be at other than the origination of the branch circuit, ~~in compliance with (a) and (b)~~ A Listed combination type receptacle AFCI shall be permitted provided it is installed as the first outlet on the branch circuit and the branch circuit wiring is continuous from the service panel to the AFCI receptacle.

Substantiation: By removing (a) and (b) and modifying the exception, this will allow competitive AFCIs namely receptacle types, to be installed and help level the playing field while giving users a choice and placing the reset convenience closer to the living area as opposed to a service panel typically located in a basement, garage or outdoor location. This will also facilitate easier troubleshooting when the AFCI detects an arc and trips. After repeated requests, no data was presented originally, or later, that substantiates AFCI protection on the "home run" portion of the branch circuit. The data was clear in indicating arcs at receptacles and in branch circuit extensions. By allowing AFCI receptacles as a viable alternative, this will promote investment and development of these products in the same manner as the previous ruling of Code-Making Panel 2 when combination AFCI circuit breakers were mandated on the expectation that they will be developed and made available. This comment seeks to extend the panel's intent with alternative products that the industry is asking for without compromising safety since no data was ever presented on the "home run".

2-137 Log #840 NEC-P02 **Final Action: Accept in Principle**
(210.12(B) Exception No. 2 (New))

Submitter: Jim Pauley, Square D Company
Comment on Proposal No: 2-142
Recommendation: Add a new Exception No. 2 to read as follows:
Exception No. 2: Where a branch circuit to a fire alarm system installed in accordance with 760.41 and 760.121 is installed in RMC, IMC or EMT with metal outlet and junction boxes, AFCI protection shall be permitted to be omitted.
Substantiation: The expansion of AFCI protection to all 15 and 20 ampere branch circuits in a dwelling unit creates a conflict with the provisions of Article 760 which states that fire alarm system branch circuits cannot be supplied through an AFCI or GFCI. This exception would provide the provisions necessary to omit the AFCI protection on this circuit alone. It is important that the panel not simply "exempt" the branch circuit without further provisions to provide some level of additional protection. The provision to install the branch circuit in metal raceway provides both the necessary physical protection as well as a proven ground-fault return path should a fault occur in the conductors in the raceway.

This is not a burdensome provision since the fire alarm panels are most often located close to the panelboard or, in the case of a Class 2 supply, they can locate the transformer using short branch circuit and run the Class 2 cabling to the fire alarm panel.
Panel Meeting Action: Accept in Principle
Revise the wording in the recommendation to read as follows:
"Exception No. 2: Where a branch circuit to a fire alarm system installed in accordance with 760.41(B) and 760.121(B) is installed in RMC, IMC, EMT, or steel armored cable, Type AC, meeting the requirements of 250.118, with metal outlet and junction boxes, AFCI protection shall be permitted to be omitted."
Panel Statement: The revised wording is consistent with the action taken on Comment 2-129 and clarifies the intent of the panel.
Number Eligible to Vote: 12

2-139 Log #756 NEC-P02 **Final Action: Reject**
(210.12(C) (New))

Submitter: Jack Wells, Pass & Seymour/Legrand
Comment on Proposal No: 2-138
Recommendation: The panel should accept in principle and revise 210.12 by adding a new section 210.12(C) as follows:
210.12(C) Existing Installations. When the overcurrent protective device for a 120-V, single phase, 15- and 20-ampere branch circuit is replaced as part of a service capacity upgrade or renovation, the branch circuit shall be protected by a listed arc-fault circuit interrupter, combination type, installed at the origination of the branch circuit or at the first outlet of the branch circuit.
Substantiation: The Panel rejected this proposal with the statement: "There is a wide variety of existing wiring configurations and the panel needs additional input on the compatibility of these wiring systems with AFCI protection". The Panel apparently did not dispute that there is a need for AFCI protection in older homes. The substantiation provided with the proposal points to CPSC data that electrical fires predominately occurred in dwellings over 20 years old with the highest rate of fires in dwellings over 40 years old. In the explanation of negatives, several panel members recognized that there is a clear need for AFCI protection in older homes. The Panel's primary concern seems to be the compatibility of AFCIs with wiring systems in older homes. This comment recommends allowing the use of a receptacle AFCI at the first outlet as an alternative to providing the AFCI at the origination of the branch circuit. Permitting the use of a receptacle AFCI at the first outlet will provide the installer with an additional option when choosing an AFCI that is appropriate for use with the wiring in older homes. A receptacle type Combination AFCI at the first outlet will provide a high level of arc fault protection in older homes.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Comment 2-141.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 3
Explanation of Negative:
KING, D.: See my explanation of negative on Comment 2-141.
LAROCCA, R.: See my explanation of negative vote on Comment 2-141.
WEBER, R.: The panel should have accepted in principle and part the submitter's comment. Given the accept in principle actions on comment 2-95; expanding the areas in a dwelling unit requiring AFCI protection and Comment 2-129, that was accepted in principle and part, thus allowing the use of a combination AFCI outlet device use. The device protection means is allowed providing that a steel raceway or Type AC steel jacketed cable and metal outlet

and junction boxes are installed from the panelboard where the branch circuit originates; then the combination AFCI device will provide protection for the remaining portion of the branch circuit downstream from that point. Presently, there is no guidance in positive code language to direct the users for existing installations that are upgraded or changed out due to effects of aging electrical systems by failure or burn out and what the current code requirements are for new installations with new construction that are indicated in the present code text. Given the fact that AFCI are an increased safety means; with its required use in older type installations only a positive effect by limiting the potential of fire hazards will be the result. It is always repeated that the electrical code is not a design manual; it does start as a minimum base line for what must be done to electrical systems and by not addressing similar requirements for system change outs or upgrades is unfortunate and not in the public best interest. Thus, the minimum standard becomes the maximum requirement and many will not do any more than that to meet the code, irregardless of the increased safety factor. From years of experience in the field, if it is not written in prescriptive code text to be complied with, the user will normally not exceed the minimum standard? This direction is needed and should be in the code to enhance electrical safety.

Comment on Affirmative:

BROWN, L.: Please see NAHB's Ballot Comment on Comments 2-79 and 2-95.

2-140 Log #1007 NEC-P02 **Final Action: Reject**
(210.12(C))

Submitter: David Shapiro, Accurate & Intriguing Writing & Editing
Comment on Proposal No: 2-106
Recommendation: Accept Mr. Eddie Phillips' proposed Part (C) as well, as modified herewith:

(C) Other Residential Occupancies. All 125 volt, single phase, 15 and 20-ampere branch circuit wiring installed in a lodging and rooming houses, dormitories, board and care facilities shall be protected by listed arc-fault circuit interrupters.

Substantiation: Besides Mr. King's argument that these occupancies serve as dwelling units and are subject to the same hazards that arise with the use of electricity as that of any other dwelling unit, many dormitories are occupied by immature individuals, this too creating a greater risk of fire due to arcing faults. A similar argument could be made about lodging and rooming houses, especially SFOs. If the entire facility is not to be protected though-many dormitories, for example, are of sufficiently fireproof construction that it is just the individual occupancy that is primarily at risk-it is hard to make argument that the entire branch circuit be protected, all the way back to the panel, or a few feet from it. Protect the receptacles, and to the extent the new AFCIs will do so, the cords plugged into them, and protect the wiring in the walls from nails, and you've protected the individual occupancy from electrical fire starting within it, to the extent the technology makes possible.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any additional information to support the expansion of AFCI devices to the locations described in the proposed new subdivision (C).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:

KING, D.: This Comment should have been accepted. I agree with the submitter's substantiation. The life saving benefit afforded by this technology should be expanded to include all occupancies that are similar to and function as dwelling units. See my explanation of negative on Comment 2-93.

WEBER, R.: The panel should have accepted in principle, the submitter's recommendation and proposed text could have been modified by including the change supported in Comment 2-238a by changing the term "dormitories" to "sleeping rooms in dormitories". With the proposed text and the enhanced safety potential provided by an AFCI protection means combination breaker or combination device type with approved wiring methods, in the occupancies noted will decrease the fire hazard. Those type of facilities do not normally have a sufficient amount of outlets provided and most when observed in the field and in actual use have a number of extension cords and relocatable power taps being utilized to connect the plethora of appliances, lamps, computers, scanners, stereos, televisions, small refrigerators and hot plates, corn poppers or other portable cooking means in use. The only way for a building manager to impact their use is to cut the ends off of the cords or remove the items; which in turn are then replaced by the occupant and the over load hazard continues once again. Given the small area in each of these type occupancies and the electrical load imposed on the system, it amazes me that fire incidences are not brought to the attention of the officials having jurisdiction more often; however, they do occur and are normally covered up by the offenders. Until such time when there is a catastrophic event and a large amount of damage done, we will not have the hard copy report to fall back on. The problem is out there and many of the adjacent unknowing users are at risk; this requirement can augment the level of safety for all. Supporters need to continue the process to incorporate this into the National Electrical Code, if not in this cycle then the next. We seem to provide a great deal of support for fire suppression systems, "sprinklers" and yet are unwilling to limit the fire source from happening in the first place as in this case, with the increased use of AFCI protection means.

Comment on Affirmative:

BROWN, L.: Please see NAHB's Ballot Comment on Comments 2-79 and 2-95.

2-141 Log #1095 NEC-P02 **Final Action: Reject**
(210.12(C))

Submitter: Jim Pauley, Square D Company
Comment on Proposal No: 2-138
Recommendation: The text should be arranged by adding a new (C) to 210.12 as follows:

(C) Panelboard Replacement in Existing Installations. Where an existing dwelling unit panelboard containing 15 or 20 ampere 120V branch circuit overcurrent devices is upgraded or replaced, AFCIs shall be installed to meet the requirements of 210.12(B). Only those branch circuits that are part of the upgraded or replaced panelboard are required to comply with this section.

Substantiation: The panel statement for Proposal 2-138 asked for input on the compatibility of AFCI devices with the wide variety of wiring systems that are in the installed based of dwelling units. The purpose of this comment is to provide input to that request and to give the panel some suggested language should a retrofit requirement be pursued.

There are numerous wiring systems installed in the existing base. Some of those variations include knob and tube wiring, 2-wire NM cable without equipment grounding conductors, AC cable and various other wiring methods still in use today. AFCIs will certainly perform their arc detection function in all of these wiring systems. But, the panel must recognize that because of the likely modifications to these wiring systems, AFCIs when installed will likely detect conditions (such as crossed neutrals, grounded neutrals, etc.) that must be corrected and in some cases may require extensive investigation by the installer and some replacement of wiring. However, it should also be recognized that these are conditions that should be corrected.

Pursing a retrofit requirement should be approached with the following key points in mind:

1) The protection must be, just as it is for new construction, for the entire branch circuit. There is no logic to trying to ignore portions of the branch circuit simply because the branch circuit may contain wiring errors (crossed/grounded neutrals, etc.).

2) It's noted that the grounded/crossed neutral situations, if they exist in the installation, occur throughout the branch circuit – including (and actually most prevalent in) the wiring downstream of the first outlet. Because of this, it makes no technical sense to attempt to resolve the issue by relocating the AFCI. In addition, a relocation gives up the protection for the very wiring where it was intended – the branch circuit wiring.

3) There will be wiring systems that have so many issues that they simply need to be replaced. This could lead to decisions to not make the upgrades because of the rewiring needed.

Relative to the code language suggested in this comment:

1) The language in Proposal 2-138 is problematic because it only applies if you are "replacing" the overcurrent device. In many cases, panels are upgraded from one amperage to a higher amperage (i.e. 100A panel to 200A panel) and, if of the same manufacturer and type, the existing circuit breakers are reused. It would seem that this defeats the intended purpose of requiring a retrofit of AFCIs.

2) This comment proposes to break the retrofit requirement into a new section (C) that would be explicit to changing out the panelboard.

3) The language is revised to make the retrofit requirement apply when the panelboard is changed or replaced.

4) The language retains the approach that AFCIs have to be installed for the same circuits as specified in 210.12(B). This makes sense and allows the retrofit requirement to track the new construction requirements. This is also consistent with the GFCI retrofit requirement in 406.3(D)(2).

5) The language applies to the panelboards that contain 15 or 20 ampere 120V circuits. This avoids confusion about whether or not the panel is the service panel or a subpanel.

6) The last sentence of the provision is intended to apply the retrofit requirement only to those branch circuits that are impacted by the upgrade. If there is another panelboard installed that is not impacted by the upgrade, those circuits are not included in the AFCI requirement.

Panel Meeting Action: Reject
Panel Statement: The panel would like more experience to be obtained regarding the installation of combination type AFCIs in new dwellings before requiring the installation of combination type AFCIs in the wide variety of existing dwellings that will have numerous different wiring configurations.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 3
Explanation of Negative:

KING, D.: This Comment should have been accepted. Panel 2 has reviewed sufficient Technical data from the Consumer Product Safety Commission that shows that there is an increased number of electrically oriented fires in dwelling units that are over 20 years old with the largest number of electrically oriented fires occurring in dwelling units that are over 40 years old. Any tripping that may occur from the installation of AFCI devices in older wiring systems is an indication of problems in the electrical wiring that needs to be

and should be corrected. Many fires will be eliminated by identifying and correcting existing wiring problems in dwelling units that in the past have been ignored. I agree with the submitter of this comment that the requirements for existing dwellings should be consistent with the requirements for new construction. The addition of this proposed text would have saved many lives and saved millions of dollars in costs associated with property damage.

LAROCCA, R.: Older dwellings are the ones most likely to have wiring systems that are compromised due to age, damage, or poor installation techniques. They are the dwellings that could benefit the most from the retrofitting of AFCIs during the replacement or upgrading of a panelboard containing 15 or 20 ampere, 120 volt branch circuit over current protection devices. The panel's action to reject this comment will make the extension of AFCI protection to these dwellings difficult.

Also, even though there are a wide variety of existing wiring configurations, all should be compatible with AFCIs if they are not damaged or otherwise compromised. Adding AFCIs to these systems will help identify potential dangers in the existing wiring.

WEBER, R.: See reason for negative vote on Comment 2-139. In addition, the submitter's recommendation should have been accepted and thus fill a void in the code addressing electrical system replacements. The last sentence in the proposed text clearly states where compliance with the requirements of 210.12(B) would be mandatory; a small first step, but one that can only lead to a safer environment for more of the public, that choose to modify their electrical system. As we view the older housing stock in use and the lack of adequate inspection and maintenance given to the electrical system, if anything is to be done; it will be when something burns out or does not work, then and only then will most of the public have the least amount of cost of repairs or replacement work completed to meet the minimum code requirement. We need to be proactive and support this guidance for the user to make the change to the electrical system by clearly stated code language and what must be done on a minimum level. The electrical system may not have any additional work done for a long time; so at the upgrade point, clear code requirements must be provided to the user.

Comment on Affirmative:

Comment on Proposal No: 2-154
Recommendation: Revise as follows:

All 125-volt single phase receptacles shall have Overload Fault Circuit Interrupter Protection for Personnel.

Substantiation: Each year residential fires destroy thousands of homes and kill hundreds of people in the United States. Many of these fires are caused by electrical faults, shorts, overloads, and damaged appliance wiring. An electrical outlet that detects such problems and automatically turns off the electricity would prevent a significant number of these fires saving both lives and property. I recently saw a demonstration of such a devices and the performance was impressive. Equally impressive were the statistics on property destruction and deaths caused by electrical fires that such a device would prevent.

First there were fuses, then circuit breakers, then GFIs; fault sensing and interrupting outlets re the next logical step in the continued improvement of electrical safety. I live outside Chicago and we have a stringent fire code and electrical wiring requirements; I wish that devices such as this were part of that code.

Submitter: K. Stephan Joseph, Marietta, GA
Comment on Proposal No: 2-154
Recommendation: Revise as follows:

All 125-volt single phase receptacles shall have Overload Fault Circuit Interrupter Protection for Personnel.

Substantiation: The overload fault technology is important and would be tremendously helpful in helping to protect people from the potential hazards present in electrical wiring and outlets. This technology would be particularly helpful in keeping both toddlers and senior citizens safe from today's electrical hazards.

First, let's address the issues involving toddler safety. Although we were all admonished not to insert any objects into electrical outlets, at some point in time most of us did. Why? We did it because of our natural human curiosity. Children are consistently developing quicker and becoming far more intelligent than the preceding generation. Simple objects like plastic outlet covers are no longer working as effective deterrents for today's innovative and tenacious youth.

Senior citizens on the other hand may have learned the dangers of electrical shock, they sometimes forget some of the things that they have learned or have reverted to a childlike mental state. In other cases, some seniors have not kept up with current technological advancements.

Although toddlers and senior citizens are the groups who would benefit most from this technology, individuals from all ages in between can benefit as well. It's no secret that many of us have taken risks when it comes to plugging too many items into a single outlet or plugging in items with damaged electric cords. Some of us are too lazy, too cheap or just too careless to go the extra mile to do things safely. That leads to taking chances and hoping that the outlet can take one more plug or that the vacuum plug can be run over a few more times before having to be tossed out.

With that being said, I truly feel that the world really does need this new technology. Whether it's for the toddler and senior citizens who don't know any better or the individuals who are careless and need to be protected from themselves, we are all in dire need of this sort of technology in our homes and businesses. Making this technology code would save countless lives and billions of dollars for insurance companies as well as business and homeowners.

Comment on Proposal No: 2-154
Recommendation: Revise as follows:
All 125-volt single phase receptacles shall have Overload Fault Circuit Interrupter Protection for Personnel.
Substantiation: I recently had the opportunity to see a product manufactured by a company called 2D2C Inc. I believe they are calling the product Safe Plug, which utilizes new technologies that they refer to as OFCI, SFCI and PFCI. As far as I can tell, this technology appears to solve a problem in the United States that for some unknown reason has not been addressed up until this point. When you look at the statistics and realize that there are 960,000 home fires that originate with electrical issues, and there is a technology that could arguably prevent all of these fires, I believe that this technology should be mandated. Unfortunately, when people or companies build or renovate structures, they are always looking to cut costs. In fact, the person building the structure or making the decision probably will never spend time in the structure so they are NOT motivated to make it as safe as possible. For this reason, I believe that this product needs to be mandated in the National Electrical Code in order to save lives in the United States. We spend a lot of money in the United States on technology and products that make our lives easier and more pleasant, please consider this product for a much better reason, it will SAVE LIVES!

Submitter: Stephen Jarvis, Glenbrook, NV
Comment on Proposal No: 2-154
Recommendation: Revise as follows:
All 125-volt single phase receptacles shall have Overload Fault Circuit Interrupter Protection for Personnel.
Substantiation: Local municipalities are spending millions of dollars of our city resources and risking the lives of the brave fire and police personnel every year responding to electrically caused fire and electrical shock incidents that are unnecessary and now preventable. NEC code requirement language should specify the use of ac receptacles that include the features of an available electronically controlled smart technology that causes the outlet to operate as a multi-level circuit breaker and that may only be energized to provide electricity to an appliance by the recognition of a proper ac plug insertion. The proposed change in code language will cause the infusion of the electrical overload circuit technology into the electrical systems of US consumer's homes which will in turn result in millions of dollars of property being saved and countless vulnerable children and citizen lives being spared from unnecessary loss, pain, suffering and death due to preventable instances and causes of fire and shock hazards.

We consumers now use significantly more electrically powered devices within our home environments. Many US homes have antiquated electrical systems that were not designed for such use. (Consumer Reports.org FEATURED REPORT August 2001 entitled Your Home wiring: Is it safe?) The fifteen year old building in which I live part-time with an active home office, contains an abundance of consumer electronic appliances, computer work stations, fax machines and entertainment electronic systems in addition to many electrical kitchen appliances, each requiring an activated ac cord in order to be on-line and operational.

In many rooms of the home, the requirement for additional receptacles, for the many ac cords needed for the appliances, exceeds the number of those currently available receptacles within the existing wall outlets. The easy solution for me, as for most consumers, has been to use multiple outlet extension cords and various external ac distribution systems with multiple outlets.

Some of these consumer appliances contain the convenience feature of internal timers that allow the unattended appliances to turn on by themselves, at prescheduled intervals, to perform the tasks for which they were designed. (TV/VCR, coffee maker, cooker pot, etc.) In some cases, such as with the fax machine and the internet server, the ac power switch of the product remains on and active at all times for the intended operational use of the product.

When I leave and when I return home, it is not practical or convenient to plug and unplug each and every electronic product's ac cord. Nor is it always practical to do so just at each time many of the electrical products are to be used. I simply don't bend over as easily as I use to. Crawling around and behind the TV and stereo is not an easy task, nor is it particularly statically safe to be plugging in and unplugging cords in and out of live, ac wall outlets in cramped and visually impaired situations. As a consequence, many electronic appliances simply remain continuously connected to the live current of the wall outlets, or into extension cords or other temporary consumer constructed ac distribution systems external to walls of the building.

The U.S citizen and consumer is only being minimally protected by the individual 15-ampere branch service circuit breaker located at the main electrical distribution panel where electricity service enters the home.

Electrical appliances do occasionally develop faults and fail. When they do fail, they often will so in a manner that draws more AC current from the outlet than the product was designed to safely handle, but not enough current to exceed the safety threshold of the 15 amperes limit offered by the branch circuit breaker located inside of the home's electrical distribution panel.

When excess electrical current within the appliance exceeds the product's design limit, severe heat is produced which in turn may cause ignition of nearby flammable materials close to the failing appliance. If such failure happens in the home, either with or without the occupant's knowledge, the resulting fire may lead to loss, pain, suffering and even death.

Submitter: Ronald Ryerson, Sutter Health
Comment on Proposal No: 2-154
Recommendation: Revise as follows:
All 125-volt single phase receptacles shall have Overload Fault Circuit Interrupter Protection for Personnel.
Substantiation: Many home fires start because of circuit overloads that occur due to faulty appliances or overloaded wall plugs. My parents experienced such a fire in their home office many years ago while they were sleeping. Fortunately, the outcome was only minor fire and smoke damage to that portion of the home. But, many elderly people are killed by home fires caused by overloaded circuits. A wall plug which could protect against such occurrences would be a great safety feature for homes and offices. Also, it would be a boon to parents of young children if they could be guaranteed protection against electrocution or shock from conducting objects being inserted into home outlets. I understand that the current types of protection against this occurrence is limited to nonconducting plug inserts being placed into the outlet, but all of these can usually be removed by most young children.

Submitter: Thomas Lischka, Kewaunee, WI
Comment on Proposal No: 2-154
Recommendation: Revise as follows:
All 125-volt single phase receptacles shall have Overload Fault Circuit Interrupter Protection for Personnel.
Substantiation: Residential fires caused by electrical faults contribute to many injuries and deaths in the U.S. A large portion of these fires are caused by electric current overload. Recently, I attended a demonstration of a new device called an Overload Fault Circuit Interrupter. This new technology can be used to prevent the current overload that causes these fires by shutting off any circuit that it detects an overcurrent draw and subsequently eliminate the overheating that causes fire. This same device was also able to detect overcurrent draw and disconnect a circuit when someone such as a child inserted a metal object into a receptacle. The current way of protecting a receptacle with a plastic outlet protector can be easily defeated by a child. I firmly believe this new device can greatly reduce the incidence of home fires and electrical shocks caused by overcurrent faults. I respectfully ask the Code-Making Panel to consider adding the requirement of this new technology into the 2008 National Electrical Code.

Submitter: Marlene Nolan, Belvidere, IL
Comment on Proposal No: 2-154
Recommendation: Revise as follows:
All 125-volt single phase receptacles shall have Overload Fault Circuit Interrupter Protection for Personnel.
Substantiation: Unknown to most, low levels of heat applied for extend periods of time can be a hazard. Organic compounds, like the plastic insulation on a wire or electrical plug, when warmed for long periods of time will release carbon molecules. Carbon acts as a conductor. This carbon can change the property of an insulator not a conductor. Power cord insulation can become a low resistance path between a "live" and "return" wire pair, causing an overload in that portion of the circuit. Extreme overloads in wires can heat them to the point of melting the insulation away from the wire, igniting adjacent flammables such as dust or igniting the insulation itself. I have seen this new technology in demonstration and I believe this product can save lives and prevent fires.

Comment on Proposal No: 2-154
Recommendation: Revise as follows:
All 125-volt single phase receptacles shall have Overload Fault Circuit Interrupter Protection for Personnel.
Substantiation: We are a family with three active children. Every year, it appears that more and more technology, appliances or toys appeals to younger and younger children, and therefore, we find that our children are routinely using products that need to be plugged in. This can range from "Winnie the Pooh" night lights that play music, to electronic keyboards for the older kids.
We are aware that every year, 20 percent of residential electrical fires are caused by electrical faults. The National Fire Protection Association reports that approximately 41,500 residential fires are caused by electrical faults, and, according to the U.S. Consumer Product Safety Commission, approximately 400 deaths occur annually from electrical faults. We also have the sad experience of knowing a family whose house caught fire years ago, and the impact of that fire still remains today. The casualties in these fires are most likely the people who are least able to help themselves — children.
We understand that technology exists to prevent the types of situations that result in far too may fires and fatalities each year. We have seen a demonstration of a 125-volt single phase receptacle with an overload fault circuit interrupter. It is our opinion that any new technology or invention that can save even one life or prevent even one fire is worthwhile. It is our belief that this receptacle can do much more than that. We urge you to take whatever steps necessary to require this type of product or technology in every home so that unnecessary fires and injuries can be prevented. In a day and age when so much of our scientific knowledge is going to improve computers and virtual technology, it seems appropriate to focus on something that can go far to protect those we love.

2-164 Log #901 NEC-P02 **Final Action: Reject**
(210.13)

Submitter: John Crymes, Jr., JMC Electrical Engineering
Comment on Proposal No: 2-154
Recommendation: As I understand it, millions of dollars and much public resource, Police, Fire Dept., and Court Litigation are unnecessarily used each year in the repair and prevention of electrical fires due to the overload of receptacles and, in particular substandard electrical extension cords. Seems to me that the inclusion of NEC specifications regarding the use of an overload protection fault device would be prudent.
Substantiation: To protect property and for personal safety, all 117 Volt Ac should have a code required overcurrent (1) protection device.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Comment 2-177.

2-165 Log #919 NEC-P02 **Final Action: Reject**
(210.13)

Submitter: Michael McQuade, E.I. Dupont de Nemours and Company Inc.
Comment on Proposal No: 2-154
Recommendation: Revise as follows:
All 125-volt single phase receptacles shall have Overload Fault Circuit Interrupter and Power Fault Circuit Interrupter protection.
Substantiation: I write this comment in response to your rejection of Proposal 2-154. I request you approve this proposal. You requested A) evidence that the proposed protective device would have prevented the fire incidents I described in the substantiation and B) independent evaluation that the safety outlets will perform their intended function and that there will be no unintended consequences such as false tripping of the device.
A) The proposed devices would have prevented many of the fire incidents.
Such a statement is impossible to absolutely support, as we cannot reenact these disasters. It is generally difficult to even identify exact percentages of fire caused by different types of electrical faults. Often, post analysis of fires does not result conclusively in cause due to lack of remaining evidence. Furthermore, the detailed analysis, including x-rays, is usually done by fire investigators, not by Fire Marshals, and paid for by a product manufacturing company that is trying to avoid liability. Therefore, this evidence is sealed from public viewing.
However, a qualitative survey of fire investigators consistently indicates three primary electrical causes of the fires they have investigated. Some of the persons interviewed include Jim Finneran of ElectroTek Consultants (Spencerville, IN), the electrical expert in the Fire Findings courses, Alfred Hogan (Winter Haven, FL), John Robison (Prattville, AL), Chris Korinek

(Cedarburg, WI), and Dr. Vytenis Babrauskas (Issaquah, WA). Most of the quantitative original research in North America on electrical ignition has been produced and published by Dr. Vytenis Babrauskas of Fire Science and Technology Inc. (www.doctorfire.com) and by Chris Korinek, P.E., of Synergy Technologies (www.synergytech.net). Their research is consistent with the experience of almost all other investigators that three events cause most of the electrical fires.

These three primary causes consist of the following in order of prevalence:
1. High current flowing through high resistance connections,
2. Excess voltage across electrical device loads, and
3. Excess current flowing through electrical device loads.

The overload protection I propose directly addresses these three causes. This preventative technology can be described as follows:

1) Over-current Fault Circuit Interrupters (OFCI) that disconnect electricity to a load (appliance, extension cord, lamp, electronic device, etc.) when the load draws more current than it has been designed to accommodate. Circuit breakers are intended to protect interior wall wiring from overloads and do not protect most loads adequately. The leakage current detection found in GFCIs and AFCIs only trips on overloads in the rare situation when the overload is caused by a current path to ground, or when excessive heating from the overload leads to carbonization of materials leading to leakage currents or arcing. Therefore, this primary fault mechanism has virtually no existing protection in the electrical distribution system presently, being presently detectable only by secondary symptoms subsequent to excessive heating. In contrast, the OFCI can detect primary symptoms that occur before an immediate fire hazard exists.

2) Power Fault Circuit Interrupters (PFCI) that disconnect electricity to a load when it measures either of the following:

a. High current flowing through a high-resistance connection in the distribution wiring
b. Excess line voltage across a load, or
c. Inadequate voltage across a load.

High resistance connections are most often found in loose wire nuts or loose wire-bonding screw down connections. High-resistance connections can exist for years without causing a fire if little current flows through the connection. However, a 1 Ohm junction results in over 200 Watts of power dissipation with a load pulling 15 amperes through it. A high resistance junction with high current flowing through it can glow red hot and act as a fire ignition source. Investigators universally agree this to be the top cause of electrically-ignited fires.

Excess voltage across a load should not occur if the electrical system has been maintained properly. However, in a residential 2-leg system, if the common (Neutral) return path disappears, the leg voltage depends on the leg-to-leg ratio of load impedance. A load imbalance results in little voltage across low resistance loads on leg A and high voltage across high resistance load on leg B. For example, with 120 VAC per leg, nothing but a 25W load plugged into a leg A outlet and a 1500W load plugged into a leg B outlet, 236 VAC would drop across the 25W load and 4 VAC drop across the 1500W load. The 25W load would experience 400 percent the normal power dissipation and could easily overheat and act as an ignition source.

Inadequate voltage across a 120 VAC relay can cause relay chatter, where the voltage is too low to hold the normally-open relay closed. Thus, the relay continuously and cyclically opens and closes. You may have experienced the equivalent "chatter" effect on your car starter solenoid with a low battery. With a load attached, the chatter causes the relay contacts to overheat to the level where it can ignite fires. 120VAC relays are often used with motors. Furthermore, inadequate voltage can damage electronics.

To my knowledge, nothing presently required by the NEC within a residential electrical distribution system protects against these faults.

I have provided a document that describes the technology itself in more detail. The document was written by a technologist at 2D2C, Inc. It describes generally how Overload Fault Circuit Interrupters, Power Fault Circuit Interrupters and Shock Fault Circuit Interrupters work.

The document also describes the first products to implement OFCI and PFCI commercially. These products are the SafePlug Model 1200 and Model 1300 safety outlets made by 2D2C, Inc., (www.safeplug.com).

B) Independent evaluation that the safety outlets will perform their intended function and that there will be no unintended consequences such as false tripping of the device.

To prove the product reliability, safety and functionality, the SafePlug products were tested against and exceeded the requirements of UL 498A (November 2005) and UL 498 (October 2006) for the US, and CSA C22.2 42-99 for Canada. See CSA International Master Contract 230670, Certification of Compliance 1686590.

Additionally, two independent fact-finding reports provide evidence of how the overload and power fault circuit interrupters would prevent the ignition of fires by the primary ignition techniques as discovered by fire investigation experts. These studies were performed by CSA International (February 2006) and by ETL Intertek Semko (December 2005).

The CSA fact finding report also tested the SafePlug product under extreme surge conditions, to match the tests applied to Ground Fault Circuit Interrupters. The SafePlug outlets not only survived the extreme surges but continued operation as normal after experiencing the series of back-to-back surges. The products have also been designed to survive corrosive environments with zinc coated steel grounding yokes and solid brass terminal screws. For more details, please contact the product developers at OFI, Inc.

I have provided copies of these fact finding reports.

In summary, these circuit interrupters must be implemented at the outlet location, not the circuit breaker panel location to be able to detect this bevy of fire ignition source faults. The OFCI and PFCI supplement the preventative protection already provided by circuit breakers, by Arc Fault Circuit Interrupters (AFCI), and by Ground Fault Circuit Interrupters (GFCI). Nevertheless, circuit breakers, AFCI and GFCI cannot protect against the ignition sources described above.

(210.13)

Submitter: Gary S. Santoro, Town of Wethersfield / Rep. New England Association of Fire Marshals
Comment on Proposal No: 2-154
Recommendation: Revise text to read as follows:
All 125-volt single phase 15- and 20-ampere receptacles shall have Overload Fault Circuit Interrupter and Power Fault Circuit Interrupter protection.
Substantiation: 2D2C, Inc., a US company, has developed several technologies to prevent the ignition of fires from excess heat due to electrical faults. These fire prevention technologies have been implemented in the form of circuit interrupters. The interrupters disconnect loads before adequate heat can be generated to ignite a fire. These interrupters supplement the preventative protection already provided by circuit breakers, by Arc Fault Circuit Interrupters, and by Ground Fault Circuit Interrupters. They fill the fire-cause gaps that remain after implementation of these protective devices - they are complimentary and not redundant technologies that should be implemented in all residential wiring systems to prevent fires.
I personally learned about the technology at the NFPA Exposition in Orlando in June 2006. I received a demonstration of the technology as implemented in the SafePlug brand of electrical safety outlets. The technology works. And from my experience as a Fire Marshal, it will save lives by preventing a large number of fires. You can view an overview of the products at their website: www.safeplug.com. I am sure company representatives would travel to the NFPA review meeting to demonstrate the product. The contact that demonstrated the product to me and gave me NFPA sanctioned technical talk of the technology at the NFPA Expo was Steve Montgomery.
These primary causes of fires from electrical faults are outlined in three primary reference documents used in the fire investigation industry. These documents include the following:
● "Guide to Fire and Explosion Investigations", NFPA 921
● "Kirk's Fire Investigation, 6th Edition", John DeHaan, Prentice Hall, 2007, Chapter 10 "Electrical Causes of Fire" by Chris Korinek, P.E.
● "Fire Ignition", Dr. Vyto Babrauskas, Fire Science Publishers, 2003
These documents all suggest that the top electrical causes of heat to ignite flammables consist of the following:
1. High current flowing through high resistance connections
2. Excess voltage across electrical device loads, and
3. Excess current flowing through electrical device loads
2D2C, Inc. has designed Fault Circuit Interrupters to remove the load after detecting these conditions. The heat source disappears if no current flows. Thus, although the Interrupter approach does not fix the wiring or load device problem, it prevents the calamity of ignition from the fault. Below is a simple description of what the two types of interrupters accomplish to prevent fires:
● Power Fault Circuit Interrupter (PFCI): Removes a load if it detects excess current flowing through a high resistance connection in the circuit OR if it detects excess AC Line utilization voltage across the device load
● Overload Fault Circuit Interrupter (OFCI): Removes a load if it detects excess current flowing into the load using a fast-trip, variable threshold, resettable breaker. The trip level matches the electrical load ampacity through RightPlug communication.
NOTE: PFCI and OFCI will prevent fires that presently occur in the presence of circuit breaker, AFCI and GFCI protection. The PFCI and OFCI protection is needed in a structural wiring system - protection does not presently exist for these faults. PFCI will prevent the super-heating of loose wire junctions inside wire nuts and screw connections that cause fires. PFCI will also protect against voltages up to 200-220 VAC across 120 VAC rated electrical devices caused by "floating neutral" conditions. OFCI will prevent against excess-current heating in the small wires (18, 20, 22, 24 gauge) inside electrical

devices caused by poor maintenance, damage, abuse, improper designs, and poor quality manufacturing. OFCI also limits current through each 120 VAC outlet to a cumulative maximum of 15 amps or (as rated for the outlet type) to prevent distribution wiring from overheating due to overloads allowed by improper size fuse or circuit breaker replacement (presently the company has not completed the designs for a 20A outlets - only 15A versions exist at the time of this writing).

Additionally, 2D2C, Inc. has invented complimentary shock safety technology to the Ground Fault Circuit Interrupter (GFCI). The GFCI prevents electrocutions from line-to-ground leakage paths. The Shock Fault Circuit Interrupter (SFCI) prevents shocks through the normal line-to-line paths. To accomplish this, the SFCI keeps electricity off at unused receptacles and only delivers electricity to tagged electrical plugs.

Please approve proposals 18-11, 18-12, and 18-13. Make this technology part of the 2008 Code. If the PFCI and OFCI technology had been installed in homes in our community where I serve as Fire Marshal, a number of fires would never have started. Please help me to save lives by requiring the use of PFCI and OFCI in the electrical outlets in residential wiring systems.

2-176 Log #1481 NEC-P02 **Final Action: Reject (210.13)**

Submitter: Charles Houston, Alamo, CA
Comment on Proposal No: 2-154
Recommendation: Revise as follows:

All 125-volt single phase receptacles shall have Overload Fault Circuit Interrupter Protection for Personnel.

Substantiation: Over the past 30 years, I have been involved in the building trades in one manner or another. I have seen numerous instances where the improper use of standard household branch circuits would have led to serious loss of property if not loss of life if not taken care of immediately. The majority of these situations involved an overloaded circuit as the result of using receptacle strips and extension cords. I have replaced burned out receptacles due to excessive heat damage that could have very easily started a fire had no one been at home to shut down the power. Many innocent homeowners and their families are unaware of the hazards they sometimes create in trying to enhance their life styles. I believe that it is imperative that the NEC be rewritten to mandate the use of a technically available “smart receptacles” that would sense and mitigate an overload situation before becoming a hazard. I sincerely hope that the NEC will act in favor of revising current text to include a life saving technology.

Panel Meeting Action: Reject

2-177 Log #1616 NEC-P02 **Final Action: Reject (210.13)**

Submitter: Steve Montgomery, OFI Inc.
Comment on Proposal No: 2-154
Recommendation: Revise text to read as follows:

All 125-volt single phase receptacles shall have Overload Fault Circuit Interrupter protection.

Substantiation: Thank you for considering the Overload Fault Circuit Interrupter (OFCI) located in an electrical outlet for fire protection of structures. In these comments, I have tried to respond to your concerns as stated:

1) There is insufficient information provided to determine if the proposed protective device would have prevented the incidents sited in the substantiation.

2) The proposed device should be independently evaluated to determine that it will perform the intended function and that there will be no unintended consequences such as false tripping of the device.

3) The submitter’s use of the term “should not” could be interpreted as not being mandatory language and may not satisfy the submitter’s original intent.

My comments are as follows:

1) I cannot accurately state what percentage of electrically-ignited fires would have been prevented by the use of OFCI. It is impossible for anyone without the forensic evidence to accurately analyze the fire examples listed in Proposal 2-154. However, the OFCI covers many of the previous gaps in electrical fire protection.

As I am sure you know, the surveys that the NFPA conducts are mostly based upon Fire Marshal Reports. I am a member of the International Fire Marshals Association (IFMA) and have spoken to a number of Fire Marshals about the level of detail regarding their investigations. In addition to the fact that only about a third of the big fires leave enough evidence to trace back to the cause, very few of them have time or the forensic tools to dive in really deep to identify the specific cause. It is often an accomplishment for anyone to determine that an electrical fault, versus another ignition source, generated the fire, let alone what type of electrical fault caused it. The insurance company fire investigator gets more detail on cause, since they must try to indict one or more product manufacturers to assign the insurance payout burden away from the insurance company. But the product liability defense forensic expert, hired to prove the product manufacturer to be innocent, is the one with the best knowledge. He understands electricity very well, replicates ignition situations in his/her lab, and even X-rays burned electrical components (appliances, circuit breakers, etc.) to identify internal states to prove cause. Only these electrical forensic experts know the detailed fire cause facts, but rarely can they share them since the evidence is associated with a court case or simply held as confidential by the electrical appliance or device manufacturer.

To identify how many of electrically ignited fires would be prevented by OFCI, we interviewed several of these expert forensic electrical fire investigators including the following persons:

- Dr. Vyto Babrauskas, Fire Science and Technology, 9000 300th Place SE, Issaquah, WA 98027, (fire researcher, forensic investigator, expert witness, author of the book “Ignition Handbook,” ISBM 0-9728111-3-3.
- Chris Korinek, P.E., Synergy Technologies LLC, N144 W6466 Pioneer Road, Cedarburg, WI 53012, expert witness, electrical forensic investigator, author, contributor to Chapter 10 “Electrical Causes of Fire” of “Kirk’s Fire Investigation” 5th and 6th editions, by John DeHaan, ISBN 0-13-171922-X.
- Jim Finneran, ElectroTek Consultants Inc., 18925 SR 1, Spencerville, IN 46788, fire researcher, electrical forensic investigator, expert witness, co-author of “Fire Findings.”
- John S. Robison, Robison Consulting LLC, PO Box 680854, Prattville, AL 36068-0854, electrical forensic investigator, expert witness, ex Fire Marshal.

The general consensus is that the three primary electrical causes of fires consist of the following in order of prevalence:

1. High current flowing through high resistance connections
2. Excess voltage across electrical device loads, and
3. Excess current flowing through electrical device loads

None of these experts wanted to commit to percentages of specific electrical fire cause. All of them feel that high current through a high resistance connection is the most common electrical ignition source. Most estimated high resistance connections as causing 50 to 80 percent of all electrically induced fires. Most suggested that floating neutral problems (excess voltage across loads) are the next biggest cause of fires. Third, would be excess current draw through extension cords, lamps, appliances, electronics and other loads. The cause of excess current in a load device represents reduced impedance. Some causes of reduced load impedance include the following:

- Improper device use (e.g., oversized light bulbs)
- Poor product manufacturing quality (flaws)
- Poor product design
- Insulation breakdown and leakage through carbonization (age and fatigue)
- Locked motor rotors (worn bearings, dirt)

Other electrical fire causes, such as induction, are extremely rare. The experts’ general opinion is that arcing from line to ground is usually a result of a fire, not the cause of a fire.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject
Panel Statement: The panel agrees that this device, if properly listed, could be used without specifically being described in the NEC. Since this device, an overload fault circuit interrupter protection for personne, is not currently described in any product standard, the panel is concerned that there are no national standards that set the parameters for the operation of the system. If the intent is to further protect flexible cords, such as those used as supply cords for appliances or as extension cord sets, 240.5(B)(1) and (B)(3) already state that these cords shall be considered to be protected when applied within the applicable listing requirements.

If proposals are submitted in the future, Code-Making Panel 2 would benefit from receiving further information regarding the development of the parameters needed to detect high-resistence connections across the variety of branch circuit configurations and lengths in wiring systems, in the form of a fact-finding investigation.

These listing requirements are developed by a technical panel that includes representation from many areas of industry such as third-party testing and listing organizations, cord manufacturers, inspectors, and others. Code-Making Panel 2 fully expects the technical committee of the product standard to address any safety issues associated within the listing requirements of these cords and that a requirement of this type is not necessary in the NEC.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:

KING, D.: The presentation given by the Submitter of this Comment at the ROC meeting was compelling. The panel was given the opportunity to review the potential of this new device to mitigate if not completely eliminate many electrically oriented fires that occur in dwelling units. This technology is new; therefore, the Panel's request for more information is warranted. Further information as requested in the Panel Statement will provide a better opportunity for acceptance of this new life saving technology in future Code cycles.

WEBER, R.: I feel the panel acted responsibly in rejecting this comment and proposal at this time frame. However, this is new and emerging technology "OFCI, Overload Fault Circuit Interrupter Protection"; is a means to asdf prevent fire scenes. In review of the substantiation submitted and supporting data on tests and state of these fire prevention technology systems; it has a potential for significantly expanding the type of measures available to the user for increased safety. Its benefit for shock protection at the outlet and ability to compliment the accepted uses of AFCI protection schemes can only have a positive effect for the end user. It is now and continues to be under the technological advancements and component reconfiguration to ease its acceptance for use by the general public. I encourage the submitter to continue the effort for OFCI acceptance in future versions of the code.

2-178 Log #1664 NEC-P02 **Final Action: Reject (210.13)**

Submitter: Julie Wagner, Waukehsa, WI
Comment on Proposal No: 2-154
Recommendation: Revise as follows:

All 125-volt single phase receptacles shall have Overload Fault Circuit Interrupter Protection for Personnel.

Substantiation: I recently saw a demonstration for the Overload Fault Circuit Interrupter and am very interested in seeing this become part of the required building code for the following reasons:

My parents are elderly and live in a mobile home park in Florida. They live on a fixed income and try to scrimp and save wherever they can. I have seen them overload sockets and extension cords in their home. They have even used their stove as a heat source. I have pointed out to them the safety issues involved but they won't buy another cord because "they don't want to spend the money" and say "don't worry, we'll keep an eye on it." If I buy them a new cord, they'll simply "save it to use when the old one wears out". The Overload Fault Circuit Interrupter would certainly give me some peace of mind.

I think of the statistics put out by the U.S. Fire Administration: December is the most dangerous month for electrical fires because of the increase in lighting, heating, and appliance use. The USFA also says that most electrical fires result from problems with "fixed wiring" and that 33 percent of residential fires are electrical in origin. Mobile homes have a fire death rate that is nearly twice the average of other dwellings.

My parents are only getting older. They are getting very forgetful. I do not live near them. I know they will be using space heaters soon. There are thousands of other elderly Americans just like them. USFA statistics say that 485 Americans die each year from electrical fires and injure 2,305 more. I do not want my parents to become one of those statistics.

Please give careful consideration to requiring the Oveload Fault Circuit Interrupter in the building code.

Submitter: Jack Maclead, San Marino, CA
Comment on Proposal No: 2-154
Recommendation: Revise as follows:

All 125-volt single phase receptacles shall have Overload Fault Circuit Interrupter Protection for Personnel.

Substantiation: I strongly recommend mandating installation of the Overload Fault Circuit Interrupter (OFCI) in new and remodeled construction, particularly residential. I attended a demonstration of the OFCI and witnessed successful overload and shock fault preventing. I am a retired CEO of a construction company and have been a commissioner of San Marino City for the past six years. This and other experiences have convinced me that electrical shock faults cause many unnecessary fires and deaths and any device such as the proven OFCI should be mandated.

Submitter: Greg Baker, 2D2C, Inc.
Comment on Proposal No: 2-154
Recommendation: Revise text to read as follows:

All 125-volt phase receptacles shall incorporate Overload Fault Circuit Interrupter Protection for Personnel.

Substantiation: I am the president of 2D2C, Inc. My company has developed products that implement Overload Fault Circuit Interrupter technology that would satisfy Proposals 2-154 and 2-155 (as well as 18-11, 12, and 13). These products are, and will be commercially available regardless of your actions for the 2008 NEC.

One of our products was listed by CSA in late 2005. We have sold some of this product without any marketing push. Our other OFCI product was recently listed. Now that we know that our high quality products exceed industry accepted safety standards, in addition to internal quality tests, we will commercially launch both products in the first quarter of 2007. While we strongly believe that this technology should be part of the NEC, our products do not need a change to the NEC to be used. Therefore, we will get the products into the marketplace to prevent fires and save lives.

We have established manufacturing capabilities to support the significant demand that we expect for these products. We have included in our manufacturing plans, contingencies for additional production capacity if you choose to include this technology in the 2008 NEC. We are working with several companies that will provide additional sources of products utilizing OFCI technology through both licensing and brand labeling agreements.

Submitter: John S. Robison, Robison Consulting, LLC
Comment on Proposal No: 2-154
Recommendation: Revise text to read as follows:

All 125-volt single phase receptacles shall have Overload Fault Circuit Interrupter protection.

Substantiation: I sincerely request that you accept the proposed technology described in Proposals 2-154 and 2-155. A company called 2D2C, Inc. (www.2d2c.com) has developed a simple approach to protecting against incorrect sizing of light bulbs to fixtures. The technology is called Overload Fault Circuit Interrupter (OFCI). I witnessed this technology in operation at an NFPA Expo, evaluated it and found that it works as described. Based upon my expertise, OFCI would eliminate most fires caused by improperly sized light bulbs if it was installed. From my experience, the only way to ensure that this OFCI technology prevents these fires, is to require its usage. If it is optional, it will not get used and these fires will continue.

Simply stated, OFCI is effectively a resettable fast-trip breaker located in the outlet or in a light fixture. The light fixture version of OFCI has a fixed trip-current level that matches the light fixture rating. If the wrong size light bulb is installed in the fixture, the OFCI disconnects electricity to the bulb and will toggle power to the light with a very low duty cycle until it detects a current draw below its trip threshold and then resets itself.

The OFCI electrical outlet version has 14 different trip-current levels and automatically matches its trip level to the device rating plugged into each receptacle independently. Outlet OFCI reads this trip level from RightPlug safety encoding inside the plug (www.RightPlug.com). The RightPlug encoding embeds a wireless memory stick inside the plug that contains information about the appliance such as its maximum current draw and power rating. Therefore, a 60 Watt, 120V lamp will have a RightPlug hold current of 0.5 Amp. When the plug is inserted in the OFCI outlet, the RightPlug reader inside the outlet reads the appliance rating and sets it trip level accordingly. If a 100 Watt light bulb is inserted in the fixture, the OFCI outlet will disconnect electricity after a few seconds to give instant feedback to the operator that an oversized light bulb has been inserted in the light fixture. On the OFCI outlet, the breaker is reset by removing the plug and reinserting it in the socket. If the correct sized bulb has been installed, the OFCI outlet will turn on power to the outlet and operate the same as any standard outlet. If an oversized bulb remains in the fixture, the OFCI outlet will trip again and disconnect electricity to the lamp cord. A red indicator light flashes adjacent to the overloaded receptacle to ease troubleshooting.

I presently act as an expert investigator for fire cause and am a retired fire marshal. As such, I have personal experience with identifying the cause of thousands of fires. On several occasions, the use of light bulbs of a higher rating than the fixture in which they were used has resulted in fires. The NFPA 101 Life Safety Code requires apartment building owners to provide annual information to tenants regarding safety procedures in the event of fire or the sounding of a fire alarm. I believe a portion of that information should include the proper use of correct wattage bulbs in light fixtures. Unfortunately, this safety practice does not normally occur nor is it practical to regulate. OFCI is a practical solution to this fire cause.

Some examples of fires that OFCI would have prevented include the following:

A fatal apartment house fire where 100 watt bulbs were routinely installed in both interior and exterior fixtures, although the fixtures carry warnings regarding the use of bulbs in excess of 60 watts.

Several interior lamp fires where bulbs in excess of 60 watts were used overheating combustible shades.

Warnings regarding this improper practice of over-sizing bulbs in fixtures and lamps are displayed on websites of nationally recognized safety organizations, however, the practice continues and fires do likewise.

2-185 Log #2262 NEC-P02 **Final Action: Reject (210.13)**

Submitter: Herbert Naito, NorthStar Consulting Services
Comment on Proposal No: 2-154
Recommendation: Revise text to read as follows:

All 125-volt single phase receptacles shall have Overload Fault Circuit Interrupter protection.

Substantiation:

According to U.S. Consumer Product Safety Commission (CPSC) staff, there are over 960,000 electrical fires each year in the United States, which cost society over $2.2 billion annually. The National Fire Protection Association (NFPA) stated that over 41,500 U.S. home fires are caused by electrical distribution equipment. The alarming facts indicate that (1) children die in home fires more than two times the U.S. national average, (2) senior citizens have a home fire death rate of more than twice the U.S. national average (most likely to be either a pre-school child or an adult over 65 years old), (3) the American households can anticipate to average one fire injury per lifetime.

According to the CPSC, NEPA, U.S. Fire Administration (USFA), and many other organizations they have data to indicate that the U.S. has one of the worst residential fire safety records in the industrialized world. Mechanical, electrical failure and malfunction have the greatest number of recorded fires. According to the U.S. Consumer Products Safety Commission, about 180 individuals die of electrocution in and around their homes each year. Over 3,500 injuries are related to electrical receptacle outlets and the persons need hospital help because young children inserted metal objects into the outlets. Hundred of thousands of less severe electrical shock victims go unreported each year.

It is clear that current outlet protection devices do not work because the Temple University study shows: (1) 47% of the 4-year olds could remove the round, flat face (2-prong) protectors or the 3/16" thick oval face with tapered sides and (2) 100% of the 2-and 4-year olds could remove the 1/16" thick oval face protectors.

It is time that we carefully analyze the poor outcomes with today's electrical protection devices and look for better ways to protect our citizens from electrical shocks, burns, and fires. With today's advancing technology, we need to focus on new approaches in protecting individuals in our society. For example, the data on single-phase receptacles that have overload fault circuit interrupter is impressive and should be considered for adoption as a new standard for homes and commercial buildings. This system will move us from the dark ages to the new state-of-the-art simple, cost-effective device to truly help reduce the alarming and significant electrical injuries and fires that occur in the U.S. each year.

2-186 Log #2128 NEC-P02 **Final Action: Reject (210.15)**

Submitter: Michael Moulton, Farmington, NH
Comment on Proposal No: 2-157
Recommendation: None given.
Substantiation: I believe this is a good way to keep fire protection and life safety to a specific standard method of wiring. With it being on a dedicated fire safety circuit, it has a far less chance of being mistakenly disabled or shutdown, due to an overloaded circuit that has been tripped.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any recommendation as required by 4.4.5(c) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-187 Log #439 NEC-P02 **Final Action: Reject (210.18)**

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 2-158
Recommendation: Accept revised:

Add "dormitories" before "guest" in the heading and text.

Substantiation: Dormitories in colleges, recreational camps, and penal institutions are as much or more akin to dwelling units than most hotel or motel rooms. The addition of "dormitories" was accepted in Proposal 2-242 for 210.60(A).

Panel Meeting Action: Reject
Panel Statement: The term "dormitories" is too broad to be included in 210.18. This can include prison dorms, military barracks, as well as many other occupancies described in local building codes.

The limited revision in 210.60 is related only to the required receptacles and receptacle placement.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:

KING, D.: The Panel has not addressed the submitter's concerns that there are inconsistencies in the minimum branch circuit requirements in these types of occupancies that are similar to and function as dwelling units. The same minimum branch circuit installation requirements should apply to these types occupancies. Section 210.60(A) requires receptacles in Dormitories to be installed to the minimum standard of dwelling units. These receptacles should be supplied by branch circuits that meet the minimum requirements of dwelling units. I disagree with the Panel that "the term 'dormitories' is too broad to be included in 210. 18." The term could have been more clearly defined by describing the types of Dormitories where the requirements of Section 210.18 should apply. This could have been accomplished by accepting in principal this Comment with the submitter's text revised to read as follows:
"and in dormitories in colleges, penal institutions, recreational camps, etc." after "Hotels" in the text and heading.
The revised text above would have satisfied the submitter's intent.

WEBER, R.: The panel action should have been to accept this comment or accept in principle at best and included the term "sleeping rooms and areas in educational dormitories". When reviewing the building codes Residential Group R this type of use and similar area is defined or classified by the terms, "For sleeping accommodations such as apartment houses, convents, dormitories, fraternities and sororities in part." The comments made in the negative vote in Comment 2-140 are valid here as well. The panel needs to recognize and review the actual uses in the field; that these are living units and although some may not legally allow provisions for cooking, many do and they should have a requirement in the code to have branch circuits installed to meet the rules for dwelling units. Many AHJs are forced to make that call on experience and the 90.4 authority to accomplish the submitter's recommendation. If the normal use is there, the code should address it, and if the units do not have those provisions, then it does not apply. At the time of construction is the time to provide the needed circuitry. The designers, installers, inspection community and user need this positive code text.

17-1 Log #19 NEC-P17 **Final Action: Accept (210.19(3))**

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 2-162
Recommendation: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 17 for action within Article 422.

This action will be considered by Code-Making Panel 17 as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the direction of the TCC to consider Proposal 2-162. The panel rejects Proposal 2-162.
The submitter of Proposal 2-162 has not provided substantiation to show that household electric ranges, wall-mounted ovens, and counter-mounted cooking equipment have created a loss of property or life to justify the additional requirements for GFCI protection. These appliances are inherently designed to handle heat. Other household cooking equipment should already be protected by GFCI-protected kitchen countertop receptacles per 210.8(A)(6).
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9
Ballot Not Returned: 1 Gill, C.

2-188 Log #1900 NEC-P02 **Final Action: Accept in Principle in Part (210.19(A)(1))**

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 2-166
Recommendation: Either reject the proposal, OR revise the final paragraph of Annex D, Example D3(a) to read as follows:

"~~Although~~ Because the neutral runs between the main switchboard and the building panelboard, likely terminating on a busbar at both locations, ~~the busbar connections are part of listed devices and not "separately installed pressure devices."~~ and not on overcurrent devices, the effects of continuous loading can be disregarded in evaluating its terminations [see 215.2(A)(1) Exception No. 2]. ~~Therefore 110.14(C)(2) does not apply, and the normal termination temperature limits apply. In addition, the listing requirement to gain exemption from the additional sizing allowance under continuous loading (see 215.3 Exception) covers of just the overcurrent protective device, but its entire assembly as well. Therefore, since the lighting load is continuous, the minimum conductor size is based on 1.25 x~~ That calculation is (11,600 VA ÷ 277V) = ~~52~~ 42 amperes, to be evaluated under the 75°C column of Table 310.16. The minimum size of the neutral ~~is 6 AWG~~ might seem to be 8 AWG, but that size would not be sufficient to be depended upon in the event of a line-to-neutral short circuit [see 215.2(A)(1), second paragraph]. ~~This size is also the minimum size required by 215.2(A)(1), because~~ Therefore, since the minimum size equipment grounding conductor for a 150 ampere circuit, as covered in Table 250.122, is 6 AWG, that is the minimum neutral size required for this feeder.
Substantiation: The present wording of Example D3(a) substantiates rejecting this proposal. However, assuming CMP 2 has decided to rethink the technical merits involved, then the wording of Example D3(a) must be adjusted accordingly. This comment puts both options on the table for the panel to consider.
Panel Meeting Action: Accept in Principle in Part

Revise the last paragraph in Annex D Example D3(a) as follows:
~~Although~~ Because the neutral runs between the main switchboard and the building panelboard, likely terminating on a busbar at both locations, ~~the busbar connections are part of listed devices and are not "separately installed pressure devices".~~ and not on overcurrent devices, the effects of continuous loading can be disregarded in evaluating its terminations (see 215.2(A)(1) Exception No.2). ~~Therefore, 110.14(C)(2) does not apply, and the normal termination temperature limits apply. In addition, the listing requirement to gain exemption from the additional sizing allowance as well. Therefore, since the lighting load is continuous, the minimum conductor size is based on 1.25x~~ That calculation is (11,600 VA + 277V) = ~~52~~ 42 amperes, to be evaluated under the 75° column of Table 310.16. The minimum size of the neutral is ~~6 AWG~~ might seem to be 8 AWG, but that size would not be sufficient to be depended upon in the event of a line-to-neutral short circuit (see 215.2(A)(1), second paragraph). ~~This size is also the minimum size required by 215.2(A)(1), because~~ Therefore, since the minimum size equipment grounding conductor for a 150 ampere circuit, as covered in Table 250.122, is 6 AWG, that is the minimum neutral size required for this feeder.
Panel Statement: The panel accepts the revision to Annex D, but not the recommendation to reject the proposal. The word "are" as it appears in the original text is also being deleted in the first sentence.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-189 Log #1009 NEC-P02 **Final Action: Reject (210.19(A)(1), FPN 4)**

Submitter: David Shapiro, Accurate & Intriguing Writing & Editing
Comment on Proposal No: 2-168
Recommendation: Revise text to read as follows:

...and where the maximum total drop from nominal voltage ~~on feeders and branch circuits~~ to the farthest outlet...
Substantiation: The Panel Statement agrees that, "The fine print note... does not cover all possible causes for the voltage drop." I have had multiple conversations over a long period that demonstrated clearly that the texts presently listing two sources, feeders and branch circuits, is misleading to many. While FPNs are advisory, not mandatory, they constitute a de facto standard of good practice, relied on by specifiers, lawyers, and others. Deleting the two examples removes the misleading element. Adding language such as "from the sum of all upstream impedances" might emphasize the point, but may be gratuitous. Parsimonious language often is preferable-one reason I have no issue with the CMPs nixing my initial proposals addition of other sources. The reason that I suggest the additional wording, "from nominal voltage" is that the FPN is advising about proper operation of utilization equipment. This is effected not by what VD testers report-the drop from initially supplied voltage, in response to a simulated load-but by voltage significantly lower than its design voltage. Electricians have only partial control over this, but certainly more control than "feeders and branch circuits" implies.
Panel Meeting Action: Reject
Panel Statement: The panel does not agree that the recommendation adds any clarity to the section. The text refers to feeders and branch circuits as they apply to Articles 210 and 215.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-190 Log #506 NEC-P02 **Final Action: Reject (210.19(A)(2))**

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 2-169
Recommendation: Accept proposal to include "outlets".

Substantiation: 210.20(B)(2)(3) includes "outlets". Proposal would harmonize these sections.
Panel Meeting Action: Reject
Panel Statement: Section 210.19(A)(2) requires that conductors have an ampacity of the branch circuit rating when more than one receptacle is supplied. Adding the word "outlets" changes the application of the section without substantiation, since lighting outlets would also be included if the change were made. There is no 210.20(B)(2)(3) as noted in the submitter's substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-191 Log #2265 NEC-P02 **Final Action: Reject (210.21(A))**

Submitter: Michael Beanland, Vancouver, WA
Comment on Proposal No: 2-142
Recommendation: Add:
Manufacturers of AFCI devices shall make documentation on the reliability (ability to detect typical arc faults), selectivity (ability to distinguish between faults and non-fault activity) and security (ability to react to arc faults and not react to non-fault activity) for their AFCI devices available to users.
Substantiation: If AFCI devices are only "intended" to provide protection, documentation of performance should be required to verify manufacturer's success are meeting this "intention."
Panel Meeting Action: Reject
Panel Statement: The panel recognizes that the submitter is referencing 210.12 with this comment. The intended arc protection provided by AFCIs is well defined in UL 1699. Additional documentation is unnecessary.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
BROWN, L.: Please see NAHB's Ballot Comment on Comments 2-79 and 2-95.

2-192 Log #433 NEC-P02 **Final Action: Reject (210.21(B)(2) and Table 210.21(B)(2))**

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 2-175
Recommendation: Accept proposal.
Substantiation: See substantiation for this proposal and Proposal 2-174. This section does not allow for large office areas or suites to have multiple outlets with special configuration receptacles such as twistlock types to provide power for floor polishers or carpet cleaners, which in effect limits the load to one utilization equipment and, therefore, meets the definition of individual circuit. Testing labs indicate a receptacle can carry its rated load. This requirement does not appear to relate to 90.1(A) and (B).
Panel Meeting Action: Reject
Panel Statement: The maximum loading values are part of the entire system of branch circuit safety requirements. The submitter has not substantiated deleting the section. Deletion of the section would simply allow equipment to run at continuous ratings up to the rating of the receptacle. This would remove a portion of the safety margin built into the system.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-193 Log #434 NEC-P02 **Final Action: Reject (210.21(B)(2) and Table 210.21(B)(2))**

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 2-175
Recommendation: Accept proposal.
Substantiation: This section is virtually unenforceable. Receptacles are tested and listed to supply a load up to their rating which suggests there is no safety hazard. 90.1 indicates the purpose of the code is safeguarding from hazards. What hazard is involved in a receptacle supplying its rated load current? This limitation appears intended to provide for additional or future current use for other outlets which is not in accordance with 90.1(B).
Panel Meeting Action: Reject
Panel Statement: See panel statement on Comment 2-192.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-194 Log #774 NEC-P02 **Final Action: Reject (210.21(B)(1))**

Submitter: William Riggenbach, Riggs Electric
Comment on Proposal No: 2-8
Recommendation: Revise text to read as follows:
Single ~~receptacle~~ device on an individual branch circuit. A single ~~receptacle~~ device installed on an individual branch circuit shall have an ampere rating not less than that of the branch circuit.
Substantiation: A single 15 amp duplex receptacle is allowed on a 20 amp circuit under 210.21(B)(3) i.e., "...two or more receptacles...and Table 210.21(B)(3). This limits the receptacle load to 12 amps per Table 210.21(B)(2). It also creates a fire hazard should an equipment using 16 amps if connected to the receptacle. This is a standard practice in the Atlanta, GA area. I have seen this situation on 20 amp circuits for microwave ovens, heaters, etc., including bathroom GFC and REC. Requiring a 20 amp rated receptacle (device) whether single or duplex would eliminate this problem.
Panel Meeting Action: Reject
Panel Statement: Allowing a 15 ampere receptacle on a 20 amp branch circuit does not pose a hazard since all 15 ampere receptacles are evaluated for 20 amperes of current through the entire assembly. The submitter's contention that a 16 ampere load could be connected to a single 15 ampere receptacle is incorrect, since that would require a 20 ampere cord cap on the equipment in accordance 210.21(B)(2).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-195 Log #773 NEC-P02 **Final Action: Reject (210.21(B)(3))**

Submitter: William Riggenbach, Riggs Electric
Comment on Proposal No: 2-8
Recommendation: Add new text to read as follows:
20 amp circuit conductors connected to a 15 amp receptacle must be made by means of splicing the conductors and bringing out a tap in accordance with Table 210.24.
Substantiation: Current practice allows using the 15 amp duplex receptacle(s) for continuity of the 20 amp circuit. Conductors generally are stabbed into the back of a residential grade 15 amp duplex receptacle. This includes both the feed conductors and the circuit continuation. This effectively inserts the equivalent of a short piece of 15 amp wire at each receptacle location. This creates a fire hazard. I have encountered at least 2 of these where arcing has resulted, and burning of the receptacle was in evidence. In one, active was occurring even as I was removing the receptacle to replace it. In this instance, a 1500 watt heater was plugged into the circuit downstream of this receptacle. This 1500 watt load, added to the existing half of table lamps, a large screen projection TV and surround sound system, caused a load in excess of 15 amps and began the burning process.
As well as being a licensed electrician since 1975, I am also a retired Miami (FL) fire captain. I can tell you this is a very real fire hazard. It was not allowed in South Florida, but goes on routinely here in Georgia.
Note: Supporting Material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The substantiation provided by the submitter is incorrect. Since 15 ampere receptacles are evaluated for 20 amps of "feed through" current, a splice/tap arrangement is not technically substantiated. The panel also notes that relative to the submitter's drawing, the "quick wire" holes that are referenced are, by the UL standard, limited to #14 AWG wire and as such a 15 ampere circuit maximum. Receptacles are not permitted to have #12 AWG inserted into the backs of receptacles for a feed through, "quick wire" connection.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 2-190
Recommendation: It was the action of the Technical Correlating Committee that consideration be given to using a list format as recommended in 2.1.5.1, 3.3.1.2, and 3.3.2 of the NEC Style Manual.
This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: See panel action on Comment 2-198.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-198 Log #843 NEC-P02 **Final Action: Accept (210.52)**

Submitter: Jim Pauley, Square D Company
Comment on Proposal No: 2-190
Recommendation: Revise the first paragraph of 210.52 to read as follows:
210.52 Dwelling Unit Receptacle Outlets. This section provides requirements for 125-volt, 15- and 20-ampere receptacle outlets. The receptacles required by this section shall be in addition to any receptacle that is:

(1) Part of a luminaire (lighting fixture) or appliance, or ~~is~~
(2) Controlled by a wall switch in accordance with 210.70(A)(1) Exception No. 1, or ~~is~~
(3) Located within cabinets or cupboards, or ~~is~~
(4) Located more than 1.7 m (5 1⁄2 ft) above the floor

Substantiation: This comment simply reorganizes the first paragraph into a list format as recommended by the TCC note for Proposal 2-190.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-199 Log #1135 NEC-P02 **Final Action: Reject**
(210.52)

Submitter: Steven Roncourt, Roncourt Enterprises Inc / Rep. Electrical Contractors Business Association
Comment on Proposal No: 2-142
Recommendation: This proposal should be rejected.
Substantiation: While as an organization we are always concerned about safety and any new technology that may contribute to this, we feel that you must balance the implementation of new technology with the effectiveness and reliability when a product is first introduced into the market. We are well aware that with any new product, besides the original testing, the only way to gain this knowledge is to actually use it, as is with any new computer software. This being said we feel that there still needs to be further testing and development with AFCIs and their testing equipment, before trying to implement them in such a dramatic fashion.

Some of the concerns that we have at this point in time is that there are no combination type AFCIs (series and parallel fault type) devices on the market. Manufacturers have had years to produce a product for sale that meets these requirements for commercial use and testing since the original inception of AFCIs and to date have not.

To install this AFCI protection using the existing technology would not be in the public's best interest. They would only be getting an AFCI with series protection instead of a combination type protection (series and parallel). Many areas where this device can be helpful are on older parallel wiring circuits, especially knob and tube wiring and it would be much easier to implement if they would have an AFCI receptacle available as well to deal with any issues that may not allow a breaker to be installed.

Even though this may be a step in the right direction, with the existing technology still in its infancy, this board should require that additional testing be done under the existing NEC code, before having consumers spend BILLIONS of dollars on installing AFCI protection that will be changing or advancing by the 2011 code cycle. It is in the consumer's best interest to only have to pay once for this to be done and not a second time after the manufacturers finally make advances to meet the code requirements.

There is not enough data to support any possible issues that may arise with the use of AFCIs in conjunction with GFCIs which are common throughout dwelling unit living areas. This is of grave concern to the industry because there have been issues with AFCIs that are not always reported. The contractor will simply return what seems to be the defective product and install a new one until it works. The reasons for this is because when you call the supplier or manufacturer they do not always have a reason why you are having issues. This was very common with GFCIs when they first came out and is true of any new product. Until additional equipment is available, you may not be able to meet the requirement of the proposed code for eery application that may arise. This, again will add to the cost to implement them as proposed, above and beyond the cost of the breaker.

Most AFCIs over the last 2 years have been installed in new dwelling units which on a normal basis do not have any problems with these arc faults for quite a few years to come if at all, unless there was an installation error. This alone wold make the data and research results supplied by the manufacturers unreliable and appear as though the product was actually making more of a difference than they actually are or if they were never installed. There must be more time allowed to evaluate the true safety factor that these provide before requiring them to be installed so widespread.

I would like to take a minute to tell you of a couple of experiences that I have come across since the code change. I had installed AFCIs in many new residences as I had been doing since the code change. Occasionally, I would get different test results on a house but with no consistency to determine what the cause or issue may be and sometimes with the issue clearing up by itself. I had made sure to purchase a new AFCI tester so that there would not be any issues.

On this one particular house I had one AFCI out of 4 that would not trip, I spent a lot of time trouble shooting the problem out of concern that the owners would not be properly protected. I did all the obvious trouble shooting methods. First checking my circuit for any faults, checking to see if the breaker was wired wrong, then changing the breaker. After changing the breaker a couple of times it didn't make sense to me that I could have 3-4 defective breakers. What was confusing about the matter was that if I moved the position of the breaker to a different phase within the panel all of the breakers that I thought were defective would work. If I moved any of the other breakers to the phase that this particular breaker was on they would now not work. I tested, retested and tested again to no avail. At this point and time I had no idea why this was happening. After going through 9 AFCI breakers, I finally found one that tested out with my tester. After talking to another electrician, I decided to try another tester, a much more expensive one, with the bad breakers for my own piece of mind. The cost of a tester shouldn't matter if they are being sold and marketed as a UL listed tester.

What I found is that with the new tester the 9 breakers that I had tried all seemed to work or test out properly. Now I understand that you may get a defective tester or maybe even one might go bad, so I didn't think too much of it at that point other than possibly my tester was defective, but why did my original tester work on the other 3 breakers if it was defective? Please keep in mind that I used the same manufacturer for panels and breakers on a normal basis and have for almost 20 years.

Not too long afterwards I came across a situation where I had to add a subpanel and wanted to keep the equipment the same in the original house. Again, I had the same issues with a different manufacturer's product but with the new more expensive tester. But the breakers did test out properly with the older less expensive tester. These results just did not make sense to me and I still have not been able to get an explanation from either manufacturer. I apologize for the length of the story, but I felt it was necessary to show the inconsistencies that still exist with the product on an everyday basis.

This inconsistency causes grave concern among installers and our organization. Do we really know how many times this may have happened? Do the manufacturers actually have real feed back from the installers in the field or just from their own statistics. How many breakers have been returned as defective? Have they considered this in their substantiation? How many installers did not report anything and just changed the breaker until it worked? We all know that you do not get much of a response from a manufacturer with regards to any concerns over product even if you do go through the proper channels to report it. I explained this to both of the manufacturer's reps/ suppliers and asked them to pass it on to the manufacturers, with not one call back to check the issue out. Not every installer will have the initiative to find out why this situation may have occurred. Mostly because all of this trouble shooting is done at our own expense. We cannot bill the customer or contractor for it, it is not their fault. And the manufacturer is not going to do anything but give us a new product. So what happens in the real world? Most of these things just don't get reported. Why would two different testers from two different manufacturers being used on two different types of breakers, give different testing results. We should really try to address these issues, which I might add are probably typical with a new product. I recall having the same problem when GFCIs were first introduced.

Let the manufacturers produce a combination type AFCI and let's put them to test under the NEC code we have now and give us a few more years to test and correct the issues before mandating them to be installed throughout a dwelling, with no exceptions. When you get results like I have there is no way to tell if we are installing a defective breaker or it is something else causing the issue or if the breaker will function properly at all.

Combine this info with the fact that as stated before, most new dwelling units do not usually have problems with arc faults issues due to the newness of the installation. We believe that the substantiation is not completely accurate. With over 800 pages of ROP it is difficult to address them all and research them all with enough detail by the deadline required. Please allow the manufacturers and installers the time to combine efforts and actual results to get it right the first time and then look at this proposal again in the future.

As an organization made up of electrical contractors and associate members consisting of many suppliers within the area we hope that you will take the time to consider these issues before making a decision. We thank you for your time in hearing our comments and look forward to working with you in the future.

Panel Meeting Action: Reject
Panel Statement: The panel understands that the submitter is referring to 210.12. The submitter's substantiation is anecdotal in nature and lacks the necessary technical data to support his recommendation. Product malfunction, if there is an issue, should be addressed to the manufacturers. The panel notes that the acceptance of Proposal 2-142 is based on the commercial availability of combination-type AFCI devices by January 2008. The panel maintains its position that it has reviewed sufficient technical data that warrant the use of AFCI protection in dwelling units. The use of A
FCI indicators is not an indication of AFCI performance. The AFCI test button should be used to verify that AFCI devices are functioning. The submitter has not substantiated that listed combination-type AFCI devices are not compatible with listed GFCI devices.

2-200 Log #1300 NEC-P02 **Final Action: Reject**
(210.52)

Submitter: Steven Roncourt, Roncourt Enterprises Inc
Comment on Proposal No: 2-190
Recommendation: Please consider the remarks below before making a decision on this proposal.
Substantiation: 1. It is unclear to me whether or not the language proposed by the panel is in favor or against having a half switched receptacle with 2 outlets in this location to meet this requirement. With 20 years experience in the residential industry, I believe that a half switched receptacle as stated above does not pose a safety condition. I have been installing them for over 20 years and have never had a complaint from a customer concerning this. I do not believe in installing a receptacle that is completely controlled by a wall switch, this does create a condition for a possible safety hazard. A half switched receptacle should be allowed if this proposal is approved.

2. That being said, I disagree with the submitter's substantiation with concerns to the switch being left in the off position if this is not changed. It has been my experience that it is just the opposite. The switch is left in the on position to allow access to the receptacle, therefore, not causing the issue described in the substantiation, but creating an issue with 210.70(A)(1). Why would someone completely disable a receptacle instead of just leaving it on to utilize it? These remarks in my opinion are completely wrong and there was no supporting documentation with any technical information.

3. It is also my experience with my 20 plus years in the electrical industry that the NEC has provided for sufficient receptacle placement under 210.52 and that on average the majority of people in a bedroom because of 210.52, do not have more than 1 device plugged into a receptacle at one time.

4. If this proposal does not allow for a half switched receptacle, you will now have to install a quad receptacle with one of them being switched or an additional receptacle with two outlets directly adjacent to the one required under 210.70(A)(1). This seems like this would only cause more confusion on the part of the consumer. I hope that the panel will consider these issues when making your decision.
Panel Meeting Action: Reject
Panel Statement: The submitter's recommendation is unclear and does not provide specific text. Regarding the points in the submitter's substantiation, the comment about leaving the switch on is exactly the issue that is being resolved. Section 210.70(A)(1) requires a switch-controlled lighting outlet, which could be a receptacle in accordance with Exception No. 1. If the switch is left in the "on" position, the requirement for a switched lighting outlet is defeated. Subsequently, a duplex receptacle that is only 1/2 switched would meet the requirements of both 210.70 and 210.52.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-201 Log #2013 NEC-P02 **Final Action: Reject**
(210.52)

Submitter: Lawrence Brown, National Association of Home Builders (NAHB)
Comment on Proposal No: 2-189
Recommendation: Reject the proposed change.
Substantiation: The proposed change, developed by the Panel, referring to 210.70(A)(1) Exception No. 1, should not be accepted. The other modification to this section of deleting the word "outlets" is correct in the application of the NEC and should be accepted. The intent of 210.70(A)(1) is to provide "switch-controlled lighting" for habitable rooms. The exception to this rule is to allow a design feature of a switched receptacle to be used in lieu of a switched lighting outlet in the ceiling or wall. It is a matter of design. There is no basis, nor was any supporting documentation presented, to support the submitter's belief that it is a "common" practice to "leave the switch" controlling a duplex outlet "permanently in the closed position." Nor, is there any substantiation to support the "switch will either be left in the "ON" position [defeating the purpose of 210.70(A)(1), or (perhaps more likely) an extension cord will be run across a traveled area from a receptacle not controlled by the switch." The receptacle required by 210.70(A)(1) is a receptacle that could easily be used for a lighting fixture for the room whether or not the receptacle is switched. This design feature of convenience should not be penalized as a basis to require additional general lighting wall receptacles.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Comment 2-200.

Ballot Results: Affirmative: 12

2-202 Log #2020 NEC-P02 **Final Action: Reject**
(210.52)

Submitter: Lawrence Brown, National Association of Home Builders (NAHB)
Comment on Proposal No: 2-190
Recommendation: Reject the proposed change.
Substantiation: The proposed change, developed by the Panel, referring to Section 210.70(A)(1), Exception No. 1, should not be accepted. The other modifications to this section of deleting the word "outlets" is correct in the application of the NEC and should be accepted. The intent of Section 210.70(A)(1) is to provide "switch-controlled lighting" for habitable rooms. The exception to this rule is to allow a design feature of a switched receptacle to be used in lieu of a switched lighting outlet in the ceiling or wall. It is a matter of design. There is no basis, nor was any supporting documentation presented, the support the submitter's belief that it is a "common" practice to "leave the switch" controlling a duplex outlet "permanently in the closed position." Nor is there any substantiation to support the "switch will either be left in the "ON" position [defeating the purpose of Section 210.70(A)(1)], or (perhaps more likely) an extension cord will be run across a traveled area from a receptacle not controlled by the switch." The receptacle required by Section 210.70(A)(1) is a receptacle that could be easily used for a lighting fixture for the room whether or not the receptacle is switched. This design feature of convenience should not be penalized as a basis to require additional general lighting wall receptacles.
Panel Meeting Action: Reject
Panel Statement: The panel agrees that Proposal 2-190 provides substantiation demonstrating that using a completely switched receptacle can defeat the intent of either 210.52 or 210.70. The revision accepted provides a reasonable way to comply with both by switching only 1/2 of the duplex receptacle. See panel statement on Comment 2-200.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-203 Log #2151 NEC-P02 **Final Action: Reject**
(210.52(4)(4))

Submitter: David H. Kendall, Carlon
Comment on Proposal No: 2-198
Recommendation: Proposal 2-198 should be an "Accept in Principle" with the revised proposed text for 210.52(A)(4) to read as follows:

(1) Receptacle outlets in floors shall not be counted as part of the required number of receptacle outlets unless located within 450 mm (18 in.) of the wall.

(2) A receptacle outlet in a listed floor box shall be installed at least 1.8 m (6 ft) from the wall in rooms other than basements, kitchens, bathrooms, garages and swimming pool rooms that are 60 m2 (625 ft2) in area or greater and where one wall is not less than 900 mm (3 ft) from the center of the room. A receptacle outlet in a listed floor box shall be installed for each 60 m2 (625 ft2) in area in a room.
Substantiation: This proposal should be Accepted in Principle. Panel 2 discussed how cord lengths have been shortened from 6 ft to 5 ft. As stated in the original proposal: "The lack of a sufficient number of available receptacle outlets leads the homeowner to use extension cords. The NEC has long recognized the hazards presented by the use of extension cords, especially where extension cords are used in place of permanent wiring. With the proliferation of cord connected home entertainment systems, computer equipment, electronic games, multiple TVs, appliances, etc., it is evident that the number of receptacles required 50 years ago is no longer adequate for today's home. The addition of floor receptacles as recommended in this proposal will help to ensure that there are an adequate number of receptacles available for connection of the large number of cord connected appliances now being used in the typical dwelling." When floor boxes are installed in large rooms then the number of extension cords used will be reduced.

The location for the floor box was increased to a minimum 1.8 m (6 ft) per Ray Weber's negative comment.
Panel Meeting Action: Reject
Panel Statement: Requiring the placement of receptacles in the floors of dwelling unit areas of 625 sq. ft. or more, located at least 6 ft. from the wall, in areas that may have no furniture or other provisions for interior design specifications, is not practical and has not been substantiated. If a floor receptacle were required in such areas, it could still end up underneath furniture which, if still used by the homeowner, would be a hazard in itself.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:

KING, D.: This Comment should have been accepted. I disagree with the Panel that this is a design consideration. This is a minimum installation requirement that allows for the safe and practical use of electricity in an area where it is commonly required by the end user. Requiring a floor receptacle to be installed in rooms with an area of 625 sq ft or larger will reduce the use of extension cords that are commonly used today. Without the requirement for a floor receptacle the homeowner would have to resort to running extension cords across walkways and under carpets to supply electrical appliances that are utilized in open areas and do not have safe access to wall receptacle outlets. I disagree with the Panel that this proposed requirement has not been substantiated. The potential shock and fire hazard that exist with the use of extension cords that are routed across walkways and concealed under carpeting is well documented and should not require any further substantiation.

WEBER, R.: The panel should have accepted in principle the comment the submitter in offering "at least 1.8 m (6 ft) from the wall", in large room areas of over 60 m square (625 sq ft), does address a need that should have positive code text to provide mandatory requirements; it could be restated in the text to allow it to be located anywhere in the room provided it is greater than 1.8 m (6 ft) from the wall. In the panel statement, the interior furniture layout is a design feature and a true statement, but at least one receptacle would have to be installed and then the coordination of its location is up to the designer, electrical installer and owner as to where it should be placed. As we review building trends going to larger size dwelling units, with rooms over the indicated size; the use of extension cords are often times the only solution to deal with the electrical outlet needs of the owner. It is always repeated that the electrical code is not a design manual; it does start as a minimum base line for what must be done to electrical systems and by not addressing changes in building sizes and room uses as to needs of receptacle locations other than just the wall area is unfortunate and not in the public best interest. Thus, the minimum standard becomes the maximum requirement and many will not do any more than that to meet the code, irregardless of the increased safety factor. If there is positive code text, then the AHJ does not have to go back to 90.4 for developing a local code requirement or addition for a receptacle outlet in a listed floor box, to be installed.

2-205 Log #666 NEC-P02 **Final Action: Reject (210.52(A))**

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 2-195
Recommendation: This Proposal should have been Accepted in Principle in Part with the following action:

Add an additional phrase to the first sentence of 210.52(F) "in addition to the appliance receptacle outlet required in 210.50(C)" so the sentence reads as follows:

"In dwelling units, at least one receptacle outlet shall be installed for the laundry in addition to the appliance receptacle outlet required in 210.50(C)."
Substantiation: The additional phrase will make it clear that the appliance receptacle outlet required in 210.50(C) does not satisfy the requirement for the additional receptacle outlet required in 210.52(F). This change will not require any additional receptacles in the laundry area, but will add clarity to the requirements.
Panel Meeting Action: Reject
Panel Statement: The submitter is incorrect in that the appliance receptacle requirement for a washer or gas dryer, in order to meet 210.50(C), does not meet the requirement for 210.52(F). This proposed change would require an additional receptacle to be installed but does not provide substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-206 Log #667 NEC-P02 **Final Action: Reject (210.52(A))**

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 2-195
Recommendation: This Proposal should have been Accepted in Principle in Part with the following action:

Accept the addition of "foyer," in 210.52(A). The remainder of 210.52(A) should read as shown in the 2005 NEC.

Add immediately following 210.52(A)(2)(2):

Exception to (1) and (2): In foyers, a receptacle outlet shall not be required where the unbroken wall space is less than 1.2 m (4 ft) in width or less than 1.8 m (6 ft) from the opposite wall.
Substantiation: I agree with Mr. King's Explanation of Negative Vote.

In the foyer of a typical two-story, one-family home, there can be three doorways (front entry, closet, and basement stairs), three openings (living room, dining room, kitchen), and one stairway. There are several wall spaces that would be 5 ft or more in width and could easily accommodate a small cabinet, table, or desk with a lamp, or even a trophy cabinet, credenza or hutch with interior lighting. Where does the power come from? Lacking adequate receptacles in the foyer, the power will have to be provided most likely from one of the adjacent rooms through the use of extension cords laid on the floor through the opening or doorway or, possibly, under a rug or carpet. Not a very safe installation and, by not requiring additional outlets in the foyer, the NEC condones the practice.

This problem becomes magnified many times over in the newer larger McMansion homes (15,000 sq ft and up) where the foyer may be 30 ft long and all the NEC requires is "at least one receptacle outlet" if the hallway is longer than 10 ft.

A hallway has a different connotation than a foyer. A hallway is usually narrow and does not lend itself to locating furniture in the area, although second floor hallways can be wider than those on the first floor and would permit locating furniture in that area. A foyer may be quite wide in addition to being long and does provide adequate space to locate furniture in this area.

Consider a home that has an atrium foyer that is 15 - 20 ft sq with a two- or two and one-half story ceiling and a balcony surrounding the atrium opening on the second floor. One receptacle outlet located on either level would comply with the 2005 NEC.

It could be argued that the wording "or similar room or area of dwelling units" in 210.52(A) already covers foyers with the more stringent requirements for receptacle outlets than that being recommended in this Comment.

While the Accept in Principle of the "foyer" part of Proposal 2-195 does not require complete compliance with the receptacle requirements within rooms, it does provide more lenient and reasonable requirements that partially address the problem stated in the proposal's substantiation.
Panel Meeting Action: Reject
Panel Statement: The term "foyer" is not a clearly defined term in the NEC and could be interpreted to cover many types of spaces. The proposed exception is unclear as to what types of spaces are intended to be exempt.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:

KING, D.: This Comment should have been accepted. The term "foyer" is clearly understood and does not need to be further defined as indicated in the Panel Statement. Most foyers are of sufficient size and have sufficient wall space to allow for the placement of furniture. Electrical appliances placed at these locations would require a receptacle outlet. Without a requirement for receptacles at these locations, extension cords would most likely be used which would have to be routed through doorways or entryways to reach the nearest available receptacle outlet. This would create a shock or fire hazard due to potential physical damage to these cords where they pass through the entryways and doorways. I disagree with the Panel that the proposed exception is unclear. The proposed exception outlined by the submitter is clear in its intent and would exempt this requirement where the wall space and or floor area is too small for the placement of furniture and electrical appliances. The Panel should give further consideration to this Comment.

WEBER, R.: The panel should have accepted in principle the comment, in the panel statement. "The term "foyer" is not a clearly defined term in the NEC" is used as part of the justification for rejecting the comment. Which may be true, however as we read section 210.52(A), Kitchen will now have a definition and the remaining rooms indicated do not have a definition in Article 100 either; but at present the AHJ often times is forced to make the call and tie in that (foyer) areas use to the last part of the sentence "or similar room or area of a dwelling unit" to solve the problem of receptacle requirements in that space. Hallways are not defined but requirements are indicated in 210.52(H), and a length is given but not a width; clearly if the area is (3 ft) or (4 ft) in width and functions as a passage way, that is its intended purpose and when (10 ft) or more the code requires a receptacle be installed. Foyers are something other than that in size and use, and can be of a considerable square footage in area. It often times has many pieces of furniture or other types of furnishings being placed in that space, that have lamps, decorative fixtures and uses in need of an outlet. If a receptacle is not provided as an option of the builder or installer, the owner will use a cord to meet the receptacle needs. As a panel, we need to think of the installer's perspective as well and provide enforceable text to meet in field problems and provide that area with wall spaces indicated in 210.52(A)(2) must be met.

2-207 Log #1308 NEC-P02 **Final Action: Accept (210.52(A)(1))**

Submitter: Joseph A. Hertel, Safety and Buildings
Comment on Proposal No: 2-197
Recommendation: I support the action on this proposal.
Substantiation: The submitter must realize that the NEC is by its own intent (Section 90.1(C)) is not a design specification. While agreement can be reached that additional receptacles may provide some degree of additional safety, they can always be added by exceeding the minimum requirements of the NEC. If as the explanation of one of the negative votes says that product standards have changed to allow the use of shorter cords it is these standards that should be modified to reflect the length needed for compliance with the NEC without the use of extensions.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:
KING, D.: See my explanation of negative on Comment 2-208.
Comment on Affirmative:
BROWN, L.: Please see my Ballot Comment on Comment 2-208. The NEC (NFPA 70) is a standard on the minimum provisions for safe electrical installations. It is not a standard for "electrical convenience".

2-208 Log #1348 NEC-P02 **Final Action: Reject (210.52(A)(1))**

Submitter: Donald M. King, Wilmington, DE
Comment on Proposal No: 2-197
Recommendation: Revise submitter's recommended text to read as follows:
210.52(A)(1) Spacing. Receptacles shall be installed so that no point measured horizontally along the floor line in any wall space is more than ~~1.8 m (6 ft)~~ 1.5 m (5 ft) from a receptacle outlet.
Substantiation: The submitter of this proposal has provided adequate substantiation to support the need for a change in the spacing receptacle spacing requirements described in 210.52(A)(1). Product standards addressing the minimum cord length of electrical appliances have been revised since the 6 foot requirement was added to 210.52 of the NEC. There are many listed appliances available today that have cord lengths that are less than 6 feet. For portable luminaries, UL 153, the cord must be a minimum 5 ft. For power tools, UL 45, it is also a 5 ft minimum, but there are some exceptions, like for hand circular saws, where it is a minimum of 6 ft. For cooking appliances, UL 1026, cooking appliances for kitchen countertop must be between 2 and 7 ft. The purpose of this section is to eliminate the use of extension cords in dwelling units, thus reducing the risk of fires. Changing the spacing requirement for receptacle outlets to be in line with the minimum cord length as defined in the most recent product standards will aid in the reduction of the number of extension cords used.
Panel Meeting Action: Reject
Panel Statement: The panel disagrees with the suggestion that it is necessary to lessen the required 6 ft spacing to accommodate the manufacturer's decision to shorten their appliance cords to 5 ft.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 3
Explanation of Negative:
KING, D.: I disagree with the Panel that it is not necessary to lesson the 6 ft spacing requirement to 5 ft. Receptacle spacing should be coordinated with the product standards to reduce the number of extension cords used in dwelling units. The 6 ft spacing requirement in the NEC was initially implemented to be in line with the cord manufacturer's product standards. The intent of this revision is not to accommodate the product manufacturer's decision to shorten their cord length as stated by Panel 2 but rather to require a minimum standard for receptacle spacing to reduce the number of fires associated with the use of extension cords. Panel 2 should give this comment further consideration.
LAROCCA, R.: The present rule in Section 210.52(A)(1), that requires receptacles to be installed so that no point measured horizontally along the floor line is more than 6 ft from a receptacle outlet, has been in the NEC since the mid-1950's. Prior to that the length was 10 ft. The 6 feet distance corresponded to the minimum length at the time of power supply cords in product standards typical of appliances such as portable lamps, audio-video equipment, etc., that are commonly installed in fixed locations within the dwelling unit. In the mid-1970s, these product standards enacted temporary requirements that reduced this minimum cord length from 6 ft to 5 ft. This was done to address a growing concern over the shortage of copper and the need to conserve this nonrenewable resource. These temporary length requirements subsequently became permanent. The submitters comment on Proposal 2-197 to reduce this receptacle outlet spacing to 5 ft makes sense given these current cord lengths, and should reduce the likelihood of an extension cord set being used on a prolonged basis to reach the nearest outlet.
PAULEY, J.: See my Explanation of Negative Vote on Comment 2-209.
Comment on Affirmative:
BROWN, L.: Proposal 2-197 did not provide any relative and substantial study data to support a change to the 6-foot dimension for wall receptacles. The CPSC information did not equate the use of electrical extension cords to dwellings where the receptacles are installed to the current 6-foot dimension.
The cases could easily be located in dwellings constructed prior to the receptacle spacing. The 2006 figures released by NFPA shows the annual average between 1999-2003 to be 2,400 fires related to cord or plugs 2,400, with only 30 deaths, and 160 civilian injuries. Again, with no data to show the fires occurred in dwellings with the current required receptacle spacing. These figures are significantly lower then CPSC cited in the Proposal. But absolutely, the proposal change did not provide any means that would change any of the cited statistics by having a receptacle one-foot closer then is now required. The "Reason" for this Proposal is also flawed and one would be hard pressed to find any computer station where an extension to the wall or floor receptacle is not used to power all of the related equipment. As for the fixture cord length, the Committee Statement is correct. Perhaps the standards developed by the testing laboratories and underwriters should mandate a cord length that is usable for the situation in which the fixture is reasonably expected to be located.

2-209 Log #1410 NEC-P02 **Final Action: Reject (210.52(A)(1))**

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 2-197
Recommendation: The Panel should Accept in Principle and change the proposed text to read as follows:
210.52(A)(1) Spacing. Receptacles shall be installed so that no point measured horizontally along the floor line in any wall space is more than ~~1.8 m (6 ft)~~ 1.2 m (4 ft) from a receptacle.
Substantiation: Both the panel statement and the substantiation for this proposal noted that the 6 ft receptacle spacing is based on the standard length of the flexible cord used on an appliance or lamp. The substantiation also quoted earlier editions of the NEC handbook which stated, "This rule intends that an appliance or lamp with a flexible cord attached may be placed anywhere in the room and be within 6 ft of a receptacle". However, many UL standards for portable electric products, such as the Standard for Portable Electric Lamps UL 153, now require a cord length of 1.5 m (5 ft).
This comment revises the current receptacle spacing from 6 ft to 4 ft. The 4 ft spacing accommodates the likelihood that a table lamp or other cord connected appliance will be located on a table top or similar raised surface which effectively reduces the distance that flexible cord will reach along the wall to the receptacle. The 4 ft spacing also takes into account locating a receptacle at the standard stud spacing in typical residential construction.
The NEC requirement for the 6 ft receptacle spacing has not been changed in at lest 50 years. In the least 50 years there has been a significant increase in the capacity of the service for dwellings. It is common today to have a service rated for 150, 200 amps or greater compared to a rating of 60 amps in the 1950's. These higher ratings are due not only to the larger size of homes but also to the increased demands of the electrical equipment used in a typical residence. Although not all of the increase is due to cord connected electrical equipment, there are cord connected electrical products in use today that were not envisioned 50 years ago. Cord connected products such as home entertainment systems, multiple televisions, electronic gaming systems, transformers, air purifiers, air fresheners, etc., all require connection to a receptacle. If a sufficient quantity of receptacles is not provided at convenient spacing than it is likely that extension cords will be used. This proposal is intended to reduce the use of extension cords. The original proposal substantiation cited the CPSC report that documents the death and injury incidents associated with the use of extension cords.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 2-208.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
KING, D.: This Comment should have been accepted in principal with a revised spacing maximum spacing of 5 ft. A maximum spacing of 5 ft. aligns the cord manufacturer's product standard with the spacing requirement in the NEC. See my explanation of negative on Comment 2-208.
PAULEY, J.: The revision in the product standards that allowed appliance cords to be reduced to 5 feet in length is sufficient substantiation to make the change to the receptacle spacing. The reduced cord length can result in more use of extension cords in order to reach a receptacle.
Comment on Affirmative:
BROWN, L.: Please see my Ballot Comment on Comment 2-208. The NEC (NFPA 70) is a standard on the minimum provisions for safe electrical installations. It is not a standard for "electrical convenience".

2-210 Log #1454 NEC-P02 **Final Action: Reject (210.52(A)(1))**

Submitter: James O'Driscoll, IBEW Local #98
Comment on Proposal No: 2-197
Recommendation: I agree with the submitter, D. King, and J. Pauley.
Substantiation: The submitter's substantiation gives this panel very staggering statistics. Given the fact that appliance cords are mostly 4 to 5 ft, I feel receptacle spacing requirements should be reduced.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 2-208.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
KING, D.: See my explanation of negative on Comment 2-208.
PAULEY, J.: See my Explanation of Negative Vote on Comment 2-209.
Comment on Affirmative:
BROWN, L.: Please see my Ballot Comment on Comment 2-208. The NEC (NFPA 70) is a standard on the minimum provisions for safe electrical installations. It is not a standard for "electrical convenience".

2-211 Log #2150 NEC-P02 **Final Action: Reject (210.52(A)(1))**

Submitter: David H. Kendall, Carlon
Comment on Proposal No: 2-197
Recommendation: Proposal 2-197 should be an "Accept in Principle" with the revised proposed text for 210.52(A)(1) to read as follows:

210.52(A)(1) Spacing. Receptacles shall be installed so that no point measured horizontally along the floor line in any wall space is more than ~~1.8 m (6 ft)~~ 1.2 m (4 ft) from a receptacle outlet.

Substantiation: I agree with the substantiations submitted with the NEMA Proposal and Comment. I agree with the 4 ft spacing because when using 16 in. stud spacing the outlet would be located right on the stud installed 48 in. away. The current 6 ft requirements puts the outlet between the 64 in. and 80 in. studs. To be code compliant, without installing another stud, the outlet would be located on the 64 in. stud (5.33 ft) away.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 2-208.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:

KING, D.: This Comment should have been accepted in principal with a revised spacing maximum spacing of 5 ft. A maximum spacing of 5 ft. aligns the cord manufacturer's product standard with the spacing requirement in the NEC. See my explanation of negative on Comment 2-208.

PAULEY, J.: See my Explanation of Negative Vote on Comment 2-209.
Comment on Affirmative:

BROWN, L.: Please see my Ballot Comment on Comment 2-208. The NEC (NFPA 70) is a standard on the minimum provisions for safe electrical installations. It is not a standard for "electrical convenience".

2-212 Log #1309 NEC-P02 **Final Action: Accept (210.52(A)(4))**

Submitter: Joseph A. Hertel, Safety and Buildings
Comment on Proposal No: 2-198
Recommendation: I support the panel action.
Substantiation: The submitter must realize that the NEC is by its own intent (Section 90.1(C)) is not a design specification. While agreement can be reached that additional receptacles may provide some degree of additional safety, they can always be added by exceeding the minimum requirements of the NEC.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

KING, D.: See my explanation of negative on Comment 2-203.

2-213 Log #2246 NEC-P02 **Final Action: Reject (210.52(B)(1))**

Submitter: Donald A. Ganiere, Ottawa, IL
Comment on Proposal No: 2-201
Recommendation: The proposed language should be accepted.
Substantiation: The panel should reconsider and accept this change. The panel statement said that the word "covered" was used in place of the word "required" in an attempt to make it clear that all of the receptacles installed in the kitchen, pantry, breakfast room, dinning room, or similar area of a dwelling unit be supplied by the two or more small appliance branch circuits. Based on the debates of this issue, both in the field and in the online code forums, this attempt was not successful. The code language in this proposal would make the panel's intent completely clear and enforceable.
Panel Meeting Action: Reject
Panel Statement: The panel agrees that this submitter has not provided adequate substantiation in order to change the use of these terms.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-214 Log #2021 NEC-P02 **Final Action: Reject (210.52(B)(1) Exception No. 2)**

Submitter: Lawrence Brown, National Association of Home Builders (NAHB)
Comment on Proposal No: 2-199
Recommendation: Accept the proposed change.
Substantiation: It should be noted that Section 210.52(B)(1) Exception No. 3 already allows the receptacle outlet for refrigeration equipment to be on an individual branch circuit of 15 amperes or greater. I see no reason to limit individual circuits for these types of permanently installed appliances, such as the disposer and dishwasher, that would not require a circuit rated greater than 15 amperes. I believe the panel statement is somewhat misleading in its assertion that Section 210.52(B)(1) and the proposed text relate only to the countertop receptacles that are covered in Section 210.52(B)(3) and 210.52(C). In other words, I do not believe the panel statement is a good response to the submitter's substantiation. If the Panel believes these appliances are already allowed to be on a circuit(s) that do not supply the receptacles as outlined in Section 210.52(B)(1), it should be acknowledged.
Panel Meeting Action: Reject
Panel Statement: The panel agrees that this change is not necessary. The only reason there is an exception for refrigeration equipment is that refrigeration equipment is specifically required to be on the small-appliance branch circuit. The current Code does not prohibit receptacles in the kitchen that are other than countertop (210.52(C)) or wall spaced (210.52(A)) to be on 15- or 20-ampere circuits appropriately rated for the equipment.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:

BROWN, L.: The circuits for receptacles for permanently installed kitchen appliances, such as the disposer and dishwasher are not covered under Section 210.52(B)(1) (not allowed) and are to be on another circuit.

2-215 Log #21 NEC-P02 **Final Action: Accept (210.52(C))**

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 2-207
Recommendation: The Technical Correlating Committee directs that the Panel Action on this Proposal be correlated with Figure 210.52 by changing the title of the Figure to "Figure 210.52(C)(1)" to comply with 2.3.1 of the NEC Style Manual, and change the Table titles from "Sink or range…" to "Range, counter-mounted cooking unit or sink…" to correlate with Panel Actions on this Proposal and Proposals 2-211 and 2-218.

The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal as to the placement of the proposed text within 210.52(C).

This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept

Revise Figure 210.52 as follows:

The panel takes the following actions:

(1) Place the text of the recommendation in Proposal 2-207 as modified by the panel action text and make it a second paragraph to 210.52(C).

(2) The panel accepts changing the title of the figure to "Figure 210.52(C)(1) Determination of Area Behind a Range, Counter-Mounted Cooking Unit or Sink."

(3) The panel directs that the labels on the figures in the ROP Draft be changed to reflect the accepted panel change from Proposal 2-206a. This will change the words "Outlets not required.." to "Space exempt from wall line measurement."

(4) The captions for both figures should be changed from "Sink or range.." to "Range, counter-mounted cooking unit or sink.." to be consistent with the text of the Exception to 210.52(C)(1).
Panel Statement: The panel accepts the direction of the TCC to clarify the panel action. The panel has also made the appropriate changes to the labels within the figures to match the text accepted in Proposal 2-206a.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-216 Log #973 NEC-P02 **Final Action: Accept in Principle (210.52(C))**

Submitter: Mark C. Ode, Underwriters Laboratories Inc.
Comment on Proposal No: 2-207
Recommendation: Change "counter" in the subsection to "countertop" to be consistent throughout the section as follows:

210.52 Dwelling Unit Receptacle Outlets

(C) Countertops. In kitchens and dining rooms of dwelling units, receptacle outlets for counter<u>top</u> spaces shall be installed in accordance with 210.52(C)(1) through (C)(5). Where a range, counter-mounted cooking unit, or sink is installed in an island or peninsular countertop and the width of the counter behind the range, counter-mounted cooking unit, or sink is less than 300 mm (12 in.), the range, counter-mounted cooking unit, or sink is considered to divide the countertop into two separate countertop spaces as defined in 210.52(C)(4). Each separate countertop space shall comply with the applicable requirements in 210.52(C).

(1) Wall Countertop Spaces. A receptacle outlet shall be installed at each wall countertop space that is 300 mm (12 in.) or wider. Receptacle outlets shall be installed so that no point along the wall line is more than 600 mm (24 in.) measured horizontally from a receptacle outlet in that space.

Exception: Receptacle outlets shall not be required on a wall directly behind a range or sink in the installation described in Figure 210.52.

(2) Island Countertop Spaces. At least one receptacle shall be installed at each island countertop space with a long dimension of 600 mm (24 in.) or greater and a short dimension of 300 mm (12 in.) or greater. Where a rangetop or sink is installed in an island countertop and the width of the countertop behind the rangetop or sink is less than 300 mm (12 in.), the rangetop or sink is considered to divide the island into two separate countertop spaces as defined in 210.52(C)(4).

(3) Peninsular Countertop Spaces At least one receptacle outlet shall be installed at each peninsular countertop space with a long dimension of 600 mm (24 in.) or greater and a short dimension of 300 mm (12 in.) or greater. A peninsular countertop is measured from the connecting edge.

Substantiation: Make changes throughout 210.52(C) to ensure the same terminology use of "countertop" spaces.

Panel Meeting Action: Accept in Principle

Revise 210.52(C), (C)(1), (C)(2), and (C)(3) as follows:

The panel agrees to change the words "Counter" to "Countertop" throughout the text in 210.52(C), (C)(1), (C)(2) and (C)(3).

Panel Statement: The panel agrees with the concept but accepted the comment in principle because the submitter included language in the subsections that does not take into account other changes that were made in the ROP.

2-217 Log #1010 NEC-P02 **Final Action: Accept in Principle (210.52(C))**

Submitter: David Shapiro, Safety First Electrical Contracting Consulting & Safety Education

Comment on Proposal No: 2-205

Recommendation: Accept Mr. Eugene Swisher's proposal.

Substantiation: I am with Messrs. King and Weber. It makes sense to define "kitchen" in terms of having both permanent food-preparation facilities and a sink; the sink creates the need for GFCI protection. However, neither the circuiting requirement nor the receptacle-spacing requirement at a food-preparation countertop is related to the presence of a sink and thus to satisfying the definition of "kitchen". I was called in recently to discuss bringing the wiring up to date in a single-family residence's basement. It had a food-preparation countertop, including a built-in range, but no sink. Dishes were carried upstairs to the dishwasher. The nearest 120 volt receptacle was several feet away from the countertop. This was an extreme case, but it underscores the fact that countertops in food-preparation areas should fulfill the same requirements for both circuiting and spacing as those in kitchens.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Comment 2-218.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-218 Log #1365 NEC-P02 **Final Action: Accept in Principle (210.52(C))**

Submitter: Eugene Swisher, City of Tampa / Rep. IBEW Local 915 & IAEI Suncoast Division

Comment on Proposal No: 2-205

Recommendation: Revise text to read as follows:

In kitchens and dining rooms, breakfast rooms, pantries, and similar areas of dwelling units. Receptacle outlets ~~for~~ serving counter spaces shall be installed in accordance with 210.52(C)(1) through (C)(5).

Substantiation: I concur with the comments of D. King and R. Weber. This proposal would solve a serious enforcement problem for inspectors. Although 210.52(B)(1) may demand that these areas are supplied by branch circuits required by 210.11(C)(1), failure to specify them in 210.52(C) makes proper (safe) spacing, difficult to enforce.

Panel Meeting Action: Accept in Principle

Revise the first sentence in 210.52(C) to read as follows:

"In kitchens, pantries, breakfast rooms, dining rooms, and similar areas of dwelling units, receptacle outlets for countertop spaces shall be installed in accordance with 210.52(C)(1) through (C)(5)."

Panel Statement: The panel has accepted the submitter's concept but has rearranged the description of the areas to be consistent with the arrangement of the same areas in 210.52(B).

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-219 Log #2324 NEC-P02 **Final Action: Accept in Principle (210.52(C))**

Submitter: Ken Brewer, Tampa JATC / Rep. IBEW 915

Comment on Proposal No: 2-205

Recommendation: The panel should Accept this Proposal.

Substantiation: The panel's recognition that receptacles installed for counter tops in the additional proposed areas are served by the 20 amp small appliance branch circuits per 210.52 (B)(1) does not take into consideration the spacing and location requirements of 210.52 (C)(1) through (5). The current requirements seem to indicate that counter tops in the proposed areas could be served by receptacles located beneath the counter tops and be exempt from the horizontal spacing requirements of 210.52 (C)(1) through (5). The proposed requirements insure that receptacles are correctly placed so as to prevent the need to drape cords over the edge of, and/or extend for excess lengths, along counter top areas.

BROWN, L.: See my Ballot Comment on Public Comment 2-230.
In addition "readily accessible"?

2-227 Log #1411 NEC-P02 **Final Action: Accept in Principle in Part**
(210.52(E))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 2-229
Recommendation: Continue to Accept in Principle and revise the text as follows:
(E) Outdoor Outlets. Outdoor receptacle outlets shall be installed in accordance with (E)(1) through (E)(3).
(1) One-Family and Two-Family Dwellings. For a one-family dwelling and each unit of a two-family dwelling that is at grade, at least one receptacle outlet accessible at grade level and not more than 2.0m (6 1/2 ft) above grade shall be installed at the front and back of the dwelling.
(2) Multifamily Dwellings. For each dwelling unit of a multifamily dwelling where the dwelling unit is located at grade level and provided with individual exterior entrance/egress, at least one receptacle outlet accessible from grade level and not more than 2.0 m (6 1/2 ft) above grade shall be installed.
(3) Balconies, Decks and Porches. Balconies, decks and porches that are attached to the dwelling unit and are accessible from inside the dwelling shall have at least one receptacle outlet installed that is readily accessible while ~~from~~ on the balcony, deck or porch.
Substantiation: Adding the terms "readily accessible" and "on" will insure that the receptacle can be easily reached by a person standing on the balcony, deck or porch. Use of the terms "readily accessible" and "on" should also prevent considering a receptacle that is located inside the building that can be reached through a door or window as being considered the receptacle that meets this requirement.
Panel Meeting Action: Accept in Principle in Part
Revise the (E)(3) wording from Proposal 2-229 to read:
"(3) Balconies, Decks, and Porches. Balconies, decks, and porches that are accessible from inside the dwelling unit shall have at least one receptacle outlet installed within the perimeter of the balcony, deck, or porch. The receptacle shall not be located more than 2.0 m (6 ½ ft) above the balcony, deck, or porch surface."
Panel Statement: The panel agrees with the submitter's request to provide clarity to the location of the balcony, deck, or porch receptacle and offers revised text to accomplish this. The panel does not agree that "readily accessible" is a better word choice than "accessible" when considering the definitions of these terms from Article 100.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
BROWN, L.: See my Ballot Comment on Public Comment 2-230.
In addition "readily accessible"?

2-228 Log #1448 NEC-P02 **Final Action: Accept in Principle**
(210.52(E))

Submitter: Larry Cross, IBEW Local 98
Comment on Proposal No: 2-231
Recommendation: I agree with R. Weber. The Panel should have accepted this proposal as submitted.
Substantiation: . None.

Panel Meeting Action: Accept in Principle
Panel Statement: See panel statement on Comment 2-225.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-229 Log #1452 NEC-P02 **Final Action: Accept in Principle (210.52(E))**

Submitter: James O'Driscoll, IBEW Local #98
Comment on Proposal No: 2-231
Recommendation: I agree with the submitter and Mr. R. Weber.
Substantiation: Mr.R. Weber makes it very clear why this proposal should have been accepted as submitted. "While Standing" should be added to this section.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel statement on Comment 2-225.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-230 Log #2023 NEC-P02 **Final Action: Accept in Principle (210.52(E))**

TCC Action: The Technical Correlating Committee directs that "20 sq. ft" be revised to read "1.86 m2 (20 ft2)" in compliance with the NEC Style Manual Units of Measurement.
Submitter: Lawrence Brown, National Association of Home Builders (NAHB)
Comment on Proposal No: 2-229
Recommendation: Reject the proposed change until additional study of the typical porch, deck or ornamental railing space configurations can be related to the proposed change.
Substantiation: Concerning new 210.52(E)(3): It would be more appropriate for there to be a minimum size balcony, deck, or porch for the application of this new provision. As was discussed at the ROP meeting, some members would consider exterior area in front of a door used for solely ventilation a "balcony", just because there is the installation of a protective guard (railing) to prevent falls. In reality there is no actual floor space. Also, many designs of high-rise multifamily buildings include a very small standing area, perhaps 3 feet by 6 feet, to allow for fresh air and a place to have a smoke and not contaminate the interior environment. There is barely room for a single chair. The Panel should consider the use of the deck area relative to the need for a receptacle. For a floor space large enough to allow outdoor cook (electric grill) or sunbathing (radio) the installation of a receptacle may be appropriate. For a floor space that is a result of a designed ventilation opening, a receptacle would be of no practical use.

It should also be noted that for all multifamily construction the guards are required to be a minimum of 42 inches in height above the deck surface. For the small deck areas the guard usually is attached to the building directly adjacent to the door frame. This provides no wall surface with the guard to instal a receptacle. If the receptacle was to be installed it would be located approximately 46 inches above the deck surface, and due to structural framing around the door would be located 12 or more inches outside the deck area.

The installation of a receptacle for usable deck areas would seem appropriate, and is usually already included in the design of the unit as a convenience for using outdoor appliances. The contention that that outlet is needed, in the event holiday lighting is installed is not the basis for requiring a receptacle. If you require a receptacle for holiday lighting on the deck, why not one for all of the gutters and rake boards? As with any use of holiday or other decorative lighting, this is a use and design consideration of the user. Not one of minimum electric safety regulations. The use of holiday lighting cords and fixtures are already covered in the NEC and the product's listing.
Panel Meeting Action: Accept in Principle

Add the following Exception to 210.52(E)(3), :

"Exception to (3): Balconies, decks, or porches with a useable area of less than 20 sq ft are not required to have a receptacle installed."
Panel Statement: The panel continues to recognize the need for receptacles on most balconies, decks, or porches. However, the panel also understands it is not practical to install receptacles for all balconies, decks, or porches, especially those non-functioning spaces used for architectural or decorative purposes only.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

KING, D.: I disagree with the Panel that a minimum dimension of 20 sq ft should be a condition for this requirement. If a porch, deck or balcony is accessible and intended for use by occupants of the dwelling than a receptacle should be required regardless of the minimum dimension. The purpose of this section is to eliminate the use of cords through doorways to supply electrical equipment at these locations. Cords passed through doorways are a potential cause for electric shock and fire due to damage that can easily occur to the cord where it passes through the doorway. Acceptance of this Comment will allow this hazardous condition to continue to exist for porches, decks and balconies that are less than 20 sq. ft.
Comment on Affirmative:

BROWN, L.: The Panel's Action of adding an Exception for small landing, etc. is appropriate and important.

In fact, the 20 Square Foot dimension may be too small. As written, one could interpret that a single-step 5-foot by 5-foot (25 S.F.) "landing" at an exterior door is a "porch". Clearly, the landing is only there because it is required by the building code. It serves no other purpose than to provide easy entry and exit from a building, a screen door may swing over the landing, and there is no usable space on the landing. There are also the instances for upper-floor rooms where an extremely small exterior area in front of a door used for solely ventilation would be considered a "balcony", just because there is the installation of a protective guard (railing) to prevent falls. Without the Exception, these small landings and exterior shelves at ventilation doors would require a receptacle that would never be used.

In response to the Ballot Comment by Mr. King: You need to go back and review the original
proposals on this matter. No data was presented to show there is a correlation with extension
cords and the possibility of holiday lighting being located on a deck railing. For all we know,an
outside receptacle was available for all of these situations. Nor was any data provided to show extension cords are being run through exterior doorways.

(In all, see Comments 2-226 and 2-227.)

WEBER, R.: There is a need for a receptacle in this space; however in the ROP phase in Proposal 2-229, and panel discussion on the intent of the requirement area limits were discussed. Due to the varied uses a size limitation for an exception was not supported at that time; by accept in principle, of this comment the panel has now exempted area of "less than 20 sq ft" from having to have a receptacle. This is too large of an area and the panel should have retained the original text of Proposal 2-229, which addressed many other contingencies of use. By accepting this exception, the user has to use a cord through a door or window to provide an outlet in those smaller spaces in violation of 400.8(3). I do not want to lose this requirement in the code so I am voting in the affirmative, but wish to go on record that the exempted space is going to be used and a required receptacle should have been afforded in that space irregardless of size.

2-231 Log #2024 NEC-P02 **Final Action: Accept in Principle (210.52(E))**

Submitter: Lawrence Brown, National Association of Home Builders (NAHB)
Comment on Proposal No: 2-228
Recommendation: Reject the proposed change until additional study of the typical porch, deck or ornamental railing space configurations can be related to the proposed change.
Substantiation: Concerning new 210.52(E)(3): It would be more appropriate for there to be a minimum size balcony, deck, or porch for the application of this new provision. As was discussed at the ROP meeting, some members would consider exterior area in front of a door used for solely ventilation a "balcony", just because there is the installation of a protective guard (railing) to prevent falls. In reality there is no actual floor space. Also, many designs of high-rise multifamily buildings include a very small standing area, perhaps 3 feet by 6 feet,
to allow for fresh air and a place to have a smoke and not contaminate the interior environment. There is barely room for a single chair. The Panel should consider the use of the deck area relative to the need for a receptacle. For a floor space large enough to allow outdoor cook (electric grill) or sunbathing (radio) the installation of a receptacle may be appropriate. For a floor space that is a result of a designed ventilation opening, a receptacle would be of no practical use.

It should also be noted that for all multifamily construction the guards are required to be a minimum of 42 inches in height above the deck surface. For the small deck areas the guard usually is attached to the building directly adjacent to the door frame. This provides no wall surface with the guard to instal a receptacle. If the receptacle was to be installed it would be located approximately 46 inches above the deck surface, and due to structural framing around the door would be located 12 or more inches outside the deck area.

The installation of a receptacle for usable deck areas would seem appropriate, and is usually already included in the design of the unit as a convenience for using outdoor appliances. The contention that that outlet is needed, in the event holiday lighting is installed is not the basis for requiring a receptacle. If you require a receptacle for holiday lighting on the deck, why not one for all of the gutters and rake boards? As with any use of holiday or other decorative lighting, this is a use and design consideration of the user. Not one of minimum electric safety regulations. The use of holiday lighting cords and fixtures are already covered in the NEC and the product's listing.

In addition "readily accessible"?

2-232 Log #2247 NEC-P02 **Final Action: Reject**
(210.52(E))

Submitter: Donald A. Ganiere, Ottawa, IL
Comment on Proposal No: 2-233
Recommendation: This proposal should be accepted.
Substantiation: There were four proposals to change this section. All of them made the point that the required outside dwelling unit receptacles should be accessible "from grade" and not "at grade" as in the current code wording. There is no safety or any other logical case that can be made to show that a receptacle "accessible from grade" presents any type of problem. The design of many single family dwelling units makes compliance with the current wording impossible as they have porches or decks that cover the complete front or back of the dwelling unit.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its position that we intend to use the words "at grade" not "from grade". See panel statement on Comment 2-225 for further clarification.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-196 Log #1082 NEC-P02 **Final Action: Accept in Principle**
(210.52(E)(3))

Submitter: Jim Pauley, Square D Company
Comment on Proposal No: 2-229
Recommendation: Revise the 210.52(E)(3) from the ROP to read as follows:
(3) Balconies, Decks and Porches. Balconies, decks and porches that are attached to the dwelling unit and are accessible from inside the dwelling shall have at least one receptacle outlet installed that is readily accessible ~~from~~ on the balcony, deck or porch.
Substantiation: This revision is intended to remove the confusion about where an accessible receptacle can be located to meet this requirement. During the panel discussions, it was clear that the panel intended that a receptacle be installed so that you could utilize it while ON the balcony, deck or porch. The words "…accessible from the…" in the ROP accepted text implies that a receptacle that you could get to by walking down the steps from the balcony or deck would meet the requirements.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action and statement on Comment 2-227.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

BROWN, L.: Please see my Ballot Comment on Public Comment 2-230.

2-233 Log #1666 NEC-P02 **Final Action: Reject**
(210.52(E)(3))

Submitter: James Grant, Rochester, NH
Comment on Proposal No: 2-229
Recommendation: Revise as follows:
(3) Balconies, Decks and Porches. Balconies, decks and porches that are attached to the dwelling unit and are accessible through doorways from inside the dwelling shall have at least one receptacle outlet installed accessible from the balcony, deck or porch.
Substantiation: By adding this text, it will exclude balconies, whose only means of access is through a window, that are furnished solely for an area of refuge during a fire as permitted by NFPA 101.
Panel Meeting Action: Reject
Panel Statement: The panel notes space accessible only through a window is not a balcony, deck, or porch.
See the panel action and statement on Comment 2-227.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
BROWN, L.: See my Ballot Comment on Public Comment 2-230.
In addition "readily accessible"?

2-234 Log #1053 NEC-P02 **Final Action: Reject**
(210.52(F) Exception No. 3 (New))

Submitter: Andre R. Cartal, Princeton Borough Building Dept.
Comment on Proposal No: 2-236
Recommendation: Accept proposal.
Substantiation: The panel comment for Proposal 2-95 indicates that the present requirement is a "minimum" but if the "minimum" for the equipment is 30 amperes why can't that be the accepted minimum? The 20 amp receptacle serves no purpose.
Also, please see comment on Proposal 2-96.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its position that the existing text provides for the minimum installation and may require an additional circuit for compact or stacked laundry equipment. See panel statement on Comment 2-67.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-204 Log #1995 NEC-P02 **Final Action: Accept in Principle**
(210.52(G))

Submitter: Lawrence Brown, National Association of Home Builders (NAHB)
Comment on Proposal No: 2-240
Recommendation: Reject the proposed change.
Substantiation: This is nonsense. The addition of the term "general-use" to describe a typical receptacle adds absolutely no additional clarification to these provisions. Looking at the 2005 NEC, this term is only used in Article 220 (Branch-Circuit, Feeder, and Service Calculations); 440.62(C) (Air-conditioning and refrigerating Equipment - Provisions for Room Air-Conditioners); and 552.46(B)(3) (Park Trailers - Branch Circuits - General Appliances). But, what is a "general-use" receptacle? There is no definition, as there is for "General-Use Switch", in the NEC. Regarding the submitter's substantiation, adding this term will provide no more enforcement of having a usable receptacle in these locations than the current language already provides. What would ever make someone think a single receptacle is not a "general-use" receptacle? If you really want to address the submitter's purported problem, make these receptacles in addition to any other receptacle used for equipment installed in those areas.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 2-237.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-235 Log #23 NEC-P02 **Final Action: Accept**
(210.52(G))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 2-240
Recommendation: It was the action of the Technical Correlating Committee that the panel reconsider the proposal relative to the grammar and the use of complete sentences. This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel has revised the text as Accepted in the panel action on Comment 2-237 to reflect the proper grammar.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-236 Log #1012 NEC-P02 **Final Action: Accept in Principle**
(210.52(G))

Submitter: David Shapiro, Safety First Electrical Contracting Consulting & Safety Education
Comment on Proposal No: 2-240
Recommendation: Revise text to read as follows:
For a one-family dwelling, at least one ~~general use~~ receptacle outlet, in addition to any provided for the laundry equipment or for any fixed equipment, shall be installed in each basement and in each attached garage, and in each detached garage with electric power. See 210.8(A)(2) and (A)(5). Where a portion of a basement is finished into one or more habitable rooms, each separate unfinished portion shall have an additional receptacle outlet installed in accordance with this section.
Substantiation: The concern described in Mr. Mark Shapiro's substantiation was that these receptacles might be confounded with those serving fixed equipment. It seems better to state this explicitly rather than to introduce a term, as Mr. Lawrence Brown notes.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action on Comment 2-237, as it meets the submitter's intent.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-237 Log #1083 NEC-P02 **Final Action: Accept in Principle in Part**
(210.52(G))

Submitter: Jim Pauley, Square D Company
Comment on Proposal No: 2-240
Recommendation: Revise the 210.52(G) from the ROP to read as follows:
(G) Basements and Garages. For a one-family dwelling, the following provisions shall apply:
(1) At least one ~~general-use~~ receptacle outlet, in addition to those for specific equipment, shall be installed in each basement and in each attached garage, and in each detached garage with electric power.

(2) ~~See 210.8(A)(2) and (A)(5).~~ Where a portion of the basement is finished into one or more habitable rooms, each separate unfinished portion shall have a ~~general-use~~ receptacle outlet installed in accordance with this section.
FPN: See 210.8(A)(2) and (A)(5) for GFCI requirements for these receptacles.
Substantiation: This comment is intended to address the concern from Mr. Brown associated with the user of the term "general use". The revision removes that term and now specifically states that the receptacle must be in addition to any provided for specific equipment. Examples of specific equipment would include laundry, fire alarms, pumps, etc.

In addition, the comment creates a list format to address the concern expressed in the TCC note. The provision associated with the reference to 210.8 has been moved to An FPN since it is merely calling attention to the provisions of another section. This will also address the concern in the TCC note relative to complete sentences.
Panel Meeting Action: Accept in Principle in Part
Revise the 210.52 (G) text to read:

"(G) Basements and Garages. For a one-family dwelling, the following provisions shall apply:

(1) At least one receptacle outlet, in addition to those for specific equipment, shall be installed in each basement, in each attached garage, and in each detached garage with electric power.

(2) Where a portion of the basement is finished into one or more habitable rooms, each separate unfinished portion shall have a receptacle outlet installed in accordance with this section."
Panel Statement: The panel accepts the submitter's text except for the FPN and a grammatical revision requested by the Technical Correlating Committee. The FPN is not needed, as the requirements of 210.8(A)(2) and (A)(5) already apply to 210.52.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-238 Log #1412 NEC-P02 **Final Action: Accept in Principle (210.52(G))**

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 2-240
Recommendation: NEMA agrees in Principle with the intent to require installation of at least one receptacle for general use. We recommend changing the rule as follows:

210.52(G) Basements and Garages. For a one-family dwelling, at least one general use receptacle outlet, in addition to any provided for specific purposes such as laundry equipment, sump pumps, HVAC equipment, garage door openers, shall be installed in each basement and in each attached garage, and in each detached garage with electric power. See 210.8(A)(2) and (A)(5). Where a portion of the basement is finished into one or more habitable rooms, each separate unfinished portion shall have a general use receptacle outlet installed in accordance with this section
Substantiation: The intent is to provide a receptacle available for general use other than those that are installed for a specific purpose. Since there is no definition for a "general use" receptacle in the code, including several examples of what is excluded would further clarify the intent and give the guidance to the AHJ.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel does not agree that listing additional types of equipment adds any clarity to the text.

See the panel action on Comment 2-237 as it meets the submitter's intent.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:

BROWN, L.: Though I agree with this Panel's Comment and subsequent change and believe it is
appropriate, nonetheless, this change is meets the definition of a "Substantive Change" under the ANSI Essential Requirements. As such, it is required to receive "Due Process" by being presented for Public Comment, and consideration of any subsequent Public Comment by the Panel.

2-238a Log #CC200 NEC-P02 **Final Action: Accept (210.60(A))**

Submitter: Code-Making Panel 2,
Comment on Proposal No: 2-242
Recommendation: Change the title of 210.60 to read as follows:

"Guest Rooms, Guest Suites, Dormitories and Similar Occupancies."

Revise 210.60(A) to read as follows:

"(A) General. Guest rooms or guest suites in hotels, motels, sleeping rooms in dormitories, and similar occupancies shall have receptacle outlets installed in accordance with 210.52(A) and 210.52(D). Guest rooms or guest suites proved with permanent provisions for cooking shall have receptacle outlets installed in accordance with all of the applicable rules in 210.52."
Substantiation: The panel action clarifies the original intent of Proposal 2-242.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-239 Log #690 NEC-P02 **Final Action: Reject (210.60(A))**

Submitter: Timothy M. Croushore, Allegheny Power
Comment on Proposal No: 2-242
Recommendation: Please reject the original proposal.
Substantiation: The explanation of negative by Mr. Purvis is correct. Also, Mr. Brown's affirmative comment is also correct. Dormitories are engineered occupancies dependent on the individual housing wishes of the college or university. The dormitory occupancies can be designed with or without cooking, with or without bathrooms, showers and sinks.

No technical substantiation of any hazards or problems has been provided by either the submitter or the members of the code-making panel to add dormitories to the occupancies needing to comply with 210.60(A).
Panel Meeting Action: Reject
Panel Statement: The panel does not agree with the submitter's intent. See action taken on Panel Comment 2-238a (Log # CC200).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-240 Log #1901 NEC-P02 **Final Action: Reject (210.60(B))**

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 2-243
Recommendation: Accept the proposal.
Substantiation: The submitter experimented with more traditional text (e.g. "as required") and realized that the text in the proposal is exactly correct and enforceable. The receptacle spacing follows 210.52(A) rules as a default. Then one or more outlet locations can shift due to a permanent furniture layout. How much? Exactly "to the extent necessary to accommodate" the layout, and no more. This is not an academic question. We have been confronted with designers who didn't take this rule into account and then tried to add the additional outlet where it would minimize their costs. regardless of how useless the outlet would be.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its original statement on the proposal that use of the phrase "to the extent necessary to accommodate" is vague and unenforceable.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-241 Log #1625 NEC-P02 **Final Action: Reject (210.70)**

Submitter: Wally Harris, Atlantic Inland Inspections
Comment on Proposal No: 2-252
Recommendation: Revise the text of this Proposal to read as follows:

210.70 Lighting Outlets Required. Lighting outlets shall be installed where specified in 210.70(A), (B), and (C).

(A) Dwelling Units. In dwelling units, lighting outlets shall be installed in accordance with 210.70(A)(1), (2), and (3).

(1)Habitable Rooms. At least one wall switch-controlled lighting outlet shall be installed in every habitable room and bathroom, with switch control provided at each entrance to these rooms.

(2) Additional Locations. Additional lighting outlets shall be installed in accordance with (A)(2)(a), (A)(2)(b), and (A)(2)(c).

(a) At least one wall switch-controlled lighting outlet shall be installed in hallways, stairways, attached garages, and detached garages with electric power.

(b) For dwelling units, attached garages, and detached garages with electric power, at least one wall switch–controlled lighting outlet shall be installed to provide illumination on the exterior side of outdoor entrances or exits with grade level access. A vehicle door in a garage shall not be considered as an outdoor entrance or exit.

(c) Where one or more lighting outlet(s) are installed for interior stairways, there shall be a wall switch at each floor level, and landing level that includes an entry way, to control the lighting outlet(s) where the stairway between floor levels has six risers or more.

(d) Where lighting outlets are installed as specified in 210.70(A)(2)(a), (b), and (c) above switch control shall be provided at each entrance to these locations.
Substantiation: The original proposal in the ROP should be reconsidered, and accepted.

The Panel Statement in the ROP stated as follows, "The location and number of switches is a design requirement that is determined by the designer, user or installer."

I must respectfully disagree. If the location and number of switches is in fact a design requirement, then it would seem that the whole of 210.70(A)(2) is in fact moot and should not be included in the NEC. The problem cited in my substantiation in the ROP stems from any number of typical scenarios that can be imagined, but I will cite one from personal experience.

One evening during the summer months I was working in the yard after dinner. At the time my wife was away, and I decided to tackle about an hours

worth of yard work. I locked the house, and exited through the rear door on the first floor while it was still light at about 6:00 PM. Until about 7 PM or so, there is adequate light through my basement windows from outside to see in the basement, so I entered the basement from the outside door - which was open at the time to retrieve my gardening implements.

At about 7:00 PM my neighbor engaged me in a hearty conversation and a pleasant snack. Before too long it was nearing 9:00 PM and the daylight was for all intent and purposes gone. Not desiring to stumble through the basement because it was dark, and there was no switch at the rear basement entry door for the interior lights, I went to the first floor rear entrance to enter there. Much to my surprise I found that the door was inadvertently locked upon my exit. I had no other choice but to enter my house except through the dark basement, tripping on an upturned throw rug in the basement.

Had there been a switch at the rear basement entry for the interior lighting in the basement, perhaps my tripping (and bruised knee) could have been prevented. To quote the old adage; "An ounce of prevention is worth a pound of cure."

I would also take this opportunity to quote from the Commentary following 210.70(A)(2) in the National Electrical Code Handbook NINTH EDITION - Copyright 2002 National Fire Protection Association, Inc., which states in part; "adequate lighting and proper control and location of switching are as essential to the safety of occupants of dwelling units, hotels, motels, and so on, as are proper wiring requirements. Proper illumination ensures safe movement for persons of all ages, thus preventing many accidents."

Safety in and of itself is in fact a "design requirement" (to borrow a phrase from the Panel Statement in the ROP). Safety should be designed into each installation according to 90.1(B).

In an attempt to have the original proposal reconsidered, I have presented a personal experience and quoted from the esteemed authors of the industry benchmark National Electrical Code Handbook NINTH EDITION - Copyright 2002 National Fire Protection Association, Inc. I would also call the Panel's attention to Panel Member Mr. King's "Explanation of Negative" in the ROP.

In the interest of safety, I respectfully thank you for your important reconsideration of this proposal.

Panel Meeting Action: Reject

Panel Statement: The panel reaffirms that location and number of switches is a design requirement and determined by the designer, user, or installer.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

KING, D.: See my explanation of negative on Comment 2-242.

WEBER, R.: The panel should have accepted this comment and the Proposal 2-252 as well. The time has come to provide clear and positive code text and guidance to the designer and installers as to where switches or controls for lighting outlets are to be located. We often times hear that "it is a design issue" rose as to why there is not definitive direction as to switch or control location. At present, one could place a switch or lighting control in the further corner of a room or space and have the user proceed through a darkened space to turn on the lighting outlet. The panel needs to address an essential safety element for the use of electrical systems to provide switching and proper control locations in the code to ensure the safe movement of persons occupying those spaces. We address illumination requirement for emergency systems in 700.16 and switch locations in 700.21, but do not afford the same level of concern for the everyday use of structures or rooms, as to the need for illumination prior to traveling through that space to find a lighting switch or control. The building codes under the energy conservation requirements will specify type and location of controls for illumination; it should also be identified in the electrical code.

2-242 Log #1681 NEC-P02 **Final Action: Accept (210.70(A)(1))**

Submitter: Nicholas Thompson, Gregory C. Thompson & Sons

Comment on Proposal No: 2-258

Recommendation: Continue to Reject the proposal.

Substantiation: The code states that "at least one wall switch controlled lighting outlet shall be installed in every habitable room and bathroom. To install wall switches at every entrance to every habitable room would raise more controversy over wording and interpretation. The intent of the code is not design, to enforce electricians to install switches in every habitable room at every entrance would not be practical and unneeded. This revision should be rejected because it is purely a desire of design and not something code should cover because of the impracticality of some instances.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

KING, D.: The control of illumination at the entrance to habitable rooms is a safety issue and not a design consideration as stated by the submitter. Location and accessibility of switches is addressed in other sections of the NEC. Section 210.70(A)(3) requires at least one point of control for illumination of equipment and storage spaces to be at the usual entry point to these spaces. This is intended to provide control of illumination at a location that will allow for safe access to these spaces. The same level of safety should be required for occupants entering all habitable living spaces within a dwelling. The submitter has also not substantiated that this requirement would not be practical. Panel 2 should give further consideration to this Comment.

WEBER, R.: The panel should have rejected this comment. I do not agree with the submitter's substantiation statement on "controversy over wording and interpretation", clearly stated code text and requirements do not seem to be a problem for other parts of the code for the users. The "impracticality" concern is not a valid reason to reject the proposed change as well; if the space can be illuminated prior to entrance, the safety to occupants is enhanced. See my explanation of negative vote on Comment 2-241.

2-243 Log #1014 NEC-P02 **Final Action: Reject (210.70(A)(2) Exception No. 2)**

Submitter: David Shapiro, Safety First Electrical Contracting Consulting & Safety Education

Comment on Proposal No: 2-261

Recommendation: Designate the existing exception as Exception No. 1 and add a second exception as follows:

Exception No. 2 to (c): Where a stairway connects to an unfinished area with no other entryway, that by virtue of its dimensions or of permanently installed equipment cannot be converted to use as a sleeping area, the switch at the level of the unfinished area shall be permitted to be omitted.

Substantiation: I agree with Mr. Frederick Hartwell that there is little gain from having a switch at the end of a stairway. Moreover, there is an advantage to using SPSTs, with ON always being the Up position. Even if such a basement or attic has a certain amount of daylighting, the electricity cost associated with leaving the light on while working in such a space is compensated for by the owner's never having to question whether the light is on or off, versus needing a new light bulb or having an electrical problem.

Panel Meeting Action: Reject

Panel Statement: The panel disagrees with the submitter and notes that the additional switch does serve a purpose for stairwells having six or more treads.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-244 Log #1364 NEC-P02 **Final Action: Reject (210.70(A)(2)c.)**

Submitter: Eugene Swisher, City of Tampa / Rep. IBEW Local 915 & IAEI Suncoast Division

Comment on Proposal No: 2-262

Recommendation: Revise text to read as follows:

Where one or more lighting outlet(s) are installed for interior stairways, or exterior stairways that provide the sole means of access to the upper level of multilevel, single family residences. There shall be a wall switch at each floor or grade level that includes an entryway, to control the lighting outlet(s) where the stairway between floor level or grade and access level has six risers or more.

Substantiation: As the original submitter of this proposal, I was attempting to identify and rectify the problem that is inherent to a garage type apartment or mother-in-law suite located above the garage of a single family residence that has a detached structure, for garage and suite. This type of installation is very prevalent in this area and the codes does not dictate safe lighting control in this situation.

Panel Meeting Action: Reject

Panel Statement: The panel does support requiring switches at exterior locations, but this is not prohibited in the code.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

KING, D.: The submitter of this Comment is correct in stating that the same switching requirements for the interior stairways of a dwelling unit should apply to the exterior stairways of the dwelling unit. The same hazards exist from the absence of control of illumination whether the stairway is located indoors or outdoors. The Panel statement does not properly address the submitter's recommendation. The Panel needs to clarify in their statement why they do not support requiring switches at exterior locations. Accepting this Comment would provide for the consistent application of section 210.70(A)(2)(C) regardless of the location of the stairway at the dwelling unit and should be given further consideration.

WEBER, R.: The panel should have accepted in principle this comment and the original Proposal 2-262. The panel statement in the proposal phase is correct for the last sentence regarding multi-family applications, but the use of other control means could be allowed to make sure the user is not forced to utilize the stairway in darkness. Building codes mandate level of illumination on stairway areas; and the NEC should indicate where switches or lighting controls should be located at. The portion of the panel statement that indicates "but this is not prohibited in the code" is true, but we are once again back to the concept of the minimum requirement to pass inspection then becomes the maximum of what is normally done and no more beyond that point is provided to address a safety issue.

ARTICLE 215 — FEEDERS

2-245 Log #1757 NEC-P02 **Final Action: Reject**
(215.2)

Submitter: Mark C. Ode, Underwriters Laboratories Inc.
Comment on Proposal No: 2-275
Recommendation: Add the word "of" before the words "not less than" in the first and second sentence and add a hyphen in the word "noncontinuous." To read as follows:
215.2 Minimum Rating and Size.
(A) Feeders Not More Than 600 Volts.
(1) General. Feeder conductors shall have an ampacity of not less than required to supply the load as calculated in Parts III, IV, and V of Article 220. Feeder-circuit conductors that are connected to an overcurrent device assembly shall have a minimum allowable ampacity, before the application of any adjustment or correction factors, of not less than the non-continuous load plus 125 percent of the continuous load.
Substantiation: Corrections are for editorial purposes only.
Panel Meeting Action: Reject
Panel Statement: The submitter's revision does not add any clarity to the code.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-246 Log #442 NEC-P02 **Final Action: Reject**
(215.2(A)(1))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 2-274
Recommendation: Accept proposal.
Substantiation: Please refer to proposal substantiation which postulated a feeder protected at 800 amperes with a grounded conductor load of 3 amperes which requires a 1/0 cu. or 3/0 al grounded conductor. Consider the same installation supplied by service conductors instead of a feeder. If the grounding electrode is a driven rod or concrete encased electrode the GEC can be a 6 AWG or 4 AWG. 230.42(C) permits the grounded conductor to be the minimum size permitted by 250.24(C)(1), not smaller than the GEC required in Table 250.66, modified by 250.66(A)(B) to permit a 6 AWG or 4 AWG where the 12-1/2 percent requirement of 250.24(C)(1) does not require a larger size. It is hard to understand why a service grounded conductor can be smaller than a feeder grounded conductor which has overcurrent protection where the load and conductors are the same. A 3-phase 3-wire feeder from a corner grounded transformer supplying a motor(s) may have overcurrent protection higher than the feeder ampacity and this rule could require the grounded conductor to be larger than the ungrounded conductors. There is no provision similar to 250.122(A) that limits the size. This section does not allow for reduced size tap conductors. It is faulty in that it doesn't address grounded conductors of other feeders or branch circuits installed in the same raceway where the conductor sizes and overcurrent protection may vary. If the largest feeder requires a 3/0 grounded conductor, does this size apply to other circuit grounded conductors in the same raceway regardless of the circuit rating?
Panel Meeting Action: Reject
Panel Statement: The panel was unable to establish the submitter's intent.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-247 Log #443 NEC-P02 **Final Action: Reject**
(215.2(A)(1))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 2-274
Recommendation: Accept proposal.
Substantiation: The panel reference to 250.66 only indicates that a grounded service conductor shall not be smaller than the GEC specified in Table 250.66 (8 AWG) which relates to (unprotected) service grounded conductors not (protected) feeder grounded conductors. This section is flawed in that it apparently assumes or is based on feeders that are installed in dedicated raceways without other conductors. However, if a feeder is installed in a raceway or enclosure such as a wireway with other circuit conductors (branch circuits or feeders) of various sizes and overcurrent protection ratings, and a grounded conductor of a feeder or branch circuit (e.g., a 14, 12 or 10 AWG) short-circuits to a 500 kcmil ungrounded feeder conductor. This rule provides no protection or assurance that the smaller conductor will not burn open.
Panel Meeting Action: Reject
Panel Statement: The panel notes that 250.122 does address equipment grounded conductor sizing for multiple circuits run in the same raceway. The inclusion of an additional, smaller equipment grounded conductor, as sited in the submitter's example, is not prohibited but would constitute a poor design.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-248 Log #1013 NEC-P02 **Final Action: Reject**
(215.3(A)(3), FPN 2)

Submitter: David Shapiro, Safety First Electrical Contracting Consulting & Safety Education
Comment on Proposal No: 2-278
Recommendation: Revise text to read as follows:
...and where the maximum total ~~voltage~~ drop from nominal voltage ~~on feeders and branch circuits~~ to the farthest outlet...
Substantiation: While the Panel Statement says, "It is not necessary to define possible combinations of equipment to convey the intent of the FPN," its present wording specifies one single combination of equipment. This implies to many that they need not be concerned about the voltage reaching equipment so long as these two sources of impedance are addressed. I have had multiple conversations that demonstrated this. While FPNs are advisory, not mandatory, they constitute a de facto standard of good practice, relied on by specifiers, lawyers, and others. Deleting the two examples removes the misleading element. Adding language such as "from the sum of all upstream impedances" might emphasize the point, but may be gratuitous. Parsimonious language often is preferable-one reason I have no issue with the CMP's nixing my initial proposals addition of other sources. The reason that I suggest the additional wording, "from nominal voltage" is that the FPN is advising about proper operation of utilization equipment. This is effected not by what VD testers report-the drop from initially supplied voltage, in response to a simulated load-but by voltage significantly lower than its design voltage. Electricians and other users of the NEC have only partial control over this, but certainly more control than "feeders and branch circuits" implies.
Panel Meeting Action: Reject
Panel Statement: The panel does not agree that the recommendation adds any clarity to the section. The text refers to feeders and branch circuits as they apply to Articles 210 and 215. Voltage drop is a design issue.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-249 Log #2248 NEC-P02 **Final Action: Reject**
(215.4)

Submitter: Donald A. Ganiere, Ottawa, IL
Comment on Proposal No: 2-280
Recommendation: This proposal should be accepted.
Substantiation: There is no prohibition on the use of a common neutral for multiple circuits to be found anywhere in the NEC. The use of the wording "shall be permitted" in 215.4 does not act as a prohibition on the use of common neutrals for other circuits. It is only a permission to use them in specific cases, however this permission does not prohibit the use of common neutrals in other cases. The NEC Manual of Style (3.1.2) says that the words "shall be permitted" are permissive in nature and that they are used to indicate optional or alternate installation methods. Unless there is a required installation method, the permission to use an alternate method has no meaning. Given that the NEC has no general prohibition against the use of common neutrals, the existing wording in 215.4(A) has no meaning and should be changed.
Panel Meeting Action: Reject
Panel Statement: The panel disagrees with the submitter's statement that there is no limit regarding the numbers of feeders that can be run together, and clarifies the limits using revised wording. See the action and statement on Panel Comment 2-249a (Log #201).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-249a Log #CC201 NEC-P02 **Final Action: Accept**
(215.4(A))

Submitter: Code-Making Panel 2,
Comment on Proposal No: 2-281
Recommendation: Revise 215.4(A) to read as follows:
"215.4 (A) Feeders with Common Neutral. Up to three sets of 3-wire feeders or two sets of 4-wire or 5-wire feeders shall be permitted to utilize a common neutral."
Substantiation: The revised texts adds clarity in that it better defines the limits of feeders to be run with a common neutral.
Panel Meeting Action: Accept
Panel Statement: The revised texts adds clarity in that it better defines the limits of feeders to be run with a common neutral.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-250 Log #24 NEC-P02 **Final Action: Accept**
(215.6)

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 2-283
Recommendation: It was the action of the Technical Correlating Committee that the panel reconsider this Proposal and correlate with the action taken on Proposal 5-119. This action will be considered by the panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Revise the text from the Proposal to read as follows:
"215.6 Feeder Equipment Grounding Conductor. Where a feeder supplies branch circuits in which equipment grounding conductors are required, the feeder shall include or provide an equipment grounding conductor in accordance with the provisions of 250.134, to which the equipment grounding conductors of the branch circuit shall be connected. Where the feeder supplies a separate building or structure, the requirements of Article 250.32 (B) shall apply."
Panel Statement: The revision meets the intent of the submitter.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-251 Log #1878 NEC-P02 **Final Action: Accept in Principle**
(215.6)

Submitter: Mike Holt, Mike Holt Enterprises, Inc.
Comment on Proposal No: 2-283
Recommendation: Continue to accept the proposal with the following change:
215.6 Feeder Conductor Equipment Grounding Conductor Means. Where a feeder supplies branch circuits in which equipment grounding conductors are required, the feeder shall include or provide an equipment grounding conductor a grounding ~~means~~, in accordance with the provisions of 250.134, to which the equipment grounding conductors of the branch circuits shall be connected.
Exception: Where the feeder to a separate building or structure is installed in accordance with 250.32(B)(1) Exception, an equipment grounding conductor shall not be installed.
Substantiation: This comment is simply a correlation with the accepted Proposal 5-119. The accepted proposal to 215.6 should have the reference changed from 250.32(B)(2) to 250.32(B)(1) Exception. This proposal should only be accepted if 5-119 continues to be accepted.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action and statement on Comment 2-250.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-252 Log #1888 NEC-P02 **Final Action: Reject**
(215.9(A) and (B))

Submitter: Paul S. Hamer, Richmond, CA
Comment on Proposal No: 2-285
Recommendation: This proposal (and its companion Proposals 2-6, 2-88, 11-48 and 11-49 - Comments submitted separately) should be accepted. Add to the end of the proposed wording: This requirement shall become effective January 1, 2011. This aligns with Mr. Weber's Explanation of Negative for Proposal 2-88 regarding the development of new, life-saving concepts. The Proposal wording, and its included phrase "shall be permitted," is important so the GFCIS-3Ph is identified as a specific permitted alternative. The Panel Statement "the panel notes that the system recommended by the proposal is currently not prohibited" avoids the reality that unless a permitted concept is identified in the NEC, it will not be applied. Adding the delayed effective date would provide the incentive and the necessary time for the Three-Phase Ground-Fault Circuit-Interrupter System (GFCIS-3Ph) to be further developed and commercialized.
Substantiation: The Panel Statement of Proposal 2-88 (referred to in this Proposal's Panel Statement includes "...The submitter's substantiation notes that the hazard is when unqualified persons work on equipment without taking the appropriate precautions to deenergize the circuit and verify that circuit is disconnected...". There are numerous instances where unqualified persons were electrocuted by faulty or defective equipment (see the supporting material submitted with the proposals), and these people may have been protected from electrocution by the proposed GFCIS-3Ph. See also the Explanation of Negatives of Mr. King and Mr. Weber for Proposal 2-88. The patent applications are pending for the GFCIS-3Ph as of this date, but further field measurements made since the Proposal submittal date indicate that the distributed phase capacitances on an actual installed three-phase 480 volt power system are balanced enough to permit the sensitivity described in the proposals.
Panel Meeting Action: Reject
Panel Statement: The panel notes that the system recommended by the submitter is not prohibited. See panel action and statement on Comment 2-62.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
KING, D.: See explanation on comment 2-62.

2-253 Log #405 NEC-P02 **Final Action: Reject**
(215.12(C))

Submitter: Daniel Leaf, Seneca, SC
Comment on Proposal No: 2-294
Recommendation: Accept proposal revised:
Where the premises wiring system has feeders supplied from more than one ~~nominal voltage~~ system with different characteristics such as voltage, frequency, phases. Ac or dc, or supplied from different services or separately derived systems, each ungrounded conductor of a feeder ~~where accessible~~ shall be identified by system at all terminations, connections, and supply points. The means of identification shall be permitted to be by different color coding, marking tape, or other approved means. The means of identification shall be posted at the point where the feeder receives its supply.
Exception No. 1: Conductors for fire alarm circuits.
Exception No. 2: Conductors for emergency systems.
Exception No. 3: The enclosures for busway conductors shall be identified in an approved manner.
Exception No. 4: Associated control and signal conductors installed in the same raceway, cable or enclosure with the feeder conductors.
Exception No. 5: Where the authority having jurisdiction determines that a system is sufficiently limited or separated from other systems, identification shall not be required.
Substantiation: This section only applies to different voltage systems interconnection or misconnection of conductors with differences other than voltage, such as ac and dc, frequencies, grounded and ungrounded, separately derived, can be hazardous mixtures of such systems with the same voltage may be in the same raceway, enclosure or cable tray, which merit identification. The proposed exceptions are covered elsewhere or proposed for practicality.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Comment 2-19.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-254 Log #1898 NEC-P02 **Final Action: Accept in Principle**
(215.12(C))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 2-292
Recommendation: I. Rephrase the additional text as "phase or line and". II. Split the second sentence into two sentences, revised to read as follows: The means of identification shall be permitted to be by separate color coding, marking tape, tagging, or other approved means. the method utilized for conductors originating within each feeder panelboard or similar feeder distribution equipment shall be permanently posted on the equipment.
Substantiation: I. The rule will also apply to single-phase distributions, where both ungrounded conductors are of the same phase but with a potential difference between them. The panel action incorrectly implies that these conductors are of differing phases, which is not the case. This wording makes the rule technically correct.
II. At every seminar I give on the 2005 NEC, someone and usually more than one, asks whether the panelboard labeling rule covers the conductors originating at that panel, or whether the rule is a reciprocal rule requiring every panel to list every identification scheme for every system in the building. The words in the NEC will support both interpretations. When I raised this at the Eastern Section IAEI meeting, the speakers had no idea either, and suggested I address it with a comment. This wording supposes the intent is the former; if I guessed wrong, then please put contrary wording in the book. It does seem that when you get a number of systems you would need a huge amount of real estate to list all the options, so I hope I guessed correctly.
Panel Meeting Action: Accept in Principle
The panel accepts the submitter's revision to change "phase and" to "phase or line and".
Revise the last sentence of 215.12(C) of the ROP text to read as follows:
"The method utilized for conductors originating within each feeder panelboard or similar feeder distribution equipment shall be documented in a manner that is readily available or shall be permanently posted at each feeder panelboard or similar feeder distribution equipment."

Panel Statement: The panel has accepted the addition of the words that apply to phase or line conductors. The panel agrees with the intent of the submitter that the identification is required to identify the conductors that originate at that panelboard. To accomplish that intent, the panel has revised the words from the ROP to state that the identification (whether documentation or posting) be for the conductors at that panelboard.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 220 — BRANCH-CIRCUIT, FEEDER, SERVICE CALCULATIONS

2-255 Log #1310 NEC-P02 **Final Action: Reject**
(220.10)

Submitter: Joseph A. Hertel, Safety and Buildings
Comment on Proposal No: 2-300
Recommendation: None.
Substantiation: I can agree with the CMP in that current requirements of 220.10 are not in conflict with energy codes. They provide for values that are significantly larger for lighting than energy codes allow. This as the panel response indicates requires services and feeders that will provide more than adequate capacity. My question would be why should we provide adequate capacity for something we cannot use?
Panel Meeting Action: Reject
Panel Statement: No specific recommendation has been made. The comment does not comply with Section 4.3.3(c) of the Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

Comment on Proposal No: 2-305
Recommendation: We support the panel's action in Accepting this Proposal as written.
Substantiation: None.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-258 Log #1311 NEC-P02 **Final Action: Reject**
(220.20)

Submitter: Joseph A. Hertel, Safety and Buildings
Comment on Proposal No: 2-307
Recommendation: I can agree with the CMP in that current requirements of 220.40 are not in conflict with energy codes. They provide for values that are significantly larger for lighting than energy codes allow. This, as the panel response indicates, requires services and feeders that will provide more than adequate capacity. My question would be why should we provide adequate capacity for something we cannot use?
Substantiation: As an example: A major retailer routinely specifies a 4000 Ampere service for their identical facilities when by historical data the need does not exceed 1200 Amperes for operation. They have reduced the service size to 3000 amperes which provides more than adequate amperage.
Panel Meeting Action: Reject
Panel Statement: No specific recommendation has been made. The comment does not comply with Section 4.3.3(c) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-259 Log #2227 NEC-P02 **Final Action: Reject**
(220.50)

Submitter: Mike Holt, Mike Holt Enterprises, Inc.
Comment on Proposal No: 2-329
Recommendation: This Proposal should be Accepted, changed as follows:
220.50 Motors. Motor loads shall be calculated in accordance with 430.24, 430.25, and 430.26 and with ~~440.6~~ 440.31, 440.32, 440.33, 440.34, and 440.35 for hermetic refrigerant motor compressors.
Substantiation: This section is intended to clarify whether the A/C is to be calculated at 100 percent or 125 percent. It also refers the code user to more prescise sections of Article 440, similar to the references to Article 430 in this section.
Panel Meeting Action: Reject
Panel Statement: The panel does not agree that adding references to 440.31, 440.32, 440.33, and 440.35 would provide clarity for determining motor loads. In addition, 440.6 should remain, as it addresses motor ratings.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-260 Log #2135 NEC-P02 **Final Action: Reject**
(220.51, FPN (New))

Submitter: Sheldon Monson, Wadena, MN
Comment on Proposal No: 2-314
Recommendation: Add a Fine Print Note: The purpose of this section is for determining a load contribution from electric space heaters used in determining the overall feeder and service load. Services or feeders that are solely supplying electric heat loads shall be sized accordingly to 230.42 and 215.2.
Substantiation: I find that many installers misapply this section when sizing feeders or services that solely supply electric heat loads. This has been problematic with all the structures that have dedicated services or feeders that only feed heating loads. Adding a fine print note would clarify the intended purpose of 220.51.
Panel Meeting Action: Reject
Panel Statement: The submitter's proposed FPN does not add any clarity to the intent in 220.5. In addition, fine print notes should not be written in mandatory language.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-261 Log #537 NEC-P02 **Final Action: Reject**

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 2-324
Recommendation: Accept in Part:
"208-volt and 240-volt"
Substantiation: The requirement should specifically apply only to such dryers. The laundry branch circuit covers 120-volt dryers.
Panel Meeting Action: Reject
Panel Statement: Section 220.54 addresses the loads assigned to electric clothes dryers regardless of voltage.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-262 Log #1756 NEC-P02 **Final Action: Accept**
(220.54)

Submitter: Mark C. Ode, Underwriters Laboratories Inc.
Comment on Proposal No: 2-325
Recommendation: Change "under this section" in the last sentence to "in this section" as follows:
220.54 Electric Clothes Dryers — Dwelling Unit(s). The load for household electric clothes dryers in a dwelling unit(s) shall be either 5000 watts (volt-amperes) or the nameplate rating, whichever is larger, for each dryer served. The use of the demand factors in Table 220.54 shall be permitted. Where two or more single-phase dryers are supplied by a 3-phase, 4-wire feeder or service, the total load shall be calculated on the basis of twice the maximum number connected between any two phases. Kilovolt-amperes (kVA) shall be considered equivalent to kilowatts (kW) for loads calculated In ~~under~~ this section.
Substantiation: This change is editorial since the calculation is "in this section" not "under this section."
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-263 Log #848 NEC-P02 **Final Action: Reject**
(Table 220.55)

Submitter: John P. Masarick, Independent Electrical Contractors Inc.
Comment on Proposal No: 2-326
Recommendation: The panel is encouraged to continue to Reject Proposal 2-326.
Substantiation: The reasons to continue to Reject the Proposal are as follows:
1. The trend by the CMPs over the last several code cycles has been to limit the use of FPNs.
2. There is also a correlation issue. There is a conflict between those panels that accepted the proposal and those that rejected the proposal.
3. These standards are also covered by a Fine Print Note in 110.12.
4. The FPN should not be accepted because numerous standards and installation manuals exist and to only mention one does not adequately inform the public about accepted industry practices. The NEC is not intended to be an instruction manual for untrained persons. If the FPNs are allowed to reference these standards, then they should list all applicable standards.
5. Since the referenced installation standards are intentionally general to cover different models of equipment, approval of the FPN may lead many to believe these standards can be used instead of listed or labeled manufacturer's instructions which would be in violation of 110.3(B).
6. If the CMP would like to include the reference, it should be placed in the Annex with the other references.
Panel Meeting Action: Reject
Panel Statement: The panel notes that Proposal 2-326 was accepted. The substantiation does not support the comment. The comment does not comply with 4.3.3(c) of the Regulations Governing Committee Projects.

Comment on Proposal No: 2-330
Recommendation: Accept as revised:
Where it is unlikely that two or more noncoincident loads will be in use simultaneously or where a means is provided to prevent simultaneous use of two or more loads, it shall be permitted to use only the largest load that will be used at one time for calculating the ~~total~~ branch circuit, feeder, and service load.
FPN: A selector switch is one means to prevent simultaneous use.
Substantiation: The text of this section is applicable to feeders and services but the heading "Noncoincident Loads" is general and encompasses branch circuits. 422.12, Exception No. 2 permits dissimilar loads on the same branch circuit and the proposal would allow this section to apply to that exception. Such branch circuits would be governed by all applicable rules. Present wording literally permits the largest branch circuit to comprise the total load for the feeder and service.
Panel Meeting Action: Reject
Panel Statement: The submitter's proposed wording does not add any clarification to 220.60.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-265 Log #1879 NEC-P02 **Final Action: Accept in Principle**
(220.61(C)(1))

Submitter: Mike Holt, Mike Holt Enterprises, Inc.
Comment on Proposal No: 2-336
Recommendation: Continue to accept this proposal, with the following changes:
Any portion of a 3-wire circuit consisting of ~~2-phase~~ ungrounded conductors and the neutral conductor of a 4-wire, 3-phase, wye-connected system.
Substantiation: This comment is being made simply to provide more consistency throughout the Code.
Panel Meeting Action: Accept in Principle
Revise the wording 220.61(C)(1) to read as follows:
"Any portion of a 3-wire circuit consisting of 2 ungrounded conductors and the neutral conductors of a 4-wire, 3 phase, wye-connected system."
Panel Statement: The panel agrees with changing the word "phase" to "ungrounded".
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-266 Log #514 NEC-P02 **Final Action: Reject**
(220.82(B) and (C))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 2-338
Recommendation: Accept in part (B)(2) as revised:
~~1500~~ 3000 volt-amperes for ~~each~~ the two or more 2-wire 20 ampere small appliance branch circuits and 1500 volt amperes for each laundry branch circuit covered in 210.11(C)(1) and (C)(2).
Substantiation: The word "each" was not intended in the proposal. The 3000 volt amperes was intended to apply to two or more small appliance branch circuits. Substantiation is the same as in the proposal.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its statement that each small appliance branch circuit be calculated at 1500 VA.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-267 Log #595 NEC-P02 **Final Action: Accept**

Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-270 Log #1803 NEC-P02 **Final Action: Reject**
(220.89)

Submitter: Michael Walls, American Chemistry Council
Comment on Proposal No: 2-356
Recommendation: Add text to read as follows:
220.89 Optional Calculations - New Petroleum and Chemical Processing Plants.
(A) Applicability - New petroleum and chemical processing plants must comply with the following criteria in order to apply the optional calculations permitted in 220.89 in lieu of part III of this article.
(1) Exist for the primary purpose of manufacturing, refining and/or processing petroleum and chemical products.
(2) Qualify as a plant within a Supervised Industrial Installation as defined in article 240.2.

(3) Have measured demand data obtained in accordance with article 220.87 (1) from at least two existing petroleum or chemical processing plants using similar process technology in the manufacture of the same product(s).

(B) Demand Factor - For services and feeders in Petroleum and Chemical Processing Plants, calculation of load shall be permitted to be the product of the total connected load and a demand factor. The applied demand factor shall meet the following requirements:

(1) Be calculated and applied under engineering supervision.

(2) Yield a sufficient ampacity capable of serving the actual operating load.

(3) Not be less than 50% of the connected load

(4) Not be less than 125% times the highest maximum demand determined for two similar plants as measured per article 220.87(1).

Substantiation: The alternate proposed text offered in B. Nenninger's Explanation of the Negative should be accepted: (See Code Text Above)
The NEC does not specifically recognize the use of demand factors in the determination of loads in industrial installations. As a result, the NEC determined loads for these installations are overly conservative and require distribution systems with higher than needed ratings at a significant cost to owners. Further, this approach is inconsistent with the historical experience found in both utilities and industry. Utilities have been successfully sizing and operating supplies using a demand-based approach for many years. Industry has also had success a
pplying a demand-based approach in calculating loads when allowed by the authority having jurisdiction. The NEC recognizes this as an issue and partially addresses it in Article 220 by allowing sixteen optional methods that make use of demand factors for determining particular types of loads. However, none of these optional methods address industrial installations. The proposed text is considerably more restrictive than past remedy's, focusing specifically on petroleum and chemical process facilities and offering specific, enforceable provisions for this industry segment. Additionally, the requirement that the petroleum or chemical plant qualify as being within a Supervised Industrial Installation per article 240.2 ensures only qualified persons monitor and service the system and that the plant is part of an overall system load exceeding 2500 kVA. Finally, requiring the use of measured maximum demand data per article 220.87 for two comparable plants in operation establishes a minimum demand based on actual data. In the case of the petroleum and chemical industry, it is difficult to gather comparable "one size fits all" load data as was done for the restaurant calculations. In order to achieve a similar approach, one would need to gather extensive data sets around a long list of specific process technologies such as Polyethylene, Chlor-alkali, Polycarbonate, Ethylene, etc. Even then, the core technologies used in these segments evolve impacting demand profiles.

Panel Meeting Action: Reject

Panel Statement: The panel believes that the submitter has taken the correct approach to narrow this comment to a specific industry segment, and requests that data be provided to compare the NEC calculated loading to the actual loading in the facilities. In addition, there is nothing in the present Code that would prohibit the user from working with the authority having jurisiction to obtain special permission to utilize alternative calculation methods.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

NENNINGER, B.: The optional demand calculation offered for "New Petroleum and Chemical Plants" should have been accepted for the reasons already articulated in the various proposals/comments submitted. However, the panel's request for data better substantiating the problem is understandable. It is encouraging to note the panel's willingness to reconsider the issue if concerns raised are substantiated with industry data. The issue should be revisited in the 2011 cycle given a successful effort to collect actual operating demand vs. NEC calculated demand for an assortment of industrial installations.

2-271 Log #704 NEC-P02 **Final Action: Reject**
(220.90)

Submitter: Timothy M. Croushore, Allegheny Power

Comment on Proposal No: 2-357

Recommendation: Please accept the proposed text as shown in Mr. Purvis' negative ballot statement as published on page 70-133 of the ROP.

Substantiation: The substantiation of the proposal is addressing essentially the same issues for commercial occupancies as also identified in Proposal 2-356 for industrial occupancies. The same exact load characteristic issue is addressed in ANSI/IEEE Std. 241 Recommended Practice for Electric Power Systems in Commercial buildings in Chapter 2. I agree with the substantiation of Dorothy Kellogg of the American Chemistry Council. I also agree with Mr. Purvis that this optional method should not apply to one- and two-family dwellings.

The proposed text by Mr. Purvis of Proposal 2-357 is much cleaner and can be applied to both commercial and industrial occupancies rather than just industrial occupancies as requested in Proposal 2-356. For chain commercial occupancies as indicated in the original proposal, actual metered electric loads are much more available by the electric utility industry and discussed as a valid method in the ANSI/IEEE 241 Std. The NEC recognizes or permits engineering judgment, evaluation, or supervision for the following requirements:

Ampacity calculation in 310.15(C)
Electrical enclosures in 110.70 and 110.71
Branch circuits over 600 volts in 210.19(B)(2)
Minimum size and rating of feeders over 600 Volts in 215.2(B)
Overcurrent protection of Part III of Article 240
Series Rating of overcurrent protection in 240.86
Short-circuit and ground fault protection in 240.92 and 240.100
Neutral Ampacity and size of neutral conductors in 250.184(A)(2) and 310.4 Exception No. 4
Ampacity of conductors rated 2001 to 35,000 volts in 310.60(B) and (D)
Ampacity of conductors in cable trays in 392.11(B)(3) exception
Instantaneous trip rating of a circuit breaker in 430.52(C)(3)
Hazardous location equipment evaluation in 500.8(A)(1)(3), 505.9(A)(3) and 506.9(A)(3)
Flexible cords in hazardous locations in 501.140(A)(2) and 505.17
Supervision of work in hazardous locations in 505.7(A)
In health care facilities, to prevent overloading of onsite emergency generation in 517.34(A) Exception
In garages, for ventilation calculations on engineered systems for electric vehicles in 625.29(D)(3)

The engineering judgment, evaluation, and supervision concept that is currently in the National Electrical Code does establish a minimum level of safety while providing flexibility for design criteria of the actual installation. The National Electrical Code already permits the engineer to calculate conductor ampacity and overcurrent protection for non-typical occupancies such as mentioned in the above sections. It is reasonable to allow the qualified registered professional engineer to calculate the actual load for such a facility as an optional method of load calculation.

Panel Meeting Action: Reject

Panel Statement: The panel is not willing to accept an open-ended approach to load calculations. Article 220 contains the minimum requirements for calculations.

For additional information, see the panel action and statement on Comment 2-270.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

PURVIS, R.: Comment 2-271 on Proposal 2-357 should be accepted. EEI disagrees that this is an open ended approach for calculating the feeder and service load. Rather it would make load calculation more nearly match the transformer size of the serving utility rather than be oversized based on present Article 220 load calculations. Acceptance of this comment would also include both commercial and industrial calculations as well as meeting the intent of Comment 2-270 on Proposal 2-356 for a new Section 220.89.

ARTICLE 225 — OUTSIDE BRANCH CIRCUITS AND FEEDERS

4-3 Log #1085 NEC-P04 **Final Action: Reject**
(225.1, FPN)

Submitter: Jim Pauley, Square D Company

Comment on Proposal No: 4-5

Recommendation: Accept the Proposal.

Substantiation: The submitter is correct. The FPN does add confusion when one considers that the NEC is an enforcement document that is adopted by practically all jurisdictions in the US.

The NESC does indeed contain provisions that are in conflict with the NEC. Should users decide to utilize the NESC for installations covered by the NEC, the conflicts place the AHJ in a very difficult position. Although the NESC may be useful for some engineering design information, its reference as a source from the NEC implies that it is capable of being used without interfering with the use of the NEC. The code loses nothing by deleting the reference, but has increased confusion/conflict with the reference included.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Comment 4-4.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

Comment on Affirmative:

ROGERS, J.: This issue is one of great relevance to the electrical profession. The panel chair has appointed a task group to look at this issue and make recommendations to the TCC for the 2011 NEC cycle. These recommendations may include just those areas covered by CMP 4 and/or the recommendation to create a larger task group to review implications of NESC requirements throughout the NEC. Those that took the time to express their concerns relative to this issue in both the proposal and the comment stages should be commended as it is my opinion that these issues need to be addressed.

4-4 Log #2032 NEC-P04 **Final Action: Reject**
(225.1, FPN 2)

Submitter: Donald Cook, Shelby County Building Inspections
Comment on Proposal No: 4-5
Recommendation: Delete this FPN completely.
Substantiation: The panel statement indicates the FPN provides Code users with more information on high voltage installations. If that information is needed by designers and installers to make proper and safe installations, it should be included as mandatory text, not an informational FPN. As an AHJ with a significant number of installations that utilize systems greater than 600-volts, I can confirm the FPN currently adds to the confusion for requirements on installations above 600-volts. If adoption of two standards is required or needed for governmental bodies to regulate the installations, it seems the NEC should remove those installations from it's scope and remove the uncertainty of responsibility for these installations. If the NEC continues to claim responsibility for the installations, a complete set of requirements should be established and references to another document in FPN's should be removed. In the enforcement of the NEC, the NEC references to the NESC cause regular debate and challenge from designers that attempt to use the NEC for pole line distribution on the secondary of the service point. The purpose for this proposal and comment is not to change the requirements that govern the installations, but to clarify which code or standard is responsible for installations on the customer side of the service point. Confusion can not enhance safety. See CMP-1 action on Proposal 1-145.
Panel Meeting Action: Reject
Panel Statement: The original submitter and the commenter both raise legitimate issues relative to the functionality of the FPN. Even though there is no mandatory requirement, the reference to the NESC could provide further assistance where there are no specific NEC requirements. The purpose of this fine print note is to point out that more information on high-voltage installations is available by accessing the National Electrical Safety Code, which is sometimes adopted by government regulatory authorities.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10
Comment on Affirmative:
ROGERS, J.: See my comment on Comment 4-3.

4-5 Log #1680 NEC-P04 **Final Action: Reject**
(225.4 Exception)

Submitter: Donald W. Zipse, Electrical Forensics, LLC
Comment on Proposal No: 4-6
Recommendation: Delete the following words from Section 225.4, Exception, "and grounded circuit conductors".
Substantiation: This proposal needs to be reconsidered in light of the acceptance of Code Making Panel No. 7 to stay with their decision to make the messenger a non-current carrying support cable.
Panel Meeting Action: Reject
Panel Statement: This exception is necessary, since it recognizes that an uninsulated grounded conductor is permitted to be bare or covered in other articles of the NEC. For example, Article 396 permits messenger-supported wiring to have an uninsulated or covered messenger wire to support insulated conductors. Another example of a wiring method permitting an uninsulated grounded conductor is found in 338.10(B)(2) Exception covering service entrance cable (Type SE or USE cable) where the grounded conductor is covered within the overall jacket of the cable but would not be considered as insulated. The grounded conductor is permitted by 250.32(B)(2) to be installed from one building or structure to another building or structure without the use of an equipment grounding conductor under certain considerations, with 396.10(A) permitting SE or USE cable to be used as messenger-supported wire. Millions of miles of overhead cables with uninsulated grounded conductors as messenger cables for service drops are installed by the utility companies without problems.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:
DEATON, R.: Grounded circuit conductors should be covered or insulated.

4-6 Log #1015 NEC-P04 **Final Action: Accept**
(225.10)

Submitter: David Shapiro, Safety First Electrical Contracting Consulting & Safety Education

Ballot Results: Affirmative: 10

4-7 Log #1216 NEC-P04 **Final Action: Accept**
(225.18, 230.24(B), and 230.50)

Submitter: Neil F. LaBrake, Jr., Syracuse, NY
Comment on Proposal No: 4-4
Recommendation: The NEC TCC Grounding and Bonding Task Group recommends that CMP-4 continue to Accept in Principle for Sections 225.18, 230.24(B) and 230.50.
Substantiation: The NEC TCC Grounding and Bonding Task Group concurs with CMP-4 Panel Action to accept in Principle for Sections 225.18, 230.24(B) and 230.50 based on CMP-4's Panel actions on Proposals 4-12 and 4-40 to remove the word "ground" describing clearances.
This Comment was developed by a Task Group assigned by the NEC Technical Correlating Committee to address actions that were other than "accept" taken by Code-Making Panels on proposals from the TCC to resolve 2005 NEC Proposal 5-1 and Comment 5-1. Members of the Task Group on Grounding and Bonding for this Comment included: C. Douglas White; Michael Johnston; Jeffrey Boksiner; Daleep Mohla; Phil Simmons; Christopher Hutchings; James Carroll; Alan Rebeck; Richard Loyd; Paul Dobrowsky; and Neil F. LaBrake, Jr.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-8 Log #1312 NEC-P04 **Final Action: Hold**
(225.18(5) (New))

Submitter: Joseph A. Hertel, Safety and Buildings
Comment on Proposal No: 4-12
Recommendation: Add the following to 225.18 Clearance from Grade:
"(5) 7.5 m (24.5 ft) - over track rails of railroads."
Substantiation: There is currently no specified height for these conductors above a railroad. We have many industrial facilities where rail is used throughout the facility and the conductors are owned and maintained by the facility. The height requirements are from tables found in ANSI C2, National Electrical Safety Code, which we have used since there is no mention in the NEC.
Panel Meeting Action: Hold
Panel Statement: The comment offers new material that has not had public review and is being held for processing as a proposal for the next revision cycle in accordance with 4.4.6.2.2 of the Regulations Governing Committee Projects.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-9 Log #490 NEC-P04 **Final Action: Reject**
(225.22)

Submitter: Timothy P. McNeive, Thomas & Betts Corporation
Comment on Proposal No: 4-14
Recommendation: Change the panel action to Accept in Part. Revise 225.22 as follows:
225.22 Raceways on Exterior Surfaces of Buildings or Other Structures. Raceways on exteriors of buildings or other structures shall be arranged to drain and shall be ~~raintight~~ suitable for use in wet locations.
Exception: Flexible metal conduit, where permitted in 348.12(1), shall not be required to be ~~raintight~~ suitable for use in wet locations.
Substantiation: Product standards for "raceways" do not include tests for resistance to moisture ingress. This is because the appropriate NEC Article for each raceway deems the particular raceway suitable, or not, for use in "wet locations" by its intrinsic construction and the availability of fittings also listed for use in "wet locations". With respect to fittings used with raceways in services and elsewhere, the word "raintight" has either already been removed in favor of a reference to the requirement in 314.15(A), or proposals are being considered in the appropriate Articles.
The Technical Correlating Committee should consider the action by several Code-Making Panels during the 2005 and 2008 NEC cycles where the word "raintight" has been, or will be replaced by "wet location."
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comments 4-10 and 4-11. Panel 8 has accepted Proposals 8-26, 8-27, and 8-28 to delete the use of FMC in a wet location per 348.12(1), so Panel 4 has accepted Comments 4-10 and 4-11 to delete 225.22 Exception.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-10 Log #1848 NEC-P04 **Final Action: Accept**
(225.22)

Submitter: Mike Holt, Mike Holt Enterprises, Inc.
Comment on Proposal No: 4-14
Recommendation: Accept the Proposal as submitted.
Substantiation: With the acceptance of Proposal 8-27, this proposal should be accepted for the sake of consistency.
Panel Meeting Action: Accept
Panel Statement: The submitter is correct that this exception is not necessary. Should flexible metal conduit be permitted to be installed in a particular location, the requirements found in Article 348 and the manufacturer's instructions will define the installation method. In addition, CMP 8 has accepted a change for the 2008 NEC that will prohibit installing flexible metal conduit in wet locations.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-11 Log #2152 NEC-P04 **Final Action: Accept**
(225.22)

Submitter: David H. Kendall, Carlon
Comment on Proposal No: 4-14
Recommendation: Panel 4 should reverse their action on Proposal 4-14 and should "Accept" this Proposal.
Substantiation: Panel 8 has the jurisdiction to determine which conduits are acceptable for "Wet Locations". Panel 8 "Accepted" Proposals 8-26, 8-27, and 8-28 to delete the use of FMC in a wet location per 348.12(1). The Exception found in 225.22 would only reference a "Uses Not Permitted" and would not change the rule.

The Technical Correlating Committee (TCC) should have addressed this proposal in their review. Also, see Panel Action on Proposal 4-58.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-12 Log #596 NEC-P04 **Final Action: Hold**
(225.30)

Submitter: Henry A. Jenkins, Wake County, Inspections Development / Rep. N.C. Ellis Cannady Chapter of I.A.E.I
Comment on Proposal No: 4-16
Recommendation: The Panel should have Accepted in Principle. We suggest the addition of a new second paragraph to read as follows:

"Where a branch circuit or feeder originates in these additional buildings or other structures, only one feeder circuit shall be permitted to supply power back to the original building or structure, unless permitted in 225.30(A) through (E)."

Insert it between the existing first sentence and the last sentence. Making the existing sentence into a separate third paragraph. The new text to read as follows:

225.30 Number of Supplies. Where more than one building or other structure is on the same property and under single management, each additional building or other structure that is served by a branch circuit or feeder on the load side of the service disconnecting means shall be supplied by only one feeder or branch circuit unless permitted in 225.30(A) through (E).

Where a branch circuit or feeder originates in these additional buildings or other structures, only one feeder or branch circuit shall be permitted to supply power back to the original building or structure, unless permitted in 225.30(A) through (E).
Substantiation: The existing text only covers one feeder or branch circuit to supplying an additional building or structure where there is more than one building on the same property and under single management. The text does not address bringing more than one feeder or branch circuit from one of these peripheral buildings back to the original building. The present text would permit an unlimited number of feeders or branch circuits to be brought back to the original building. For example, a generator could provide power for an emergency branch circuit panel in building No. 2 and any number of branch circuits could be fed from that emergency panel back to the original building to supply any number of emergency loads. The same would hold true for a feeder distribution panel.
Panel Meeting Action: Hold

4-14 Log #505 NEC-P04 **Final Action: Reject**
(225.34(B))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 4-21
Recommendation: Accept the proposal.
Substantiation: Same as proposal. Note that the panel comment, third sentence, agrees the disconnects must be located sufficiently remote from ANY other system disconnects which is the thrust of the proposal.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any new substantiation to address the panel's concerns as stated in the panel statement in the proposal. The present Code wording is clear.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10
Comment on Affirmative:

ROGERS, J.: I voted with the panel on this comment, however, the submitter is correct in his concern about this item. I would encourage the submitter to resubmit his concerns in a proposal to the 2011 NEC. The proliferations of onsite power production systems and the location of disconnecting means for these systems need to be reviewed. There is merit in separating these disconnects from those disconnects that may be installed for emergency and/or essential electrical systems in the buildings. Should there be a catastrophic failure in the disconnect for one of these onsite systems, there should be some assurance that the emergency supply disconnect is not compromised by this failure.

4-15 Log #412 NEC-P04 **Final Action: Reject**
(225.39)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 4-22
Recommendation: Accept proposal for (A) and (B).
Substantiation: If a 15-ampere circuit originating in one building supplies an overcurrent device (for example a 5 ampere fuse for motor, the 15 ampere circuit is a feeder, per definition and the 15 ampere minimum should apply. The literal wording in (B) requires one 2-wire circuit to have a disconnecting means rated not less than 30 amperes. Since "one" is "not mroe than two." An installation consisting of two 15 ampere multiwire circuits, or two 3-phase 15 ampere or less branch circuits is required by (D) to have a disconnect rated not less than 60 amperes although a 30 ampere rating is sufficient. Proposal did not advocate deletion of (C) and (D). Two 2-wire branch circuits (which may be 15 amperes or less) should only require a feeder disconnect means not less than 30 amperes if the feeder is 2-wire. A 15 ampere feeder disconnect rating is sufficient for a 3-wire feeder supplying two 15 ampere 2-wire branch circuits.
Panel Meeting Action: Reject
Panel Statement: In the first example given in the comment substantiation, the 15 amp circuit breaker supplying the motor with a 5 ampere fuse, as additional protection for the motor, would still be a single branch circuit and not a feeder. The purpose of 225.39(A) through (D) is to provide a minimum rating for feeder or branch circuit disconnecting means to ensure the disconnecting means ability to carry the loads. The submitter has not provided any technical substantiation that a problem exists with the existing text or that the present minimum rating for feeder and branch circuit disconnects is causing a problem.

4-16 Log #329 NEC-P04 **Final Action: Accept**
(Figure 230.1)

Submitter: Joe Tedesco, Boston, MA
Comment on Proposal No: 5-61
Recommendation: Change "Grounding" to "Grounding and Bonding"
Substantiation: To reflect the change in the title of Article 250 made in the 2005 edition.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-17 Log #1217 NEC-P04 **Final Action: Accept**
(230.7 Exception No. 1)

Submitter: Neil F. LaBrake, Jr., Syracuse, NY
Comment on Proposal No: 4-4
Recommendation: The NEC TCC Grounding and Bonding Task Group agrees with CMP-4's Panel action to reject the proposed changes to 230.7 Exception No.1 in Proposal 4-4.
Substantiation: The NEC TCC Grounding and Bonding Task Group concurs with CMP-4 that the existing text in the 2005 NEC is adequate for 230.7 Exception No.1.

This Comment was developed by a Task Group assigned by the NEC Technical Correlating Committee to address actions that were other than "accept" taken by Code-Making Panels on proposals from the TCC to resolve 2005 NEC Proposal 5-1 and Comment 5-1. Members of the Task Group on Grounding and Bonding for this Comment included: C. Douglas White; Michael Johnston; Jeffrey Boksiner; Daleep Mohla; Phil Simmons; Christopher Hutchings; James Carroll; Alan Rebeck; Richard Loyd; Paul Dobrowsky; and Neil F. LaBrake, Jr.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-18 Log #2278 NEC-P04 **Final Action: Reject**
(230.24 Exception No. 5 (New))

Submitter: Joseph Watson, Watson Electrical & Mechanical Corp.
Comment on Proposal No: 4-38
Recommendation: Revise to read:

Exception No. 5: Where voltage between conductors does not exceed 300, and there is no permanent access to roof, a reduction in clearance to 6 ft shall be permitted.

Substantiation: An 8 ft clearance above the roof places the NEC and the NESC in direct contradiction to each other. When an installation complies with one, it is in violation of the other. The 8 ft clearance is unsafe for the installing electrician and any line co. servicemen as it is an OSHA violation to have a ladder on a sloped roof. People do not spend much time on a sloped roof without permanent access.

This requirement is an OSHA violation, and a direct (unnecessary) conflict between two code giants - NEC and NESC, placing the installer in an impossible situation. (Here the power co. will not connect to an 8 ft mast).
Panel Meeting Action: Reject
Panel Statement: It appears to the panel that the commenter may have intended to refer to Proposals 4-37 and 4-39 rather than 4-38, which deals with an errata. When reviewing the clearance requirements in 234C3d(1) in the National Electrical Safety Code, it should be noticed that the exceptions concerning the suggested clearance requirements for service drops over roofs or balconies contain more text clarifying when a roof is considered to be accessible versus readily accessible and where a roof is not considered to be readily accessible. Taking just a small part of another standard without providing all of the accompanying qualifying text can change the intent of the requirement, as seems the case here.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10
Comment on Affirmative:

ROGERS, J.: The panel is correct in rejecting this comment. The submitter has not submitted any technical substantiation for the change. However, this is one of the areas that the task group that has been appointed by the panel chair will be reviewing.

4-19 Log #415 NEC-P04 **Final Action: Reject**
(230.30(A))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 4-52a
Recommendation: In 230.50(A) add: "and service laterals" after "Underground Service-Entrance Conductors" in the heading and text, or alternatively delete "entrance."
Substantiation: Service laterals should be included. A service may be supplied by a service lateral with non-service-entrance conductors, per the FPN to definition of Service-Entrance Conductors, Underground System.
Panel Meeting Action: Reject
Panel Statement: Section 230.50 is located within Part IV of Article 230 specifically covering service-entrance conductors. Part III of Article 230 covers underground service lateral conductors. Adding "service lateral" to 230.50(A) would thus be inappropriate.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10
Comment on Affirmative:

ROGERS, J.: The panel was correct in rejecting this comment in its present format. The task group will be reviewing these requirements as part of their review of the use of the term "Service Point". I recommend that the submitter resubmit a proposal for the 2011 NEC to be certain that his concerns are adequately addressed in that cycle. It is my opinion that the concerns raised by the submitter are legitimate and should be addressed.

4-20 Log #436 NEC-P04 **Final Action: Reject**
(230.34 (New))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 4-41
Recommendation: Accept proposal.
Substantiation: Same as proposal substantiation. See explanation of negative vote by Mr. J. Rogers.
Panel Meeting Action: Reject
Panel Statement: The proposal and the comment do not provide for all the wiring methods available for service laterals. In rejecting the comment, the panel recognizes that service lateral conductors and service drop conductors are under the exclusive control of the serving electric utility when they are installed on the utility side of the "Service Point" as defined in Article 100 and as established by the serving utility. The panel also recognizes that there are many times when these conductors are installed on the customer side of the Service Point as defined by the serving utility, and these installations are subject to the requirements of the National Electrical Code. This proposal seeks to define the wiring methods required when the installations are performed on the customer side of the Service Point as defined by the serving utility. This NEC requirement does not place any restrictions on these conductors when they are installed on the utility side of the Service Point as defined by the serving utility.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10
Comment on Affirmative:

ROGERS, J.: See my comment on Comment 4-19.

4-21 Log #1618 NEC-P04 **Final Action: Reject**
(230.42(A))

Submitter: Noel Williams, Herriman, UT
Comment on Proposal No: 4-47
Recommendation: Another portion of this proposal should have been accepted in principal. The panel should accept the concept of the proposal that applies 125% (or 100% for rated overcurrent devices) only to conductors that connect to those overcurrent devices. The panel should either accept in principal additional wording from the original proposal or change the first sentence to read: "For service-entrance conductors directly connecting to overcurrent devices the ampacity ~~of the service entrance conductors~~ before the application of any correction or adjustment factors shall be not less than either (A)(1) or (A)(2)."
Substantiation: The panel statement objected to the proposed revision on the grounds that it would only apply to those conductors that directly connect to overcurrent devices. That is as it should be. By allowing 100% rather than 125% for OCDs rated at 100%, the existing language makes it clear that the only reason for increasing the ampacity of a conductor under the rule is that is connects to an overcurrent device. Ampacity is, by definition, the continuous current rating of a conductor, so the conductors that do not connect to OCDs only need to be sized per 310.15. Panel 2 has correctly clarified this point for both branch circuit conductors and feeder conductors. Panel 4 should also recognize the original reason for the 125% rule and clarify this point for service-entrance conductors. The proposed revised text will clarify application of the 125% rule and retain the reference to 310.15 for determining ampacity.
Panel Meeting Action: Reject
Panel Statement: The submitter's comment describes the requirements for "directly-connecting to overcurrent devices". The phrase "directly-connecting" is not clearly defined and interpretations of this phrase could cause misapplication of service entrance conductor sizing in field installations.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10
Comment on Affirmative:
ODE, M.: As the Code is currently written, there are cases where the service conductors are required to be unnecessarily oversized by 25 percent. The proposal attempted to correct this, but would possibly have allowed undersized conductors in some situations. It may be appropriate to address this in the 2011 Code cycle. Further consideration should be given to the various types of equipment that may be used as service equipment, as well as the size of supply conductors mandated by the test requirements of the certification standards for each type of equipment.
ROGERS, J.: The submitters of both the proposal and the comment are correct in their concerns. There were two different although very similar submittals for the language change in this section, one in the proposal stage and one in the comment stage. I agree that this has technical merit and should be changed, however, I also agree with the panel that the language submitted was not sufficiently clear to address all installations and the language was not in a format that could be easily understood by all users of the NEC. The proposal should be resubmitted for the 2011 NEC with new language.

4-22 Log #535 NEC-P04 **Final Action: Reject**
(230.43(15) and (16))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 4-50
Recommendation: Accept as revised:
(15) One length of flexible metal conduit, or liquid tight flexible metal conduit, or liquidtight flexible nonmetallic conduit not over 1.8 m (6 ft) long between raceways specified in (3), (4), (5) and if metal (8) and (10), or between such raceways and service equipment.
Delete (16).
Substantiation: It appears the intent is to permit one length of flexible conduit, however, actual wording permits daisy chaining of the conduits (between raceways). Present wording permits LFMC and LFNC between nonmetallic raceways of (8), (10), (11), and (16) where the bonding requirements for outside the raceway serve no purpose since there is no grounding path and where inside the conduit no accessible connection points are available. The present (16) infers liquidtight flexible nonmetallic conduit, if used, must be for the entire length of service conductors since there is no 6 ft limitation, but doesn't prohibit or include short lengths for which no bonding requirements are stated.
Panel Meeting Action: Reject
Panel Statement: As long as the proper bonding jumpers are installed, there is no reason to restrict the various flexible wiring methods to one length. Deleting (16) and incorporating liquidtight flexible nonmetallic conduit into (15) does not add any clarity to the NEC.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-23 Log #597 NEC-P04 **Final Action: Accept**
(230.44)

Submitter: Henry A. Jenkins, Wake County, Inspections Development / Rep. N.C. Ellis Cannady Chapter of I.A.E.I

4-24 Log #1213 NEC-P04 **Final Action: Accept**
(230.44)

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Comment on Proposal No: 4-52
Recommendation: We support the panel's action of Accepting in Principle the Proposal.
Substantiation: Breaking the original proposal up into two sentences changes nothing in the original proposal. Both changing this into two sentences and removing the words "or equivalent" adds clarity to the original proposal.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-25 Log #414 NEC-P04 **Final Action: Reject**
(230.44 and Exception)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 4-51
Recommendation: Accept proposal as revised:
"Cable trays used to support (open individual) (single conductor) service conductors shall only contain service conductors."
Add to exception:
"or the conductors are installed in a raceway or metal covered cable."
Substantiation: Unless the service conductors are installed as single conductors what is the need for separation? While it may be construed that a solid barrier includes raceways and metal covered cables, that is not clear. Present wording indicates service conductors, even if in a raceway shall not be installed with other conductors. The panel statement that present text does not apply to service conductors in a cable assembly or raceway is not borne out by the wording.
Panel Meeting Action: Reject
Panel Statement: There is no technical substantiation to limit service conductors installed in a cable tray to just single conductor types since 392.9 permits multiconductor cables to be installed in cable trays. In the exception, the use of the word "conductors" is specific to conductors not installed in a raceway or a metal covered cable. The purpose of the main text is to permit service entrance conductors to be installed in cable trays with the exception to permit the same cable tray to be used where a proper fixed barrier is installed and proper marking labels are installed. If the cable tray is being used for support of raceways or metal-covered cables, the cable tray is simply a support mechanism and the separation is based on the raceways or metal-covered cables.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-26 Log #1376 NEC-P04 **Final Action: Accept in Principle**
(230.50(A))

Submitter: William Wagner, Certification Solutions
Comment on Proposal No: 4-53
Recommendation: This Proposal should be Accepted as originally proposed.
230.50 Protection of Open Conductors and Cables Against Damage - Above Ground. Service-entrance conductors installed above ground shall be protected against physical damage as specified in 230.50(A) or (B).
(A) Service Cables. Service cables, where subject to physical damage, shall be protected by any of the following:
(1) Rigid metal conduit
(2) Intermediate metal conduit
(3) Schedule 80 rigid ~~nonmetallic~~ PVC conduit
(4) Electrical metallic tubing
(5) Other approved means

Substantiation: In accordance with CMP-8's action on Proposal 8-53, Article 352 will now apply only to "Rigid Polyvinyl Chloride Conduit: Type PVC" rather than "Rigid Nonmetallic Conduit: Type RNC." Therefore, it is necessary to revise the terminology used throughout the remainder of the NEC. As the only type of rigid nonmetallic conduit that is currently listed in Schedule 80 dimensions is rigid PVC conduit, the reference in 230.50(A) should be revised as noted above.
Panel Meeting Action: Accept in Principle
Revise comment to read: (3) Schedule 80 ~~rigid nonmetallic~~ PVC conduit
Panel Statement: After the definition in 352.2, the phrase used throughout Article 352 is "PVC conduit," with the word "rigid" not used.

4-31 Log #1902 NEC-P04 **Final Action: Reject**
(230.70(A)(1))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 4-62
Recommendation: Accept the proposal.
Substantiation: The panel statement is not responsive to the proposal. The proposal does not require the service disconnect to be attached to building, although that is an option. It could also be "immediately adjacent thereto." This wording was chosen because CMP 4 did not want to use a prescriptive dimension, such as ten feet. The proposal also does not change anything with respect to the location of an inside service disconnect. What it does do is place a proximity limit on an outside disconnect. A service disconnect that is at a great distance or out of view from the building served is an unsafe situation.
Panel Meeting Action: Reject
Panel Statement: The proposal reference for this comment should be 4-63 rather than 4-62. The panel was very responsive to the proposal. There was absolutely no technical substantiation provided in either the proposal or the comment to require the service disconnecting means to be attached to or immediately adjacent to the building. In recent Code cycles, the panel has tried to develop a particular distance at which the service disconnecting means can be located outside the building or structure, but based on the architectural design of the building, problems with landscape and plant, and other premises problems, a reasonable distance could not be established. If the unprotected utility company conductors remain outside the building, there really is not a hazard associated with these conductors where properly maintained by the utility company. Where these unprotected conductors enter into a building, it is now necessary to terminate these conductors in a proper overcurrent protection device at a location nearest the point of entrance of these conductors into the building. Requiring the service disconnecting means to be located on the exterior of the building or immediately adjacent to the building or structure, instead of anywhere outside the building or structure, would be too restrictive and would result in too many exceptions. This concept has been acceptable, in one form or another, since the 1897 NEC and should remain as presently written.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-32 Log #813 NEC-P04 **Final Action: Accept in Principle**
(230.71)

Submitter: Timothy M. Croushore, Allegheny Power
Comment on Proposal No: 4-66
Recommendation: Revise the last sentence of 230.71(A) General to put in list format as follows:

For the purpose of this section, disconnecting means used solely for the following shall not be considered a service disconnecting means:
(1) Power monitoring equipment
(2) Surge protective device(s)
(3) Control circuit of the ground-fault protection system
(4) Power-operable service disconnection means, installed as part of listed equipment

Substantiation: The recommended revision is for clarity of the requirements of the last sentence in the original text. Typically, power monitoring equipment and surge protective devices are after-market items installed after the switchboard, panelboard or switchgear is manufactured. Occasionally, ground-fault protection is installed as an after-market item. However, GFP is typically installed by the original equipment manufacturer. As addressed in the original proposal, only Type 2 surge protective devices need to be installed as part of listed equipment as shown in 230.82(8).
Panel Meeting Action: Accept in Principle
Revise 230.71(A) General as follows:

For the purpose of this section, disconnecting means installed as part of listed equipment and used solely for the following shall not be considered a service disconnecting means:
(1) Power monitoring equipment
(2) Surge protective device(s)
(3) Control circuit of the ground-fault protection system
(4) Power-operable service disconnecting means

Panel Statement: The final phrase "installed as part of listed equipment" was originally inserted in 1987 as part of the exception for the control circuit of the ground-fault protection system to be installed as part of listed equipment. Section 230.82(8) also applies this same requirement to both ground-fault protection systems and transient voltage surge suppression systems. This layout will make it clear that these four systems must be installed as part of the listed equipment.

(230.71(B), FPN)

TCC Action: The Technical Correlating Committee understands that the action on Proposal 9-7c occurs in Comment 4-32a.
Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 9-7c
Recommendation: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 4 for action. This action will be considered by Code-Making Panel 4 as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-34 Log #515 NEC-P04 **Final Action: Reject**
(230.79(B))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 4-69
Recommendation: Accept proposal for (B):
TWO CIRCUIT INSTALLATION FOR installations consisting of ~~not more than~~ two 2-wire circuits the service disconnecting means for a 2-wire service shall have a rating of not less than 30 amperes. For installations consisting of two multiwire circuits or two 3-phase circuits, the service disconnecting means shall have a rating of not less than 30 amperes.
Substantiation: "Not more than two" literally includes only one 2-wire branch circuit which is permitted by (A) to be rated 15 amperes. Present wording requires two 15 ampere multiwire branch circuits or two 3-phase 15 ampere branch circuits to have a 60 ampere service disconnecting means which is 200 percent of the current rating of the branch circuits supplied.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any technical substantiation to justify permitting two multiwire circuits or two 3-phase circuits at a rating of not less than 30 amperes. Changing "consisting of not more than two 2-wire circuits" to "consisting of two 2-wire circuits," means it would apply to two 2-wire circuits and would no longer apply to one or two as it did before.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-35 Log #1086 NEC-P04 **Final Action: Accept in Principle in Part**
(230.82)

Submitter: Jim Pauley, Square D Company
Comment on Proposal No: 4-73
Recommendation: Accept the Proposal.
Substantiation: The submitter has provided a very reasonable rearrangement of this section and has introduced important and necessary requirements for meter disconnect switches.
The panel statement for rejection is somewhat disingenuous. First, if the issue was truly related to 90.2(B)(5), we would not need any text to deal with the meter disconnect switch. If utilities truly want "exclusive control" they need to purchase, install and maintain the disconnect. That is not what is happening. End users are being forced to purchase a disconnect (at the user expense) for the sole purpose of satisfying what is a utility company issue. The disconnect serves no purpose for the user. Utilities have also been emphatic that if the disconnect needs to be replaced, the user is required to make the replacement. If a fusible device is used and a fuse opens, utilities have also made it clear that the fuse must be replaced by the customer. Clearly these disconnects are not under the exclusive control of the utility.
The points made by the submitter relative to the disconnect needing to interrupt the load served and have an adequate short circuit current rating are both important safety issues. The panel statement says that the utility can open the service disconnect to remove the load. True, but that is not what actually happens. If the watt-hour meter needs to be replaced or tested, the meter-disconnect switch is opened, the meter removed, new meter inserted and the switch turned back on. If the device is not suitable for making or breaking the load, then it should be marked as an isolating switch along with DO NOT OPEN UNDER LOAD.
The last paragraph of the panel statement is of most concern. Allowing the utility company installation manuals to handle the issue is exactly what is creating major problems across the country today. Utilities are all taking different approaches and imposing different requirements on products. This reduces standardization (which is ironic, since one of the objectives we all have with the adoption of the NEC is to have more consistent installations). This reduction in standardization increases the costs for the end user.
The panel should either accept the proposal which will provide improved wording and requirements or they should delete the text all together.
Panel Meeting Action: Accept in Principle in Part
Accept only the following sentence from proposal 4-73.
"A meter disconnect shall be capable of interrupting the load served."
Add the word "switch" between the words "disconnect" and "shall", and insert the sentence at the end of 230.82(3): "A meter disconnect switch shall be capable of interrupting the load served."
Reject the balance of proposal 4-73.
Panel Statement: The panel agrees with the commenter that this switch must be capable of interrupting the load served.
The title in (A) is "Unswitched Equipment," so Items (1) through (7) would not apply if the equipment in (A) is installed on the load side of a meter disconnecting means since it would now be switched.

4-36 Log #1903 NEC-P04 **Final Action: Accept in Principle in Part**
(230.82)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 4-73
Recommendation: Accept the proposal.
Substantiation: The panel statement is in serious error when it describes a meter disconnect as always subject to 90.2(B)(5). If the meter socket is on the load side of the service point (usually but not always the case), then the meter disconnect is premises wiring even if under utility seal, and even if it is installed pursuant to a utility mandate. The fact that a utility can unload a meter is irrelevant, since the existence of the disconnect usually means that the utility has requested it. The panel statement then goes on to complain about the short-circuit capability requirement for the switch, which is bizarre since CMP 4 already located this requirement in the NEC [at 230.82(3)] and this proposal merely retains the existing requirement. The proposal also carefully accommodates true service disconnects for meter stacks (not, in such cases, meter disconnects). The panel statement is not responsible to the merits of the proposal.

4-38 Log #2241 NEC-P04 **Final Action: Reject**
(230.82)

Submitter: Wes Hoppler, American Power Technologies Inc.
Comment on Proposal No: 4-74
Recommendation: Adopt the proposal as submitted.
Substantiation: The issue here is a catch 22. UL 1008 is based on the NEC. 2 pole meter socket adapter transfer switches cannot reasonably provide a neutral disconnect to function as service equipment. They also use breakers (OCPDs) in the switching mechanism. They contain a ground-neutral bond and attach that lead to the grounded service conductor which is in turn bonded to the existing meter socket. No new multiple paths are created that would affect service conditions under normal utility supplied power service. Since they are then generally the first source of OCP, but have no neutral disconnect, and a ground neutral bond, complying with the marking requirements of UL 1008 is problematic. This proposed change would allow for a change in the UL 1008 language that would allow installation on the service-side without being labeled as service equipment but rather "suitable only for installation on the service side of the main disconnect." The exemption for these units to be installed "under the exclusive control of the serving utility" works in some instances such as critical municipal loads and others. However, it is not practical for typical residential homes. When the generators are needed, typically the utility has more pressing things to do such as the restoration of power in storm damaged areas. Obviously, the serving utility needs to approve any device that their meter plugs into. However, it seems better to modify the Code than to suppose that all customers with such devices are duly authorized agents acting on behalf of the serving utility.
Panel Meeting Action: Reject
Panel Statement: These devices are for use only under the exclusive control of the utility company in accordance with their listing, and therefore no NEC requirement is necessary in accordance with 90.2(B)(5).

Ballot Results: Affirmative: 10

4-39 Log #1218 NEC-P04 **Final Action: Reject**
(230.82(2) and 230.82(3))

Submitter: Neil F. LaBrake, Jr., Syracuse, NY
Comment on Proposal No: 4-4
Recommendation: The CMP-4 Panel action item 4 should be to accept the original proposal for Sections 230.82(2) and 230.82(3).
Substantiation: The NEC TCC Grounding & Bonding Task Group does not agree that CMP-4's revised text of the proposal to 230.82(2) more accurately describes the specific parts for both grounding and bonding than does the original proposal. The CMP-4 made no change to the original proposed text for 230.82(3) as noted in the Panel's action.

This Comment was developed by a Task Group assigned by the NEC Technical Correlating Committee to address actions that were other than "accept" taken by Code-Making Panels on proposals from the TCC to resolve 2005 NEC Proposal 5-1 and Comment 5-1. Members of the Task Group on Grounding and Bonding for this Comment included: C. Douglas White; Michael Johnston; Jeffrey Boksiner; Daleep Mohla; Phil Simmons; Christopher Hutchings; James Carroll; Alan Rebeck; Richard Loyd; Paul Dobrowsky; and Neil F. LaBrake, Jr.
Panel Meeting Action: Reject
Panel Statement: The panel's action in Proposal 4-4 covering 230.82(2) achieves the commenter's intent but uses clearer language. Grounding is covered under Part VII, and bonding under Part V. After reviewing the panel action on the proposal, the panel notes that the same changes were intended for 230.82(3) as were made to 230.82(2), as noted in item 4 of the panel statement.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-39a Log #CC403 NEC-P04 **Final Action: Accept**
(230.82(3))

Submitter: Code-Making Panel 4,
Comment on Proposal No:
Recommendation: Revise 230.82 (3) as follows:

230.82 (3) Meter disconnect switches nominally rated not in excess of 600 volts that have a short-circuit current rating equal to or greater than the available short circuit current, provided all metal housings and service enclosures are grounded in accordance with Part VII and bonded in accordance with Part V ~~and Part VII~~ of Article 250.
Substantiation: The panel changed the proposed text to 230.82 (2) to more clearly identify which Part of Article 250 applied to the grounding and which Part of Article 250 applied to the bonding. It was intended that the same changes be made to 230.82 (3). The panel meeting action clarifies that intent.

4-40 Log #2240 NEC-P04 **Final Action: Reject**
(230.94)

Submitter: Wes Hoppler, American Power Technologies Inc.
Comment on Proposal No: 4-82
Recommendation: Adopt the proposal as submitted.
Substantiation: The issue here is a catch 22. UL 1008 is based on the NEC. 2 pole meter socket adapter transfer switches cannot reasonably provide a neutral disconnect to function as service equipment. They also use breakers (OCPDs) in the switching mechanism. They contain a ground-neutral bond and attach that lead to the grounded service conductor which is in turn bonded to the existing meter socket. No new multiple paths are created that would affect service conditions under normal utility supplied power service. Since they are then generally the first source of OCP, but have no neutral disconnect, and a ground neutral bond, complying with the marking requirements of UL 1008 is problematic. This proposed change would allow for a change in the UL 1008 language that would allow installation on the service -side without being labeled as service equipment but rather "suitable only for installation on the service side of the main disconnect." The exemption for these units to be installed "under the exclusive control of the serving utility" works in some instances such as critical municipal loads and others. However, it is not practical for typical residential homes. When the generators are needed, typically the utility has more pressing things to do such as the restoration of power in storm damaged areas. Obviously, the serving utility needs to approve any device that their meter plugs into. However, it seems better to modify the Code than to suppose that all customers with such devices are duly authorized agents acting on behalf of the serving utility.

Comment on Proposal No: 4-83
Recommendation: Continue to Reject the Proposal.
Substantiation: This proposal is requesting a relaxation of the present safety parameters in the NEC without any substantiation to support such a reduction. The present language has been in the NEC for well over 30 years.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10
Comment on Affirmative:

ROGERS, J.: I am voting with the panel on this comment but for different reasons than those stated in the original panel statement on Proposal 4-83. I do not agree with the assumption by the panel that in all cases it is easier to change a fuse than a rating plug. In many cases the opposite may be the case. In either event the panel should base its decision on factual technical language and not on a perceived ease of installation or change issue. I encourage the submitter to resubmit in the 2011 NEC cycle with further technical information.

4-43 Log #1184 NEC-P04 **Final Action: Reject**
(230.96 (New))

Submitter: Mark H. Sumrall, IBEW Local Union 527
Comment on Proposal No: 4-85
Recommendation: The Panel should accept this proposal.
Substantiation: The panel statement does not take into consideration the well documented, multi-injuries, multi-fatalities, associated with exposure to any arc flash or blast. While PPE should be considered the last stand on injury prevention, engineering hazards "out of the industry" should be considered the norm, with the knowledge base of the present day industry documentation. This should always be the first stand, when hazards are known, and not the exception. These hazards have been recognized since the early 1980's. Prior to this date, arc blast and flash were considered "the nature of the beast." Electricians "know the hazards" and must take "personal" steps in preventing their exposure to these hazards. This work practice is no longer acceptable. The field employees need all the help we can collect for prevention of these exposures.
Panel Meeting Action: Reject
Panel Statement: The panel recognizes the submitter's concerns, however the submitter of the proposal does not provide the method of installation for current-limiting fuses or circuit breakers at the "source of supply" for the service entrance conductors. For example, the service drop conductors connect to service entrance conductors at the weatherhead. These service entrance conductors are then installed in various types of wiring methods required by 230.40 to the service equipment, such as the meter socket and the service disconnecting means. The proposal appears to require an additional fusible disconnect at the point of connection between the service drop conductors and the connection point (commonly called the service point) for the service entrance conductors. Even if these devices were installed at this location, the installation would be a violation of 240.24(A) requiring overcurrent devices to be readily accessible.The addition of these devices would not eliminate the likelihood of injury. The only way to eliminate injury is to shut off the power.

(230.200, FPN)

Submitter: Jim Pauley, Square D Company
Comment on Proposal No: 4-86
Recommendation: Accept the Proposal.
Substantiation: The submitter is correct. The FPN does add confusion when one considers that the NEC is an enforcement document that is adopted by practically all jurisdictions in the US.
The NESC does indeed contain provisions that are in conflict with the NEC. Should users decide to utilize the NESC for installations covered by the NEC, the conflicts place the AHJ in a very difficult position. Although the NESC may be useful for some engineering design information, its reference as a source from the NEC implies that it is capable of being used without interfering with the use of the NEC. The code loses nothing by deleting the reference, but has increased confusion/conflict with the reference included.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 4-4.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-45 Log #2033 NEC-P04 **Final Action: Reject**
(230.200, FPN)

Submitter: Donald Cook, Shelby County Building Inspections
Comment on Proposal No: 4-86
Recommendation: Delete this FPN completely.
Substantiation: The panel statement indicates the FPN provides NEC Code users with additional information for conductor clearances for utility company conductors on the line side of the service point. Utility conductors on the line side of the service point are not within the scope of the NEC. I fail to see the value of including that information in the NEC. While the NESC requirements certainly seem applicable to installations on the line side of the service point, they do not seem relevant to NEC installations. As an AHJ with a significant number of installations that utilize systems greater than 600-volts, I can confirm the FPN currently adds to the confusion for requirements on installations above 600-volts. If the NEC continues to claim responsibility for the installations, a complete set of requirements should be established and references to another document in FPN's should be removed. In the enforcement of the NEC, the NEC references to the NESC cause regular debate and challenge from designers that attempt to use the NEC for pole line distribution on the secondary of the service point. The purpose for this proposal and comment is not to change the requirements that govern the installations, but to clarify which code or standard is responsible for installations on the customer side of the service point. Confusion can not enhance safety. See CMP-1 action on Proposal 1-145.
Panel Meeting Action: Reject

Ballot Results: Affirmative: 10

4-49 Log #2089 NEC-P04 **Final Action: Reject**
(230.203)

Submitter: James J. Rogers, Bay State Inspectional Agency
Comment on Proposal No: 4-3
Recommendation: This Proposal should be Accepted in Principle.
Substantiation: The panel action on this proposal should have been accept or accept in principle. The submitter has raised an issue that should be addressed relative to the lack of installation requirements for service lateral conductors. For some reason, the submitter only raised the issue with service laterals over 600 volts and I believe that the general requirements should also be addressed. I do not agree with the statement that all service laterals are under the control of the utility companies and the definition of "service point" supports my opinion. If the panel is not in agreement with this opinion, then a lot of work has to be done within Article 230 to define these conductors as underground service entrance conductors. The basic diagram that is found in 230.1 clearly exhibits that the conductors between a riser pole or underground street main are service lateral conductors up to the terminal box, meter or other enclosure. These conductors are routinely installed by private contractors all across the country. If the panel truly believes that these are not service lateral conductors, then a tremendous change in the basic understanding throughout the electrical

profession would have to be made. And, as I stated above technical changes within Article 230 would have to be made. I truly do not understand what the problem is. These conductors are service laterals, if they are installed and maintained by the utility then they are on the utility side of the service point, if they are installed and maintained by private contractors they are on the customer side of the service point. In either case, they are still service lateral conductors until such time as Article 230 is changed to define them differently.
Panel Meeting Action: Reject
Panel Statement: The submitter of the proposal and the submitter of this comment have not provided any technical substantiation to require specific wiring methods be installed for service lateral conductors.
See panel action and statement on Comment 4-48.

Ballot Results: Affirmative: 10

4-50 Log #1220 NEC-P04 **Final Action: Accept**
(230.204(D))

Submitter: Neil F. LaBrake, Jr., Syracuse, NY
Comment on Proposal No: 4-4
Recommendation: The NEC TCC Grounding and Bonding Task Group recommends that CMP-4 reconsider accepting the proposed changes in principle to 230.204(D) with the following alternative text changes.
230.204(D): Revise the title and section as follows:
(D) ~~Grounding~~ Connection to Ground. Isolating switches shall be provided with a means for readily connecting the load side conductors to a grounding electrode system, equipment ground bus bar, or grounded structural steel when disconnected from the source of supply. A means for grounding the load side conductors to a grounding electrode system, equipment grounding bus bar, or grounded structural steel shall not be required for any duplicate isolating switch installed and maintained by the electric supply company.
Substantiation: The NEC TCC Grounding & Bonding Task Group concludes this alternative change to 230.204(D) is more prescriptive and specific with respect to making a connection to ground on high voltage equipment for safe work practices. This connection is required to be a solid connection to a grounding electrode system, equipment grounding bus bar, or grounded structural steel that may or may not be specified in 250.52. These connections to ground are not made through potential equalizing grids or ground mats which are similar as defined in IEEE 80 to reduce step and touch voltage exposure to personnel. The IEEE 80-2000 definition for "ground mat is:
"**3.13 ground mat:**
A solid metallic plate or a system of closely spaced bare conductors that are connected to and often placed in shallow depths above a ground grid or elsewhere at the earth's surface, in order to obtain an extra protective measure minimizing the danger of the exposure to high step or touch voltages in a critical operating area or places that are frequently used by people. Grounded metal gratings, placed on or above the soil surface, or wire mesh placed directly under the surface material, are common forms of a ground mat."
This Comment was developed by a Task Group assigned by the NEC Technical Correlating Committee to address actions that were other than "accept" taken by Code-Making Panels on proposals from the TCC to resolve 2005 NEC Proposal 5-1 and Comment 5-1. (230.211)

TCC Action: The Technical Correlating Committee directs that Comment 4-51 be reported as Reject based on Code-Making Panel 9's action to Reject Proposal 9-158 on Comment 9-90, which was the basis for acceptance of Comment 4-51.
Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 4-89
Recommendation: Accept the proposal.
Substantiation: As the proposal substantiation clearly indicated, this was a companion proposal to one submitted to locate all the relevant requirements of this gear in Article 490. All technical content within Section 230.211 has been incorporated in Section 490.47 pursuant to Proposal 9-158. this section (490.46 in the 2005 NEC) now will contain an extensive array of construction requirements for this switchgear, and makes sense to bring all these requirements together.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

ARTICLE 240 — OVERCURRENT PROTECTION

10-2 Log #64 NEC-P10 **Final Action: Accept**
(240.4(D))

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 10-10
Recommendation: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal as it relates to 110.5. This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Code-Making Panel 10 accepts the Technical Correlating Committee direction to clarify the panel action on Proposal 10-10 as it relates to 110.5. The following revisions have been made for increased clarity and usability:
(1) Use of the term "copper" is necessary for clarity and usability in a section that references both copper and aluminum conductors.
(2) The word "through" was editorially changed to "or" per Comment 10-3.
(3) The text accepted in the panel action on proposal 10-10 has been editorially revised to comply with the NEC Style Manual and to increase clarity and usability.
The text will now read as follows:
"(D) Small Conductors. Unless specifically permitted in 240.4(E) or (G), the overcurrent protection shall not exceed the following after any correction factors for ambient temperature and number of conductors have been applied.
(1) 18 AWG Copper. 7 amperes, provided all the following conditions are met:
(1) Continuous loads do not exceed 5.6 amperes.
(2) Overcurrent protection is provided by one of the following:
a. Branch circuit rated circuit breakers listed and marked for use with 18 AWG copper wire
b. Branch circuit rated fuses listed and marked for use with 18 AWG copper wire
c. Class CC, Class J, or Class T fuses
(2) 16 AWG Copper. 10 amperes, provided all of the following conditions are met:
(1) Continuous loads do not exceed 8 amperes
(2) Overcurrent protection is provided by one of the following:
a. Branch circuit rated circuit breakers listed and marked for use with 16 AWG copper wire
b. Branch circuit rated fuses listed and marked for use with 16 AWG copper wire
c. Class CC, Class J, or Class T fuses
(3) 14 AWG Copper. 15 amperes
(4) 12 AWG Aluminum and Copper-Clad Aluminum. 15 amperes
(5) 12 AWG Copper. 20 amperes
(6) 10 AWG Aluminum and Copper-Clad Aluminum. 25 amperes
(7) 10 AWG Copper. 30 amperes"

10-4 Log #516 NEC-P10 **Final Action: Reject**
(240.5(A) Exception (New))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 10-12
Recommendation: Accept the proposed new Exception for (A):
Exception: Where permitted elsewhere in this Code to be permanently connected as branch circuit or feeder conductors extra hard usage flexible cords and flexible cables not in contact with heated or heat-producing surfaces shall be permitted to be protected in accordance with 240.4(A), (B), and (G).
Substantiation: The provisions of (A), (B), and (G) do not apply to permanently connected cords and cables as they are excluded by the first sentence of 240.4 and 310.15 doesn't include them. Table 240.4(G) for example indicates such cords used for motor circuit conductors may be protected at greater than their ampacity in accordance with Article 430 but the first sentence of 240.4 precludes this by excluding flexible cords from (G). For example if a 3-phase motor rated 15.2 ampere could utilize a 12 AWG Type SO cord rated 20 amperes per 400.7(7)(9) for current requirements but if the motor overcurrent protection exceeds 20 amperes (usual case) the cord would be in violation of 240.5(A).
Panel Meeting Action: Reject
Panel Statement: The proposed exception does not increase clarity for users of the Code.

Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-7 Log #1624 NEC-P10 **Final Action: Reject**
(240.20(B)(1))

Submitter: Wally Harris, Atlantic Inland Inspections
Comment on Proposal No: 10-17
Recommendation: Revise the text of this Proposal to read as follows:
Multiwire Branch Circuit. Except where limited by 210.4(B), individual single-pole circuit breakers, with ~~or without~~ approved handle ties, shall be permitted as the protection for each ungrounded conductor of multiwire branch circuits that serve only single-phase line-to-neutral loads.
Substantiation: The original proposal in the ROP should be reconsidered, and accepted.
First, let us address the aspect of the grounded (neutral) conductor of a multi-wire circuit. The grounded conductor carries the unbalanced current in a multi-wire circuit. As an example:
120/240 volt circuit
Served by spaces 2 and 4 in a panel.
Assume space 2 - "Leg A" is a 20 ampere circuit - with a load of 12 amps.
Assume space 4 - "Leg B" is a 20 ampere circuit - with a load of 15 amps.
The current in the grounded conductor would be; 15 amps - 12 amps = 3 amps.
3 amperes is more than enough to cause injury or death.
Even if one leg is switched off in the above noted 120/240 volt circuit, the other leg would still carry current, as would the grounded conductor.
Secondly, let us address that which is noted in the ROP "Panel Statement" - the "automatic" opening of the overcurrent device, and the further statement of the Panel that a handle tie "...does not establish a common trip mechanism." I would respectfully disagree with the Panel by noting that an Approved Handle Tie is the most basic form of a "common trip mechanism".
The automatic opening of the overcurrent device is not so much the largest safety problem, nor is the unbalanced current in the grounded conductor addressed above. Another safety consideration is what is connected to the circuit in question.
Let us consider a hypothetical situation in a school, hospital, or commercial setting:
Duplex receptacle outlet:
● Top - served by "Leg A" - Serves an assumed Toaster
● Bottom - served by "Leg B" - Serves an assumed Coffee maker.
● Maintenance receives a call that the receptacle outlet in the Second Floor Kitchenette broke on the bottom when the toaster was unplugged.
● Maintenance person inserts polarity tester (A "weapon of choice" for many maintenance persons) in the TOP receptacle and flips breakers until the light goes out.
● Maintenance then goes to remove the receptacle and does not realize that the BOTTOM portion that broke is in fact still hot and is injured.
Considering this scenario the problem arises more so when the overucrrent device is serving as a circuit disconnect.
Many so called maintenance persons are ill trained in the industry today, due in part to budget cuts, and staffing cutbacks. All too often a so called maintenance person is no more than a "bulb changer", and is often times assigned tasks that they are not qualified to do.
This is a problem that needs to be addressed at some point in time, and hopefully it will be soon enough to prevent injury, death or other loss.
Panel Meeting Action: Reject
Panel Statement: The submitter is confusing common trip with common disconnect.
The panel reaffirms that handle ties ensure common ON/OFF switching but that handle ties do not ensure common tripping under overload. There is a difference between multipole common trip circuit breakers and handle tied individual circuit breakers, and this is discussed, for example, in the NFPA NEC 2005 Handbook on pages 165-167. With respect to single pole circuit breakers applied to multiwire branch circuits serving only single-phase line-to-neutral loads, tripping of the breaker in an ungrounded conductor will remove both current and voltage from that load in a safe manner. There could, indeed, still be current flow in the grounded neutral conductor, but this current will be flowing to a separate load.
The scenario relative to the duplex receptacle is covered in 210.4(B). Here, it is noted that 210.4(B) was expanded in the 2005 Code from dwelling units to also include general multiwire circuits. Thus, a multiwire branch circuit supplying more than one device or equipment on the same yoke shall be provided with a means to disconnect simultaneously all ungrounded conductors at the panel where the branch circuit originated. Individual single-pole circuit breakers would have to be handle tied in order to meet this requirement.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
FREDERICKS, C.: I support the panel action and statement, but I would like to comment that I agree with the idea to require common switching for multi-wire branch circuits. As I understand, there are pending changes in Article 210 to require this common switching. This should meet the commenter's intent, with no further action required in Article 240.
KIMBLIN, C.: The first sentence of the panel statement reads that handle ties do not ensure common tripping under overload. However, and more accurately, handle ties do not ensure common tripping under overcurrent conditions. Per the definition in Article 100, these include overload, short circuit or ground fault. The appropriate term in the first sentence of the panel statement is "overcurrent" rather than "overload."
KOVACIK, J.: In addition to the substantiation provided by the panel in support of the rejection of this comment, it is important to note that UL489, the Standard for circuit breakers, does not recognize a handle tie as a common trip mechanism in performance testing of circuit breakers.
OCKULY, G.: I vote to affirm the panel action with the following comment:
In the panel statement, second line, the word "overload" should read "overcurrent". Tie handles do not ensure common trip during overload, short-circuit, or ground fault conditions. Therefore, the word "overcurrent" is the correct term.

10-8 Log #1509 NEC-P10 **Final Action: Accept**
(240.20(B)(3))

Submitter: Jeffrey Boksiner, Telcordia Technologies, Inc.
Comment on Proposal No: 10-18
Recommendation: Technical Correlating Committee Task Group on the definition of "Neutral Conductor" concurs with the panel action on this proposal.
Substantiation: This comment was developed by the Technical Correlating Committee (TCC) Task Group (TG) on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6). The TCC

directed that the action on this proposal be sent to the TG for review and comment.
Panel Meeting Action: Accept

(240.21(C)(2)(1)(c))

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 10-27
Recommendation: The Technical Correlating Committee directs that the Code-Making Panel clarify the Panel Action on this Proposal with respect to the location of the added text. This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
The panel accepts the direction of the Technical Correlating Committee.
The panel action is to delete existing 240.21(C)(2)(1)(c) and create a new 240.21(C)(2)(4) to read:
"For field installations where the secondary conductors leave the enclosure or vault in which the supply connection is made, the rating of the overcurrent device protecting the primary of the transformer, multiplied by the primary to secondary transformer voltage ratio, shall not exceed 10 times the ampacity of the secondary conductor".
Panel Statement: The existing text in 240.21(C)(2)(1)(c), including the submitter's proposed text, has been revised and placed in a new 240.21(C)(2)(4), which is consistent with the structure and text found in 240.21(B)(1)(4).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-12 Log #608 NEC-P10 **Final Action: Accept in Principle**
(240.21(H) (New))

Submitter: Paul Guidry, Fluor Enterprises, Inc
Comment on Proposal No: 10-33
Recommendation: Accept the proposed wording in Mr. Frederick's comments in the ROP, except change the term "overload" to "overcurrent" in 240.21(H)(1). Also, assign a length to the conductors. If the panel disagrees with 25 ft as recommended in my proposal, then the panel should discuss the issue and decide on a suitable length.
Substantiation: The panel statement ("The panel disagrees with the substantiation that there are no restrictions.") is somewhat incorrect. In my substantiation I did not state that there are no restrictions on these installations. I stated that there are currently no restrictions on how far these unprotected conductors may be routed without an overcurrent device and that nothing specifically requires them to be physically protected. I still believe that to be true, and if it's not, I'd appreciate it if the panel would reference a section of the Code in the panel statement that indicates where running conductors from batteries with or without overcurrent and physical protection is acceptable.
There has to be some length of conductor from battery terminals to a breaker or set of fuses since the overcurrent protective device cannot be installed directly on the terminals. Mr. Kovacik's comments are unclear to me. Section 480.3 does indeed govern the installation and will continue to do so, and as such, the general requirements of the Code do too. However, I feel like the general requirements of the Code do not cover these conductors well enough. There are many installations today where the battery conductors are being installed in lengths of 50-100 ft, unprotected against short circuits, ground-faults, overcurrent and overloads, and some of them are not adequately protected from physical damage. Not only do I believe this to be unsafe to personnel, but a fire hazard as well.
I appreciate that the panel is concerned that this new text would apply only to industrial installations. That was my intent. The panel doesn't indicate whether they think this is a good idea or a bad idea. In my line of work, I'm only concerned about industrial installations, so if the panel feels the scope needs to be broadened it should have been accepted in principle, accepted in part, or accepted in principle in part and the panel could have added what was needed for other installations.
The reason I feel like 25 ft of conductor is reasonable is I've yet to see a battery installation where you can't install a fusible switch or breaker within 25 ft of the batteries. I'm sure that somewhere it is possible that 25 ft would not be sufficient, but I felt like I had to submit the proposal with a given length. Also, the 25 ft tap rule has existed in the Code for years and apparently has withstood the test of time. I don't know what better substantiation I can provide.
Last, I want to thank the panel for asking the Technical Correlating Committee to assign a task group to this issue. I believe this is something that needs to be addressed this cycle.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action and statement on Comment 10-13. That action meets the intent of the submitter.
The submitter's concern relative to the length limitations is also covered in the action taken on Comment 10-13. A specific length limitation, as proposed by the submitter, would not be appropriate for the full range of storage battery installations.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-13 Log #1846 NEC-P10 **Final Action: Accept in Principle**
(240.21(H) (New))

Submitter: Michael Walls, American Chemistry Council
Comment on Proposal No: 10-33
Recommendation: Accept proposal 10-33 in part in principle, by adding new section 240.21(H) as follows:
(H) Battery Conductors. Conductors connected to storage battery terminals shall be permitted to be protected against overcurrent at a nonhazardous location as near as practical to the battery terminals.
Substantiation: ACC agrees with Mr. Fredericks' explanation of negative vote on proposal 10-33. The panel action was inconsistent in that it asserts the basic rule of 240.21 should apply to battery conductors, while at the same time acknowledging that allowing 25 feet to the first overcurrent device might not be enough for some larger installations.
The proposed text meets the same intent as the panel action and addresses this issue for general installations, while a companion comment proposes new text for Supervised Industrial Installations in 240.92, in accordance with the text provided with Mr. Fredericks' explanation of negative vote.
Panel Meeting Action: Accept in Principle
Revise the recommended wording in the comment to read as follows:
"(H) Battery Conductors. Overcurrent protection shall be permitted to be installed as close as practicable to the storage battery terminals in a non-hazardous location. Installation of the overcurrent protection within a hazardous location shall also be permitted."
Panel Statement: The intent of the submitter has been met. Furthermore, the installation should be consistent with the environment surrounding the overcurrent protective device where due consideration is given to characteristics of DC systems, including the risks caused by the potential of explosion of the batteries, or hazards caused by gases and/or vapors.
Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

10-14 Log #413 NEC-P10 **Final Action: Reject**
(240.24(D))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 10-39
Recommendation: Accept proposal as applied to (E); the designation of (D) was either a misprint or error on my part.
Substantiation: Dormitories in recreational camps, colleges, and penal institutions, without cooking facilities, do not meet the definition of dwelling unit, and are not presently included.
Panel Meeting Action: Reject
Panel Statement: The submitter has presented no substantiation that prohibiting the location of overcurrent devices in dormitories will resolve an issue.

Furthermore, "Dormitory" is not defined in this Code.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-15 Log #267 NEC-P10 **Final Action: Accept in Principle**
(240.24(F))

Submitter: Stanley J. Folz, Morse Electric, Inc.
Comment on Proposal No: 10-40
Recommendation: Text to remain as presented in the ROP.
Substantiation: The Panel action on this proposal should have been to Accept. I am in agreement with the negative comment presented by Mr. Dollard. In addition, the panel statement "refer to CMP 1 for comment and switches are permitted over steps", was unresponsive to the submitter. Switches are not electrical equipment and do not come under the rules of 110.26. 110.26 does a good job of outlining clearances required for electrical equipment except it does not address a panelboard on a stairway, i.e., there is no provision in 110.26 for a level work area. This is one of those common sense things. We all know it's wrong. Let's say it.
Panel Meeting Action: Accept in Principle

Revise the recommended text in Proposal 10-40 to read as follows:

"240.24(F) Not located over Steps. Overcurrent devices shall not be located over steps of a stairway."
Panel Statement: The panel accepts the concept that overcurrent devices should not be installed over the riser sections of stairways. However, many stairways have horizontal landings that could prove suitable for installations where appropriate working space exists. The prohibition of installations over steps of a stairway satisfies the intent of Proposal 10-40 and Comment 10-15.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-16 Log #1099 NEC-P10 **Final Action: Accept in Principle**
(240.24(F))

Submitter: James Dollard, IBEW Local 98
Comment on Proposal No: 10-40
Recommendation: This proposal should be Accepted.
Substantiation: The submitter has identified a serious problem. The negative comments as written to this proposal should be further considered by CMP-10. It is important to note that CMP-1 has rejected proposal 1-115 to 110.26(A)(3). This proposal suggested adding the following text: "Stairs or stair treads shall not be permitted as the grade, floor, or platform as referred to in this section." This proposal was rejected 11 to 1. The panel statement read as follows: "The proposed requirement is restrictive and unnecessary. Qualified persons routinely work from various surface areas and conditions that may be within the workspace. If necessary, the qualified person working on the equipment can create a flat and level workspace. Generally, the height measurement would be from the lowest grade, floor, or platform surface. CMP-1 concludes that the proposal does not contain a clear statement of the problem or substantiation for the change. See the Regulations Governing Committee Projects, sections 4.3.3(b) and (d). "
It is the opinion of CMP-1 that overcurrent devices may be installed in a stairway and that persons maintaining overcurrent devices can "create a flat and level workspace." I disagree.
There is no practical reason to permit, or allude to a perceived permission to allow overcurrent protective devices to be installed in stairways.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action and statement on Comment 10-15.
Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

10-17 Log #1320 NEC-P10 **Final Action: Reject**
(240.30(C) (New))

Submitter: Vincent J. Saporita, Cooper Bussmann
Comment on Proposal No: 10-41
Recommendation: The original proposal has merit and can be improved with a change or two. The panel should accept this proposal when modified as follows:

(C) Marking. Enclosures containing service or feeder circuit overcurrent protective devices shall be field marked with the amount of available short-circuit current.
Substantiation: This modification limits the requirements to enclosures for service and feeder overcurrent protective devices where there is a greater likelihood that there may be a violation of 110.9. In order to meet 110.9, the installer already has to know the available short-circuit current, so why not mark it on the enclosure. It will make the field inspector's job of enforcing 110.9 easier by allowing them to easily compare the marked available short-circuit current with the installed overcurrent device interrupting ratings. This marking will have no affect on the plan check process. That must continue as it has in the past.
Panel Meeting Action: Reject
Panel Statement: The comment has not substantiated that a safety issue is being resolved by requiring such a field marking. The accuracy of the marking after initial inspection and installation may become an issue where systems are changed, particularly in industrial settings. It is advisable to request accurate information on the available fault current before adding equipment, revising a system, or performing any work on the electrical system.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-107 Log #66 NEC-P01 **Final Action: Accept**
(240.35)

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 10-43
Recommendation: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 1 for action in Article 110. This action will be considered by Code-Making Panel 1 as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the direction of the TCC to take action on Proposal 10-43 that was originally sent to CMP-10 as a public proposal. The Panel rejects the proposal for the reasons expressed in the panel Statement on Proposal 1-85 as published in the A2007 ROP. See panel action and statement on Comment 1-57. The panel concludes that proposal 10-43 expands the requirements even further than rejected proposal 1-85, as published in the A2007 ROP, in that it would affect all enclosures containing overcurrent devices.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:

STAUFFER, H.: I support the panel action, but am concerned that the action recorded in the Report on Comments isn't clear. CMP-1 was obligated to accept the direction of the TCC to take action on Proposal 10-43. The panel's action was "accept", but the panel statement explains that CMP-1 rejected Proposal 10-43. I am voting to affirm the panel's action on Public Comment 1-107, and understand that by doing this I am voting to reject Proposal 10-43.

10-18 Log #1510 NEC-P10 **Final Action: Accept**
(240.40(A)(2))

Submitter: Jeffrey Boksiner, Telcordia Technologies, Inc.
Comment on Proposal No: 10-45
Recommendation: Technical Correlating Committee Task Group on the definition of "Neutral Conductor" concurs with the panel action on this proposal.
Substantiation: This comment was developed by the Technical Correlating Committee (TCC) Task Group (TG) on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6). The TCC directed that the action on this proposal be sent to the TG for review and comment.
Panel Meeting Action: Accept
Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

10-19 Log #379 NEC-P10 **Final Action: Reject**
(240.83(C), FPN (New))

Submitter: Robert Zachariason, Minnesota State Community and Technical College
Comment on Proposal No: 10-49
Recommendation: This proposal should have been accepted.
Substantiation: I agree with the proposal as submitted and believe the proposal should have been accepted. Although the NEC is not a maintenance agreement, many short circuits happen during remodeling or the first time a breaker is turned on. Electricians are not aware that a circuit breaker may not operate properly after a fault. Fine print Notes are for information only, and this information is absolutely necessary.
Panel Meeting Action: Reject
Panel Statement: The Code deals with correct installation rules and does not address how to resolve errors made in the installation that may be recognized during the commissioning process. Errors could impact any component in the electrical system. The panel reaffirms its position as stated in its action on Proposal 10-49.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-20 Log #1100 NEC-P10 **Final Action: Accept**
(240.86)

Submitter: James Dollard, IBEW Local 98
Comment on Proposal No: 10-50
Recommendation: Continue to Reject.
Substantiation: As noted in the panel statement, no new information is provided by the submitter. The additional text provided by CMP-10 in their action to develop and accept panel proposal 10-50a, will help to clarify the requirement for the licensed professional engineer.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
KIMBLIN, C.: NEMA opposes the panel action for the reason expressed with Comment 10-21.
KOVACIK, J.: Allowing the determination of acceptable series combinations under engineering supervision is technically counter to the experience and expertise of the manufacturers of the affected downstream products (circuit breakers). It is important for the panel to keep the history of series ratings in mind. Years ago, systems were "engineered" to try to accomplish exactly what is being proposed. Manufacturers learned through field and laboratory experience that the "engineering" methods employed were flawed and could result in problems with the application of products in the field. Since learning of those issues, extensive testing programs under strict third party supervision have been developed to determine appropriate safe combinations of overcurrent devices. That testing program is the only accepted means available to the industry today. The panel is assuming that a "licensed professional engineer" can determine what is needed to engineer a safe system. Circuit breaker manufacturers have licensed engineers that are engaged every day in circuit breaker design and application and those engineers have not been able to establish an acceptable "engineering" method that can consistently and coherently be applied. If an acceptable safe method were available, circuit breaker manufacturers would use it to avoid expensive testing associated with establishing series ratings between circuit breaker combinations and fuse/circuit breaker combinations. The bottom line is that the code panel is allowing a code rule to exist that permits a product to be used in a manner that is directly counter to the instructions issued by the manufacturer and the listing of the product.
We believe that CMP 10 has stepped outside of its scope in allowing engineering supervision as a means of series combination selection to remain. We believe that this attempts to redefine the safety performance of a product in a manner that is above and beyond it's rating, directly counter to the product standard and counter to NEC 110.3(B).

10-21 Log #1417 NEC-P10 **Final Action: Reject**
(240.86)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 10-50
Recommendation: NEMA recommends that Proposal 10-50 be Accepted as written.
Substantiation: By adding text to require the passivity of the downstream circuit breaker, which is one very important component in a calculated series rating, the panel has obviously recognized the challenge of engineering a series rating due to dynamic impedance. However, it must be noted that passivity must not only be demonstrated at the interrupting rating of the downstream circuit breaker but also through the entire amperage range up to the maximum available short circuit current (the series rating). How can an engineer demonstrate such performance? The only method known today in the industry is through testing.
Application information published by a fuse manufacturer states; "An appropriate analysis method has yet to be found for circuit breakers that clear in less than 1/2 cycle. It is possible, but a practical analysis method based on present available circuit breaker data is not yet feasible." This guidance is misleading because clearing is not the issue but rather contact opening. The technical challenge is understanding when the downstream circuit breaker contacts will begin to open, thus introducing dynamic impedance, not when the fault will actually be cleared. Passivity implies that the contacts remain closed until the line-side device clears the fault. Where does an engineer obtain this information?
It is well known that the current flow through a set of contacts will be constricted to a very small area of the contact (Circuit Interruption Theory and Techniques, edited by Thomas E Browne, Jr., Marcel Dekker, 1984, page 582). The current flow near the surface of the contacts results in a repulsion force, known as constriction force, that will attempt to blow the contacts open. Unless the current path in the downstream circuit breaker is of a blow-on design, which the engineer would not likely know, at some current level the contacts will blow open. The question is, will this level be below or above the current limiting level of the upstream overcurrent device?
Circuit breaker manufacturers do not publish the levels at which the contacts of their devices blow open. It may not be possible to even ask the question as the manufacturer may no longer be in business, may not have this information for obsolete designs or may be unwilling to release it for current designs for various legitimate reasons. The only means to understand these values across the amperage range is to test the overcurrent device.
In tested series ratings, the UL 489 standard requires intermediate level testing to determine the level of short circuit current at which only downstream circuit breaker opens and the level at which both devices open. This is to insure that the combination will safely operate at all fault levels. Determining this is not possible to do in the field or by calculations.
In summary, it is not possible with the information available for an engineer to calculate a series rating. The only means to understand if an overcurrent device will remain passive is to understand its characteristics across the entire amperage range. The safety implication of permitting such a rating without any industry supported engineering method places people and property at risk.
Panel Meeting Action: Reject
Panel Statement: In past panel statements, the merits as well as the limits of engineering of series rated systems have been discussed. In no case did the panel infer, state, or suggest that all circuit breakers can be applied in an engineered series rated system.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
KIMBLIN, C.: NEMA agrees that the additional wording in 240.86(A) dealing with circuit breaker passivity is a necessary caution for the application of engineered series ratings. However, NEMA considers the example, Comment 10-23, of an attempted engineered series rating by the engineering community as demonstrating that a series rating cannot be engineered. In fact, the only reason that the safety of the system was preserved, in this case, was due to "tested combinations". Without testing the combination in the equipment, it would not have been recognized that the integrity of the system would have been placed in jeopardy. NEMA reaffirms its position that testing is the only method to ensure the integrity of a series rating within an electrical system.
KOVACIK, J.: See my explanation of negative vote on Comment 10-20.

10-22 Log #348 NEC-P10 **Final Action: Accept in Principle**
(240.86(A))

Submitter: Code-Making Panel 1,
Comment on Proposal No: 10-52
Recommendation: CMP-1 agrees that markings are required for Engineered Series Combination systems (240.86(A)). However, the specifics of the marking should appear in 110.22 that already contains marking requirements for Tested Combinations (240.86(B)). CMP-1 has accepted Proposal 1-98 that deals with these added requirements in 110.22. CMP-1 considers that Proposal 1-98 meets the intent of 10-52 relative to specific markings associated with 240.86(A), however, CMP-1 also believes specific revisions need to be made to accepted Proposal 1-98 and to the accepted text of Proposal 10-52. For 240.86, it is suggested that a fine print note be added to 240.86 as follows:
FPN: See 110.22 for marking requirements for Series Combination Systems.
For 110.22, CMP-1 will submit a comment on Proposal 1-98, Section 110.22, that will divide the section into an (A), (B), (C) paragraph style section titled "110.22 Identification of Disconnecting Means," with the following subtitles "(A) General"; "(B) Engineered Series Combination Systems," and "(C) Tested Series Combination Systems." This revision is intended to separate and clarify the three main requirements in 110.22. In addition, both FPNs are being proposed for revision as follows:
Under subsection (B) - "FPN: See 240.86(A) for requirements for Engineered

Series Combination Systems." and under subsection (C) - "FPN: See 240.86(B) for requirements for Tested Series Combination Systems."

Substantiation: This comment was developed by a Task Group of CMP-1 members to address actions taken by CMP-10 on Proposal 10-52, which was referred to CMP-1 by CMP-10. Members of the Task group included Louis Barrios, Jr.; Kenneth Boyce; Mark Christian; Neil LaBrake; Lanny McMahill; Gill Moniz; and John Minick. Identification requirements for disconnecting means have been identified with 110.22 since the 1965 NEC edition and marking requirements for series combination systems have been associated with 110.22 since the 1990 NEC when such requirements for series combination systems first appeared. CMP-1 and CMP-10 both received similar proposals for marking requirements for Engineered Series Combination Systems that first appeared in the 2005 NEC edition. It is CMP-1's opinion that marking requirements for Series Combination Systems should remain in 110.22 and that technical requirements and descriptions of Series Combination Systems should remain in 240.86. In addition, such marking requirements for Series Combination Systems should not be separated into completely different NEC articles, as would be the case for the 2008 NEC if Proposal 10-52 is accepted by CMP-10.

This comment was balloted through CMP-1 with the following final ballot results:

12 Eligible to Vote
11 Affirmative
1 Not Returned (L. Barrios, Jr.)

Mr. P. Hickman voted affirmatively stating: "We are in general agreement with the content of the proposal including dividing the section into (A), (B), and (C). However, we feel the use of the word "requirements" is in violation of 3.1.3 of the NEC Style Manual.

Panel Meeting Action: Accept in Principle

Revise the first fine print note to read as follows:

"FPN: See 110.22 for marking of Series Combination Systems."

In the fine print notes in 110.22(B) and (C), remove the words " for requirements".

Panel Statement: The wording has been revised to comply with the NEC Style Manual.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

10-23 Log #886 NEC-P10 **Final Action: Reject**
(240.86(A))

Submitter: Ed Larsen, Square D Company

Comment on Proposal No: 10-50

Recommendation: The Panel should accept Proposal 10-50 to delete 240.86(A).

Substantiation: The present language in 240.86(A) permits the engineering of series ratings that may leave the electrical system unprotected. The Panel has wrestled with this topic for a number of cycles with the supporting discussion at the Panel meeting indicating "it has been done for years and there is no issue, please show me an example of where an engineered system has failed." The false assumption behind this argument is that there is no "real world" data to back this position. There is no operational data on the engineered overcurrent device systems that would support that they operate appropriately when called upon to perform. However, there is now a "real world" example of the electrical industry working together in a failed attempt to engineer a series rating.

The following is a "real world" example of why series ratings cannot be engineered in the field. The only reason this unsafe engineered series rated system is not in use today is because the design was tested before it was installed.

In early 2005, a developer in Seattle planned to add a second apartment building adjacent to an existing building already owned by the developer. The service entrance in the existing building is a bolted pressure switch with 1400A Class L fuses feeding group metering. The tenant main circuit breakers in the NEMA 1 meter centers are 100A 2-pole circuit breakers rated 42kAIR and the branch circuit breakers in the residential tenant load centers are rated 10kAIR.

A licensed professional engineer engaged primarily in the design of electrical installations was hired to design the electrical system for the new building. Originally, it was planned to use a new transformer located in the fault in the existing building to feed both buildings. The existing transformer is a 75kVA 26.4kV/208V unit. The proposed new design would have replaced this transformer with three 167.5 kVA 265.4kV/208V units. Replacing the existing transformer would have increased the available SCA from 47kA to 93kA per Seattle City Light. The fuse manufacturer stated that there was not a UL listed 100/42kA series rating with the existing tenant main circuit breakers, thus the desire to engineer a series rating for the circuit breakers in the original building.

With the 1400A fuses in the bolted pressure switch, the fuse manufacturer stated that the "up-over-down" method indicated the tenant main circuit breakers would be adequately protected as the let-through current would be 34kA at a perspective available SCA of 93kA. A flow chart from a second consulting engineer suggested that if the circuit breakers were not of a "blow-open" design, then a series rating could be engineered using the up-over-down method. The technical literature published by another fuse manufacturer confirmed this. A check with the circuit breaker manufacturer indicated that these circuit breakers had a "conventional" current path construction, not a "blow-open" design.

A short circuit study indicated that any panels located 40 feet or more from the meter center would have 10kA or less available, thus they would be fully rated. The plan was to replace any panel located less than 40 feet from the meter center with 22 kAIR fully rated circuit breakers. There were no interrupting rating issues with the equipment feeding the retail spaces in the original building.

The AHJ approved the plan in writing, indicating that documentation stamped by a licensed professional engineer in the State of Washington would be required, anticipating adoption of the 2005 NEC in Washington later in the year.

At the suggestion of the consulting engineer, the property owner engaged the services of the second consulting engineer previously referenced to help evaluate the proposed engineered series rating. In order to confirm the validity of the rating, the fuse manufacturer was requested to conduct a test in their lab. The test was not witnessed by UL but did follow the UL 489 series rating test procedure.

In actuality, five individual tests were conducted. Tests #1 and 2 were conducted at 100 kA at 240V single phase with a 1400A Class L fuse of the same type installed in the original building upstream and a 100A 2-pole 42kAIR circuit breaker of the same type installed in the original building downstream. The circuit breaker cases ruptured during these tests. The observed let-through current in both tests was 25kA.

Since Tests #1 and 2 were run at 240V and the service is act ually 208V, a third test was conducted to see if the lower voltage would improve the results. Test #3 was conducted at 93kA at 208V single phase with a more current limiting 1400A Class L fuse upstream and a 100A 2-pole 42kAIR circuit breaker of the same type installed in the original building downstream, housed in a NEMA 3R enclosure. After the test the circuit breaker could not be reset and the enclosure cover was bent.

At this point, use of Class T fuses was considered, however, Class T fuses could not be installed in the existing bolted pressure switch and are not available above 1200A, thus this was not an available option.

A new short circuit study was conducted to take into account the impedance of the utility's conductors within their vault, indicating that there would be only 77 kSCA available at the bolted pressure switch. With this new information, Test #4 was conducted using the same fuse and circuit breaker as in Test #3, except at 80kA 208V. Once again the circuit breaker failed.

Finally, Test #5 was conducted at 80kA at 208V single phase with the same 1400A Class L fuse upstream as was used in Test #3-4, except a 100A 2-pole 65kAIR circuit breaker from a different manufacturer was used downstream. This circuit breaker also failed during the test.

Increasing the length of the service conductors by 140 feet by wrapping them around the vault was considered as this would have reduced the available SCA below 42kA but this approach was unacceptable to Seattle City Light. The final solution was to build a vault in the new building to house a transformer to feed just the new building.

In his final letter to the City of Seattle Department of Planning and Development, the engineer stated, "The conclusion I have reached is that relying on the "up-over-down" let-through curves to determine the available fault current to downstream devices is not reliable, and if this method is used, I strongly suggest that the combination be tested." The engineer considers it fortunate that the developer was willing to pay for the short circuit testing, even though it is not required by 240.86(A), otherwise a potentially hazardous condition would have been created.

The last question that remains is the passivity of the downstream circuit breaker. There is no literature or technical documentation that discusses or explains how to ensure a device is passive. These engineers did not understand that impact of the dynamic operating characteristics of the circuit breaker, and even if they did, where would they have obtained that information? And how is an engineer supposed to address the equipment impact, such as the failure point of the bus structure or the enclosure as demonstrated in this example? Safety is being compromised in 240.86(A).

In summary, a few key points are apparent with this new information:

1) Two consulting engineers and a fuse manufacturer were involved in attempting to engineer a series rating with the circuit breakers in an existing building in accordance with 240.86(A).

2) Technical literature from two fuse manufacturers supported the failed engineering method used for this series rating.

3) Five series rating tests were conducted in the fuse manufacturer's short circuit test laboratory in accordance with the UL 489 test procedure. All five tests failed.

4) It should also be noted that the equipment enclosure was damaged as well, which is entirely ignored in the NEC, and there is no technical method

to address the impact of the higher current levels on the equipment without testing.

5) The service design was revised to ensure that appropriate NEC compliant ratings existed without utilizing the failed engineered series rating method.

This experience confirms that series ratings are being engineered in the field that comply with the NEC but result in unacceptable electrical hazards. This is the only supporting data that has been presented to the panel indicating the practical (or impractical in this case) validity of an engineered series rating. The panel has never been presented data that supports that engineered series ratings safely protect electrical systems, only that they are in place in electrical systems and that documents exist supporting such practice. 240.86(A) must be deleted to preserve safe electrical installations.

Panel Meeting Action: Reject

Panel Statement: The submitter's example is a verification that the existing Code text is appropriate (see Proposal 10-50a). In past panel statements, the merits as well as the limits of engineering of series rated systems have been discussed. In no case did the panel infer, state, or suggest that all circuit breakers can be applied in an engineered series rated system.

The statement that the up-over-and-down method used to determine available fault current is incorrect. Both fuse and circuit breaker let-through curves are accurate for determining let-through currents for comparison with all protective devices that are passive during the operating time of the current-limiting device.

10-25 Log #1659 NEC-P10 **Final Action: Reject**
(240.87)

Submitter: Paul A. Keleher, Paul Keleher Electrical Services

Comment on Proposal No: 10-55

Recommendation: The Submitter asks the CMP to Accept-in-Principle the following Recommended Committee Action Text in lieu of originally submitted text.

Attached as supporting documentation is Recommended Committee Action Text for the proposed revision to UL 489, and substantiation for changes to the text.

NEC Section/Paragraph: Article 240.2.) Add new definition to **240.2**

Defined Instantaneous Trip (DIT) Circuit Breaker. A circuit breaker that opens within 1 cycle of being subjected to an overcurrent equal to 11 times its rated current or greater.

Revise 240.87 as follows:

240.87 Circuit Breakers Installed in Dwelling Units. 120/240-volt circuit breakers rated 50 amperes or less installed in dwelling units to meet the requirements of 210.20 shall be of the DIT type.

Exception No. 1: Use of non-DIT type circuit breakers in compliance with 240.4 shall be permissible at the discretion of the AHJ on circuits serving loads with high inrush current or motor starting loads where a DIT breaker can be shown to nuisance trip.

Exception No. 2: Where 240.3 or 240.4(G) applies.

Add new marking requirement (F) to read as follows:

240.83(F) Circuit breakers installed in accordance with 240.87 shall be marked with the letters "DIT" in accordance with 240.83(A).

Substantiation: Explanation:

A new definition in 240.2 defines a threshold current level at which an overcurrent on a 120/240-volt branch circuit is recognized by the circuit breaker installed per 210.20 as a fault condition as opposed to an overload condition. The threshold current level is specified as that level of overcurrent equal to 11 times the current rating of the circuit breaker or greater for engagement of a response mechanism that will open the circuit within1-cycle. A circuit breaker that meets these response requirements shall be known as a DIT circuit breaker. Proposed revision text for UL 489 specifying the additional tests required in Section 7 accompanies this proposal as a substantiating document. A new article 240.87 will limit the installation requirements of DIT breakers to dwelling units, with exceptions for certain hi-inrush loads, specific conductor applications and where other overcurrent protection articles apply. A labeling requirement will permit easy identification and differentiation from non-DIT breakers after installation.

CMP-10 REJECTION STATEMENT:

"The panel understands that the submitter's intent is to limit the energy delivered from a fault condition "that is capable of causing ignition" to the greatest extent possible in order to mitigate the risk of fire. The "DIT" concept was presented to the NEC during the development of the 1996 NEC and it was determined that such protection and technology would not provide the level of protection necessary. This is recognized by the submitter's substantiation that protection would be "the greatest extent possible". At that time the panel also took into consideration the UL Fact Finding Report E878837. The Arc-Fault Interrupter technology was accepted as an answer to address the protection sought from the 1993 proposal and is a technology that will more comprehensively address the concern of the submitter."

4.) **Substantiation for 240.87**:

Evidence exists that the level of nuisance tripping occurrences in the residential environment with magnetic trip settings at 11 times rated current is acceptable since at least two of the 5 major product lines have maintained this level for many years. The exceptions allow for practical considerations of specific circumstances of installation already recognized by the Code to continue to be recognized, and for exception to be made for specific appliances with exceptionally high inrush current. It should be noted 240.87 is intended to include ALL 120/240 circuit breakers rated 50A or less installed in dwelling units are included in the requirement, including AFCI and GFCI circuit breakers.

4.) **Substantiation for 240.83(F)**:

This labeling requirement will permit easy recognition after installation of a standard circuit breaker that meets the DIT performance requirement from one that does not.

4.) **Substantiation for 240.2 New Definition:**

By adding 250.4(A)(5) to the NEC in 2005, CMP-2 makes it clear that rapid response to ground-fault conditions is so important that the purpose of an Equipment Grounding Conductor (EGC) and the necessity for a low-impedance pathway to assure rapid breaker response are explained right in the article, not in a Fine Print Note customarily used for explanatory material. The submitter understands that the intention of 250.4(A)(5) is to trigger an instantaneous trip in a circuit breaker in the event of a ground-fault.

All standard circuit breakers of the type installed in dwelling units contain dual modes of operation: an instantaneous trip (typically called its magnetic response) is intended to provide an instantaneous trip (per the definition of a circuit breaker in Article 100) to the relatively high overcurrent that may be caused by a circuit damage condition, such as a short-circuit or ground-fault, and a thermal mechanism that is expected to provide an inverse-time response (per the same definition) to the relatively lower overcurrent conditions created by excessive appliance loads. A breaker responds to an overcurrent in thermal mode until the level of overcurrent rises to a level known as its "magnetic pick-up setting", at which point the magnetic response of the circuit breaker is triggered, and the breaker trips instantaneously ending any delay in response created by the inverse-time function.

Section 7 of UL 489, to which standard circuit breakers are listed, requires no timed response tests to the levels of fault current typically available at outlets on 15 or 20 Amp/120-volt branch circuits, typically between 100 and 1000 amperes. The magnetic trip threshold setting in a standard circuit breaker is a fixed current value determined at the discretion of each breaker manufacturer that determines how much fault current is required to trigger the magnetic response of the breaker. According to manufacturer's currently published trip curves, which are illustrated in a chart accompanying this comment, the magnetic trip in Product B in the chart will trigger with a minimum threshold current of 120 amps of fault current, while Product E may require 600 amps to trigger a magnetic response.

Despite an EGC installed in full compliance with Article 250, the intent of 250.4(A)(5) will not be met at any outlet where the available fault current is less than the threshold current setting required to trigger the magnetic trip of the circuit breaker protecting the outlet. All such outlets will never be protected by an instantaneous response; protection will be thermal (inverse-time) only. Depending on the fault current available at the outlet, an inverse-time response may take several seconds. Test data recently gathered from short-circuit tests conducted at 120-volt receptacle outlets in residences indicate several relevant characteristics:

·Just within the 1000 test sample, thermal (inverse-time) responses ranged as high as 3 seconds in response to a short-circuit current of 120 amperes. It must be noted here that if an uncontrolled short-circuit or ground-fault of 120 amperes is permitted 3 seconds to either heat up or arc, fire can ignite.

·The available fault current at 75% of the outlets tested is less than 300 Amps, which is insufficient to trigger the magnetic response in 1 manufacturer's 15 amp breakers according to current manufacturers' time/current curves.

·v% of all outlets tested were protected by a thermal-only breaker response

because the magnetic (instantaneous trip) function was ineffective in response to a short-circuit at the outlet tested.

For the intention of 250.4(A)(5) to be met consistently, both a low-impedance ground path and a predictable circuit breaker response to fault current are required. In the submitter's view, a thermal response by a circuit breaker to a ground-fault condition constitutes failure of an installation to fulfill the intent of 250.4(A)(5).

Such failures impact all users of the NEC who rely on the circuit breakers they install to protect installations from liabilities that may result from accidental ground-fault occurrences. CMP-10 must address this lack of coordination between product and installation requirements to ensure that the intention of 250.4(A)(5) is met. This proposal achieves that goal for the majority of outlets (65% in the test sample) by standardizing the magnetic response threshold current setting at 11-times handle-rating.

Presently, 4 of 5 major product lines are at or close to the proposed threshold requirement; one intent of this proposal is to ensure the user community that all circuit breakers installed in dwellings provide equivalent magnetic pick-up settings in response to branch circuit level overcurrent, and that these responses cannot be elevated above the proposed minimum requirement at some time in the future.

For outlets whose available fault current is below the threshold proposed, this submitter plans a follow-up proposal in the 2011 NEC revision cycle to limit impedance at the furthest outlet on a circuit to assure sufficient available fault to trigger a standardized instantaneous trip and meet the intent of 250.4(A)(5) at all installed outlets.

In its rejection, the CMP stated, "The panel understands that the submitter's intent is to limit the energy delivered from a fault condition … to mitigate the risk of fire." The CMP underestimates the submitter's intent, which is not only to reduce the risk of fire, but to reduce other risks inherent with fault level overcurrent as well such as (1) reduce damage to wire, circuit and equipment components and appliances that may be subjected to unnecessarily prolonged fault current from a thermal breaker response, (2) reduce risk of electrocution or exposure to arcing fault current that may be exposed to the exterior of an outlet or appliance, and (3) to assure that the intent of other NEC articles requiring rapid response to fault current from an OCPD are met, as discussed above. Indeed, given its mandate to maximize the safety of installations, the submitter challenges the CMP to provide any rationale whatsoever for permitting fault-level overcurrent to remain in any circuit longer than necessary.

The Panel also stated, "The 'DIT 'concept was presented to the NEC during the development of the 1996 NEC and it was determined that such protection and technology would not provide the level of protection necessary. This is recognized by the submitter's substantiation that protection would be 'the greatest extent possible.'…The Arc-Fault Interrupter technology was accepted as an answer to address the protection sought from the 1993 proposal." These statements make it clear that the CMP is confusing the purpose of overcurrent protection with that of circuit fault detection and monitoring technologies (such as AFCI and GFCI). The former is to mitigate the known hazards associated with fault-level overcurrent by all practical and effective means, while the latter is specifically designed to prevent fire, unrelated to current level. It is not appropriate to consider AFCI as "preferable" to DIT breaker response because they each address different hazards. The CMP is comparing apples to oranges. Proposal 10-55 should be seen as complementary to AFCI protection not as an alternative to it. The submitter respectfully cannot accept the Panel's statement that AFCI "is a technology that will more comprehensively address the concern of the submitter."

The submitter believes the reason why the CMP has determined that standardizing magnetic pick-up response thresholds "would not provide the level of protection necessary", is because an arc can develop sufficient resistance to cause the current level of a parallel arcing fault to fall below any acceptable magnetic response setting, causing a DIT circuit breaker to clear an arcing fault in thermal mode, and therefore to be ineffective in preventing fire. What limited fire research there is does indicate that non-arcing faults (called "glowing" connections) can ignite nearby combustibles before producing an arc. Unless and until an aggravated fault degenerates into a sustained and unrecognized arcing condition before it causes adjacent combustibles to begin smoldering, a listed AFCI responds exactly as a standard circuit breaker. It may be that in some cases ignition from a fault condition that does not arc, but may produce sufficient heat to ignite a fire if a thermal breaker response allows fault current to linger, could be averted by a magnetic breaker response clearing the fault current before heat has time to build up or degenerate into an arc.

Finally, the submitter asks the CMP, how it can continue to assert that a technology (AFCI) that is inherently incapable of detecting hazardous fault conditions that do not produce an arc, and 8 years after introduction still does not deliver the protection originally promised, "provide the level of protection necessary" and "address the concern of the submitter"?

Given all of the above arguments, the submitter respectfully requests the CMP to consider an ACCEPT-IN-PRINCIPLE vote to proposal 10-55 as a practical and inexpensive measure to satisfy other requirements of the Code, and improve overcurrent protection, in addition to pursuing the potential benefit of circuit monitoring technologies. It is a no-cost proposal that will improve branch circuit fault protection, which may save lives and improve safety.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The panel statement on Proposal 10-55 that appears in the ROP remains appropriate. Further, the requirements for North American circuit breakers appear in Safety Standard UL 489, "Molded-Case Circuit Breakers, Molded-Case Switches and Circuit-Breaker Enclosures". It is noted that, at the March 16, 2006, meeting of the UL 489 STP (Standards Technical Panel), the commenter made a presentation relative to a possible new supplement for UL 489 dealing with molded-case circuit breakers having specified instantaneous trip levels. Any change to circuit breaker test requirements could continue to be addressed to the UL 489 STP.

10-29 Log #1418 NEC-P10 **Final Action: Reject**
(240.91)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 10-56
Recommendation: The Proposal should be Rejected.
Substantiation: The proposal substantiation states that conductors in Supervised Industrial Installations are protected against overload by load calculation and by monitoring, and against short circuit by selection of the overcurrent device as part of an overcurrent coordination study. Presumably this statement refers to Transformer Secondary Conductors of Separately Derived Systems [240.92(B)] where short-circuit and ground-fault protection can be calculated [240.92(C)] and where overload protection can also be calculated [240.92(C)]. The proposal, however, deals with general overcurrent protection in Supervised Industrial Installations, and here conductors are protected under the rules of Article 240.4 rather than by calculation. The proposed change is the relaxation of a safety rule that has been in place for over 40 years and NEMA does not accept the substantiation statement that (1) conductors in Supervised Industrial Installations are (always) protected against overload by load calculation and monitoring and that (2) the factors associated with Supervised Industrial Installations make overload protection by the overcurrent device selection less critical. No testing has been performed to show that a 95 percent ampacity rule permits the safe application of lower ampacity conductors for all currents above 800A. Here it is noted that loading a conductor to 5 percent above rated conductor ampacity will increase the heating load by 10 percent. But, products such as circuit breakers and switches are evaluated with conductors of the correct ampacity. One reason is to determine acceptable temperature rises at device terminals. However, the substantiation does not address the product impact of these additional heating effects due to smaller conductors. No substantiation has been provided to demonstrate integrity of the conductors during normal operation or when the overcurrent device is called upon to operate. In addition, no substantiation has been presented to demonstrate that the integrity of the terminals (circuit breakers, fused switches, etc.) will be retained for the proposed reduction in conductor area. Since manufacturers themselves are unable to supply thermal and mechanical data without specific tests, it is difficult to understand how engineers in supervised industrial installations will be able to make these assessments.
This proposal removes numerous safety principles that ensure the safe performance of overcurrent device, conductors and equipment during overload. These reservations are also reflected in the negative comment of John Kovacik of UL, who states that, at the very least, a study should be conducted to demonstrate that conductors and equipment would not sustain damage from the currents permitted by this proposal. Finally it is noted that a similar Proposal, 10-9, dealt with a relaxation of ampacity requirements to 1600A. That proposal was rejected, and the panel statement reflects the panels' reservations. The safety concerns expressed in that 10-9 panel statement are not resolved by permitting relaxed ampacity protection requirements in Supervised Industrial Installations.
Panel Meeting Action: Reject
Panel Statement: As commented in the substantiation for Proposal 10-56, it is a common practice in supervised industrial installations to monitor conductors for overload and/or to design such that conductors cannot be overloaded in normal conditions. Where conductors are monitored for overload, action of the overcurrent device is not needed to protect the conductors against overheating by an overload condition. This principle is already recognized in 240.12 of the general Code text.
The commenter also did not acknowledge that higher percentage overloads without monitoring are permitted below 800 amps for general installations by existing Code text.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 3
Explanation of Negative:
KIMBLIN, C.: The panel statement reads that it is common practice, in supervised industrial installations, to monitor conductors for overload and/or to design such that conductors cannot be overloaded in normal conditions. But common practice is different from stating that all conductors in supervised industrial installations are monitored or protected in this manner. The code wording in 240.92 is intended to cover all Supervised Industrial Installations. However, the words "common practice" acknowledge that, in many cases, the additional monitoring and/or design will not be present. In those cases, the conductors will not be fully protected against overload. Proposal 10-56 should be rejected because it will permit conductor protection above their ampacity for all currents above 800A. This will also impact the performance of electrical equipment negatively. Thus, the panel continues to take a position that equipment can be used outside the permitted listing safety standard requirements of the equipment. But there is no method to determine the safe use of electrical equipment outside the listing parameters. Only the manufacturer understands the performance of the components within the equipment such as the fuse clip, blade hinge, lubricant, terminals, and plating. The interaction of multiple overcurrent devices within equipment further complicates any attempt to reduce the conductor size and not impact adjacent components. Consider a fusible switchboard with not only devices over 800A, but also those 800A and below. The increase in heat from smaller conductors will not only increase the heat on devices over 800A, but the additional heat will also impact the integrity of neighboring devices 800A or less.
It is foreseeable that a revision to the UL Product Standards to reduce conductor sizes during testing will drive either a derating of present product designs (1200A fuse switch possibly becoming a 1000A switch) or a redesign of products could drive a larger footprint with more copper within the equipment to compensate for the thermal impact of this change. Any short-term savings in wire size will likely be offset by an increase in equipment size and costs in the near future, not only for supervised installations but for all electrical installations.
There has been no substantiation presented that this has or can be accomplished in a safe manner. This change, presumably based on theory, is likely to impact the entire industry by increasing the cost of equipment and by possibly driving larger equipment. These could increase the size of the equipment rooms or reduce working space to NEC minimums.
Lastly, the panel did not address the questions and technical concerns presented in Comment 10-30. Failure to address these concerns places the manufacturer in the unfortunate position of having an NEC requirement that is in direct conflict with NEC 110.3(B).
KOVACIK, J.: The issue here is virtually identical to that raised in Proposal 10-9, which the Panel rejected. Specifically, quoting from the Panel Statement on Proposal 10-9, "It is noted that the amount of heat generated in a conductor increases as the square of the current through that conductor, and the characteristics of overcurrent devices are such that overloads are tolerated for significant periods of time before the device operates. At the very least, a study should be conducted to demonstrate that the conductors and equipment would not sustain damage from carrying the current permitted by this proposal.
SOBEL, R.: I agree with the submitter's substantiation and believe Proposal 10-56 should be a reject. Furthermore, the devices are not tested and listed with smaller conductors. See the substantiation for Comment 10-30.

10-30 Log #2335 NEC-P10 **Final Action: Reject**
(240.91)

Submitter: Alan Manche, Square D Company
Comment on Proposal No: 10-56
Recommendation: Reject this Proposal.
Substantiation: The panel has been consistent in their position and their statement with regard to this proposed text as repeated below:
"There has been no further substantiation presented in this proposal to address the concerns and issues raised by the panel in previous NEC development cycles. There are no specially listed devices that satisfy the proposed 240.4(C)(4), and the impact on the equipment in which these devices are to be used has not been considered."
"A study should be conducted to demonstrate that the conductors and equipment would not sustain damage from carrying the current permitted by this proposal. For example, the proposer could approach UL through their open Standards Technical Panel process to address the listing requirements."
The panel provided no statement that would support an understanding of how a Supervised Engineering Installation can resolve the issue raised. The panel has also been focused on a single overcurrent device, and has not considered how does this impact adjacent overcurrent devices, the equipment which not only includes the lugs but the insulating materials, impact on the switch blades in a fused switch to perform at elevated temperatures adjacent to other overcurrent device wired in a similar matter. What is the impact in an MCC, Switchboard, panelboard, or even a busway plug-in unit? As a registered Professional Engineer and formerly being an electrical facilities engineer for a large automotive facility, based on my experience in this environment I do not understand why Panel 10 would support product being utilized outside it's listing parameters. The product is no longer listed for this purpose and the safety mark and other ratings on the product are being used outside the ratings and markings. Is it the intent of Code Panel 10 to permit the use products outside the parameters of their listing? Does the panel truly believe an engineer has all of the knowledge to substitute for the performance evaluation that

is conducted by a staff of design engineers from the manufacturer and UL engineers? Reject this proposal.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Comment 10-29.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 3
Explanation of Negative:
KIMBLIN, C.: NEMA opposes the panel action for the reason expressed with Comment 10-29.
KOVACIK, J.: See negative ballot and substantiation on Comment 10-29.
SOBEL, R.: I agree with the submitter's substantiation.

10-31 Log #941 NEC-P10 **Final Action: Reject**
(240.92(B))

Submitter: Robert G. Fahey, City of Evansville
Comment on Proposal No: 10-21
Recommendation: Revise text to read as follows:
(B) Feeder Taps. For feeder taps specified in 240.21(B)(2), (B)(3), and (B)(4), the tap conductors shall be permitted to be sized in accordance with Table 240.92(B) when the calculation is performed by a licensed professional engineer engaged primarily in the design or maintenance of electrical installations. The selection shall be documented and stamped by the professional engineer. This documentation shall be available to those authorized to design, install, inspect, maintain, and operate the system.
Substantiation: The new calculation which the CMP approved should only be allowed when the calculations are performed by an engineer who is familiar with the electrical installation at the supervised industrial location. With the additional language, it will clearly require an engineer to perform the calculation and with this requirement, it will help the electrical inspector be assured the wire is, in fact, protected properly. The additional wording is taken from 240.86(A) for series rated systems. My other concern is that this installation will continue to be safe after the initial installation, will other types of overcurrent devices be installed in the future which will change the characteristics of the circuit, thus having a negative impact on the tap conductor.
Panel Meeting Action: Reject
Panel Statement: The determinations needed to correctly apply this rule are well within the capabilities already required for a supervised industrial installation in 240.2, which requires conditions of engineering supervision among other qualifications.
The calculations referenced are simple and are performed daily by engineers and engineering designers.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
KIMBLIN, C.: NEMA votes affirmatively on the panel action but disagrees with the panel statement. See NEMA reason for its negative vote with Comment 10-32.

10-32 Log #1419 NEC-P10 **Final Action: Reject**
(240.92(B) (New))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 10-21
Recommendation: The Proposal should be Rejected.
Substantiation: These proposed changes to the tap rules, even for supervised industrial installations, can reduce electrical safety. NEMA also disagrees with the panel statement that these relaxed rules increase the enforceability of the tap rules. There is no "trigger" to indicate when the replacement of an overcurrent device may be placing not only the conductor protection at risk, but also the facility and the electrical maintenance personnel working around these "protected" conductors. Industry currently assumes that you can replace an overcurrent device with a comparable rated overcurrent device and the conductors will continue to be protected. In order to assure electrical safety, industry must now assume that all conductor sizes are being based on temperature calculations before replacing overcurrent devices.
The submitter indicates the value of this proposal is in providing a "significant cost savings for electrical distribution systems, allowing North American manufacturers to be more competitive in the global marketplace." The submitter only considers the initial installation and not the electrical safety and down time over the life of the system which has significant implications. All overcurrent device replacements must now be confirmed against ALL load side conductor sizes to understand if a tap conductor calculation has been applied during the initial installation before replacement and energizing can take place.
These proposed tap rules require an in-depth knowledge of the overcurrent device characteristics. Once again, this information is required not only during initial system installation, but throughout the maintenance life of the system to ensure either an identical overcurrent device replacement or reengineering of the system and possible replacement of the conductors to ensure appropriate protection is maintained.
The action of the panel to reject the inclusion of this proposal as part of the general tap rules in 240.21 indicates a safety issue does exist, however, the panel does not explain what safety issues are resolved by restricting to a supervised industrial location. How does the panel action enhance enforceability? It simply removes the need for enforcement from many electrical installations.
What enforceability exists to recheck the tap conductors when the available fault current changes serving the facility? An increase in the available fault current by a utility may be well within the maximum short circuit current rating of the service equipment, however, the tap conductor protection may have been calculated based on the previous available fault current. Is a utility notification process necessary to ensure electrical safety when these calculations are utilized within a facility?
The submitter further claims these rules are used around the world. There has been no substantiation presented, even with the claim of other world market acceptance, which support the work practices that would be necessary to ensure the safety of this installation over the life of the facility. Making this change requires careful consideration as this change will impact work practices and the safety of facilities and personnel.
Panel Meeting Action: Reject
Panel Statement: The determinations needed to correctly apply this rule are well within the capabilities required for a supervised industrial installation, which requires conditions of engineering supervision among other qualifications.
The calculations referenced are simple and are performed daily by engineers and engineering designers and do not require any detailed knowledge of overcurrent device characteristics, only standard curves and data that are available on every manufacturer's website.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
KIMBLIN, C.: Overcurrent protection rules in the NEC need to be uniformly applied across all applications and for the life of the facility. This revision for industrial supervised installations creates a significant anomaly to that uniformity. the expectation that the system is controlled enough to be able to have such exacting requirements for tap-conductor protection is a flawed expectation. the calculations would have to be performed not only during initial installation, but also for subsequent system upgrades due to higher available fault currents from the utility. In particular, the characteristics of the overcurrent protective device have to be taken into account, both during initial installation and during possible subsequent replacement.
Further, it is unclear whether the tap conductor sizing calculation would be based on the calculated available fault current or on the fault current rating of the overcurrent protective device. If the sizing calculation were based on the actual available fault current level, then available fault current changes due to fluctuations in utility parameters may establish unprotected conductors in the facility's electrical system. it would be necessary for the utility to notify the facility of such parameter changes. However, based on the present challenges in establishing the appropriate values for performing calculations for use in determining the level of PPE for NFPA 70E, utilities are not presently in a position to provide actual values of available fault current.
The present tap rules have served well in a large variety of installations and they are consistent with the engineering and long-term maintenance approaches taken in installations including supervised industrial installations. It is noted that a similar proposal (11-45) for determining the characteristics of tap conductors under engineering supervision was rejected by CMP-11 at the proposal stage with a reaffirming position in the comment stage on Comment 11-15.
KOVACIK, J.: No technical substantiation has been provided to support the proposed relaxation of the rules for determining the ampacity of tap conductors. Restricting this relaxation to supervised installations does not insure that all safety issues associated with conductors carrying currents higher than normally allowed will be resolved. The proposed formulas seem complex and onerous, and are better suited for a design manual than the NEC.

10-33 Log #1850 NEC-P10 **Final Action: Reject**
(240.92(E) (New))

Submitter: Michael Walls, American Chemistry Council
Comment on Proposal No: 10-33
Recommendation: Accept proposal 10-33 in part in principle, by adding new section 240.92(E) as follows:
(E) Battery Conductors. Each set of battery conductors feeding separate loads shall be permitted to be connected to storage batteries, without overcurrent protection at the battery, as specified in 240.92 (E)(1) or 240.92(E)(2).
(1) Battery Conductors. Conductors from battery terminals shall be permitted to be protected from overload where the following conditions are met:
(1) The battery conductors are protected from physical damage by being enclosed in an approved raceway or by other approved means from the battery terminals to the overcurrent device. The positive and negative conductors may be enclosed in separate non-magnetic raceways.
(2) The ampacity of the battery conductors is not less than the design load

and is also not less than the 60-minute rated discharge current of the storage batteries.

(3) Where multiple overcurrent devices are used, all overcurrent devices are grouped, and the number of overcurrent devices does not exceed six circuit breakers or six sets of fuses

(4) The sum of the ratings of the overcurrent devices does not exceed the ampacity of the battery conductors.

(2) Battery Conductors From Chargers. Conductors from the battery charger to the batteries shall be protected from physical damage by being enclosed in an approved raceway or by other approved means. The conductors shall be protected by an overcurrent device rated not more than the ampacity of the conductors. The overcurrent device may be an integral part of the battery charger.

FPN: In some instances, the conductors from the batteries to the overcurrent device are the same conductors as those connected to the charger.

Substantiation: ACC agrees with Mr. Fredericks' explanation of negative vote on proposal 10-33. The panel action was inconsistent in that it asserts the basic rule of 240.21 should apply to battery conductors, while at the same time acknowledging that allowing 25 feet to the first overcurrent device might not be enough for some larger installations.

A companion comment addresses this issue for general installations, while this comment proposes new text for Supervised Industrial Installations in 240.92. This proposed text is in accordance with the text provided with Mr. Fredericks' explanation of negative vote.

Panel Meeting Action: Reject

Panel Statement: The panel rejects the comment to allow battery conductors of unlimited lengths without overcurrent protection.

For the location of storage battery conductor overcurrent protection, see the panel action and statement on Comment 10-13.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

10-34 Log #2326 NEC-P10 **Final Action: Reject**
(240.92(V))

Submitter: Jim Pauley, Square D Company

Comment on Proposal No: 10-21

Recommendation: Reject the Proposal.

Substantiation: This proposal will reduce electrical safety. Overcurrent protection rules in the NEC need to be uniformly applied across application. This revision creates a significant anomaly to that uniformity. The expectation that the system is controlled enough to be able to have such exacting requirements for conductor protection is a flawed expectation.

The current tap rules have served well in a large variety of installations and they are consistent with the engineering and maintenance approaches taken in all installations including large industrial.

Panel Meeting Action: Reject

Panel Statement: See the panel action and statement on Comment 10-32.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

KIMBLIN, C.: NEMA opposes the panel action for the reason expressed with Comment 10-32.

KOVACIK, J.: See my explanation of negative vote on Comment 10-32.

Comment on Proposal No: 5-76

Recommendation: The Panel Action to Accept in Principle is correct, however, the Panel Action shows 250.32(B)(3) as Accept and that section does not exist. The reference should have been to 250.32(B)(2)(3).

Substantiation: 250.32(B)(3) does not exist in the 2005 Code, the 2008 Preprint, Proposal 5-121a, nor Proposal 5-119.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-27 Log #801 NEC-P05 **Final Action: Hold**
(250.2)

TCC Action: The Technical Correlating Committee notes that the panel statement is incomplete and not fully responsive to the technical content of the comment as noted in the comment on vote and directs that Proposal 5-57 and this comment be reported as "Hold" in accordance with 3.4.2 of the NFPA Regulations Governing Committee Projects. The Technical Correlating Committee notes that the revised definition will create correlation issues with the use of the term "ground fault" in other parts of the Code such as 230.95, the requirement for ground fault protection of equipment.

The Technical Correlating Committee also directs that Proposal 5-58 be reported as "Hold" because the Fine Print Note is related to the definition in Proposal 5-57 and Comment 5-27.

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute-Electric Light & Power Group
Comment on Proposal No: 5-57
Recommendation: Accept in Principle the proposal. Change the definition to read as follows:

Ground Fault. An unintentional, electrically conducting connection between an ungrounded conductor of an electrical circuit and the grounded conductor or normally non-current-carrying conductors, metallic enclosures, metallic raceways, metallic equipment or earth.

Substantiation: In the National Electrical Code, calling the connection between the normally, current-carrying, grounded, unbalanced current return path and the not-normally, current-carrying, equipment grounding conductor path will cause confusion in the industry and a conflict within the National Electrical Code as it discusses prescriptive requirements for ground-fault protection in 230.95, 215.10, 240.13, 517.17 and Part IV and Part V of Article 430. This definition will also cause conflict and confusion between the National Electrical Code and the Codes and Standards of the Institute of Electrical and Electronic Engineers (IEEE). One such standard is ANSI/IEEE Std 242 – 2001, Recommended Practice for Protection and Coordination of Industrial and Commercial Power Systems termed the "Buff Book". This reference sets the current standard for fault current calculation and system protection and the proper selection, application, and coordination of components that may be required to protect industrial and commercial power systems against abnormalities that could reasonably be expected to occur in the course of electrical system operation.

Other IEEE Standards such as the ANSI/IEEE Std 141-1993, IEEE Recommended Practice for Electric Power Distribution for Industrial Plants and the ANSI/IEEE Std 241-1990, IEEE Recommended Practice for Electric Power Systems in Commercial Buildings both reference appropriate editions of ANSI/IEEE Std 242 for fault current calculations. Also, the Bussman, Electrical Protection Handbook discusses and uses the methodologies developed in ANSI/IEEE Std 242 to discuss and recommend overcurrent protection as well as protection from ground faults in accordance with the requirements of the National Electrical Code.

The principle issue in Proposal 5-57 is the use of the phrase "a normally current carrying conductor" in the definition developed by CMP-5 in the Recommendation portion of the comment.

Many times "a normally current carrying conductor" is an ungrounded conductor (typically referred as a line conductor or a phase conductor). However, a grounded conductor or a neutral conductor is also "a normally current carrying conductor". Connection of a grounded conductor or a neutral conductor of an electric circuit and the normally non-current-carrying conductors, metallic enclosures, metallic raceways, metallic equipment or earth is not a ground fault. Rather the term for this connection is not currently defined in any standard. Defining a grounded conductor or neutral conductor connection to the ground or non-current carrying grounded metal members goes against the history of the term as it is used in calculating the magnitude and phase angle of unbalanced currents during accidental connection of single-line to ground short-circuits or double-line to ground short-circuits.

The history of the term "ground fault" and ground fault current calculations dates back to 1926 when A. P. Mackerras used a mathematical method previously developed by Dr. C. L. Fortescue (later called Symmetrical Components) to establish and publish his work on the determination of single-phase short-circuits on three-phase systems. Unbalanced (unsymmetrical) currents during a single-phase, line-to-ground, short-circuit (termed ground fault) in a three-phase system using the mathematical method could be broken down into three, symmetrical currents to ease the complex circuit calculations. These three symmetrical models of the unsymmetrical current, voltage or impedance are the positive-sequence component, the negative-sequence component and the zero-sequence component.

In order to use the theory of symmetrical components on three-phase systems (that is now widely accepted as a standard practice) with Ohms law for AC systems,

$$\left(I = \frac{E}{Z} \right)$$

voltages (E) and circuit impedances (Z) are broken down into their respective symmetrical sequence components.

Calculations are made at the symmetrical sequence component level and re-constructed back to the unsymmetrical level for an answer to determine the magnitude and phase angle of current. Single-phase systems are much simpler to calculate a shorted phase to ground or shorted phase to neutral current.

In a three-phase wiring system, both the positive-sequence component and the negative-sequence component impedance are based on the resistance (wire resistance) and reactance (geometry) of the individual phase or line conductors. The zero-sequence component impedance is based on the resistance and reactance of the common return path. This work pre-dates the work of Eustace C. Soares and the equipment-grounding conductor philosophy currently found in the National Electrical Code (separate grounded conductor and equipment grounding conductor generally beyond the main disconnecting means in the NEC wired system).

It is interesting to note that the concept of defining Ground Fault and Short Circuit is not a new concept. It was recommended in 1966 by Eustace Soares himself to end the confusion between the definition of a short circuit and a ground fault. He proposed the following two definitions.

SHORT CIRCUIT: A conducting connection, whether intentional or accidental, between any of the conductors of an electrical system whether it be from line to line or line to the grounded conductor.

GROUND FAULT: A conducting connection, whether intentional or accidental between any of the conductors of an electrical system and the conducting material which encloses the conductors or any conducting material that is grounded or that may become grounded.

Here is the reason why these definitions were not accepted in the past. In the NEC system, both the grounded conductor path (usually a wire or busbar) and the equipment-grounding conductor path (generally, a wire, a metallic raceway or metallic conductor enclosure) are part of the zero-sequence component impedance. Connecting these two conducting paths (grounded path and grounding path) together does not constitute a fault and will not cause a high current to flow in the system. Rather, connecting these two together roughly relates to paralleling two impedances together and reducing the overall impedance. This is one technical reason why in patient care areas of health care facilities, a parallel equipment-grounding conductor inside a metallic raceway is used as required by 517-13. It reduces the zero-sequence impedance and improves the effective fault current path (as discussed in 250.4) for line-to-ground faults.

Connecting the grounded conductor to the equipment-grounding conductor path will cause normal unbalanced load current to flow on non-normally current carrying metallic raceways, metallic enclosures and other metallic paths such as building steel, plumbing, metallic support structures and etc. This current flow outside of the normal conductor path is generally undesired (but, not necessarily unsafe) in premises wiring installed in accordance with the National Electrical Code.

The proposed definition in 5-57 falls apart in service enclosures, enclosures such as meter sockets prior to the main disconnecting means, and metallic service raceways. If the bare grounded conductor comes in contact with one of these enclosures, is it a ground fault or a short circuit or just a normal occurrence provided it was intentional? What happens if an electrician intentionally makes an inappropriate connection and re-grounds the grounded conductor in a feeder supplied panel board? Does an erroneously made, intentional connection vitiate the proposed definition of ground fault in 5-57?

If definition of "ground fault" is approved as it appears in Proposal 5-57 of the ROP, the National Electrical Code will now permit ground faults as the normal occurrences with the connection of the main bonding jumper at the service, the system bonding jumper at a separately derived system, or the connections as permitted in 250.32 (B).

I would agree that a term that describes the inappropriate grounding connection (grounding error) between a grounded conductor and the equipment grounding conductor path beyond the main disconnecting means should be developed. However, the term "ground fault" is not the correct term for this occurrence. The revised wording of the definition shown below in this comment accurately defines the term "ground fault".

Ground Fault. An unintentional, electrically conducting connection between an ungrounded conductor of an electrical circuit and the grounded conductor or normally non-current-carrying conductors, metallic enclosures, metallic raceways, metallic equipment or earth.

Further, if this definition of ground fault is accepted, the definition of short circuit could be defined as follows in a future edition of the NEC.

Short Circuit. An unintentional, electrically conducting connection between two or three ungrounded conductors of an electrical circuit.

Panel Meeting Action: Reject
Panel Statement: An unintentional connection of a grounded conductor of an electric circuit and the normally non-current-carrying conductors, metallic enclosures, metallic raceways, metallic equipment or earth may trip a GFCI, and thus is a ground fault.

Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
WHITE, C.: This comment should have been accepted. The submitter provided a sound argument that the proposed definition of a Ground Fault is technically incorrect. And, he proposed the following more technically correct definition:

Ground Fault. An unintentional, electrically conducting connection between an ungrounded conductor of an electrical circuit and the grounded conductor or normally non-current-carrying conductors, metallic enclosures, metallic raceways metallic equipment or earth.

According to the definition of "Ground-Fault Protection of Equipment" in Article 100, the intent is to provide protection of equipment from damaging line-to-ground fault currents. This protection is provided at current levels less than those required to protect conductors from damage through the operation of a supply circuit overcurrent device. As pointed out by the submitter, when the neutral or grounded conductor comes in contact with the equipment-grounding conductor path, normal unbalanced load current will begin to flow on non-normally current carrying metallic raceways, metallic enclosures and other metallic path
s such as building steel, plumbing, metallic support structures, etc. This current flow outside of the normal conductor path is generally undesired but it is not damaging. It is not an overcurrent and it is not a ground fault. By accepting this new definition of fault current, will we now ask "Ground Fault Protection Equipment" to trip for the current levels caused by the grounded conductor coming into contact with the equipment grounding conductor path? Obviously not? And, if not, why would that connection be included in the definition of "Ground Fault".

5-28 Log #1016 NEC-P05 **Final Action: Accept in Principle**
(250.2)

Submitter: David Shapiro, Safety First Electrical Contracting Consulting & Safety Education
Comment on Proposal No: 5-51
Recommendation: In line 2, replace "permanent" with "durable" so as to read:

An intentionally constructed, ~~permanent,~~ durable low-impedance electrically conductive path...

Substantiation: Our interpretation and enforcement of the NEC is supposed to be based on the dictionary definitions of common English terms, augmented by special definitions found in Article 100, and those unique to particular articles and defined at the beginning of each such article. While the NEC is not intended as a design manual for untrained persons, its language is not supposed to be based on "Hey, Bud, you should know what they intend here" translation. Saying "...the word...is generally understood in...[this] application" demands just that sort of interpretation. I don't know how commonly inexpert inspectors make the sort of mistake Mr. Schwan is trying to head off, but I do know that AHJs often rely on inadequately trained inspectors. For this reason, the Style Manual's blessing on terms that have become accepted warrants sparing use. The CMP does have a point, that while the change in the original proposal to remove the sense of "permanent" as meaning "not subject to removal" is worthwhile, "reliable" is a term that is particularly difficult to pin down. I propose "durable," a term that is in fact used elsewhere in the NEC for similar purposes, as better conveying the intent. We understand a plug-in under cabinet light that is not double-insulated as a point on an electrical system potentially part of a ground fault current path, whose ground prong should make a durable or reliable grounding connection. However, a separable connection definitely can be viewed as not being permanent.
Panel Meeting Action: Accept in Principle

The panel action is to remove the word "permanent" and revise the definition of Effective Ground-Fault Current Path to read as follows:
Effective Ground-Fault Current Path. An intentionally constructed,~~, permanent,~~ low-impedance electrically conductive path designed and intended to carry current under ground-fault conditions from the point of a ground fault on a wiring system to the electrical supply source and that facilitates the operation of the overcurrent protective device or ground fault detectors on high-impedance grounded systems.
Panel Statement: The panel agrees with the concept of removing the word "permanent" from this section and does not agree that the proposed replacement word "durable" is necessary for this definition. Removing the word "permanent" addresses the concerns of the submitter, and not replacing it with any other descriptive word addresses the other concerns of subjectivity, ambiguity, enforceability, and inconsistent application of the provisions of this section by users of the Code. The panel concludes that the descriptive wording provides the performance language necessary for users without the use of the word "permanent" or any other descriptive adjective. The panel also affirms that this action to remove the word permanent is consistent with similar revisions in the NEC where the same concerns were raised about the use of this word. This action is also consistent with the work of the TCC assigned Task Group on Grounding and Bonding to keep definitions of words and terms related to grounding and bonding in their simplest form.

Other Articles having similar organization charts locate them with the Article scope. See 220.1 and 430.1 for examples.
Panel Meeting Action: Accept in Principle
Move the FPN to 250.1 and revise as follows:

"FPN: See Figure ~~250.4~~ 250.1 for information on the organization of Article 250 covering grounding and bonding requirements."

Renumber the present Figure 250.4 as Figure 250.1
Panel Statement: Editorial revisions were made for consistency with the new location of the table.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-31 Log #1520 NEC-P05 **Final Action: Accept**
(250.4(A)(1))

TCC Action: The Technical Correlating Committee directs that this comment be reported as "Accept" since the text of the Fine Print Note accepted in the panel action contains a recommendation and is not in compliance with 3.1.3 of the NEC Style Manual. The text of the comment as submitted is informational and, as such, is in compliance with the NEC Style Manual.
Submitter: Jeffrey Boksiner, Telcordia Technologies, Inc. / Rep. Alliance for Telecommunications Industry Solutions
Comment on Proposal No: 5-89
Recommendation: Convert the proposed text into a new FPN located after 250.4(A)(1) as follows:

An important consideration for limiting the imposed voltage is the routing of bonding and grounding conductors so that they are not any longer than necessary to complete the connection without disturbing the permanent parts of the installation and so that unnecessary bends and loops are avoided.

Substantiation: The comment revises the original proposal into an FPN as suggested by the Panel Statement. This information is important and needs to be in the NEC.
Panel Meeting Action: Accept in Principle
Add a new FPN after 250.4(A)(1) as follows:
FPN: An important consideration for limiting the imposed voltage is the routing of bonding and grounding conductors. These conductors should not be longer than necessary to complete the connection without disturbing the permanent parts of the installation. Unnecessary bends and loops should be avoided.
Panel Statement: The revised text provides good guidance and consideration to users of the NEC.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-32 Log #278 NEC-P05 **Final Action: Reject**
(250.4(A)(5))

Submitter: Steve Byers, Scott Industrial Systems
Comment on Proposal No: 5-66
Recommendation: Vague - "permanent-low-impedance". Is an enclosure door continuous hinge considered a permanent low-impedance path to ground?

Require enclosure manufacturers to install ground stud on enclosure doors capable of having electrical devices mounted on the door.
Substantiation: Some less expensive enclosures are being manufactured without door ground studs, NFPA 79-2003 Section 8.2.3.6.1 states if devices are mounted on conductive doors, a bonding jumper shall be installed. Since I can find no code that requires a stud be welded on the door, how can this be accomplished without compromising the NEMA rating.

Panel Meeting Action: Reject
Panel Statement: This comment does not comply with 4.4.5(c) of the NFPA Regulations Governing Committee Projects in that it does not provide text of the comment, including the wording to be added, revised (and how revised), or deleted.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-33 Log #1017 NEC-P05 **Final Action: Accept in Principle (250.4(A)(5))**

Submitter: David Shapiro, Safety First Electrical Contracting Consulting & Safety Education
Comment on Proposal No: 5-65
Recommendation: In line 4, replace "permanent" with "durable" so as to read:
(5) Effective Ground-Fault Current Path. Electrical equipment and wiring and other electrically conductive material likely to become energized shall be installed in a manner that creates a ~~permanent,~~ durable low-impedance circuit...
Substantiation: Our interpretation and enforcement of the NEC is supposed to be based on the dictionary definitions of common English terms, augmented by special definitions found in Article 100, and those unique to particular articles and defined at the beginning of each such article. While the NEC is not intended as a design manual for untrained persons, its language is not supposed to be based on "Hey, Bud, you should know what they intend here" translation. I don't know how commonly inexpert inspectors make the sort of mistake Mr. Schwan is trying to head off, but I do know that AHJs often rely on inadequately trained inspectors. For this reason, the Style Manual's blessing on terms that have become accepted warrants sparing use. The CMP does have a point, that while the change in the original proposal to remove the sense of "permanent" as meaning "not subject to removal" is worthwhile, "reliable" is a term that is particularly difficult to pin down. I propose "durable," a term used elsewhere in the NEC for similar purposes, as better conveying the intent. We understand a plug-in under cabinet light that is not double-insulated as a point on an electrical system potentially part of a ground fault current path, whose ground prong should make a durable or reliable grounding connection. However, a separable connection definitely can be viewed as not being permanent.
Panel Meeting Action: Accept in Principle
The panel action is to remove the word "permanent" and revise Section 250.4(A)(5) as follows:
(5) Effective Ground-Fault Current Path. Electrical equipment and wiring and other electrically conductive material likely to become energized shall be installed in a manner that creates a ~~permanent,~~ low-impedance circuit facilitating the operation of the overcurrent device or ground detector for high-impedance grounded systems. It shall be capable of safely carrying the maximum ground-fault current likely to be imposed on it from any point on the wiring system where a ground fault may occur to the electrical supply source. The earth shall not be considered as an effective ground-fault current path.
Panel Statement: The panel agrees with the concept of removing the word "permanent" from this section and does not agree that the proposed replacement word "durable" is necessary for this section. Removing the word "permanent" addresses the concerns of the submitter, and not replacing it with any other descriptive word addresses the other concerns of subjectivity, ambiguity, enforceability, and inconsistent application of the provisions of this section by users of the Code. The panel concludes that the descriptive wording provides the performance language necessary for users without the use of the word "permanent" or any other descriptive adjective. The panel also affirms that the action to remove the word "permanent" is consistent with similar revisions in NEC where the same concerns were raised about the use of this word.
Number Eligible to Vote: 15

Submitter: David Shapiro, Safety First Electrical Contracting Consulting & Safety Education
Comment on Proposal No: 5-67
Recommendation: Revise text to read as follows:
...~~permanent~~ durable low-impedance path for ground-fault current...
Substantiation: Our interpretation and enforcement of the NEC is supposed to be based on the dictionary definitions of common English terms, augmented by special definitions found in Article 100, and those unique to particular articles and defined at the beginning of each such article. While the NEC is not intended as a design manual for untrained persons, its language is not supposed to be based on "Hey, Bud, you should know what they intend here" translation. I don't know how commonly inexpert inspectors make the sort of mistake Mr. Schwan is trying to head off, but I do know that AHJs often rely on inadequately trained inspectors. For this reason, the Style Manual's blessing on terms that have become accepted warrants sparing use. The CMP does have a point, that while the change in the original proposal to remove the sense of "permanent" as meaning "not subject to removal" is worthwhile, "reliable" is a term that is particularly difficult to pin down. I propose "durable," a term that is used elsewhere in the NEC for similar purposes, as better conveying the intent. We understand a plug-in under cabinet light that is not double-insulated as normally non-current-carrying conductive equipment enclosing electrical conductors. Its ground prong should make a durable or reliable grounding connection. However, a separable connection definitely can be viewed as not being a permanent bond.
Panel Meeting Action: Accept in Principle
The panel action is to remove the word "permanent" and revise Section 250.4(B)(2) as follows:
(2) Bonding of Electrical Equipment. Non–current-carrying conductive materials enclosing electrical conductors or equipment, or forming part of such equipment, shall be connected together and to the supply system grounded equipment in a manner that creates a ~~permanent,~~ low-impedance path for ground-fault current that is capable of carrying the maximum fault current likely to be imposed on it.
Panel Statement: The panel agrees with the concept of removing the word "permanent" from this section and does not agree that the proposed replacement word "durable" is necessary for this section. Removing the word "permanent" addresses the concerns of the submitter, and not replacing it with any other descriptive word addresses the other concerns of subjectivity, ambiguity, enforceability, and inconsistent application of the provisions of this section by users of the Code. The panel concludes that the descriptive wording provides the performance language necessary for users without the use of the word "permanent" or any other descriptive adjective. The panel also affirms that this action to remove the word "permanent" is consistent with similar revisions in NEC where the same concerns were raised about the use of this word.

(250.8)

Submitter: Donald A. Ganiere, Ottawa, IL
Comment on Proposal No: 5-84
Recommendation: Continue to accept in principle.
Substantiation: The original submitted wording would have prohibited the use of standard pressure connectors (wire nuts) for use with EGCs, and would have required the use of "green" wire nuts for this purpose. The panel should continue to accept its revised wording as the revised wording makes it very clear that any listed pressure connector can be used for the connection of EGCs.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-45 Log #1023 NEC-P05 **Final Action: Reject**
(250.8(A)(5) and (6))

Submitter: David Shapiro, Safety First Electrical Contracting Consulting & Safety Education
Comment on Proposal No: 5-84
Recommendation: Revise text to read as follows:

(5) Machine screw-type fasteners that engage not less than two threads or are secured with a nut, with a washer inserted between the fastener's head and the conductor, where necessitated by the size or shape of the head.

(6) Thread-forming machine screws that engage not less than two threads in the enclosure, with a washer inserted between the fastener's head and the conductor, where necessitated by the size or shape of the head.
Substantiation: We were advised at the UL session of the 2006 Eastern Section, IAEI meeting that grounding screws are not Listed items. However, any screw that engages the two or more threads and grabs the conductor under its head should be as acceptable as the green screws sold for the purpose. As such, a screw or fastener is not required to be tested as an element of a Listed system, it would be well to put installers on notice that when the conductor would not be held securely by its head, it would need to be augmented. This also would take into account a recommendation in Proposal 5-85 that was not addressed by the CMP.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its actions and statements on Proposal 5-85 addressing the term "sheet metal screws" as previously used in that section and provided the needed clarification regarding the acceptable means of making grounding and bonding connections. Accessory features are currently provided by equipment manufacturers that do not include any washers as mentioned in this comment. Providing no specific size or head shape would make this additional language difficult to apply.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-46 Log #1847 NEC-P05 **Final Action: Reject**
(250.14 (New))

Submitter: Mike Holt, Mike Holt Enterprises, Inc.
Comment on Proposal No: 5-90
Recommendation: This Proposal should be Rejected.
Substantiation: This proposal should be rejected for a few different reasons:

(1) The substantiation seems to imply that an unsafe condition would exist should a person remove the termination from the enclosure. While this is true, the code can't protect against persons changing the electrical installation.

(2) The proponent seems to be concerned about the metal enclosure carrying neutral current. If the enclosure is in fact listed to carry neutral current, then it has been tested, evaluated and listed for such use, indicating that it is in fact safe. If the product is not listed for such an application, the installation is illegal via 110.3(B). Perhaps this concern would be better addressed by the proponent changing the product standard instead of the Code.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its original actions on Proposal 5-90. It is recognized that this new requirement is addressed in the listing information of equipment as is the other equipment that is listed as suitable for use as service equipment that is installed to meet the requirements in 250.24. See the panel actions on Comment 5-47.

(250.14 (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 5-90
Recommendation: Accept the proposal in principle. Locate the text in 200.2 as a lettered paragraph, as follows:

200.2 General... in accordance with 200.6. The grounded conductor shall comply with (A) and (B).
(A) Insulation. The grounded conductor, where insulated, shall have.. as described in 250.184(A).
(B) Continuity. [Insert the text of Proposal 5-90 here]
Substantiation: This comment responds to the reservation expressed in the voting, with which the submitter now agrees. Instead of simply tacking this topic on at the end of the article, however, the submitter has tried to incorporate it where it would be more editorially suitable.
Panel Meeting Action: Accept

The comment is accepted to locate the text in 200.2 as a lettered paragraph. Section 200.2 reads as follows:
200.2 General. All premises wiring systems, other than circuits and systems exempted or prohibited by 210.10, 215.7, 250.21, 250.22, 250.162, 503.155, 517.63, 668.11, 668.21, and 690.41 Exception, shall have a grounded conductor that is identified in accordance with 200.6. The grounded conductor shall comply with (A) and (B).
(A) Insulation. The grounded conductor, where insulated, shall have insulation that is (1) suitable, other than color, for any ungrounded conductor of the same circuit on circuits of less than 1000 volts or impedance grounded neutral systems of 1 kV and over, or (2) rated not less than 600 volts for solidly grounded neutral systems of 1 kV and over as described in 250.184(A).
(B) Continuity. The continuity of a grounded conductor shall not depend on a connection to a metallic enclosure, raceway, or cable armor.
Panel Statement: The action on this comment does not add a new 250.14 but rather relocates the recommendation to 200.2.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-48 Log #2070 NEC-P05 **Final Action: Reject**
(250.14 (New))

Submitter: Chuck Mello, Underwriters Laboratories
Comment on Proposal No: 5-90
Recommendation: The text should be relocated to an appropriate section in Article 300, such as under 300.3, under wiring methods that addresses the general installation of circuit conductors.

Continuity of Grounded Conductors. The continuity of a grounded conductor shall not depend on a connection to a metallic enclosure, raceway, or cable armor.
Substantiation: Panel 5 should have rejected this proposal. The intent is correct but the requirements are in the wrong Article. The grounded conductor is permitted or required to be connected to the grounding system under specific conditions in Article 250 so as to provide for the grounded conductor to also serve an equipment grounding function or to establish which conductor is the grounded conductor for a system. The example of the main bonding jumper being called a "grounded conductor" is a clear misapplication of terms and creates confusion. The connection of the grounded conductor in and out of any enclosure must be on a suitable conductor, as indicated in the proposal's substantiation, and not use the metal enclosure for the current carrying path. The TCC should correlate this to the correct location since panel 5 is not the correct panel to establish wiring methods for connection of the grounded conductor.

Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its original actions on Proposal 5-90. It is recognized that this new requirement is addressed in the listing information of equipment as is the other equipment that is listed as suitable for use as service equipment that is installed to meet the requirements in 250.24. See the panel action on Comment 5-47.

5-49 Log #604 NEC-P05 **Final Action: Accept in Principle**
(250.21 Exception)

TCC Action: The Technical Correlating Committee directs that the accepted text of the comment be rewritten as follows to be in compliance with 3.3.3 of the NEC Style Manual in expressing limits.
"(B) Ground Detectors. Ungrounded alternating current systems as permitted in 250.21(A)(1) through (A)(4) operating at not less than 120 volts and not exceeding 1000 volts shall have ground detectors installed on the system."
Submitter: Jamie McNamara, Hastings, MN
Comment on Proposal No: 5-97
Recommendation: Revise as follows:
250.21 Exception: Systems of less than 120 volts ~~to ground~~ phase-to-phase as permitted by this Code shall not be required to have ground detectors.
Substantiation: The panel was correct in rejecting the original proposed text. The panel should reconsider the clarified text, requirement for nongrounded systems. In a nongrounded system, theoretically, there are zero volts to ground and an installer could be misled in applying the exception. (Into thinking for example a 480 volt ungrounded system that measured less than 120 volts to ground with a meter would not require ground detectors). I thank the panel for the very clear panel statement as to the intent of the exception and how it is to be applied.
Panel Meeting Action: Accept in Principle
Revise the text of 2008 NEC Draft Section 250.21(B) to read as follows:
(B) Ground Detectors. Ungrounded alternating current systems as permitted in 250.21(A)(1) through (A)(4) operating from ~~at~~ 120 volts to 1000 volts ~~to ground~~ shall have ground detectors installed on the system.
Panel Statement: Only systems less than 120 volts nominal are permitted to omit ground detection. The panel changes the existing text of the Code for clarity.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
BOKSINER, J.: The new language might not comply with the NEC Style Manual with respect to expression of limits. Alternative language could be as follows:
(B) Ground Detectors. Ungrounded alternating current systems as permitted in 250.21(A)(1) through (A)(4) operating at not less than 120 volts to and not exceeding 1000 volts to ground shall have ground detectors installed on the system.

5-50 Log #2075 NEC-P05 **Final Action: Accept in Principle**
(250.24(C))

Submitter: Chuck Mello, Underwriters Laboratories
Comment on Proposal No: 5-76
Recommendation: Revise the proposed text to read as follows:
250.24(C)
(C) Grounded Conductor Brought to Service Equipment. Where an ac system operating at less than 1000 volts is grounded at any point, the grounded conductor(s) shall be run to each service disconnecting means and shall be connected ~~bonded~~ to each disconnecting means grounded conductor(s) terminal or bus. A main bonding jumper shall connect the grounded conductor(s) to each service disconnecting means enclosure. The grounded conductor(s) shall be installed in accordance with 250.24(C)(1) through (C)(3).
Exception: Where more than one service disconnecting means are located in ~~an~~ single assembly listed for use as service equipment, it shall be permitted to run the grounded conductor(s) to the assembly common grounded conductor(s) terminal or bus. The assembly shall have a main bonding jumper for connecting the grounded conductor(s)~~and the conductor(s) shall be connected bonded~~ to the assembly enclosure.
Substantiation: The revised text as acted on the by the panel would literally require the grounded circuit conductor to be connected to the service disconnecting means enclosure. This could easily be interpreted as being "directly" connected which is not a proper installation. The proper termination point for the service grounded conductor is to the grounded conductor terminal or bus intended and identified for the termination of this conductor. The main bonding jumper is in fact the conductor that connects the service grounded conductor terminal or bus to the service equipment enclosure (green screw, strap, bus, or wire type MBJ). Similarly in the exception, the grounded conductor would appear to be required to be connected to the assembly enclosure and not to the service grounded conductor terminal(s) or bus provided for that purpose. The grounded conductor is to be connected to that terminal or bus and the main bonding jumper then connects that terminal or bus to the assembly enclosure. Under the definition in the 2005 code using the word "bonded" allowed the correct installation of terminating on the lug or bus, but then some mean of "bonding" of this terminal or bus was provided.
Panel Meeting Action: Accept in Principle
Change the word "have" in the last sentence of the exception to the word "include." Accept the rest of the comment as an editorial revision to the work in Proposal 5-76.
Panel Statement: Editorial revision to Proposal 5-76.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
MELLO, C.: The panel statement is not correct that this was an editorial change to proposal 5-76. The text changes shown in the comment and accepted by the panel were more than editorial and corrected a deficiency created by the action on proposal 5-76.

5-51 Log #467 NEC-P05 **Final Action: Reject**
(250.24(E))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 5-104
Recommendation: Accept proposal revised:
The grounding electrode conductor shall be connected to a non-flexible metal enclosure of the service conductors suitable for use as a grounding conductor at any accessible...(remainder unchanged).
Substantiation: Method (15) permits flexible metal conduit or liquidtight flexible metal conduit not suitable for a ground clamp connection. Although a conduit connector with a lug for a bonding jumper could be used for a connection point, it is a fitting not an enclosure.
Panel Meeting Action: Reject
Panel Statement: Use of the term "nonflexible" is not appropriate for enclosures that are applicable for this section.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

(Note: The sequence no. 5-52 was not used)

5-53 Log #1758 NEC-P05 **Final Action: Accept**
(250.28(D))

Submitter: Mark C. Ode, Underwriters Laboratories Inc.
Comment on Proposal No: 5-107
Recommendation: Add titles to each of (1) through (3) to comply with the NEC Style Manual, such as:
(1) General. (2) Main Bonding Jumper for Service with More Than One Enclosure (3) Separately Derived System With More Than One Enclosure. 250.28 Main Bonding Jumper and System Bonding Jumper
(D) Size. Main bonding jumpers and system bonding jumpers shall be sized in accordance with 250.28(D)(1) through (D)(3).
(1) General. Main bonding jumpers and system bonding jumpers shall not be smaller than the sizes shown in Table 250.66. Where the supply conductors are larger than 1100 kcmil copper or 1750 kcmil aluminum, the bonding jumper shall have an area that is not less than 12 1/2 percent of the area so the largest phase conductor except that, where the phase conductors and the bonding jumper are of different materials (copper or aluminum), the minimum size of the bonding jumper shall be based on the assumed use of phase conductors of the same material as the bonding jumper and with an ampacity equivalent to that of the installed phase conductors.
(2) Main Bonding Jumper for Service with More Than One Enclosure. Where a service consists of more than a single enclosure as permitted in 230.71(A), the main bonding jumper for each enclosure shall be sized in accordance with 250.28(D)(1) based on the largest ungrounded service conductor serving that enclosure.
(3) Separately Derived System With More Than One Enclosure. Where a separately derived system supplies more than a single enclosure, the system bonding jumper for each enclosure shall be sized in accordance with 250.28(D)(1) based on the largest ungrounded feeder conductor serving that enclosure or a single system bonding jumper shall be installed at the source and sized in accordance with 250.28(D)(1) based on the equivalent size of the largest supply conductor determined by the largest sum of the areas of the corresponding conductors of each set.
Substantiation: Add titles to each of the (1) through (3) to comply with the NEC Style Manual.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-54 Log #1843 NEC-P05 **Final Action: Reject**
(250.28(D))

Submitter: Mike Holt, Mike Holt Enterprises, Inc.
Comment on Proposal No: 5-107
Recommendation: Accept the Proposal as modified:
(D) Size. Main bonding jumpers and system bonding jumpers shall be sized in accordance with 250.28(D)(1) through (D)(3).
(1) Proposed text to remain unchanged.
(2) Where a service consists of more than a single enclosure as permitted in 230.71(A), the main bonding jumper for each enclosure shall be sized in accordance with 250.28(D)(1) based on the largest ungrounded service conductor serving that enclosure.
(3) Where a separately derived system supplies more than a single enclosure, the system bonding jumper for each enclosure ~~shall be sized in accordance with 250.28(D)(1) based on the largest ungrounded service conductor serving that enclosure or a single system bonding jumper~~ shall be installed at the source and sized in accordance with 250.28(D)(1) based on the equivalent size of the largest supply conductor determined by the largest sum of the areas of the corresponding conductors of each set.
Substantiation: The proposed allowance of installing multiple system bonding jumpers at separate enclosures will result in objectionable currents. It is assumed that the multiple enclosures will ultimately be bonded together, presumably through the grounding electrode system.
Panel Meeting Action: Reject
Panel Statement: The suggested revisions in this comment would restrict installation of the system bonding jumper to the source enclosure where multiple enclosures are installed. This restriction is without substantiation and is in conflict with the current provisions of 250.30(A)(1).
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-56 Log #1620 NEC-P05 **Final Action: Reject**
(250.30(A)(7))

Submitter: Noel Williams, Herriman, UT
Comment on Proposal No: 5-115
Recommendation: This proposal should have been accepted.
Substantiation: The panel statement that they reaffirm a previous position is unresponsive to the issue. Contrary to the panel statement, it is not clear that "nearest" applies to the other electrode types, when in fact the wording does not say that. In reality, the other electrode types are not an option under the existing wording unless the building steel and water pipe are "not available." Is far away "not available?" Under the existing wording, a concrete-encased electrode or ground ring or even the busbar permitted by 250.64(C)(3) may be within a few feet, but if the water pipe is 250 ft away, it is available and the water pipe must be used rather than the other electrodes, even though other changes the panel has made support the fact that some of the other electrodes probably provide superior earth connections and are more reliable. The issue in 250.50 is not whether they are available, but whether they exist. It makes no sense to go a long distance for an electrode that the panel has acknowledged is not entirely reliable on its own rather than use a superior electrode that is nearby.
Panel Meeting Action: Reject
Panel Statement: The panel concludes that the wording of current NEC 250.30(A)(7) already addresses the submitter's concerns through the wording "as near as practicable and preferably in the same area." This allows judgment to be applied to address the conditions identified by the submitter rather than resulting in an absolute and impracticable requirement.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-57 Log #1341 NEC-P05 **Final Action: Reject**
(250.32)

Submitter: Nathan Philips, Integrated Electronic Systems
Comment on Proposal No: 5-119
Recommendation: Reject the proposed change in its entirety.
Substantiation: The submitter provides no evidence that accidents have resulted from the existing Code language. There are many rural and remote applications where the additional burden imposed by this change would be quite significant, and adequate justification has not been provided. In addition, the proposed change is unenforceable, since buildings and structures aren't normally inspected following original construction.
Panel Meeting Action: Reject
Panel Statement: This change as suggested by the submitter would help reduce the number of designs that purposely invite the possibilities of inappropriate neutral-to-ground connections that can and often do happen at a later date. There is no sound engineering basis for allowing neutral current to return on multiple paths because of improper or multiple neutral-to- ground connections at buildings or structures supplied by a feeder or branch circuit. The panel concludes that this requirement is enforceable and has already been adopted by some jurisdictions.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
TOOMER, R.: Adequate substantiation has not been provided for this major change in the NEC. This provision has been in the NEC for many, many years with no evidence of any problems. We have received only one proposal in over 30 years to make this change, and now we take this action with little regard to the consequences. The fact that the Panel has received no prior Proposals on this issue suggests that it is not a major problem. This comment should have been accepted.
Comment on Affirmative:
JOHNSTON, M.: The submitter indicated that this requirement is not enforceable because buildings normally are not inspected after the original construction. fortunately this is not true in most parts of the country. The previous codes have allowed two options for grounding and bonding feeders to separate buildings or structures, which have resulted in many misapplications of grounding and bonding. The new requirement of a separate equipment grounding conductor routed to a separate building in this section will provide safer installations by minimizing the conditions that lead to neutral currents returning on multiple paths creating an unsafe installation. It will now be clear on how to ground and bond a feeder to a separate building with no questions whether to bond or not to bond the grounded neutral conductor or the potential problems with future installations of a metallic path ran to the separate building. From the enforcement perspective this will help reduce problems in the field and provide additional safety. Retaining the exception in this section assists users by allowing installations that met the criteria of 250.52(B)(2) to remain operational and built upon in the future as long as the conditions contained with the exception are maintained.

5-58 Log #1518 NEC-P05 **Final Action: Accept in Principle**
(250.32)

Submitter: James Daly, Upper Saddle River, NJ
Comment on Proposal No: 5-119
Recommendation: The Panel Action should continue to be Accept in Principle with the following additional changes.
In 250.32 (B), revise the last phrase to read "shall comply with the following requirements."
Delete the title "(1) Equipment Grounding Conductor" from 250.32(B)(1). The remainder of the Panel Action is unchanged.
Substantiation: The Panel Action changed 250.32(B)(2) into an Exception to 250.32(B)(1) so there is now only one section and, therefore, it should not be numbered. It can be a separate paragraph without a title.
The revision to 250.32(B) correlates this change.
Panel Meeting Action: Accept in Principle
Revise 250.32 as follows:
250.32 Buildings or Structures Supplied by a Feeder(s) or Branch Circuit(s).
(A) Remains unchanged.
(B) Grounded Systems. For a grounded system at the separate building or structure, ~~the connection to the grounding electrode and grounding or bonding of equipment, structures, or frames required to be grounded or bonded shall comply with either 250.32(B)(1) or (B)(2).~~
~~(1) Equipment Grounding Conductor.~~ an equipment grounding conductor as described in 250.118 shall be run with the supply conductors and be connected to the building or structure disconnecting means and to the grounding electrode(s). The equipment grounding conductor shall be used for grounding or bonding of equipment, structures, or frames required to be grounded or bonded. The equipment grounding conductor shall be sized in accordance with 250.122. Any installed grounded conductor shall not be connected to the equipment grounding conductor or to the grounding electrode(s).

Exception: For existing premises wiring systems only, ~~new or existing buildings or structures only~~, the grounded conductor run with the supply to the building or structure shall be permitted to be connected to the building or structure disconnecting means and to the grounding electrode(s) and shall be used for grounding or bonding of equipment, structures, or frames required to be grounded or bonded where all the requirements of (1), (2), and (3) are met:
(1) An equipment grounding conductor is not run with the supply to the building or structure.
(2) There are no continuous metallic paths bonded to the grounding system in each building or structure involved.
(3) Ground-fault protection of equipment has not been installed on the supply side of the feeder(s).
Where the grounded conductor is used for grounding in accordance with the provision of this exception, the size of the grounded conductor shall not be smaller than the larger of either of the following:
(1) That required by 220.61
(2) That required by 250.122

Panel Statement: The panel incorporates the concepts in this and other comments and makes editorial improvements.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
TOOMER, R.: Adequate substantiation has not been provided for this major change in the NEC. This provision has been in the NEC for many, many years with no evidence of any problems. We have received only one proposal in over 30 years to make this change and now we take this action with little regard to the consequences. The fact that the Panel has received no prior Proposals on this issue suggests that it is not a major problem. This comment should have been rejected.

(250.32)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 5-119
Recommendation: Reject the proposal.
Substantiation: This submitter has been consistently supported as CMP 5 steadfastly made the transition to the concept that neutral return current should travel over conductors bought at electrical supply houses. It has previously done so in ways that, until now, allowed electrical designers to choose how to deal with regrounded neutrals as long as neutral current passed over recognized conductors. However, Proposal 5-119 crosses a line that should not be crossed that is, into the territory of attempting to sunset a distribution practice that has been routine for over a century. Furthermore, it is a practice that brings the overwhelming majority of electrical service power to commercial and residential occupancies throughout North America, and that will not be going away within the lifetime of any member of the NEC committee The comparison with 250.140 is not apt, because that was an anomaly occasioned by the Second World War. However, it is also instructive in that it hung on for fifty years. Why? Because no one ever demonstrated any loss experience even though just about all of us (myself included) thought it was bad practice. The proposal substantiation is frankly overwrought. CMP 5 should not take sides in this political controversy.
Panel Meeting Action: Reject

5-61 Log #2250 NEC-P05 **Final Action: Reject**
(250.32)

Submitter: Donald A. Ganiere, Ottawa, IL
Comment on Proposal No: 5-119
Recommendation: This proposal should be rejected.
Substantiation: The submitter and the panel are asking the code users to believe that electricity behaves differently on the line side of the service disconnect than is does on the load side. Not only are the parallel paths that the submitter says are so hazardous on the load side of the service disconnect permitted on the line side, they are actually even required on the line side in a number of cases. How can these parallel paths be a serious hazard on the load side of the service disconnect and be required on the line side of the same disconnect? What magic takes place at the service disconnect that changes the hazard? Where is the technical justification for the acceptance of this proposal? Where are the reports of accidents or other types of problems that have been caused by the existing rule?
Panel Meeting Action: Reject
Panel Statement: The panel does accept the concept of continuation of migrating away from the use of the grounded circuit conductor for grounding beyond the service. See panel action and statement on Comment 5-57.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
TOOMER, R.: See my Explanation of Negative Vote on Comment 5-57.

5-62 Log #979 NEC-P05 **Final Action: Accept in Principle**
(250.32(B)(2) Exception)

Submitter: Mark C. Ode, Underwriters Laboratories Inc.
Comment on Proposal No: 5-119
Recommendation: There cannot be a (B)(1) without a (B)(2) so this must be revised by deleting (1) and the title and rewording (B) as follows:
250.32 Buildings or Structures Supplied by Feeder(s) or Branch Circuit(s)
(B) Grounded Systems. For a grounded system at the separate building or structure, the connection to the grounding electrode and grounding or bonding of equipment, structures, or frames required to be grounded or bonded shall be as follows~~: comply with either 250.32(B)(1) or (B)(2).~~
~~(1) Equipment Grounding Conductor.~~ An equipment grounding conductor as described in 250.118 shall be run with the supply conductors and connected to the building or structure disconnecting means and to the grounding electrode(s). The equipment grounding conductor shall be used for grounding or bonding of equipment, structures, or frames required to be grounded or bonded. The equipment grounding conductor shall be sized in accordance with 250.122. Any installed grounded conductor shall not be connected to the equipment grounding conductor or to the grounding electrode(s).
Exception: For existing premises wiring systems only, new or existing buildings or structures only, the grounded conductor run with the supply to the building or structure shall be permitted to be connected to the building or structure disconnecting means and to the grounding electrode(s) and shall be used for grounding or bonding of equipment, structures, or frames required to be grounded or bonded where all the requirements of (1), (2), and (3) are met:
(1) An equipment grounding conductor is not run with the supply to the building or structure,
(2) There are no continuous metallic paths bonded to the grounding system in each building or structure involved, and
(3) Ground-fault protection of equipment has not been installed on the supply side of the feeder(s),
Where the grounded conductor is used for grounding in accordance with the provision of this exception, the size of the grounded conductor shall not be smaller than the larger of either of the following:
(1) That required by 220.61
(2) That required by 250.122

Substantiation: The text in 250.32(B) must be revised to comply with the NEC Style Manual. Since (2) was deleted and made into an exception, (1) title and text was revised by deleting (1) and the title and rewording the text in (B).
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 5-58.
Number Eligible to Vote: 15

5-63 Log #2107 NEC-P05 **Final Action: Accept in Principle**
(250.32(B)(2) Exception)

Submitter: Patrick Healy, County of San Diego
Comment on Proposal No: 5-119
Recommendation: Revise text to read as follows:

Exception: For existing premises wiring systems ~~only~~, serving new or existing buildings or structures ~~only~~, the grounded conductor run with the supply to the building or structure shall ~~be permitted to~~ be connected to the building or structure disconnecting means and to the grounding electrode system and shall be used for grounding or bonding of equipment, structures or frames required to be grounded or bonded where all the requirements of (1), (2), and (3) are met...

Substantiation: 1) The use of the word "only" twice is confusing especially since this is an exception to the article which means that it already assumes the meaning of "only".

2) The words "shall be permitted" suggests that they have the option of bonding the neutral conductor to the structure disconnect enclosure and grounding electrode system. In the next sentence, the word "shall" assumes that the same conditions are not an option.

3). The word "system" needs to be added to avoid the interpretation that the neutral needs to be directly run to the grounding electrode.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 5-58.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1

5-64 Log #1908 NEC-P05 **Final Action: Reject**
(250.32(D))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 5-125
Recommendation: Reject the proposal.
Substantiation: The proposal is unnecessary. The references to Article 700, 701, and 702 are Chapter 7 modifications to Chapter 2 general requirements, and as such are fully covered in 90.3. See also 4.1 of the Style Manual.
Panel Meeting Action: Reject
Panel Statement: The panel concludes that this is an area where users need to be advised of requirements in the referenced articles regarding generators that are sometimes installed in out buildings.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-65 Log #518 NEC-P05 **Final Action: Reject**
(250.34)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 5-126
Recommendation: Accept the proposal.
Substantiation: Same as proposal. According to the definition of "Grounded" in

Article 100, the generator frame is a conducting body that serves in place of the earth. Unless the frame is considered grounded, and one conductor is bonded to the frame there is no ground fault current return path, no grounded (white) conductor, no equipment grounding conductor (by definition), and devices with terminals intended for connection to grounded (white) conductors or grounding conductors cannot be used.
Panel Meeting Action: Reject
Panel Statement: The frame of a generator is not considered to be grounded if not connected to a grounding electrode, based on the definition of "grounded" as accepted by CMP-5 and published in the Report on Proposals. In addition, 250.34(D) of the 2005 NEC requires the system conductor required to be grounded by 250.26 to be bonded to the frame of the generator that is a component of a separately derived system. This connection provides the ground-fault return path.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-66 Log #494 NEC-P05 **Final Action: Reject**
(250.34(B))

Submitter: Richard D. Thompson, Thompson Assoc.
Comment on Proposal No: 5-127
Recommendation: Revise as follows:

250.34(B) Vehicle-Mounted Generator. The frame of a vehicle shall not be required to be connected to a grounding electrode as defined in 250.52 for a system supplied by a generator located on this vehicle under the following conditions:

(1) The frame of the generator is bonded to the vehicle frame, and

(2) The generator supplies only equipment located on the vehicle, ~~or~~ cord-and-plug connected equipment supplied through receptacles, or through single-pole separable connectors mounted on the vehicle, or both equipment located on the vehicle ~~and~~ cord-plug-connected equipment, or through single-pole separable connector receptacles mounted on the vehicle or on the generator, and

(3) The non-current carrying metal parts of the equipment and the equipment grounding conductor terminals of the receptacles are bonded to the generator frame.

(4) Where the service provided by the generator supplies equipment that is located, installed or adjacent to other derived electrical services; the ground of the generator and that of the other derived system shall be bonded.

Substantiation: While this section of the NEC may have originally been written to cover small engine generators or welding/generator machines installed in work trucks; more recently we find that larger truck mounted or towed vehicle mounted generators ranging from 5.0 KW (17.5) AMPS at 120 VOLTS to trailer mounted generators in capacities up to 4000 KW (12040) AMPS at 240 VOLTS. Typically, these generators provide voltages at 120/208 volts or 120/240 volts AC or supply a transformer with voltages suitable to the service required. Some have a rectifier to provide a 110 Volt DC voltage, but this requirement, by the motion picture industry, is being phased out as the use of carbon arc luminaires are obsolete.

Besides construction sites, these generators are commonly used in a number of entertainment industry applications such as on location motion picture and television productions, outdoor concerts or theatrical events, carnivals, circuses and fairs. These generator assemblies will also be found as emergency back-up power for cell phone towers, other communication installations, emergency lighting, rescue equipment, etc. during failure of the utility supplied power such as immediately following an earthquake, or hurricanes.

The question as to whether or not there is a requirement for installing a ground rod needs to now be clarified. The City of Los Angeles does not require the installation of a ground rod for motion picture production. However, the industry finds that when the same production moves it location to another jurisdiction they may be required to install a ground rod. Investigation within the carnivals has found that the requirement of installing a ground rod and its later removal have created more workers compensation claims due to accidents in the removal of the rod than any other claims.

At a 2003 Southern California Section meeting of the International Association of Electrical Inspectors that was chaired by this submitter, the question of ground rods was discussed. Some AHJs present at the meeting would accept a "floating ground" while others were adamant that within their jurisdiction there shall be a ground stake in the ground. The same organization held another meeting in 2004 where a representative of UL explained that if the service was cord and plug connected a ground rod was not required.

There was a question as to whether or not the single-pole separable connectors commonly known as "Cam-Lock" connectors were considered a "plug". These devices fall under UL "Receptacles Stage Type" (RUFR) and UL 1681 Standard. An interpretation by a representative of Underwriters Laboratories has stated that the single-pole separable connector is defined as a plug.
Panel Meeting Action: Reject
Panel Statement: The addition of "single-pole separable connectors" is unnecessary and confusing. The addition of the fourth condition is incorrect because generators do not meet the definition of Service.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-67 Log #1797 NEC-P05 **Final Action: Accept in Principle**
(250.35)

Submitter: Mark R. Hilbert, Wolfeboro, NH
Comment on Proposal No: 5-128
Recommendation: Accept the proposal in principle and revise to read:

Permanently Installed Generators. A conductor that provides an effective ground fault current path shall be installed with the supply conductors from a permanently installed generator(s) to the first disconnecting means in accordance with (A)(1) or (2) and (B)(1) or (2).

(A) Bonding Means.

(1) Where the generator is installed as a separately derived system the requirements in 250.30 shall apply.

(2) Where the generator is not installed as a separately derived system an equipment bonding jumper shall be installed between the generator equipment grounding terminal and the equipment grounding terminal or bus of the first disconnecting means enclosure.

(B) Equipment Bonding Jumper Size.

(1) Where installed on the supply side of the first overcurrent device, the conductor shall be sized in accordance with 250.102(C) based on the size of the derived phase conductors.

(2) Where installed on the load side of the first overcurrent device the conductor shall be sized in accordance with 250.102(D).

Substantiation: I agree with Mr. Mello in his negative comment in that this is an area where guidance is necessary and it could be a safety issue. How to ground the non-current carrying parts of a permanently installed generator that is operating as non-separately derived system is a common question. There is little guidance to provide a definitive answer. This new text attempts to consider the panel's concern regarding re-grounding of the grounded conductor while following the path set forth in 2002 with 250.30(A)(2). The above proposed text considers both the submitters recommendations and Mr. Mello's recommendations in his negative vote comment. The language regarding the metal to metal attachment of the disconnecting means enclosure and the raceway systems was purposely left out of the proposed text. I had concerns with evaluating the suitability of the metal to metal contact and not including the metallic raceway systems seemed to be in line with the action taken in 250.30(A)(2) in 2002. The reference towards using the grounded conductor as the bonding means was also purposely left out as the panel seems to be migrating toward not using the grounded conductor for that purpose. A reference to the use of the grounded conductor could be added if deemed appropriate. The proposed text may need additional work, but hopefully it will provide a benchmark for the panel to develop a clear requirement to address a very real issue.

Panel Meeting Action: Accept in Principle

Revise the 250.35 text from Comment 5-67 to read as follows:

250.35 Permanently Installed Generators. A conductor that provides an effective ground-fault current path shall be installed with the supply conductors from a permanently installed generator(s) to the first disconnecting mean(s) in accordance with (A) or (B).

(A) Separately Derived System. Where the generator is installed as a separately derived system, the requirements in 250.30 shall apply.

(B) Non-separately Derived System. Where the generator is not installed as a separately derived system, an equipment bonding jumper shall be installed between the generator equipment grounding terminal and the equipment grounding terminal or bus of the enclosure of supplied disconnecting mean(s) in accordance with (1) or (2).

(1) The equipment bonding jumper on the supply side of each generator overcurrent device shall be sized in accordance with 250.102(C) based on the size of the conductors supplied by the generator.

(2) The equipment grounding conductor on the load side of each generator overcurrent device shall be sized in accordance with 250.102(D) based on the rating of the overcurrent device supplied.

Panel Statement: Editorial revisions were made for clarity.

5-68 Log #2080 NEC-P05 **Final Action: Accept in Principle**
(250.35 (New))

Submitter: Chuck Mello, Underwriters Laboratories
Comment on Proposal No: 5-128
Recommendation: Revise proposed text to read as follows:
250.35 Permanently Installed Generators. A means that provides an effective ground fault current path shall be installed from a permanently installed generator(s) to the enclosure for the first disconnecting means in accordance with 250.35(A) and (B).

250.35(A) Bonding Means. Where the generator is a separately derived system the requirements in 250.30 shall apply. Where the generator is not a separately derived system, the generator shall be bonded to the disconnecting means enclosure by one of the following:

(1) Direct metal-to-metal attachment of the disconnecting means enclosure to the generator frame

(2) Installing the generator feeder conductors in rigid metal conduit, intermediate metal conduit, electrical metallic tubing or wireway

(3) Installing a wire type equipment bonding jumper between the generator terminal enclosure and the first disconnecting means enclosure.

250.35(B) Equipment Bonding Jumper Size. Where on the supply side of the generator overcurrent device, the conductor shall be sized in accordance with 250.102(C) based on the size of the derived phase conductors. Where on the load side of the overcurrent device, the conductor shall be sized in accordance with 250.102(D).

Substantiation: The substantiation provided by the submitter for the proposal clearly indicates a significant safety problem and also an area where the NEC is lacking guidance. There are clear requirements for connection of generators that are in fact separately derived systems but there is no direction on all the connections for non-separately derived systems for permanently installed units. This is particularly true when large generators are installed in parallel to separate paralleling switchgear, which contain both the generator disconnecting means and overcurrent protection. What are the requirements for connecting the generator frame to this switchgear enclosure since it is ahead of the overcurrent protection? This is the same case the panel clarified in the 2002 NEC for separately derived systems with the added equipment bonding jumper between the derived system and the first disconnecting means enclosure. While I agree with the panel's desire not to create another situation where the system grounded conductor is connected to ground again, creating possible parallel paths, the panel should have considered revised language to address the problem. The proposed language above does address this issue and does address the panel's concern about reconnecting the grounded conductor to ground.

Panel Meeting Action: Accept in Principle

Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-69 Log #1861 NEC-P05 **Final Action: Accept in Principle**
(250.36)

Submitter: Mike Holt, Mike Holt Enterprises, Inc.
Comment on Proposal No: 5-133
Recommendation: Accept the Proposal with the following changes:

250.36 High-Impedance Grounded ~~Neutral~~ Systems. High-impedance grounded neutral systems in which a grounding impedance, usually a resistor, limits the ground-fault current to a low value shall be permitted for 3-phase ac systems of 480 volts to 1000 volts where all the following conditions are met:

(1) Remain unchanged.
(2) Remain unchanged.
(3) Remain unchanged.
(4) Remain unchanged.

High-impedance grounded ~~neutral~~ systems shall comply with the provisions of 250.36(A) through (G).

(A) Grounding Impedance Location. The grounding impedance shall be installed between the grounding electrode conductor and the system neutral point. Where a neutral point is not available, the grounding impedance shall be installed between the grounding electrode conductor and the neutral point derived from a grounding transformer.

(B) ~~Neutral~~ Conductor. The ~~neutral~~ conductor from the neutral point of the transformer or generator to its connection point to the grounding impedance shall be fully insulated.

The ~~neutral~~ conductor shall have an ampacity of not less than the maximum current rating of the grounding impedance. In no case shall the ~~neutral~~ conductor be smaller than 8 AWG copper or 8 AWG aluminum or copper-clad aluminum.

(C) System Neutral Connection. The ~~system neutral~~ conductor shall not be connected to ground except through the grounding impedance.

FPN: Remain unchanged.

(D) ~~Neutral~~ Conductor Routing. The conductor connecting the neutral point of the transformer or generator to the grounding impedance shall be permitted to be installed in a separate raceway. It shall not be required to run this conductor with the phase conductors to the first system disconnecting means or overcurrent device.

(E) Remain unchanged.
(F) Remain unchanged.
(G) Remain unchanged.

Substantiation: Mr. Mello's statements at the proposal stage are 100 percent correct. The accepted definition (at the ROP stage) does not include the conductor being described in this Code section. The conductor described here does not carry current under normal conditions... it carries current under fault conditions. A fault is not a normal condition. Whatever you call this conductor it most certainly can't be called a neutral, if the accepted definition of "neutral" continues to pass in Article 100.

A similar comment is being made to the proposed definition of "neutral conductor" (5-36) that would allow the technical committees to change the proposed definition so that it doesn't conflict with all of section 250.36. These two comments should be correlated so the discrepancy between this section and the definition does not occur.

Panel Meeting Action: Accept in Principle
Revise 236.36 in the 2008 NEC ROP Draft as follows:

250.36 High-Impedance Grounded Neutral Systems.

High-impedance grounded neutral systems in which a grounding impedance, usually a resistor, limits the ground-fault current to a low value shall be permitted for 3-phase ac systems of 480 volts to 1000 volts where all the following conditions are met:

(1) The conditions of maintenance and supervision ensure that only qualified persons service the installation.
(2) Ground detectors are installed on the system.
(3) Line-to-neutral loads are not served.

High-impedance grounded neutral systems shall comply with the provisions of 250.36(A) through (G).

(A) Grounding Impedance Location. The grounding impedance shall be installed between the grounding electrode conductor and the system neutral point ~~conductor~~. Where a neutral point ~~conductor~~ is not available, the grounding impedance shall be installed between the grounding electrode conductor and the neutral point derived from a grounding transformer.

(B) Grounded System ~~Neutral~~ Conductor. The grounded system ~~neutral~~ conductor from the neutral point of the transformer or generator to its connection point to the grounding impedance shall be fully insulated. The grounded system ~~neutral~~ conductor shall have an ampacity of not less than the maximum current rating of the grounding impedance. In no case shall the grounded system ~~neutral~~ conductor be smaller than 8 AWG copper or 6 AWG aluminum or copper-clad aluminum.
(C) System Grounding ~~Neutral~~ Connection. The system ~~neutral conductor~~ shall not be connected to ground except through the grounding impedance. FPN: Remain Unchanged.
(D) Neutral Point to Grounding Impedance Conductor Routing. The conductor connecting the neutral point of the transformer or generator to the grounding impedance shall be permitted to be installed in a separate raceway from the ungrounded conductors. It shall not be required to run this conductor with the phase conductors to the first system disconnecting means or overcurrent device.
(E) Remain Unchanged
(F) Remain Unchanged
Panel Statement: Editorial changes are made for consistency with Comments 5-70 and 5-71. The title is not changed because these systems have a neutral point.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-70 Log #2071 NEC-P05 **Final Action: Accept in Principle (250.36(A))**

Submitter: Chuck Mello, Underwriters Laboratories
Comment on Proposal No: 5-133
Recommendation: Revise the proposed text to read as follows:
250.36(A) Grounding Impedance Location. The grounding impedance shall be installed between the grounding electrode conductor and the system neutral point. Where a neutral point is not available, the grounding impedance shall be installed between the grounding electrode conductor and the neutral point derived from a grounding transformer.
Substantiation: The panel action should have been to accept in principle. Changing the term "neutral" to "neutral conductor" is incorrect in accordance with the definition of the term "neutral conductor" accepted by the panel. Since this conductor is not expected to carry current, unbalanced or from non-linear loads, under normal conditions, then it cannot be called a neutral conductor. Adding the term "neutral point" is clearer and bypasses the necessity of naming this conductor, which may really be a bonding conductor or another variation of a grounding conductor.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 5-69.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-71 Log #2076 NEC-P05 **Final Action: Accept in Principle (250.36(D))**

Submitter: Chuck Mello, Underwriters Laboratories
Comment on Proposal No: 5-134
Recommendation: Revise 250.36(D) to read as follows:
~~Neutral~~ Conductor Routing. The conductor connecting the neutral point of the transformer or generator to the grounding impedance shall be permitted to be installed in a separate raceway. It shall not be required to run this conductor with the phase conductors to the first system disconnecting means or overcurrent device.
Substantiation: In this case, just deleting the term "neutral" from the section title is the best solution. The specific conductor being addressed is clarified by the first part of the first sentence, which states "The conductor connecting the neutral point of the transformer or generator to the grounding impedance", and does not need any additional label. The term neutral conductor as defined now is to carry current under certain normal conditions and in this application, the only time this conductor has current flow is under ground fault (abnormal) conditions.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 5-69.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-72 Log #1024 NEC-P05 **Final Action: Reject (250.50)**

Submitter: David Shapiro, Safety First Electrical Contracting Consulting & Safety Education
Comment on Proposal No: 5-135
Recommendation: Add between the two sentences presently constituting 250.50:
"...electrode system. An electrode or electrodes fulfilling the requirement in 250.52(A)(3) shall be installed in any construction utilizing one or more new concrete footings whose dimensions would permit their installation. Where none of these are...".
Substantiation: Mr. Whitehead has provided ample substantiation in terms of improved safety in the City of Macon. Many jurisdictions, in Maryland and other places, have local amendments requiring the installation of concrete-encased electrodes in new construction, based on the work of Mr. Herbert Ufer and on less-than-satisfactory results from other means of establishing grounding electrode systems. The proposed clarification of wording and location should satisfy the CMP's concern about format.
Panel Meeting Action: Reject
Panel Statement: The additional language suggested would add a requirement to install a structural component. The intent of this section is to mandate the use of appropriate structural components, when they exist, as grounding electrodes.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-73 Log #1025 NEC-P05 **Final Action: Accept (250.50)**

Submitter: David Shapiro, Safety First Electrical Contracting Consulting & Safety Education
Comment on Proposal No: 5-136
Recommendation: Reject this proposal.
Substantiation: I agree with Mr. Brender that using the earth as a means of maintaining an equal potential between the piers or foundation elements is undesirable. There is no harm in using encapsulated rebar for all but one section of concrete. If Proposal 5-135 is accepted as I suggested in my comment on that, the installation still will not lose out on having this preferable form of grounding electrode.
Panel Meeting Action: Accept
Panel Statement: The submitter wants the proposal rejected, which was the action of the panel in ROP. The panel continues to reject Proposal 5-136. This substantiation appears to be for Proposal 5-137, which also has a comment from submitter.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-74 Log #1060 NEC-P05 **Final Action: Reject (250.50)**

Submitter: David Shapiro, Safety First Electrical Contracting Consulting & Safety Education
Comment on Proposal No: 5-137
Recommendation: I urge that you do not Accept nor Accept in Principle.
Substantiation: Mr. Brender's concern should not be overlooked. There is no evidence that builders eliminate all potential concrete-encased electrodes where their bonding is required. I certainly have heard nothing to this effect from AHJs in my area where Ufers are required. Indeed, the hardship of having to bond rebar can be eliminated by using encapsulated rebar, a better system-but a more-expensive one! Furthermore, if Mr. Whitehead's proposal is accepted as I propose rewording it in my comment on Proposal 5-135, we retain the benefit and reduce the risk that concerns Mr. Jones, one usable Ufer will remain.
Panel Meeting Action: Reject
Panel Statement: The permissive language in this proposal would not preclude designer and builders from bonding multiple concrete-encased electrodes together.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
BRENDER, D.: The action on the Proposal to Accept in Principle should be reversed. Where more than one concrete encased electrode exists in the foundation for the building or structure, they should all be bonded together. If this is not done, dangerous voltages can be impressed between metallic portions of the buildings or structures that are connected to grounding electrodes that are not bonded together.

5-75 Log #1909 NEC-P05 **Final Action: Reject (250.50)**

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 5-138
Recommendation: Continue, in effect, to accept the proposal in principle (even though it was erroneously rejected). The concept of the multiple concrete-encased electrodes only needing a single connection (II of the proposal) has been accepted under Proposal 5-137. The concept of a concrete-encased electrode bonded to a steel column (I of the proposal) appears to have been accepted in the panel action on Proposal 5-148.

Substantiation: Please reconsider the proposal and double check to be sure that the concepts are indeed included, particularly the allowance to allow structural steel as a sufficient bonding path to a concrete-encased electrode. Many foundation designs show the reinforcing steel members tightly secured to the J bolts holding the steel columns. We routinely review this during inspections.
Panel Meeting Action: Reject
Panel Statement: Proposal 5-138 has multiple requirements that were rejected by the Code panel. No additional substantiation was provided for reconsideration.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-76 Log #382 NEC-P05 **Final Action: Reject**
(250.50, FPN (New))

Submitter: James D. Erwin, Celanese Ltd
Comment on Proposal No: 5-135
Recommendation: Add FPN to 250.50 to read:
"FPN: For new construction, buildings or structures requiring rebar or rods (concrete-encased electrodes) shall include the rebar or rods as part of the grounding electrode system, regardless if other grounding electrodes are available."
Substantiation: The Article does not clearly address new construction. The second sentence of 250.50 specifies that where no grounding electrodes exist, listed specific requirements must be installed and used. Assuming no grounding electrodes exist with new construction, this seems to imply that the second sentence requirement is sufficient. The addition of the FPN will add clarity.
Panel Meeting Action: Reject
Panel Statement: The proposed text does not comply with 3.1.3 of the NEC Style manual, since it uses mandatory text in the FPN.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-77 Log #609 NEC-P05 **Final Action: Reject**
(250.50(A))

Submitter: Paul Guidry, Fluor Enterprises, Inc
Comment on Proposal No: 5-153
Recommendation: Add new text:
250.50(A): For engineered, supervised industrial installations it shall be permissible to eliminate the bonding of the concrete-encased steel reinforcing bars in foundations to the grounding electrode system where it has been determined corrosion of the steel reinforcing bars will occur due to galvanic corrosion.
FPN: Refer to NACE Standard Recommended Practice RP0290-2000. Item No. 21403, Impressed Current Cathodic Protection of Reinforcing Steel In Atmospherically Exposed Concrete Structures, for more information regarding steel corrosion and other deterioration phenomena associated with concrete.
Substantiation: I disagree with the panel statement that "there are methods of bonding the concrete-encased grounding electrode to the grounding electrode system that would minimize or eliminate any possibilities of corrosion due to galvanic reactions". This implies that there is a pressure connector or an exothermic connection that reduces corrosion. I'm not aware of a UL 467 listed, dielectric electrical connector. If this is a true statement, can the panel please refer to a document such as NEMA, NFPA or IEEE where this is covered?

There are indeed methods to minimize or eliminate the possibility of corrosion of the rebar and it's usually referred to as "cathodic protection" systems. Adding a cathodic protection system to the rebar has nothing to do with bonding methods. Cathodic protection systems can add a great deal of cost to a project when the rebar didn't need to be bonded to the copper to begin with. When this revision was made in the 2005 Code, (Proposal 5-115 and Comment 5-77) there was no substantiation given as to a history of problems in using copper rods and cable alone for a grounding electrode system.

The other part of the cost issue is the amount of rebar that would need to be bonded. According to the words in 250.50 today, all rebar in pile caps, small pump foundations, i.e., any concrete slab with more the 20 ft of 1/2 in. rebar has to be bonded to the copper grounding electrode system. This is impractical as well as costly. If bonding all this rebar to the copper grounding electrode system served a real safety purpose, then cost wouldn't be an issue. But, in industrial plants where the specifications typically require less the 5 ohms resistance, bonding all the rebar doesn't make it a safer installation.

I agree with the panel that for most commercial or residential installations that the rebar should be part of the grounding electrode system. But, in large, engineered, petrochemical plants with a copper rod/cable grounding electrode system this is unnecessary. I've modified the text to allow this exception to apply to engineered, industrial installations only.

The Code states in Article 90 that the NEC isn't a design guide. This is a design issue, not a safety issue. Engineering judgment should prevail in some instances and I believe this is one of them.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its original actions on Proposal 5-153. Concrete-encased electrodes that are an inherent element of the building construction are natural grounding electrodes that are required to be included as part of the grounding electrode system as required in 250.50. There has been no substantiation provided that indicates corrosion in building footings is a problem directly related to connecting a copper conductor to a length of steel reinforcing rod. The submitter has provided no substantiation that indicates equivalent safety can be achieved in supervised industrial installations by eliminating a natural and present grounding electrode from the required grounding electrode system.

(250.52(A)(1))

Submitter: Andre R. Cartal, Princeton Borough Building Dept.
Comment on Proposal No: 5-146
Recommendation: Please accept the proposal to add the word "institutional."
Substantiation: The panel comment "CONCLUDES" that institutional buildings are INCLUDED, but the Panel's comment doesn't count as they REJECTED the proposal.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 11 Negative: 4
Explanation of Negative:

BRETT, JR., M.: I am voting negative, I agree with the negative votes. The term "institutional" is well understood, however, I do not believe a special allowance should be permitted. Most facilities such as a school campus or a military base have multiple occupancies and each should be individually classified by use, occupancy and safety hazards to personnel when determining the proper electrical installation methods.

HAMMEL, D.: The current wording is used in exceptions throughout the NEC. The use of the term "institutional" as an occupancy variance from a main rule should have a broad consensus throughout the NEC.

MELLO, C.: Adding the word "institutional" resolved one submitter's issue but now raises the greater issue of how many "occupancy types" will the panel be requested and have to debate about adding to this ever growing list. Also see my statement for Comment 5-81.

MOHLA, D.: This proposal to add term "institutional" should be rejected otherwise it will become a laundry list of various terms.
The term "institutional" is not defined in the National Electrical Code. Addition of this term to the code would create confusion to what is an "institution" and what does it cover?
Does it cover educational institutions only? Or does it cover other institutional installations such as correctional facilities, health care etc.? How is it ensured that maintenance work has not been out sourced at such facilities? AHJ has the final jurisdiction to confirm. If conditions of maintenance and supervisions ensure only qualified personnel will perform the electrical work similar to the conditions in industrial and commercial installations. This cannot be a laundry list of locations where such provisions apply and final decision has to be by AHJ on a case by case basis.

5-81 Log #2081 NEC-P05 **Final Action: Reject**
(250.52(A)(1))

Submitter: Chuck Mello, Underwriters Laboratories
Comment on Proposal No: 5-146
Recommendation: Delete the terms "industrial and commercial" from the existing text to read as follows:

250.52(A)(1) Exception: In ~~industrial and commercial~~ buildings or structures where conditions of maintenance and supervision ensure that only qualified persons service the installation, interior metal water piping located more than 1.52 m (5 ft) from the point of entrance to the building shall be permitted as a part of the grounding electrode system or as a conductor to interconnect electrodes that are part of the grounding electrode system, provided that the entire length, other than short sections passing perpendicular through walls, floors, or ceilings, of the interior metal water pipe that is being used for the conductor is exposed.

Substantiation: The panel should have acted to Accept in Principle and revise the existing text to delete the terms "industrial and commercial". The problem raised by the submitter is common when there are NEC definitions for some types of buildings and there are Building Code definitions and names that are different from the NEC. The panel's statement is correct that the intent is to include "institutional" buildings in the group of "industrial and commercial". The question for the panel is what other type of occupancies are intended to be included that is now open to wide interpretation? The real question that needs to be asked is if the building type, industrial, commercial, health care facility, institutional, multi-family dwelling, multiple occupancy, etc. matters where the key qualifier is having continuous maintenance and supervision that ensures the original system is not impaired through actions of other trades over the building or structures life. If the qualified staff and supervision are present then the building or business type really would not appear to matter. Deleting the qualifier "industrial and commercial" altogether would be a better alternative than adding "institutional" as proposed and continue the list building evolution that will assuredly come.
Panel Meeting Action: Reject
Panel Statement: The removal of "industrial and commercial" from the exception would allow the exception to be applied in a residential occupancy. The current wording is used throughout the NEC. There is no technical substantiation that a problem exists with the current wording.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:

BRETT, JR., M.: I am voting negative, I agree with the negative voter. See my explanation of vote on Comment 5-80.

MELLO, C.: As stated in the substantiation for the comment, the real concern is that a properly qualified maintenance management staff or system be in place to ensure other trades do not disturb the water piping and thereby open the "ground" reference where used as an extended grounding electrode. In reality, the type of occupancy does not matter and by continuing to establish and use undefined occupancy types as a qualifier will only garner more proposals for adding to the list. The great concern identified for "residential" or "dwellings" is easily covered by having to convince the AHJ that the owner has "qualified maintenance and supervision" to maintain the integrity of the system. Even for the "institutional" occupancy that was added for the university cited in the proposal substantiation, does this also include the residence halls that are technically residential type occupancies? I would think it does since the same maintenance staff oversees these buildings as well as the classroom and laboratory buildings. Does a high-rise building with multiple floors of retail and office space topped by several stories of condominiums qualify as a "commercial" building or does the residential aspect disqualify the entire structure from using the exception. What about a small manufacturing "industrial" plant that has the owner residing above the plant office. The comment submitted should have been considered by the panel to really highlight the requirement for "qualified maintenance and supervision" and eliminate the undefined type of building use.

5-82 Log #1033 NEC-P05 **Final Action: Reject**
(250.52(A)(1) Exception)

Submitter: David Shapiro, Safety First Electrical Contracting Consulting & Safety Education
Comment on Proposal No: 5-146
Recommendation: Revise text to read as follows:

"In ~~industrial and commercial~~ buildings or...".

Substantiation: The operant terms are "where conditions of maintenance and supervision ensure...".

To take the most extreme example, Mr. Cartal talks of a college campus, but let's look at their dormitories; these are parts of institutions that serve as residences, and moreover residences occupied by often-immature people. Nonetheless, where the AHP can be convinced that conditions of maintenance and supervision ensure that only qualified persons will have dealings with the GEC connections, the degree of safety may be comparable to or better than that in a store basement.
Panel Meeting Action: Reject

5-83 Log #345 NEC-P05 **Final Action: Reject**
(250.52(A)(2))

Submitter: Edward G. Kroth, Westphal & Company Electrical Construction
Comment on Proposal No: 5-149
Recommendation: Revise text to read as follows:

(2) Effectively Grounded Metal Frame of the Building or Structure. The metal frame of the building or structure shall be considered effectively grounded when it is connected to earth in either of the following methods. ~~where any of the following methods are used to make connection to earth.~~

Substantiation: As an instructor in IBEW Local 159's night school program, I have found that having the phrase "Effectively Grounded" as part of the previous code edition helped to reinforce the concept that not all building steel is necessarily a grounding electrode.

Moreover, I do not agree with the panel's statement that the term "effectively grounded" is vague and unenforceable in this case. Effectively has a definition of "producing the expected results." In this instance, the expected result is to provide a permanent and low impedance path to ground. The adverb is appropriate because the emphasis is necessary in order to distinguish the difference between metal structural framing that is a grounding electrode and that which is not. (I've seen experienced electricians confuse the two types all too often.)

Due to the criteria set out in 250.52(A)(2), the term "effectively grounded" is no longer vague and unenforceable. 250.52(A)(2)(1) through (4) as it exists in the '05 NEC and (1) through (3) as it exists in the panel's response to Mr. Johnston's Proposal 5-148 in the current ROP in effect defines the term "effectively grounded" metal frames of a building or structure and in my mind gives clear separation from the structural metal referred to in 250.104(C).

Using the phrase "effectively grounded metal frame" certainly rolls off the tongue easier than having to say "metal frame of the building or structure that satisfies the criteria of 250.52(A)(2)".
Panel Meeting Action: Reject
Panel Statement: The term "effectively grounded" is subjective, and there are no specific parameters by which one can judge something to be "effectively grounded." CMP-5 deleted the definition of this term for this reason under the scope and work of the TCC-assigned task group on grounding and bonding. See panel action and statements on Proposal 5-12 (Log. No. 1516).
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-84 Log #1283 NEC-P05 **Final Action: Reject**
(250.52(A)(2))

Submitter: Michael P. O'Quinn, MOGO Enterprises, Inc.
Comment on Proposal No: 5-148
Recommendation: Revise text to read as follows:

(2) Metal Frame of the Building or Structure. The metal frame of the building or structure, where ~~any of the following methods are used to make an earth connection~~:

~~(1)~~ 3.0 m (10 ft) or more of a single structural metal member in direct contact with the earth or encased in concrete ~~that~~ is in direct contact with the earth.

~~(2) The structural metal frame is bonded to one or more of the grounding electrodes as defined in 250.52(A)(1). (A)(3), or (A)(4)~~
~~(3) The structural metal frame is bonded to one or more of the grounding electrodes as defined in 250.52(A)(5) or (A)(6) that comply with 250.56, or~~
~~(4) Other approved means of establishing a connection to earth.~~
FPN: See 250.104(C) for required bonding.

Substantiation: The problem with this Section deals with the definition of a grounding electrode introduced in the 2005 NEC®. "A device that establishes an electrical connection to the earth." Simply put, if the possible electrode relies on another electrode to fulfill this definition, it is not an electrode.

I think we are confusing a grounding electrode - a device used to fulfill 250.4(A)(1), 250.4(A)(2), and 250.4(B)(1) to establish a ground reference - with the bonding requirements of 250.104(C), which fulfllls 250.4(A)(3), 250.4(A)(4), 250.4(B)(2), and 250.4(B)(3) keeping building steel at ground-level voltage.

The examples given by the submitter, as well as Mr. Rappaport in his Explanation of Negative, refer to using a "real" grounding electrode to make building steel one. This does fulfill 250.104(C), but requires building steel to be "supplemented" in most cases with another real electrode, essentially having the same requirements as metal water piping, without the wording. This gives the false belief that building steel establishes the ground reference, but actually the ground rod or concrete-encased electrode does - building steel is just bonded.

The addition of the fine print note will remind the installer of the bonding requirement.

Panel Meeting Action: Reject
Panel Statement: The commenter has proposed, without substantiation, eliminating viable grounding practices. While the comment may be attempting to ensure that the language of 250.52 is semantically correct, editorial changes of this type require corresponding correlating changes in other Code sections to ensure that the existing Code rules are not affected. The panel action on Proposal 5-146 addressed the concerns of the submitter by removing the conflict with the water pipe electrode supplement requirements created in the 2005 NEC cycle. The panel retained former (4) as a renumbered (3) to recognize other approved means of establishing a connection to the earth through the metal building frame.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-85 Log #1521 NEC-P05 **Final Action: Accept**
(250.52(A)(2))

Submitter: Jeffrey Boksiner, Telcordia Technologies, Inc. / Rep. Alliance for Telecommunications Industry Solutions
Comment on Proposal No: 5-148
Recommendation: Modify 250.52(A)(2) resulting from Panel Action on Proposal 5-148 as follows:

(2) Metal Frame of the Building or Structure. The metal frame of the building or structure that is connected to the earth by either of the following methods:

(1) 3.0 m (10 ft) or more of a single structural metal member in direct contact with the earth or encased in concrete that is in direct contact with the earth

(2) The structural metal frame is connected to the reinforcing bars of a concrete-encased electrode as provided in 250.52(A)(3) or 250.52(A)(4).

(3) The structural metal frame is bonded to one or more of the grounding electrodes as defined in 250.52(A)(5) or (A)(6) that comply with 250.56, or

(4 ~~3~~) Other approved means of establishing a connection the earth.

Substantiation: Panel Action on proposal 5-148 removed the possibility of using metal frame of the building or structure as a grounding electrode where the metal frame is connected to other acceptable grounding electrodes. This comment would restore the permission to consider the metal frame of a building or structure as a grounding electrode if it is connected to a ground ring or made electrodes.

The substantiation in the proposal was related to connections to water pipes and supplemental electrodes. The problem described in the substantiation can be solved completely by removing reference to 250.52(A)(1) in item 2. This comment retains this deletion. There was no substantiation for deletion of a connection to a ground ring or other electrodes. Use of metal frame of a building or structure connected to a ground ring or a field of made electrode as grounding electrode has been a long-standing practice used when extensive contact with earth and good shielding is required for facilities.
Panel Meeting Action: Accept

Modify 250.52(A)(2) resulting from panel action on Proposal 5-148 as follows:

(2) Metal Frame of the Building or Structure. The metal frame of the building or structure that is connected to the earth by any of the following methods:

(1) By 3.0 m (10 ft) or more of a single structural metal member in direct contact with the earth or encased in concrete that is in direct contact with the earth

(2) By connecting the structural metal frame to the reinforcing bars of a concrete-encased electrode as provided in 250.52(A)(3) or ground ring as provided in 250.52(A)(4)

(3) By bonding the structural metal frame to one or more of the grounding electrodes as defined in 250.52(A)(5) or (A)(6) that comply with 250.56, or

(4 ~~3~~) By other approved means of establishing a connection to earth.

Panel Statement: Only editorial corrections were made to this recommended text.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:

JOHNSTON, M.: The panel action confirms that structural steel that is only grounded to the metal water system should not be considered as a grounding electrode. Metal water systems are required to be supplemented by another electrode to be considered a grounding electrode and should not be allowed to be the only qualifier for structural steel to become a grounding electrode. This was inadvertently incorporated in the 2005 edition in error.

The panel action on Comment 5-85 has not addressed the primary objectives of Proposal 5-148. All grounding electrodes listed in 250.52(A) should meet the criteria in the revised definition of the term grounding electrode in Article 100. This definition, as revised by Proposal 5-14, clearly indicates that grounding electrodes are in direct contact with the earth. The panel actions on Comment 5-148 to restore item (3) contradicts what constitutes a grounding electrode, by definition. A grounding electrode should not require being connected to another electrode to become a grounding electrode. As accepted, this is what item (3) allows.

Information provided in the substantiation to Comment 5-148 indicated a need to introduce additional provision that will recognize interconnected metallic building frames as serving as a conductive path to ground through the electrodes in 250.52(A) to which it is connected. The resulting action on Comment 5-85 and Proposal 5-148 clearly indicate a need for new provisions in the 2011 NEC that will adequately address current industry practices of using structural metal building frames as grounding electrodes, even when they do not qualify as grounding electrodes by definition.

MELLO, C.: The efforts of the TCC Grounding and Bonding Task Group were to clarify terminology and to ensure correct application. This panel action goes against those efforts. There is a clear definition of what a "grounding electrode" is in Article 100 and that is expanded on in 250.52 with specifics. 250.52(A)(2)(1) is clearly a grounding electrode all by itself and historically is what was meant by the old terminology "effectively grounded structural metal". 250.52(A)(2)(2) in the first part, with the rebar in the support footings connected to the frame, also provides the structural metal columns and interconnecting beams as a grounding electrode unto itself. To now say that something is a grounding electrode because it is connected to something else that really is a grounding electrode is illogical and can create great confusion to installers and AHJs. One of the accepted substantiations to redefine the structural metal electrode in the 2005 cycle was that the bonding of the structural metal to the service as required in 250.104 does not then make the structural metal a grounding electrode. While I agree that the structural metal frame of a building may be the best conductor to get to the grounding electrode, when the structural metal frame is itself not a grounding electrode, the fact is that it is a conductor and to call it a "grounding electrode" is incorrect.

5-86 Log #381 NEC-P05 **Final Action: Accept in Principle**
(250.52(A)(3))

Submitter: James D. Erwin, Celanese Ltd
Comment on Proposal No: 5-152
Recommendation: Accept Proposal 5-152.
Substantiation: Present wording requires concrete-encased electrodes to be located near the bottom of the concrete foundation or footing. There is no technical substantiation for this requirement and it precludes the use of any other type of design without major modification.
Panel Meeting Action: Accept in Principle

(3) Concrete-Encased Electrode. An electrode encased by at least 50 mm (2 in.) of concrete, located horizontally ~~within and~~ near the bottom or vertically, and within that portion of a concrete foundation or footing that is in direct contact with the earth, consisting of at least 6.0 m (20 ft) of one or more bare or zinc galvanized or other electrically conductive coated steel reinforcing bars or rods of not less than 13 mm (1/2 in.) in diameter, or consisting of at least 6.0 m (20 ft) of bare copper conductor not smaller than 4 AWG. Reinforcing bars shall be permitted to be bonded together by the usual steel tie wires or other effective means. Where multiple concrete-encased electrodes are present at a building or structure, it shall be permissible to bond only one into the grounding electrode system.

Panel Statement: The revised text meets the intent of the submitter.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-87 Log #1059 NEC-P05 **Final Action: Reject**
(250.52(A)(3))

Submitter: David Shapiro, Safety First Electrical Contracting Consulting & Safety Education
Comment on Proposal No: 5-135
Recommendation: Add new text as follows:
In any construction utilizing a new concrete footing, at least one concrete-encased electrode shall be constructed.
Substantiation: Mr. Whitehead offers ample substantiation based on Macon's before-and-after experience. The utility of adding such language is borne out by the practice of various other jurisdictions, including a number in Maryland, that have required Ufers in new construction. The language, "In any construction utilizing a new concrete footing..." is intended to make this easier to accept, by reducing the burden on a contractor, with the Ufer requirement added when there's going to be a pour anyway.
Panel Meeting Action: Reject
Panel Statement: There is no additional substantiation to require the installation of a concerte-encased electrode. It is not the intent of this section that a concrete-encased electrode be constructed. Rather it must be used if present.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-88 Log #1047 NEC-P05 **Final Action: Reject**

Submitter: David Shapiro, Safety First Electrical Contracting Consulting & Safety Education
Comment on Proposal No: 5-155
Recommendation: Revise text to read as follows:
(4) ~~Ground Ring.~~ Copper Wire Electrode. At least 6.0 m (20 ft) of bare copper conductor not smaller than 2 AWG ~~ground ring encircling the building or structure, or a grounding lateral~~ in direct contact with the earth.~~, consisting of at least 6.0 m (20 ft) of bare copper conductor not smaller than 2 AWG.~~
FPN: Traditionally, this has been installed in the form of a ring encircling the building or structure.
Substantiation: I agree with Messrs. Don Ganiere and Chuck Mello that since there is no technical substantiation for use of the ring shape, we lack justification for restricting these installations to that design. If ground rings were installed in the form of closed loops, they would enjoy some of the advantages of the British ring wiring of circuits-break a wire in one place and continuity remains from the other direction. However, installers have not been required to install these with their ends bonded together, so this remains a design choice. Hence, the ring shape offers no clearly substantiated advantage over others. I agree with the CMP that there is no strong reason for using the additional term, "grounding lateral."
Panel Meeting Action: Reject
Panel Statement: No substantiation has been provided to remove the provisions for grounding ring electrode from this section. The proposed allowance for not less than 6.0 m (20 ft) of 2 AWG copper in contact with the earth is unsubstantiated as a satisfactory grounding electrode.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-90 Log #2072 NEC-P05 **Final Action: Reject**
(250.52(A)(4))

Submitter: Chuck Mello, Underwriters Laboratories
Comment on Proposal No: 5-155
Recommendation: Revise the text for 250.52(A)(4) as follows:
Ground Ring or Grounding Lateral. A ground ring encircling the building or structure, or a grounding lateral in direct contact with the earth, consisting of at least 6.0 m (20 ft) of bare copper conductor not smaller than 2 AWG.
Substantiation: The panel's statement in rejecting this proposal does not support the panel action. 250.52 and its various subparts are In fact what defines the device or thing that constitutes a grounding electrode. The panel statement that a "ground lateral" is not currently defined is negated by the fact that a "ground ring" is also not currently defined except by 250.5(A)(4) exactly where the submitter wants to add this other option. The panel's statement that there was no substantiation is also incorrect. No more substantiation than the statement that a ground ring is acceptable is needed and is sufficient to what is proposed, otherwise the panel needs to technically substantiate why the ring continues to be accepted and that the proposed "grounding lateral" is not. The IEEE green book and a number of long time engineering practices for telecommunications and power distribution sites (high voltage transmission towers) have recognized the "counterpoise" or "ground lateral", or whatever term is to be used, as a suitable grounding electrode. The proposed "grounding lateral" is no more than the already accepted "ground ring" straightened out instead of being in a circular shape. If 20 feet of 2 AWG copper in a circular shape around a building or structure is acceptable, what is the technical reason for 20 feet of 2 AWG copper buried along side the building or structure or radiating out from one or more sides or corners not acceptable? The same earth contact is achieved at the same burial depth, etc.
Panel Meeting Action: Reject
Panel Statement: The panel maintains that ground ring electrodes are required to encircle the building or structure, and no substantiation has been provided that demonstrates 6.0 m (20 ft) of 2 AWG copper wire in contact with the earth will perform as a satisfactory grounding electrode. The panel maintains that the term "ground lateral" is undefined and would contribute to inconsistent application and interpretations of the Code rules applying to ground ring electrodes. See panel action and statement on Proposal 5-155 and Comment 5-88.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
MELLO, C.: The panel statement fails to technically address the substantiation provided. To continue to say the term "grounding lateral" is not defined, when "ground ring" is also not defined, yet both serve the same function is illogical. Technical substation was provided from industry practice and also from recognized industry standards on this application. It should be noted that NFPA 780 section 4.13.5 for Lightning Protection systems specifically recognizes the "grounding lateral" (their term is a "radial electrode" as a suitable grounding electrode. The amount of earth contact for a wire 20 feet in length buried 30 inches deep is exactly the same if it is in a straight line or if it is in a circle around a building or structure. The panel did not provide a technical response as to why the ground ring continues to be accepted and this proposed and industry recognized alternative is not.

5-91 Log #2251 NEC-P05 **Final Action: Reject**
(250.52(A)(4) (New))

Submitter: Donald A. Ganiere, Ottawa, IL
Comment on Proposal No: 5-155
Recommendation: The panel should accept this proposal.
Substantiation: This proposal should be reviewed in the light of the negative comments of Mr. Mello. I am asking for an additional option for the installation of grounding electrodes. Clearly a 20ft length of bare copper, buried at least 30 in. below grade would be a superior electrode to a single 8ft rod buried horizontally at the same depth as now permitted by 250.53(G).
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 5-90.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
MELLO, C.: See my statement for Comment 5-90.

5-92 Log #446 NEC-P05 **Final Action: Reject**
(250.52(A)(4), FPN (New))

Submitter: Paul Schwartz, FLUOR
Comment on Proposal No: 5-155
Recommendation: Add a new FPN below paragraph 250.52(A)(4) as follows:
FPN: For more information regarding the installation of ground rings, see IEEE 80, Guide for Safety in AC Substation Grounding.
The text may also be added to 250.53(F) if the panel decides it is appropriate.
Substantiation: 250.52(A)(4) allows for ground rings to be installed. The recommended FPN addition will clarify that information on ground rings and ground grids associated with high voltage installations can be found in IEEE 80.
Panel Meeting Action: Reject
Panel Statement: IEEE 80 generally covers installations outside of the scope of the NEC. A reference to IEEE 80 in 250.52(A)(4) is not helpful to the user.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-93 Log #628 NEC-P05 **Final Action: Accept**
(250.52(A)(5))

Submitter: Roger J. Montambo, Glavan Industries, Inc.
Comment on Proposal No: 5-160
Recommendation: Affirmative comment!
Substantiation: This communication is intended to provide technical support and acceptance by offering an "affirmative comment" on panel-5's action to "accept-in-principle" proposed amendment for the 2008 NEC 250.52.A.5, Log #1985. The panel's action very effectively clarifies 250.52 by eliminating potential interpretation errors by the AHJs related to wording, which has been interpreted inconsistently by AHJs nationwide. These changes eliminate confusion, and allow the code to be interpreted for exactly what it is.
We feel that certified or "listed products" further simplify inspections performed by AHJs by acknowledging the "listing mark" during the inspection process. This allows the AHJ to immediately proceed to the next step in the process. It also removes likelihood of misinterpretation due to code wording confusion, thus providing an installation in full compliance of the NEC. How many "non-listed" products are presently permitted in a residential electrical installation?

Galvan is a supporter of the panel's decision to accept in principle paragraph 250.52(A)(5) - as written. This does not eliminate "non-listed" products which may comply with the code, but provides for a means to verify compliance without the need for special tools and/or equipment during the inspection process.

Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-94 Log #2077 NEC-P05 **Final Action: Reject**
(250.52(A)(5))

Submitter: Chuck Mello, Underwriters Laboratories
Comment on Proposal No: 5-156
Recommendation: Revise text of 250.52(A)(5) to read as follows:

250.52(A)(5) Rod-Type and Pipe Electrodes. Rod and pipe-type electrodes shall meet the following requirements:

(a) Pipe or conduit-type electrodes shall not be smaller than metric designator 21 (trade size ¾) and, where of iron or steel, shall have the outer surface galvanized or otherwise metal-coated for corrosion protection.

(b) Rod-type electrodes shall meet all the following requirements:

(1) Rod-type electrodes shall be listed.

(2) Rod-type electrodes shall not be less than 2.44 m (8 ft) in length.

(3) Rod-type electrodes of steel, stainless stee
l, or their equivalent shall not be less than 13 mm (½ in.) in diameter.

(4) Rod-type electrodes of steel, other than stainless steel, shall be coated with copper or zinc.

Substantiation: The panel action on proposal 5-156 should have been to Accept in Part. The part to delete the "pipe" electrode was substantiated by the fact, indicated by the installer representatives on the panel, that galvanized pipe or rigid conduit is still used, although infrequently in the United States.

With regard to ground rods the action should have been to Accept in Principle. Over the past three Code cycles there have been numerous proposals about hard set size, vs. hard or soft metric conversions, tolerances due to nominal manufacturing size, copper vs. galvanized coating, etc. The submitter made a good case for the enforcement agencies to have all ground rods listed to eliminate this continued flow of proposals and the field issues the many installers and AHJs have to wrestle with about if this one acceptable or is that acceptable, or can I use this splice connector on this rod, and so on. UL 467 already deals with the make up of the rod materials, dimensions, coating issues, suitability of the coating to withstand the impact of installation, compatibility of splice connectors etc. Listing can and does exist for ground rods of diameters 5/8 inch or greater. One of the major manufacturer's in his presentation to the panel confirmed that Listing would resolve many of the controversies and issues coming from the industry. In addition, by requiring Listing, some of the existing convoluted Code language can be simplified into a list format as detailed above with the incorporation of panel accepted actions. The panel should also note that by the present language an Iron or steel rod 5/8 Inch or greater in diameter has no restrictions, no corrosion protection requirements or anything else. The big controversy about sustainability for some time is not even considered for rods that are 5/8 Inch or larger, whereas with the proposed changes all rods will have to meet specific requirements.

Panel Meeting Action: Reject
Panel Statement: There is no field evidence to require rod-type electrodes to be listed.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:

JOHNSTON, M.: The installation of different types and sizes of listed and non-listed rod type grounding electrodes is a concern for the enforcement and installers of rod type grounding electrodes. The submitter is correct that it has led to many field issues with contractors and inspectors. Listing of rod type electrodes is done by some manufacturers and if only listed rod type electrodes were required, there would be no questions by the contractor or the inspector that the rod complies. Enforcers of the code rely on testing laboratories to verify the construction criteria of many electrical components and UL 467 is a standard that evaluates rod type electrodes for various installation concerns. A requirement that all ground rods be listed will result in leveling the playing field and require manufacturers of these grounding electrodes to meet minimum criteria in a product standard, not just the NEC. This type of requirement would benefit the code enforcement community by providing a more ready basis for approvals and limit the amount of non-code-complaint products being installed to meet a grounding requirement, which is an essential element of the electrical safety system. The submitters of the proposal and comment did provide evidence indicating a clear need for this listing requirement.

MELLO, C.: The panel statement for rejecting this comment does not address the substantiation provided in the comment. In fact much substantiation has been provided in the several proposals and comments over the last three Code cycles that many ground rods are not suitable or cannot be determined to be suitable by AHJs. It is interesting the panel continues to require a ¾ inch pipe electrode to be galvanized, yet continues to allow "rod" made of steel or iron 5/8 inch or greater in diameter to be used without any corrosion protection requirements. It is also interesting to note the panels unwavering requirement that the connectors for the grounding electrode conductor to this "rod" have to be listed as grounding and bonding equipment, yet the rod does not if it is 5/8 inch or greater in diameter. In the presentation to the panel this cycle, one such example was shown where a rod failed one of the basic tests for coatings required under the listing, but this rod could continue to be sold and installed since there is no Code listing requirement where 5/8 inch or greater in diameter. The discussion about longevity is not an issue since none of the electrodes identified in 250.52 have requirements for longevity nor is longevity a Code consideration in 250.50. Longevity of the grounding electrode(s) selected is an issue with many variables on soil conditions, moisture, and other environmental variables and is a design decision that goes beyond Code requirements. This comment sought to finally set minimum requirements that would allow products meeting those minimum requirements to be in the marketplace and to enable AHJs to readily verify the product is suitable in its installation. This would take all the debates about nominal dimensions, coatings, and the other product specific arguments surrounding ground rods out of the Code realm and properly place them in the product standard arena where they belong.

5-95 Log #383 NEC-P05 **Final Action: Reject**
(250.52(A)(5)(b))

Submitter: Michael Gassman, ERICO, Inc.
Comment on Proposal No: 5-160
Recommendation: Revise as follows:

Grounding rod electrodes of solid stainless steel, solid copper, ~~and or~~ copper coated solid steel or zinc coated solid steel shall be at least 15.87 mm (5/8 in.) in diameter, ~~unless listed and not less than 12.70 mm (1/2 in.) in diameter.~~

Listed grounding rod electrodes of solid stainless steel or copper coated solid steel shall be at least 12.70 mm (1/2 in.) in diameter.

Substantiation: 1. The draft of 250.52(A)(5)(b) is ambiguous. The current draft could be interpreted to exclude copper coated steel ground rod electrodes. It also does not specify "rod" electrodes.

The NEC Style Manual states:

3.3...procedure clear, unambiguous, NEC language.

3.3.5...list should be parallel...

2. Solid stainless steel and solid copper ground rod electrodes need to be clearly identified.

3. In the substantiation of Proposal 5-160, "Longevity is NOT part of the NEC."

Comment:

NEC 90.1 Purpose

NEC 90.1(A) Practical Safeguarding. The purpose...practical safeguarding of persons and property from hazards...

NEC 90.1(B) Adequacy...considered necessary for safety. Compliance therewith and proper maintenance results in an installation that is essentially free from hazard...

Conclusion: Safeguarding and safety indicate longevity. This makes it a code concern.

In addition, 250.52(A)(7)(B) excludes the use of aluminum. This is because it will not last.

4. "Corrosion" is used throughout the code. It is referred to over 100 times. "Corrosion-resistant is referred to over 30 times.

5. Corrosion resistance is related to longevity.

Galvanic series charts are established based on electrochemical potentials (V) for a material.

Zinc is highly anodic, while copper is noble.

Zinc sacrifices itself for the steel core. Copper protects the steel core.

Corrosion due to electrochemical action between dissimilar metals are minimized if the potential difference between the metals is no more than 0.50V.

6. The changes to the code are assuming equality between a stainless steel, a copper coating and a zinc coating, which we know not to be true.

In addition, while no changes will be envisioned for the copper coated ground rod electrode requirements, the proposed change on the zinc coated ground rod electrode means the rod may have up to 36.4% less steel and 20.13% less zinc. It will have a shorter life cycle. Once the zinc corrodes there is less steel to corrode.

7. The most extensive research on metallic structures buried in soils or in contact with soils is the "National Bureau of Standards Circular 579" on underground corrosion.

Page 110 states: "An analysis of these data showed that in most soils, zinc coatings of 2 oz. or less were destroyed during the 10 year exposure period, and pitting of the underlying steel occurred."

Page 115 states: "It was also shown that a 3 oz. coating provided adequate protection for 10 to 13 years in all the inorganic reducing soils except in soils 51 and 56, which are strongly reducing soils containing high concentrations of soluble salts."

The report confirms that copper lasts longer than zinc coated steel in buried applications.

8. Technical Report R660 "Field testing of Electrical Grounding Rods" February 1970 by the Naval Facilities Engineering Command reported that after 7 years, zinc coated steel ground rod electrodes have a weight loss of 1.57 to 4.46 times that of a copper coated steel ground rod electrode. Listed copper coated ground rod electrodes have 0.01 in. of copper coating. Zinc coated

ground rod electrodes have 0.0039 in. on zinc. Zinc coated ground rod electrodes have a shorter life.

9. 250.52(A)(6) on plate electrodes do not differentiate between galvanized steel plate electrode and a plate electrode of iron or steel. The plate electrode must be at least four times thicker than a copper plate electrode. Again, the reason is corrosion.

10. NEMA GR-1 2005 and NESC C2-2007 have both standardized on a minimum 0.625 inch diameter for zinc coated steel ground rod electrodes. The proposed dimension change to the zinc coated steel ground rod electrodes reduces the effectiveness of those rod electrodes in the 5-160 proposal.

11. In the substantiation of Proposal 5-160, "Listed products are certified by a listing laboratory, and are subject to performance testing."

Comment:

This is an untrue statement. UL tests coated steel rod ground electrodes for physical dimensions and coating adhesion. No corrosion testing is performed.

12. In the substantiation of Proposal 5-160, "The ground rod electrodes addressed herein are "UL" and include permanent marking on the rod."

Comment: A true statement, however, the stamping is often unreadable as it fills in with zinc. In addition, to pass the "listed" requirements for a zinc coated steel ground rod electrode requires special handling during manufacturing. The special handling of submitted samples would not reflect actual products purchased by the consumer. ERICO's standard product of zinc coated steel grounds will not pass the listed test.

13. Adding an international perspective, IEC 0364-5-54 2002 requires a minimum diameter of 16 mm (0.629 in.) for zinc coated steel ground rod electrodes, and 14 mm (0.551 in.) for copper coated steel ground rod electrodes.

Panel Meeting Action: Reject

Panel Statement: The panel affirms its original action and statements on Proposal 5-160 as providing the necessary clarity and usability to this section. This comment attempts to introduce a type of electrode (solid copper grounding rods) not currently addressed by the NEC. See panel actions on Proposals 5-160 and 5-156 and Comment 5-93.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

Comment on Affirmative:

STEINMAN, G.: NEMA votes affirmatively on the panel action but acknowledges there remains some confusion in the NEC regarding the construction, installation and use of the various types of ground rod type electrodes.

5-96 Log #1961 NEC-P05 **Final Action: Accept in Principle**
(250.52(A)(6) (New))

Submitter: Noel Williams, Herriman, UT

Comment on Proposal No: 5-164

Recommendation: This Proposal should have been Accept in Principle and revised to read as follows:

(6) Listed electrodes installed in accordance with their listing and their installation instructions.

Substantiation: The panel statement that the proposal is not complete sets a standard that may not be possible to meet as each type of listed electrode may have somewhat different installation requirements. The suggested revised language makes the installation requirements part of the requirement since the specific installation instructions for every listed product cannot be included in 250.53. The panel should give more consideration to the comments on negative expressed by Mr. Mello.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Comment 5-97.

Submitter: Chuck Mello, Underwriters Laboratories

Comment on Proposal No: 5-164

Recommendation: Add the following text to 250.52(A):

250.52(A) (6) Listed Electrodes.

Renumber present 250.52(A)(6) to (A)(7) Plate Electrodes and renumber present 250(A)(7) Other Local Metal Underground Systems or Structures to 250.52(A)(8).

Substantiation: The panel action should have been to Accept the original proposal with whatever sequence numbering that would be appropriate. While the panel statement that there is nothing to specifically prohibiting the use of "Listed" electrodes, the fact that 250.52 is a distinct list and does not Include and language to indicate that It is not all Inclusive, as well as the fact that 250.50 only recognizes the grounding electrodes identified in 250.52 effectively makes use of anything else that might be suitable, not acceptable to many AHJs without long discussions, and potential project delays. To just add the ability to use "Listed" grounding electrodes to the list of existing does not create any burden and meets the same thing the panel statement is saying is not prohibited. If there are installation requirements, these would have to be dealt with as part of the listing and be covered by 110.3(B) since not every type of Listed electrode is known. If there are concerns specifically for the chemical rod type electrodes, then those can be dealt with in future Code cycles in 250.53. The proposal used the chemical type electrodes as an example and the proposed change language did not Indicate or limit the addition to chemical type electrodes. I do not believe the lack of installation requirements for one type of Listed electrode used as an example in the substantiation should be sufficient reason not to allow the use of Listed grounding electrodes in general in 250.52.

Panel Meeting Action: Accept in Principle

Add the following text to 250.52(A):

250.52(A)(6) Other Listed Electrodes.

Renumber present 250.52(A)(6) to "(A)(7) Plate Electrodes" and renumber present 250(A)(7) Other Local Metal Underground Systems or Structures as 250.52(A)(8).

In addition, change 250.50 to read as follows:

250.50 Grounding Electrode System. All grounding electrodes as described in 250.52(A)(1) through (A)(7) that are present at each building or structure served shall be bonded together to form the grounding electrode system. Where none of these grounding electrodes exist, one or more of the grounding electrodes specified in 250.52(A)(4) through (A)(8) shall be installed and used.

Panel Statement: Editorial correction to Section 250.50 to allow this panel action. The word "other" was added to differentiate from the listed electrodes identified in 250.52(A)(5).

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-98 Log #2097 NEC-P05 **Final Action: Reject**
(250.52(B), FPN)

Submitter: James H. Maxfield, Dover, NH

Comment on Proposal No: 5-166

Recommendation: Add a new FPN to read as follows:

FPN: For further information see NFPA 13, Standard for the Installation of Sprinkler Systems and NFPA 24, Standard for the Installation of Private Fire Service Mains and Their Appurtenances for the limited use of these systems as grounding electrode.

Substantiation: CMP-5 should reconsider the addition of the FPN as submitted in the proposal stage because Section 10.6.7 of both NFPA 13 and NFPA 24 (2002 ed.) clearly indicates the limited use of the piping systems. Sections 10.6.8 of both standards state "In no chase shall pipe in 10.6.7 be used for grounding of electrical service." The addition of the FPN as submitted would assist the industry in determining what metal water piping systems may be used as grounding electrodes and which documents to refer to.

Panel Meeting Action: Reject

Panel Statement: The panel reaffirms its original action and statement on Proposal 5-166 and concludes that the additional FPN as suggested in the proposal and comment do not improve usability or provide additional clarity to the requirements of this section. The panel maintains that grounding electrodes as described in 250.52(A) that are present for use in the grounding electrode system for buildings and structures are required to be used to form such grounding electrode systems, regardless of the type of water piping system or its use within the building or structure.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-99 Log #1964 NEC-P05 **Final Action: Reject**
(250.52(B)(2) (New))

Submitter: Noel Williams, Herriman, UT

Comment on Proposal No: 5-165

Recommendation: This Proposal should have been Rejected or Accepted in Principle with the following revised wording for item (2):

Aluminum electrodes in direct contact with the earth.

Substantiation: As proposed and as accepted, the proposal prohibits the use of an aluminum structure. The metal used for a structure is not specified in 250.52(A)(2). A metal structure that meets the requirements of that section is not just permitted, it is required to be used as an electrode. Aluminum is not the most common material for building structures, but it is used for many structures such as permanently installed "tents." The prohibition of aluminum for any electrode system is in direct contradiction to 250.52(A) for such structures. In previous cycles, Panel 5 accepted revised wording for 250.104(C) to recognize structural metal materials other than steel.

Panel Meeting Action: Reject

Panel Statement: The concerns of the submitter are already addressed in the revised definition of Grounding Electrode that resulted from the work of the TCC-assigned task group on grounding and bonding. See panel action and statement on Proposal 5-14 that indicate that grounding electrodes are required to be in direct contact with the earth. The panel actions on Proposal 5-148 and Comments 5-84 and 5-85 also provide additional clarification on the concerns expressed by the submitter.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

(250.56)

Submitter: Andre R. Cartal, Princeton Borough Building Dept.
Comment on Proposal No: 5-174
Recommendation: Delete "shall be augmented by one additional electrode of any of the types specified by 250.52(A)(1) through 250.52(A)(7)."
Substantiation: The present wording of this section presents us with an endless loop of requirements. For example, 250.52(A)(2), (3), and (4) are individually or collectively permitted without a supplemental electrode. Including them in 250.56 makes no sense as there is no resistance value and if they were installed 250.56 would NOT apply. I can see now why inspectors are requiring a concrete encased electrode to be AUGMENTED by ground rods.
Panel Meeting Action: Accept in Principle
Revise 250.56 to read as follows:
250.56 Resistance of Rod, Pipe, and Plate Electrodes
A single electrode consisting of a rod, pipe, or plate that does not have a resistance to ground of 25 ohms or less shall be augmented by one additional electrode of any of the types specified by 250.52(A)(4) through (A)(8). Where multiple rod, pipe, or plate electrodes are installed to meet the requirements of this section, they shall not be less than 1.8 m (6 ft) apart.
FPN: The paralleling efficiency of rods longer than 2.5 m (8 ft) is improved by spacing greater than 1.8 m (6 ft).
Panel Statement: The requirement for a single electrode that does not have a resistance 25 ohms or less to be augmented does not apply to any electrodes other than rod, pipe, or plate. It is required to augment such an electrode with one additional electrode of any of the types specified by 250.52(A)(4) through 250.52(A)(8).
Number Eligible to Vote: 15

5-101 Log #500 NEC-P05 **Final Action: Reject**
(250.62)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 5-179
Recommendation: Accept in Part as revised:
Where the grounding electrode conductor is installed with other conductors in a raceway, cable tray, or enclosure and is not in cable armor or a dedicated raceway, it shall be identified by tagging or other effective means acceptable to the authority having jurisdiction.
Substantiation: Where installed with other conductors, a simple test will indicate it is grounded and it may be assumed to be a grounded circuit conductor or equipment ground (especially if bare). A connection of an equipment grounding conductor to this GEC does not comply with the connection point specified in the definition of equipment grounding conductor (service equipment or separately derived system source). Although 250.130(C)(2) permits such a connection (which appears to be a conflict).
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its original action and statement on Proposal 5-179. No additional substantiation has been provided to indicate there is a need to introduce this new specific identification requirement for grounding electrode conductors where they are installed with other conductors in the same raceway, enclosure, cable tray, etc.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-102 Log #1055 NEC-P05 **Final Action: Reject**
(250.62)

Submitter: David Shapiro, Safety First Electrical Contracting Consulting & Safety Education
Comment on Proposal No: 5-178
Recommendation: Add to the end of the existing text:
When covered or insulated, the grounding electrode conductor(s) in switchboards, panelboards, cutout boxes, transfer switches, and other enclosures, shall be identified by a green stripe or other distinctive means.
Substantiation: While I agree with the CMP that there is an advantage to retaining the unique identification of equipment grounding/bonding conductors, at least as a requirement, I also agree with Mr. Nadon that it would be good to sort out GECs from hot conductors. It also would be good to more easily sort them out from what ought-to-be-identified conductors that didn't, however, get painted or taped. In performing inspections and consultations, I have had to hunt and to puzzle unnecessarily. "Is this a subpanel that's missing its floating neutral? I don't see a main bonding jumper. Is this a service panel missing its MBJ, or have I overlooked it? It's kinda crowded. Where are the GECs? Oh, maybe this is one. Geez, I wish it was easier to trace what was what."
Panel Meeting Action: Reject
Panel Statement: The identification requirements for equipment grounding conductors are provided in 250.119. The grounding electrode conductor is currently not required or prohibited from being identified by any of the means specified in 250.119. The possibility is not likely that the grounding electrode conductor will be confused with any other conductor. The submitter has failed to indicate there is a safety concern related to the proposed more restrictive identification requirements.

(250.64)

TCC Action: The Technical Correlating Committee directs that the words "the source of " in the recommendation be deleted to correlate with the Technical Correlating Committee action on Comments 5-116 and 5-119.
In addition, the Technical Correlating Committee understands that this comment relates to the action taken on Proposal 5-18.
Submitter: Jeffrey Boksiner, Telcordia Technologies, Inc. / Rep. Alliance for Telecommunications Industry Solutions
Comment on Proposal No: 5-16
Recommendation: Modify the first paragraph of 250.64 as follows:
250.64 Grounding Electrode Conductor Installation.
Grounding electrode conductors at the service, at each building or structure where supplied by a feeder(s) or branch circuit(s), or at the source of a separately derived system shall be installed as specified in 250.64(A) through (F).
Substantiation: This is a correlating comment to resolve a problem created by the change in the definition of the "grounding electrode conductor." NEC Section 250.64 has specific requirements for the grounding electrode conductors that ground the service or the separately derived system as such conductors perform an essential safety function. However, certain installations, particularly installations for information technology and communications technology equipment, often have various supplementary (auxiliary) grounding conductors installed for reasons of electromagnetic compatibility, lightning protection, establishing ground planes for antennas, etc. The change in the definition defines these supplementary grounding conductors as grounding electrode conductors. Thus, the new definition would imply that requirements of 250.64 apply to these supplementary grounding conductors.
I do not believe that CMP 5 intended to change the application of 250.64, nor is there any rationale to change the requirements for all grounding conductors. Therefore, the term grounding electrode conductor in 250.64 should be qualified by the phrase "at the service, at each building or structure where supplied by a feeder(s) or branch circuit(s), or at the source of a separately derived system," as proposed in this comment.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

(250.64(A))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 5-204
Recommendation: Accept proposal revised:
Where installed ~~used~~ outside uninsulated aluminum or copper-clad aluminum grounding electrode conductors not in a raceway or enclosure shall not be used where in direct contact with masonry or the earth or where subject to corrosive conditions. Where installed ~~used~~ outside connections of aluminum or copper-clad aluminum grounding electrode conductors not in an enclosure shall not be within 450 mm (18 in.) of the earth.
Substantiation: The grounding conductor should be specified as a grounding electrode conductor for consistency with 250.62, 250.64, and 250.64(B). Since aluminum conductors are permitted in cables and raceways underground and embedded in concrete and masonry, separation from earth where in a raceway or enclosure does not seem warranted. Present wording does not permit a connection (termination) inside a completely enclosed outdoor switchgear assembly within 18 in. of the earth. "Terminations" implies an end to the conductor, conductors may loop unbroken through ground clamps.
Panel Meeting Action: Reject
Panel Statement: The submitter added text without substantiation. The submitter misquoted the existing Code text. The proposed wording is confusing.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

(250.64(B))

Submitter: David Shapiro, Safety First Electrical Contracting Consulting & Safety Education
Comment on Proposal No: 5-184
Recommendation: Accept as proposed.
Substantiation: The CMP lists one objection to the proposed wording: use of an armored conductor should not be prohibited.

Using a coil of armored bare conductor is not much more similar to greenfield with a bare wire field-installed than running ACHH is the same as running greenfield and pulling (kraft-wrapped) insulated wires and a bonding strip through it. Armored conductors are in close proximity to the armor, protecting it much as-in fact better than-the new type of MC cable's bare conductor protects its armor.
Panel Meeting Action: Reject
Panel Statement: Cable armor is permitted as specified in the last sentence of 250.64(B). The bare armored ground cable is listed as grounding and bonding equipment for this purpose.

5-107 Log #1285 NEC-P05 **Final Action: Reject**
(250.64(C))

Submitter: Michael P. O'Quinn, MOGO Enterprises, Inc.
Comment on Proposal No: 5-186
Recommendation: Reject this Proposal; Restore wording to 2005 NEC language.
Substantiation: 250.64(C) refers to grounding electrode conductors - the connection between one of the grounding electrodes listed in 250.52 and the grounded service bus. In the NEC 2005, 250.64(C)(3) allowed the use of aluminum or copper busbars for "splicing" purposes, or just a convenient location to collect the grounding electrode conductors from various electrodes before attaching with a single conductor to the grounded service bus. [See Proposal 5-158 and Panel Statement, 2005 NEC ROP.] If used for this purpose, for instance, a ground rod used to supplement a metal underground water pipe would require a grounding electrode conductor the same size as the grounding electrode conductor from the metal underground water pipe. This is because the grounding electrode conductor from the ground rod would not be run solely to the grounded service terminal as 250.66(A) through (C) requires for size reduction, but instead to the "collection" busbar. The last sentence of 250.64(F) states: "The grounding electrode conductor shall be sized for the largest grounding electrode conductor required among all the electrodes connected to it." The exceptions to Table 250.66 listed in 250.66(A) through (C) would not apply.

The installer has the choice to run each grounding electrode conductor directly to the grounded service bus, allowing the provisions of 250.66(A) through (C), but if multiple electrodes are connected/bonded together and run with a common grounding electrode conductor to the service grounded bus, 250.64(F) applies, requiring the same size grounding electrode conductor from each electrode.

The term "bonding jumpers" referred to in 250.64(C)(3), according to Article 100, is "A reliable conductor to ensure the required electrical conductivity between metal parts required to be electrically connected." In this case the "bonding jumpers" are grounding electrode conductors, but are not run directly/solely to the grounded service bus. "Sole connection" is the main requirement for size reduction in 250.66(A) through (C).

Further, 250.64(F) is concerned with the size of the grounding electrode conductor and its connection to the electrode(s). The copying of 250.64(C)(3) to 250.64(F) would increase understanding, but deleting 250.64(C)(3) will prohibit the use of this "collection" busbar for use with grounding electrode conductors, which does not appear to be the intent of the Proposal submitter.

Additionally, 250.64(C)(4) should be kept for the same reason the submitter added it to 250.64(F) - the installer needs to be reminded about the prohibiting of connections to aluminum conductors within 18 inches of the earth.
Panel Meeting Action: Reject
Panel Statement: Section 250.64(C) is to ensure the grounding electrode conductor is continuous, without splices (except as permitted) from the equipment served to the grounding electrode or grounding electrode system. See the revised definition of "grounding electrode conductor" from Comment 5-6. The panel notes that the bonding jumpers used to interconnect multiple grounding electrodes or from the grounding electrodes to the common busbar are not "grounding electrode conductors" and are purposefully identified as "bonding jumpers". The panel concludes that the installation requirement for the common busbar do belong in 250.64(F) as substantiated in Proposal 5-186.

(250.64(E))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 5-194
Recommendation: Accept the proposal.
Substantiation: This section only requires ferrous enclosures for grounding electrode conductors (e.g., raceways) to be electrically continuous and exempts nonferrous raceways. 250.92(A)(3) requires bonding of metallic (includes ferrous and nonferrous types) raceways and enclosures which in effect makes them electrically continuous.
Panel Meeting Action: Reject
Panel Statement: The referenced 250.92(A)(3) was removed by panel action on Proposal 5-219 and therefore no longer applies to raceways containing grounding electrode conductors. Only 250.64(E) addresses raceways for grounding electrode conductors and the panel intends that this apply only to ferrous metal raceways.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-111 Log #922 NEC-P05 **Final Action: Accept**
(250.64(E))

Submitter: Peter D. Noval, Jr., Philadelphia, PA
Comment on Proposal No: 5-195
Recommendation: Delete "service equipment" from text proposed by panel meeting action, so that the section reads as follows:

(E) Enclosures for Grounding Electrode Conductors. Ferrous metal enclosures for grounding electrode conductors shall be electrically continuous from the point of attachment to cabinets or equipment to the grounding electrode and shall be securely fastened to the ground clamp or fitting.

Nonferrous metal enclosures shall not be required to be electrically continuous. Ferrous metal enclosures that are not physically continuous from cabinets or equipment to the grounding electrode shall be made electrically continuous b y bonding each end of the raceway or enclosure to the grounding electrode conductor. Bonding shall apply at each end and to all intervening ferrous raceways, boxes, and enclosures between the ~~service equipment, cabinets, or equipment~~ cabinets or equipment and the grounding electrode. The bonding jumper for a grounding electrode conductor raceway or cable armor shall be the same size as, or larger than, the ~~required~~ enclosed grounding electrode conductor. Where a raceway is used as protection for a grounding electrode conductor, the installation shall comply with the requirements of this appropriate raceway article.

Substantiation: The panel meeting action to leave "service equipment" in the text increases the chance of misinterpretation that the requirements pertain to just service-related equipment and cabinets. Deleting "service equipment" will eliminate any potential ambiguity. Due to the addition of "cabinets or equipment" in the text, the requirement for bonding is consistent throughout 250.64(E), and bonding between the grounding electrode and service equipment is still covered by this section.

I am in concurrence with panel action to delete "required" as referenced in the panel statement.

Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-112 Log #924 NEC-P05 **Final Action: Reject**
(250.64(E))

Submitter: Peter D. Noval, Jr., Philadelphia, PA
Comment on Proposal No: 5-199
Recommendation: Revise text to read as follows:

(E) Enclosures for Grounding Electrode Conductors. Ferrous metal enclosures for grounding electrode conductors shall be electrically continuous from the point of attachment to cabinets or equipment to the grounding electrode ~~and shall be securely fastened to the ground clamp or fitting~~. ~~Nonferrous metal enclosures shall not be required to be electrically continuous.~~ ~~Ferrous~~ Metal enclosures that are not physically continuous from cabinets or equipment to the grounding electrode shall be made electrically continuous by bonding each end of the raceway or enclosure to the grounding electrode conductor. Bonding shall apply at each end and to all intervening ~~ferrous~~ metal raceways, boxes, and enclosures between the service equipment and the grounding electrode. The bonding jumper for a grounding electrode conductor raceway or cable armor shall be the same size as, or larger than, the required enclosed grounding electrode conductor. Where a raceway is used as protection for a grounding electrode conductor, the installation shall comply with the requirements of the appropriate raceway article.

Substantiation: I am in agreement with the panel statement that "the electrically continuous requirement applies to metal enclosures for grounding electrode conductors and is the general requirement of this section. The bonding requirements are applicable where the metal enclosure is not electrically continuous from the cabinet or enclosure to the grounding electrode."

In support of this statement, the revised text makes it clear that all metal enclosures, not just ferrous ones, are subject to the intent of the panel, with regard to bonding requirements, where the metal enclosure is not electrically continuous from the cabinet or enclosure to the grounding electrode.

In addition, as written, 250.64(E) does not require nonferrous metal enclosures to be "securely fastened to the ground clamp or fitting." Only ferrous metal enclosures need to "Be securely fastened to the ground clamp or fitting." If this intent here is bonding the enclosure, that requirement is stated in subsequent text.

The revised text clarifies the intent of this section by deleting this potentially unenforceable statement.

Further, if the panel insists on retaining the exemption from bonding for nonferrous metal enclosures in 250.64(E), then Section V. Bonding should be reviewed and revised accordingly to provide consistency throughout Article 250.

Panel Meeting Action: Reject
Panel Statement: The proposal would lessen the requirements of this section without technical substantiation. The electrically continuous requirement applies to ferrous metal enclosures for grounding electrode conductors and is the general requirement of this section. The bonding requirements are applicable where the ferrous metal enclosure is not electrically continuous from the cabinet or enclosure to the grounding electrode.

5-113 Log #32 NEC-P05 **Final Action: Accept**
(250.64(F))

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 5-203
Recommendation: The Technical Correlating Committee directs that the Code-Making Panel clarify the Panel Action on this Proposal with respect to the wording of the subsections (1) through (4) and their relationship to (F). This action will be considered by the Code-Making Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept

Revise the text of 250.64(F) from the 2008 NEC Draft as follows:

(F) Installation to Electrode(s). ~~A~~ ~~g~~Grounding electrode conductor(s) and bonding jumpers interconnecting grounding electrodes shall be ~~permitted~~ installed as in (1), (2), or (3)~~, or (4)~~. The grounding electrode conductor shall be sized for the largest grounding electrode conductor required among all the electrodes connected to it.

(1) The grounding electrode conductor shall be permitted to ~~B~~be run to any convenient grounding electrode available in the grounding electrode system where the other electrode(s), if any, are connected by bonding jumpers per 250.53(C).

(2) Grounding electrode conductor(s) shall be permitted to be run to ~~O~~one or more grounding electrode(s) individually.

(3) Bonding jumper(s) from grounding electrode(s) ~~and grounding electrode conductor(s)~~ shall be permitted to be connected to an aluminum or copper busbar not less than 6 mm × 50 mm (1.4 in. × 2 in.). The busbar shall be securely fastened and shall be installed in an accessible location. Connections shall be made by a listed connector or by the exothermic welding process. The grounding electrode conductor shall be permitted to be run to the busbar. Where aluminum busbars are used, the installation shall comply with 250.64(A).

~~(4) Where aluminum busbars are used, the installation shall comply with 250.64(A).~~

~~The grounding electrode conductor shall be sized for the largest grounding electrode conductor required among all the electrodes connected to it.~~

Panel Statement: The panel accepts the direction of the TCC to clarify the text. The panel action accomplishes this direction.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-114 Log #1842 NEC-P05 **Final Action: Accept in Principle**
(250.64(F))

Submitter: Mike Holt, Mike Holt Enterprises, Inc.
Comment on Proposal No: 5-203
Recommendation: Accept the proposed language, with the following changes:

~~(F) To Electrodes(s). A grounding electrode conductor shall be permitted in (1), (2), (3) or (4).~~

~~(1) Be run to any convenient grounding electrode available in the grounding electrode available in the grounding electrode system, or~~

~~(2) One or more grounding electrode(s) individually, or~~

~~(3) Bonding jumper(s) from grounding electrode(s) and grounding electrode conductor(s) shall be permitted to be connected to an aluminum or copper busbar not less than 6 mm × 50 mm (1/4 in. × 2 in.). The busbar shall be securely fastened and shall be installed in an accessible location. Connections shall be made by a listed connector or by the exothermic welding process.~~

~~(4) Where aluminum busbars are used, the installation shall comply with 250.64(A). The grounding electrode conductor shall be sized for the largest grounding electrode conductor required among all the electrodes connected to it.~~

The new text should read as follows:

(F) To Electrodes(s). A grounding electrode conductor shall be sized for the largest grounding electrode conductor required among all the electrodes connected to it. In addition, a grounding electrode conductor shall be permitted.

(1) Run to any convenient grounding electrode available in the grounding electrode system.

(2) Run to one or more grounding electrode(s) individually

(3) Connected to an aluminum or copper busbar. Connections shall be made by a listed connector or by the exothermic welding process.

Substantiation: As the TCC stated, the proposed text does not make sense grammatically. In addition, there is no reason to repeat the requirement for aluminum conductors and busbars complying with 250.64(A), since (F) does not modify the rule of (A). The remainder of the proposed (4) is better located in the charging text of (F), since it applies to all installations, not just busbars.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 5-113.

(250.66)

TCC Action: The Technical Correlating Committee directs that the language be modified as shown in the affirmative comment on vote.
In addition, the Technical Correlating Committee understands that this comment relates to the action taken on Proposal 5-18.
Submitter: Jeffrey Boksiner, Telcordia Technologies, Inc. / Rep. Alliance for Telecommunications Industry Solutions
Comment on Proposal No: 5-16
Recommendation: Modify the first paragraph of 250.66 as follows:
250.66 Size of Alternating-Current Grounding Electrode Conductor. The size of the grounding electrode conductor at the service, at each building or structure where supplied by a feeder(s) or branch circuit(s), or at the source of a separately derived system of a grounded or ungrounded ac system shall not be less than given in Table 250.66, except as permitted in 250.66(A) through (C).
Substantiation: This is a correlating comment to resolve a problem created by the change in the definition of the "grounding electrode conductor." NEC Section 250.66 has specific requirements for the grounding electrode conductors that ground the service or the separately derived system as such conductors perform an essential safety function. However, certain installations, particularly installations for information technology and communications technology equipment, often have various supplementary (auxiliary) grounding conductors installed for reasons of electromagnetic compatibility, lightning protection, establishing ground planes for antennas, etc. The change in the definition defines these supplementary grounding conductors as grounding electrode conductors. Thus, the new definition would imply that requirements of 250.66 apply to these supplementary grounding conductors.

I do not believe that CMP 5 intended to change the application of 250.66, nor is there any rationale to change the requirements for all grounding conductors. Therefore, the term grounding electrode conductor in 250.66 should be qualified by the phrase "at the service, at each building or structure where supplied by a feeder(s) or branch circuit(s), or at the source of a separately derived system," as proposed in this comment.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:

BRENDER, D.: The language accepted by the Panel is flawed as it controls the sizing of a grounding electrode conductor only when the connection to a separately derived system is made at the source. Section 250.30(A)(1) and (A)(3) permits the grounding electrode conductor to be connected at a single point from the source to the first system disconnecting means or overcurrent device. Clearly, these sections distinguish between the source and other points on the separately derived system.

The words "the source of" should be deleted from the accepted new sentence so it would read, "250.66 Size of Alternating-Current Grounding Electrode Conductor. The size of the grounding electrode conductor at the service at each building or structure where supplied by a feeder(s) or branch circuit(s), or at ~~the source of~~ a separately derived system, of a grounded or ungrounded ac system shall not be less than given in Table 250.66, except as permitted in 250.66(A) through (C)."

5-117 Log #2141 NEC-P05 **Final Action: Reject**
(250.66)

Submitter: Danish Verma, Bowie, MD
Comment on Proposal No: 5-205
Recommendation: Add new text as follows:

250.66(D) Connection to Enclosures. Termination of the grounding electrode conductors entering cabinets, cutout boxes and other equipment enclosures shall be done using only listed devices such as lugs, clamps pressures connectors or other listed means. Ground clamps or fittings shall be listed for the materials of the grounding electrode conductor. Not more than one conductor shall be connected to a single clamp or fitting unless the clamp or fitting is listed for multiple conductors.

Substantiation: The grounding electrode connection to enclosures, cutout boxes requires standardization. The current wiring practice of using no fitting or an unlisted fitting or fitting not listed for grounding poses many problems.

(1) Difference of potential (2) Choke effect (3) Does not comply with the appropriate ANSI/UL Standards (4) Not in compliance with NFPA 780 recommendations for bonding the electrode to the enclosures, sideflash (5) Using a fitting listed for bonding and grounding will ensure positive bonding jumper connection under severe fault conditions, surges, over voltages or if one were to misapply or fail to install the proper bonding jumper at the service enclosure. The fitting would provide a safety net in these applications. Not to mention possibility of cross threading or over tighten or breaking of the bonding screw.

The NEC recognizes the connection of the grounding electrode conductor at the electrode under 250.70 but does not identify the connection at the cabinet. The use of listed fittings will ensure proper support, proper strain relief (torque value) and ensure proper bonding. Will clarify the requirements of 312.5(A) NEC "Openings to be Closed" in cut out boxes and cabinets by using a proper listed grounding and bonding fittings.

Strain relief testing is required under both UL 486A Standards for Connectors and UL 467 Standard for Grounding and Bonding. Although I have witnessed arguments over whether strain relief is necessary, without the use of a proper fitting the grounding electrode conductor can work loose from the grounded bar after being struck by hand held mower equipment without proper strain relief. UL Standards requires a push pull test on connectors and fittings. It's appropriate to apply the standard. UL 486A 12.1 requires a pullout test for connectors, Table 12.1 provides the test values for the pullout test. Example: 6 AWG requires 100LB pullout force.

UL 467, Table 13.1 Short - time test currents: present practice of not using a listed fitting fails to meet the short-time current test of the standard. Knowing that the NEC now identifies these product safety standards in Annex A, I believe it's just as important to adhere to these recognized standards. UL 467, Table 13.1 requires a 3/0 copper conductor to withstand 8030 amperes for 9 seconds without burning away from the enclosure. Unlisted fittings do not meet these requirements/standards.

UL White Book (KDER) recommends that "If there is a need for such a conductor a grounding bushing should be used." Note: KDER "covers bonding devices, ground clamps, grounding and bonding bushings and locknuts, ground rods, armored grounding wire, protector grounding wire, grounding wedges, ground clips for securing the ground wire to an outlet box, water meter shunts, and similar equipment". Applying all the standards and knowledge one can teach and apply these applications, it would be helpful and added safety for bonding the electrode to enclosures.
Panel Meeting Action: Reject

(250.66(D))

Submitter: Andre R. Cartal, Princeton Borough Building Dept.
Comment on Proposal No: 5-211
Recommendation: Please review requested technical substantiation and accept the proposal.
Substantiation: Figure 11-14 on page 206 of Soares Grounding and Bonding gives the five second withstand rating of a #6 copper conductor as 621 amperes-per ICEA (the lowest of the 3 values). Based on unrealistically low residential grounding electrode systems of 5 Ohms at 120V to ground, the current in the grounding electrode conductor with be 24 amperes. Let's consider a residential primary voltage conductor, 2100V to ground, contacting the service (worst case) in a storm, the current would be 420 amperes - and this is for a 5 OHM grounding electrode system! How many of those are out there? The service conductor size has no effect on the current on the grounding electrode conductor.
Panel Meeting Action: Reject
Panel Statement: Insufficient substantiation has been provided to relax the minimum sizing requirements for grounding electrode conductors for existing installations at single-family dwellings. The proposed text is not adequate in all cases. Grounding electrode conductors for all installations are required to meet the minimum sizes specified in 250.66.

5-120 Log #2034 NEC-P05 **Final Action: Reject**
(250.68(A))

Submitter: Donald Cook, Shelby County Building Inspections
Comment on Proposal No: 5-212
Recommendation: Accept proposal as submitted.
Substantiation: For several code cycles, I have submitted proposals and comment to this section hoping to gain understanding for the purpose of the accessibility requirement. The panel statement for this proposal appears to question the value of the "listing" of these termination fittings. If they are listed for the purpose of terminating grounding electrode conductors to the specific electrode that is utilized, it would seem that users and AHJ should be concerned for the connection loosening during construction. If there is concern for loosening, it seems these mechanical connections should be prohibited. I still do not see any explanation for CMP-5's confidence these mechanical connections will not loosen where installed in concrete or direct burial applications. Outdoor, underground connections to ground rods, rebar, or water pipe would seem to be subject to damage by landscape work than a termination behind wall covering like sheetrock or paneling. The current requirement is very clear, but very difficult for an AHJ to justify with the current exceptions.
Panel Meeting Action: Reject
Panel Statement: If a mechanical connection becomes damaged or loosened during the construction of a building, it is necessary to have accessibility so it can be tightened or replaced. The exceptions to this section recognize conditions where damage is unlikely.

(250.68(B))

Submitter: David Shapiro, Safety First Electrical Contracting Consulting & Safety Education
Comment on Proposal No: 5-214
Recommendation: Revise text to read as follows:
(B) Effective Grounding Path. The connection of a grounding electrode conductor or bonding jumper to a grounding electrode shall be made in a manner that will ensure a ~~permanent~~ durable and ~~an~~ effective grounding path.
Substantiation: Our interpretation and enforcement of the NEC is supposed to be based on the dictionary definitions of common English terms, augmented by special definitions found in Article 100, and those unique to particular articles and defined at the beginning of each such article. While the NEC is not intended as a design manual for untrained persons, its language is not supposed to be based on "Hey, Bud, you should know what they intend here" translation. Saying "...the word...is generally understood in...[this] application" demands just that sort of interpretation. I don't know how commonly inexpert inspectors make the sort of mistake Mr. Schwan is trying to head off, but I do know that AHJs often rely on inadequately trained inspectors. For this reason, the Style Manual's blessing on terms that have become accepted warrants sparing use. The CMP does have a point, that while the change in the original proposal to remove the sense of "permanent" as meaning "not subject to removal" is worthwhile, the idea of using a means with integrity is worth retaining. I propose "durable," a term used elsewhere in the NEC for similar purposes, as better conveying the intent.
Panel Meeting Action: Accept in Principle
The panel action is to remove the word "permanent" and revise 250.68(B) as follows:
(B) Effective Grounding Path The connection of a grounding electrode conductor or bonding jumper to a grounding electrode shall be made in a manner that will ensure a~~n permanent and~~ effective grounding path.
The remainder of the section is unchanged.
Panel Statement: The panel agrees with the concept of removing the word "permanent" from this section and does not agree that the proposed replacement word "durable" is necessary for this section. Removing the word "permanent" addresses the concerns of the submitter, and not replacing it with any other descriptive word addresses the other concerns of subjectivity, ambiguity, enforceability, and inconsistent application of the provisions of this section by users of the Code. The panel concludes that the descriptive wording provides the performance language necessary for users without the use of the

word "permanent" or any other descriptive adjective. The panel also affirms that this action to remove the word "permanent" is consistent with similar revisions in NEC where the same concerns were raised about the use of this word.

Submitter: Neil F. LaBrake, Jr., National Grid / Rep. Edison Electric Insitute-Electric Light & Power Group
Comment on Proposal No: 5-220
Recommendation: Add the following underlined text in 250.84 of Proposal 5-220:
Bonding for Other Systems. An intersystem bonding termination for connecting intersystem bonding and grounding conductors required for other systems shall be provided external to enclosures at the service equipment and at the disconnecting means for any additional buildings or structures. The intersystem bonding termination shall be accessible for connection and inspection. The intersystem bonding termin
ation shall have the capacity for connection of not less than three intersystem bonding conductors. The intersystem bonding termination device shall not be installed on an enclosure cover and shall not interfere with opening a service or metering equipment enclosure. The intersystem bonding termination shall be one of the following:
(1) A set of terminals securely mounted to the meter socket enclosure and electrically connected to the meter socket enclosure. This terminals and the enclosure shall be listed for grounding.
(2) A bonding bar near the service equipment enclosure, meter socket enclosure or raceway for service conductors. The bonding bar shall be connected with a minimum 6 AWG copper conductor to an equipment grounding conductor(s) in the service equipment enclosure, meter socket enclosure or exposed nonflexible metallic raceway.
(3) A bonding bar near the grounding electrode conductor. The bonding bar shall be connected to the grounding electrode conductor with a minimum 6 AWG copper conductor.
Exception: In existing buildings or structures where any of the intersystem bonding and grounding conductors required by 770.93, 800.100(B), 810.21(F), 820.100(B), 830.100(B) exist, installation of the Intersystem Bonding Termination is not required. An accessible means external to enclosures for connecting intersystem bonding and grounding electrode conductors shall be permitted provided at the service equipment and at the disconnecting means for any additional buildings or structures by at least one of the following means:
(1) Exposed nonflexible metallic raceways
(2) Exposed grounding electrode conductor
(3) Approved means for the external connection of a copper or other corrosion-resistant bonding or grounding conductor to the grounded raceway or equipment
FPN No. 1: A 6 AWG copper conductor with one end bonded to the grounded nonflexible metallic raceway or equipment and with 150 mm (6 in.) or more of the other end made accessible on the outside wall is an example of the approved means covered in 250.94, Exception, (3).
Retain 2005 NEC FPN No. 2 as written.
Substantiation: Often the device that is used to provide this intersystem bonding termination is installed on the cover or door of service and/or meter enclosures thus preventing their routine opening. In these cases, the only option available to properly operate or maintain this equipment is to remove the intersystem bonding termination device from the service or meter enclosure. This additional wording provides prescriptive requirements that mandate the proper installation of bonding terminations at these locations and will correlate with the actions on proposals of CMP-16 in Chapter 8.
Panel Meeting Action: Accept in Principle
Revise the proposed text to read as follows:
Add the following underlined text in 250.94 of Proposal 5-220:
"Bonding for Other Systems. An intersystem bonding termination for connecting intersystem bonding and grounding conductors required for other systems shall be provided external to enclosures at the service equipment and at the disconnecting means for any additional buildings or structures. The intersystem bonding termination shall be accessible for connection and inspection. The intersystem bonding termination shall have the capacity for connection of not less than three intersystem bonding conductors. The intersystem bonding termination device shall not interfere with opening a service or metering equipment enclosure. The intersystem bonding termination shall be one of the following:
(1) A set of terminals securely mounted to the meter ~~socket~~ enclosure and electrically connected to the meter ~~socket~~ enclosure. ~~This terminals and the enclosure shall be listed for grounding.~~ The terminals shall be listed as grounding and bonding equipment.
(2) A bonding bar near the service equipment enclosure, meter ~~socket~~ enclosure, or raceway for service conductors. The bonding bar shall be connected with a minimum 6 AWG copper conductor to an equipment grounding conductor(s) in the service equipment enclosure, meter ~~socket~~ enclosure or exposed nonflexible metallic raceway.
(3) A bonding bar near the grounding electrode conductor. The bonding bar shall be connected to the grounding electrode conductor with a minimum 6 AWG copper conductor.
Exception: In existing buildings or structures where any of the intersystem bonding and grounding conductors required by 770.93, 800.100(B), 810.21(F), 820.100(B), 830.100(B) exist, installation of the Intersystem Bonding Termination is not required. An accessible means external to enclosures for connecting intersystem bonding and grounding electrode conductors shall be permitted, provided at the service equipment and at the disconnecting means for any additional buildings or structures by at least one of the following means:
(1) Exposed nonflexible metallic raceways
(2) Exposed grounding electrode conductor
(3) Approved means for the external connection of a copper or other corrosion-resistant bonding or grounding conductor to the grounded raceway or equipment
FPN No. 1: A 6 AWG copper conductor with one end bonded to the grounded nonflexible metallic raceway or equipment and with 150 mm (6 in.) or more of the other end made accessible on the outside wall is an example of the approved means covered in 250.94, Exception, item (3)."
Retain 2005 NEC FPN No. 2 as written.
Panel Statement: Editorially correct reference in the first line. The panel concludes that the revised text adds clarity and meets the intent of the submitter. In addition, the panel incorporated the changes made by action on Comments 5-125 and 5-127.

Comment on Proposal No: 5-220
Recommendation: Continue to accept the proposal in principle, but revise item 1:

(1) A set of terminals securely mounted to the meter socket enclosure and electrically connected to the meter socket enclosure. This terminals set ~~and the enclosure~~ shall be listed as ~~for~~ grounding and bonding equipment.

Substantiation: Presently, the sentence is not grammatically correct. Meter socket enclosures are not specifically listed for grounding.
Panel Meeting Action: Accept in Principle
Panel Statement: The word "set" was removed for clarity. See panel action and statement on Comment 5-122.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-128 Log #1227 NEC-P05 **Final Action: Accept**
(250.96(A))

Submitter: Neil F. LaBrake, Jr., Syracuse, NY
Comment on Proposal No: 5-48
Recommendation: The TCC Task Group on Grounding and Bonding accepts the TCC direction to reconsider the action on proposal 5-48 with respect to text of Section 250.96(A). The Task Group agrees with the TCC note that the text needs to reflect Section 250.96(A) and remove the word "effectively" as provided in Proposal 5-48.

Suggested Action: At Section 250.96(A) of Proposal 5-48, replace the text in the proposal with the text of 2005 Section 250.96 as follows with the revision to remove the word "effectively" from this section.

(A) General Metal raceways, cable trays, cable armor, cable sheath, enclosures, frames, fittings, and other metal non–current-carrying parts that are to serve as grounding conductors, with or without the use of supplementary equipment grounding conductors, shall be ~~effectively~~ bonded where necessary to ensure electrical continuity and the capacity to conduct safely any fault current likely to be imposed on them. Any nonconductive paint, enamel, or similar coating shall be removed at threads, contact points, and contact surfaces or be connected by means of fittings designed so as to make such removal unnecessary.

Substantiation: The text at the line item covering Section 250.96(A) in Proposal 5-48 did not reflect the text in 2005 NEC Section 250.96(A) with the proposed revision to delete the word "effectively" as indicated in the proposal. This comment by the Task Group recognizes the inadvertent placement of incorrect text in the proposal at Section 250.96(A) and this comment provides the correct Section 250.96(A) text as modified by the Proposal 5-48.

This Comment was developed by a Task Group assigned by the NEC Technical Correlating Committee to address actions that were other than "accept" taken by Code-Making Panels on proposals from the TCC to resolve 2005 NEC Proposal 5-1 and Comment 5-1. Members of the Task Group on Grounding and Bonding for this Comment included: C. Douglas White; Michael Johnston; Jeffrey Boksiner; Daleep Mohla; Phil Simmons; Christopher Hutchings; James Carroll; Alan Rebeck; Richard Loyd; Paul Dobrowsky; and Neil F. LaBrake, Jr.

TCC Action: The Technical Correlating Committee understands that the panel meeting action text modifies the panel actions on Proposals 5-224 and 5-224a.
Submitter: David Shapiro, Safety First Electrical Contracting Consulting & Safety Education
Comment on Proposal No: 5-223
Recommendation: Revise text to read as follows:
"...to provide a ~~permanent~~ durable electrical bond,...".
Substantiation: Our interpretation and enforcement of the NEC is supposed to be based on the dictionary definitions of common English terms, augmented by special definitions found in Article 100, and those unique to particular articles and defined at the beginning of each such article. While the NEC is not intended as a design manual for untrained persons, its language is not supposed to be based on "Hey, Bud, you should know what they intend here" translation. Saying "...the word...is generally understood as it relates..." demands just that sort of interpretation. I don't know how commonly inexpert inspectors make the sort of mistake Mr. Schwan is trying to head off, but I do know that AHJs often rely on inadequately trained inspectors. For this reason, the Style Manual's blessing on terms that have become accepted warrants sparing use. The CMP does have a point, that while the change in the original proposal to remove the sense of "permanent" as meaning "not subject to removal" is worthwhile, the idea of using a means with integrity is worth retaining. I propose "durable," a term used elsewhere in the NEC for similar purposes, as better conveying the intent.
Panel Meeting Action: Accept in Principle
The panel action is to remove the word "permanent" and revise 250.97 Exception as follows:
Exception: Where oversized, concentric, or eccentric knockouts are not encountered, or where a box or enclosure with concentric or eccentric knockouts is listed to provide a ~~permanent,~~ reliable ~~electrical~~ bonding connection, the following methods shall be permitted:
Panel Statement: The panel agrees with the concept of removing the word "permanent" from this section and does not agree that the proposed replacement word "durable" is necessary for this section. The action of removing the word "permanent" from this section addresses the concerns of the submitter, and not replacing it with any other descriptive word addresses the other concerns of subjectivity, ambiguity, enforceability, and inconsistent application of the provisions of this section by users of the Code. The panel concludes that the descriptive wording provides the performance requirements necessary for users without the use of the word "permanent" or any other descriptive adjective. The panel also affirms that this action to remove the word "permanent" is consistent with similar revisions in NEC where the same concerns were raised about the use of this word.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-131 Log #2069 NEC-P05 **Final Action: Accept**
(250.97 Exception)

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 5-224a
Recommendation: Delete the word "permanent" from the exception so it will read in part:
"...to provide a reliable bonding connection...".
Substantiation: The Panel, in its substantiation for the Proposal states, "The phrase "...reliable bonding connection" is the preferred requirement." The word "permanent" indicates a connection that perhaps is made with exothermic welding or an irreversible compression connection. Neither method is common for these connections in metal boxes.

See also the substantiation for Proposal 5-223.

Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-132 Log #1431 NEC-P05 **Final Action: Reject**
(250.104(B))

Submitter: Robert Torbin, Cutting Edge Solutions, LLC / Rep. Titeflex Corporation
Comment on Proposal No: 5-239
Recommendation: Revise text to read as follows:

250.104 Bonding of Piping Systems and Exposed Structural Steel.

(B) Other Metal Piping. Where installed in or attached to a building or structure, metal piping system(s), including gas piping, that is likely to become energized shall be bonded to the service equipment enclosure, the grounded conductor at the service, the grounding electrode conductor where of sufficient size, or to the one or more grounding electrodes used. The bonding jumper(s) shall be sized in accordance with 250.122, using the rating of the circuit that is likely to energize the piping system(s). ~~The equipment grounding conductor for the circuit that is likely to energize the piping shall be permitted to service as the bonding means.~~ The points of attachment of the bonding jumper(s) shall be accessible.

As determined by the authority having jurisdiction, the equipment grounding conductor for the circuit that is likely to energize the piping shall be permitted to serve as the bonding means. In geographical locations subject to high lightning activity, the authority having jurisdiction may require a single bonding connection. When a single bond is made at the service entrance, the bonding jumper shall be sized in accordance with 250.66 and connected in accordance with 250.70.

Substantiation: Corrugated stainless steel tubing (CSST) is used as gas piping extensively throughout the Untied States, and has demonstrated a propensity to become energized from nearby lightning strikes. Conventional bonding of gas piping through the equipment grounding conductor [NEC 250.104(B)] has proven inadequate (under these circumstances) to protect the CSST from arcing damage. The submitted technical article summarizes the arcing damage inflicted on gas piping caused by indirect lightning strikes. CSST manufacturers collectively report dozens of damaged systems caused by improper or inadequate bonding resulting in fire damage or loss of property. The ROP 5-239 (lightning protection) was rejected because mandatory text does not belong in the FPN. Therefore, this necessitates some modifications to 250.104(B), as recommended in the submitted change, to allow alternative methods for direct bonding of metal piping to the grounding system to insure a minimum threshold of protection from all threats (including indirect lightning strikes) that are likely to energize the piping. Current bonding of gas piping to the equipment grounding conductor will continue to be permitted. More prescriptive language is being submitted to NFPA 54 National Fuel Gas Code for the 2009 cycle.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The proposed text would add vague and unenforceable language. The phrase “geographical locations subject to high lightning activity” would be difficult to apply consistently and is one example.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-133 Log #1474 NEC-P05 **Final Action: Accept in Principle**
(250.104(B) (New))

Submitter: Mark P. Morgan, East Coast Lightning Equipment, Inc. / Rep. Lightning Safety Alliance
Comment on Proposal No: 5-239
Recommendation: Recommend the proposed FPN text have the word “shall” changed to “should”.
Substantiation: This information is necessary because of instances I have encountered where local AHJs require the mandated NFPA 780 bonding requirements to be removed, thereby preventing these properties from complying with NFPA 780 and prevent them from receiving UL Master Label Certificate.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 5-134.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-134 Log #2223 NEC-P05 **Final Action: Reject**
(250.104(B))

TCC Action: The Technical Correlating Committee directs that the comment be reported as reject because the FPN may be interpreted as a requirement, which is in violation of 3.1.3 of the NEC Style Manual. The Technical Correlating Committee also notes that the proposed FPN would add an unnecessary third reference to NFPA 780.
Submitter: Technical Committee on Lightning Protection,
Comment on Proposal No: 5-239
Recommendation: Revise the existing Fine Print Note in 250.104(B) as follows:

FPN: Bonding all piping and metal air ducts within the premises will provide additional safety. For structures with a lightning protection system, NFPA 780 requires that all grounding media on a structure be interconnected to provide a common ground potential. This interconnection includes lightning protection, electric service, telephone, and communication system grounds, as well as underground metallic piping systems. For further information see NFPA 780-2004, Standard for the Installation of Lightning Protection Systems.

Substantiation: This submission corrects the procedural error incorporated in the original proposal correctly indicated in the panel’s rejection of the original submission.
Panel Meeting Action: Accept in Principle

Retain existing FPNote following 250.104(B). Move the remaining text to a new FPN No. 3 following Section 250.106 to read as follows:

FPN No. 3: For structures with a lightning protection system, NFPA 780 requires that all grounding media on a structure be interconnected to provide a common ground potential. This interconnection includes lightning protection, electric service, telephone, and communication system grounds, as well as underground metallic piping systems. For further information, see NFPA 780-2004, Standard for the Installation of Lightning Protection Systems.

Panel Statement: The panel moved the FPN to 250.106 to consolidate all lightning protection explanatory information.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:

BRETT, JR., M.: I am voting negative, I agree with the negative voter. There should only be one general FPN referencing the lightning standard, NFPA 780. If there are specific rules related to connections between the lightning installation system and the electrical system, then they should be in mandatory text and not FPNs.

MOHLA, D.: This should have been rejected by the panel. 250.106 already has two FPNs referencing to two different requirements of NFPA 780 “Standard for the Installation of Lightning Protection Systems”. Lightning protection is a separate field and requires different expertise to properly evaluate, design, and install lightning protection facilities necessary for proper protection from lightning hazards. By adding sporadic references of NFPA 780 in the National Electrical Code, other important requirements for lightning protection may be very easily overlooked resulting in a partial protection from lightning hazards. At this rate, we will soon end up adding all requirements from NFPA 780 in National Electrical Code. By multiple references to NFPA 780, an electrical contractor may be held responsible for electrical installation to comply with NFPA 780 also. There should be only one FPN referencing NFPA 780 and addition of a third FPN is going in the wrong direction.

5-135 Log #2073 NEC-P05 **Final Action: Reject**
(250.106, FPN 2)

Submitter: Chuck Mello, Underwriters Laboratories
Comment on Proposal No: 5-247
Recommendation: Revise the text to read as follows:
250.106

FPN No. 2: Metal raceways, enclosures, frames, and other non–current-carrying metal parts of electric equipment installed on a building equipped with a lightning protection system may require bonding to or spacing from the lightning protection conductors based on the calculated sideflash distances in accordance with NFPA 780-2004, Standard for the Installation of Lightning Protection Systems. ~~Separation from lightning protection conductors is typically 1.8 m (6 ft) through air or 900 mm (3 ft) through dense materials such as concrete, brick, or wood.~~

Substantiation: The panel action and the final language for FPN No. 2 do not match. The panel action was to delete the typical distance of 6 feet and replace this with “calculated sideflash distance” per NFPA 780. The only actual change that occurred in the revised text was to delete the last sentence to remove the “typical distance” reference but there was no replacement with a “calculated side flash distance”. This leaves the user no information at all instead of what could be incorrect information if the typical distance was used without qualification by true calculations. The proposed language above resolves the conflict between the panel action and the result of that action.
Panel Meeting Action: Reject
Panel Statement: Side flash calculations are already in FPN No. 1. There is no need to repeat that phrase in FPN No. 2.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-136 Log #1987 NEC-P05 **Final Action: Accept in Principle**
(250.118(2) Exception (New))

Submitter: James S. Conrad, Tyco Thermal Controls
Comment on Proposal No: 5-256
Recommendation: Although this proposal was originally submitted as an exception to 250.118(2) it would be more appropriate as an explanatory FPN in 250.120(A) to read as follows:

FPN: See the UL Guide Information on FHIT systems for grounding conductors installed in a raceway that are part of an Electrical Circuit Protective System or a fire rated cable listed to maintain circuit integrity.

Substantiation: This proposed FPN has had public review and should not be considered new material for as the concept in Proposal 5-257 was to bring an awareness for selecting the proper ground wire for fire rated circuits as outlined in the UL guide.

The UL guide information for FHIT systems states: "If not specified, the ground shall be the same as the fire-rated wire described in the system. Use of any other ground wire violates the system fire rating. As an example, THHN ground wire should not be used with a fire-rated system unless specified in the system."

Fire rated cables are used for life safety circuits in Article 700 and Article 695 and this FPN would clarify the importance of the proper type of ground wire used with these systems.

Panel Meeting Action: Accept in Principle

In the proposed text, editorially correct the term "grounding conductor" to "equipment grounding conductor" in the FPN.

Panel Statement: Editorial correction to the FPN.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

Comment on Affirmative:

BRETT, JR., M.: I support this new fine print note (FPN) for safety reasons. I believe it would be more informative if placed in locations in the NEC where the product is permitted. However, since it was submitted for this location, and it is very important information, I am voting affirmative.

Steel conduit and tubing are recognized as equipment grounding conductors per 250.122. However, there are times that a supplemental (wire) equipment grounding conductor is specified by the designer or installer for various reasons.

In the listing for FHIT systems (electrical circuit protective systems) which are used as fire protection measures, UL has determined that where the user or designer chooses to install an enclosed equipment grounding conductor it must be sized in accordance with 250.122, AND the insulation material type must be the same as that of the fire-rated circuit integrity cable. Use of other types of insulation on the enclosed equipment grounding conductors or bare conductors can constitute a safety hazard and violates the fire-rating listing of the system in the event of a fire. Compatibility of materials in a fire-rated system is of concern to UL. Some materials can provide carbon residue that is conductive or can generate conductive gases that can cause premature failure.

I would emphasize that neither the Code nor the Listing requires a ground wire when the system is installed in metal conduit or metal tubing.

5-137 Log #1988 NEC-P05 **Final Action: Accept in Principle**
(250.118(3) (New))

Submitter: James S. Conrad, Tyco Thermal Controls
Comment on Proposal No: 5-257
Recommendation: Although this proposal was originally submitted as an exception to 250.118(3) it would be more appropriate as an explanatory FPN in 250.120(A) to read as follows:

FPN: See the UL Guide Information on FHIT systems for grounding conductors installed in a raceway that are part of an Electrical Circuit Protective System or a fire rated cable listed to maintain circuit integrity.

Substantiation: This proposed FPN has had public review and should not be considered new material for as the concept on Proposal 5-257 was to bring an awareness for selecting the proper ground wire for fire rated circuits as outlined in the UL guide.

The UL guide information for FHIT systems states: "If not specified, the ground shall be the same as the fire-rated wire described in the system. Use of any other ground wire violates the system fire rating. As an example, THHN ground wire should not be used with a fire-rated system unless specified in the system."

Fire rated cables are used for life safety circuits in Article 700 and Article 695 and this FPN would clarify the importance of the proper type of ground wire used with these systems.

Comment on Affirmative:

BRETT, JR., M.: See my Explanation of Affirmative Vote on Comment 5-136.

5-139 Log #493 NEC-P05 **Final Action: Accept**
(250.119)

Submitter: Milton Dean, North Carolina Department of Transportation
Comment on Proposal No: 5-265
Recommendation: I concur with the panel's statement. While the submitter points out there is a UL lisiting for traffic signal cable, he fails to acknowledge that no other UL standards exist for other traffic signal components.

Substantiation: The NEC requires equipment to be approved by the authority having jurisdiction. Most authorities require listing or labeling by a third party testing agency. In North Carolina, we request electrical inspections of the service entrance conductors and the disconnecting means. Traffic signal equipment and its installation is inspected by Dept. of Transportation personnel.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-140 Log #1966 NEC-P05 **Final Action: Accept in Principle**
(250.119 Exception (New))

Submitter: Noel Williams, Herriman, UT
Comment on Proposal No: 5-264
Recommendation: This Proposal should have been Accepted or Accepted in Principle. If the panel is concerned about the proposal being overly broad, the following revised text would address that issue and still resolve the conflict with long-standing standardized color codes in signaling and communications:

Exception: Where equipment is connected by a multiconductor cable and is not required to be grounded in accordance with 250.112(1) or Chapter 8, the color green may be used for other than grounding conductors.

Substantiation: Standard color-coding for Class 2 thermostat circuits and cables uses green as the ungrounded conductor that controls the fan in HVAC equipment. This has been a standardized practice for decades. Also, green is used as identification in many communications circuits and cables. For example, Cat 5 cable includes a green pair that is not intended for use as grounding conductors. This Cat 5 cable is permitted to be used as a substitute for Class 2 or 3 cable or for fire alarm cable according to Articles 725 and 760. No substantiation to overturn these long-standing standards and practices was ever submitted when this section was revised in the 2005 NEC. It appears that this problem was not even considered. As a result, installers and inspectors of such installations are forced to ignore either the NEC or the installation instructions for listed equipment that uses such cables and color codes. See also the comment on negative by Mr. Dobrowsky. The language referring to Chapter 8 is probably not necessary as this requirement does not apply there anyway according to 90.3.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Comment 5-141.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

Comment on Affirmative:

HAMMEL, D.: See my explanation of affirmative vote on Comment 5-141.

5-141 Log #603 NEC-P05 **Final Action: Accept in Principle**
(250.119(D) (New))

Submitter: Henry A. Jenkins, Wake County, Inspections Development
Comment on Proposal No: 5-265
Recommendation: Add a new subsection (D) to 250.119 as follows:
(D) Circuits of Less than 50 Volts. Circuits of less than 50 volts shall be permitted to use a conductor with green insulation or a conductor with green insulation with one or more yellow stripes for other than grounding purposes.
Substantiation: While the submitter of Proposal 5-265 has identified an issue with low voltage traffic signal systems using a green conductor, there are many other low voltage systems that use a green insulated conductor for low voltage power applications. For example, air conditioner thermostat circuit wiring uses a green insulated conductor as the low voltage power conductor as the "hot" conductor for the A/C fan supply. This color coding in T-Stat wiring and the associated cable has been used for this function for many years without any problem mistaking this conductor as a grounding conductor. The added text to 250.119 in the 2005 NEC would not permit this green conductor to be used. There is similar wording for grounded conductors in 200.7(B) permitting the white, gray, or white with three continuous colored striped conductor to be used for other than the grounded conductor. This same permission must be applied to the green conductor and was probably just an oversight by Panel 5 during the 2005 process. This change will not adversely affect safety since it has been done in various systems for many years without any adverse problems. This new text would not be "new" material since the issue was actually dealt with in this proposal but rejected by the panel. This proposed text will permit the use of this green insulated conductor for any low voltage system of less than 50 volts, including traffic signaling systems installed as premises wiring.
Panel Meeting Action: Accept in Principle
Add a new exception to 250.119 (main body) to read as follows:
Exception: Power limited, Class 2, or Class 3 circuit cables containing only circuits operating at less than 50 volts shall be permitted to use a conductor with green insulation for other than equipment grounding purposes.
Panel Statement: The addition of this exception addresses the submitter's concerns.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
HAMMEL, D.: I agree with the panel action to add an exception to permit the use of conductors with green insulation for other than equipment grounding in limited energy installations only. While it is true that it has been standard practice to use green as part of the color-coding for Class 2 and Class 3 circuit conductors, it is also true that it has been standard practice to use conductors with green insulation for equipment grounding ONLY. It is an important safety practice to use conductors with green insulation for only equipment grounding when installing lighting, power and, Class 1 remote control circuits.

5-142 Log #1674 NEC-P05 **Final Action: Reject**
(250.120(B))

Submitter: Phil Simmons, Olympia, WA
Comment on Proposal No: 5-269
Recommendation: Accept this Proposal.
Substantiation: Experience has shown that aluminum conductors fail at a high rate when installed in direct-burial applications. When the bad section of the aluminum conductor is dug up, it is found the aluminum conductor has deteriorated and has become a white powder. This white powder is not conductive and as a result, the circuit opens.
If this happens to energized conductors, there will be some indication of the problem as equipment will not work properly. When this happens to an equipment grounding conductor, the conductor fails with no indication of an open circuit until the conductor is called upon to carry fault current and it doesn't. This open circuit can result in equipment being at a dangerous voltage above ground if there is a ground fault to equipment beyond the point of the break in the aluminum conductor.
This issue was recently mentioned to a group of journeyman electricians. One of them volunteered that they make repairs to failed aluminum conductors every week so this is a widespread problem.
The panel stated when rejecting the proposal, "Aluminum conductors with insulation suitable for direct burial are listed for that purpose. As with all conductors, care in handling and installation by qualified persons is also required to have a Code compliant installation. Any conductor directly buried with damaged insulation can experience failure under different soil conditions." The issue here is history has proven the aluminum conductor fails with great regularity in spite of code compliant installations. It is fallacy to assume every failure is due to faulty installations. An associate in the industry recently stated their installation of direct-burial aluminum conductors failed within a few years in spite of carefully embedding the conductors in select backfill.
This proposal needs to be accepted to ensure the effective ground-fault return path required by 250.4.
Panel Meeting Action: Reject
Panel Statement: No field evidence has been provided to indicate that properly installed insulated aluminium conductors listed for direct burial are not suitable for use in that application.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
BRENDER, D.: The original proposal and this comment have identified a safety issue that could be easily addressed. It has long been recognized that aluminum conductors corrode rapidly in the presence of moisture. Pinhole leakage in the outer covering of underground cables is also a recognized mode of failure. History has shown that aluminum conductors in direct burial applications fail with regularity, irrespective of listing or compliance with installation recommendations.
While loss of a phase conductor would normally not cause a safety concern, loss of the grounding conductor will not cause operation of the overcurrent device and will cause a substantial safety hazard. When called upon to handle fault current, the aluminum grounding conductor will simply not be useful.
Adoption of the proposal and acceptance of this Comment will easily and inexpensively address this potential safety hazard.

5-143 Log #2349 NEC-P05 **Final Action: Accept in Principle**
(250.122)

Submitter: Alan Manche, Square D Company
Comment on Proposal No: 5-274
Recommendation: Revise NEC 250.122 with the additions (underlined) and deletions (strike through) as shown. The entire text of 250.122(A) is shown for clarity, but only those changes shown underlined or strike through are part of this proposal.
250.122 Size of Equipment Grounding Conductors.
(A) General. Copper, aluminum, or copper-clad aluminum equipment grounding conductors of the wire type shall not be smaller than shown in Table 250.122 but shall not be required to be larger than the circuit conductors supplying the equipment. Where the conductor supplying the equipment is smaller than 14 AWG, the equipment grounding conductor shall not be required to be larger than the circuit conductor.
Substantiation: I agree with the panel's position on this matter, however, the conjunction "but" leaves it unclear as to whether the minimum is a number #14 as is found in Table 250.122 or if it can be a size less when the conductors are #16. It conveys that it must be at least as larger as a #14 but not more than the circuit conductor. In essence you can not drop below #14 which does not permit you to reduce to a #16 or smaller where the circuit conductors are smaller. Based on the present interpretation of the panel, I could argue that the wording requires you to use #14 in Class 2 and 3 wiring means.
Panel Meeting Action: Accept in Principle
Revise the first sentence of 250.122(A) to read as follows:
250.122 Size of Equipment Grounding Conductors.
(A) General. Copper, aluminum, or copper-clad aluminum equipment grounding conductors of the wire type shall not be smaller than shown in Table 250.122, but in no case shall ~~not~~ they be required to be larger than the circuit conductors supplying the equipment.
Panel Statement: This change addresses the concerns of the submitter.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-144 Log #709 NEC-P05 **Final Action: Reject**
(250.122(A))

Submitter: Dean Negrelli, Wiremold/Legrand
Comment on Proposal No: 5-272
Recommendation: The Panel should accept in principle and add the words "Listed (Classified)" before "cable tray" in the second sentence as follows (note that the text is taken from 2008 ROP Draft):
Where a Listed (Classified) cable tray, a raceway, or a cable armor or sheath is used as the equipment grounding conductor, as provided in 250.118 and 250.134(A), it shall comply with 250.4(A)(5) or (B)(4). [ROP 5-272]
Substantiation: Only cable tray Listed (Classified) by a qualified testing laboratory should be used as an equipment grounding conductor. Listing/Classification ensures the cable tray has been investigated for this purpose. Listing/Classification also ensures the appropriate instructions and hardware are provided to create a reliable equipment grounding conductor.
Panel Meeting Action: Reject
Panel Statement: Section 250.118(11) requires cable tray used as an equipment grounding conductor to meet the requirements of 392.7. In 392.7 the term used for sections of cable tray is identified. There are also requirements for fittings and cross-sectional area. Including cable tray in 250.122(A) is mandating the performance requirements of 250.4. The point of the second sentence in 250.122(A) is to make sure that the equipment grounding conductors that are not of the wire type meet the performance requirements of 250.4.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-145 Log #1057 NEC-P05 **Final Action: Reject**
(250.122(A))

Submitter: David Shapiro, Safety First Electrical Contracting Consulting & Safety Education
Comment on Proposal No: 5-272
Recommendation: Revise text to read as follows:
"Where ~~a~~ cable tray, ~~a~~ raceway, ~~a~~ cable armor, or cable sheath, that qualifies as an equipment-grounding conductor in accordance with 250.118...".
Substantiation: While Mr. Daniel Leaf has a point in adding this means of grounding, it is patently true that not all raceway, or cable armor installations constitute suitable grounds-not just cable trays. At first, it seemed that the CMP majority was right and Messrs. Chuck Mello and Martin Brett were worrying unnecessarily. However, on reflection, I believe the reminder is worthwhile, but a more-general reminder. I have come on too many installers who assumed that any armor must be a good and legal ground. Their hearing about the new type of MC cable, I fear, will only add to their confusion. Deletion of the "a"s is just an editorial suggestion for tighter writing. The particular language I suggest here is the TCC's, from 3-5 Log #1532.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 5-144.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-146 Log #2078 NEC-P05 **Final Action: Reject**
(250.122(A))

Submitter: Chuck Mello, Underwriters Laboratories
Comment on Proposal No: 5-272
Recommendation: Revise text as follows:
250.122(A) General. Copper, aluminum, or copper-clad aluminum equipment grounding conductors of the wire type shall not be smaller than shown in Table 250.122 but shall not be required to be larger than the circuit conductors supplying the equipment. Where a raceway or a cable armor or sheath or cable tray listed for the purpose is used as the equipment grounding conductor, as provided in 250.118 and 250.134(A), it shall comply with 250.4(A)(5) or (B)(4).
Substantiation: The panel should not have accepted this change without qualification. Cable tray is suitable as an equipment-grounding conductor only when Listed (Classified) and when installed with the instructions, hardware and accessories provided or specified by the manufacturer. As worded with this change, cable tray has been made equivalent to raceways where no such listing (Classification) is necessary and may lead to confusion and unsafe installations. At most the panel should have Accepted in Principle and added the appropriate qualifiers as stated above. Otherwise the panel should reject the proposal since it is incomplete and may allow unsafe installations.
Panel Meeting Action: Reject
Panel Statement: The panel assumes that this comment is related to Proposal 5-272. See panel action and statement on Comment 5-144.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-147 Log #270 NEC-P05 **Final Action: Reject**
(250.122(B))

Submitter: Dennis Downer, Morrisville, VT
Comment on Proposal No: 5-275
Recommendation: Add the following underlined text to Article 250.122(B).
(B) Increased in Size. Where ungrounded conductors are increased in size to compensate for voltage drop or for any other reason related to proper circuit operation, equipment grounding conductors, where installed, shall be increased in size proportionately according to circular mil area of the ungrounded conductors.
Substantiation: There is no electrical theory to the requirement to increase the EGC if one designs a feeder and installs a larger conductor than is required for the purpose of future usage.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The addition of the term "proper circuit operation" is vague and unenforceable.
The feeder design in the substantiation is incorrect. The panel agrees that inadequate substantiation was submitted with the proposal, and it should be rejected on that basis. The panel concludes that any adjustment in size of the ungrounded circuit conductors can adversely affect the safety circuit of the system that includes the equipment grounding conductor. To eliminate any possibility of an inadequately sized equipment grounding conductor that does not meet the performance requirements of 250.4, the panel concludes that whenever the ungrounded circuit conductors are increased in size, the equipment grounding conductor must be adjusted in size proportionately. See panel action on Comment 5-152.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-148 Log #335 NEC-P05 **Final Action: Reject**
(250.122(B))

Submitter: Dennis Downer, IBM / Rep. Inspector Member of IAEI
Comment on Proposal No: 5-276
Recommendation: Revise text to read as follows:
(B) Increased in Size. Where ungrounded conductors are increased in size to compensate for voltage drop, correction factors for ambient temperature, correction factors for more than three current carrying conductors, or for any other reason related to proper circuit operation, equipment grounding conductors, where installed, shall be increased in size proportionately according to circular mil area of the ungrounded conductors.
Substantiation: The 1999 NEC called this article Adjustment for Voltage Drop, stating where conductors are adjusted for voltage drop the EGC shall be adjusted proportionately. In 2002, it was changed to Increase in Size with no exception.
I would agree with the explanation of the negative vote, that the resistance would rise and, therefore, shouldn't the EGC be increased for the same reason, to carry back a fault when needed. Also, the same consideration should be given to adjustment factors for more than three wires in a conduit, where the wire size is increased rather than decrease the OCPD. And, also for voltage drop, same reasons as above, increased wire size, which was what this section was called in the 1999 NEC.
There is also no electrical theory for this requirement to increase the EGC if one designs a feeder and installs a larger conductor than is required for the purpose of future usage, an example is as follows:
Design Scope
For economical reasons a feeder is to be designed for 200 amps to accommodate any future tool/equipment which can utilize the full 200 amp feeder. An existing 100A tool/equipment which is being utilized today will be connected to the designed new feeder for the future 200 amp loads, but we will protect/fuse the feeder for 100 amps.
- Per Table 310.16, a 200 amp feeder at 75°C requires the phase conductors to be #3/0 AWG Cu (167,800 cir mils)
- Per Table 250.122, the ground conductor shall be a #6 AWG Cu (26,240 cir mils)

Question
Per 250.122(B) "Where ungrounded conductors are increased in size..." Does the ground wire need to be increased in size if the 200 amp feeder is fused at 100 amps as shown below?
- 100 amp feeder - per Table 310.16 phase conductors is only required to be #3 AWG Cu (52,620 cir mils)
- Per Table 250.122, the ground conductor shall be 8 AWG Cu (16,510 cir mils)
- Size Ratio: #3/0 (167,800 cir mils) / #3 (52,620 cir mils) = 3.19
- #8 AWG Cu (16,510 cir mils) x 3.19 = 52,649 cir mils
- Therefore, a #2 AWG Cu Ground is required on the new 200 amp feeder which will presently be fused at 100 amps. Please verify.

If the above is a correct assumption, a new 200 amp feeder fused with a 200 amp fuse will require only a #6 AWG Cu ground conductor. However, a new 200 amp feeder fused with a 100 amp fuse must have a #2 AWG Cu Ground wire. There is no electrical theory or reason why this would be a requirement.
Note: If an equipment grounding conductor is not installed in the conduit, and the conduit is utilized as the equipment grounding conductor, can the 200 amp feeder (3/0 AWG Cu cable) be fused with a 100 amp fuse? By the language in 250.122(B) today this only applies to where an EGC is installed.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 5-147.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-149 Log #388 NEC-P05 **Final Action: Reject**
(250.122(B))

Submitter: Dennis Downer, IBM
Comment on Proposal No: 5-276
Recommendation: Revise as follows:
(B) Increased in Size. Where ungrounded conductors are increased in size ~~for reasons other than application of ampacity adjustments factors~~ to compensate for voltage drop, correction factors for ambient temperature, correction factors for more than three current carrying conductors, or for any other reason related to proper circuit operation, equipment grounding conductors where installed, shall be increased in size proportionately according to circular mil area of the ungrounded conductors.
Substantiation: The submitter's language change and substantiation does not meet the intent of ampacity adjustments and does not address the total issue.
The 1999 NEC called this article Adjustment for Voltage Drop, stating where conductors are adjusted for voltage drop, the EGC shall be adjusted proportionately.

In 2002 it was changed to increase in size with no exceptions. I agree with the explanation of the negative vote that the circuit resistance will rise due to the heating affect and therefore shouldn't the EGC be increased for the same reason, to carry back any fault current when needed to trip the OCPD at the proper time interval. This same consideration should be given to adjustment factors for more than three wires in a conduit, where the wire size is increased rather than decrease the OCPD, and also for voltage drop, where the wire size is increased and the OCDP remains the size, which is what this section was intended for and was called in the 1999 NEC.

There is also no electrical theory for this requirement to increase the EGC if one designs a feeder and installs a larger conductor than is required for the purpose of future usage, an example is shown below:

Design Scope

For economical reasons a feeder is to be designed for 200 Amps to accommodate any future tool/equipment which can utilize the full 200 Amp feeder. An existing 100A tool/equipment which is being utilized today will be connected to the designed new feeder for the future 200 Amp loads, but we will protect/fuse the feeder for 100 Amps.

- Per Table 310.16, a 200 Amp feeder at 75 degree C requires the phase conductors to be #3/0 AWG Cu (167,800 cir mils)
- Per Table 250.122, the ground conductor shall be a #6 AWG Cu (26,240 cir mils)

Question

Per 250.122(B, "Where ungrounded conductors are increased in size..." Does the ground wire need to be increased in size if the 200 Amp Feeder is fused at 100 Amps as shown below?

- 100 Amp Feeder - Per Table 310.16 phase conductor is only required to be #3 AWG Cu (52,620 cir mils)
- Per Table 250.122, the ground conductor shall be 8 AWG Cu (16,510 cir mils)
- Size Ratio: #3/0 (167,800 cir mils)/#3 (52,620 cir mils) = 3.19
- #8 AWG CU (16,510 cir mils) x 3.19 = 52,649 cir mils
- Therefore a #2 AWG Cu Ground is required on the new 200 Amp feeder which will presently be fused at 100 Amps. Please verify.

If the above is a correct assumption, a new 200 Amp feeder fused with a 200 Amp fuse will require only a #6 AWG Cu ground conductor. However, a new 200 Amp feeder fused with a 100 Amp fuse must have a #2 AWG Cu Ground wire. There is no electrical theory or reason why this would be a requirement.

Note: If an equipment grounding conductor is not installed in the conduit, and the conduit is utilized as the equipment grounding conductor, can the 200 Amp feeder (3/0 AWG Cu Cable) be fused with a 100 Amp Fuse? By the language in 250.122(B) today, this only applies to where an EGC is installed.

(250.122(B))

Submitter: Richard E. Loyd, Sun Lakes, AZ
Comment on Proposal No: 5-276
Recommendation: Revise this proposal as follows:
250.122(B) Increased in Size. Where ungrounded conductors are increased in size for reasons other than application of ampacity adjustments factors **in** 310.15(B)(2**)**, equipment grounding conductors,----------
Substantiation: The proponents substantiation is correct and the addition of the correct NEC reference 310.15(B)(2) will add clarity for the user.

Temperature rise also increases the impedance in a circuit and a larger EGC may be needed, lack of design is not a good reason to allow the installer to install a minimum size EGC from Table 250.122 that may or may not provide a low enough impedance path for the fault to cause the overcurrent device to trip before the wiring and or equipment is damaged excessively.

The safety factors contained in the present text of 250.122(B) may be justified is some cases. Grounding books such as Soares and Simmons Electrical Grounding and Bonding are available with text and tables to assist the designer in making safe and correct designs. Also free "GEMI" software is available for making simple calculations to assist the designer or installer. Please reconsider and and accept the addition of the reference.

Panel Meeting Action: Reject

(250.122(B))

Submitter: Phil Simmons, Olympia, WA
Comment on Proposal No: 5-276
Recommendation: Reject this Proposal.
Substantiation: This proposal was accepted with inadequate substantiation. It is obvious that equipment grounding conductors are subject to the same conditions of use as the circuit conductors. If the circuit conductors require derating for conditions of use such as high ambient temperatures or excessive number of conductors, and, as a result, larger conductors are required, the equipment grounding conductors must also be adjusted in size. This is a fairly simple physical law.

As temperatures rise, the resistance of any conductor increases. This increased circuit resistance decreases fault current, and may cause the overcurrent device to open later than planned, or not open at all. There were no calculations or supporting data submitted with the proposal to show the proposed change would represent safe practice.

It is also obvious that not all ampacity adjustments result in an increase in circuit conductor sizes. Often, this is due to derating starting from the 90°C ampacity of the conductors. However, where ampacity adjustments of circuit conductors result in an increase in size, the equipment grounding conductor must also be increased in size as has been required in the Code for safety.

Ballot Results: Affirmative: 15

5-153 Log #1910 NEC-P05 **Final Action: Accept in Principle**
(250.122(D))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 5-284
Recommendation: Accept the proposal, or, at a minimum, revise the paragraph as follows:

(D) Motor Circuits. Where the overcurrent device consists of an instantaneous-trip circuit breaker or motor short-circuit protector, as allowed in 430.52, the equipment grounding conductor shall be permitted to be sized not smaller than that given by Table 250.122 using the maximum permitted size of a time-delay fuse selected for short-circuit and ground-fault protection in accordance with 430.52(C)(1) Exception No. 1.

Substantiation: This comment works from information provided in the comments in the voting. It clarifies that the dual-element fuse parameter is based on the next higher standard size rule, which is usually how such fuses are actually selected in the field.

Panel Meeting Action: Accept in Principle
Delete the present language in paragraph (D). Add new language to the section as follows:

(D) Motor Circuits. Equipment grounding conductors for motor circuits shall be sized in accordance with (D)(1) or (D)(2).

(1) General. The equipment grounding conductor size shall not be smaller than determined by 250.122(A) based on the rating of the branch circuit short-circuit and ground-fault protective device.

(2) Instantaneous-Trip Circuit Breaker and Motor Short-Circuit Protector. Where the overcurrent device is an instantaneous-trip circuit breaker or a motor short-circuit protector, the equipment grounding conductor shall be sized not smaller than that given by 250.122(A) using the maximum permitted rating of a dual element time-delay fuse selected for branch-circuit short-circuit and ground-fault protection in accordance with 430.52(C)(1), Exception No. 1.
Panel Statement: The proposed comment was restructured to comply with the NEC Style Manual. The revised text meets the submitter's intent.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-154 Log #341 NEC-P05 **Final Action: Reject**
(250.146(A))

Submitter: Bryan P. Holland, City of North Port
Comment on Proposal No: 5-298
Recommendation: Revise proposal to state:
At least one of the insulated retaining washers shall be removed from receptacles that... OR, At least one of the retaining washers of insulated materials shall be removed from receptacles that...
Substantiation: The revised wording meets both the intent of the original proposal while also resolving the statement made by the panel.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its original action and statement on this proposal and concludes that the additional revision proposed on this comment does not add clarity or improve the usability of this section.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-155 Log #337 NEC-P05 **Final Action: Accept**
(250.146(D))

Submitter: Michael J. Johnston, Plano, TX
Comment on Proposal No: 5-301a
Recommendation: Continue to accept the proposal but revise the last sentence as follows:
This equipment grounding conductor shall be permitted to pass through one or more panelboards~~, boxes, wireways, or other enclosures~~ without connection to the panelboard grounding terminal as permitted in 408.40, Exception, so as to terminate within the same building or structure directly at an equipment grounding conductor terminal of the applicable derived system or service. Where installed in accordance with the provisions of this section, this equipment grounding conductor shall also be permitted to pass through boxes, wireways, or other enclosures without being connected to such enclosures.
Substantiation: The revised wording does not add new information. The proposal, as accepted, inadvertently created a wording issue with the existing text. By adding the new sentence, the concept of equipment grounding conductors through enclosures other than panelboards alone, is retained which was the original intent of the proposal. The comment is intended to be editorial revisions for clarity. Adding the word "equipment" provides clarification for users as to which conductor is referenced in these requirements, since the term "grounding conductor" is a specifically defined term.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-156 Log #2084 NEC-P05 **Final Action: Reject**
(250.146(D))

Submitter: Chuck Mello, Underwriters Laboratories
Comment on Proposal No: 5-304
Recommendation: Revise the text as accepted by the panel on proposal 5-310a to read as follows:
250.146 (D) Isolated Ground Terminal Receptacles. Where installed for the reduction of electrical noise (electromagnetic interference) on the grounding circuit, a receptacle in which the grounding terminal is purposely insulated from the receptacle mounting means shall be permitted. The receptacle grounding terminal shall be connected to a~~n~~ insulated dedicated equipment grounding conductor run with the circuit conductors. This dedicated equipment grounding conductor shall be permitted to pass through one or more panelboards, boxes, wireways, or other enclosures without a connection to the panelboard equipment grounding terminal bar as permitted in 408.40, Exception, so as to terminate within the same building or structure directly at an equipment grounding conductor terminal of the applicable derived system or service.
FPN: Use of an ~~isolated~~ dedicated equipment grounding conductor does not relieve the requirement for grounding the raceway system and outlet box.
Substantiation: The panel should reconsider the action and not reject the entire proposal outright. The receptacles can continue to be referred to as "isolated grounding receptacles" since the yoke is in fact isolated from the green equipment grounding screw provided for connecting the third (grounding) receptacle sleeve. The submitter has provided good substantiation that the term "Isolated" has created Issues and unsafe Installations In the field due to the misunderstanding of the Intended meaning of the word "Isolated".
The change to the fine print note should be further considered and possibly use the term "dedicated" in place of "isolated" when referring to the equipment grounding conductor. In the 2002 cycle the term "dedicated" was suggested and the panel statement at that time indicated that dedicated could be inferred to mean a separate equipment grounding conductor for each receptacle. The term dedicated means "to set apart for a definite use" (Websters New Collegiate Dictionary), which is exactly what is intended. The "dedicated equipment grounding conductor" is set apart from the required equipment grounding conductor for a definite use limiting electronic noise interference. The confusion in the industry indicated by the submitter is in dealing with the insulated green wire that comes from the isolated grounding receptacle. The term "isolated" is a poor word to use and has caused great confusion and down right dangerous installations to be completed. I believe the panel action should have been to Accept in Principle and In Part. The above revised language should resolve at least some of the problems encountered. The word "equipment" was added in one location to better clarify the wording in that part since it is the equipment grounding conductor that is being referred to in this case.
Panel Meeting Action: Reject
Panel Statement: The new word "dedicated" provides no benefit to the clarity and usability of this section. The conductor used to connect to the terminal of an isolated ground receptacle is an insulated equipment grounding conductor. It has to be installed to meet the applicable provisions for this type of installation. The panel concludes that introducing an additional and undefined term in this section is not necessary and is unsubstantiated.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
MELLO, C.: The panel's statement does not address the issue nor the substantiation. The statement that the conductor connected to the isolated ground terminal is an "insulated equipment grounding conductor" infers that the required equipment grounding conductor that connects to the raceway, box and other equipment is not insulated or would not be permitted to be insulated. This conductor being insulated is part of the requirement in 250.146(D) has nothing to do toward a solution to the poorly applied term "isolated". The term dedicated is clearly defined in Webster's dictionary, as brought out in the comment's substantiation, and in accordance with the NEC Style Manual any term not specifically defined in the Code uses standard dictionary definitions. It should be pointed out that the term "dedicated" is used in the NEC 35 times without specific definition. It is used in various contexts such as "dedicated branch circuit", "dedicated space", and "dedicated strut" among others. If the term dedicated, meaning "for a specific purpose or use" is understood for these 35 applications, how can the panel say the term is "undefined" and would not be understood to differentiate the "insulated equipment grounding conductor" installed for a special purpose from the one required to meet the required raceway, equipment and other equipment grounding requirements? The original proposal submitter has over several cycles provided substantiation of a problem with the term "isolated" and has provided evidence of serious safety issues because of misunderstanding of that term.

5-157 Log #401 NEC-P05 **Final Action: Reject**
(250.157)

Submitter: Daniel Leaf, Seneca, SC
Comment on Proposal No: 5-312
Recommendation: Accept the proposal.
Substantiation: Where multiple derived systems are installed, there is no code provision for a common grounding electrode conductor with taps. Since it is not specifically allowed or disallowed code users have no guidance. There may be installations where, for example, two generators are installed to provide for varying loads, or a back-up system in case of malfunction or maintenance and repair.
Panel Meeting Action: Reject
Panel Statement: There is no demonstrated need for such a provision. There is no technical evidence that installations following the present requirements are unsafe.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-158 Log #520 NEC-P05 **Final Action: Reject**
(250.166(A))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 5-311
Recommendation: Accept the proposal.
Substantiation: If the largest conductor is 2 AWG copper, an aluminum 2 AWG conductor may be used per the present text. Which infers a difference in conductivity is irrelevant. Table 250.66 for ac systems applies to different sizes for copper and aluminum which infers conductivity is not equal.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its original action and statement on this proposal. No additional substantiation has been provided to indicate this revision is necessary in response to any problems or conflicts in the field with regard to application of this section to dc systems. The proposal was not editorial and did not add clarity to this requirement.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-159 Log #519 NEC-P05 **Final Action: Accept**
(250.168)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 5-313
Recommendation: Accept as revised:
Direct Current System Bonding Jumper. For direct-current systems that are to be grounded an unspliced bonding jumper shall be used to connect the equipment grounding conductor(s) to the grounded conductor at the source or the first system disconnecting means where the system is grounded. ~~For direct current systems~~ The size of the bonding jumper shall not be smaller than the system grounding electrode conductor specified in 250.166 and shall comply with the provisions of 250.28(A), (B), and (C).
Substantiation: 250.168 prescribes the size for a bonding jumper, but there is no section that REQUIRES one. Is it optional? Without a bonding jumper there is no effective ground-fault current path required by 250.2. 250.28 doesn't seem to apply since (D) of that section refers to Table 250.66 which is for ac systems. 250.34(C) doesn't cover dc generators since it relates to grounding in 250.26 for ac systems.
Panel Meeting Action: Accept

Ballot Results: Affirmative: 15

5-161 Log #1682 NEC-P05 **Final Action: Reject**
(250.184(A)(1) Exception No. 1, No. 2, and No. 3)

Submitter: Donald W. Zipse, Electrical Forensics, LLC
Comment on Proposal No: 5-318
Recommendation: Delete Section 250.184(A)(1) Exception No. 1, Exception No. 2, and Exception No. 3.
Substantiation: Please read Mr. Elliott Rappaport's Explanation of Negative vote. It appears that he understands the dangers involved.
Please continue your Panel Statements as I assure you I will address all of them in the next cycle.
Let us look at 250.184(A)(1), Exception No. 1, which states, "Bare copper conductors shall be permitted to be used for the neutrals of service entrances and the neutral of direct-buried portions of feeders." This allows bare conductors for certain applications.
Now look at 250.184(B)(7), which states, "The neutral, where provided, shall be insulated and isolated from earth except at one location."
It sure seems to me that there is a conflict between the two statements.
In addition, first thing is there is no single point grounded system when it comes to utility services since the utility grounds the neutral at the transformer and possibly again at the meter. In addition the NEC requires the neutral to be grounded at the service entrance. **SO WHERE IS THIS SINGLE POINT GROUNDED ELECTRICAL (service) SYSTEM? Only when the system originates after the service with the installation of another transformer.** It would be great if the panel could have the ability to look at the total electrical circuit instead of thinking with blinders on and compartmentalize the circuit to fit their desires.
Panel Meeting Action: Reject
Panel Statement: The panel does not agree that a conflict exists between the statements pointed out by the submitter. The exceptions in 250.184(A)(1) apply to the insulation level of the neutral conductor. Paragraphs (B) and (C) specify two different ways the neutral conductor can be grounded and provide for options for the desired engineering design. Specifically 250.184(B)(7) would set neutral insulation requirements that would not allow the exceptions in 250.184(A)(1) only where the option of single point grounding is chosen. Therefore, the single point grounded system referenced in 250.184(B), if chosen, is the system that is grounded at the service or at a separately derived system. Furthermore, the NEC does not cover installations under the exclusive control of an electric utility.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
MOHLA, D.: Submitter is correct about the possible conflict between 250.184(A)(1) and 250.184(B)(7).
250.184(A) and 250.184(B)(7) both require that neutral conductor be insulated.
250.184(A)(1) Exceptions allow bare neutral conductors in certain cases.
251.184(B)(7) does not allow any exceptions to insulated neutral requirements.
The Panel statement indicates bare neutral is not allowed when single point grounding system is utilized. So by default only place bare copper neutral can be used is when multi grounded Neutral system is utilized.
This is not very clear in the text and to the users and is a source of conflict.

ARTICLE 280 — SURGE ARRESTERS

5-162 Log #975 NEC-P05 **Final Action: Accept in Principle**
(280)

TCC Action: The Technical Correlating Committee directs that NFPA staff update the references to the standards as provided in the affirmative comments on vote.
Submitter: Mark C. Ode, Underwriters Laboratories Inc.
Comment on Proposal No: 5-335
Recommendation: Revise as follows:
ARTICLE 280 Surge Arresters, Over 1 kV
I. General
280.1 Scope. This article covers general requirements, installation requirements, and connection requirements for surge arresters installed on premises wiring systems over 1 kV.
280.2 Uses Not Permitted. A surge arrester shall not be installed where the rating of the surge arrester is less than the maximum continuous phase-to ground power frequency voltage available at the point of application.
280.3 Number Required. Where used at a point on a circuit, a surge arrester shall be connected to each ungrounded conductor. A single installation of such surge arresters shall be permitted to protect a number of interconnected circuits, provided that no circuit is exposed to surges while disconnected from the surge arresters.
280.4 Surge Arrester Selection. The surge arresters shall comply with all of the following:
(A) Rating. The rating of a surge arrester shall be equal to or greater than the maximum continuous phase-to-ground voltage available at the point of application.
(B) Silicon Carbide Types. The rating of a silicon carbide-type surge arrester shall be not less than 125 percent of the maximum continuous phase-to-ground voltage available at the point of application.
FPN No. 1: For further information on surge arresters, see ANSI/IEEE C62.1-1989, Standard for Gapped Silicon-Carbide Surge Arresters for AC Power Circuits; ANSI/IEEE C62.2-1987, Guide for the Application of Gapped Silicon-Carbide Surge Arresters for Alternating-Current Systems; ANSI/IEEE C62.11-1999, Standard for Metal-Oxide Surge Arresters for Alternating-Current Power Circuits (> 1kV); and ANSI/IEEE C62.22-1997, Guide for the Application of Metal-Oxide Surge Arresters for Alternating-Current Systems.
II. Installation
280.11 Location. Surge arresters shall be permitted to be located indoors or outdoors. Surge arresters shall be made inaccessible to unqualified persons, unless listed for installation in accessible locations.

280.12 Routing of Surge Arrester Grounding Conductors. The conductor used to connect the surge arrester to line, bus, or equipment and to a grounding conductor connection point as provided in 280.21 shall not be any longer than necessary and shall avoid unnecessary bends.

III. Connecting Surge Arresters

280.21 Connection. The arrester grounding conductor shall be connected to one of the following:

(1) Grounded service conductor
(2) Grounding electrode conductor
(3) Grounding electrode for the service
(4) Equipment grounding terminal in the service equipment

280.23 Surge-Arrester Conductors. The conductor between the surge arrester and the line and the surge arrester and the grounding connection shall not be smaller than 6 AWG copper or aluminum.

280.24 Interconnections.

The grounding conductor of a surge arrester protecting a transformer that supplies a secondary distribution system shall be interconnected as specified in 280.24(A), (B), or (C).

(A) Metallic Interconnections. A metallic interconnection shall be made to the secondary grounded circuit conductor or the secondary circuit grounding conductor provided that, in addition to the direct grounding connection at the surge arrester, the following occurs:

(1) Grounded Conductor Connection to Grounding. The grounded conductor of the secondary has elsewhere a grounding connection to a continuous metal underground water piping system. ~~However,~~ In urban water-pipe areas where there are at least four water-pipe connections on the neutral conductor and not fewer than four such connections in each mile of neutral conductor, the metallic interconnection shall be permitted to be made to the secondary neutral conductor with omission of the direct grounding connection at the surge arrester.

(2) Grounded Conductor Part of Multi-Ground Neutral. The grounded conductor of the secondary system is a part of a multi-ground neutral system or static wire of which the primary neutral conductor or static wire has at least four ground connections in each mile of line in addition to a ground at each service.

(B) Through Spark Gap or Device. Where the surge arrester grounding conductor is not connected as in 280.24(A) or where the secondary is not grounded as in 280.24(A) but is otherwise grounded as in 250.52, an interconnection shall be made through a spark gap or listed device as follows:

(1) Ungrounded or Uni-Grounded Primary Systems. For ungrounded or uni-grounded primary systems, the spark gap or listed device shall have a 60-Hz breakdown voltage of at least twice the primary circuit voltage but not necessarily more than 10 kV, and there shall be at least one other ground on the grounded conductor of the secondary that is not less than 6.0 m (20 ft) distant from the surge arrester grounding electrode.

(2) Multi-Grounded Neutral Primary Systems. For multi-grounded neutral primary systems, the spark gap or listed device shall have a 60-Hz breakdown of not more than 3 kV, and there shall be at least one other ground on the grounded conductor of the secondary that is not less than 6.0 m (20 ft) distant from the surge arrester grounding electrode.

(C) By Special Permission. An interconnection of the surge arrester ground and the secondary neutral conductor, other than as provided in 280.24(A) or (B), shall be permitted to be made only by special permission.

280.25 Grounding Conductor Connections and Enclosures. Except as indicated in this article, surge arrester grounding conductor connections shall be made as specified in Article 250, Parts III and X. Grounding conductors installed in metal enclosures shall comply with 250.64(E).

Substantiation: Added titles where needed at all headings in accordance with the NEC Style Manual and made one correction to text of deleting the word "however" since this is not Code language.

Panel Meeting Action: Accept in Principle

Revise 2008 NEC ROP Draft of Article 280 to read as follows:

Article 280 Surge Arresters, Over 1 kV

I. General

280.1 Scope. This article covers general requirements, installation requirements, and connection requirements for surge arresters installed on premises wiring systems over 1 kV.

280.2 Uses Not Permitted. A surge arrester shall not be installed where the rating of the surge arrester is less than the maximum continuous phase-to-ground power frequency voltage available at the point of application.

280.3 Number Required. Where used at a point on a circuit, a surge arrester shall be connected to each ungrounded conductor. A single installation of such surge arresters shall be permitted to protect a number of interconnected circuits, provided that no circuit is exposed to surges while disconnected from the surge arresters.

280.4 Surge Arrester Selection. The surge arresters shall comply with 280.4(A) and (B).

(A) **Rating.** The rating of a surge arrester shall be equal to or greater than the maximum continuous ~~phase-to-ground~~ operating voltage available at the point of application.

(1) Solidly Grounded Systems. The maximum continuous operating voltage shall be the phase-to-ground voltage of the system.

(2) Impedance or Ungrounded System. The maximum continuous operating voltage shall be the phase-to-phase voltage of the system.

(B) Silicon Carbide Types. The rating of a silicon carbide-type surge arrester shall not be less than 125 percent of the rating specified in 280.4(A).~~of the maximum continuous phase-to-ground voltage available at the point of application.~~

FPN No. 1: For further information on surge arresters, see ANSI/IEEE C62.1-1989, Standard for Gapped Silicon-Carbide Surge Arresters for AC Power Circuits; ANSI/IEEE C62.2-1987, Guide for the Application of Gapped Silicon-Carbide Surge Arresters for Alternating-Current Systems; ANSI/IEEE C62.11-1999, Standard for Metal-Oxide Surge Arresters for Alternating-Current Power Circuits (>1 kV); and ANSI/IEEE C62.22-1997, Guide for the Application of Metal-Oxide Surge Arresters for Alternating-Current Systems.

FPN No. 2: The selection of a properly rated metal oxide arrester is based on considerations of maximum continuous operating voltage and the magnitude and duration of overvoltages at the arrester location as affected by phase-to ground faults, system grounding techniques, switching surges, and other causes. See the manufacturer's application rules for selection of the specific arrester to be used at a particular location.

280.5 Listing. A surge arrester shall be a listed device.

II. Installation

280.11 Location. Surge arresters shall be permitted to be located indoors or outdoors. Surge arresters shall be made inaccessible to unqualified persons, unless listed for installation in accessible locations.

280.12 Routing of Surge Arrester Grounding Conductors.

The conductor used to connect the surge arrester to line, bus, or equipment and to a grounding conductor connection point as provided in 280.21 shall not be any longer than necessary and shall avoid unnecessary bends.

III. Connecting Surge Arresters

280.21 Connection. The arrester grounding conductor shall be connected to one of the following:

(1) Grounded service conductor
(2) Grounding electrode conductor
(3) Grounding electrode for the service
(4) Equipment grounding terminal in the service equipment

280.23 Surge-Arrester Conductors. The conductor between the surge arrester and the line and the surge arrester and the grounding connection shall not be smaller than 6 AWG copper or aluminum.

280.24 Interconnections. The grounding conductor of a surge arrester protecting a transformer that supplies a secondary distribution system shall be interconnected as specified in 280.24(A), (B), or (C).

(A) Metallic Interconnections. A metallic interconnection shall be made to the secondary grounded circuit conductor or the secondary circuit grounding conductor provided that, in addition to the direct grounding connection at the surge arrester, the following occurs:

(1) ~~**Grounded Conductor Connection to Grounding**~~ **Additional Grounding Connection**. The grounded conductor of the secondary has elsewhere a grounding connection to a continuous metal underground water piping system. ~~However~~, In urban water-pipe areas where there are at least four water pipe connections on the neutral conductor and not fewer than four such connections in each mile of neutral conductor, the metallic interconnection shall be permitted to be made to the secondary neutral conductor with omission of the direct grounding connection at the surge arrester.

(2) ~~**Grounded Conductor Part of Multi-Grounded Neutral**~~ **Multi-Grounded Neutral System Connection.** The grounded conductor of the secondary system is a part of a multi-grounded neutral system or static wire of which the primary neutral conductor or static wire has at least four grounding connections in each mile of line in addition to a grounding connection at each service.

(B) Through Spark Gap or Device. Where the surge arrester grounding conductor is not connected as in 280.24(A) or where the secondary is not grounded as in 280.24(A) but is otherwise grounded as in 250.52, an interconnection shall be made through a spark gap or listed device as follows:

(1) **Ungrounded or Uni-Grounded Primary System**. For ungrounded or uni-grounded primary systems, the spark gap or listed device shall have a 60-Hz breakdown voltage of at least twice the primary circuit voltage but not necessarily more than 10 kV, and there shall be at least one other ground on the grounded conductor of the secondary that is not less than 6.0 m (20 ft) distant from the surge arrester grounding electrode.

(2) **Multi-Grounded Neutral Primary System**. For multi-grounded neutral primary systems, the spark gap or listed device shall have a 60-Hz breakdown of not more than 3 kV, and there shall be at least one other ground on the grounded conductor of the secondary that is not less than 6.0 m (20 ft) distant from the surge arrester grounding electrode.

(C) By Special Permission. An interconnection of the surge arrester ground and the secondary neutral conductor, other than as provided in 280.24(A) or (B), shall be permitted to be made only by special permission.

280.25 Grounding Conductor Connections and Enclosures.

Except as indicated in this article, surge arrester grounding conductor connections shall be made as specified in Article 250, Parts III and X. Grounding conductors installed in metal enclosures shall comply with 250.64(E).

Panel Statement: The panel revised the proposed titles to clarify the contents of the section and revised the text in 280.24(A)(2) to clarify the types of connections. This comment also incorporates the changes from Comment 5-163 and adds the word "operating" to be technically correct.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

Comment on Affirmative:

MELLO, C.: Subsequent to the panel meeting it was noted that the two ANSI/IEEE references in 280.4 FPN No. 1 for Gapped Silicon-Carbine Surge Arresters for AC Power Circuits are more than ten years old and in fact have been withdrawn without replacement by IEEE in March 2000. These are ANSI/IEEE C62.1-1989(r1994) and ANSI/IEEE C62.2-1987(r1994). The fine print note for Gapped Silicon-Carbide Surge Arresters has been part of Article 280 for a number of cycles and was added at some point in the past because it provided some additional information for users. It is our belief that since that time, the use of these devices has been greatly reduced in favor of the much more predominate metal-oxide surge arresters in use today. In view of the regulations on FPN references, and the fact that IEEE has withdrawn the two referenced standards without replacements, we conclude that removing these two references from Section 280.4 FPN no. 1 does not harm the application of the NEC. The only requirement specifically applicable to the gapped silicon-carbide surge arresters is in 280.4(B) is which requires a rating of 125% of the maximum operating voltage and the information in the FPN does nothing to add or enhance understanding of this fairly simple requirement. For the remaining two references, the edition dates need to be updated as follows: ANSI/IEEE C62.11 should be updated to the 2005 edition and the ANSI/IEEE C62.22 should be updated to the 1997 edition date.

MOHLA, D.: Article 280

Surge Arresters, Over 1kV

The text in this article accepted by the panel during the proposal and comment stages will result in problems for the manufacturers, contractors, user, and Inspection communities. Due to procedural issues involved, the text cannot be revised at this stage by the panel.

Some of the concerns with the current text are listed below:

1. Text stipulates use of Silicon Carbide arresters which is an obsolete technology and has not been manufactured since early 1990's.
2. UL has no manufacturers listed under category of Surge Arresters 1000 Volts and higher (VZQK).
3. IEEE Standards C62.1 & C62.2 have been withdrawn by IEEE since March 2000 due to the fact that technology used in these standards is obsolete.

280.4 states: "The Surge Arresters shall comply with 280.4(A) and (B).

280.4(B) mentions only one specific type of surge arrester "Silicon-Carbide Types".

Silicon Carbide types refer to an obsolete technology type and have not been manufactured since early 1990's. This was based on an IEEE standard C62.1 - 1989 (R 1994) "Standard for Gapped Silicon-Carbide Surge Arresters for AC Power Circuits" which was withdrawn in March 2000.

280.4(B) not only refers to an obsolete technology by name which is not available in the market, but it does not mention the current Metal Oxide technology used for manufacturing of Surge Arresters except in the FPN.

Since Silicon-Carbide is only technology mentioned by name, a user may be inclined to specify this technology without realizing that this is no longer available.

Substantiation submitted with Proposal 5-335 indicated that surge arresters will be evaluated to IEEE C62.11 (1999).

C62.11 -1999 is titled "Standard for Metal Oxide Surge Arresters for Alternating Current Power Circuits (>1 kV).

If surge arresters are going to be evaluated under C62.11, which is Metal Oxide technology, then Silicon-Carbide technology should not be listed in the title.

280.5 Listing. A surge arrester shall be a listed device. This new requirement to NEC 2005 was added during the proposal stage by a proposal submitted by UL.

To the best of my knowledge, there is no manufacturer who is listed by UL for Surge Arresters for 1 kV and over application.

FPN 1 & 2 Reference IEEE C62.1 and C62.2 which has been withdrawn since 2000 due to obsolete technology.

Recommendation

As a minimum, the following actions need to be taken to provide a credible document to the users.

1. Delete 280.5 Listing requirements for Surge Arresters 1 kV and over.
2. Add Metal Oxide to the title of 250.84(B) by changing to "Metal Oxide or Silicon-Carbide Type".
3. Delete references to obsolete IEEE Standards C62.1 and C62.2 which have been withdrawn since March 2000 due to obsolete Silicon-Carbide technology.

5-163 Log #2319 NEC-P05 **Final Action: Accept in Principle**
(280.4(A))

Submitter: David Beach, Gresham, OR

Comment on Proposal No: 5-335

Recommendation: Revise text to read as follows:

(A) The rating of a surge arrester shall be equal to or greater than the maximum continuous ~~phase-to-ground~~ voltage available at the point of application.

(1) Solidly grounded systems. The maximum continuous voltage shall be the phase-to-ground voltage of the system.

(2) Impedance- or ungrounded system. The maximum continuous voltage shall be the phase-to-phase voltage of the system.

Substantiation: Phase-to-ground rated arresters are only suitable for use on solidly grounded systems, phase-to-phase rated arresters must be used on systems that are ungrounded or grounded through an impedance. The presence of a standing phase-to-ground fault will expose the arresters on the other phases to phase-to-phase voltages and this can have potentially catastrophic results if the arrester is only rated for phase-to-ground voltage.

Panel Meeting Action: Accept in Principle

Revise text to read as follows:

(A) The rating of a surge arrester shall be equal to or greater than the maximum continuous ~~phase-to-ground~~ operating voltage available at the point of application.

(1) Solidly Grounded Systems. The maximum continuous operating voltage shall be the phase-to-ground voltage of the system.

(2) Impedance or ungrounded system. The maximum continuous operating voltage shall be the phase-to-phase voltage of the system.

Panel Statement: The word "operating" was added to be technically correct.

Comment on Proposal No: 5-337

Recommendation: Continue to accept the TCC Grounding and Bonding Task Group proposal 5-337 as modified and revised by the actions of CMP-5.

Substantiation: The CMP-5 revisions to the proposal have been made for clarity and continue to be consistent with the Grounding and Bonding Task Group's original initiatives. It is understood that these revisions apply to both Articles 280 and 285. These articles have been restructured and reorganized as a result of action on Proposals 5-335 and 5-340 and would require correlation of these revisions resulting from CMP-5 actions on this proposal.

This Comment was developed by a Task Group assigned by the NEC Technical Correlating Committee to address actions that were other than "accept" taken by Code-Making Panels on proposals from the TCC to resolve 2005 NEC Proposal 5-1 and Comment 5-1. Members of the Task Group on Grounding and Bonding for this Comment included: C. Douglas White; Michael Johnston; Jeffrey Boksiner; Daleep Mohla; Phil Simmons; Christopher Hutchings; James Carroll; Alan Rebeck; Richard Loyd; Paul Dobrowsky; and Neil F. LaBrake, Jr.

ARTICLE 285 — TRANSIENT VOLTAGE SURGE SUPPRESSORS: TVSSS

5-168 Log #2351 NEC-P05 **Final Action: Accept in Principle in Part (285)**

TCC Action: The Technical Correlating Committee advises that article scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the panel action.
Submitter: Alan Manche, Square D Company
Comment on Proposal No: 5-349
Recommendation: Revise the proposed text as indicated below. The entire text is shown for clarity with only new text indicated with an underline and deleted text shown with a strikethrough.

ARTICLE 285 Surge Protective Devices (SPDs) 1kV or less

I. General

285.1 Scope. This article covers general requirements, installation requirements, and connection requirements for SPDs (surge arresters and transient voltage surge suppressors (TVSS)) permanently installed on premises wiring systems 1 kV or less.

FPN: Transient Voltage Surge Suppressors (TVSSs) are also known as Type 2 and 3 SPDs.

285.3 Uses Not Permitted. A SPD (surge arrester or TVSS) device shall not be installed in the
following:

(1) Circuits exceeding 1 kV volts

(2) On ungrounded systems, impedance grounded systems, or corner grounded delta systems unless listed specifically for use on these systems.

(3) Where the rating of the SPD (surge arrester or TVSS) is less than the maximum continuous
phase-to-ground power frequency voltage available at the point of application

FPN: For further information on SPDs (TVSSs), see NEMA LS 1-1992, Standard for Low Voltage Surge Suppression Devices. The selection of a properly rated SPD (TVSS) is based on criteria such as maximum continuous operating voltage, the magnitude and duration of overvoltages at the suppressor location as affected by phase-to-ground faults, system grounding techniques, and switching surges.

285.4 Number Required. Where used at a point on a circuit, the SPD (sure arrester or TVSS) shall be connected to each ungrounded conductor.

285.5 Listing. A SPD (surge arrester or TVSS) shall be a listed device.

285.6 Short Circuit Current Rating. The SPD (surge arrester or TVSS) shall be marked with a short circuit current rating and shall not be installed at a point on the system where the available fault current is in excess of that rating. This marking requirement shall not apply to receptacles.

II. Installation

285.11 Location. SPDs (surge arresters or TVSSs) shall be permitted to be located indoors or
outdoors and shall be made inaccessible to unqualified persons, unless listed for installation in accessible locations.

285.12 Routing of Connections. The conductors used to connect the SPD (surge arrester or TVSS) to the line or bus and to ground shall not be any longer than necessary and shall avoid unnecessary bends.

III. Connecting SPDs (Surge arrester or TVSS)

285.21 Connection. Where a SPD (surge arrester or TVSS) device is installed, it shall comply
with 285.23 through 285.28.

285.23 Type 1 SPDs (Surge Arrester). Type 1 SPDs shall be installed in accordance with

285.23(A) ~~and 285.23(B)~~

(A) Installation. Type 1 SPDs (surge arresters) shall installed as follows:

(1) Type 1 SPDs (surge arresters) shall be permitted to be connected to the supply side of the
service disconnect as permitted in 230.82(4) or

(2) Type 1 SPDs (surge arresters) shall be permitted to be connected as specified in 285.24.

~~(B) At the Service. When installed at services, the grounding conductor of a Type 1 SPD shall be connected to one of the following:~~

~~(1) Grounded service conductor~~

~~(2) Grounding electrode conductor~~

~~(3) Grounding electrode for the service~~

~~(4) Equipment grounding terminal in the service equipment~~

285.24 Type 2 SPDs (TVSS). Type 2 SPDs (TVSS) shall be installed in accordance with 285.24(A) through 285.24(C).

(A) Service Supplied Building or Structure. Type 2 SPDs (TVSS) shall be connected anywhere on the load side of a service disconnect overcurrent device required in 230.91, unless installed in accordance with 230.82(8).

(B) Feeder Supplied Building or Structure. Type 2 SPDs (TVSS) shall be connected at the building or structure ~~in accordance with (1) or (2)~~ anywhere on the load side of the first overcurrent device at the building or structure.

~~(1) Anywhere on the load side of the first overcurrent device where the main disconnect for the building or structure consists of a circuit breaker or fused disconnect switch.~~

~~(2) Anywhere on the load side of a branch circuit overcurrent protective device in the first panel where the building or structure main disconnect does not contain an overcurrent protective device.~~

(C) Separately Derived System. The SPD (TVSS) shall be connected on the load side of the first overcurrent device in a separately derived system.

285.25 Type 3 SPDs (TVSS). Type 3 SPDs (TVSSs) shall be permitted to be installed anywhere on the load side of branch circuit overcurrent protection up to the equipment served, provided the connection is a minimum 10 m (30 ft.) of conductor distance from the service ~~panel~~ disconnect. ~~or separately derived system.~~

285.26 Conductor Size. Line and grounding conductors shall not be smaller than 14 AWG copper or 12 AWG aluminum.

285.27 Connection Between Conductors. A SPD (surge arrester or TVSS) shall be permitted to be connected between any two conductors — ungrounded conductor(s), grounded conductor, grounding conductor. The grounded conductor and the grounding conductor shall be interconnected only by the normal operation of the SPD (surge arrester or TVSS) during a surge.

285.28 Grounding Conductor Connections and Enclosures. Except as indicated in this article, SPD grounding connections shall be made as specified in Article 250, Part III. Grounding conductors installed in metal enclosures shall comply with 250.64(E).

Substantiation: A number of items are addressed in the proposed text changes.

1) Include "(surge arrester and TVSS)" after SPD as indicated in the proposed text above. The third edition of the UL 1449 product standard has recently been published with an effective date for compliance nearly three years away. Therefore, the 2008 NEC can not simply drop the TVSS and surge arrester terminology as products are still currently being manufactured using this terminology and will remain in the distributor pipeline for some time to come beyond January 1, 2008. A familiar terminology change nearly identical to this change was the revision of "light fixture" to "luminaire." This proposed text change follows the same logic to ensure a transition to the new terminology that will be transparent to the industry from the aspect of product availability being compliant with Article 285.

2) The new text in 285.23(B) is unnecessary. Do we need to explain where the grounded conductor can be installed for all other devices or circuits in the NEC? There is no guidance where to connect the grounding conductor at locations other than the service, so why is guidance required here? This actually permits (misguides) the installer to possibly connect the grounding conductor of the SPD to the grounded service conductor terminal in the equipment without any consideration if it is on an ungrounded system. Delete this new text.

3) The proposed revised text in 285.24(B) prohibits an SPD from being installed on the load side of the first feeder overcurrent device on the load side of the building disconnect. The existing text addresses where the SPD can be installed, however, it may be clarified by adding the word "anywhere" so as to not be interpreted that it must be immediately at the structure disconnect.

4) The location of the Type 3 SPD is based on the exposure to the surge protection environment, specifically lightning. By making sure 10ft of conductor is between the SPD and where it can be exposed to a lightning surge inherently protects the Type 3 SPD as outlined. The "separately derived system" text should be deleted. This would permit a Type 3 SPD to be installed outside 10 feet from a transformer or generator and still be exposed to the surge environment intended for a Type 1 SPD, exposing the Type 3 SPD to an unintended environment.

Panel Meeting Action: Accept in Principle in Part

Revise the proposed text as indicated below. The entire text is shown for clarity, with only new text indicated with an underline and deleted text shown with a strikethrough.

ARTICLE 285 Surge Protective Devices (SPDs) 1 kV or less

I. General

285.1 Scope. This article covers general requirements, installation requirements, and connection requirements for SPDs (surge arresters and transient voltage surge suppressors (TVSS)) permanently installed on premises wiring systems 1 kV or less.

FPN No 1: Surge arresters less than 1 kV are also known as Type 1 SPDs

FPN No. 2: Transient voltage surge suppressors (TVSSs) are also known as Type 2 and Type 3 SPDs.

285.3 Uses Not Permitted. A SPD (surge arrester or TVSS) device shall not be installed in the
following:

(1) Circuits exceeding 1 kV

(2) On ungrounded systems, impedance grounded systems, or corner grounded delta systems unless listed specifically for use on these systems.

(3) Where the rating of the SPD (surge arrester or TVSS) is less than the maximum continuous
phase-to-ground power frequency voltage available at the point of application

FPN: For further information on SPDs (TVSSs) ; see NEMA LS 1-1992, Standard for Low Voltage Surge Suppression Devices. The selection of a properly rated SPD (TVSS) is based on criteria such as maximum continuous operating voltage, the magnitude and duration of overvoltages at the suppressor location as affected by phase-to-ground faults, system grounding techniques, and switching surges.

285.4 Number Required. Where used at a point on a circuit, the SPD (surge arrester or TVSS) shall be connected to each ungrounded conductor.

285.5 Listing. A SPD (surge arrester or TVSS) shall be a listed device.

285.6 Short Circuit Current Rating. The SPD (surge arrester or TVSS) shall be marked with a short-circuit current rating and shall not be installed at a point on the system where the available fault current is in excess of that rating. This marking requirement shall not apply to receptacles.

II. Installation

285.11 Location. SPDs (surge arresters or TVSSs) shall be permitted to be located indoors or
outdoors and shall be made inaccessible to unqualified persons, unless listed for installation in accessible locations.

285.12 Routing of Connections. The conductors used to connect the SPD (surge arrester or TVSS) to the line or bus and to ground shall not be any longer than necessary and shall avoid unnecessary bends.

III. Connecting SPDs (Surge arrester or TVSS)

285.21 Connection. Where a SPD (surge arrester or TVSS) device is installed, it shall comply
with 285.23 through 285.28.

285.23 Type 1 SPDs (Surge Arrester). Type 1 SPDs shall be installed in accordance with
285.23(A) and 285.23(B)

(A) Installation. Type 1 SPDs (surge arresters) shall installed as follows:

(1) Type 1 SPDs (surge arresters) shall be permitted to be connected to the supply side of the
service disconnect as permitted in 230.82(4) or

(2) Type 1 SPDs (surge arresters) shall be permitted to be connected as specified in 285.24.

(B) At the Service. When installed at services, the grounding conductor of a Type 1 SPD shall be connected to one of the following:

(1) Grounded service conductor

(2) Grounding electrode conductor

(3) Grounding electrode for the service

(4) Equipment grounding terminal in the service equipment

285.24 Type 2 SPDs (TVSS). Type 2 SPDs (TVSS) shall be installed in accordance with 285.24(A) through 285.24(C).

(A) Service Supplied Building or Structure. Type 2 SPDs (TVSS) shall be connected anywhere on the load side of a service disconnect overcurrent device required in 230.91, unless installed in accordance with 230.82(8).

(B) Feeder Supplied Building or Structure. Type 2 SPDs (TVSS) shall be connected at the building or structure ~~in accordance with (1) or (2)~~ anywhere on the load side of the first overcurrent device at the building or structure.

~~(1) Anywhere on the load side of the first overcurrent device where the main disconnect for the building or structure consists of a circuit breaker or fused disconnect switch.~~

~~(2) Anywhere on the load side of a branch circuit overcurrent protective device in the first panel where the building or structure main disconnect does not contain an overcurrent protective device.~~

(C) Separately Derived System. The SPD (TVSS) shall be connected on the load side of the first overcurrent device in a separately derived system.

285.25 Type 3 SPDs (TVSS). Type 3 SPDs (TVSSs) shall be permitted to be installed anywhere on the load side of branch circuit overcurrent protection up to the equipment served, provided the connection is a minimum 10 m (30 ft.) of conductor distance from the service ~~disconnect panel~~ or separately derived system disconnect.

285.26 Conductor Size. Line and grounding conductors shall not be smaller than 14 AWG copper or 12 AWG aluminum.

285.27 Connection Between Conductors. A SPD (surge arrester or TVSS) shall be permitted to be connected between any two conductors — ungrounded conductor(s), grounded conductor, grounding conductor. The grounded conductor and the grounding conductor shall be interconnected only by the normal operation of the SPD (surge arrester or TVSS) during a surge.

285.28 Grounding Conductor Connections and Enclosures. Except as indicated in this article, SPD grounding connections shall be made as specified in Article 250, Part III. Grounding conductors installed in metal enclosures shall comply with 250.64(E).

Panel Statement: The panel accepts in principle the concept to bridge the terminology from surge arresters and TVSS to the surge protective devices. A new FPN No. 1 was added to 285.1 to explain Type 1 SPDs. The panel does accept the revision of the text in 285.24(B), to simplify the requirements in this part.

The panel does not accept the deletion of 285.23(B), as this text was from the existing 2005 NEC and there was inadequate technical substantiation to remove this text. The panel concludes that while possibly redundant, it does provide guidance to users for this specific installation.

The panel does not accept the deletion of the separately derived system for Type 3 SPDs, as the requirement for 30 feet of conductor length is necessary from the listing. There are possible cases where a separately derived system installed outdoors and subject to lightning may not have that 30 feet of conductor length before the installation of the Type 3 SPD; therefore this requirement was determined to be necessary. The Type 3 SPD cannot be installed outdoors, as the listing and markings provided requires use in indoor applications only.

ARTICLE 300 — WIRING METHODS

3-3 Log #1084 NEC-P03 **Final Action: Accept**
(300.3)

Submitter: Jim Pauley, Square D Company

Comment on Proposal No: 3-8

Recommendation: Continue to Reject the Proposal.

Substantiation: This comment is intended to address some of the issues raised by Mr. Guida's negative comment and to add additional information to support the panel's rejection of this proposal.

The reference to issues associated with 210.4 is correct. The product described by Mr. Guida in his comment is frequently used in residential applications where multi-wire branch circuits are present and the wiring arrangement does, in fact, introduce a code violation for these circuits. He is correct in his comment that 210.4 would not apply if multi-wire branch circuits are not involved.

However, there is a more serious issue that occurs with what would be permitted by this proposal. This issue relates to the disconnection/isolation of the circuit. To actually isolate a branch circuit, you need to disconnect the ungrounded conductor (i.e. turn of the CB) and disconnect the grounded conductor from the terminal bar (this is why you can only have one grounded conductor per terminal in panelboards – 408.41). With the arrangement described, the ungrounded conductor "disconnect" is in the "sub panel" and the grounded conductor "disconnect" for that branch circuit is in a separate panel. This creates an unacceptable and potentially unsafe situation since the disconnects are not located in the same place.

Part of the intent of 300.3 is certainly related to the magnetic heating effects associated with grouping/routing of conductors. However, the panel should not ignore that the section is also depended on to ensure that other problematic situations such as the disconnect issue noted above does not occur as well. If the panel allowed this as a new permission in 300.3, it then forces changes to be made in other parts of the code to compensate for the hole that opens. This change should not be made.

Panel Meeting Action: Accept

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-4 Log #2254 NEC-P03 **Final Action: Reject**
(300.3(B)(1) Exception)

Submitter: Donald A. Ganiere, Ottawa, IL
Comment on Proposal No: 3-11
Recommendation: The proposal should be accepted.
Substantiation: The panel rejected this proposal with the statement that isolated phase installations would not be permitted if the exception to 300.3(B)(1) were to be deleted. I disagree. The exception is not needed as isolated phase installations are permitted by the wording in 300.3(B)(3). The exception adds nothing to the understanding of the code.
Panel Meeting Action: Reject
Panel Statement: Section 300.3(B)(1) Exception must remain in the NEC as a very specific application where paralleled conductors are installed in an underground installation with special permission to install isolated phase installations (all of one phase) in a nonmetallic conduit. These underground duct banks are installed in this manner to permit easy installation of these paralleled conductors on cable racks in a concrete manhole. Without this exception, some AHJs might have problems with acceptance of this type of installation. Leaving it in the NEC provides clear direction on this application.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-5 Log #1626 NEC-P03 **Final Action: Accept in Principle**
(300.3(D) (New))

Submitter: Paul J. Casparro, Scranton Electricians JATC / Rep. International Brotherhood of Electrical Workers
Comment on Proposal No: 3-13
Recommendation: This Proposal should be Accepted.
Substantiation: The panel statement states that sections 310.8 and 310.13 address the requirement for the cables to be suitable for the location in which they are installed. These sections only cover the types of insulations that may be used in each of the given locations. The only specific location that is addressed by this section is exposure to direct sunlight. This section does not give any indication of the definition of dry and wet locations. The editorial text following the definition of wet locations in the 2005 NEC Handbook states: "It is intended that the inside of a raceway in a wet location or a raceway installed underground be considered a wet location. Therefore, any conductors contained therein would be required to be suitable for wet locations."
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action on Comment 3-20a (Log# CC300).

3-6 Log #1804 NEC-P03 **Final Action: Accept in Principle**
(300.3(D) (New))

Submitter: Michael Walls, American Chemistry Council
Comment on Proposal No: 3-13
Recommendation: Accept the proposal as modified below.
(D) Listing. Cables and insulated conductors installed in ~~enclosures or~~ raceways shall be listed for use in wet locations where the ~~enclosures or~~ raceways are in wet locations.
Substantiation: By removing the words "enclosure or" its limits the requirement to the conductors in raceways and eliminate the need to have wet location listed conductors in the enclosures. The inside of an enclosure should not be considered as a wet location especially if the enclosure contains electrical components. This would mean having wet location listed electrical components inside an enclosure that is listed for a wet location. I agree with Mr. Caspaaro in his Explanation of Negative that Article 310 does not clearly or adequately define that the inside of the a raceway installed in a wet location is also a wet location. This explanation is more appropriate for Article 300.
Panel Meeting Action: Accept in Principle

3-7 Log #1970 NEC-P03 **Final Action: Accept in Principle**
(300.3(D))

Submitter: Noel Williams, Herriman, UT
Comment on Proposal No: 3-13
Recommendation: This Proposal should have been Accepted.
Substantiation: This proposal addresses a very common interpretation problem and belongs in Article 300 since Article 300 covers all wiring methods. Many people think the inside of a raceway or box is a different type of location than the outside of the same enclosure. A similar proposal was accepted in the 1999 NEC and then relocated in the 2002 NEC, but that section (300.5) only covers underground installations. This proposal covers all installations and all locations and is needed for clarity and uniformity. In fact, acceptance of this proposal would make the existing rule of 300.5(B) unnecessary. The panel should give more consideration to the comment on negative by Mr. Casparro. This proposal does not duplicate anything in Article 310. Article 310 requires conductors installed in wet locations to be of certain types, but does not help clarify where the wet locations are. The definition of wet locations does not help either because of the misconception that inside the enclosure may be a different location than outside the enclosure.
Panel Meeting Action: Accept in Principle

3-8 Log #1837 NEC-P03 **Final Action: Hold**
(300.4)

TCC Action: The Technical Correlating Committee directs that this comment and Proposal 3-32 be reported as "hold".
The Technical Correlating Committee will appoint a Task Group, including members from Code-Making Panels 1, 3, and 9, to review and correlate this issue during the 2011 code cycle.
The Technical Correlating Committee notes that Code-Making Panel 9 rejected the concept in Proposal 9-38.
In addition, the concept proposed applies beyond Chapter 3 related requirements.
Submitter: John Smith, Wire Guard, Inc.
Comment on Proposal No: 3-32
Recommendation: Add new text as follows:
300.4 Protection Against Physical Damage.
(G) Conductors Inside Electrical Boxes. Conductors, inside electrical boxes, subject to physical damage from router bits, sheet rock saws, and knives, and nonconductive coatings; such as drywall mud, paint, lacquer and enamel, must be protected during the construction process by means of a rigid cover, plate, or insert of a thickness and strength as to prohibit penetration by the above mentioned items.
Substantiation: I have been an electrician for over 30 years. During this time, I have encountered thousands of wires inside the electrical box damaged by sheetrock routers, knives, saws, mud, paint, enamel, and lacquer.
Furthermore, I have received many calls from homeowners complaining of "the smell of burning wires" or "a receptacle or switch that doesn't work". What I inevitably find are damaged wires inside the electrical box. The insulation on the wires has melted due to excessive heat because the amperage rating of the wires has been compromised or lessened as a result of a nick or cut in the wires. If the homeowner hadn't noticed the "smell of burning wires" or "that the switch or receptacle was not operational", the damaged wire would have eventually caused a fire.
Per the US Home Product Report, Appliances & Equipment, 01/02 issued by the NFPA's Fire Analysis & Research, Quincy, MA:
The number one cause of an "Electrical Distribution Equipment" fire is a short circuit or a ground fault. Damaged conductors cause short circuits and ground faults. When the conductors are damaged the amperage rating of the conductor is compromised or lessened. This results in overheating, which results in the fire.
The form of material first ignited from an "Electrical Distribution Equipment" fire is the electrical wire or cable insulation.
There are codes in place that provide for the Integrity of Electrical Equipment and Connections 110.12(C) and Protection Against Physical Damage 300.4(A-F).
These codes specifically protect the wire at all points of vulnerability from the distribution panel up to, but not including, the point where the wires are inserted into the electrical box.
There is no code that specifically ensures the protection of the conductors after they are inserted in the electrical box.
Once the conductors are inserted in the electrical box, they are extremely vulnerable to the inevitable damage caused by sheet rock routers, sheet rock saws and knives, and nonconductive coatings; such as drywall mud, paint, lacquer and enamel.
It may be assumed that an inspection will detect damaged wires and the electrician will be required to rerun the wires. That is not always true. An inspector may not always see a damaged wire hidden in the wall or spliced. The plug in tester used during the inspection will confirm that the outlet or receptacle is working even though the amperage rating of the conductor is compromised or lessened due to damage.
It may also be assumed that electricians will re-run a damaged wire that violates code 300.14 "Length of Free Conductors at Outlets, Junctions, and Switch Panels". However, from my experience and from conversations I've had with many electricians, that is not what is occurring.
Please see supporting material results of Survey of Electricians conducted from 2004 through 2006.

It is a simple case of economics, the electrician has contracted the job for a certain fee that doesn't allow for re-doing any part of the job. Nor does the electrician's scheduling for completion of that job or to begin future jobs permit the added delays. Nor will the electrician be a favorite with the General Contractor if he demands the drywall be removed so new wires can be run. As a result, electricians have found a work-around to re-running the wires.

As members of the NFPA, I feel that we have a responsibility to ensure that the wires are explicitly protected by a specific code at every point of vulnerability during construction from the distribution panel to inside the electrical box.

This is especially true of the conductors once they are inside the electrical box as they are extremely vulnerable to the inevitable damage from sheet rock routers, sheet rock saws and knives, and nonconductive coatings; such as drywall mud, paint, lacquer and enamel.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle

Revise recommended text to read:

(G) Conductors Inside Electrical Boxes. Conductors, inside electrical boxes, subject to physical damage from router bits, sheet rock saws, and knives, and nonconductive coatings, such as drywall mud, paint, lacquer and enamel, ~~must~~ shall be protected during the construction process by means of a rigid cover, plate, or insert of a thickness and strength as to prohibit penetration by the above mentioned items.

Panel Statement: The panel has revised the recommended text for compliance with the NEC Style Manual regarding expression of mandatory text.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 9 Negative: 4

Explanation of Negative:

AYER, L.: The responsibility of protecting electrical conductors within a box during construction is covered in 110.7, Insulation Integrity. While it is possible that conductors may be nicked or cut within a box, there are numerous ways that electricians can prevent this from happening. Asking for carpenters to use shorter router

blades, pushing the wires back deep into the box, or installing deeper device boxes are ways to solve this problem. To require a protector plate for each device box in every application would be considered excessive. Wires within surface mount boxes or masonry walls are not subject to the same damage from routers or knives as boxes installed in other areas. Enforcement of this issue would be difficult and would require additional inspection costs to verify that protector plates were installed.

MAASSEN, R.: After reviewing the negative votes, I concur with Mr. Ayer that the responsibility of protecting the electrical conductors within a box is covered in 110.7, Insulation Integrity. There are many ways to protect the conductors from damage like stuffing the conductors to the rear of the box, using shorter router blades and using deeper device boxes are ways to solve this problem. Also, not all walls are dry walled. To require the protective plate for each device box in every application would not be needed to protect the conductors. Enforcement of this issue would be difficult and would require additional inspection costs to verify that protector plates were installed prior to dry walling.

OWEN, S.: Protection for conductors is a good idea, and an important issue with respect to methods of installing sheetrock, when outlet openings are being cut with a router. The proposal and the comment have been submitted to the wrong article and section of the NEC. Section 300.4 requires conductor protection from physical damage in cable- and raceway-type wiring methods, not in enclosures and boxes as would be covered in Articles 312 and 314. Panel 9 has jurisdiction over Article 312 for cabinets, cutout boxes, and meter socket enclosures, Article 314 for outlet, device, pull and junction boxes, as well as conduit bodies, fittings, and handhole enclosures, and Article 408 which covers switchboards and panelboards. Protection for conductors is more appropriately covered in all three of the articles covered by Panel 9, and is already covered in 110.12(C) for corrosion and other protection.

SLEIGHTS, J.: I continue to reject the addition of requirements related to this proposal/comment. There was no new relevant material submitted during the comment stage to cause the committee to reverse the original vote on the proposal. Submitters provided various information in comments but it is of a generic nature and not directly related to the "problem" as stated. To this point, I have seen only anecdotal information on the extent and severity of the specific "problem" in the field.

When damage to conductors does occur, for whatever reason, to say that the electrician will not fix the damage correctly is an issue separate to mandating another requirement. Clearly they are violating other code rules in not fixing any damage correctly. If the "problem" is widespread, and the costs to repair damage sufficient, then the use of a product or technique to prevent such damage would make financial sense in and of itself. There is NO code rule prohibiting the use of specialty products or other techniques at present.

Finally, the matter of damage to conductors and equipment during installation is a wider concern than just conductors in boxes behind drywall. It extends to ALL equipment installed prior to the actions of other trades. This is clearly addressed in section 110.12(C). Any upgrade in requirements, if properly documented and proposed, belongs with the code section already devoted to the subject.

Comment on Affirmative:

CASPARRO, P.: This is a positive move and in the right direction to protect the integrity of conductors in outlet boxes during construction.

EASTER, L.: NEMA understands that the protection requirements resulting from acceptance of this comment applies to outlet boxes and similar boxes.

3-9 Log #1061 NEC-P03 **Final Action: Reject**
(300.4(A)(1) Exception No. 3)

Submitter: David Shapiro, Safety First Electrical Contracting Consulting & Safety Education

Comment on Proposal No: 3-20

Recommendation: Add new text as follows:

Exception No. 3: Where a wood member is in contact with masonry, holes shall be permitted to be bored without protection from penetration originating from the direction of the masonry.

Substantiation: If I understood the CMP's statement correctly, they were concerned that the original proposal could be taken as authorizing unprotected holes anywhere in wood members, so long as the members were in contact with masonry at some point. The revised wording of the proposed exception eliminates this possibility.

I admit to being confused by the CMP's argument against counting multiple layers or elements of wood as the sum of their thicknesses in a particular direction so I am unable to dispute it.

Panel Meeting Action: Reject

Panel Statement: The proposed exception is not necessary since there is not a penetration issue from the masonry side of the wood member. The text in 300.4(A)(1) is only dealing with protection issues where there is a possibility of damage to conductors installed in either cables or raceways. The only penetration issue would be from opposite side of the wood member with the edge of the bored hole required to be a distance of not less than 1 ¼ inch from the nearest edge.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-10 Log #2040 NEC-P03 **Final Action: Accept in Principle**
(300.4(E))

Submitter: William Benard, State of New Hampshire, Bureau of Electrical Safety and Licensing

Comment on Proposal No: 3-31

Recommendation: Revise as follows:

(E) Cables and Raceways installed under roof decking. Exposed and concealed locations, where a cable- or raceway-type wiring method is installed under roof decking, such as metal corrugated sheeting, or other material that supports a roof insulating and waterproofing membrane and will be penetrated by screws or other mechanical devices designed to provide "hold down" strength of the waterproofing membrane, the cable or raceway shall be installed and supported so that the nearest outside surface of the cable or raceway is not less than 38.1 mm (1 1/2 in.) from the nearest surface of the roof decking where screws are likely to penetrate when roofing maintenance repairs or replacement occurs before or after the initial raceway installation.

(~~E~~) (F) Cables and Raceways Installed in Shallow Grooves

(Remaining text unchanged)

(~~F~~)(G) Insulated Fittings

(Remaining text unchanged)

Substantiation: This proposal needs to be accepted as amended. The panel members may not have completely understood the problem addressed in the original proposal. The intention of the proposal is to prevent accidental penetration of electrical cables and raceways under common flat roof decks. The submitter did not intend to describe a scenario where the roof deck was being replaced. Sufficient substantiation was provided to establish that this problem does, indeed, exist.

Typically, the decking would remain unchanged and in its original condition. The waterproofing and insulating material above conventional metal corrugated sheeting is the element of repair or replacement. Roofing material manufacturer's installation standards mandate a self tapping deck screw to penetrate the underside of the corrugated steel decking by at least 1 inch and up to 1 1/4 inches. Minimum penetration provides "hold down" strength for the insulating material above but becomes a hazard to anything within the lower penetration proximity. Therefore, raceways located in close proximity to the underside of the decking would be exposed to severe physical damage. This is happening every single day during re-roofing projects that are only repairing or replacing the waterproofing material on the surface of the roof of an occupied building. It is not the first installation that is a concern because typically the exterior insulation and waterproofing material of the flat roof is already in place before the electrician begins to install the new wiring methods.

The selection of a minimum "38.1 mm (1 1/2 in.) from the nearest surface of the roof decking where screws are likely to penetrate" was chosen after measuring a multitude of installations where 38.1 mm (1 1/2 in.) was discovered to be a minimum safe distance in a majority of installations from the protruding screw at the lowest point of the underside of the roof deck.

The original panel statement alludes to a responsibility of the "individual building trades" and an ability to stay away from electrical raceways that might be located in harms way when making repairs to a damaged building. This reroofing should not be considered as a repair but as routine maintenance. All roofing material has a life that necessitates maintenance, repair, or replacement. Is it the Panel's intention to indicate that whenever a roofing material is replaced the electrical wiring for the building has to be replaced as well? It would be impracticable to provide a replacement of material above a finished metal roof deck and be able to know where a roof could or could not penetrate the decking with any one of a thousand deck screws. If any electrical wiring methods are installed within a 1 1/2 inch proximity of the underside of the metal decking, it is a sure bet that at least one electrical raceway or cable will be damaged causing a failure to the electrical system. At the very least, an overcurrent device will be called upon to hopefully prevent fire, personal injury or possible electrocution. Considering the various voltages and inrush fault currents available an imminent hazard will be present if an unqualified person attempts to reset the device without clearing the fault at its origin. Refer to the evidence submitted describing actual incidents. These incidents happen all too often when the faults are created over retail outlets without the retail personnel even being aware of work going on above them. There is no need to elaborate the possible hazardous scenarios that could evolve from this potential.

I submit that this problem is at least as serious as the threat recognized and addressed in the current section 300.4(D). If we are concerned about a sheetrock screw penetrating a cable adjacent to a wall stud, then we should recognize the similar hazard of a deck screw penetrating a metal raceway. The proof is in the pudding see the photos I have provided.

The cut away roofing detail exemplifies the purpose for the screw installation for roofing surface material installation, maintenance or replacement before and after electrical wiring installations. Notice the screw penetration below the underside of the metal decking. Photos exemplifying screw penetration are also provided.

Retail store maintenance representatives and service electricians confirm that re-roofing projects (replacing insulating and/or waterproofing material) causes thousands of dollars of expenditure for repairs to electrical systems damaged during membrane maintenance or repair. Copies of testimony with invoicing for repair of damage caused by screws penetrating electrical conduit is provided as evidence.

Photos (1, 2, and 3) accompaning with this proposal provide evidence of damage to wiring methods in the identified area. The incident cascaded to personal injury when unqualified individuals in the retail store repeatedly attempted to reset an overcurrent device supplying a 277 volt lighting circuit without consideration to the increased hazards from the repeated short circuit.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle

Revise recommended text to read:

"(E) Cables and Raceways Installed Under Roof Decking. A cable- or raceway-type wiring method, installed in exposed or concealed locations under metal-corrugated sheet roof decking, shall be installed and supported so the nearest outside surface of the cable or raceway is not less than 38 mm (1 1/2 in.) from the nearest surface of the roof decking.

FPN: Roof decking material is often repaired or replaced after the initial raceway or cabling and roofing installation and may be penetrated by the screws or other mechanical devices designed to provide "hold down" strength of the water-proof membrane or roof insulating material.

Exception: Rigid metal conduit and intermediate metal conduit shall not be required to comply with 300.4(E)."

Reidentify existing 2005 NEC subdivisions (E) and (F) as (F) and (G)

Panel Statement: The proposed text was revised for clarity and ease of use. Some of the wording within the proposal was informative text that fit better as a fine print note and the exception was added to cover rigid and IMC that would not suffer damage from these hold-down devices or screws. The metric measurement was changed to a hard conversion, as it is the panel's opinion that the 0.1 mm provided in the soft conversion was not critical.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

Comment on Affirmative:

CASPARRO, P.: Allowing additional room between the underside of roof decking and where a cable or raceway type wiring methods is allowed to be installed should alleviate damage to these cables and raceways.

SLEIGHTS, J.: I support the panel action on this proposal in recognition of the problem with the following comment.

There was no substantiation for the addition of the exception for RMC and IMC and it should not have been included.

3-11 Log #1627 NEC-P03 **Final Action: Accept in Principle (300.4(F))**

Submitter: Paul J. Casparro, Scranton Electricians JATC / Rep. International Brotherhood of Electrical Workers

Comment on Proposal No: 3-32

Recommendation: The Proposal should be Accepted.

Substantiation: See comment on Proposal 3-35.

Panel Meeting Action: Accept in Principle

Comment on Affirmative:

CASPARRO, P.: See my explanation of vote on Comment 3-8.

3-12 Log #2255 NEC-P03 **Final Action: Accept in Principle (300.4(F))**

Submitter: Donald A. Ganiere, Ottawa, IL

Comment on Proposal No: 3-34

Recommendation: The proposal should be accepted.

Substantiation: The panel rejected this proposal with a statement that said: "It covers all raceways where 4 AWG and larger conductors enter a cabinet, box, enclosure, or raceway." If the code rule actually said that there would have been no reason for this proposal, however the code rule doesn't say where "conductors enter the enclosure", it says where "raceways containing conductors enter enclosures". The current wording only requires protection for ungrounded conductors #4 and larger where the raceway itself enters the enclosure. The only two raceways that actually enter the enclosure are the threaded raceways, RMC and IMC. The other raceways terminate at a connector and the connector, not the raceway enters the enclosure. The other point that this proposal attempts to address is protection for the ungrounded conductors of cables. The code doesn't now require the use of an insulated fitting to protect the ungrounded conductors of cables where they enter enclosures. If the cable jacket does not extend into the enclosure beyond the metallic cable connector, there is the same potential for problems as there is where raceways are used without an insulated bushing.

Panel Meeting Action: Accept in Principle

Revise the 2005 NEC text in 300.4(F) to read:

"Where raceways contain~~ing ungrounded conductors~~ 4 AWG or larger ungrounded conductors and these conductors enter a cabinet, box enclosure, or raceway, the conductors shall be protected by a substantial fitting providing a smoothly rounded insulating surface, unless the conductors are separated from the fitting or raceway by substantial insulating material that is securely fastened in place."

Existing exception and second paragraph remain unchanged.

Panel Statement: The text was clarified to indicate that the key issue is not the raceway entering the cabinet, box, or raceway but rather the 4 AWG and larger conductors entering these enclosures being properly protected with a substantial fitting with a smoothly insulated surface.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-13 Log #767 NEC-P03 **Final Action: Accept in Principle (300.4(G) (New))**

Submitter: Carlo Compagnone, Compa Covers, Inc.

Comment on Proposal No: 3-35

Recommendation: This proposal should be accepted.

Substantiation: As a Master electrician for many years, and one who is justifiably concerned with workplace and home-safety issues, I would like to take this opportunity to elaborate on why I respectfully disagree with the Panel's decision to reject Proposal 3-35.

Specifically, the safety issues that are addressed within said Proposal 3-35 have been ongoing concerns that have yet to be fully resolved. The mere fact that Section 110.12(C) was written into the NEC serves as evidence of the very real potential for damage and contamination to the internal parts of electrical equipment and to electrical wiring and electrical outlet boxes during construction. The greatest attribute of Section 110.12(C) is that it makes clear the fact that damaged or contaminated electrical equipment and wiring is likely to "adversely affect safe operation or (the) mechanical strength of the equipment...".

Section 110-12(C) specifically addresses the need for protecting the "internal parts of electrical equipment", and it is thus debatable whether it is applicable to or speaks to the concerns covered within Proposal 3-35. Specifically, it appears unclear as to whether Section 110.12(C) is intended to address the protection of wiring within electrical outlet boxes from damage and contamination during the construction phase. In the event that Section 110.12(C) is not to be construed so broadly as to cover or address the problem of damage and contamination to electrical wiring situated within open electrical outlet boxes during the rough-in and construction phases, then it is readily apparent that the National Electrical Code is in need of and would benefit from the acceptance of Proposal 3-35. That proposal addresses specifically the very real need for protecting electrical outlet boxes from contamination and damage to wiring during the rough-in and construction phases.

At least some of the members of the applicable NEC Panel appear to have interpreted the word "equipment" within that section sufficiently broadly so as to cover damage and contamination to wiring within electrical outlet boxes. Assuming arguendo that Section 110.12(C) is intended to address damage and contamination to wiring within electrical outlet boxes, it nevertheless lacks direction as to the means for implementing its mandates. Specifically, although Section 110.12(C) provides a mandate that prohibits, inter alia, the damaging of internal parts of electrical equipment, it provides no real guidance as to the measures to be taken in preventing the damage. It leaves open the possibility that electricians will use many different and varied ways of attempting to prevent contamination and damage to wiring within electrical outlet boxes in an effort to comply with Section 110.12(C). It is foreseeable that such a lack of uniformity will result in failed attempts to comply with that section, despite good faith attempts to do so. These failed attempts may in turn result in excessive costs and rework for electricians, fire damage to the premises at issue, electrical shock and even death. An electrician may leave him or herself open to liability in the event that the method chosen by that electrician for attempting to comply with Section 110.12(C) was deemed insufficient in retrospect.

The fact that damage to and contamination of wiring and electrical components within electrical outlet boxes continues to be widespread and commonplace during the construction phase, speaks directly to the fact that Section 110.12(C) does not go far enough. It is devoid of a uniform procedure for implementing its mandates, and a uniform procedure is needed to alleviate the problem.

Proposal 3-35 provides for that uniform procedure relative to potential damage and contamination to wiring within electrical outlet boxes, and its acceptance would eliminate the guess work as to how to implement the mandates of Section 110.12(C). Proposal 3-35 complements Section 110.12(C) and provides it with the means for implementing its mandates as it applies to wiring within electrical outlet boxes. The proposal includes a requirement that a nonmetallic, temporary cover be placed on the open front of electrical outlet boxes during the construction phase. This requirement is an easy-to-implement solution to the aforementioned problem. It would shield against the plaster, spray from insulation, power routers, and paint contamination that is addressed within the language of Section 110.12(C), and that is so often present as a result of the carelessness of nonelectrical tradespersons who are eager to finish their work in a timely manner. It would provide protection so that wiring and other electrical components within electrical outlet boxes are not damaged, broken, bent or cut by others during the rough-in or construction phases.

The concept of providing specific solutions for the protection of wiring is not foreign to the National Electrical Code. For example, Article 300 provides for very specific methods of safeguarding cables which are subject to damage during the construction phase. 300.4 requires the installation of a nail plate where cable wiring is subject to nail or screw penetration. 300.4(B)(1) requires installation of bushings or grommets on all metal edges of punched out or factory-installed holes. Article 300 also requires a minimum burial depth for underground cable installation, and additional protection when depth is reduced by the use of concrete. Proposal 3-35 supplies the National Electrical Code with the specific solution to the ongoing problem of construction-phase damage and contamination to the internal electrical wiring and components contained within electrical outlet boxes.

Proposal 3-35 would result in cost-savings to electricians who so often, at present, are required to rewire or repair electrical outlet boxes that have been damaged by others during a construction phase, due to internal wiring and components having been left exposed. Proposal 3-35 would result in a satisfactory solution to the safety concerns that are continuously arising as a result of damaged or contaminated internal electrical wiring.

One primary purpose of the National Electrical Code is the safeguarding of persons and property, which in turn is a primary reason why the National Fire Protection Association sponsors the code-making process and publishes the National Electrical Code. Acceptance of Proposal 3-35 would be, at the very least, a definitive step in the direction of saving electricians and homeowners time and money. More importantly, it would provide a uniform and specific mandate to electricians that, when implemented, would serve as a safeguard against the loss of property due to fire damage, physical harm, and even death.

Submitter: Sanford Egesdal, Egesdal Associates PLC

Comment on Proposal No: 3-32

Recommendation: Accept or Accept in Principle Proposals 3-32 and 3-35.

Substantiation: It makes sense to protect electrical conductors from construction debris, until final electrical installation. The fire alarm industry manufacturers ship smoke detectors with a protective covering, which is removed after there is no longer potential damage from the various construction trades. Some fire alarm control panels are shipped with a protective device (often a piece of cardboard) to place over the fire alarm system wiring and terminals in a rough-in-box for protection from paint, plaster, and general construction site grime. A steel plate may not be necessary for protection. Also, I recently renovated my condo. I was disappointed with the sheetrock mud, paint, and other construction debris that had to be scraped and chipped out of the electrical boxes and off the electrical conductors.

(300.4(G) (New))

Submitter: Jody Cook, Plugs & Switches, Inc.

Comment on Proposal No: 3-36

Recommendation: Revise text to read as follows:

(C) Integrity of Electrical Equipment and Connections. Internal parts of electrical equipment, including busbars, wiring terminals, insulators, junction boxes, and other surfaces...

(D) Method of Protecting Conductors. Either the method of installing sheet rock is to be non-evasive to protect against damage to conductors and the introduction of foreign substances or the electrician has to use a cover or both.

Substantiation: I read through the explanation of denial of 300.4(G). I respectfully request that you reconvene on this proposal. I realize that this proposal is difficult to approve without endorsing a specific product or creating a conflict of interest. However, without protection of conductors in junction boxes, you are asking the electrical contractors and inspectors to compromise on their guarantee of circuit integrity.

We all agree that there is a problem with 110.12(C) not thoroughly covering this topic, as the NEC is written as a minimum safety standard. Why would we pass codes about unused openings in junction boxes, but not codes addressing circuit integrity? It is not uncommon for an electrician to find that the copper wires have turned green due to an oxidation chemical reaction, and electricians often remove foreign materials and debris from junction boxes at their own time and expense.

Typically, the inspector and electrical contractor are not on site during, or able to monitor, the sheet rock installation. Therefore, there is no care, nor custody, of electrical systems and terminations. The goal of protecting conductors and junction boxes is not being met today. It is not practical to hold the sheet rock installer liable; the practical solution is to have the electrician protect his work.

In conclusion, the electrical conductors need to be protected. My suggestion would be to add text to 110.12(C) "junction boxes", and the addition of the subsection 110.12(D) "Method of Protecting Conductors: To protect against damage to conductors and the introduction of foreign substances, either the method of installation of the sheet rock is to be non-evasive; the electrician has to use a cover; or both."

(300.4(G) (New))

Submitter: Paul J. Casparro, Scranton Electricians JATC / Rep. International Brotherhood of Electrical Workers
Comment on Proposal No: 3-35
Recommendation: The Proposal should be Accepted. Add the following wording to 300.4(G):
Protection of Outlet Boxes During Construction. The open front of both metal and nonmetallic electrical outlet boxes shall be temporarily covered to protect insulated electrical conductors from physical damage or deterioration due to power routers, plaster spray, spray foam insulation, and other potential damage during construction. The covers shall be constructed of a nonmetallic material and shall be clearly marked "Not for Permanent Installation".
Substantiation: Conductors inside electrical boxes during construction are physically damaged by sheet rock routers, sheet rock screws, knives, etc. When the conductors are damaged, the ampere rating of the conductor is compromised or lessened. This can cause overheating which often leads to fires.

(300.5)

Submitter: Larry Cross, IBEW Local 98
Comment on Proposal No: 3-38
Recommendation: I agree with P. Casparro that a warning ribbon placed 12 in. above the underground would alleviate this problem, thus saving unnecessary damage and possible bodily harm.
Substantiation: None.
Panel Meeting Action: Reject
Panel Statement: The basic section deals with direct burial conductors and cables with a warning ribbon to be installed 12 inches above the cables that are directly buried at 18 inches or deeper. If a metal raceway is installed for the underground installation, as requested in the proposal, there is no reason for direct-burial style conductors to be used and thus no reason to have the warning ribbon installed. Regular wet location type conductors, such as THWN which are not approved as direct buried conductors or cables, could and probably would be installed. Schedule 80 PVC could certainly be used as a protection method for underground service conductors or cables. Restricting the protection to metal conduit would not recognize this alternative protection method. A backhoe operator could damage cables or conductors in any wiring method installed, but a raceway can and does provide some level of protection for these service conductors. Direct burial cables are not protected, so a warning ribbon is a method to help identify the location for these conductors and provide some warning that service cables are located below.

Ballot Results: Affirmative: 13

3-20a Log #CC300 NEC-P03 **Final Action: Accept**
(300.5(B))

Submitter: Code-Making Panel 3,
Comment on Proposal No: 3-42
Recommendation: Revise 300.5(B) as follows:
(B) Wet Locations. The interior of enclosures or raceways installed underground shall be considered to be a wet location. Insulated conductors and cables installed in these enclosures or raceways in underground installations shall be listed for use in wet locations and shall comply with 310.8(C). Any connections or splices in an underground installation shall be approved for wet locations.
Substantiation: There seems to be a misunderstanding in the industry about the types of conductors and splices that can be installed in enclosures or raceways in an underground installation. The requirement for using wet location listed conductors must also comply with 310.8(C) since there are three

different methods to comply with insulated conductors and cables used in wet locations. They must be:
(1) Moisture-impervious metal-sheathed;
(2) Types MTW, RHW, RHW-2, TW, THW, THW-2, THHW, THHW-2, THWN, THWN-2, XHHW, XHHW-2, ZW; or
(3) Of a type listed for use in wet locations.
Panel Meeting Action: Accept
Panel Statement: The text in this comment provides a clarification of the underground installation that the interior of these raceways or enclosures is considered to be a wet location. This concept was introduced in both Comments 3-21 and 3-52, but the panel decided to modify the text in 300.5(B) for underground installations since all other underground installation requirements were already located in 300.5.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13
Comment on Affirmative:
CASPARRO, P.: The text in this comment provides a clarification of the code for underground installations and states that the interior of these raceways or enclosures is considered to be a wet location.

3-22 Log #409 NEC-P03 **Final Action: Accept in Principle in Part (300.5(C))**

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 3-45
Recommendation: Accept proposal revised:
UNDERGROUND CABLES UNDER BUILDINGS OR STRUCTURES.
Underground cable installed under a building, or a structure with a floor shall be in a raceway that extends beyond the ~~outside walls~~ perimeter of the building or structure, or to the points of emergence within the perimeter of the building or structure.
Exception; A raceway shall not be required for Type MI cable.
Substantiation: Structures that are not deemed buildings but have a floor (earth or other material) should be included. Such structure may not have walls, per se but will have a perimeter. Some underground cables may not extend beyond outside walls but be terminated entirely within the perimeters of the building or structure. A raceway does not seem necessary for Type MI cable.
Panel Meeting Action: Accept in Principle in Part
Revise the 2005 NEC 300.5(C) text to read:
UNDERGROUND CABLES UNDER BUILDINGS. Underground cable installed under a building shall be in a raceway. ~~that is extended beyond the outside walls of the building.~~
Panel Statement: The addition of structures was not accepted since the main reason for this subsection is to enable direct buried cables installed under a concrete slab under a building, not a structure. The addition of an exception was not accepted as it presents new material not addressed in the original proposal. The concept of "emergence within the perimeter" was accepted in principle. The deletion of the last part of the sentence provides clarity that the cable installed under a building must be installed in a raceway.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-23 Log #694 NEC-P03 **Final Action: Reject (300.5(D))**

Submitter: Jamie McNamara, Hastings, MN
Comment on Proposal No: 3-38
Recommendation: The panel should reconsider this proposal and except it. It would add a degree of safety to people excavating around underground installations.
Substantiation: In the panel statement, it indicated that "In addition, the result of this proposal would be to delete the present 300.5(D)(2) because it has not been shown as retained, and the reason for doing so has not been provided." It was my intent to retain all text that did not have a strike through. I used strike through to show deleted text and underline to show added text, everything else is to remain the same.
Original proposal:
300.5 Underground Installations...
(D) Protection form Damage. Direct-buried conductors and cables shall be protected from damage in accordance with 300.5(D)(1) through (D)(3)~~(4)~~.
(1)...
~~(3) Service Conductors. Underground service conductors that are not encased in concrete and that are buried 450 mm (18 in.) or more below grade shall have their location identified by a warning ribbon that is placed in the trench at least 300 mm (12 in.) above the underground installation.~~
(3)~~(4)~~ Enclosure or Raceway Damage..... (E)...
(G) Service Conductors. Underground service conductors that are not encased in concrete or in metal conduit and that are buried 450 mm (18 in.) or more below grade shall have their location identified by a warning ribbon that is placed in the trench at least 300 mm (12 in.) above the underground installation.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Comment 3-18.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-24 Log #1306 NEC-P03 **Final Action: Reject (300.5(D)(3))**

Submitter: David Williams, Delta Township
Comment on Proposal No: 3-47
Recommendation: Revise text to read as follows:
300.5(D)(3) Service Conductors. Underground direct buried service conductors that are not encased in concrete or installed in a raceway and that are buried 450 mm (18 in.) or more below grade shall have their location identified by a warning ribbon that is placed in the trench at least 300 mm (12 in.) above the underground installation.
Substantiation: This section is often misinterpreted to require the warning ribbons for service raceway installations as well. I personally think it is a good idea for the warning ribbon on raceway installations since those still have the potential of a serious accident if dug into with a backhoe.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Comment 3-18.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-25 Log #1445 NEC-P03 **Final Action: Reject (300.5(D)(3))**

Submitter: Larry Cross, IBEW Local 98
Comment on Proposal No: 3-50
Recommendation: I agree with P. Casparro that a warning ribbon placed above the underground would alleviate this problem, thus saving unnecessary damage and possible bodily harm.
Substantiation: Can we really ever be too safe?
Panel Meeting Action: Reject
Panel Statement: Installing a warning ribbon above underground feeder and branch circuits is permitted but not required. Anyone digging in a location where directly buried service conductors have a ribbon installed 12 inches above the cable should be warned that there is a cable below that location. Expanding this warning ribbon requirement to all service, feeder, and branch-circuit underground direct burial applications would tend to desensitize the effect of the warning ribbon.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

(300.5(D)(3))

Submitter: Wally Harris, Atlantic Inland Inspections
Comment on Proposal No: 3-50
Recommendation: Revise the text of this Proposal to read as follows:
(3) Service, Branch Circuit and Feeder Conductors. Underground branch circuit, feeder and service conductors that are not encased in concrete and that are buried 450 mm (18 in.) or more below grade shall have their location identified by a warning ribbon that is placed in the trench at least 300 mm (12 in.) above the underground installation.
Substantiation: The original proposal in the ROP should be reconsidered, and accepted.

In the Rejection statement the Panel stated in Part; "Service conductors are not protected by overcurrent protection devices and constitute a much greater hazard where these conductors are damaged during excavation."

By including the wording "...constitute a much greater hazard" in their statement, the Panel surely recognizes that there is some degree of hazard present in Branch Circuit and Feeder conductors as well as Service conductors. The degree of hazard is not the question. The question is whether or not the "practical safeguarding of persons and property" as stated in 90.1(A) is in fact being considered by the Panel in the initial rejection of the original Proposal. Panel member Mr. Casparro asked the ultimate question in his comment in the "Explanation of Negative" in the ROP - "Can we really ever be TOO safe?"

I must respectfully disagree with the Panel in their statement that the presence of a warning ribbon would tend to "desensitize the effect of the warning ribbon." The Panel also stated that "Human nature tends to disregard safety items where that person is constantly exposed too often to that safety item."

Desensitization of human beings, and human nature are best left to members of the Medical and Psychological professions. The "...practical safeguarding of persons and property from hazards arising from the use of electricity" as stated in 90.1(A) is best left in the competent hands of the Code Panels and the industry professionals that enhance the NEC and continue to make it the benchmark for electrical work world wide.

Ballot Results: Affirmative: 13

3-30 Log #2256 NEC-P03 **Final Action: Reject**
(300.5(D)(3))

Submitter: Donald A. Ganiere, Ottawa, IL
Comment on Proposal No: 3-49
Recommendation: The panel should accept this proposal.
Substantiation: The panel statement says that if a safety rule is difficult or expensive to comply with then we don't need it in the code. The "warning ribbon" rule is intended to provide some protection in the form of a warning ribbon to someone who is digging in the area of the underground service cable. The method of original installation does not change the level of hazard to the future digger. They are just as hurt or killed if they dig into an energized service cable that was installed using directional boring equipment as one that was installed using conventional trenching. If this is really a hazard to future workers, then they deserve the protection of a warning ribbon no matter what cable installation method was used. If it is not really a hazard, then the rule should be deleted from the code, but you can't have it both ways. The panel statement says one is safe to the future digger and the other is a hazard, when in reality there is no difference in the level of hazard involved.
Panel Meeting Action: Reject
Panel Statement: The only way to install a warning ribbon 12 inches above a bored hole containing service conductors would be to drill an additional hole with the ribbon inserted in the hole and pulled through from one location to another or to dig a trench to a depth 12 inches above the cable. In addition, since the ribbon would be installed in a drilled hole, the inspector would not be able to verify the depth of the ribbon as being 12 inches above the service conductors. Unenforceable requirements must not be inserted into the NEC.

Mr. R. Loyd voted negatively stating: "Proposal 3-52 was to reject. No comment necessary, CMP-8 has no substantiation or recommendation that CMP-3 reverse their action."
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action on Comment 3-33.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-33 Log #391 NEC-P03 **Final Action: Accept**
(300.5(D)(4))

Submitter: David H. Kendall, Carlon
Comment on Proposal No: 3-52
Recommendation: This proposal should be Accept in Principle and revised to read as follows:
300.5(D)(4) Enclosure or Raceway Damage. Where the enclosure or raceway is subjected to physical damage, the conductors shall be installed in rigid metal conduit, intermediate metal conduit, Schedule 80 ~~rigid nonmetallic~~ PVC conduit, or equivalent.
Substantiation: Panel 8 did Accept in Principle Proposal 8-53. To be consistent with the revised Article 352 "Schedule 80 PVC conduit" should be used instead of "Schedule 80 rigid PVC conduit" as proposed.
Panel Meeting Action: Accept
Panel Statement: The panel notes that there is an inconsistency in how PVC is designated in the action taken on Proposal 8-53.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-34 Log #1063 NEC-P03 **Final Action: Reject**
(300.5(D)(4))

Submitter: David Shapiro, Safety First Electrical Contracting Consulting & Safety Education
Comment on Proposal No: 3-52
Recommendation: Revise text to read as follows:
"...~~physical~~ damage of the sort that tends to be readily visible...".
Substantiation: NEC users rely on standard dictionary definitions, augmented by the NEC's explicit definitions. The NEC Style Manual saying in "3.2.5.5 Provisions on Protection Against Physical Damage. If protection against physical damage is to be one of the requirements, this can be standardized by the use of this terminology" this does not benefit the ordinary user. The Style Manual is offering an option, not a requirement. I assumed the term was being used loosely to mean damage from blows, abrasion, pressure, or tension, but assumptions should not be necessary. An ideal I believe we share is to enforce the Code as written, not "You know what we mean." This CMP's statement indicates that they intended the long-term physical effects of chemicals and radiation, such as embrittlement, to be among types of damage excluded. Other CMPs use the term with somewhat different intentions, if one reads the Panel Statements in this ROP. Webster's definition does not clue us to this, nor does Article 100, nor does the beginning of this chapter. I would hope 110.3(A)(2)'s requirement of suitable "mechanical strength and durability" sufficed. If this additional statement is needed because that is too broad, let's say exactly what the CMP statement indicates is meant.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any additional technical substantiation to delete the word "physical" from the text in 300.5(D)(4). The panel reaffirms its panel statement from the proposal as follows: "Physical" is used throughout the NEC as a descriptive adjective to the noun "damage." While the submitter feels the phrase "physical damage" is superfluous, the word "physical" seems to provide a certain emphasis and a further description where combined into the phrase "physical damage." This phrase tends to draw more attention than just "damage." In addition, physical damage provides a description of thermal and mechanical damage where the damage can be readily identified, such as a raceway that has been physically damaged versus damage from ultraviolet light where the raceway may be more brittle and thus can be easily damaged physically by impact to the raceway. Chemicals or heat can cause unseen damage to electrical components that can eventually lead to physical damage at a later time. This phrase is used in the NEC Style Manual in 3.2.5.5 as an acceptable method to describe physical damage.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-35 Log #1371 NEC-P03 **Final Action: Accept in Principle**
(300.5(D)(4))

Submitter: William Wagner, Certification Solutions
Comment on Proposal No: 3-52
Recommendation: This Proposal should be Accepted as originally proposed.
Revise 300.5(D)(4) as follows:
300.5(D)(4) Enclosure or Raceway Damage. Where the enclosure or raceway is subject to physical damage, the conductors shall be installed in rigid metal conduit, intermediate metal conduit, Schedule 80 rigid ~~nonmetallic~~ PVC conduit, or equivalent.
Substantiation: In accordance with CMP-8's action on Proposal 8-53, Article 352 will now apply only to "Rigid Polyvinyl Chloride Conduit: Type PVC" rather than "Rigid Nonmetallic Conduit: Type RNC." Therefore, it is necessary to revise the terminology used throughout the remainder of the NEC. As the only type of rigid nonmetallic conduit that is currently listed in Schedule 80 dimensions is rigid PVC conduit, the reference in 300.5(D)(4) should be revised as noted above.
This will correlate with the TCC Action on Proposal 3-52.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel action on Comment 3-33 addresses the submitter's concern.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-36 Log #2503 NEC-P03 **Final Action: Reject**
(300.5(D)(4))

Submitter: Michael Walls, American Chemistry Council
Comment on Proposal No: 3-52
Recommendation: Accept the proposal revised as follows.
300.5(D)(4) Enclosure or Raceway Damage. Where the enclosure or raceway is subject to physical damage, the conductors shall be installed in rigid metal conduit, intermediate metal conduit, RTRC, Schedule 80 rigid nonmetallic PVC conduit, or equivalent.
Substantiation: RTRC should be included in this list. If RTRC is not included then this proposal should be rejected. Not including RTRC in the list is not appropriate. There is no information that shows RTRC cannot also provide this function.
Panel Meeting Action: Reject
Panel Statement: Reinforced thermosetting resin conduit (RTRC) cannot be added to this section because the RTRC designation does not necessarily indicate that the conduit provides the extra physical protection as does Schedule 80 PVC.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
PACE, D.: In past RTRC has been acceptable for this appliation. No technical substantiation has been submitted to exclude RTRC from this application. This comment should be rejected.

3-37 Log #1064 NEC-P03 **Final Action: Reject**
(300.5(F))

3-40 Log #1263 NEC-P03 **Final Action: Reject**
(300.6(A) (New))

TCC Action: The Technical Correlating Committee directs that this comment be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.
Submitter: Sanford Egesdal, Egesdal Associates PLC
Comment on Proposal No: 3-58
Recommendation: Accept Proposal 3-58.
Substantiation: Considering that electrically conductive corrosion resistant compound applied in the field will be expected to function for decades, it is reasonable to require a listed product. Independent evaluation and listing will provide long-term confidence in the product and integrity of the conduit system.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 7 Negative: 6
Explanation of Negative:
AYER, L.: At the present time, there is only one company which provides a listed compound that can be used for corrosion protection. It would not be a fair practice to allow this monopoly. Other approved products have been used for over 30 years without incident or hazard. The submitter has not provided any additional substantiation why the present methods used to protect against corrosion are not sufficient.
EASTER, L.: The panel should have rejected the comment to require a listed coat
ing. The existing text makes it clear that an electrically conductive coating must be used where corrosion protection of field threads is necessary. The word "approved" is used in lieu of "listed" because there are many products, such as zinc rich spray paint, that will provide the intended field thread protection. There has never been any substantiation submitted to show there is a problem with the use of these types of products that have been approved for use for years but are not "listed" products. If there is a listed product available on the market, this does not preclude its use.
MAASSEN, R.: The panel should not have accepted requiring a "listed" compound for application to all field threads. The existing text makes it clear that an electrically conductive coating must be used where corrosion protection of field threads is necessary. To use a product from only one manufacturer that is presently listed is inappropriate. Also, this product remains tacky and can cause additional contamination of the surface, causing it to loose conductivity.
OWEN, S.: The existing text makes it clear that an electrically conductive coating must be used where corrosion protection of field threads is necessary. The word "approved" is used in lieu of "listed" because there are many products, such as zinc-rich spray paint, that will provide the intended field thread protection. There has never been any substantiation submitted to show that there is a problem with the use of these types of products that have been approved for use for years, but are not "listed" products. If there is a listed product available on the market, this does not preclude its use.
PACE, D.: The panel should not have accepted requiring a "listed" compound for application to all field threads. No substantiation was provided to show that "non-listed" compounds are a problem. Just because a product listing category exists does not mean that it is necessary to require a listing of the products used. "Listed" products may be approved for use, but there is no justification to require "listed" products only. Changes in the NEC should be well documented with appropriate substantiation to support the change. This comment should be rejected.
SANDERS, M.: The panel should have rejected the comment to require a listed coating.
The term "approved" should continue to be used in lieu of "listed" because there are products, such as zinc rich pastes, that have an historical track record of providing the intended corrosion protection and intended conductivity of field cut threads.
A review of the history of this sentence (initially an exception) adoption into the Code shows 1987 acceptance of a Proposal (NEC TCR) statement that zinc chromate paste does not reduce the current carrying capacity of the conduit in (during) a fault condition and also did not challenge the use of red lead paint. During the 1999 NEC cycle, the term "identified" was accepted as being too restrictive and it was changed to "approved." Subsequent to this, UL Product Category FOIZ was developed, a product listing was established, and in the ROP for the 2005 Code cycle the term "approved" was initially changed to "listed", and specifically rejected adding "zinc rich compound." During the comment period, it was pointed out the historical record of using this compound as both a corrosion inhibitor and electrically conductive agent, and that only anecdotal comments were submitted with no technical substantiation offered to reject this long standing practice. This was accepted by CMP-03, and the term "approved" was retained for the 2005 NEC. No technical substantiation has been provided in the 2008 NEC Proposal or Comment period that would prohibit the use of this long standing practice of using a zinc rich paste compound.
However, many are incorrectly assuming that any substance used on field cut threads, such as zinc rich spray paint, Teflon taping, red lead paint, and pipe dope are also acceptable. The quantity of zinc in zinc rich spray paint is unknown. Teflon tape contains no metallic particles, it is not a compound as the text of 300.6(A) specifically requires, and should never be used on electrical metallic raceway. Red lead paint was developed to resist wood decay in barns (hence the red color of barns), the quantity of metallic particles in the paint is unknown, and the lead has not been used in any galvanizing procedure subject to any listing process. Pipe dope does not contain any metallic particles and should never be used on electrical metallic raceway. Zinc rich paste has an acceptable historical track record in the type metal that does go through a listing procedure following the galvanizing process.
Comment on Affirmative:
CASPARRO, P.: This is a step in the right direction because listed corrosion resistant compounds have been tested for both their corrosion resistively and electrical conductivity. This will also take the guess work out for the inspectors.

3-41 Log #1337 NEC-P03 **Final Action: Reject**
(300.6(A))

TCC Action: The Technical Correlating Committee directs that this comment be reported as "Reject" to correlate with the Technical Correlating Committee action on Comment 3-40.
Submitter: Kevin McCall, Local Union #98 IBEW
Comment on Proposal No: 3-58
Recommendation: Revise text as follows:
Add the word "listed" along with the word "approved" to describe electrically conductive corrosion resistant compound. Where the corrosion protection is necessary and the conduit is threaded in the field, the threads shall be coated with a listed and approved electrically conductive corrosion resistant compound.
Substantiation: Installer, AHJ all involved in the installation process will have any doubts about the proper installation process. The language "approved" acceptable to the AHJ and "listed" equipment, materials, or services included in a list published by an organization that is acceptable to the AHJ and concerned with evaluation of products or services that maintain provides inspection. As defined in Article 100 of NEC "listed" and "approved" would supplied adequate language for all to know that equipment, materials, and services are more guarantied and (text illegible).
Panel Meeting Action: Accept in Part
Accept adding the word "listed" but delete the word "approved" in the last sentence of 300.6(A).
Panel Statement: Section 110.2 already requires this corrosion-resistant installation to be approved, but there is listed material that is tested as an acceptable ground return path through the coated threads. Listed corrosion-resistant compounds have been tested for both their corrosion resistivity and electrical conductivity. Electrical inspectors should not be required to determine in the field whether a material installed on the threads of a raceway is electrically conductive when there is a listed material that is available that will ensure conductivity of the conduit path.

3-52 Log #2257 NEC-P03 **Final Action: Accept in Principle**
(300.9 (New))

Submitter: Donald A. Ganiere, Ottawa, IL
Comment on Proposal No: 3-63
Recommendation: This proposal should be accepted.
Substantiation: I understand that panel's point that conductors must be selected so that they are suitable for the locations where they are being installed. The point of this proposal is to make it clear that the interior of any raceway installed in a wet location is a wet location. That is not a completely accepted idea in the field. A section was added, 300.5(B) in a previous code to make it clear that the interior of all underground raceways is a wet location. This is the same issue with raceways that are installed in wet locations. The interior of the raceway will be a wet location and conductors or cables installed in these raceways must be listed as suitable for use in wet locations. If the interior of raceways in outside or wet locations is not also a wet location, why do sections 225.22 and 230.53 require that "raceways on exteriors of buildings or other structures shall be arranged to drain"? Note: This proposal covers underground raceways and raceways in wet locations and if accepted, you should also accept Proposal 3-43.
Panel Meeting Action: Accept in Principle
Revise recommended text for 300.9 to read:
300.9 Raceways in Wet Locations Above Grade. Where raceways are installed in wet locations above grade, the interior of these raceways shall be considered to be a wet location. Insulated conductors and cables installed in raceways in wet locations above grade shall comply with 310.8(C).
Panel Statement: The panel accepts the recommendation to create a new 300.9 for aboveground wet locations and has chosen to place the underground installation requirements in 300.5(B). The text was not deleted in 300.5(B) since this entire Section 300.5 applies to underground installations. Providing additional underground requirements in a new 300.9 could be missed by the user of the Code. The requirement for using wet location listed conductors in the proposal was changed to "complying with 310.8(C)" because there are three different methods to comply with insulated conductors and cables used in wet locations. They must be:
(1) Moisture-impervious metal-sheathed;
(2) Types MTW, RHW, RHW-2, TW, THW, THW-2, THHW, THHW-2, THWN, THWN-2, XHHW, XHHW-2, ZW; or
(3) Of a type listed for use in wet locations.
See the panel action and statement on Comment 3-20a (Log #CC300).
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13
Comment on Affirmative:
CASPARRO, P.: See my explanation of vote on Comment 3-20a.

3-53 Log #1841 NEC-P03 **Final Action: Accept in Principle**
(300.10 Exception No. 2 (New))

Submitter: Mike Holt, Mike Holt Enterprises, Inc.
Comment on Proposal No: 3-65
Recommendation: This Proposal should have been Accepted in Principle, and located in 300.12 as opposed to 300.10. Leave 300.10 as currently written, and add a new Exception No. 2 (and number the existing Exception as No. 1 as follows:
Exception No. 2: Conduit installed into the bottom of open bottom equipment, such as switchboards, motor control centers, and transformers, shall not be required to be mechanically secured to the equipment.
Substantiation: This relaxation of the requirement of mechanical continuity (especially as modified by the panel) belongs in 300.12 for mechanical continuity, as opposed to 300.10 for electrical continuity.
Panel Meeting Action: Accept in Principle
Accept the recommendation to relocate the new exception to 300.12 and revise the exception to read:
"Exception No. 2: Raceways and cables installed into the bottom of open bottom equipment, such as switchboards, motor control centers, and floor or pad-mounted transformers, shall not be required to be mechanically secured to the equipment."
Identify the current exception to 300.12 as Exception No.1.
Panel Statement: The submitter is correct that a better place for this text is in 300.12 for mechanical continuity. "Floor and pad-mounted" was added to differentiate between a wall mount transformer and a floor or pad-mounted transformer, and the existing exception was relabeled as Exception No. 1. The term "raceway" has been used to include all of the raceways covered in Chapter 3, and the panel has also included cables in the exception for consistency.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

9-3 Log #27 NEC-P09 **Final Action: Accept**
(300.11(A))

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 3-67
Recommendation: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 9 for action in Article 314. This action will be considered by Code-Making Panel 9 as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: Panel 9 understands this comment to be a direction to consider action in Article 314. After reconsideration, Panel 9 respectfully declines to take this action. See panel action and statement on Comment 9-4.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

9-4 Log #56 NEC-P09 **Final Action: Accept**
(300.11(A))

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 9-7d
Recommendation: The Technical Correlating Committee directs that the panel reconsider this Proposal since boxes for power-limited fire alarms are not excluded from Article 314 by any rules from Article 760. This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: After reconsideration, CMP 9 respectfully declines to incorporate the subject of Proposal 9-7d within Article 314. The submitters request is already permitted under 314.23(D)(1). CMP 9 understands that the rules in 314.23 apply without modification to boxes used in fire alarm wiring within the scope of Article 760 because no modifications have been made in that article to Chapter 3 provisions in this regard. To the extent the proposal could address Article 760 systems, it is requesting that such modifications be made. CMP 9 lacks the background to evaluate whether the particular characteristics of this equipment warrant a modification of the general NEC rules with respect to enclosure support. If CMP 9 were to act on the merits of the proposal, the result would be an exception in 314.23 for certain equipment within the scope of Article 760. This sort of an exception is exactly what the Style Manual is attempting to avoid, as it recognizes the role of 90.3. This was the reason for the last sentence of the panel statement on Proposal 9-7d.

(300.11(A)(2) Exception)

Submitter: John Stacey, City of St. Louis
Comment on Proposal No: 3-69
Recommendation: Revise text to read as follows:
The ceiling support system shall be permitted to support flexible ceiling branch circuit wiring and associated ceiling equipment. ~~where installed with the manufacturer's instructions.~~
Substantiation: Drop ceilings must be junk and need to be listed for the load of the associated equipment - the luminaries, etc. and the wiring associated - both have no instructions from manufacturer's. Additional support wires will have the same shortening effect when loaded with conduits. Allow flexible wiring - 2 or 3 caddy clips is not a life safety or fire safety hazard per 90.1(A). This appears to be a manufacturer's whim. No documented testing in the original substantiation.

I am 30+ years in the industry and I have never seen or heard of ceiling installers removing clips. There needs to be some relief for electricians - not just ceiling manufacturers. Good Luck!
Panel Meeting Action: Reject
Panel Statement: Manufacturers of ceiling systems have designed most dropped ceilings for the installation of 2 ft X 2 ft or 2 ft X 4 ft drop-in fluorescent luminaires or recessed incandescent luminaires but not the additional weight of raceways or cables. Where additional support wires are connected to the building structure for support of raceways or cables, the installer should either use the new type of support devices that will not cause the wire to be shortened or install the raceways or cables on the additional support wire before the support wire is tied to the ceiling grid assembly. Where ceiling support wires are shortened by installing raceway or cable support clips or devices to the wire, removing the raceway or cable support clip and not providing any additional support could cause damage to the raceway or cable and the internal conductors, which very easily could be a life safety or fire issue.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-55 Log #2036 NEC-P03 **Final Action: Reject**
(300.11(B))

Submitter: Donald Cook, Shelby County Building Inspections
Comment on Proposal No: 3-70
Recommendation: Accept proposal as submitted.
Substantiation: The panel statement first indicates that raceways are not tested nor listed for external mechanical load carrying conditions. If that is the case, it is difficult to understand why the text in the section allows these raceways to support other raceways, cables or nonelectric equipment under the conditions in (2) and (3). I assume that item (1) is included so a raceway manufacturer has the ability to submit their product to a certification body and have it evaluated for that purpose. As indicated in the original proposal and Mr Ayer's negative ballot, the items included in (3); boxes, conduit bodies, and luminaries are not raceways, cables or nonelectric equipment. Please provide clarification of the panel intent.
Panel Meeting Action: Reject
Panel Statement: To clarify the text of this particular subsection, it is necessary to go back to the original text as accepted for the 1987 NEC. The original text was as follows:
"300-11(b) Raceways Used as Means of Support. Raceways shall not be used as a means of support for other raceways, cables or non-electric equipment.
Exception No. 1: Where the raceway or means of support are identified for the purpose.
(FPN): See Article 318 for cable trays.
Exception No. 2: Raceways containing power supply conductors for electrically controlled equipment shall be permitted to support Class 2 circuit conductors or cables that are solely for the purpose of connection to the equipment control circuits.
Exception No. 3: As permitted in 370-23 for boxes or conduit bodies or 410-16(f) for fixtures."
The main text did not permit a raceway to support other raceways, cables, or non-electric equipment; however, the first exception permits a raceway or means of support where identified for the purpose. The non-electric equipment referred to the main text and subsequently in the first exception was a reference to a cable tray system defined as "a unit or assembly of units or sections and associated fittings forming a structural system used to securely fasten or support cables and raceways. The cable tray is non-electric equipment that is for supporting cables and raceways but is identified for that purpose. The text was changed from a section with exceptions to positive text without any exceptions but with the same general purpose to permit cable trays as a means of support for cables and raceways. The present text appeared as follows:
"300.11(B) Raceways Used as Means of Support. Raceways shall be used only as a means of support for other raceways, cables, or non-electric equipment under any of the following conditions:
(1) Where the raceway or means of support is identified for the purpose.
(2) Where the raceway contains power supply conductors for electrically controlled equipment and is used to support Class 2 circuit conductors or cables that are solely for the purpose of connection to the equipment control circuits.
(3) Where the raceway is used to support boxes or conduit bodies in accordance with 314.23 or to support luminaires (fixtures) in accordance with 410.16(F)."

(300.12 Exception No. 1)

Submitter: David Shapiro, Safety First Electrical Contracting Consulting & Safety Education
Comment on Proposal No: 3-75
Recommendation: Revise text to read as follows:
"...~~physical~~ damage of the sort that tends to be readily visible...".
Substantiation: NEC users rely on standard dictionary definitions, augmented by the NEC's explicit definitions. The NEC Style Manual saying in "3.2.5.5 Provisions on Protection Against Physical Damage. If protection against physical damage is to be one of the requirements, this can be standardized by the use of this terminology" this does not benefit the ordinary user. The Style Manual is offering an option, not a requirement. I assumed the term was being used loosely to mean damage from blows, abrasion, pressure, or tension, but assumptions should not be necessary. An ideal I believe we share is to enforce the Code as written, not "You know what we mean." This CMP's statement indicates that they intended the long-term physical effects of chemicals and radiation, such as embrittlement, to be among types of damage excluded. Other CMPs use the term with somewhat different intentions, if one reads the Panel Statements in this ROP. Webster's definition does not clue us to this, nor does Article 100, nor does the beginning of this chapter. I would hope 110.3(A)(2)'s requirement of suitable "mechanical strength and durability" sufficed. If this additional statement is needed because that is too broad, let's say exactly what the CMP statement indicates is meant.
Panel Meeting Action: Reject

(300.15(L))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 3-79
Recommendation: Accept the proposal.
Substantiation: The panel statement is at odds with customary trade practice. Relatively few handholes contain boxes to enclose splices. Instead, the handholes rely on the fact that the typical cover requires tools to open, either because of bolts made-up wrench tight, or (unusual for a handhole) a cover over 100 lbs. This is also a requirement in 314.30(D). Nevertheless, most handholes are accessible to the public. In fact, handhole strength ratings are based on whether they will be driven over or just walked over. By accessible, I mean that members of the public can walk/dance on top of the cover, not that the public can get into the interior of the enclosure. A requirement to supplement the handhole enclosure with some kind of wet-location inner box for any handhole enclosure in public spaces simply because someone may have the requisite tools is excessive. Remember, whoever gets into the handhole enclosure will also have the tools to open the enclosed box, even more easily.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
PACE, D.: Accepting this comment thus, accepting the original proposal, would allow conductors to be run in manhole or hand hole enclosures that are accessible to un-qualified persons without being required to be run in a box or conduit body. This reduces the level of safety for this type installation and potentially places un-qualified persons at risk for injury when they have no way of knowing or understanding the hazards. This comment should be rejected.

3-60 Log #437 NEC-P03 **Final Action: Accept in Principle**
(300.16(A))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 3-80
Recommendation: Accept addition of "conduit body" after "box" and revise last sentence: A fitting other than a conduit body used for this purpose shall contain no splices or taps...(remainder unchanged).
Substantiation: Conduit bodies with three or more hubs are suitable. 590.4(G) recognizes a conduit body as suitable. The definition of fitting in Article 100 includes conduit bodies. 314.16(2) permits splices in conduit bodies without special permission.
Panel Meeting Action: Accept in Principle
Revise the existing text in 300.16(A) as follows:
300.16 Raceway or Cable to Open or Concealed Wiring
(A) Box, Conduit Body, or Fitting. A box, conduit body, or terminal fitting having a separately bushed hole for each conductor shall be used wherever a change is made from conduit, electrical metallic tubing, electrical nonmetallic tubing, nonmetallic-sheathed cable, Type AC cable, Type MC cable, or mineral-insulated, metal-sheathed cable and surface raceway wiring to open wiring or to concealed knob-and-tube wiring. A fitting used for this purpose shall contain no taps or splices and shall not be used at luminaire (fixture) outlets. A conduit body used for this purpose shall contain no taps or splices, unless it complies with 314.16(C)(2).
Panel Statement: Conduit body has been added to both the title and the first sentence in 300.16(A) since 314.17(B) permits this application for open wiring on insulators and for concealed knob-and-tube wiring. The last sentence was added to ensure that any conduit body where a splice to the wiring system is necessary also complies with 314.16(C)(2).
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-61 Log #1913 NEC-P03 **Final Action: Reject**
(300.17)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 3-81
Recommendation: Accept the proposal.
Substantiation: The panel statement is incorrect. The proposal clearly conditions the rule on the absence of a pull point at the transition. Strut-type channel raceway has pull points along its entire length, as long as the cover is removed. Surface raceways in the medium and larger sizes have removable covers as well, and only the smaller ones would be (and should be) subject to this rule. The important concept here is simply this: without this proposal a raceway method transition without a pull point can effectively nullify any XXX.26 bend limitation.
Panel Meeting Action: Reject
Panel Statement: Section 300.17 is dealing with the number and size of conductors, not the number of bends in a run. Section 300.17 has a fine print note referencing various sections for the number and size of conductors within a wiring method, so adding a second paragraph dealing with the number and degree of bends would be inappropriate.
Number Eligible to Vote: 13

3-66 Log #2090 NEC-P03 **Final Action: Reject**
(300.18(C) (New))

Submitter: Leonard F. Devine, Jr., Palm Beach County Plan Review
Comment on Proposal No: 3-84
Recommendation: Add new text to read as follows:
300.18(C) Raceway Diameter. Raceways shall be of the same trade size from end to end of a run unless the trade size of the raceway is changed at an exposed junction/pull box, or the size of the raceway is changed in the run where visible.
Substantiation: This will help negate changes being made in a run where not visible and not being discovered during a remodel when one has assumed that the raceway is of the same trade size form one end to the other. Wiring sometimes is damaged when a contractor pulls wire into a smaller raceway.
Panel Meeting Action: Reject
Panel Statement: Section 300.18 applies generally to all wiring methods in Chapter 3. To make the proposed change apply generally would involve some wiring methods that are totally covered by concrete, such as under-floor raceways in Article 390, cellular metal floor raceways in Article 374, cellular concrete floor raceways in Article 372, or other possible raceways, where the raceways and the junction boxes are under the concrete and technically would be in violation of the proposed text. In addition, the connecting raceways between the under-floor junction boxes are not a trade size. Trade sizes can be changed at conduit bodies, seal-off devices, and other applications also not covered by the proposed text.

3-68 Log #1374 NEC-P03 **Final Action: Reject**
(300.22)

Submitter: William Wagner, Certification Solutions
Comment on Proposal No: 3-92
Recommendation: This Proposal should be revised and Accepted as follows:
300.22 Wiring in Ducts, Plenums, and Other Air-Handling Spaces. The provisions of this section apply to the installation and uses of electric wiring and equipment in ducts, plenums, and other air-handling spaces.
FPN: See Article 424, Part VI, for duct heaters.
(A) Ducts for Dust, Loose Stock, or Vapor Removal. No wiring systems of any type shall be installed in ducts used to transport dust, loose stock, or flammable vapors. No wiring system of any type shall be installed in any duct, or shaft containing only such ducts, used for vapor removal or for ventilation of commercial-type cooking equipment.
(B) Ducts or Plenums Used for Environmental Air. Only wiring methods consisting of Type MI cable, Type MC cable employing a smooth or corrugated impervious metal sheath without an overall nonmetallic covering, electrical metallic tubing, flexible metallic tubing, intermediate metal conduit, ~~or~~ rigid metal conduit without an overall nonmetallic covering, or phenolic Type RTRC rigid nonmetallic conduit listed as having adequate fire-resistant and low smoke-producing characteristics, shall be installed in ducts or plenums specifically fabricated to transport environmental air. Flexible metal conduit shall be permitted, in lengths not to exceed 1.2 m (4 ft), to connect physically adjustable equipment and devices permitted to be in these ducts and plenum chambers. The connectors used with flexible metal conduit shall effectively close any openings in the connection. Equipment and devices shall be permitted within such ducts or plenum chambers only if necessary for their direct action upon, or sensing of, the contained air. Where equipment or devices are installed and illumination is necessary to facilitate maintenance and repair, enclosed gasketed-type luminaires (fixtures) shall be permitted.
(C) Other Space Used for Environmental Air. This section applies to space used for environmental air-handline purposes other than ducts and plenums as specified in 300.22(A) and (B). It does not include habitable rooms or areas of buildings, the prime purpose of which is not air handling.
FPN: The space over a hung ceiling used for environmental air-handling purposes is an example of the type of other space to which this section applies.
Exception: This section shall not apply to the joist or stud spaces of dwelling units where the wiring passes through such spaces perpendicular to the long dimension of such spaces.
(1) Wiring Methods. The wiring methods for such other space shall be limited to totally enclosed, nonventilated, insulated busway having no provisions for plug-in connections, Type MI cable, Type MC cable without an overall nonmetallic covering, Type AC cable, or other factory-assembled multiconductor control or power cables that is specifically listed for the use, or listed prefabricated cable assemblies of metallic manufactured wiring systems without nonmetallic sheath. Other types of cables and conductors shall be installed in electrical metallic tubing, flexible metallic tubing, intermediate metal conduit, rigid metal conduit without an overall nonmetallic covering, phenolic Type RTRC rigid nonmetallic conduit listed as having adequate fire-resistant and low smoke-producing characteristics, flexible metal conduit, or, where accessible, surface metal raceway or metal wireway with metal covers or solid bottom metal cable tray with solid metal covers.
(2) Equipment. Electrical equipment with a metal enclosure, or with a nonmetallic enclosure listed for the use and having adequate fire-resistant and low-smoke-producing characteristics, and associated wiring material suitable for the ambient temperature shall be permitted to be installed in such other space unless prohibited elsewhere in this Code.
Exception: Integral fan systems shall be permitted where specifically identified for such use.
(D) Information Technology Equipment. Electric wiring in air-handling areas beneath raised floors for information technology equipment shall be permitted in accordance with Article 645.
Substantiation: This proposal was Rejected by CMP-3 based upon the NFPA Standards Council's Decision 05-24 that the NEC Project is "to maintain status quo in the NEC until the Technical Committee on Air Conditioning has, through processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A." This was done to "give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues pertaining to plenum cables." However, since that time, I have been made aware of the Standards Council's clarification that states that if a proposal has technical merit, and is not related to NFPA 90A flammability of plenum wire and cables issues, then the NEC CMP needs to act on them. This is the case for my proposal to revise 300.22 of the NEC to permit the use of a limited range of RTRC products as a general purpose wiring method in Ducts of Plenums Used for Environmental Air. Therefore, I request that CMP-3 reconsider it, in conjunction with the additional technical substantiation presented below.
Clearly, the determination of what raceway products are suitable for use in these applications is under the jurisdiction of NEC CMP-3. This proposal relates neither to the use of plenum wire or cable, nor to any product that is intended for use related to air conditioning applications. To unnecessarily restrict the range of products that can demonstrate their ability to provide safe and dependable performance, not based upon any technical merits, would result in an unfair advantage for products which have been grandfathered into these applications.

Accordingly, I have developed the necessary technical substantiation to conclusively demonstrate to CMP-3 the ability of these products to be safely used in these applications. Based on this substantiation, phenolic RTRC products warrant inclusion in 300.22.

The position of Underwriters Laboratories in relation to flame spread and smoke developed values for materials used in plenums was put forth in UL's Mr. Randy Laymon's letter dated December 15, 2004.

As a result of my initial proposal, and this UL position paper, FRE Composites (2005) Inc. undertook testing with Underwriters Laboratories of phenolic RTRC products to both UL 2024 plenum and riser tests, and the ASTM E84 flame spread and smoke developed tests. As can be seen from the UL test data and reports, phenolic RTRC products, in a variety of trade sizes, were able to complete each of these testing programs with flame and smoke ratings significantly below the criteria established for products to be used in both plenum and riser applications.

The performance of these products, as demonstrated, is summarized as follows:

Test	Maximum Permitted Value	Maximum Test Value
Plenum (UL 2024) Flame	5.0 ft	2.0 ft
Plenum (UL 2024) Smoke Peak	0.50	0.10
Plenum (UL 2024) Smoke Avg.	0.15	0.02
Riser (UL 2024) Flame	12.0 ft	4.0 ft
Riser (UL 2024) Temperature	850.0˚F	371˚F
ASTM E84 Flame Spread Index (FSI)	25	5
ASTM E84 Smoke Developed Index (SDI)	50	0

Therefore, in consideration of the data generated by an independent, NRTL accredited test laboratory, and in conjunction with UL's stated position on this issue, these conduit products have conclusively demonstrated their ability to perform acceptably in both plenum and riser applications and I recommend their inclusion in 300.22 in accordance with revised Proposal 3-92. It should be noted that this proposal has been slightly modified from its original version in order to delete the FPN indicating suggested acceptance criteria for these products. The development of appropriate flame and smoke criteria, along with the product's listing requirements is best left to the determination of the listing organization.

Additionally, a reference to "phenolic" RTRC conduit has been added in order to limit this proposal to only that conduit type which was evaluated as part of the technical substantiation provided with this comment.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: This continues to be a proposal to be rejected based on Standards Council Decision 05-24 (SC #05-7-4). This decision relates to combustibles in plenums and would include cables in conduit as well as "plenum cables."

"1. Jurisdiction over combustibles in plenums. As the Council has indicated earlier in this decision, the Technical Committee on Air Conditioning, rather than the NEC Project, has, for many years, and should continue to have, primary jurisdiction for air distribution systems including the subject of combustibles, such as cables, in ducts, plenums and other air handling spaces (plenum spaces)."

3-69 Log #2155 NEC-P03 **Final Action: Accept**

(300.22)

Submitter: David H. Kendall, Carlon

Comment on Proposal No: 3-95

Recommendation: Proposal 3-95 should be "Accept" by Panel 3.

Substantiation: Panel 3 misused the Standards Council Decision 05-24 (SC#05-7-4) when rejecting Proposal 3-95. The Standards Council decision is a directive to Plenum-Cables and NFPA 90A. Proposal 3-95 addresses wiring methods that are installed inside metal raceways which are located within the plenum. Products that are installed inside a metal raceway are outside of the airflow of the plenum. NFPA 90A does not address wiring methods inside a metal raceway, this is the privy of Panel 3 and needs to be addressed by Panel 3.

Proposal 3-95 only indicates that it is acceptable to install other raceways inside metal conduits. Proposal 3-95 should be accepted by the Panel.

Panel Meeting Action: Accept

Panel Statement: This comment and proposal to add raceways installed inside metal raceways within other spaces used for environmental air is not encompassed by the Standards Council decision based on NFPA 90A.

3-70 Log #828 NEC-P03 **Final Action: Reject**

(300.22(C) Exception)

Submitter: Neal Dorenkott, City of Eastlake / Rep. BOCONEO

Comment on Proposal No: 7-54

Recommendation: Delete the following text:

~~Exception: This section shall not apply to the joist or stud spaces of dwelling units where the wiring passes through such spaces perpendicular to the long dimension of such spaces.~~

Substantiation: Referring to Proposal 7-54 Log #553, the Panel Statement states: "Section 300.22 addresses wiring in ducts, plenums, and other air-handling spaces and, therefore, applies to all wiring methods. The reference in 334 is not needed." If the panel states it is unnecessary to repeat the requirement in 334.10, then they are agreeing with the issue that NM, NMC and NMS should not be allowed in air returns. Therefore the exception of 300.22(C) is not justified. The panel is allowing contradiction by allowing this exception. I encourage the panel to reconsider my proposal and/or delete the exception of 300.22(C), as it is allowing confusion in the interpretation of the code.

Panel Meeting Action: Reject

Panel Statement: The exception in 300.22(C) has been in the NEC for many years and applies where a joist or stud space is used in a dwelling unit as other spaces for environmental air. This exception permits wiring to pass through this space perpendicular to the long dimension of the space. Panel 7 simply stated that it was not necessary to repeat the requirement in 334.10.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

(300.31)

Submitter: David Shapiro, Safety First Electrical Contracting Consulting & Safety Education
Comment on Proposal No: 3-101
Recommendation: Revise text to read as follows:
"...~~physical~~ damage of the sort that tends to be readily visible...".
Substantiation: NEC users rely on standard dictionary definitions, augmented by the NEC's explicit definitions. The NEC Style Manual saying in "3.2.5.5 Provisions on Protection Against Physical Damage. If protection against physical damage is to be one of the requirements, this can be standardized by the use of this terminology" this does not benefit the ordinary user. The Style Manual is offering an option, not a requirement. I assumed the term was being used loosely to mean damage from blows, abrasion, pressure, or tension, but assumptions should not be necessary. An ideal I believe we share is to enforce the Code as written, not "You know what we mean." This CMP's statement indicates that they intended the long-term physical effects of chemicals and radiation, such as embrittlement, to be among types of damage excluded. Other CMPs use the term with somewhat different intentions, if one reads the Panel Statements in this ROP. Webster's definition does not clue us to this, nor does Article 100, nor does the beginning of this chapter. I would hope 110.3(A)(2)'s requirement of suitable "mechanical strength and durability" sufficed. If this additional statement is needed because that is too broad, let's say exactly what the CMP statement indicates is meant.

3-75 Log #1200 NEC-P03 **Final Action: Accept**
(300.40)

Submitter: Neil F. LaBrake, Jr., Syracuse, NY
Comment on Proposal No: 3-5
Recommendation: The NEC TCC Grounding and Bonding Task Group recommends that CMP-3 consider the following alternative revised wording for Section 300.40:
300.40 Insulation Shielding. Metallic and semiconducting insulation shielding components of shielded cables shall be removed for a distance dependent on the circuit voltage and insulation. Stress reduction means shall be provided at all terminations of factory-applied shielding. Metallic shielding components such as tapes, wires, or braids, or combinations thereof~~, and their associated conducting or semiconducting components~~ shall be connected to a grounding conductor, grounding bus bar, or a grounding electrode ~~grounded~~ .
Substantiation: The NEC TCC Grounding and Bonding Task Group agrees with CMP-3 that for 300.40 the original proposed wording was not entirely correct in this case. However, the Task Group remains concerned that "connected to ground" does not adequately prescribe where this connection is to be made. Therefore, the Task Group has proposed new wording that more clearly identifies where the connection of the shielding can be made.
This Comment was developed by a Task Group assigned by the NEC Technical Correlating Committee to address actions that were other than "accept" taken by Code-Making Panels on proposals from the TCC to resolve 2005 NEC Proposal 5-1 and Comment 5-1. Members of the Task Group on Grounding and Bonding for this Comment included: C. Douglas White; Michael Johnston; Jeffrey Boksiner; Daleep Mohla; Phil Simmons; Christopher Hutchings; James Carroll; Alan Rebeck; Richard Loyd; Paul Dobrowsky; and Neil F. LaBrake, Jr.
The following is the minority affirmative comment by one Task Group member during the Task
Group's results balloting:
"The term "grounding conductor" should be "grounding electrode conductor". The present definition for "grounding conductor" is vague and very similar to the definition of "grounding electrode conductor"."

(Table 300.50)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 3-105
Recommendation: In the panel text, insert the words "or institutional" after "industrial".
Substantiation: The panel is on the right track, but this allowance has been in routine use at major institutional settings as well, and should continue. We just approved the use of this cover reduction at the Flaghship State University (under state rules that restored this provision). This campus has a staff of approximately 60 FTE licensed electricians and they are responsible for the campus 13.8 kV distribution as well as utilization voltages. The level of sophistication at that campus equals or exceeds that often seen at industrial facilities. The inspection community should not be routinely forced into providing special permission pursuant to 90.4 in facilities that are not "industrial" but have an equivalent level of control.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any technical substantiation to support expansion of this note to institutional establishments.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-78 Log #1375 NEC-P03 **Final Action: Accept in Principle**
(300.50(B))

Submitter: William Wagner, Certification Solutions
Comment on Proposal No: 3-106
Recommendation: This Proposal should be Accepted as originally proposed.
300.50(B) Protection from Damage. Raceways installed on poles shall be of rigid metal conduit, intermediate metal conduit, ~~PVC~~ Schedule 80 rigid PVC conduit, or equivalent, extending from the minimum cover depth specified in Table 300.50 to a point 2.5 m (8 ft) above finished grade.
Substantiation: In accordance with CMP-8's actions on Proposals 8-53, Article 352 will now apply to "Rigid Polyvinyl Chloride Conduit: Type PVC". Therefore, it is necessary to revise the terminology used throughout the remainder of the NEC for consistency. As the only type of rigid nonmetallic conduit that is currently listed in Schedule 80 dimensions is rigid PVC conduit, the reference in 300.50(B) should be revised as noted above.
Panel Meeting Action: Accept in Principle
Revise 300.50(B) to read:
(B) Protection from Damage. Raceways installed on poles shall be of rigid metal conduit, intermediate metal conduit, Schedule 80 PVC conduit, or equivalent, extending from the minimum cover depth specified in Table 300.50 to a point 2.5 m (8 ft) above finished grade.
Panel Statement: Based on the action of Panel 8 on Proposal 8-53, it appears that revised Article 352 uses the acronym PVC, not rigid PVC, so the text was revised using PVC.
Number Eligible to Vote: 13

ARTICLE 310 — CONDUCTORS FOR GENERAL WIRING

6-1 Log #672 NEC-P06 **Final Action: Accept**
(310.4)

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 6-7
Recommendation: I agree with the Panel Action to add a new paragraph to 310.13 except the word "multi-conductor" should be changed to "multiconductor".
Substantiation: This is an editorial correction for consistency. Multiconductor is not hyphenated. In the 2005 NEC, the word "multi-conductor" is only used in Articles 690 and 810 and Annex D. The word "multiconductor" is used in 31 Articles, Chapter 9, and Annex B. In the 2008 preprint, "multi-conductor" only appears 7 times whereas "multiconductor" appears 142 times.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-2 Log #673 NEC-P06 **Final Action: Accept in Principle in Part**
(310.4)

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 6-7a
Recommendation: The Proposal should be Accepted in Principle.
Revise the second sentence in the first paragraph to read:
"Where parallel equipment grounding conductors are used with conductors in parallel, they shall be sized in accordance with 250.122."
Combine Exceptions No. 1 and No. 2 by moving the phrase "for frequencies of 360 Hz and higher" from Exception No. 2 into Exception No. 1 so Exception No. 1 will read as shown below (underlining added for Comment review only and is not to be included in the final text):
Exception No. 1: Conductors, other than equipment grounding conductors, in sizes smaller than 1/0 AWG shall be permitted to be run in parallel to supply control power to indicating instruments, contactors, relays, solenoids, and similar control devices, or for frequencies of 360 Hz and higher, provided all of the following apply:
(a) They are contained within the same raceway or cable.
(b) The ampacity of each individual conductor is sufficient to carry the entire load current shared by the parallel conductors.
(c) The overcurrent protection is such that the ampacity of each individual conductor will not be exceeded if one or more of the parallel conductors become inadvertently disconnected.
Delete Exception No. 2.
Renumber Exception No. 3 as Exception No. 2 and in the FPN, change Exception No. 3 to Exception No. 2.
Delete Exception No. 4.
In the FPN, at the end of the section, change "multi-conductor" to "multiconductor", delete the word "listed", and reword to read:
"See 310.13 for sectioned equipment grounding conductors in multiconductor cables."
Substantiation: The deletion of the words "with conductors in parallel" from the existing 2005 NEC changes the requirements without substantiation and would permit the use of parallel equipment grounding conductors when the phase, neutral, or grounded circuit conductors are not paralleled.
Since Exceptions No. 1 and No. 2 have identical requirements, the two Exceptions can be combined into Exception No. 1, Exception No. 2 can be deleted, and Exception No. 3 renumbered as Exception No. 2.
Exception No. 4 is not required since 90.3 states "Chapters 1, 2, 3, and 4 apply generally; Chapters 5, 6, and 7 apply to special occupancies, special equipment, or other special conditions. These latter chapters supplement or modify the general rules. Chapters 1 through 4 apply except as amended by Chapters 5, 6, and 7 for the particular conditions." 620.12(A)(1) modifies the general rule in 310.4 for traveling cables.
The substantiations for the modifications to the FPN at the end of the section are as follows:
(1) The change to "multiconductor" is an editorial correction for consistency. Multiconductor is not hyphenated. In the 2005 NEC, the word "multi-conductor" is only used in Articles 690 and 810 and Annex D. The word "multiconductor" is used in 31 Articles, Chapter 9, and Annex B. In the 2008 preprint, "multi-conductor" only appears 7 times whereas "multiconductor" appears 142 times.
(2) Deletion of the word "listed" is necessary since "listing" is not a requirement in most of the multiconductor cable Articles.
(3) FPN reworded in accordance with 4.1.2 of the NEC Style Manual.
Panel Meeting Action: Accept in Principle in Part
The comment is accepted in principle in part by the panel by modifying the panel action on Comment 6-3 as follows:
Revise Exception No. 1 to read "Exception No. 1: Conductors in sizes smaller than 1/0 AWG shall be permitted to be run in parallel to supply control power to indicating instruments, contactors, relays, solenoids, and similar control devices, or for frequencies of 360 Hz and higher, provided all of the following apply:"
Delete Exception No. 2.
Renumber "Exception No. 3" as "Exception No. 2" and change the reference in the FPN to "Exception No. 2"
In 310.4(E) FPN, delete the word "listed".
The panel does not accept the remainder of the Comment.
Panel Statement: The inclusion of these revisions in the panel action on Comment 6-3 further enhances the reorganization and clarity of the section.
The word "listed" was deleted from 310.4(E) FPN since not all multiconductor cables in Chapter 3 are required to be listed but, when paralleled, they still must comply with 250.122.
The text as contained in Comment 6-03 for 310.4(E) addresses the requirements.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-3 Log #1088 NEC-P06 **Final Action: Accept in Principle in Part**
(310.4)

TCC Action: The Technical Correlating Committee understands that the FPN immediately following 310.4(E) of the text recommended in Comment 6-3 is deleted and incorporated as a new second sentence in 310.4(E).
The Technical Correlating Committee further understands that the word "listed" is deleted from this new second sentence by the panel action on Comment 6-2.
Submitter: Jim Pauley, Square D Company
Comment on Proposal No: 6-7a
Recommendation: Revise 310.4 of the ROP text to read as follows:
310.4 Conductors in Parallel.
(A) General. Aluminum, copper-clad aluminum, or copper conductors of size 1/0 AWG and larger, comprising each phase, polarity, neutral~~,~~ or grounded circuit conductor~~, or equipment grounding conductor~~ shall be permitted to be connected in parallel (electrically joined at both ends). ~~Where parallel equipment grounding conductors are used they shall be sized in accordance with 250.122.~~
Exception No. 1: Conductors~~, other than equipment grounding conductors~~, in sizes smaller than 1/0 AWG shall be permitted to be run in parallel to supply control power to indicating instruments, contactors, relays, solenoids, and similar control devices, provided all of the following apply:
(a) They are contained within the same raceway or cable.
(b) The ampacity of each individual conductor is sufficient to carry the entire load current shared by the parallel conductors.
(c) The overcurrent protection is such that the ampacity of each individual conductor will not be exceeded if one or more of the parallel conductors become inadvertently disconnected.
Exception No. 2: Conductors~~, other than equipment grounding conductors,~~ in sizes smaller than 1/0 AWG shall be permitted to be run in parallel for frequencies of 360 Hz and higher where conditions (a), (b), and (c) of Exception No. 1 are met.
Exception No. 3: Under engineering supervision, grounded neutral conductors in sizes 2 AWG and larger shall be permitted to be run in parallel for existing installations.
FPN: ~~Section~~ 310.4 Exception No. 3 can be used to alleviate overheating of neutral conductors in existing installations due to high content of triplen harmonic currents.
(B) Conductor Characteristics. The paralleled conductors in each phase, polarity, neutral, grounded circuit conductor, or equipment grounding conductor shall comply with all of the following:

(1) Be the same length
(2) Have the same conductor material
(3) Be the same size in circular mil area
(4) Have the same insulation type
(5) Be terminated in the same manner

(C) Separate Cables or Raceways. Where run in separate cables or raceways, the cables or raceways with conductors shall have the same number of conductors, and shall have the same electrical characteristics. Conductors of one phase, polarity, neutral, grounded circuit conductor, or equipment grounding conductor shall not be required to have the same physical characteristics as those of another phase, polarity, neutral, grounded circuit conductor, or equipment grounding conductor to achieve balance.

(D) Ampacity Adjustment. Conductors installed in parallel shall comply with the provisions of 310.15(B)(2)(a).

(E) Equipment Grounding Conductors. Where parallel equipment grounding conductors are used they shall be sized in accordance with 250.122. FPN: For sectioned equipment grounding conductors in listed multiconductor cables, see 310.13

~~Exception No. 1: Conductors, other than equipment grounding conductors, in sizes smaller than 1/0 AWG shall be permitted to be run in parallel to supply control power to indicating instruments, contactors, relays, solenoids, and similar control devices, provided all of the following apply:~~
~~(a) They are contained within the same raceway or cable.~~
~~(b) The ampacity of each individual conductor is sufficient to carry the entire load current shared by the parallel conductors.~~
~~(c) The overcurrent protection is such that the ampacity of each individual conductor will not be exceeded if one or more of the parallel conductors become inadvertently disconnected.~~
~~Exception No. 2: Conductors, other than equipment grounding conductors, in sizes smaller than 1/0 AWG shall be permitted to be run in parallel for frequencies of 360 Hz and higher where conditions (a), (b), and (c) of Exception No. 1 are met.~~
~~Exception No. 3: Under engineering supervision, grounded neutral conductors in sizes 2 AWG and larger shall be permitted to be run in parallel for existing installations.~~
~~FPN: Section 310.4 Exception No. 3 can be used to alleviate overheating of neutral conductors in existing installations due to high content of triplen harmonic currents.~~
~~Exception No. 4: As permitted in 620.12(A)(1).~~
~~The paralleled conductors in each phase, polarity, neutral, grounded circuit conductor, or equipment grounding conductor shall comply with all of the following:~~
~~(1) Be the same length~~
~~(2) Have the same conductor material~~
~~(3) Be the same size in circular mil area~~
~~(4) Have the same insulation type~~
~~(5) Be terminated in the same manner~~
~~Where run in separate cables or raceways, the cables or raceways with conductors shall have the same number of conductors, and shall have the same electrical characteristics. Conductors of one phase, polarity, neutral, grounded circuit conductor, or equipment grounding conductor shall not be required to have the same physical characteristics as those of another phase, polarity, neutral, grounded circuit conductor, or equipment grounding conductor to achieve balance.~~
~~Conductors installed in parallel shall comply with the provisions of 310.15(B)(2)(a).~~
~~FPN: For sectioned equipment grounding conductors in listed multiconductor cables, see 310.13~~

Substantiation: The panel was correct to begin a reorganization of 310.4 in Proposal 6-7a. This comment is to further enhance that rewrite by reorganizing the material into subsections with headings. This arrangement will also allow the exceptions to follow the appropriate part of the text they are taking exception to. The following is the specific substantiation for the revisions and arrangement:

1) The first paragraph is titled "general" since it contains the basic permission to allow parallel connections.

2) The words "equipment grounding conductor" have been deleted from this main paragraph. When the panel added equipment grounding conductors to the list of involved conductors, it created a direct conflict with the last sentence relative to the permitted sizing. Equipment grounding conductors have not been subjected to the 1/0 and larger provisions, but the revision in the ROP implies that they are subject to that limitation. The sentence dealing with equipment grounding conductor sizing has been given its own subsection and heading.

3) Exceptions 1, 2 and 3 have been relocated to follow this "general" paragraph. All three exceptions are taking exception to the 1/0 sizing provisions in some manner or another. This arrangement makes the exceptions more logical in their approach.

4) In exceptions 1 and 2, the words "other than equipment grounding conductors" have been deleted from the first sentence. These words are no longer needed since equipment grounding conductors are dealt with separately in paragraph (E). The main paragraph specifies the involved conductors and the exceptions would be limited to those conductors (unless further limited by the exception itself).

5) The existing text about the conductor characteristics is still in tact, but is now placed under its own subsection as item (B).

6) The existing paragraph about separate raceways or cables is still intact, but broken out into its own subsection (C).

7) The existing sentence about applying the ampacity adjustment factors is still in tact but given its own subsection (D).

8) The equipment grounding conductor sizing provisions has been moved to its own subsection (E). This also allows for placement of the FPN on sectioned conductors to be located directly below this paragraph.

9) The existing Exception #4 is deleted. Since the rule in 620 takes specific exception to the text in 310, and exception is not needed. In fact, the inclusion of the exception adds confusion because it implies that any item modified by Chapters 5, 6, or 7 needs an exception in the general chapters. The deletion of the exception is consistent with the TCC direction to avoid redundancy with the provisions of 90.3.

The requirements for 310.4 are not changed by this comment, but the material is provided in a much more user friendly manner and will make the rules easier to find and cite when needed.

Panel Meeting Action: Accept in Principle in Part

Delete the FPN immediately following (E) and add a second sentence to (E) to read: "Sectioned equipment grounding conductors smaller than 1/0 AWG shall be permitted in multiconductor cables in accordance with 310.13, provided the combined circular mil area in each cable complies with 250.122."

The panel accepts the remainder of the Comment.

Panel Statement: This action also addresses Comment 6-41 and locates the information in the FPN as positive text as recommended in the NEC Style Manual.

The panel action on Comment 6-02 modifies the action on this comment.

Number Eligible to Vote: 11

6-4 Log #1885 NEC-P06 **Final Action: Accept in Principle (310.4)**

Submitter: Mike Holt, Mike Holt Enterprises, Inc.

Comment on Proposal No: 6-7a

Recommendation: Accept the proposal with the following changes:

310.4 Conductors in Parallel. Aluminum, cooper-clad aluminum, or copper conductors shall be permitted to be connected in parallel (electrically joined at both ends) in accordance with (A) through (E):

(A) Ungrounded and Grounded Conductors. Ungrounded and Grounded conductors shall comply with the following: Conductors shall

(1) be not smaller than 1/0 AWG

Exception No. 1 to (1): Conductors in sizes smaller than 1/0 AWG shall be permitted to be run in parallel to supply control power to indicating instruments), contactors, relays, solenoids, and similar control devices, provided all of the following apply:

(a) They are contained within the same raceway or cable.

(b) The ampacity of each individual conductor is sufficient to carry the entire load current shared by the parallel conductors.

(c) The overcurrent protection is such that the ampacity of each individual conductor will not be exceeded if one or more of the parallel conductors become inadvertently disconnected.

Exception No. 2 to (1): Conductors in sizes smaller than 1/0 AWG shall be permitted to be run in parallel for frequencies of 360 Hz and higher where conditions (a), (b), and (c) of Exception No. 1 are met:

Exception No. 3 to (1): Under engineering supervision, grounded conductors in sizes 2 AWG and larger shall be permitted to be run in parallel for existing installations.

FPN: Section 310.4 Exception No. 3 can be used to alleviate overheating of neutral conductors in existing installations due to high content of triplen harmonic currents.

Exception No. 4 to (1): As permitted in 620.12(A)(1).

(2) be the same length
(3) have the same conductor material
(4) be the same size in circular mil area
(5) have the same insulation type
(6) be terminated in the same manner

(B) Equipment Grounding Conductors. Equipment grounding conductors shall comply with 310.4(A)(2) through (A)(6) and shall be sized in accordance with 250.122(F).

(C) Raceways and Cables. Cables or raceways with conductors shall have the same number of conductors, and shall have the same electrical characteristics.

(D) Conductor sets. Conductors of one phase, polarity, neutral, or grounded circuit conductor, shall not be required to have the same physical characteristics as those of another phase, polarity, neutral, or grounded circuit conductor, to achieve balances.

(E) Ampacity adjustment. Conductors installed in parallel shall comply with the provisions of 310.15(B)(2)(a).

FPN: For sectioned equipment grounding conductors in listed multiconductor cables, see 310.13.

Substantiation: The existing text of the accepted proposal does not allow for equipment grounding conductors smaller than 1/0 AWG. In addition to this, a list format and subsections makes for a more user-friendly document.

(310.4)

Submitter: Donald A. Ganiere, Ottawa, IL

Comment on Proposal No: 6-8

Recommendation: This proposal should be accepted.

Substantiation: The panel rejected this proposal with the comment that the current wording complies with section 3.1.3 of the NEC Style Manual. Based on the online version of this document, I think the panel meant to say section 3.1.2. This section says that the use of the words “shall be permitted” are to be used to “indicate allowed optional or alternate methods.”

That would indicate that there must be some rule that says that conductors cannot be installed in parallel. I am not aware of any such rule. Using the current wording of “shall be permitted” in no way limits the use of smaller conductors installed in parallel. The rule should be changed to the wording in the proposal to provide a valid restriction on the use of conductors smaller than 1/0 in parallel.

Panel Meeting Action: Reject

Panel Statement: The submitter is correct that the NEC Style Manual reference in the panel statement on Proposal 6-8 should have been 3.1.2, Permissive Rules. The parenthetical sentence immediately following the referenced text states, “(Note that these are still mandatory language and constitute rules.)” Also, Item 4 under 3.3.1, Writing Style General Guidelines, in the NEC Style Manual states, “Use positive language, rather than negative, wherever possible.” Section 250.118 defines the types of equipment grounding conductors and uses the singular of “conductor” except in 250.118(10). Section 310.4 deals with conductors that are run in parallel. The language specifically allows conductors 1/0 or larger to be run in parallel, which means conductors smaller than 1/0 in general are not permitted to be run in parallel.

Comment on Proposal No: 6-13

Recommendation: Accept Proposal 6-13.

Substantiation: Insufficient evidence exists to stop the use of UL listed and manufacturer approved non-shielded cable that is properly installed and properly terminated for 5 kV applications. The introduction of shielded cables with stress cone termination in confined spaces may introduce new safety concerns

Panel Meeting Action: Reject

Panel Statement: The potential hazard that arises by using nonshielded cable above 2.4 kV exists in all locations in all conditions whether maintained by qualified or unqualified personnel. This includes conduit installations and metal-clad cable installations.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 8 Negative: 3

Explanation of Negative:

HUDDLESTON, JR., R.: The panel again chose to ignore the many years of solid evidence supporting the fact that with proper installation, non shielded cable may be used safely for 4160 volt applications. The Panel Statement sums it up: “The potential hazard that arises by using non shielded cable above 2.4 kV exists in all locations in all conditions whether maintained by qualified or unqualified personnel. This includes conduit installations and metal-clad cable installations.” By making this statement, the Panel has effectively said that it does not matter whether the cable is installed in conduit or is metal-clad and installed by qualified persons - they believe it is unsafe regardless. What a statement! Where in the world is the technical substantiation for making such a statement? Where is the evidence that a conduit or MC cable installation is unsafe? There was none (other than anecdotal) during the 2005 Code cycle, and there was none presented during the 2008 Code cycle. I also find it curious that the Panel chose to allow the use of 5 kV non shielded cable for airfield lighting series circuits. The statement made by the panel : “hazard...exists in all locations in all conditions whether maintained by qualified or unqualified personnel” would lead one to believe they believe that this too would be an unsafe installation, yet the Panel agreed to allow this practice to continue. If the Panel truly believed their statement : ”hazard...exists in all locations in all conditions”, then surely they would not have granted this exception. Furthermore, this code requirement requires costly change-out of existing equipment or extensive field modification of listed equipment to allow shielded cable to be used in existing installations. Such replacement is neither warranted nor justified, yet the panel continues to ignore the comments of the user community and the safe installations that have been in place for many years.

MCCLUNG, L.: The Panel Statement in Comments: 6-10, 6-11, 6-12, 6-13, 6-14, 6-15, 6-16, 6-17, 6-18, 6-19, 6-20, 6-21, 6-22, 6-23, 6-24, 6-25, and 6-26; “The potential hazard that arises by using non-shielded cable above 2.4 kV exists in all locations in all conditions whether maintained by qualified or unqualified personnel. This includes conduit and metal-clad cable installations”; is erroneous, misleading and a distortion of the facts. In no way does it justify deletion of the usage of non-shielded 5 kV from the Code. 5 kV non-shielded cable used above 2.4 kV (i.e. 3.3 kV, 4.16 kV, etc.), properly specified with the correct insulation wall thicknesses and a non tracking type jacket with or without an overall metallic sheath or armor, properly installed and terminated by a qualified individual is equally as safe as medium voltage shielded cable.

As one of the “user” representatives IEEE needs to identify the necessity for major industrial/commercial entities to continue to have available the 5 kV non-shielded cables for wiring medium voltage motors and other medium voltage equipment where equipment manufacturer’s (NEMA members) traditionally have not included adequate space for shielded cable terminations. (NOTE: This usage applies to both installed and new equipment).

Rather than penalizing the user of this type cable, the Panel should work with the users to establish the necessary rules to assure proper application similar to that which the Technical Correlating Committee recommended for the 5000 volt non-shielded cable for airfield series lighting when installed in accordance with the FAA Advisory Circulars (ACs).

WALL, C.: See my statement on Comment 6-12.

Comment on Affirmative:

CLINE, S.: As hard and fairly as we tried, we were unable to close the distance between the two widely separated camps. It seems we still have overall people-resistant safety on one side, and the hope of practical risk-management on the other.

It seems possible to me that use within an overall metallic sheath, conduit or armor MAY be acceptable if evidentiary-level substantiation of the equivalent safety performance, when compared to shielded construction, is presented.

Very surprisingly to me, there was no suggestion to accept like-kind cable replacement for existing installations of high-level installations.

ZIMNOCH, J.: The original purpose for applying shields to medium voltage cables, discovered in the late 1800’s, was to “connect the sufficient number of points on the insulation surface for the purpose of equalizing the potential differences.” Thus, the shield provides a zero-potential on the external surface of the insulation.

In the case of a non-shielded cable operating at voltages above 2.4 kV, the greater the air gap from the insulation surface to ground, the greater the potential on the surface of the cable which creates a substantial safety and reliability concern.

ICEA had always recommended the use of a shield for voltages rated above 2kV for the reasons above. It was the introduction of the “Exception” in the 1975 code that permitted use of non-shielded cable to voltages as high as 8 kV. In 1975 the scientific laws had not changed, only the rules guiding its use had.

To date, regardless of the type of insulation or thickness used, both the cable and terminations will retain a standing voltage and discharge when operated above 2.4 kV. The use of metallic conduit, sheaths or track resistant tubing’s over the ends will not stop this.

I have spoken to many trained medium voltage splicers/electricians that agreed that limiting the use of non-shielded cable to 2.4 kV operation was a step in the right direction for theirs and others safety.

6-7 Log #572 NEC-P06 **Final Action: Reject**
(310.6)

Submitter: William M. Lewis, Martinsville, IN

Comment on Proposal No: 6-13

Recommendation: The proposal should have been Accepted and expanded to include the installation of non-shielded 4160 volt cable in metallic conduit.

Substantiation: All of the negative comments are correct.

Also, the proposal addresses the perceived safety issues in the positive comments. Regarding Mr. Laider’s comment: Shielded cable is not shielded at the termination. My experience is that shielded cable experiences higher failure rates at the terminations than nonshielded at 4160 volts.

Regarding Mr. Zimnoch’s comments: The proposed metallic overall enclosure, while not addressing the technical issue of insulation degradation, would have the same result as individual shielding as regards to safety.

Two points regarding the panel statement:

1. the panel made the change in the 2005 code without technical substantiation.

2. the extensive testing and listing by UL provides adequate technical substantiation.

I am submitting a comment only on this one proposal to reduce the panel's workload, even though all the proposals from 6-14 through 6-25 need reconsideration:

Panel Meeting Action: Reject

Panel Statement: The potential hazard that arises by using nonshielded cable above 2.4 kV exists in all locations in all conditions whether maintained by qualified or unqualified personnel. This includes conduit installations and metal-clad cable installations. The panel disagrees with the statement that technical substantiation was lacking in the previous code cycle.

(310.6)

Submitter: James M. Daly, Upper Saddle River, NJ

Comment on Proposal No: 6-16

Recommendation: I support the Panel Action to Reject the Proposal.

Substantiation: UL is developing UL Standard 2460 that will address the submitter's request for use of nonshielded conductors up to 5000 volts when part of an assembly. The Scope of the proposed standard is shown below for information.

1 Scope.

1.1 These requirements cover single-conductor, nonshielded cables rated 5000 volts, 90°C dry only.

1.2 The cables covered by these requirements are intended solely for use as factory-installed wiring in equipment (internal wiring).

1.3 These requirements do not cover cables that are intended for direct installation in buildings or structures in accordance with the National Electrical Code (NEC), NFPA 70.

1.4 The final acceptance of these cables is dependent upon their use in complete equipment that conforms with the standards applicable to such equipment.

6-9 Log #1235 NEC-P06 **Final Action: Accept in Principle**
(310.6)

TCC Action: The Technical Correlating Committee directs that the panel action on this comment be reported as "Accept in Principle" according to the panel action on Comment 5-6 on Proposal 5-18 and the term "grounding conductor" is changed to "grounding electrode conductor".

Submitter: Neil F. LaBrake, Jr., Syracuse, NY

Comment on Proposal No: 6-4

Recommendation: Revise 310.6 as follows:

Solid dielectric insulated conductors operated above 2000 volts in permanent installations shall have ozone-resistant insulation and shall be shielded. All metallic insulation shields shall be connected to a grounding conductor, grounding busbar, or a grounding electrode ~~be grounded through an effective grounding path meeting the requirements of 250.4(A)(5) or 250.4(B)(4)~~. Shielding shall be for the purpose of confining the voltage stresses to the insulation.

Substantiation: The revised wording proposed in this comment attempts to address the concerns expressed by the Panel in their rejection of this part. The existing language is vague and does not describe how the grounding of the cable shield is to be done. The Bonding and Grounding Task Group concluded that it is necessary to replace vague references to "shall be grounded" with more prescriptive requirements. If the proposed wording does not meet the intent of this section, the Task Group encourages the Panel to develop alternative wording that provides a prescriptive requirement.

Note: the term "grounding conductor" will have to be replaced with "grounding electrode conductor" if Proposal 5-18 continues to be accepted.

This Comment was developed by a Task Group assigned by the NEC Technical Correlating Committee to address actions that were other than "accept" taken by Code-Making Panels on proposals from the TCC to resolve 2005 NEC Proposal 5-1 and Comment 5-1. Members of the Task Group on Grounding and Bonding for this Comment included: C. Douglas White; Michael Johnston; Jeffrey Boksiner; Daleep Mohla; Phil Simmons; Christopher Hutchings; James Carroll; Alan Rebeck; Richard Loyd; Paul Dobrowsky; and Neil F. LaBrake, Jr. The following is the minority affirmative comment by one Task Group member during the Task Group's results balloting:

"The term "grounding conductor" should be "grounding electrode conductor". The present definition for "grounding conductor" is vague and very similar to the definition of "grounding electrode conductor"."

Panel Meeting Action: Accept

Panel Statement: If Proposal 5-18 continues to be accepted, this comment is accepted in principle and "grounding conductor" is changed to "grounding electrode conductor."

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

6-10 Log #1891 NEC-P06 **Final Action: Reject**
(310.6)

Submitter: Paul S. Hamer, Chevron Energy Technology Company

Comment on Proposal No: 6-13

Recommendation: Proposal 6-13, as modified in Mr. McClung's Explanation of Negative, should be accepted.

Substantiation: When conductors are enclosed in an overall metallic sheath or armor that is grounded, there is no shock hazard since the conductor's electric field is confined to within the metallic sheath or armor. In fact, the same is true for unshielded cables installed in metallic conduit. The Panel Statement for rejection of this Proposal is incorrect.

Panel Meeting Action: Reject

Panel Statement: The potential hazard that arises by using nonshielded cable above 2.4 kV exists in all locations in all conditions whether maintained by qualified or unqualified personnel. This includes conduit installations and metal-clad cable installations.

Panel Statement: The potential hazard that arises by using nonshielded cable above 2.4 kV exists in all locations in all conditions whether maintained by qualified or unqualified personnel. This includes conduit installations and metal-clad cable installations.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 8 Negative: 3
Explanation of Negative:
HUDDLESTON, JR., R.: See My Explanation of Negative on Comment 6-6.
MCCLUNG, L.: See My Explanation of Negative on Comment 6-6.
WALL, C.: Listed products installed per their listing are safe; however, the panel statement clearly shows that the majority of the panel does not believe this. The panel has implicated the entire system of ensuring that hazards do not exist. They have clearly stated that nonshielded cables give rise to a hazard that proper installation using listed products cannot eliminate. The hazard that they allude to is only a hazard to an electrician that removes a cover from a termination enclosure while the cables are energized. Improperly trained electricians incorrectly believe they should be able to touch the outer surface of energized nonshielded cables operating above 2.4 kV and not receive a shock. If an electrician touches the outer surface of an energized nonshielded or shielded conductor in a medium voltage termination chamber he has violated several safe work practice rules. Statements made by panel members during the meeting indicated that they believe they can protect workers from unsafe work practices by requiring shielded cables. They are incorrect on this. Contact with a terminator installed on a shielded cable can cause a shock just as contacting a nonshielded cable since charges exist on the outer surface of a terminator installed on shielded cables just as charges exist on the outer surface of nonshielded cables.
A panel member stated that today's maintenance personnel and electricians are not as well trained as in past times. He is incorrect. With today's emphasis on safe work practices, today's electrical workers are safer than they have ever been. I have confidence in the ability of IBEW and contractors to properly train their personnel. When electricians observe NFPA 70E and OSHA work rules, then the hazards alluded to by panel members will be eliminated.
Additionally, the panel ignored the concern expressed by at least two panel members over how to replace nonshielded cables with shielded cables in existing installations without violating the listing of the motors and controllers. Motors operating at voltages above 2.4 kV are expensive. The termination enclosures of many existing motors and controllers do not have adequate space for terminating shielded cables. Modifying the enclosure is not an option. Replacing a motor with one that has a larger enclosure is the only other option, but is unnecessarily expensive; however, when this was brought out during panel discussions it was quickly dismissed. A number of panel members opposing the use of shielded cables (above 2.4 kV) were willing to compromise so that nonshielded cables would only be used on existing installations; however, most on the panel were opposed to a compromise position. It was obvious that some of the panel had their minds made up and were not going to consider the facts.
Comment on Affirmative:
CLINE, S.: See my affirmative comment on Comment 6-6.

6-13 Log #1156 NEC-P06 **Final Action: Reject**
(310.6 Exception)

Submitter: Neil F. LaBrake, Jr., National Grid / Rep. Edison Electric Insitute-Electric Light & Power Group
Comment on Proposal No: 6-15
Recommendation: Accept-in-principle Proposal 6-15 with the following revised text.
310.6 Exception No. 2 (New): Where the conditions of maintenance and supervision ensure that only qualified persons service the installation, nonshielded insulated conductors shall be permitted for use up to 5000 volts.
Substantiation: In addition to the lack of consideration that Code-Making Panel 6 gave to the fact that nonshielded cables have been used safely for decades, they did not consider that many existing installations include motors with terminal housings that do not have adequate space for terminating shielded cables, either for the added length of the terminator, the increased minimum bending radius of shielded cable, nor the termination and connection of the metallic shield or neutral. It is a fact that the termination boxes on large motors would have to be modified to accept shielded cable under the 2005 NEC present 310.6, which is both time consuming and impractical.
The Edison Electric Institute supports efforts to bring this change about. We prefer to have the exception worded to not limit the use of nonshielded cable to industrial customers, nor to limit the installation to metallic conduits. It may be more acceptable to CMP-6 to allow use up to 5,000 volts rather than 8,000 volts as 4.16kV and 4.8kV applications are more prevalent.
Refer to EEI's companion comment on Proposal 6-19.

6-16 Log #1814 NEC-P06 **Final Action: Reject**
(310.6 Exception)

Submitter: Michael Walls, American Chemistry Council
Comment on Proposal No: 6-13
Recommendation: Proposal 6-13 should have been accepted as submitted.
Renumber present Exception as Exception No. 1: and add Exception No. 2: "Nonshielded multiconductor cables rated 2001 - 5000 volts listed by a qualified testing laboratory shall be permitted for use up to 5000 volts if the cable has an overall metallic shield or armor. The metallic sheath or armor shall be grounded through an effective grounding path meeting the requirements of 250.4(A)(5) or 250.4(B)(4).
FPN: see 300.3(C)(2) for installation requirements for conductors rated over 600 volts."

Substantiation: Insufficient evidence was presented to the panel to ban the use of nonshielded cable for 4160 volt applications during the 2005 cycle, especially when installed as armored cable as this proposal specified. Code Panel members should seriously consider the effects on those in industry who are faced with situations where they have existing medium voltage installations where terminations are not stress-coned and non-shielded cable has been used successfully. If changes or modifications to these installations must be made, older existing equipment will not generally allow enough space to terminate shielded cable.
Panel Meeting Action: Reject

(310.6 Exception)

Submitter: Michael Walls, American Chemistry Council
Comment on Proposal No: 6-14
Recommendation: Proposal 6-14 should have been accepted as submitted.
Change Exception 1 to read " Nonshielded insulated conductors listed by a qualified testing laboratory shall b permitted for use up to 5000 volts under the following conditions…".
Substantiation: Insufficient evidence was presented to the panel to ban the use of nonshielded cable for 4160 volt applications. There are literally hundreds of documented examples of safe nonshielded cable installations that have been in place for many years, with no problems whatsoever. The panel, in rejecting this proposal, refused to acknowledge the hardships that banning nonshielded cable for 4160 volt applications imposes on users of existing equipment, such as retrofitting larger junction boxes on motors and switchgear in order to allow adequate room to install stress cones (and voiding UL listing by modifying the equipment).
Panel Meeting Action: Reject
Panel Statement: The potential hazard that arises by using nonshielded cable above 2.4 kV exists in all locations in all conditions whether maintained by qualified or unqualified personnel. This includes conduit installations and metal-clad cable installations.

(310.6 Exception No. 2 (New))

Submitter: Neil F. LaBrake, Jr., National Grid / Rep. Edison Electric Insitute-Electric Light & Power Group
Comment on Proposal No: 6-19
Recommendation: Accept-in-principle Proposal 6-19 with the following revised text.
310.6 Exception No. 2 (New): Where the conditions of maintenance and supervision ensure that only qualified persons service the installation, nonshielded insulated conductors shall be permitted for use up to 5000 volts.
Substantiation: In addition to the lack of consideration that Code-Making Panel 6 gave to the fact that nonshielded cables have been used safely for decades, they did not consider that many existing installations include motors with terminal housings that do not have adequate space for terminating shielded cables, either for the added length of the terminator, the increased minimum bending radius of shielded cable, nor the termination and connection of the metallic shield or neutral. It is a fact that the termination boxes on large motors would have to be modified to accept shielded cable under the 2005 NEC present 310.6, which is both time consuming and impractical.
The Edison Electric Institute supports efforts to bring this change about. We prefer to have the exception worded to not limit the use of nonshielded cable to industrial customers, nor to limit the installation to metallic conduits. It may be more acceptable to CMP-6 to allow use up to 5,000 volts rather than 8,000 volts as 4.16kV and 4.8kV applications are more prevalent.
Refer to EEI's companion comment on Proposal 6-15.

6-25 Log #1819 NEC-P06 **Final Action: Reject**
(310.6 Exception No. 2 (New))

Submitter: Michael Walls, American Chemistry Council
Comment on Proposal No: 6-19
Recommendation: Proposal 6-19 should have been accepted in principle as amended during panel discussions - replacing 8000 volts (8 kV) by 5000 volts (5 kV) in the proposal text.
"Exception No. 2: In industrial establishments where the conditions or maintenance and supervision ensure that only qualified persons service the installation, nonshielded insulated conductors shall be permitted for use up to 5000 volts when installed in a metal raceway such as rigid metal conduit."
Substantiation: Insufficient evidence was presented to the panel to ban the use of nonshielded cable for 4160 volt applications. Rejecting the proposal on a safety basis ignores the fact that conduit installations are undoubtedly a safe way to install nonshielded cable. Panel members who supported rejecting this proposal are apparently unaware that grounded /bonded conduit systems provide a safe, secure means of protecting the cable from any corona damage, and as long as proper installation techniques are used when terminating the cable, a safe, proper installation will result. Of course, if improper techniques are used to install and terminate shielded cable, an unsafe installation results - the same as with a nonshielded cable installation.
Panel Meeting Action: Reject
Panel Statement: The potential hazard that arises by using nonshielded cable above 2.4 kV exists in all locations in all conditions whether maintained by qualified or unqualified personnel. This includes conduit installations and metal-clad cable installations.
Number Eligible to Vote: 11

ZIMNOCH, J.: See my affirmative comment on Comment 6-6.

6-26 Log #1893 NEC-P06 **Final Action: Reject**
(310.6 Exception No. 2 (New))

Submitter: Paul S. Hamer, Chevron Energy Technology Company
Comment on Proposal No: 6-19
Recommendation: Proposal 6-19 should have been "accepted in principle," reducing "8000 volts" to "5000 volts."

Substantiation: When conductors are enclosed in an overall metallic sheath, armor, or conduit, there is no shock hazard since the conductor's electric field is confined to within the metallic sheath, armor, or conduit. Also, see the Explanation of Negative comments for this Proposal. The Panel Statement for rejection of this Proposal (by referring back to the 2005 Code cycle) does not respect the NFPA Regulations Governing Committee Projects 4-3.5.1, which states "...Such statement shall be sufficiently detailed so as to convey the TC's rationale for its action so that rebuttal may, if desired, be submitted during the Comment period...". The Panel must provide reasonable rationale if the Panel Action on the original Proposal is other than "accept." It has not fulfilled this obligation in the ROP.

Panel Meeting Action: Reject

Panel Statement: The potential hazard that arises by using nonshielded cable above 2.4 kV exists in all locations in all conditions whether maintained by qualified or unqualified personnel. This includes conduit installations and metal-clad cable installations.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 8 Negative: 3

ZIMNOCH, J.: See my affirmative comment on Comment 6-6.

6-27 Log #35 NEC-P06 **Final Action: Accept**
(310.6 Exception No. 3 (New))

Submitter: Technical Correlating Committee on National Electrical Code

Comment on Proposal No: 6-21

Recommendation: The Technical Correlating Committee directs that the panel reconsider the proposal and act on its merits since the application discussed is not exempt under 90.2(B). This action will be considered by the panel as a public comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

Add a new Exception No. 2 as follows:

Exception No. 2: Where permitted in 310.7 Exception No. 2.

Panel Statement: See panel the action and statement on Comment 6-36.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

Comment on Affirmative:

WALL, C.: Acceptance of this comment allows nonshielded cables up to 5000 volts in conduit installations. By accepting this comment the panel is admitting that nonshielded cables can be operated and worked safely up to 5000 volts. This is contrary to their panel statement for comment 6-12 where they stated that there were hazards that arose for such cables in all locations and under all conditions.

6-28 Log #675 NEC-P06 **Final Action: Accept**
(310.7)

Submitter: James M. Daly, Upper Saddle River, NJ

Comment on Proposal No: 6-23

Recommendation: The Proposal should have been Accepted and the original Panel Action to Accept was correct and should be reinstated.

Substantiation: I agree with the Affirmative Comments to Accept the Proposal; they are all correct and factual.

During the discussion and Panel Action on Proposal 6-49 for the 2005 NEC, there was never any discussion by the panel regarding the 310.7 Exception. There was no discussion regarding leaving it in the Code nor revising or removing it; it was totally overlooked.

The Panel should Accept Proposal 6-23 and revise the Exception from 5000 volts to 2400 volts.

Failure to correct the Exception will continue to perpetuate a conflict within the Code between 310.6, 328.10, Table 310.63 and the 310.7 Exception.

Even if the nonshielded conductors are installed in a raceway, or a metallic sheathed or armored cable, the conductors must still be separated out individually for terminations and the workers will still be exposed to the safety issues at the terminations, particularly when working on adjacent circuits while the nonshielded conductors are energized.

Table 310.63 was revised in the 2005 NEC to limit nonshielded insulated conductors to 2400 V. UL Standard 1072 was subsequently revised to require shielding in cables rated higher than 2400 volts so a cable manufacturer can no longer obtain a UL Listing for nonshielded conductors or cables rated above 2400 V. Listed nonshielded conductors rated above 2400 V are no longer available for use in metallic sheathed or armored cables nor for use in raceways.

UL Standard 2460 is being developed to provide for the use of nonshielded single conductors rated up to 5000 volts for use as factory installed wiring in equipment (internal wiring). This standard will not "cover cables that are intended for direct installation in buildings or structures in accordance with the National Electrical Code (NEC), NFPA 70."

Panel Meeting Action: Accept

Panel Statement: The panel does not agree with all the substantiation of the comment and acknowledges that workers should be working under the provision of NFPA 70E.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 8 Negative: 3

Explanation of Negative:

HUDDLESTON, JR., R.: See My Explanation of Negative on Comment 6-6.

MCCLUNG, L.: See My Explanation of Negative on Comment 6-6.

WALL, C.: The panel is disregarding the fact that the cables allowed by the exception are listed for the application and do not create an unsafe installation. The hazard that the panel wants to eliminate is the danger associated with working on live terminations. This hazard is addressed by the work procedures dictated by NFPA 70E and OSHA, not the NEC. Requiring shielded cables does not make the installation safer. Also see my statement on Comment 6-12.

Comment on Affirmative:

CLINE, S.: See my affirmative comment on Comment 6-6.

6-29 Log #1167 NEC-P06 **Final Action: Reject**
(310.7)

Submitter: Neil F. LaBrake, Jr., National Grid / Rep. Edison Electric Insitute-Electric Light & Power Group

Comment on Proposal No: 6-22

Recommendation: Accept-in-principle Proposal 6-22 by changing the proposed text "rated 2001-5000 volts listed by a qualified testing laboratory" to "rated and listed for 2001-5000 volts" and moving FPN No. 1 as shown in the following revised text of 310.7.

310.7 Direct Burial Conductors. Conductors used for direct burial applications shall be of a type identified for such use.

FPN No. 1: See 300.5 for installation requirements for conductors rated 600 volts or less.

Cables rated above 2000 volts shall be shielded.

Exception: Nonshielded multiconductor cables rated and listed for 2001-5000 volts shall be permitted for use up to 5000 volts if the cable has an overall metallic sheath or armor.

The metallic shield, sheath, or armor shall be grounded through an effective grounding path meeting the requirements of 250.4(A)(5) or (B)(4).

~~FPN No. 1: See 300.5 for installation requirements for conductors rated 600 volts or less.~~

FPN No. 2: See 300.50 for installation requirements for conductors rated over 600 volts.

Substantiation: The Edison Electric Institute supports the Proposal Submitter's substantiation and the negative ballot comment by Mr. McClung. In addition, nonshielded cables have been used safely for decades especially where 4.16kV and 4.8kV applications are more prevalent.

The suggested revised text in this comment addresses Code-Making Panel No. 6's concern for meeting the NEC Style Manual regarding the use of the word "listed" and FPN No. 1 is technically associated with the first paragraph of 310.7.

Panel Meeting Action: Reject

Panel Statement: Limiting the voltage to 2.4 kV in the exception to 310.7 for nonshielded multiconductor cable was inadvertently overlooked during the 2005 Code cycle. The safety concerns of using nonshielded cable are the same for underground installations as for those aboveground.

6-34 Log #1236 NEC-P06 **Final Action: Accept in Principle**
(310.7 Exception)

TCC Action: The Technical Correlating Committee directs that the panel action on this comment be reported as "Accept in Principle" according to the panel action on Comment 5-6 on Proposal 5-18 and the term "grounding conductor" is changed to "grounding electrode conductor." The Technical Correlating Committee understands that the revision indicated in Comment 6-34 is to the second paragraph of 310.7, not to the Exception.
Submitter: Neil F. LaBrake, Jr., Syracuse, NY
Comment on Proposal No: 6-4
Recommendation: Revise 310.7 Exception as follows:
The metallic shield, sheath, or armor shall be connected to a grounding conductor, grounding busbar, or a grounding electrode ~~grounded through an effective grounding path meeting the requirements of 250.4(A)(5) or (B)(4).~~
Substantiation: The revised wording proposed in this comment attempts to address the concerns expressed by the Panel in their rejection of this part. The existing language is vague and does not describe how the grounding of the cable shield is to be done. The Bonding and Grounding Task Group concluded that it is necessary to replace vague references to "shall be grounded" with more prescriptive requirements. If the proposed wording does not meet the intent of this section, the Task Group encourages the Panel to develop alternative wording that provides a prescriptive requirement.
Note: the term "grounding conductor" will have to be replaced with "grounding electrode conductor" if Proposal 5-18 continues to be accepted.
This Comment was developed by a Task Group assigned by the NEC Technical Correlating Committee to address actions that were other than "accept" taken by Code-Making Panels on proposals from the TCC to resolve 2005 NEC Proposal 5-1 and Comment 5-1. Members of the Task Group on Grounding and Bonding for this Comment included: C. Douglas White; Michael Johnston; Jeffrey Boksiner; Daleep Mohla; Phil Simmons; Christopher Hutchings; James Carroll; Alan Rebeck; Richard Loyd; Paul Dobrowsky; and Neil F. LaBrake, Jr. The following is the minority affirmative comment by one Task Group member during the Task Group's results balloting:
"The term "grounding conductor" should be "grounding electrode conductor". The present definition for "grounding conductor" is vague and very similar to the definition of "grounding electrode conductor"."
Panel Meeting Action: Accept
Panel Statement: If proposal 5-18 continues to be accepted, then this comment is accepted in principle and "grounding conductor" is changed to "grounding electrode conductor."
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-35 Log #1820 NEC-P06 **Final Action: Reject**
(310.7 Exception)

Submitter: Michael Walls, American Chemistry Council
Comment on Proposal No: 6-24
Recommendation: Proposal 6-24 should have been rejected.

6-36 Log #38 NEC-P06 **Final Action: Accept**
(310.7 Exception No. 2 (New))

TCC Action: The Technical Correlating Committee directs that the text in the comment be rewritten to comply with 4.2 in the NEC Style Manual to read as follows:
"Exception No 2: Airfield lighting cable used in series circuits that are rated up to 5000 volts and are powered by regulators shall be permitted to be nonshielded.
FPN: Federal Aviation Administration (FAA) Advisory Circulars (ACs) provide additional practices and methods for airport lighting."
Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 6-25
Recommendation: The Technical Correlating Committee directs that the panel reconsider the proposal and act on its merits since the application discussed is not exempt under 90.2(B). This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Revise text in Proposal 6-25 to read:
Exception No 2: Airfield lighting cable used in series circuits that are rated up to 5000 volts and are powered by regulators shall be permitted to be nonshielded, provided the practices and methods used in airfield lighting are based on Federal Aviation Administration (FAA) Advisory Circulars (ACs).
Panel Statement: The panel concluded that the safety concerns for airfield lighting circuits justify the use of nonshielded cable as proposed.
See the panel action on Comment 6-27.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11
Comment on Affirmative:
LAIDLER, W.: I am voting to accept this comment. However, it is my opinion that for safety reasons shielded cable should be used on voltages that exceed 2.4kv in all locations and under all conditions. This being said, because of safety concerns brought up during the panel's discussion, relative to the uniqueness of airfield lighting installations, this exception is warranted.
WALL, C.: By accepting this comment the panel is admitting that nonshielded cables can be operated and worked safely up to 5000 volts. This is contrary to their panel statement for comment 6-12 where they stated that there were hazards that arose for such cables in all locations and under all conditions.

6-37 Log #1821 NEC-P06 **Final Action: Accept in Principle**
(310.8(D))

TCC Action: The Technical Correlating Committee has revised the text of the comment to comply with 3.3 of the NEC Style Manual to read as follows:
"(D) Locations Exposed to Direct Sunlight. Insulated conductors or cables used where exposed to the direct rays of the sun shall comply with (D)(1) or (D)(2).
(1) Cables shall be listed, or listed and marked, as being sunlight resistant.
(2) Cables shall be covered with insulating material, such as tape or sleeving that is listed, or listed and marked, as being sunlight resistant."
Submitter: Michael Walls, American Chemistry Council
Comment on Proposal No: 6-27
Recommendation: Proposal 6-27 should have been accepted as submitted.
(D) Locations Exposed to Direct Sunlight. Insulated conductors or cables used where exposed to direct rays of the sun shall comply with one of the following:
(1) Cables listed as being sunlight resistant.
(2) Conductors listed as being sunlight resistant.
(3) Covered with insulating material, such as tape or sleeving, that is listed as being sunlight resistant.
Substantiation: The panel seemed to misunderstand this proposal. All that is being proposed is to get rid of words that do not add anything to the meaning or intent of the Code. What is the possible benefit of wording such as "listed, or listed and marked"? Listed and marked can not exist unless the cable or conductors are listed, and there is not a requirement that the cable be marked - only listed. The National Electrical Code is confusing enough to read and understand without superfluous words.
Panel Meeting Action: Accept in Principle
Combine (1) and (2), and reword 310.8(D) to read:
"(D) Locations Exposed to Direct Sunlight. Insulated conductors or cables used where exposed to direct rays of the sun shall ~~comply with one of the following~~:
(1) ~~Cables~~ be listed, or listed and marked, as being sunlight resistant, or ~~(2) Conductors listed, or listed and marked, as being sunlight resistant~~
(2) ~~(3) Covered~~ Be covered with insulating material, such as tape or sleeving, that is listed, or listed and marked, as being sunlight resistant."
Panel Statement: This editorial consolidation of text does not change any of the existing requirements.
The terminology "listed, or listed and marked," is desired by the panel. Either of the two conditions can exist depending on the applicable product standard and, without the second condition being included, an inspector has no readily available way of knowing which condition applies. The panel statement on Proposal 6-27 correctly stated that: "Some standards require products to be marked "sunlight resistant" while others do not." For instance, an SE cable is required to be sunlight resistant without a marking, whereas a jacketed metal clad cable is not sunlight resistant unless so marked.
The panel action agrees with the negative vote on Proposal 6-27 to delete words that do not change the meaning.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-38 Log #1823 NEC-P06 **Final Action: Reject**
(310.10, FPN)

Submitter: Michael Walls, American Chemistry Council
Comment on Proposal No: 6-29
Recommendation: Proposal 6-29 should have been rejected.
Substantiation: A fine print note (FPN) referencing that there is a possibility that rooftop conduits may cause conductors to become warmer than ambient temperatures is appropriate in the NEC.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Proposal 6-51. FPN No. 2 is no longer needed because the concept has been incorporated in the 310.15(B)(2)(c) text.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 8 Negative: 3
Explanation of Negative:
HUDDLESTON, JR., R.: The Panel obviously bought into the study performed which showed that the air space inside of conduits run in close proximity to rooftops heats up in the sunshine. However, the de-rating factors in the original proposal which were accepted by the Panel fail to acknowledge that existing de-rating for ambient temperatures already takes into consideration heating of air space inside of conduits. This is amply evidenced by the fact that no data was presented to the Panel showing that failures were occurring in the field in rooftop conduits. The Panel discussed some anecdotal examples where they thought maybe they remembered a failure of a wiring system and now, in hindsight, it may have been caused by the air space inside of the conduit heating up in the sunshine - maybe. Is this the way major changes to the National Electrical Code are supposed to be made? It is this Panel member's opinion that changes must be made with deliberation and that legitimate technical substantiation of a real problem exists with the current NEC. The de-rating factors accepted by the Panel are way out of line with reality, and it is disappointing to see how the Panel made this decision.
The study this Proposal was based on was conducted using a limited range of conduit sizes and only included conductors inside the conduit. The study did not compare the effect of heating from various roof pitches or even different roof types or colors, and thus was woefully inadequate. Despite the limitations of the study, the rule was written to apply to all conduit sizes for both single conductors and multi-conductor cables. There was no testing to determine whether there was any evidence of deterioration of insulation or if an unsafe or detrimental condition existed. To be so broadly applied, this study should have been much more thorough, included evidence of insulation deterioration, and the results should be independently verified rather than assuming the results of one study are correct. Essentially, the Proposal changes the long established definition of ambient temperature without justification.
MCCLUNG, L.: Present wording in the Code is adequate to direct the qualified user to make appropriate adjustments to the ampacity for the temperature of its installation (for example, conduits on rooftops). Industrial users have been applying appropriate conductors safely and reliably for many years in these applications. No reputable field failure data was submitted to support the results of the experimental testing. The data submitted to the Panel covered one site specific application where it was recognized that the intense sunlight had immediate effect on the temperature rise in the conduit. Recognizing that the conductor temperance adders found in Table 310.15(B)(2)(c) are based on solar radiation of a single site tested condition, it is conceivable that impingement angle of the sun, roofing material and color, wind speed, atmosphere conditions, etc., will vary with location, thus directly affecting the ambient temperature and its associated ampacity. Additional site testing should be performed before making such a drastic change to the Code (i.e., a 60 A load that has normally been wired using a #6 AWG, 90 Deg C wire would require a #2 AWG, 90 Deg C wire). Such a drastic change would result in a mismatch of conductor and terminal sizing unless a reducer lug or splice is inserted at or prior to the termination.
WALL, C.: The FPN in the code is appropriate, much more so than the action taken on comment 6-54 and comment 6-45. Also see my reason for negative vote on comment 6-45.
Comment on Affirmative:
CLINE, S.: Many anecdotal substantiations were submitted. These do not meet an acceptable level of technical evidence. The testing data submitted with the base proposal was substantive and accepted.

6-39 Log #885 NEC-P06 **Final Action: Reject**
(310.10, FPN 2)

Submitter: David Wechsler, The Dow Chemical Company
Comment on Proposal No: 6-30
Recommendation: Retain the current FPN No. 2 and reject this and Proposal 6-51.
FPN No. 2: Conductors installed in conduit exposed to direct sunlight in close proximity to rooftops have been shown, under certain conditions, to experience a temperature rise of 17°C (30°F) above ambient temperature on which the ampacity is based.

Substantiation: This FPN provides a needed warning. The solution may not necessarily require a different electrical installation, but may be a different physical installation using, but not limited to a sun shield of some kind.

The data and test work that has been performed to support this proposal is an excellent example of good scientific project work. It clearly demonstrates that the sun can heat up objects and depending on the surroundings the heat buildup may be more than what might have been considered. While the details of the sun causing heat build up with an electrical conduit may not have been fully documented until now, many are familiar with heat buildups in such places as attics, crawl spaces, etc.

However, what seems to be is missing from the data findings are not the fact that the temperature within a conduit was recorded as rising, but what in fact happens at the terminations and with the temperature of the conductors. What adverse effect has been documented that would make the current practice unsafe? The sun has been around for a bit longer than this code language, but where is the data that demonstrates a real installation/safety problem? After all, implementing this proposal seems to result in a derating factor of almost 30 percent and it wuold be hoped that the committee has recognized that there was a major serious problem with this type of installation. In contacting more than a dozen electrical industrial contractors serving the Texas Gulf Coast area from Brownsville to Baytown, which does have some pretty hot summers, no one could cite any case where the hot temperatures had produced a faulty electrical installation. (i.e., they had no repair calls to replace wiring installations on roof installations).

Lastly, FPN No. 1 of this section indicates that derating must include more than just the temperature of the air. It states: "The principal determinants of operating temperature are as follows:

(1) Ambient temperature — ambient temperature may vary along the conductor length as well as from time to time.

(2) Heat generated internally in the conductor as the result of load current flow, including fundamental and harmonic currents.

(3) The rate at which generated heat dissipates into the ambient medium. Thermal insulation that covers or surrounds conductors affects the rate of heat dissipation.

(4) Adjacent load-carrying conductors — adjacent conductors have the dual effect of raising the ambient temperature and impeding heat dissipation."

The complete information needed to support the proposed change seems lacking.

For these reasons, this proposal and Proposal 6-51 should have been rejected.

See comment made on 6-51.

2-272 Log #39 NEC-P02 **Final Action: Accept**
(310.12, FPN (New))

Submitter: Technical Correlating Committee on National Electrical Code

Comment on Proposal No: 6-33

Recommendation: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 2 for Action. This action will be considered by Code-Making Panel 2 as a public comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

The panel accepts the direction of the Technical Correlating Committe and Rejects Proposal 6-33.

Panel Statement: See the panel action and statement on Comment 2-14.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

KING, D.: See my explanation of negative on Comment 2-14.

6-41 Log #284 NEC-P06 **Final Action: Accept in Principle**
(310.13)

Submitter: Code-Making Panel 5,

Comment on Proposal No: 6-7

Recommendation: Accept the proposal wording as revised. Equipment grounding conductors shall be permitted to be sectioned within a listed multi-conductor cable provided the combined circular mil area in each cable ~~area~~ complies with 250.122.

Substantiation: CMP-5 supports the revised text developed by CMP-6 and the action taken on this proposal to Accept in Principle in Part. CMP-5 supports CMP-6's recognition that listed multiconductor cables with sectioned equipment grounding conductors are permitted where the combined circular mil area complies with 250.122. CMP-5 also supports CMP-6's actions to not accept the submitter's proposed text where the paralleling of MC cables was proposed. For clarity purposes, CMP-5 notes that the 1/0/AWG sizing requirement in 310.4 does not apply to equipment grounding conductors; where phase conductors are run in parallel, a full size equipment grounding conductor sized per 250.122 must be installed in each raceway or cable.

This comment has been balloted through CMP-5 with the following ballot results:

15 Eligible to Vote

14 Affirmative

1 Not Returned (W. Helfrich)

Mr. D. Mohla voted affirmatively stating: "Change the word "recognition" in line 2 of the CMP-5 statement to "acceptance".

Delete the second sentence in the CMP-5 statement starting from CMP-5 also supports CMP-6's action...MC cables was proposed". There is no reference or mention of MC cable or paralleling of MC Cable either in the proposal or CMP-6 action."

Mr. D. Brender voted affirmatively stating: "Affirm Panel 5 action to accept, but revise the proposed additional paragraph to 310.13 to read: "Equipment grounding conductors shall be permitted to be sectioned within a listed multi-conductor cable or flexible cord provided the conductor sections are identical and the combined circular mil area of the sections are not smaller than required by complies with 250.122."

Substantiation: Sectioned equipment grounding conductors are often used in flexible cords as well as in metal-clad cables. This section needs to provide for that use. The section needs to require that where the equipment grounding conductor is sectioned, all sections are identical so any ground-fault current will be carried equally by each section. The last proposed language addition is intended to be an editorial improvement."

Panel Meeting Action: Accept in Principle

The panel action on Proposal 6-7 relocated the revised requirement into 310.13, which addresses the construction of a Type MC cable. See the panel action on Comments 6-2 and 6-3.

Panel Statement: The panel action on Proposal 6-7 relocated the revised requirement to 310.13, which addresses the construction of a Type MC cable. See the panel actions and statements on Comments 6-2 and 6-3.

Ballot Results: Affirmative: 11

6-42 Log #2110 NEC-P06 **Final Action: Accept**
(Table 310.13)

Submitter: Joe Zimnoch, The Okonite Company
Comment on Proposal No: 6-63
Recommendation: Change title of Table 310.13 to read:
Conductor Applications and Insulations Rated 600 Volts
Substantiation: Currently, 310.13 and Table 310.13 do not show a voltage rating.
Panel Meeting Action: Accept
Panel Statement: The panel understands that the comment is on Proposal 6-40a, rather than 6-63, and the requested change in title applies only to Table 310.13(A) and not 310.13, which includes conductors rated higher than 600 V. The word "Rated" was added in the panel action on Proposal 6-40a.
The panel agrees that Table 310.13(A) only includes conductors rated 600 V and does not include conductors rated less than 600 V and the revised title is consistent with the titles of the other 310.13 Tables.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-43 Log #676 NEC-P06 **Final Action: Accept in Principle**
(310.13, 310.6 Exception, 310.10, 310.15, Tables 310.16-310.20, Tables 310.67 through 310.86)

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 6-40a
Recommendation: The Proposal should be Accepted in Principle with the following changes in the titles of the following tables:
Correct the title of Table 310.13(C) (formerly Table 310.62) from "Thickness of Insulation for 601- to 2000-Volt Nonshielded Types RHH and RHW" to "Thickness of Insulation for Nonshielded Types RHH and RHW Solid Dielectric Insulated Conductors Rated 2000 Volts.
Correct the title of Table 310.13(D) (formerly Table 310.63) from "Table 310.13(D) Thickness of Insulated Conductors Rated 2400 Volts and Jacket for Nonshielded Solid Dielectric Insulation" to "Table 310.13(D) Thickness of Insulation and Jacket for Nonshielded Solid Dielectric Insulated Conductors Rated 2400 Volts"
Substantiation: Revising the titles will provide consistent wording between Tables 310.13(C), 310.13(D), and 310.13(E).
Revising the title of Table 310.13(D) will also more accurately convey the information provided in the table. The present title "Thickness of Insulated Conductor" implies that it includes both the conductor and the insulation, which is not correct. The revised title correctly states that the table provides the thickness of the insulation and jacket.
Panel Meeting Action: Accept in Principle
In addition to accepting the comment, the panel reverses the table numbers and location of Tables 310.13(B) and 310.13(C).
In 328.100, revise Table 310.13(B) to Table 310.13(C).
In 310.10 FPN, revise Table 310.13(B) to Table 310.13(C).
In 310.15(B)(1) revise Table 310.13(C) to Table 310.13(B).
In Tables 310.67 through 310.86, revise Table 310.13(B) to Table 310.13(C) in the first line of each Table.
In 336.104, revise Table 310.13(C) to Table 310.13(B).
In 396.10(B)(1), revise Table 310.13(C) to Table 310.13(B).
Panel Statement: The revisions made in this comment are editorial only.
Reversing Tables 310.13(B) and (C) provides a more logical sequence of increasing voltage.
The other revisions in the panel action provide correlation with the panel action on this comment.
NFPA staff should make the following editorial correlations and refer the panel action to the appropriate panels for information:
Code-Making Panel 5 – 300.3(A) – no change required.
Code-Making Panel 7: 320.104 and 322.112 refer to Table 310.13(A) – no change required.
328.100 – revise Table 310.13(B) to Table 310.13(C).
330.112(A) and (B), 334.112, 340.112 – no change required.
336.104 – revise Table 310.13(C) to Table 310.13(B).
396.10(B) – revise Table 310.13(C) to Table 310.13(B).
Code-Making Panel 12:
610.13 – no change required.
Note to Table 610.14(A) – revise Table 310.13 to Table 310.13(A).
Code-Making Panel 15 – 520.42, FPN – no change required.
Code-Making Panel 19 – 552.10(B)(2) and 675.4(A) – no change required.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-44 Log #471 NEC-P06 **Final Action: Reject**
(310.15(4)(a))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 6-44
Recommendation: Accept proposal.
Substantiation: A common neutral may carry current the same as individual neutrals but only unbalanced currents. The proposal would clarify that the provision of 310.15(B)(4)(a) apply to the neutral of more than the circuit of that section.
Panel Meeting Action: Reject
Panel Statement: The submitter is not clear on what neutrals or what type of circuits within his substantiation he wants the panel to address. It is possible for the common neutral to be a current-carrying conductor as in 310.15(B)(4)(b) and 310.15(B)(4)(c).

Ballot Results: Affirmative: 11

6-45 Log #1070 NEC-P06 **Final Action: Accept in Principle**
(310.15(B)(2)(1))

TCC Action: The Technical Correlating Committee directs that the FPN be identified as "FPN to Table 310.15(B)(2)(c)" and located immediately following Table 310.15(B)(2)(c).
The Technical Correlating Committee directs that the second sentence of the FPN be deleted as it can be interpreted as a requirement.
Submitter: David Shapiro, Safety First Electrical Contracting Consulting & Safety Education
Comment on Proposal No: 6-51
Recommendation: Accept the new text as revised by the CMP, but add the following Fine Print Note, in accordance with Mr. Kent's comment:
The numbers on which the recommendations are based are the result of averaging; those wishing to avoid all risk of damaging overheating of conductor insulation will take into account the most-extreme sustained temperatures in their localities.
Substantiation: Maximum temperatures obtained from reliable sources such as the National Oceanographic and Atmospheric Administration (USNOAA) are not instantaneous temperatures, but rather temperatures sustained long enough to potentially cause irreversible changes to conductor insulation, according to CDA experts I consulted. A local USNOAA expert warned, moreover, that the maximum temperatures they record are increasing. I agree that the submitter was not seeking full protection, but my understanding is that this was a matter of real politik, just trying to get something passed.
Panel Meeting Action: Accept in Principle
Add FPN immediately before the Table to read "FPN: The temperature adders in Table 310.15(B)(2)(c) are based on the results of averaging the ambient temperatures. The highest sustained ambient temperature in the location should be considered to minimize the risk of damage to the insulation by overheating."
Panel Statement: The addition of the FPN responds to the Comments on Affirmative votes on Proposal 6-51 by G. Kent and W. Laidler and was revised for clarity. This action as written provides what the submitter has requested, and is placed where appropriate.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 8 Negative: 3
Explanation of Negative:
HUDDLESTON, JR., R.: See My Explanation of Negative on Comment 6-38.
MCCLUNG, L.: See My Explanation of Negative on Comment 6-38.
WALL, C.: Documented evidence of actual failures of conductors installed on rooftops in the field was not provided. Only a non-peer reviewed study was provided by those that will potentially benefit from this change.
The study, "Effect of Rooftop Exposure on Ambient Temperatures Inside Conduits", states that "Failure is defined as exceeding the temperature rating of a given cable….", and quotes NEC section 310.10 as the reference. This is incorrect. NEC section 310.10 FPN No.1 states: "The temperature rating of a conductor (see Tables 310.13 and 310.61) is the maximum temperature, at any location along its length, that the conductor can withstand over a prolonged time period without serious degradation." It is the long term exceeding of the conductor temperature rating that causes degradation of the insulation and ultimate failure. The study did not provide information about the time period that the temperatures in the conduits were sustained; therefore, the study rushed to a conclusion that the conductors would fail when the conductor temperature rating was exceeded. Neither did the study make observations of the condition of the insulation of the conductors in the conduits to determine whether failure had occurred. Temperature ratings of conductors are determined utilizing the appropriate UL standards such as UL 1581. Following the requirements of UL 1581, a 90°C conductor temperature rating would be determined in part by checking insulation elongation after heating samples of the conductor to 102% of its rating for intervals of 90, 120 and 150 days. By deduction, a conductor

can exceed its temperature rating for prolonged periods of time. Additionally, UL 83 requires that a 90°C conductor undergo a heat shock test by heating to 120°C for one hour and being observed for cracks; the implication being that exceeding the temperature rating for short periods of time does not cause failure.

The study informs the reader that temperatures in RNC were higher than those in EMT. If that is the case, should RNC even be permitted on rooftops, or should there be different adjustment factors for RNC? Additionally, the study found that light colored roofs cause higher temperatures in conduits, but the conclusion makes no provision for this.

After reviewing the study one has to question the statistical validity of the study. It would be refreshing to see the cable manufacturers conduct a legitimate study in cooperation with the conduit manufacturers and a nationally recognized testing laboratory.

Under the proposed de-rating methodology, conductors rated 75°C at an ambient of 30°C, run across a roof with ½" of clearance must be de-rated to 33 percent of Table 310.16 ampacity. Such a change is unwarranted and puts an unnecessary burden on the end use customer.

HUDDLESTON, JR., R.: See My Explanation of Negative on Comment 6-38.

6-48 Log #573 NEC-P06 **Final Action: Reject**
(310.15(B)(2)(c))

Submitter: William M. Lewis, Martinsville, IN
Comment on Proposal No: 6-51
Recommendation: Proposal 6-51 should have been Rejected.
Substantiation: The issue raised in the proposal has not created a problem of failure of conductors installed on rooftops. If there are no failures based on years and years of operations, why penalize users by making installations more costly and difficult to design and install? I was involved in maintenance and installation of conductors on rooftops for over 30 years and witnessed no problems. Also, if the rule does stay, it is very inexact as to how it is to be applied. How many hours per day exposed or shaded? What time of day is the exposure? There are a myriad of other questions that would impact how to apply the rule.
Panel Meeting Action: Reject
Panel Statement: Correction for ambient temperature has always been required but guidance for determining the ambient temperature for use in applying the ampacity correction factors was never provided. The Panel Action on Proposal 6-51 provided a technical basis for establishing the ambient temperature in one specific type of installation that could be used for ampacity correction.

The proposal and the data provided with it show that there is an elevated exposure to heat when conductors are installed in a raceway in close proximity to a roof. This increase in temperature is exacerbated by the normal condition of the installed conductors when carrying current. This new language is nothing more than an improvement on the existing requirements.

310.10 requires that the maximum temperature of any conductor not be exceeded. Under Article 100, definition of Ampacity, "The current, in Amperes, that a conductor can carry continuously under the conditions of use without exceeding its temperature rating", is not dependent on time.

6-49 Log #617 NEC-P06 **Final Action: Reject**
(310.15(B)(2)(c))

Submitter: Ken Garr, Bruce Township, MI
Comment on Proposal No: 6-51
Recommendation: Delete the proposed new text and table.
Substantiation: This is a major proposed change - backed up with one study. The study does seem to have been carefully done. But, it is hard to avoid the question: for such a big change, with so much practical field experience, is there any known history of failures?

When one agrees with a code proposal, one says, "Of course." On the other hand, a common response to a proposal that one disagrees with is, "Where are the statistics to back this up?" In this case, we do have some statistics, but it seems like a very big change to make on the basis of one study.

6-50 Log #753 NEC-P06 **Final Action: Accept in Principle**
(310.15(B)(2)(c) (New))

Submitter: Thomas Thierheimer, Britain Electric Co.
Comment on Proposal No: 6-51
Recommendation: I support the concept of the proposal, however, there are many variables such as geographic location, altitude, color of roof, slope of roof, wind speed, etc., that all have an influence on the cooling or heating of the conduit due to external conditions. The process does not need to be complicated.

I suggest that the design process be simplified because there can be many variations in the roof selection due to the general contractor and the roofing contractor. Most of the variations will not, typically, be known or communicated to the electrical designer at the time the electrical design is completed.

I recommend that (as a more practical/simpler approach) the designer choose the maximum ambient temperature for the location of the project and add 30°F or 17°C to the maximum ambient temperature to arrive at the ambient temperature to be used in the NEC tables.

Example:

Maximum ambient temperature in Houston Texas (as selected by designer)=105°F. Conduit is routed across a roof that may be exposed to direct sunlight.

Add 30°F to this ambient for a 135°F "Effective Ambient Temperature".

Ambient Correction Factor (Table 310.16)=.71 for 90°C Wire Insulation,

Using a #8 AWG THHN/THWN 90°C Copper wire, in dry conditions (not underground) (3 current carrying conductors),

The wire ampacity is 55 Amperes (Table Ampacity) X.71 = 39 Amperes (see note below)

If there were more than 3 current carrying conductors in the conduit, the ampacity would then require an additional adjustment according to Table

310.15(B)(2)(a).
Substantiation: This was suggested by 310.10 FPN No. 2 (2005 NEC). This should be an adequate adjustment considering all of the possible variables and the possible enforcement problems related to the many variables that can occur regarding a roof design and conduit installations above the roof.
Panel Meeting Action: Accept in Principle
See Panel Actions and Statements on 6-45, 6-48, and 6-54.
Panel Statement: The Panel agrees that the average ambient temperature is more appropriate to use for ambient temperature corrections rather than the maximum ambient temperature. See Panel Actions and Statements on 6-45, 6-48
, and 6-54. Also, see sample average ambient temperatures provided in Comment 6-54.

6-51 Log #799 NEC-P06 **Final Action: Reject**
(310.15(B)(2)(c))

Submitter: Richard E. Loyd, Sun Lakes, AZ
Comment on Proposal No: 6-51
Recommendation: Revise to read as follows:
(c) Conduits and Cables Exposed to Sunlight on Rooftops. Where conduits or open runs of cable are exposed to sunlight on or above rooftops,...(remainder of section unchanged.)
Substantiation: If conductors and cables in conduit require the proposed temperature adjustments, then the adjustments should also apply to open runs of cable. It is not necessary to have text relative to conductors or cables in conduit - that is the purpose of the condition CDA (Copper Development Assn.) presented a seminar on the testing and results in Philadelphia at the Eastern Section of the IAEI meeting September 30, 2006. The presenter was asked if they tested MC cable and if so how did it perform in comparison to conduit. The response was Yes and he then proceeded to show a chart comparing Type MC cable with the raceways and pointed out to the audience the chart showed conductors in MC cable temperature was slightly high than the conductors in Raceways.
Panel Meeting Action: Reject
Panel Statement: The test data submitted with Proposal 6-51 only contained test results obtained with conduit exposed to sunlight on rooftops and no supporting data has been submitted on multiconductor cables in similar installations to determine whether the adjustment will be the same, more, or less than for conduit.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-52 Log #884 NEC-P06 **Final Action: Reject**
(310.15(B)(2)(c))

Submitter: David Wechsler, The Dow Chemical Company
Comment on Proposal No: 6-51
Recommendation: Reject this and Proposal 6-30.
Substantiation: The data and test work that has been performed to support this proposal is an excellent example of good scientific project work. It clearly demonstrates that the sun can heat up objects and depending on the surroundings the heat buildup may be more than what might have been considered. While the details of the sun causing heat build up with an electrical conduit may not have been fully documented until now, many are familiar with heat buildups in such places as attics, crawl spaces, etc.
However, what seems to be is missing from the data findings are not the fact that the temperature within a conduit was recorded as rising, but what in fact happens at the terminations and with the temperature of the conductors. What adverse effect has been documented that would make the current practice unsafe? The sun has been around for a bit longer than this code language, but where is the data that demonstrates a real installation/safety problem? After all, implementing this proposal seems to result in a derating factor of almost 30 percent and it would be hoped that the committee has recognized that there was a major serious problem with this type of installation. In contacting more than a dozen electrical industrial contractors serving the Texas Gulf Coast area from Brownsville to Baytown, which does have some pretty hot summers, no one could cite any case where the hot temperatures had produced a faulty electrical installation. (i.e., they had no repair calls to replace wiring installations on roof installations).
Lastly, FPN No. 1 of 310.10 indicates that derating must include more than just the temperature of the air. It states: “The principle determinants of operating temperature are as follows:
(1) Ambient temperature — ambient temperature may vary along the conductor length as well as from time to time.
(2) Heat generated internally in the conductor as the result of load current flow, including fundamental and harmonic currents.
(3) The rate at which generated heat dissipates into the ambient medium. Thermal insulation that covers or surrounds conductors affects the rate of heat dissipation.
(4) Adjacent load-carrying conductors — adjacent conductors have the dual effect of raising the ambient temperature and impeding heat dissipation.”
The complete information needed to support the proposed change seems lacking.
For these reasons, this proposal and Proposal 6-30 should have been rejected.
See comment made on 6-30.
Panel Meeting Action: Reject
Panel Statement: Proposal 6-51 only addresses ambient temperature. The concerns addressed in the test report refer to the increased ambient temperature and did not demonstrate any resulting effect on terminations.
Actual field testing shows that there is a standard and calculable heating effect from the sun on conductors installed in conduits on rooftops. 310.15 requires correction for the effects of heating when these effects are known.
Correction for ambient temperature has always been required but guidance for determining the ambient temperature for use in applying the ampacity correction factors was never provided. The Panel Action on Proposal 6-51 provided a technical basis for establishing the ambient temperature in one specific type of installation that could be used for ampacity correction.

6-53 Log #1233 NEC-P06 **Final Action: Reject**
(310.15(B)(2)(c))

Submitter: Joseph Dodds, P.E., Trafford, PA
Comment on Proposal No: 6-51
Recommendation: Proposal should be Rejected.
Substantiation: The test data and substantiation submitted for this proposal are accurate and valid for the conditions tested; however, this proposal to derate the conduit exposed to sunlight on or above rooftops should be rejected. The proposal is assumed to apply for all conduit applications and is being used to make a general derating of conduit using only one set of test conditions. This assumption applying one test to all applications can be misleading. For example, the test results with a black or white roof will vary, but the restraints will apply regardless of roof color. The color and texture of the conduit external surface will also affect the temperature rise.
Many years ago electric utilities faced a similar problem for rating the temperature rise of various power conductors and connections in numerous application environments, both indoor and outdoor. The problem was resolved by using a universally accepted temperature rise test for the conductor. The temperature rise that occurs from the current passing through the conductor or conductors will be the same regardless of the ambient temperature. The Δ T (Temperature Rise) is then added to maximum ambient in the intended application to make sure that the material thermal limitations are not exceeded. This method will be acceptable in any application and will not disqualify a conductor where one set of conditions was used to set thermal limits for an infinite number of application conditions.
A standard temperature rise test for conductors should be established so that the user can make a determination of conduit performance in the unique application conditions by use of conductor temperature rise data. The details of the temperature rise tests should be developed with input from interested parties.
Panel Meeting Action: Reject
Panel Statement: Proposal 6-51 only addresses ambient temperature. The temperature adders in Table 310.15(B)(2)(c) were the result of averaging and did include testing on different color roofs since the Code has no control over the color of the roof. See Panel Statement on Comment 6-48.

6-54 Log #1250 NEC-P06 **Final Action: Accept in Principle (310.15(B)(2)(c))**

Submitter: Travis Lindsey, Travis Lindsey Consulting Services
Comment on Proposal No: 6-51
Recommendation: I support the panel action of Accept in Principle.
Substantiation: Actual field testing shows that there is a standard and calculable heating effect from the sun on conductors installed in conduits on rooftops. 310.15 requires correction for the effects of heating when these effects are known. Differential temperatures proved to be much higher than expected. When damage occurs to conductors, and equipment corrections are made, the cause of the cable damage is not necessarily known and, therefore, not reported.

The research project was created as a grass roots approach to gathering information. In planning the research, tests and results were laid out to be simple and meaningful. Within practical constraints, tests were designed to closely replicate ordinary construction methods, using common materials in an effort to establish similar operational characteristics typical in construction today.

The application of the temperature adders in Table 310.15(B)(2)(c) can be minimized by locating the raceway 3 1/2 in. to 12 in. above the roof; or completely eliminated by locating the raceway 36 in. above the roof or installing the raceway in shade.

There are other Code limitations that mitigate the effect of the ambient temperature adder. In applying the temperature limitations of 110.14(C) for equipment terminations, almost all 90°C insulated conductors can only be applied at 75°C, which is approximately an 11 percent reduction in allowable ampacity. Since derating is applied to the 90°C ampacities, the ambient temperature adder has no effect on the allowable ampacity until the ambient temperature exceeds 40°C (104°F).

The overcurrent protection limitation in 240.2 further reduces the impact of the ambient temperature correction on allowable ampacity of 14, 12 and 10 AWG conductors.

Some average outdoor ambient temperatures for selected cities during the period of June to August are shown below. These temperatures are based on ASHRAE Handbook of Fundamentals 2 percent design temperatures and are measured in the shade, not in the sun.

City	°F	City	°F
Birmingham, AL	94.0	St. Louis, MO	94.4
Phoenix, AZ	109.5	Las Vegas, NV	107.4
Bakersfield, CA	102.7	Newark, NJ	92.1
Los Angeles, CA	78.6	Albany, NY	87.3
Long Beach, CA	86.9	Islip, NY	87.3
Palm Springs, CA	110.8	Akron/Canton, OH	87.1
Wilmington, DE	90.5	Providence, RI	88.3
Atlanta, GA	92.3	Knoxville, TN	91.4
Chicago, IL	90.6	Houston, TX	96.0
Baltimore, MD	92.5	Charleston, WV	89.7
Boston, MA	89.6		

Some examples of the effect on conductor ampacity when the temperature adders for conductors in raceways in direct sunlight on rooftops are applied are shown below.

Example #1:
3/C 12 AWG THHW-2 in 1/2 in. RNC or EMT installed with the bottom of the RNC or EMT 1/2 in. or less above the rooftop (most severe condition)
Table 310.16 90°C ampacity = 30 amps @ ambient temperature of 30°C
Temperature adder from Table 310.15(B)(2)(c) for raceway location = 33°C
Adjusted ambient temperature = 63°C (30°C + 33°C)
Table 310.16 Correction Factor for 63°C ambient, 90°C conductor = 0.58
Adjusted ampacity (30 amps × 0.58) = 17 amps
240.2 overcurrent protection limitation = 20 amps
Since the adjusted ampacity is 17 amps, the standard fuse or circuit breaker rating would be 20 amps [see 240.2(B)].

Example #2:
3/C 500 kcmil THHW-2 in 2 1/2 in. RNC or EMT (NEC Table C.1) installed with the bottom of the RNC or EMT 3 1/2 in. to 12 in. above the rooftop.
Table 310.16 90°C ampacity = 430 amps @ ambient temperature of 30°C
Temperature adder from Table 310.15(B)(2)(c) for raceway location = 17°C
Adjusted ambient temperature = 47°C (30°C + 17°C)
Table 310.16 Correction Factor for 47°C ambient, 90°C conductor = 0.82
Adjusted ampacity (430 amps × 0.82) = 353 amps
Comparison: Table 310.16 75°C ampacity = 380 amps @ ambient temperature of 30°C

Panel Meeting Action: Accept in Principle
Insert a new FPN immediately following (c) to read: "FPN No. 1: One source for the average ambient temperatures in various locations is the ASHRAE Handbook – Fundamentals."

Panel Statement: The FPN was added to provide a reference on where the temperatures might be obtained and responds to the Comment on Affirmative vote by W. Laidler.
See panel action and statement on Comment 6-45 that added a FPN, which now should be identified as FPN No. 2.

6-55 Log #1826 NEC-P06 **Final Action: Reject (310.15(B)(2)(c))**

Submitter: Michael Walls, American Chemistry Council
Comment on Proposal No: 6-51
Recommendation: Proposal 6-51 should have been rejected.

The implications to users of conduit /wire systems of this proposal are onerous. A derating to 33% of Table 310-16 ampacity for conductors run in conduits across roofs is completely unwarranted and verges on the ridiculous. Exactly what is the problem that we are tying to fix here? In the experience of ACC member companies, there has not been a single documented failure of conductors run in conduits across roofs that could be attributed to overheating. Existing derating according to ambient temperatures more than compensates for ampacity adjustments needed.

Industrial users of the NEC will be affected in installations to rooftop blowers and HVAC units, as well as other rooftop-mounted devices. **This proposal does not address any real problem** - only one that was perceived and dreamed up by those who would benefit from the use of larger copper for installations.

Here is an example of how this proposal, if accepted, would affect installations:

A current installation consists of a rooftop ventilation fan, mounted on top of an industrial building. Roof construction is flat roof, graveled. Conduit runs approximately 200' from an electric room up through the building, and then passes 25' directly on the graveled roof. Size of the fan motor is 30 HP, with full-load amperes being 40 AMPS. 4 - #8 AWG THHW conductors are currently installed in a ¾" Rigid Metal Conduit (RMC) system, with liquid-tight flexible metallic conduit used between the motor junction box and the conduit. All of this meets the 2005 NEC.

Under the rules of this proposal, the temperature adjustment for the conductors would be 33 degrees C (60 degrees F). It is assumed that the ambient temperature is 78 - 86 degrees F (26 - 30 degrees C); thus, no temperature correction would normally be needed. However, a 33 degree C correction would make the new temperature for ampacity considerations 30 + 33 = 63 degrees C. Type THHW insulation would thus have an ampacity of 0.33 times that shown in Table 310.16, according to the correction factor table at the bottom of 310.16.

The ampacity needed to provide power for the motor is 1.25 x 40 = 50 amperes. To find the conductor size using the temperature correction required by this proposal, it is necessary to divide 50 by 0.33, which yields 151.5 amperes. Using Type THHW conductors, Table 310.16 requires the size to be 1/0 THHW (which is good for 150 amperes).

Referring back to Table C.8 in the 2005 NEC, a 2" Rigid Metal Conduit will be required to install the 4 - 1/0 conductors.

Current 2005 NEC: #8 AWG Conductors - ¾" conduit
Using This Proposal: 1/0 Conductors - 2" conduit

An actual cost comparison was made between these installations using REAL numbers. This estimate was performed by our construction contractor estimator.

¾" Conduit - 4 #8 AWG THHW Conductors:

Material: $459.46
Labor: $2033.20
Total: $2492.66

2" Conduit - 4 1/0 THHW Conductors:

Material: $1747.60
Labor: $2948.40
Total: $4696.00

Difference of $2203.34, or an 88% INCREASE IN INSTALLED COST.
Of course, a 2" conduit will not terminate in a 30 HP motor junction box, so a larger box would need to be constructed in order to accommodate the conduit size.

Does it really make sense to expect owners of companies to pay this much more to fix a problem that obviously does not really exist in the first place?
Substantiation: The implications to users of conduit /wire systems of this proposal are onerous. A derating to 33% of Table 310-16 ampacity for conductors run in conduits across roofs is completely unwarranted and verges on the ridiculous. Exactly what is the problem that we are tying to fix here? In the experience of ACC member companies, there has not been a single documented failure of conductors run in conduits across roofs that could be attributed to overheating. Does it really make sense to expect owners of companies to pay this much more to fix a problem that obviously does not really exist in the first place?
Panel Meeting Action: Reject
Panel Statement: 310.15(B)(2)(c) does not mandate that the conduit be placed directly on the roof. In fact, Table 310.15(B)(2)(c) provides the user with conditions of installation to minimize the effect on conduits exposed to sunlight on rooftops. This requirement is only applicable for the conduit on the rooftop exposed to the sunlight. Because of this, it is possible the user could change wire and conduit at the transition to a different ambient.

6-56 Log #1840 NEC-P06 **Final Action: Reject**
(310.15(B)(2)(c))

Submitter: Mike Holt, Mike Holt Enterprises, Inc.
Comment on Proposal No: 6-51
Recommendation: Reject the Proposal.
Substantiation: Mr. McClung's statements should be reconsidered by the panel at large. Are there any documented cases of this being an issue? The panel should not accept anecdotal substantiations and should instead value the track record of existing installations.

As written in the proponent's substantiation, there are already existing NEC rules that govern conductors installed in high ambient temperatures. This is one location where Article 310 should continue to use a performance based requiremet (310.10) as opposed to a prescriptive one (proposed).
Panel Meeting Action: Reject
Panel Statement: As stated by the submitter there are already high ambient temperature adjustments required by the NEC. Correction for ambient temperature has always been required but guidance for determining the ambient temperature for use in applying the ampacity correction factors has not been provided. The Panel Action on Proposal 6-51 provided a technical basis for establishing the ambient temperature in one specific type of installation that could be used for ampacity correction and the Panel Actions on Comments 6-45 and 6-54 provide additional clarification on the average ambient temperature to be used.

6-57 Log #2211 NEC-P06 **Final Action: Reject**
(310.15(B)(2)(c))

Submitter: William A. Wolfe, Steel Tube Institute of North America
Comment on Proposal No: 6-51
Recommendation: If the Panel continues to accept this proposal, revise the text to read as follows:
(c) Conduit and Cables Exposed to Sunlight on Rooftops. Where open runs of cables or conductors or cables ~~are~~ installed in conduits are exposed to direct sunlight on or above rooftops, the adjustments shown in Table 310-15(B)(2)(c) shall be added to the outdoor temperature to determine the applicable ambient temperature for application of the correction factors in Tables 310.16 and 310.18.
Table 310.15(B)(2)(c) Ambient Temperature Adjustment for Conduits and Cables Exposed to Sunlight On or Above Rooftops.
Substantiation: Based on presentations by the submitter of this proposal at IAEI Section meetings this Fall, it is our understanding that in addition to conduit, some cables were tested as exposed runs and showed a need for derating. This data was not included, however, in the study that was submitted as substantiation for Proposal 6-51. Since there are other types of products that may be installed on rooftops, the panel should review test results for those products as well to determine the derating necessary. If this cannot be determined in this code cycle, this proposal should be held for further study. For years there has been no requirement for derating conductors in conduits on rooftops and no field problems have been shown to exist. Delaying consideration of this proposal until this study of all products is complete will not be detrimental.
Panel Meeting Action: Reject

Comment on Proposal No: 6-49
Recommendation: Text should remain as originally submitted.
Substantiation: Please indicate what testing the Panel is referring to that takes into account the light loads encountered in a dwelling.
Panel Meeting Action: Reject
Panel Statement: The information came from the Copper Development Association and was available for public comment in the 2005 Code cycle.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Abstain: 1
Explanation of Abstention:
HUDDLESTON, JR., R.: This Code Panel member believes that it is rather flippant for the Panel to disregard the submitter's request for documentation for evidence, as reported in the Panel Statement made after the Proposal was submitted to allow an exception for de-rating in a dwelling unit. If the Panel wishes to base its decisions on evidence, than that evidence should be available to the public and to those who submit Proposals and Comments to the Panel. If the evidence does not exist or is faulty, then the Panel should reconsider its actions. However, simply stating that the evidence was available 3 years ago is not the kind of response that a Panel member should provide. This Panel hopes that the submitter was not unduly insulted by this answer.

6-60 Log #343 NEC-P06 **Final Action: Reject**
(310.15(B)(2)(c))

Submitter: Joel Nelms, R & J Electric LLC
Comment on Proposal No: 6-51
Recommendation: Proposal 6-51 should have been rejected.
Substantiation: The implications to users of conduit/wire systems of this proposal are oppressive. A derating to 33 percent of Table 310.16 ampacity for conductors run in conduits across roofs is completely unwarranted and is just a ploy to generate revenue for manufacturers. In the 32 years of industrial experience that I personally have, I have not known of a single documented failure of conductors run in conduits across roofs that could be attributed to overheating. Existing derating according to ambient temperatures more than compensates for ampacity adjustments needed.
This proposal does not address any real problem - only one that was perceived and dreamed up by those who would benefit from the use of larger copper for installations. Maybe if the Code Panel committees were made up of fewer representatives from manufacturers and more representation from people who actually worked in the electrical field, the Code would serve the purpose for which it was intended.

(310.15(B)(6))

Submitter: David Shapiro, Safety First Electrical Contracting Consulting & Safety Education
Comment on Proposal No: 6-61
Recommendation: Replace "...lighting and appliance branch circuit panelboard..." with "branch circuit distribution panelboard."
Substantiation: The term, "...lighting and appliance branch circuit panelboard..." has been eliminated for 2008, and the proposed substitution uses commonly understood language.
Panel Meeting Action: Accept in Principle
See the panel action and statement on Comment 6-63.
Panel Statement: See the panel actions and statements on Comment 6-63.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-63 Log #1915 NEC-P06 **Final Action: Accept**
(310.15(B)(6))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 6-61
Recommendation: Revise the second sentence to read: "For application of this section, the main power feeder shall be the feeder between the main disconnect and the ~~lighting and appliance branch circuit~~ panelboard that supplies, either by branch circuits, or by feeders, or both, all loads that are part or associated with the dwelling unit."
Substantiation: The submitter wishes to express his sincere appreciation to CMP 6 for their panel statement. It is a perfectly worded statement of intent, one that the submitter has been pursuing for the last six cycles or so. This comment attempts to make the text of the rule convey the objectives of the statement. The wording clarifies that the dwelling could have a subpanel, as long as it is fed from the main panel so that the load diversity of the subpanel loads is included within the load profile of the main feeder. The comment wording also includes associated loads, as would be the case where there was a detached garage. Finally, the comment deletes the terminology "lighting and appliance branch-circuit" because CMP 9 is removing this from Article 408 (Proposal 9-117).
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-64 Log #1170 NEC-P06 **Final Action: Reject**
(Table 310.63)

Submitter: Neil F. LaBrake, Jr., National Grid / Rep. Edison Electric Insitute-Electric Light & Power Group
Comment on Proposal No: 6-68
Recommendation: Accept Proposal 6-68.
Substantiation: Accepting this proposal will correlate with Edison Electric Institute's companion comments on Proposals 6-15 and 6-19.
Code-Making Panel 6 lacks consideration to the fact that nonshielded cables have been used safely for decades. The Edison Electric Institute supports efforts to bring this change about. It may be more acceptable to CMP-6 to allow use up to 5,000 volts rather than 8,000 volts as 4.16kV and 4.8kV applications are more prevalent.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms the panel action and statement on Proposal 6-68.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 8 Negative: 3
Explanation of Negative:
HUDDLESTON, JR., R.: See My Explanation of Negative on Comment 6-6.
MCCLUNG, L.: The Panel Statement in Comments; 6-10, 6-11, 6-12, 6-13, 6-14, 6-15, 6-16, 6-17, 6-18, 6-19, 6-20, 6-21, 6-22, 6-23, 6-24, 6-25, and 6-26; "The potential hazard that arises by using non-shielded cable above 2.4 kV exists in all locations in all conditions whether maintained by qualified or unqualified personnel. This includes conduit and metal-clad cable installations"; is erroneous, misleading and a distortion of the facts. In no way does it justify deletion of the usage of non-shielded 5 kV from the Code. 5 kV

non-shielded cable used above 2.4 kV (i.e., 3.3 kV, 4.16 kV, etc.), properly specified with the correct insulation wall thicknesses and a non tracking type jacket with or without an overall metallic sheath or armor, properly installed and terminated by a qualified individual, is equally as safe as medium voltage shielded cable.
As one of the "user" representatives, IEEE needs to identify the necessity for major industrial/commercial entities to continue to have available the 5 kV non-shielded cables for wiring medium voltage motors and other medium voltage equipment where equipment manufacturer's (NEMA members) traditionally have not included adequate space for shielded cable terminations. (NOTE: This usage applies to both installed and new equipment).
Rather than penalizing the user of this type of cable, the Panel should work with the users to establish the necessary rules to assure proper application similar to that which the Technical Correlating Committee recommended for the 5000 volt non-shielded cable for airfield series lighting when installed in accordance with the FAA Advisory Circulars (ACs).

ARTICLE 312 — CABINETS, CUTOUT BOXES, AND METER SOCKET ENCLOSURES

9-5 Log #1073 NEC-P09 **Final Action: Accept**
(312.4)

TCC Action: The Technical Correlating Committee directs that the text following the revised section title be changed to correlate with the new title as follows:
"312.4 Repairing Noncombustible Surfaces. Plaster, drywall, or plasterboard Noncombustible surfaces...".
Submitter: David Shapiro, Safety First Electrical Contracting Consulting & Safety Education
Comment on Proposal No: 9-10
Recommendation: Revise text to read as follows:
Repairing ~~Plaster and Drywall and Plasterboard~~ Noncombustible Surfaces.
Substantiation: I agree with Mr. Holt that all surfaces warrant repair, for reasons of workmanship. I agree with the CMP that inspectors can cite 110.12 to reject unusually shoddy workmanship, so long as the shoddiness is not merely a matter of appearance, in which case such citation would be inconsistent with 90.1(A). Rather, the element of workmanship involved is to close the wall. Almost any barrier will impede the spread of fire a bit, according to a firestopping expert's presentation to our IAEI chapter. A cover plate manufacturer warned me explicitly, though, that because a cover plate does not sit flat against a wall and box, but usually touches only at the lines where the wall meets the plate's edges, the entire space under a cover plate is part of the enclosure. This would include any opening in wood paneling, for example. Hence, it is not accurate to say that openings in combustible surfaces do not present the same problem as other surfaces merely because enclosure installed in such surfaces must be brought flush.
However, for a start, let's at least add cement, tile, Durock, and similar walls, the first having been mentioned by the Panel's Statement. Firewalls are less effective when breached. While "repair" is not the same as true restoration, it must be better than leaving gaps.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

9-6 Log #1074 NEC-P09 **Final Action: Reject**
(312.4)

Submitter: David Shapiro, Safety First Electrical Contracting Consulting & Safety Education
Comment on Proposal No: 9-10
Recommendation: Accept as proposed by Mr. Holt.
Substantiation: I agree with Mr. Holt that all surfaces warrant repair, for reasons of workmanship. I agree with the CMP that inspectors can cite 110.12 to reject unusually shoddy workmanship, so long as the shoddiness is not merely a matter of appearance, in which case such citation would be inconsistent with 90.1(A). Rather, the element of workmanship involved is to close the wall. Almost any barrier will impede the spread of fire a bit, according to a firestopping expert's presentation to our IAEI chapter. A cover plate manufacturer warned me explicitly, though, that because a cover plate does not sit flat against a wall and box, but usually touches only at the lines where the wall meets the plate's edges, the entire space under a cover plate is part of the enclosure. This would include any opening in wood paneling, for example. Hence, it is not accurate to say that openings in combustible surfaces do not present the same problem as other surfaces merely because enclosure installed in such surfaces must be brought flush.
Panel Meeting Action: Reject
Panel Statement: CMP 9 understands that a cover does not necessarily completely seal an electrical enclosure in ordinary locations. It does not follow, however, that there is a safety issue if some gap remains. The present requirements are sufficient. Fire separation ratings, for example, assume a 1/8-inch gap around the perimeter of an enclosure. There has been no test data or loss experience presented to demonstrate the existence of a problem.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

9-7 Log #1241 NEC-P09 **Final Action: Reject**
(312.4)

Submitter: Joseph A. Brinley, Lewisburg, WV
Comment on Proposal No: 9-10
Recommendation: Revise text to read as follows:
Repairing ~~Plaster and Drywall or Plasterboard~~ Surfaces ~~Plaster, drywall, or plasterboard~~ Surfaces that are broken or incomplete shall be repaired so there

will be no gaps or open spaces greater than 3 mm (1/8 in.) at the edge of the cabinet or cutout box employing a flush-type cover.
Substantiation: Recommend that this proposal should be reconsidered to be accepted. This would be a sound installation practice seeing that not all installations are in drywall or plasterboard no matter if the installation requires a fire rating or not. This proposal should be revisited during the comment stage for consideration to accept.
Panel Meeting Action: Reject
Panel Statement: There is not necessarily a safety issue if some gap remains, particularly where the box extends to the surface as in combustible finishes. The present requirements are sufficient. There has been no test data or loss experience presented to demonstrate the existence of a problem.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

9-8 Log #2339 NEC-P09 **Final Action: Reject**
(312.5 Exception)

Submitter: James MAldonado, City of Tempe, Arizona
Comment on Proposal No: 9-12
Recommendation: I recommend that this panel reconsider the action taken in the ROP process and accept this proposal.
Substantiation: The methods proposed in this proposal has been successfully tested for over thirty years in the most sever weather conditions in the country. The panels themselves are not even listed for our ambient temperature, but the method proposed has worked successfully with no reported failures or fires if installed in the manner proposed. If this method were submitted to an NRTL for evaluation, it would not be subjected to the ambient temperatures our tests have put them through, neither would the test last for 30 years of real life experience. In the panels statement for rejecting this proposal it was stated that "The use of short fittings as described is a potential hazard because an arc in the panel may no longer be contained by the enclosure." A typical two screw NM cable connector has more open space on the sides of the cable than will be present in the proposed installation. The proposal also addresses the sealing of those openings in item (d) of this proposal. There is no danger of conductors being pulled out of the panels. This method also allows for a weather tight seal at the penetration of the connector through a stucco system or any other wall surface. The code allows for a cable connector to be attached to the back of panels and this type of installation has allowed for water entry into the enclosure when water runs behind the back of a surface mounted panel that is properly installed, with the required stand off from the wall surface.
Panel Meeting Action: Reject
Panel Statement: CMP 9 reaffirms the panel action and statement on Proposal 9-12 and asserts that the safest installation is one that adheres to the requirements of the NEC. In regards the statement about the entry of water through a cable connector, products covered by this article and installed in wet or damp locations must adhere to 312.2.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

ARTICLE 314 — OUTLET, DEVICE, PULL, AND JUNCTION BOXES; CONDUIT BODIES; FITTINGS; AND MANHOLES

9-9 Log #1484 NEC-P09 **Final Action: Accept in Principle in Part**
(314.4)

Submitter: Robert A. McCullough, Ocean County Construction Inspection Department
Comment on Proposal No: 9-18
Recommendation: Rewrite section as follows:
314.4 Grounding and Bonding. Except as permitted in 250.112(1), the following shall be grounded and bonded in accordance with Parts I, IV, V, VI, VII, and X of Article 250 as applicable to where the equipment is located in the electrical system.
1. Metal Boxes.
2. Metal conduit bodies.
3. Metal fittings.
4. Metal covers, plates, and canopies.
5. Exposed metal surface extensions.
6. Other metal enclosures and exposed conductive surfaces.
FPN: For additional grounding and bonding requirements, see 410.42(A) for metal luminaire canopies, and 404.12 and 406.5(B) for metal faceplates.
Substantiation: Each of the list items has its own section and grounding/bonding requirements throughout Article 314. It seems to make more sense to have a generic requirement for grounding and bonding as applicable in one place. The language the panel accepted from the Technical Correlating Committee only references Part VI of Article 250 for equipment grounding but, as the panel pointed out in rejecting a similar change to 314.30, several of these items may in fact enclose or contain service conductors so the connection to an EGC would not be correct. This proposed language guides the user to the appropriate part in Article 250 based on what type of circuit or conductors are used. The FPN uses the current language from 314.25. Companion comments are being submitted to delete the specific grounding/bonding language from 314.22, 314.25(A), 314.28(C), and 314.30(D). I don't believe these would introduce new material as the groundwork has been set by virtue of other related proposals in concept in Proposal 9-8.
Panel Meeting Action: Accept in Principle in Part
Accept the revision in principle to 314.4 up to and including the word applicable. Reject all other recommended revisions. This should read as follows:
314.4 Metal Boxes. Metal boxes shall be grounded and bonded in accordance with Parts I, IV, V, VI, VII, and X of Article 250 as applicable, except as permitted in 250.112(I).
Panel Statement: The Panel accepts the concept of specifying the parts of Article 250 to which the rule should apply. This change brings the section into compliance with the Style Manual. The additional language of bonding was added to include those parts referenced that are applicable. While the Panel recognizes the streamlining feature of locating of all of the grounding and bonding requirements in one place, it believes that it negatively affects the usability of the code.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

9-10 Log #1237 NEC-P09 **Final Action: Accept**
(314.4 and 314.30(D))

TCC Action: The Technical Correlating Committee understands that the panel action on this comment modifies 314.30(D) only and 314.4 is as modified by the panel action on Comment 9-9.
Submitter: Neil F. LaBrake, Jr., Syracuse, NY
Comment on Proposal No: 9-18
Recommendation: Revise the actions taken by CMP-9's as described in the Panel Meeting Action on Proposal 9-18 as follows:
1) Accept the Panel action on 314.4.
2) Revise the last sentence of 314.30(D) of the 2005 NEC to read as follows:
Covers. Metal covers and other exposed conductive surfaces shall be bonded in accordance with 250.92(A) ~~250.96(A)~~ if the conductors in the handhole are service conductors or in accordance with 250.96(A) if the conductors in the handhole are feeder or branch-circuit conductors.
Substantiation: Changes are proposed in 314.30(D) to identify the appropriate rules in Article 250 that apply to bonding metal handhole covers depending upon whether the conductors in the handhole are service conductors or are feeder or branch circuit conductors. The purpose is to connect all exposed conductive surfaces together for electrical continuity as required in 250.92(A) and 250.96(A) as applicable.
This Comment was developed by a Task Group assigned by the NEC Technical Correlating Committee to address actions that were other than "accept" taken by Code-Making Panels on proposals from the TCC to resolve 2005 NEC Proposal 5-1 and Comment 5-1. Members of the Task Group on Grounding and Bonding for this Comment included: C. Douglas White; Michael Johnston; Jeffrey Boksiner; Daleep Mohla; Phil Simmons; Christopher Hutchings; James Carroll; Alan Rebeck; Richard Loyd; Paul Dobrowsky; and Neil F. LaBrake, Jr.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

9-11 Log #423 NEC-P09 **Final Action: Accept in Principle**
(314.6(C)(2))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 9-34
Recommendation: Accept proposal.
Substantiation: The proposal relates cross-sectional area to the conduit body hub rather than the largest conduit or tubing to which it is attached. And the panel statement indicates the area is based on the largest hub. A cross sectional area based on the largest conduit or tubing to which it is attached does not take into account a 2 in. conduit body with reducers to accept a 1/2 in. conduit. Attached raceways are not always the same size as the hub.
Panel Meeting Action: Accept in Principle
Replace "it is" with "they can be" to read as:
In 314.16(C)(1) revise as: "Conduit bodies enclosing 6 AWG conductors or smaller, other than short-radius conduit bodies as described in 314.5, shall have a cross-sectional area not less than twice the cross-sectional area of the largest conduit or tubing to which they can be attached. The maximum number of conductors permitted shall be the maximum number permitted by Table 1 of Chapter 9 for the conduit or tubing to which it is attached."
Panel Statement: This is not meant to change the field applicability of conduit body designs, or preclude the use of oversized conduit bodies. The Panel is only modifying the first sentence of the existing code language.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:
BREITKREUTZ, B.: This comment should be rejected because the existing code language is clear without the proposed change.

9-12 Log #963 NEC-P09 **Final Action: Accept**
(314.16)

Submitter: Mark C. Ode, Underwriters Laboratories Inc.
Comment on Proposal No: 9-26
Recommendation: Revise as follows:

314.16 Number of Conductors in Outlet, Device, and Junction Boxes, and Conduit Bodies. Boxes and conduit bodies, shall be of sufficient size to provide free space for all enclosed conductors. In no case shall the volume of the box, as calculated in 314.16(A), be less than the fill calculation as calculated in 314.16(B). The minimum volume for conduit bodies shall be as calculated in 314.16(C). The provisions of this section shall not apply to terminal housings supplied with motors or generators.

FPN: For volume requirements of motor or generator terminal housings, see 430.12.

Boxes and conduit bodies enclosing conductors 4 AWG or larger shall also comply with the provisions of 314.28.

Substantiation: Added the existing last line in 2005 text that was inadvertently left off in the proposed action.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

9-13 Log #1239 NEC-P09 **Final Action: Reject**
(314.16(B)(1))

Submitter: Rhett Roe, JATC #26 IBEW/NECA
Comment on Proposal No: 9-29
Recommendation: Revise text to read as follows:

314.16(B)(1) Conductor Fill. Each conductor that originates outside the box and terminates or spliced within the box shall be counted once, and each conductor that passes through the box without splice or termination shall be counted once. Each loop or coil ~~A looped,~~ of unbroken conductor ~~not less than twice the minimum length~~ required for free conductor in 300.14 shall be counted twice. The conductor fill shall be calculated using Table 314.16(B). A conductor, no part of which leaves the box, shall ~~not~~ be counted once.

Substantiation: Comment for the affirmative. Without a conductor length the Code section has no merit or substance.
Panel Meeting Action: Reject
Panel Statement: The removal of the reference to the length would make the requirement subjective and therefore difficult to enforce. In addition there was no substantiation given to support the change in the requirement for the conductors that do not leave the box. The Code provides very specific length provisions in 300.14. In addition, the comment would require pigtail jumpers to devices to be counted in wire fill, which would be a major change without substantiation. The action on Proposal 9-29 stands.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

9-14 Log #58 NEC-P09 **Final Action: Accept**
(314.16(B)(4))

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 9-31
Recommendation: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal by replacing text that is vague and unclear, such as "precludes" and "judges". This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
See panel action on Comment 9-16.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

9-15 Log #962 NEC-P09 **Final Action: Reject**
(314.16(B)(4))

Submitter: Mark C. Ode, Underwriters Laboratories Inc.
Comment on Proposal No: 9-31
Recommendation: Revise as follows:

314.16 Number of Conductors in Outlet, Device, and Junction Boxes, and Conduit Bodies.

(B) Box Fill Calculations

(4) Device or Equipment Fill. For each yoke or strap containing one or more devices or equipment, a double volume allowance in accordance with Table 314.16(B) shall be made for each yoke or strap based on the largest conductor connected to a device(s) or equipment supported by that yoke or strap. ~~A device or utilization equipment of a width that precludes mounting in single 50 mm (2 in.) device box as described in Table 314.16(A) shall be judged on the basis of the minimum number of gangs required for this purpose.~~

Substantiation: The proposed added text does not give the user of the Code a method of determining the number of gangs required for the installation, it just states that the size of box should be **judged???** On the number of gangs required for the purpose. The text as written is not usable and certainly not enforceable and thus should be removed. Who judges the basis of the number of gangs and on what basis is this judged???
Panel Meeting Action: Reject
Panel Statement: CMP 9 believes the concept in the proposal is valid and has changed the text to meet the objections raised in this comment and also by the TCC. Refer to the action on Comment 9-16.

(314.19)

Submitter: Timothy P. McNeive, Thomas & Betts Corporation
Comment on Proposal No: 9-52
Recommendation: Reject the Panel's action and replace with the following:

314.16(B)(4) Device or Equipment Fill. For each yoke or strap containing one or more devices or equipment, a double volume allowance in accordance with Table 314.16(B) shall be made for each yoke or strap based on the largest conductor connected to the device(s) or equipment supported by that yolk or strap. Devices or equipment greater than 131 cm3 (8 in.3), shall have their volume identified and shall be calculated at 100 percent of their full volume.

314.19 Boxes Enclosing Flush Devices and Other Utilization Equipment. Boxes, including their optional accessories that provide for additional volume capacity, used to enclose flush devices and all or part of other utilization equipment or its live parts, shall be of such a design that the devices and utilization equipment or its live parts will be completely enclosed on the back and sides and substantial support for the devices and equipment will be provided. Screws for supporting the box shall not be used in attachment of the device or equipment contained therein.

Substantiation: I respect the extensive effort of the task group convened by CMP 9. However, I feel that the resulting proposal goes far beyond the scope of addressing the 2005 NEC proposal 9-34 and the subsequent comment 9-62. This 2008 proposal introduces prescriptive restrictions on specific box designs where legitimate, Code compliant applications still exist. The present requirements in 314.16 and 314.19 have served electrical safety for many years as is acknowledged in the proposal's substantiation. The concern introduced by Mr. Hagerty in 2005 NEC proposal 9-34 is valid. Although CMP 9 rejected the original proposal and the comment (9-62), clearly the new proposal to the 2008 NEC, and the panel's action, now reflects a change in the panel's position.

The panel statements in rejecting proposal 9-34 and comment 9-62 during the 2005 cycle, correctly places the responsibility on the equipment manufacturer to instruct the installer as to the minimum box volume and box depth to be used. Of course, this can be accomplished by a box alone or with a box and available accessories such as box extenders, raised covers, etc. So care needs to be taken not to place all of the burden on the box alone. The commenter in 9-62 correctly states that the information provided by the manufacturer must be driven by requirements in the NEC. The original proposal in 9-34 attempts to implement requirements in the NEC that will lead to appropriate installation of such equipment.

My comment focuses on minor amendment of the original proposal in 9-34 and appropriate amendment of 314.19, which I believe fully addresses the safety concern and permits the good code language in 314.16 and 314.19 to continue to serve our safety needs, as it has for so many years. The "standard"

box sizes in NEC Table 314.16(A), and many additional boxes, with and without accessories that provide for increasing the volume of a box, are available to serve virtually all applications. The box volume calculations in 314.16 are well known and have been utilized for many years to provide the necessary level of safety in our electrical systems. Additional pre calculations and resulting prescriptions suggested in the current proposal are unnecessary and I believe, go beyond the scope of the NEC.

Panel Meeting Action: Reject

Panel Statement: The problem cited in Proposal #34 and Comment #62 of the 2005 code cycle was that of insufficient box depth not insufficient box volume as suggested in this comment. CMP-9 has appropriately addressed the problem with Proposal 9-52. The acceptance of this comment would also result in additional marking requirements by device manufacturers. As noted in the substantiation to proposal 9-52, it was the objective of the task group not to introduce additional product markings. See Panel action and statement on Comment 9-20.

Ballot Results: Affirmative: 11

9-18 Log #1564 NEC-P09 **Final Action: Reject**
(314.22)

Submitter: Robert A. McCullough, Ocean County Construction Inspection Department

Comment on Proposal No: 9-45

Recommendation: Rewrite panel's version of the section as follows:

314.22 Surface Extensions. Surface extensions shall be made by mounting and mechanically securing an extension ring over the box. ~~Equipment grounding shall be in accordance with Part VI of Article 250.~~

Exception: A surface extension shall be permitted to be made from the cover of a box where the cover is designed so it is unlikely to fall off or be removed if its securing means becomes loose. The wiring method shall be flexible for a length sufficient to permit removal of the cover and provide access to the box interior, and arranged so that any grounding and bonding continuity is independent of the connection between the box and cover.

Substantiation: This is a companion comment to one submitted for 314.4 to establish one generic requirement for grounding and bonding as applicable. I don't believe this would introduce new material as the groundwork has been set by virtue of other related proposals in concept in Proposal 9-18.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Comment 9-9.

Number Eligible to Vote: 11

9-19 Log #867 NEC-P09 **Final Action: Reject**
(314.22 Exception)

TCC Action: The Technical Correlating Committee understands that this comment applies to Proposal 16-47 rather than Proposal 9-45.

Submitter: John P. Masarick, Independent Electrical Contractors Inc.

Comment on Proposal No: 9-45

Recommendation: The panel is encouraged to continue to Accept in Principle Proposal 16-45 and continue to Reject the addition of the FPN.

Substantiation: The reasons to continue to Accept in Principle the Proposal and Reject the addition of the FPN are as follows:

1. The trend by the CMPs over the last several code cycles has been to limit the use of FPNs.
2. There is also a correlation issue. There is a conflict between those panels that accepted the proposal and those that rejected the proposal.
3. These standards are also covered by a Fine Print Note in 110.12.
4. The FPN should not be accepted because numerous standards and installation manuals exist and to only mention one does not adequately inform the public about accepted industry practices. The NEC is not intended to be an instruction manual for untrained persons. If the FPNs are allowed to reference these standards, then they should list all applicable standards.
5. Since the referenced installation standards are intentionally general to cover different models of equipment, approval of the FPN may lead many to believe these standards can be used instead of listed or labeled manufacturer's instructions which would be in violation of 110.3(B).
6. If the CMP would like to include the reference, it should be placed in the Annex with the other references.

Panel Meeting A
ction: Reject

Panel Statement: The recommendation deals with Proposal 16-45, which deals with a section not under the purview of Panel 9. The proposal (9-45) is not related to the recommendation or the substantiation contained in comment 9-19. Panel 9 believes that this should have been referred to Panel 16. Panel 9 expresses no opinion on the technical content of this comment.

9-20 Log #1414 NEC-P09 **Final Action: Accept in Principle**
(314.24)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Comment on Proposal No: 9-52

Recommendation: The panel action on Proposal 9-52 should have been Accept in Principle in Part. NEMA recommends revision the text of Proposal 9-52 as follows:

314.24 Minimum Depth of Boxes for Outlets, Devices and Utilization Equipment~~, Outlet and device boxes shall have sufficient depth to allow equipment installed within them to be mounted properly and without likelihood of damage to conductors within the box.~~

(A) Outlet Boxes Without Enclosed Devices or Utilization Equipment.

(1) No box shall have an internal depth of less than 12.7 mm (1/2 in.)

(B) Outlet and Device Boxes With Enclosed Devices.

(1) Boxes intended to enclose ~~flush~~ devices shall have an internal depth of not less than 23.8 mm (15/16 in.)

~~(A)~~(C) ~~or~~ Utilization Equipment. Outlet and device boxes that enclose ~~devices or~~ utilization equipment shall have a minimum internal depth that accommodates the rearward projection of the equipment and the size of the conductors that supply the equipment. The internal depth shall include, where used, that of any extension boxes, plaster rings, or raised covers, the internal depth shall comply with all applicable provisions of (1) through (5),

(1) Large Equipment. Boxes that enclose ~~devices or~~ utilization equipment that projects more than 48 mm (1 7/8 in.), rearward from the mounting plane of the box shall have a depth that is not less than the depth of the equipment plus 6 mm (1/4 in.).

(2) Conductors Larger Than 4 AWG. Boxes that enclose ~~devices or~~ utilization equipment supplied by conductors larger than 4 AWG shall be identified for their specific function.

(3) Conductors 8, 6, or 4 AWG. Boxes that enclose equipment supplied by 8, 6, or 4 AWG conductors shall have an internal depth that is not less than 52.4 mm (2 1/16 in.)

(4) Conductors 12 or 10 AWG. Boxes that enclose utilization equipment supplied by 12 or 10 AWG conductors shall have an internal depth that is not less than 30.2 mm (1 3/16 in.). Where the equipment projects rearward from the mounting plane of the box by more than 25 mm (1 in.), the box shall have a depth not less than that of the equipment plus 6 mm (1/4 in.).

(5) Conductors 14 AWG and Smaller. Boxes that enclose utilization equipment supplied by 14 AWG or smaller conductors shall have a depth that is not less than 23.8 mm (15/16 in.).

Exception to (1) through (5): Utilization equipment that is listed to be installed with specified boxes shall be permitted.

~~(B) Outlet Boxes Without Enclosed Devices or Utilization Equipment. Outlet boxes that do not enclose devices or utilization equipment shall have a minimum internal depth of 12. mm (1/2 in.).~~

Substantiation: The title of the Section should be changed to "Minimum Depth of Boxes" to accurately reflect the subject of the paragraph. The current wording in 314.24 "No box shall have an internal depth of less than 12.7 mm (1/2 in.) was reformatted to be paragraph (A). The current wording in 314.24 "Boxes intended to enclose flush devices shall have an internal depth of not less than 23.8 mm (15/16 in.)" was reformatted to be paragraph (B). Then the proposal text dealing with utilization equipment was added as a paragraph (C). All references to devices were removed from paragraph (C).

The task group did an excellent job addressing the problem presented in Public Comment 9-62 on Proposal 9-34 in the 2005 NEC cycle by adding minimum depth box requirements for enclosed utilization equipment. However, the rewrite of the section would have affected the requirements for standard devices. The proposals and subsequent comments did not cite problems with requirements for standard devices. Therefore, there is no reason to change the requirements for these products.

Panel Meeting Action: Accept in Principle

Accept the Comment as written with the following five modifications:

1. Retain the parent rule in 314.24 revised as follows: "Outlet and device boxes shall have sufficient depth to allow equipment installed within them to be mounted properly and with sufficient clearance to prevent damage to conductors within the box."
2. In (A), delete "(1)" so the rule ("No box shall have …) is a sentence following the subsection title.
3. In (B), delete "(1)" so the rule ("Boxes intended to enclose …)" is a sentence following the subsection title.
4. In (B), retain the word "flush".
5. In (C)(3), insert the word "utilization" before the word "equipment".

Panel Statement: CMP 9 agrees with the revised conceptual approach in the comment, but does not want to lose all control over the potential for devices being installed in shallow boxes in a manner that will damage conductors.

The second and third changes are editorial and prevent orphaned, single-topic subsections. The fourth change retains a provision in the 2005 NEC. No technical substantiation has been presented to remove this word. The fifth change provides parallel construction with the other numbered paragraphs, and corrects what appears to have been an inadvertent omission.

Recommendation: Reject proposal.
Substantiation: The explanations of Negative Votes by panel members is valid. Code rules should not be based on speculation of what might be.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 8 Negative: 3
Explanation of Negative:
BELISLE, R.: The panel should have given the topic further consideration. In no case, would the additional proposed language create a hazard. In each and every case, it would certainly be a safer installation. There was much discussion about "what if's" and "conspiracies", yet no consideration to what is currently happening in the industry.
RUPP, B.: See my explanation of negative vote on Comment 9-28.
SZENDRE, M.: While I believe the original Proposal 9-60 was too broad and needed modifying, I believe we need to provide for supporting a fan in locations in residences where the probability is high for one being installed in the future.

9-23 Log #812 NEC-P09 **Final Action: Reject**
(314.27(D))

Submitter: Mike Weitzel, Richardson, TX
Comment on Proposal No: 9-60
Recommendation: Continue to Accept the Proposal, and revise as follows:
(D) Boxes at Ceiling-Suspended (Paddle) Fan Outlets. Outlet boxes or outlet box systems used as the sole support of a ceiling-suspended (paddle) fan shall be listed, shall be marked by their manufacturer as suitable for the purpose, and shall not support ceiling-suspended (paddle) fans that weight more than 32 kg (70 lb). For outlet boxes or outlet box systems designed to support ceiling-suspended (paddle) fans that weight more than 16 kg (32 lb), the required marking shall include the maximum weight to be supported.
"In dwelling unit occupancies," where two or more separately switched, ungrounded conductors are provided to a ceiling mounted outlet box, the outlet box or outlet box system shall be listed for sole support of a ceiling-suspended (paddle) fan.
Substantiation: I support the proposal, but recommend that text be added to clarify the issue and meet the submitter's intent that the new language be limited to dwelling unit occupancies only. As proposed by the submitter, the new requirement would unnecessarily apply to all occupancies in all conditions. Its scope of applicability should be limited to dwelling units.
Panel Meeting Action: Reject
Panel Statement: CMP 9 has reconsidered the overall merits of this proposal, and decided to reject it based on the reasoning presented in Comments 9-22, 9-25, 9-27, 9-28, 9-30, and 9-31.

(314.27(D))

Submitter: Rod Belisle, NECA-IBEW Electrical Training Center
Comment on Proposal No: 9-60
Recommendation: Accept in principle with the following change:
Add: In Installations employing a cable wiring method, before the proposed new text.
Complete paragraph to read:
In Installations employing a cable wiring method, Where two or more separately switched, ungrounded conductors are provided to a ceiling mounted outlet box, the outlet box or outlet box system shall be listed for sole support of a ceiling-suspended (paddle) fan.
Substantiation: The panel is trying to resolve a longstanding problem which exists in the residential community that creates a hazard to future inhabitants. The problem lies in the fact that builders are requesting electrical contractors to prewire for ceiling-suspended paddle fans, but not willing to install the completed installation, i.e., a Fan rated box or assembly. As written, this proposal would extend its effect to all electrical installations, which was not the intent of the submitter.
Panel Meeting Action: Reject
Panel Statement: CMP 9 has reconsidered the overall merits of this proposal, and decided to reject it based on the reasoning presented in Comments 9-22, 9-25, 9-27, 9-28, 9-30, and 9-31.

9-26 Log #942 NEC-P09 **Final Action: Reject**
(314.27(D))

Submitter: Robert G. Fahey, City of Evansville
Comment on Proposal No: 9-60
Recommendation: Revise text to read as follows:
(D) Boxes at Ceiling-Suspended (Paddle) Fan Outlets. Outlet boxes or outlet box systems used as the sole support of a ceiling-suspended (paddle) fan shall be listed, shall be marked by their manufacturer as suitable for this purpose, and shall not support ceiling-suspended (paddle) fans that weight more than 32 kg (70 lb). For outlet boxes or outlet box systems designed to support ceiling suspended (paddle) fans that weight more than 16 kg (35 lb), the required marking shall include the maximum weight to be support. ~~Where two or more separately switched, ungrounded conductors are provided to a ceiling mounted outlet box, the outlet box or outlet box system shall be listed for sole support of a ceiling suspended (paddle) fan.~~ In a dwelling unit, a ceiling outlet box installed for use as a lighting fixture outlet in a habitable room, such as a bedroom, living room, dining room, recreation room or kitchen and located where a ceiling fan could be installed shall be a type listed for ceiling fan support.
Substantiation: The proposed wording will not solve the problem with people installing ceiling fans on ceiling outlet boxes in dwelling units where the boxes are not designed for the ceiling fans. There are many ceiling fans with remote controls in which a second ungrounded conductor is not needed to make the

ceiling fan and light operate separately. The State of Wisconsin has required for the last few Code cycles a listed, ceiling fan box to be installed in all habitable rooms, including the kitchen in dwelling units. The proposed wording I have added is from the State of Wisconsin Electrical Code. This wording has worked in Wisconsin for assuring the safe installation of a future ceiling fan in these areas where it is likely the homeowner will be installing the ceiling fan. The proposed revised wording would also specify this would only apply to dwelling units, this rule would not apply to commercial or industrial buildings.

Panel Meeting Action: Reject

Panel Statement: The Comment introduces text that is unenforceable and does not comply with the Style Manual (e.g., the use of "could" and "such as"). The Panel has addressed this subject for multiple code cycles and has consistently determined that the requirement for fan boxes in ceiling outlets for the support of luminaries in all or most habitable rooms is excessive.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

9-27 Log #1045 NEC-P09 **Final Action: Accept**
(314.27(D))

Submitter: Gilbert L. Thompson, MEIA Codes and Standards

Comment on Proposal No: 9-60

Recommendation: The Panel should reconsider their action and delete the new language for part (D) and reject the proposal not accept it. The inspector's association agrees with the negative comments of Mr. Hartwell, Mr. LeMay and especially Mr. McCullough that the proposal should be rejected. The submitter has not provided any data to support such a drastic change. It also appears that this seems to be an industry recommendation for their own special interests.

Substantiation: For safety's sake, UL is already requiring warning labels and instructions on how to install paddle fans. To require that every ceiling box that's installed so it accommodates fans could cause expenses and wiring problems. As an example: some foyers, hallways, clothes closets, bathrooms and soffits (the ceiling types) contain two switch legs - one for the light, some for fans, outside lights, sconce lights, multiple control of fixtures, etc. and will never have paddle fans attached as there is not enough room or the boxes were installed for special fixtures. To take away a person's choice and dictate as to how they wire, goes against good reasoning. The present wording in this section takes safety and consideration while allowing flexibility in the wiring design.

9-28 Log #1210 NEC-P09 **Final Action: Accept**
(314.27(D))

Submitter: James W. Carpenter, International Association of Electrical Inspectors

Comment on Proposal No: 9-60

Recommendation: The Proposal should be Rejected.

Substantiation: Electrical inspectors should not be put in the position of enforcing requirements motivated by an assumption of future actions on the part of an owner. There was no fact-finding work to support the proposal, only a very questionable assertion of a likely outcome. UL 507 requires clearly visible markings on the outside of the carton for ceiling-suspended (paddle) fans as well as statements in the installation instructions regarding proper support for these fans.

The scenario presented in the proposal therefore amounts to a subterfuge. If the new owners are aware that they will be installing paddle fans on substandard boxes, then it is a conspiracy and the NEC cannot be written in such a way as to preclude such effects. If the new owners are not aware of the rules, and if the builders tell them that a fan with conventional mounting arrangements is an option, then such owners are the victims of a fraud. Listed fan boxes present such little marginal cost in comparison to the significant risk to those who would perpetrate such a practice that the likelihood of this practice being widespread seems remote. Although wiring such ceiling boxes for future fan use is noted from time to time, the usual condition is to supply fan boxes in those cases. Furthermore there are other legitimate reasons for running multiple switched conductors to ceiling boxes.

Many chandeliers are wired with one set of lamps controlled independently from the remaining lamps. Many ceilings are wired with multi-circuit lighting track for which such switching arrangements are required. An additional switched conductor may be run to an overhead outlet box because the electrician knows that although the wall will not be accessible after construction, the ceiling will be (as in an unfinished attic) and there will be an additional light provided for accent lighting. Some wiring layouts, even at the time of the rough inspection, have an additional switched conductor entering a ceiling box and then extended to a switched receptacle or second lighting outlet in the same room.

In addition, fan boxes are not and never have been the only acceptable method of hanging a paddle fan. They are only required when the box is the sole support of the fan. One major paddle fan manufacturer is now producing an enormous volume of paddle fans (sold through major home supply channels) that come complete with installation directions that do not recognize fan box support, and that instead call for direct support of the fan bracket using long screws that extend through the standard mounting hole pattern of steel boxes and into framing above the box.

The proposal applies to any ceiling outlet box, even one too close to a wall to be used for a paddle fan, and even one in a commercial or industrial occupancy for which no conceivable paddle fan use would be likely. In addition, there are many applications for which no fan box is now and ever would be likely available. For example, there are no plaster rings now listed for fan support, because of the obvious difficulties involved in attempting to cover all possible combinations in a testing laboratory. The inspection community should never be forced to routinely apply 90.4 (which requires special permission) for all these legitimate applications, both residential and nonresidential.

The proposal violates the fundamental principles of the scope of the NEC in 90.1. A ceiling outlet box wired as described in the proposal is entirely safe until and unless a paddle fan is mounted in such a way that the box is the sole support of the fan. And 90.1(B) clearly tells us that NEC compliant installations today may not be suitable for future uses tomorrow.

What stands between today and tomorrow is qualified, disinterested third-party inspection. If some jurisdictions are seeing the instances described in the proposal substantiation, it can only be because these jurisdictions have failed to create a regulatory environment that supports such inspections. This was the importance of the "Inspection Initiative" in the 1990s. Without inspection (and also without product standards) the NEC becomes invalid on its face, and our electrical safety system unravels. Rules based on a presumption of the absence of inspection create a completely misleading sense of security.

Panel Meeting Action: Accept

Number Eligible to Vote: 11

Ballot Results: Affirmative: 8 Negative: 3

Explanation of Negative:

BELISLE, R.: See my explanation of negative vote on Comment 9-22.

RUPP, B.: NEMA understands that the wording of the original proposal would add requirements to installations that were not intended to be covered, however the panel should have worked to correct the problems rather than reversing its action at the proposal stage. It is our opinion that the practice of installing "spare" circuit conductors to a location such as a bedroom light without installing an outlet box or system designed to support a fan is a potential safety issue.

SZENDRE, M.: See my explanation of negative vote on Comment 9-22.

9-29 Log #1313 NEC-P09 **Final Action: Reject**
(314.27(D))

Submitter: Joseph A. Hertel, Safety and Buildings

Comment on Proposal No: 9-60

Recommendation: Revise the proposed accepted text to read:

(D) In a dwelling unit, a ceiling outlet box installed for use as a lighting fixture outlet in a habitable room or kitchen and located where a ceiling fan could be installed shall be a type listed for ceiling fan support.

Substantiation: I can agree with the recommendation for fan boxes. The State of Wisconsin has had this requirement for several cycles and found that it eliminates the actual or perceived problems with ceiling paddle fan installation. The proposed language would apply to all facilities. The problem with homeowners doing the work is in dwellings, and commercial installations have not proven to be a problem.

Panel Meeting Action: Reject

Panel Statement: The Comment introduces text that is unenforceable and does not comply with the Style Manual (e.g., the use of "could"). (314.27(D))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Comment on Proposal No: 9-60

Recommendation: Reject the proposal.

Substantiation: I made most of my arguments in the explanation of negative vote attached to the proposal. However, in those comments, I expressed a willingness to entertain other approaches to the problem, such as actual notice

on the panelboard. I now believe that the proposal should not be accepted in any form, based on actual experience in the late spring. I was replacing a paddle fan (hung under the 1978 NEC on a conventional box) with a modern (Hu****) well-known brand with extensive market penetration, especially through home stores. While purchasing the fan, I picked up a fan box, certain that I would need it. To my amazement, the installation directions did not call for a fan box, but instead mandated a timber support across the back of a conventional outlet box. The fan came with screws designed to pass through the fan bracket and line up with the box support hole drillings, and long enough to securely engage the wooden cross support. So I hung the fan with no fan box, and even if I had installed the fan box, the listed fan and bracket assembly would have made that box irrelevant. The proposal substantiation is very far short of justifying a panel action that would violate fundamental code principles as expressed in 90.1.

9-31 Log #1972 NEC-P09 **Final Action: Accept**
(314.27(D))

Submitter: Noel Williams, Herriman, UT
Comment on Proposal No: 9-60
Recommendation: This Proposal should have been Rejected.
Substantiation: This is an extreme example of "what-if" code. The presumption that because there are two or more separately switched conductors in a box the box will be used for a fan is totally unsupported by any evidence. In fact, in installations like this, the extra conductors are often just that - extra conductors - and no switches are installed, so the conductors are not "separately switched" until the user decides to add the extra switches. That makes the rule difficult to enforce.

Furthermore, many fans available today do not even need the additional wire, as special switches are available that allow the single switched conductor to be used to control the fan, the fan speed, and even the intensity of the lights. Many other fans are supplied with wireless remote controls so that no special wiring is required. So, if the panel is really concerned about the possibility that a fan will be installed in the future, they must also assume that the people installing such fans will disregard all the instructions, and since a fan could be installed in any ceiling box with or without special wiring, the panel should just require all ceiling boxes to be suitable for fan support. In fact, how do we know someone won't take out the smoke alarm and use that for a fan? The 3 comments on negative should get additional consideration by the panel.

9-32 Log #2156 NEC-P09 **Final Action: Reject**
(314.27(D))

Submitter: David H. Kendall, Carlon
Comment on Proposal No: 9-60
Recommendation: Proposal 2-197 should continue to be "Accept in Principle" and revised as follows:

Where two or more separate switched, ungrounded conductors are provided to a ceiling mounted outlet box, <u>in single or multi-family dwellings,</u> the outlet box or outlet box system shall be listed for sole support of a ceiling-suspended (paddle) fan.

Substantiation: The revised language limits this requirement to single or multi-family dwellings. The practice of supplying a ceiling box with two switches is a common practice in new construction. For example: A standard ceiling box listed for luminaires is used when a ceiling fan is not supplied by the builder in a bedroom. Two switches are wired to the box. One of the switches is connected to the luminaire and the other switch is not connected. The new homeowner decides over a period time to replace the luminaire with a ceiling fan with a light kit and connect both switches. The homeowner is unaware of the required markings for a ceiling fan box and mounts the ceiling fan to the standard ceiling box. The ceiling fan assembly is located over the bed of a child.

I know this is a fact because it occurred in my current house. Fortunately, I am educated in the proper markings of ceiling boxes and did replace the ceiling box with a fan rated box. I do not think this is either fraud or a conspiracy, but builders taking advantage of the current code language. No where in the current NEC does it require a ceiling box rated for ceiling fan support when a fan is not installed. Since a fan was not supplied by the builder they were not obligated nor required to install a fan rated ceiling box. The proposed text fixes this problem.

Also, it is acceptable for a chandelier and other "multiple reasons" to be supported by a box listed for ceiling fan support. Ceiling fan boxes are also required to be tested and listed for luminaire support per UL 514A and UL 514C. This proposal addresses a safety issue to protect innocent homeowners from injury, fire or shock.

Panel Meeting Action: Reject
Panel Statement: CMP 9 has reconsidered the overall merits of this proposal, and decided to reject it based on the reasoning presented in Comments 9-22, 9-25, 9-27, 9-28, 9-30, and 9-31.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 8 Negative: 3
Explanation of Negative:
BELISLE, R.: See my explanation of negative vote on Comment 9-22.
RUPP, B.: See my explanation of negative vote on Comment 9-28.
SZENDRE, M.: See my explanation of negative vote on Comment 9-22.

9-33 Log #268 NEC-P09 **Final Action: Hold**
(314.27(D) Exception (New))

Submitter: Alan Halbert, EE Products Inc.
Comment on Proposal No: 2-265
Recommendation: Add a new exception to read:

314.27(D) Boxes at Ceiling-Suspended (Paddle) Fan Outlets. Outlet boxes or outlet box systems used as the sole support of a ceiling suspended (paddle) fan shall be listed, shall be marked by their manufacturers as suitable for this purpose, and shall not support ceiling-suspended (paddle) fans that weigh more than 32 kg (70 lb). For outlet boxes or outlet box systems designed to support ceiling-suspended (paddle) fans that weight more than 16 kg (35 lb), the required marking shall include the maximum weight to be supported.

<u>Exception: For outlet box systems that are not subject to national testing standards and install through the interior of the outlet box, the system shall not be required to be listed.</u>

Substantiation: The substantiation for this comment is provided in the abstract received by NFPA as supporting Material.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Hold
Panel Statement: This comment was held because it would introduce a concept that has not had public review by being included in a related proposal as published in the Report on Proposals.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

9-34 Log #59 NEC-P09 **Final Action: Accept**
(314.27(E) (New))

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 9-63
Recommendation: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal by replacing text that is vague and unclear, such as "comparable size and weight". This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: See the action on Comment 9-35, which responds to the concerns in this comment.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

9-35 Log #1918 NEC-P09 **Final Action: Accept**
(314.27(E) (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 9-63
Recommendation: Revise the action text to read as follows:

E. Utilization Equipment. Boxes used for the support of utilization equipment other than ceiling-suspended (paddle) fans shall meet the requirements of 314.27(A) and (B) for the support of a luminaire (fixture) that is the same size and weight.

Exception: Utilization equipment weighing not more than 3 kg (6 lb) shall be permitted to be supported on other boxes or plaster rings that are secured to other boxes, provided the equipment or its supporting yoke is secured to the box with no fewer than two No. 6 or larger screws.

Substantiation: To address the TCC concerns.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

9-36 Log #961 NEC-P09 **Final Action: Reject**
(314.28(A)(2))

Submitter: Mark C. Ode, Underwriters Laboratories Inc.
Comment on Proposal No: 9-67
Recommendation: Add a comma after "Angle" and delete the extra "or" in the title as follows:
314.28 Pull and Junction Boxes and Conduit Bodies
(A) Minimum Size.
(2) Angle, ~~or~~ U Pulls, or Splices. Where splices or where angle or U pulls are made, the distance between each raceway entry inside the box and the opposite wall of the box shall not be less than six times the metric designator (trade size) of the largest raceway in a row. This distance shall be increased for additional entries by the amount of the sum of the diameters of all other raceway entries in the same row on the same wall of the box. Each row shall be calculated individually, and the single row that provides the maximum distance shall be used.
Substantiation: Added a comma and deleted an extra "or" for grammatical reasons in the title of the rewritten text.
Panel Meeting Action: Reject
Panel Statement: The title is grammatically correct. The rule covers both angle and U pulls (principal application). These are related and should be grouped. The rule also, coincidentally, covers the spacing requirements for spliced conductors, which is an additional application.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

9-37 Log #1566 NEC-P09 **Final Action: Reject**
(314.28(C))

Submitter: Robert A. McCullough, Ocean County Construction Inspection Department
Comment on Proposal No: 9-18
Recommendation: Delete text as follows:
Delete what is now the last sentence after the panels action on proposal 9-68. ~~Where used, metal covers shall comply with the grounding requirements of 250.110~~.
Substantiation: This is a companion comment to one submitted for 314.4 to establish one generic requirement for grounding and bonding as applicable. I don't believe this would introduce new material as the groundwork has been set by virtue of other related proposals in concept in Proposal 9-18.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 9-9.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

9-38 Log #960 NEC-P09 **Final Action: Accept in Principle**
(314.30)

Submitter: Mark C. Ode, Underwriters Laboratories Inc.
Comment on Proposal No: 9-71
Recommendation: Revise as follows:
314.30 Handhole Enclosures.
Handhole enclosures shall be identified for use in underground systems. ~~and~~ Handhole enclosures shall also be designed and installed to withstand all loads likely to be imposed on them.
FPN: See ANSI/SCTE 77-2002, Specification for Underground Enclosure Integrity, for additional information on deliberate and non-deliberate traffic loading that can be expected to bear on underground enclosures.
Substantiation: The sentence has been restructured into two separate sentences to make more grammatical sense and a hyphen has been inserted into "non-deliberate" in the FPN.
Panel Meeting Action: Accept in Principle
Revise the text of the rule to read as follows: "Handhole enclosures shall be designed and installed to withstand all loads likely to be imposed on them. They shall be identified for use in underground systems." Make no change in the FPN.
Panel Statement: CMP 9 agrees with the concept of restating the rule using two sentences, but prefers to lead the rule with the more general provision.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

9-39 Log #275 NEC-P09 **Final Action: Reject**
(314.30(C))

Submitter: Dennis Downer, Morrisville, VT
Comment on Proposal No: 9-72
Recommendation: Revise text to read as follows:
314.30 Handhole Enclosures.
(C) Handhole Enclosures ~~Without Bottoms.~~ Where handhole enclosures ~~without bottoms~~ are installed, all enclosed cables, conductors and any splices or terminations, if present, shall be listed as suitable for wet locations.
Substantiation: Where handhole enclosures are installed, what difference does it make if the enclosure has a bottom or not, the box has the possibility of having water enter the enclosure, the enclosed conductors, cables and any splices or terminations, if present, shall be listed as suitable for wet locations. Also, the word Cables should be added to make it consistent with 300.5(B).
Panel Meeting Action: Reject
Panel Statement: As noted in the panel statement on the underlying proposal, the panel action on Proposal 9-77 accomplishes the technical objectives of this comment which merely restates that proposal verbatim. The wet location rule will now apply to all conductors and splices within handhole enclosures regardless of whether they enter as cable assemblies or from raceways. The comment presents no substantiation to support changing the CMP 9 actions on this subject.

Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

9-42 Log #818 NEC-P09 **Final Action: Reject**
(314.72)

TCC Action: It was the action of the Technical Correlating Committee that this comment be reported as Reject since it contains unenforceable and vague terminology, such as "during customary installation activity" and "at the time of manufacture, be protected…".
Submitter: Rod Belisle, NECA-IBEW Electrical Training Center
Comment on Proposal No: 9-81
Recommendation: "Accepting in principle" and insert the proposed language into new sections 312.10(D) and 314.40(E).
Substantiation: The CMP stated in their substantiation that sharp edges do create a hazard and provide "legitimate concerns," but deferred to take action due to inappropriate numbering of the proposal as submitted. The CMP also stated that this is a product standard issue. Product standards are driven by need, request of the consuming public, installers and code experts. The CMP should act on this proposal by "Accepting in principle" and insert the proposed language into new sections 312.10 (D) and 314.40 (E).

These locations would apply to all boxes and enclosures of concern, and meet the intent of the submitter's request.

Panel Meeting Action: Accept in Principle

I. Add the following new subsection to 312.10, renumbering the present 312.10(B) and 312.10(C) as 312.10(C) and 312.10(D) respectively:

(B) Enclosure Edges. All sharp edges of metal enclosures within the scope of this article that are subject to hand contact during customary installation activity shall, at the time of manufacture, be protected or shall be de-burred and rounded to minimize the risk of injury. This requirement shall take effect January 1, 2011.

II. Add the following new subsection to 314.40, renumbering the present 314.40(D) as 314.40(E):

(D) Enclosure Edges. All sharp edges of metal pull and junction boxes over 1650 cm3 (100 in.3) in size that are subject to hand contact during customary installation activity shall, at the time of manufacture, be protected or shall be de-burred and rounded to minimize the risk of injury. This requirement shall take effect January 1, 2011.

Panel Statement: CMP 9 agrees with the Comment and has modified it editorially to locate it with related material covering metal enclosures, and rewording to focus on the likelihood of hand injuries on larger enclosures. CMP 9 understands that these requirements may compel significant changes in product standards and manufacturing procedures, and has delayed the effective date accordingly.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 9 Negative: 2

Explanation of Negative:

OSBORNE, R.: Panel members agree that the concern with sharp edges is one to be addressed by the product standards. This fact is illustrated in the original panel action, the panel statement, and the proposed Code language, which indicate that sharp edges shall be protected or de-burred at the time of manufacture. The panel appears to be taking a "back door" approach to address the concern, rather than pursuing changes to the applicable product standards (if needed) and holding manufacturers accountable for products that have edges which are unacceptably sharp. Standard development organizations, such as Underwriters Laboratories, use an open process for revising standards. This process is similar to that used by NFPA to develop the Code. While many standards have requirements to address sharp edges, the opportunity exists for individuals to submit proposed changes to these standards and add or modify requirements as they relate to this issue.

Many certification organizations also have in place a process by which products with identified concerns can be reviewed. This process can be used to determine if the problem should be addressed by new or revised requirements in the standard, or if adequate requirements exist, if the problem is systemic to the industry or specific to a manufacturer. One type of product identified as having concerns with sharp edges is enclosed panelboards. The product standard for panelboards (UL 67) has detailed requirements for sharp edges, including reference to the Standard for Sharpness of Edges on Equipment (UL 1439) and UL has not received complaints of sharp edges and the form of field complains on these products. Anecdotal evidence is not sufficient to enact change to the product standard and Code. Properly documented field complaints can be used to identify whether a problem is specific to an industry, a manufacturer, a specific factory, or is a perception rather than a reality. What constitutes a sharp edge is subjective, and with any subjective requirement, places the inspector at a disadvantage when applying the requirements. Additionally, the ability of the AHJ to decide on the approval of equipment is already provided in 90.4. Should inspectors conclude that sufficiently sharp edges exist on equipment, they can reject the installation citing 90.4.

It is suggested that panel members refocus their efforts and address this concern in the proper forum rather than introducing requirements which are acknowledged by the authors as being misplaced.

RUPP, B.: NEMA continues to consider this to be a standards issue and this information does not belong in the installation code. Concerned people should contact the manufacturer of a particular type of equipment causing an issue and should actively participate on the technical panels of the product standards to affect changes where necessary.

Comment on Affirmative:

MCCULLOUGH, R.: I believe the Panel's action to be proactive on this issue is correct and, by placing the revised text in the construction specifications part of Articles 312 and 314, will force changes in the appropriate product standards as well as the manufacturing process. The delay date to allow for these changes should be sufficient. This change needs to occur at these levels rather than be in a rule enforced by the AHJ. Otherwise, there would be no consistency in enforcement. I also believe that as an editorial revision, 314.70(3) should be changed to include this new (D) as well. The same concerns of personal injury are valid for boxes used on systems over 600 volts.

SENGUPTA, S.: Comment: Delete the last sentence: "This requirement shall take effect January 1, 20011." from 312.10(B) and 314.40(E).

Reason: I agree with the IBEW/NECA's comment and CMP 9's recognition of a sharp edge on any metallic box is a safety issue and thus, I strongly recommend CMP 9 to remove the effective date. Let the manufacturers recognize the significance of both the safety issue and the code requirement and take appropriate actions. Any new code requirement always creates various degrees of significance to users, installers and manufacturers; addressing the degree of significance with an extended timeline on one requirement may not help the core issue of safety.

Additionally, removal of the date may also reduce the number of proposals in the 2011 code cycle appealing extension of the date from January 1, 2011 to January 1, 2014 or other future dates, citing this panel statement: "CMP 9 understands that these changes may compel significant changes in product standards and manufacturing procedures, and has delayed the effective date accordingly.

ARTICLE 320 — ARMORED CABLE: TYPE AC

7-1 Log #926 NEC-P07 **Final Action: Reject**
(320, 330, 332, 334, 340)

Submitter: Samuel R. LaDart, City of Memphis / Rep. IBEW Local 474
Comment on Proposal No: 7-1
Recommendation: We feel that the panel should have rejected this proposal.
Substantiation: We are not confident that the results of this task group represent consensus and justification for the TCC to offer those findings as a TCC proposals for the 2008 NEC.

Panel Meeting Action: Reject
Panel Statement: The comment provides no technical justification for rejecting the proposal, only commentary on the participation in the development of the proposal.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-2 Log #1071 NEC-P07 **Final Action: Reject**
(320.12(1))

Submitter: David Shapiro, Safety First Electrical Contracting Consulting & Safety Education
Comment on Proposal No: 7-3
Recommendation: Revise text to read as follows:
"...~~physical~~ mechanical damage".
Substantiation: The NEC Style Manual says in "3.2.5.5 Provisions on Protection Against Physical Damage: If protection against physical damage is to be one of the requirements, this can be standardized by the use of this terminology."

In this section, the NEC is not requiring the addition of mechanical protection from mechanical damage, but rather it is forbidding the use of AC cable where subject to such damage. This is not what 3.2.5.5 addresses, so it is not clear how the Panel Statement can claim that this use of the term complies with that section of the manual.

Rust is another form of physical damage, addressed explicitly in the other parts of 320.12. The CMP has clarified in its statement that 310.12(1), indeed concerns damage, not signal interference. Therefore, on the logical presumption that the rest of 320.12 is not tautological, 310.12(1) is concerned with other forms of physical damage than those caused by moisture. If 310.12(1) were a general expression of concern, it would be an unnecessary restatement of 110.3(A). Therefore, it is plausible to assume that it means to be conveying that AC cable is not considered capable of withstanding blows or abrasion-mechanical insult. This is particularly reasonable in light of the availability of such cables with reduced-strength armors.

Panel Meeting Action: Reject
Panel Statement: Physical damage is the appropriate terminology in accordance with the 2003 NEC Style Manual which states:

"3.2.5.4 Provisions on Protection Against Physical Damage. If protection against physical damage is to be one of the requirements, this can be standardized by the use of this terminology instead of using the phrase provided with mechanical protection to mean the same thing."

"Physical Damage" is a properly used generic term that directs installers and users of the code to protect wiring methods from the types of damage that could be present in a given environment.

"Mechanical Damage" is a specific type of "Physical Damage". Cables are required to be protected from all forms of damage that are likely to be present in a given area, unless approved for the purpose.

Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-3 Log #1075 NEC-P07 **Final Action: Reject**
(320.15)

Submitter: David Shapiro, Safety First Electrical Contracting Consulting & Safety Education
Comment on Proposal No: 7-5
Recommendation: Revise text to read as follows:
"...~~physical~~ damage...".
Substantiation: 3.2.5.5's permissive, not mandatory language suggests the use of the term "protection against physical damage" in place of "mechanical protection." Protection by locations is not quite identical to adding mechanical protection. Signal protection from EMI is not the same as protection from cable damage, I would think. More relevant, removing the adjective "physical" adds no confusion that I can envision as to what the installer is required to do or the inspector to enforce.
Panel Meeting Action: Reject
Panel Statement: The word "Physical", is appropriate since it specifically defines the type of protection being provided and complies with 3.2.5.5 of the NEC style manual. The code often times uses a language "all of its own" as its primary focus is on the protection of life and property. "Ampacity" is another word that is specific to the NEC, and like the phrase "physical damage", is very useful to code users.
Also see panel statement on Comment 7-2.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-4 Log #1669 NEC-P07 **Final Action: Reject**
(320.23)

Submitter: Phil Simmons, Olympia, WA
Comment on Proposal No: 7-8
Recommendation: Accept the Proposal.
Substantiation: As one who teaches the NEC, and has for many years, the wording of this section has long been criticized by students of the Code as being confusing or poorly worded. In other ways, the wording uses incorrect terminology and is out-of-date with today's construction methods.
The present title of 320.23 is "In Accessible Attics." We should note the framing members in attics are not often "floor joists" as is included in the title of 320.23(A) as well as in the text of that section. Most often, these are ceiling joists. The Merriam-Webster Online Dictionary defines the word "attic" as, "A room or a space immediately below the roof of a building." So, it seems the use of the words "floor joists" when describing the framing members in attics is incorrect. These framing members are most likely ceiling joists. In some cases, the framing member serves as the ceiling joist for the space below and the floor joist for the space above. This is the reason "framing members" is used in the Proposal. This term applies whether the framing members are ceiling joists for typical attics or combination ceiling joists/floor joists in the situation where the space is a partial attic when buildings have an attic space on one or more sides of an upper room which may have an attic above it.
It should also be noted that much of the construction uses manufactured trusses and beams in addition to stick-built buildings. It seems the term "framing member" can be used correctly for all these types of construction.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The existing wording is specific and adequate. Many attics are "floored" or are partially "floored" for storage purposes. The current text directs code users to the "specific location" that the text is referring to------ "The Floor Joist", which is indeed, "a framing member".
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-5 Log #342 NEC-P07 **Final Action: Reject**
(320.23(A))

Submitter: Bryan P. Holland, City of North Port
Comment on Proposal No: 7-7
Recommendation: I feel the proposal should be reconsidered.
Substantiation: The original proposal clearly indicated that the requirement would only apply to Type AC, MC, and NM cables and not all cables as indicated by the panel statement. As currently arranged in the NEC at this time, one must reference the article that applies to Type AC cable when installing Type MC or Type NM cable in attic spaces. It would add clarity to the code by moving this section to 300.4 with the stipulation that it only applies to Type NM, AC, and MC cables. The entire purpose for this section is for the protection of the cables.
Panel Meeting Action: Reject
Panel Statement: The text in 320.23 (a) is specific and addresses the unique installation requirements of type AC, MC, and NM cable when installed in accessible attics.
The rules, as they are currently written, are conveniently located within the very limited articles that they apply. There is no substantiation that implies that relocating the rules within the text of 300.4 will enhance code "usability". Article 300 normally contains requirements that apply in general. When a user selects a particular cable type, it is convenient to have all the rules specific to that cable type in the same Article.

Comment on Proposal No: 7-17
Recommendation: We support the panel's action in Accepting this Proposal as written.
Substantiation: None.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 328 — MEDIUM VOLTAGE CABLE: TYPE MV

7-9 Log #982 NEC-P07 **Final Action: Accept in Principle**
(328.10 and 328.12)

Submitter: Mark C. Ode, Underwriters Laboratories Inc.
Comment on Proposal No: 7-22
Recommendation: Revise as follows:
328.10 Uses Permitted
Type MV cable shall be permitted for use on power systems rated up to 35,000 volts nominal as follows:
(1) In wet or dry locations
(2) In raceways
(3) Direct buried in accordance with 300.50
(4) In messenger-supported wiring
(5) As exposed wiring in locations accessible to qualified persons only as permitted in 300.37
FPN: The ``Uses Permitted'' is not an all-inclusive list.
328.12 Uses Not Permitted
Unless identified for the use, Type MV cable shall not be used as follows:
(1) Where exposed to direct sunlight
(2) In cable trays, <u>unless permitted</u> in accordance with 392.3~~(B)(2)~~
(3) Direct buried, unless in accordance with 300.50
Substantiation: The resulting action of the Panel's action in the proposal was to not permit the use of MV cable at all in 328.10 and 328.12. By adding "unless permitted in accordance with 392.3", MV cable can now be used as stated in 392.3(B)(2).

Panel Meeting Action: Accept in Principle

Revise 328.10 of the current code as follows:

Renumber (3), (4), and (5) as (4), (5), and (6) respectively

Add "(3) In cable trays, where identified for the use, in accordance with Part II of Article 392

In (5), add the phrase "in accordance with Part II of Article 396" so it reads: "(5) In messenger-supported wiring in accordance with Part II of Article 396" In (6), delete the phrase "wiring in locations accessible to qualified persons only as" so it reads "(6) As exposed runs in accordance with 300.37"

Revise 328.12 of the current code as follows:

Delete (2) and (3) and revise to read:

"328.12 Uses Not Permitted. Type MV cable shall not be used where exposed to direct sunlight, unless identified for the use.

Panel Statement: Section 328.12(2) was relocated to 328.10(3) in accordance with Item 4 in 3.3.1 of the NEC Style Manual which encourages the use of positive language, whenever possible. The reference in (3) was changed from 392.3(B)(2) to Part II of Article 392 to correlate with the Action on Proposal 8-180 and there are other applicable sections in Part II, such as 392.13(F) and 392.15 that apply in addition to 392.10. The applicable reference was added in (5). 300.37 is applicable to all aboveground wiring methods, not just to locations accessible to qualified persons only.

Section 328.12 was revised since (2) was relocated to 328.10(3) and (3) was deleted. Since only (1) remained, the list was deleted and the text included in the first sentence of 328.12.

The Panel Action on Comment 7-12 modifies this Panel Action.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-10 Log #735 NEC-P07 **Final Action: Accept**
(328.11)

Submitter: Robert Kelleher, Paramount Electrical Services

Comment on Proposal No: 7-21

Recommendation: Continue to Reject .

Substantiation: Continue to Reject. The addition of these NECA Fine Print Notes, serves no benefit to the user of the National Electrical Code. These are not standards, they are a compilation of generic information and do not serve as information to the user. These must be purchased through NECA. This FPN as written is nothing more than free advertisement for generic, readily available information which must be purchased by the code user. A total of seventeen new Fine Print Notes were proposed to reference NECA standards. Sixteen were unanimously rejected. Inclusion of this Fine Print Note is in direct conflict with 90.1(C). The TCC should intervene to prohibit these types of Fine Print Notes. CMP7 should continue to reject this FPN. Failure to do so will mean adding Fine Print Notes for IEC, EEI, IBEW, IAEI, ACC, NETA, NEI, SEIA, AISI, API, ASHE, AHAM, ICEAI, NYBFU and dozens of others when they decide to develop income through generic standards development. If this type of Fine Print Note is placed anywhere in the NEC an Annex should be included with coupons for the code user. If the NEC is to be used for advertisement purposes, coupons should be included.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-11 Log #849 NEC-P07 **Final Action: Accept**
(328.11)

Submitter: John P. Masarick, Independent Electrical Contractors Inc.

Comment on Proposal No: 7-21

Recommendation: The panel is encouraged to continue to Reject Proposal 7-21.

Substantiation: The reasons to continue to Reject the Proposal are as follows:

1. The trend by the CMPs over the last several code cycles has been to limit the use of FPNs.

2. There is also a correlation issue. There is a conflict between those panels that accepted the proposal and those that rejected the proposal.

3. These standards are also covered by a Fine Print Note in 110.12.

4. The FPN should not be accepted because numerous standards and installation manuals exist and to only mention one does not adequately inform the public about accepted industry practices. The NEC is not intended to be an instruction manual for untrained persons. If the FPNs are allowed to reference these standards, then they should list all applicable standards.

5. Since the referenced installation standards are intentionally general to cover different models of equipment, approval of the FPN may lead many to believe these standards can be used instead of listed or labeled manufacturer's instructions which would be in violation of 110.3(B).

6. If the CMP would like to include the reference, it should be placed in the Annex with the other references.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-12 Log #677 NEC-P07 **Final Action: Accept in Principle**
(328.12)

Submitter: James M. Daly, Upper Saddle River, NJ

Comment on Proposal No: 7-22

Recommendation: I agree with the Panel Action on the Proposal to Accept in Principle, however, the following additional text should be added for clarity.

Add an Exception following 328.10(5) before the FPN to read:

Exception to (5): Type MV cable that also complies with the requirements for Type MC cable and is identified as "MV or MC" shall be permitted to be installed as exposed runs of metal-clad cable in accordance with 300.37.

Add the following Exception following 328.12(2) to read:

Exception to (2): Type MV cable that also complies with the requirements for Type MC cable and is identified as "MV or MC" shall be permitted to be installed in cable trays in accordance with 392.3(A).

Substantiation: These two Exceptions do not introduce new material nor change any existing requirements; they merely clarify what is currently permitted in the Code.

330.112(B) permits Type MC Cable to contain insulated conductors rated over 600 volts in accordance with Table 310.61 through Table 310.64 [Tables 310.13(B) through 310.13(E) in the ROP preprint]:

Table 310.61 Conductor Application and Insulation

Table 310.62 Thickness of Insulation for 601- to 2000-Volt Nonshielded Types RHH and RHW.

Table 310.63 Thickness of Insulated Conductors Rated 2400 Volts and Jacket for Nonshielded Solid Dielectric Insulation.

Table 310.64 Thickness of Insulation for Shielded Solid Dielectric Insulated Conductors Rated 2001 to 35,000 Volts.

UL 1569

, Standard for Metal-Clad Cables, and UL 1072, Standard for Medium-Voltage Power Cables, both include a provision that "A multiple-conductor Type MV cable with a smooth (other than lead) or corrugated metal sheath or with interlocked metal armor may be marked for use also as Type MC cable." UL 1569 also permits the marking "for CT use" or "for use in cable trays" on those Type MC cables that do not have an overall jacket or, if jacketed, passes the vertical-tray flame test to qualify for tray installation.

Therefore, a medium voltage cable that complies with the requirements of both UL 1569 and UL 1072 and is marked "MV or MC" can be installed wherever either or both cable types are permitted in the NEC. Single or multiconductor cables that only comply with Type MV requirements and are only marked "Type MV" or "MV", with or without the 90C or 105C conductor temperature designation, are properly limited to industrial establishments only in accordance with 392.10(B).

392.10(A) states that: "The wiring methods in Table 392.10(A) shall be permitted to be installed in cable tray systems under the conditions described in their respective articles and sections." Therefore, the conditions under which Medium Voltage Type MC cables are permitted to be installed in cable tray should be specified in Part II of Article 328.

The substantiation for exposed runs of "MV or MC" cables in the first Exception is that 330.10(A)(4) permits Type MC cable to be installed "exposed or concealed".

The substantiation for the installation of "MV or MC" cables in cable tray in any location is that 330.10(A)(6) permits Type MC cable to be installed "in cable tray where identified for such use".

Panel Meeting Action: Accept in Principle

The Panel Accepts in Part the Exception to (5) in 328.10 to immediately follow (6), before the FPN to read:

"Exception: Type MV cable that has an overall metallic sheath or armor, also complies with the requirements for Type MC cable, and is identified as "MV or MC" shall be permitted to be installed as exposed runs of metal-clad cable in accordance with 300.37."

The Panel accepts in part the second Exception to immediately follow 328.10(3) to read:

"Exception: Type MV cable that has an overall metallic sheath or armor, also complies with the requirements for Type MC cable and is identified as "MV or MC" shall be permitted to be installed in cable trays in accordance with 392.10(A)."

Panel Statement: The Panel added the phrase "has an overall metallic sheath or armor" to specifically require an overall armor, compliance with all the requirements for Type MC cable and not just compliance with the mechanical requirements for MC cable.

Exception to (5) was changed to an Exception under (6) and Exception to (2) was changed to an Exception under (3) to correlate with the Panel Action on Comment 7-9.

The reference in the Exception to (3) was changed from 392.3(B)(2) to 392.10(A) to correlate with the Action on Proposal 8-180 and to provide the correct reference.

Location of the Exceptions immediately following the main rule to which they apply is in accordance with 2.6.1 of the NEC Style Manual.

This Panel Action modifies the Panel Action on Comment 7-9.

Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 330 — METAL-CLAD CABLE: TYPE MC

7-13 Log #928 NEC-P07 **Final Action: Reject**
(330.10(A)(7) (New))

Submitter: Samuel R. LaDart, City of Memphis / Rep. IBEW Local 474
Comment on Proposal No: 7-25
Recommendation: The Panel should have accepted this proposal.
Substantiation: This is a safety issue that is directly related to proper grounding. The additional text would prevent ongoing infractions that continue to occur in the field.
Panel Meeting Action: Reject
Panel Statement: Sections 300.10 and 300.15 define the requirements for grounding the metallic armor or sheath.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:

LADART, S.: We disagree with the panel action. Proposal 7-25 addresses a grounding issue. The panel is correct in stating that Sections 300.10 and 300.15 define the requirements for grounding the metallic armor or sheath; however, infractions continue to frequently occur in the field. The acceptance of Proposal 7-25 would help eliminate the problem. The new provision (7), to 330.10(a) would give clear guidance to installers that: "when installing MC cable within a raceway the MC cable must be terminated in a fitting that provides grounding of the metal sheath." This is a safety issue.

The added prescriptive language could possibly prevent the wrongful practice of leaving the "free end" of MC cable "dangling" within an enclosure as it exits a raceway.

7-14 Log #1096 NEC-P07 **Final Action: Accept**
(330.10(B))

Submitter: James Daly, Upper Saddle River, NJ
Comment on Proposal No: 7-26
Recommendation: The Panel Action should continue to be Accept and correct the word "Part" to "Parts".
Substantiation: Grammatical correction to agree with the text in the 2005 Code and the Preprint of the 2008 Code.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-15 Log #2202 NEC-P07 **Final Action: Accept in Principle**
(330.12)

Submitter: William A. Wolfe, Steel Tube Institute of North America
Comment on Proposal No: 7-28
Recommendation: Revise text to read as follows:

330.12 Uses Not Permitted

1) Where subject to physical damage.

2) Under the following conditions unless the metallic sheath is suitable for the conditions or is protected by material suitable for the conditions:

a. For direct burial in the earth

b. For installation in concrete

FPN: MC cable that is identified for direct burial application is suitable for installation in concrete.

c. Where subject to cinder fills, strong chlorides, caustic alkalis, or vapors of chlorine or of hydrochloric acids.

Substantiation: The above revisions contain no technical changes. The reason for Proposal 7-28 was to clarify that MC is not permitted where subject to physical damage. The text in the 2005 NEC is confusing and is sometimes interpreted to mean that MC cable is allowed where subject to physical damage if the metallic sheath is suitable for the conditions. MC cable is not listed for use where subject to physical damage, regardless of the type of metallic sheath. While the submitter of this proposal attempted to clarify this, it could still be interpreted that MC cable may be used where subject to physical damage if the metallic sheath is suitable for the condition. The revision submitted in this comment makes it very clear that MC cable is not permitted where subject to physical damage.

The 1999 NEC was much clearer about the use of MC cable where exposed to physical damage. Section 334-3 Uses Permitted stated: "Unless specifically prohibited elsewhere in this Code and where not subject to physical damage, Type MC cables shall be permitted as follows."

When the cable articles were rewritten during the 2002 Code cycle, this requirement became much less clear and has caused confusion in the field.

Panel Meeting Action: Accept in Principle

Revise 330.12 to read as follows:

"330.12 Uses Not Permitted. Type MC cable shall not be used where:

(1) subject to physical damage

(2) exposed to any of the destructive corrosive conditions in (a) or (b), unless the metallic sheath or armor is resistant to the conditions or is protected by material resistant to the conditions:

(a) direct buried in the earth or embedded in concrete unless identified for direct burial

(b) exposed to cinder fills, strong chlorides, caustic alkalis, or vapors of chlorine or of hydrochloric acids"

Panel Statement: List identification and styles are in accordance with the NEC Style Manual. List item (2) was revised for consistency with the other list item. (a) and (b) were combined into one list item since the identification for direct burial also permits embedment in concrete and (c) was re-identified as (b). A FPN can only be informative, so it was combined into the rule and, since the Style Manual includes the word "suitable" as being a possibly unenforceable or vague term, it was changed to "resistant".
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-52 Log #946 NEC-P07 **Final Action: Reject**
(330.12)

Submitter: Samuel R. LaDart, City of Memphis / Rep. IBEW Local 474
Comment on Proposal No: 7-28
Recommendation: The Panel should have rejected this proposal.
Substantiation: Type MC cable should not be installed where exposed to physical damage. Removing the text from the "uses not permitted" section (330.12 (1) is not consistent with other cabling articles.
Panel Meeting Action: Reject
Panel Statement: Proposal 7-28 did not propose the deletion of "subject to physical damage" only its relocation within the section. Also see the panel action and statement on Comment 7-15.

The panel notes that the recommendation was submitted as effecting 338.12 but actually applies to 330.12
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-16 Log #1980 NEC-P07 **Final Action: Reject**
(330.80(B)(1))

Submitter: Robert Konnik, Rockbestos-Surprenant
Comment on Proposal No: 7-36
Recommendation: Change section 330.80(B)(1) from Table 310.20 to 310.17 as shown below for high temperature MC cables.

(B) Single type MC Conductors Grouped Together. Where single Type MC conductors are grouped together in a triangular or square configuration and installed on a messenger or exposed with a maintained free air space of not less than 2.15 times one conductor diameter (2.15 X OD) of the largest conductor contained within the configuration and adjacent conductor configurations or cables, the ampacity of the conductors shall not exceed the allowable ampacities in the following tables:

(1) Table 310.20 for conductors rated 0 to 2000 volts.

a. Exception: MC cables with silicone rubber insulation may use Table 310.17.

(2) Tables 310.67 and 310.68 for conductors rated over 2000 volts.

Substantiation: This would make 330.80(B)(1) the same as 332.80(B) for MI cables and MC cables with high temperature insulation. If the ampacity in Table 310.17 is acceptable for MI cable, it should be acceptable for MC cable. I do not believe it is germane that MI cable insulation may be able to withstand temperatures greater than 90oC, but since the panel believes this is a requirement, I have modified the proposal to be specific to MC cable with silicone rubber insulation since silicone rubber is rated for special applications at 200oC.
Panel Meeting Action: Reject
Panel Statement: Section 310.10 states "No conductor shall be used in such a manner that its operating temperature exceeds that designated for the type of insulated conductor involved." The explanatory FPN states "The temperature rating of a conductor [see Table 310.13(A) and Table 310.13(B)] is the maximum temperature, at any location along its length, that the conductor can withstand over a prolonged time period without serious degradation."

The standard rating for Type SA is 90ºC (194ºF) for dry and damp locations. The 200ºC (392ºF) rating is for special applications such as a high ambient temperature in the vicinity of a heat source, such as a blast furnace, and the ampacity correction factors in Tables 310.20 and 310.17 will correct the allowable ampacity to a lower value where the insulation will not be degraded under normal operating conditions.

When subjected to extremely high ambient temperatures for extended periods of time, the highly compressed refractory mineral insulation in Type MI cable will not suffer degradation.

Ballot Results: Affirmative: 14

7-19 Log #1098 NEC-P07 **Final Action: Reject**
(334.10)

Submitter: James Daly, Upper Saddle River, NJ
Comment on Proposal No: 7-42a
Recommendation: The Panel Action should be to Accept in Principle and revise the section to read as follows:
Relocate (4) to immediately follow (3).
The FPNs should immediately follow (4) and be in the sequence shown and read as follows:
FPN No. 1 to (1), (2), (3), and (4): Types of building construction and occupancy classifications are defined in NFPA 220-1999, Standard on Types of Building Construction, or the applicable building code, or both. See Annex E for a summary of the Types of Construction [NFPA 220, Table 3.1].
~~FPN No. 2 to (1), (2), (3), and (4): See Annex E for a summary of the Types of Construction [NFPA 220, Table 3.1].~~
FPN No. 2 to (1), (2), (3), and 4: See 310.10 for temperature limitation of conductors.
FPN No. 3 to (2), (3), and 4: NM cable may be installed in any Type of construction in buildings if the building code permits the building to be Type III, IV, or V construction.
Substantiation: The revisions proposed do not change any existing requirements; they just further clarify the requirements and enhance useability. The placement of the FPNs provides logical placement of the FPNs and defines the specific list items to which each FPN applies.
FPN No. 2 revised for clarity to agree with the title in Annex E and combined with FPN No. 1 since both FPNs are related to the same information and reference the same NFPA standard.
FPN No. 3 was revised to eliminate the mandatory language to comply with 3.1.3 of the NEC Style Manual.
Panel Meeting Action: Reject
Panel Statement: The use of NM Cable in dwellings and structures that are permitted to be Type III, IV, or V construction but are constructed to Type I or II requirements is already permitted in 334.10 (2), (3), and (4).
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-20 Log #1839 NEC-P07 **Final Action: Reject**
(334.10, FPN 2 (New))

Submitter: Mike Holt, Mike Holt Enterprises, Inc.
Comment on Proposal No: 7-42a
Recommendation: Add new FPN as follows:
FPN No. 2 to (2), (3) and (4): It is the intent of this section to allow NM Cable in any type of construction in buildings that the adopted building code permits to be of Type III, IV, or V construction.
Substantiation: Mr. Daly is correct in his assessment of the proposed language violating the Style Manual; however, his suggestion also does not comply.

Section 3.1.2 of the Style Manual states that the term "may" "shall only be used where it recognizes a discretionary judgment on the part of an authority having jurisdiction."
Panel Meeting Action: Reject
Panel Statement: The use of NM Cable in dwellings and structures that are permitted to be Type III, IV, or V construction but are constructed to Type I or II requirements is already permitted in 334.10 (2), (3), and (4).
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-20a Log #1779 NEC-P07 **Final Action: Reject**
(334.10(3))

Submitter: Joseph A. Hertel, Safety and Buildings
Comment on Proposal No: 7-45
Recommendation: Support proposal 7-45 and revise 334.10(3) by deleting the second sentence.
Substantiation: The CMP has written a rule that is ignored. While this creates a violation of the NEC, there is certainly no increased hazard in wiring buildings as they have been done for the past 40 years. A garden shed behind a dwelling cannot be wired with NM cable without covering the wiring with a 15 minute finish rating. Is this the intent of the panel? The same applies to a detached garage as well as agricultural facilities since other nonmetallic cable articles refer to Article 334 for installation requirements. To create a list of exceptions is not in the interest of a usable code. The CMP has taken the basic rule and in the 2002 edition of the NEC added language that restricts the use of the wiring method for no apparent purpose other than restraint of trade. The basic requirement in the 1999 NEC restricted the wiring method to structures three floors or less above grade. I am not aware of any change in the composition of NM cable since 2002 that creates a hazard when the method is used in other than dwellings.
Panel Meeting Action: Reject
Panel Statement: Violations of the NEC requirements are not reason for changing requirements of the Code. The present text is inclusive of all "Other Structures". The substantiation addresses only unfinished garages and agriculture installations where Type UF cable is preferred. No substantiation has been submitted to address why the 15- minute finish rating for these and other commercial and non-residential installations should not be required. The panel advises the submitter that these installations might be more appropriately addressed under the Type UF Cable Article.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-21 Log #678 NEC-P07 **Final Action: Reject**
(334.10(3))

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 7-45
Recommendation: The Proposal should be Accept in Principle with the addition of an exception immediately following 334.10(3) to read:

"Exception to (3): When Type UF cable is installed as nonmetallic-sheathed cable in animal housing facilities classified as storage occupancies, the cable shall not be required to be concealed within walls, floors, or ceilings that provide a thermal barrier of material that has at least a 15-minute finish rating."

Revise existing "FPN No. 1" to "FPN No. 1 to (2) and (3)" and "FPN No. 2" to "FPN No. 2 to (2) and (3)".

Add an additional Fine Print Note after FPN No. 2 to read:

"FPN No. 3 to Exception: Classification of animal housing facilities as storage occupancies is defined in NFPA 1-2006, Uniform Fire Code, NFPA 101-2006, Life Safety Code, and NFPA 5000-2006, Building Construction and Safety Code."
Substantiation: The Panel was not aware of this information during consideration of the Proposal at the ROP meeting.

The three NFPA Codes classify any type of animal housing facility as a storage occupancy, defined as an "occupancy used for the storage or sheltering of goods, merchandise, products, vehicles, or animals." A storage occupancy is typically characterized by the presence of few people, usually only owners and employees. If members of the public enter the building, the building can no longer be considered simply a storage occupancy. Additional information is contained in the NFPA Journal, November/December 2004 issue, page 22.

At its July 2004 meeting, the NFPA Standards Council approved an expansion of NFPA 150, Racetrack Stables, to include life and fire safety requirements for both humans and animals in all types of animal housing facilities and it changed the name of the committee to the Technical Committee on Animal Housing Facilities.

The submitter is correct that the use of gypsum wallboard or other thermal barriers is not appropriate in animal housing facilities. Also, 340.10(3) permits Type UF Cable to be used in wet locations.

The proposed Exception will provide appropriate and justified relief from concealing the cable in this very specific type of installation.

The revision to the numbering of FPN No. 2 and FPN No. 3 is in compliance with 2.6.1 of the NEC Style Manual.

The addition of FPN No. 3 provides the user with a source of additional NFPA information regarding the classification of animal housing facilities.

Panel Meeting Action: Reject

Panel Statement: When UF cable is installed as NM cable it must comply with the installation requirements of Article 334 in accordance with 340.10(4).

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-22 Log #1782 NEC-P07 **Final Action: Reject**
(334.10(3))

Submitter: Joseph A. Hertel, Safety and Buildings
Comment on Proposal No: 7-42
Recommendation: Revise 334.10(3) to say:

(3) Other structures permitted to be of Types III, IV, and V construction except as prohibited in 334.12.

Substantiation: The 1999 NEC limited the use of NM cable to buildings or structures not exceeding three floors above grade without the additional protection of a 15 minute finish rating. The current language requires a 15 minute finish rating in all but dwelling occupancies while the building Type limits the height of buildings to 5 or 6 stories depending on fire protection. The Code Panel says there is no substantiation to address the removal of the 15 minute finish rating. Based on the previous editions of the NEC I cannot find any substantiation to keep the requirement. Can the CMP provide substantiation of what happened in the last two code cycles to make Nonmetallic-Sheathed cable hazardous?

Panel Meeting Action: Reject

Panel Statement: The current text was accepted by the Panel following an appeal that resulted in a decision by the NFPA Standards Council to accept Proposal 7-137 of the NEC 2001 Report on Proposals, which was subsequently upheld by the NFPA Board of Directors.

7-23 Log #937 NEC-P07 **Final Action: Reject**
(334.10(5) (New))

Submitter: Samuel R. LaDart, City of Memphis / Rep. IBEW Local 474
Comment on Proposal No: 7-47
Recommendation: The panel should have accepted this proposal.
Substantiation: This is a safety issue. Protecting wiring within residential air returns should be required, and appear as text within the confines of Article 334.

Panel Meeting Action: Reject

Panel Statement: The submitter has not provided any new technical basis or documentation to support the change.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

LADART, S.: We disagree with the panel action. This is a safety issue. Proposal 7-47 suggests that: Wiring placed within residential air returns be protected by a metal raceway in order to reduce the possible spread of fire.

Although there was no technical basis or documentation to support the change, many AHJ's do not allow "any" wiring method to penetrate the space; therefore, it seems logical that protecting the cable by placing it within a metal raceway is a minimum effort to prevent the "spread of fire".

7-24 Log #42 NEC-P07 **Final Action: Accept**
(334.12)

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 7-50
Recommendation: The Technical Correlating Committee directs the panel to clarify the action on this proposal. This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

Panel Statement: The panel accept the TCC direction. The panel reaffirms the action taken on Proposal 7-50 to "Revise 334.12(B)(4) to read "In wet or damp locations."" No other action is intended.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-25 Log #334 NEC-P07 **Final Action: Reject**
(334.12)

Submitter: Ronald G. Nickson, National Multi Housing Council
Comment on Proposal No: 7-49
Recommendation: Delete text as follows:

334.12 Uses Not Permitted. Type, NM, NMC, and NMS cables shall not be used under the following conditions or in the following locations:

~~(1) For multifamily dwellings of other than Types III, IV, and V construction.~~

~~(2) For non-dwelling structures of other than Type III, IV, and V construction where the cables are not concealed within walls, floors and ceilings that provide a thermal barrier of materials that has at least a 15-minute finish rating as identified in listings of fire rated assemblies.~~

~~FPN No. 1: Building constructions are defined in NFPA 220-1999, Standard on Type of Building Construction, or the applicable building code, or both.~~

~~FPN No. 2: See Annex E for determination of building types (NFPA 220, Table 3.11).~~

~~(3)~~ (1) For cable tray installations unless the cable is identified for the use.

~~(4)~~ (2) For open run installations in dropped or suspended ceilings in other than one- and two-family and multifamily dwellings.

~~(5)~~ (3) For installation as service entrance-cable.

~~(6)~~ (4) For use in commercial garages having hazardous (classified) locations, except in accordance with 511.3(B).

~~(7)~~ (5) For use in theaters and similar locations, except where permitted in 518.4.

~~(8)~~ (6) For use in motion picture studios.

~~(9)~~ (7) For use in storage battery rooms.

~~(10)~~ (8) For use in hoistways, or on elevators or escalators.

~~(11)~~ (9) For installations embedded in poured cement, concrete, or aggregate.

~~(12)~~ (10) For use in hazardous (classified) locations, except where permitted in the following:

Substantiation: The proposed new wording adds additional restrictions on the use of NM cable well beyond what was acted on and approved by the decision of the NFPA Standards Council in accepting Proposal 7-137 of the NEC 2001 Report on Proposals, which was subsequently upheld by the NFPA Board of Directors. Specifically, the limitation that NM cable can only be used in Types III, IV, and V construction conflicts with the provisions of 334.10 which specifically allows NM cable in buildings "permitted to be" of Types III, IV, and V construction as clarified in the new FPN accepted per Log 7-42a.

In addition, the substantiation for the change only addressed the issues concerning us in normally dry locations and the expansion of the language for uses in damp locations.

The two FPNs are already included under 334.10 of the 2005 NEC.

Panel Meeting Action: Reject

Panel Statement: See panel action on Comment 7-18. The action on Proposal 7-49 included only Part B item (4).

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-26 Log #938 NEC-P07 **Final Action: Reject**
(334.12 Exception (New))

Submitter: Samuel R. LaDart, City of Memphis / Rep. IBEW Local 474
Comment on Proposal No: 7-51
Recommendation: The panel should have rejected this proposal.
Substantiation: This is a safety issue. Type NM cable should not be allowed to be routinely installed within a raceway system. The installation will contribute to short circuits, ground faults, and the overheating of conductors.

Panel Meeting Action: Reject

Panel Statement: The Exception limits installation of NM type cables into raceways that are authorized to be installed in Type I and II construction. The ampacity of NM type cables is specified in 334.80, is required to be corrected for ambient temperature and adjusted for more than 3 conductors in a raceway or cable. Chapter 9, Note to Tables (9) stipulates that the major diameter of elliptical cables shall be used to calculate the raceway fill.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

LADART, S.: We disagree with the panel action. Proposal 7-51 should be rejected.

Type NM cable is not designed to be routinely installed within a conventional raceway system. Raceway systems are allowed to contain as much as 360 degrees of total bend between pull points. Damage to the outer sheath of NM cable, (which is listed for use of up to 600 volts) could easily occur when installed within the confines of the raceway articles.

There are also reasonable concerns relating to the safe dissipation of heat. Conductors that are contained within a sheath, and then further confined within a raceway, and then possibly placed within thermal insulation creates a potential ignition source for a fire. The build up of heat will contribute to conductor insulation degradation that could ultimately lead to short circuits and ground faults: Clearly, something that the code requires that we avoid. This becomes a safety issue. Although the ampacity of NM cable is specified in 334.80, the acceptance of Proposal 7-51 establishes a new "condition of use" for NM cable with no technical substantiation for such an allowance.

7-27 Log #2203 NEC-P07 **Final Action: Reject**
(334.12 Exception)

Submitter: William A. Wolfe, Steel Tube Institute of North America
Comment on Proposal No: 7-51
Recommendation: Reject this Proposal.
Substantiation: During the Panel discussion in January, it was noted that this hybrid cable is not in production. When this comment was submitted during the 2005 NEC cycle, no data was presented to support the installation of this hybrid NM cable in a raceway system. We agree with the negative comments of Mr. Brown that Panel 6 would need to review such issues as heat dissipation, possible physical damage to the cable when pulled in a raceway, etc. Or a Fact-Finding Report should be submitted to assure that there are no negative consequences of installing the cable in a raceway. Types I and II buildings are generally hi-rise buildings where the safety of the wiring system is especially critical.
Panel Meeting Action: Reject
Panel Statement: The Exception limits installation of NM type cables into raceways that are authorized to be installed in Type I and II construction. The ampacity of NM type cables is specified in 334.80, is required to be corrected for ambient temperature and adjusted for more than 3 conductors in a raceway or cable. Chapter 9, Note to Tables (9) stipulates that the major diameter of elliptical cables shall be used to calculate the raceway fill.
Number Eligible to Vote: 14

7-28 Log #988 NEC-P07 **Final Action: Reject**
(334.12(1))

Submitter: Samuel R. LaDart, City of Memphis / Rep. IBEW Local 474
Comment on Proposal No: 7-57
Recommendation: The panel should have accepted this proposal.
Substantiation: Consistency should remain throughout the code. Other cabling articles list the requirements concerning physical damage in their respective articles. The same requirement should appear in Article 334.
Panel Meeting Action: Reject
Panel Statement: Section 300.4 addresses protection against physical damage for all wiring methods, and it is not necessary to repeat the requirements in 334.12. In addition the requirements of 334.15(B) address physical protection of the cable.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
SCHUMACHER, D.: This comment should have been accepted, Type NM cables are prone to be installed in all types of locations and conditions, and as they are the most commonly used, and the easiest to damage, they should be afforded more protection. 300.4 and 334.15(B) address how to protect cables in certain installation environments, but they do not forbid the installation of cables in all damaging locations.

7-29 Log #939 NEC-P07 **Final Action: Reject**
(334.12(A)(11) (New))

Submitter: Samuel R. LaDart, City of Memphis / Rep. IBEW Local 474
Comment on Proposal No: 7-54
Recommendation: The panel should have accepted this proposal.
Substantiation: This is a safety issue. Every attempt should be made to stop the spread of fire. We recommend a Fine Print Note to accomplish this objective.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any new technical basis or documentation to support the change.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
LADART, S.: We disagree with the panel action. This is a safety issue. Proposal 7-47 suggests that: "Wiring placed within residential air returns be protected by a metal raceway in order to reduce the possible spread of fire".
Although there was no technical basis or documentation to support the change, many AHJ's do not allow "any" wiring method to penetrate the space; therefore, it seems logical that protecting the cable by placing it within a metal raceway is a minimum effort to prevent the "spread of fire".

7-30 Log #644 NEC-P07 **Final Action: Reject**
(334.15(C))

Submitter: Mark Shapiro, Farmington Hills, MI
Comment on Proposal No: 7-58
Recommendation: Reject the proposed new wording.
(C) In Unfinished Basements ~~and Crawl Spaces.~~ Where cable is run at angles with joists in unfinished basements ~~and crawl space.~~
Substantiation: Where is there a problem with securing NM Cable to the underside of crawl space joists? To drill holes in joists, so as to raise the cables, is to weaken the building's structure.
Are we requiring this just because it is not uniform with the requirements in basements? So what? There is a level of homeowner activity in a basement that justifies the requirement to protect the cables there. Very little goes on in a crawl space and anyone working there is going to be a lot more aware of the surroundings than someone moving things around in a basement.
In other words, the claim in the original substantiation that, "the same dangers exist in both basements and crawl spaces" is simply not true.
Finally, on a purely practical level (dare I mention that); aside from the unnecessary structural weakening that would result from this proposal, is there a problem that makes it worthwhile requiring people to expend the extra labor?
Panel Meeting Action: Reject
Panel Statement: NM cable needs to be protected from physical damage in crawl spaces just as it is in other locations.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-31 Log #943 NEC-P07 **Final Action: Reject**
(334.15)

Submitter: Samuel R. LaDart, City of Memphis / Rep. IBEW Local 474
Comment on Proposal No: 7-58
Recommendation: The panel should have rejected this proposal.
Substantiation: This is a safety issue. This proposal will allow for unprotected wiring to be surface-installed directly to the lower edges of joists in (crawl spaces). Without a definition on what a crawl space is, this quickly becomes a hazardous situation. We feel as though there should be some well-defined height restrictions placed on the installation.
Panel Meeting Action: Reject
Panel Statement: NM cable needs to be protected from physical damage in crawl spaces just as it is in other locations.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
LADART, S.: We disagree with the panel action. Proposal 7-58 should have been rejected. The proposal will allow cables that are not smaller than No. 6 AWG or three No. 8 AWG conductors to become fastened directly to the lower edges of joists (in a crawl space). A "crawl space" is not defined in the NEC. Without placing "height restrictions" or defining a "crawl space", this added provision quickly becomes a safety issue. For example: A crawl space may exist beneath a building on a conventional foundation. An individual would have to navigate under surface mounted wiring, (possibly in a tight space), while attempting to move around under the building. The individual could snag the wiring and pull it away from its fastening. "Tight spaces" are already an impediment to performing work. Surface mounted cables should not be located in these types of spaces.
Without defining "crawl space", there are no guidelines or restrictions for allowing a lessening of the current rules. The panel action statement suggests that "adding crawl spaces" to the rules governing "unfinished basements" provides added protection for NM cable from physical damage because all of the rules pertaining to unfinished basements will now apply to crawl spaces as well. 300.4 requires NM cable, regardless of size to be protected from physical damage when installed through or parallel to framing members. We now have the acceptance of a proposal which is a lessening of current code requirements, with a panel action statement that suggests a strengthening of code requirements.

7-32 Log #355 NEC-P07 **Final Action: Accept**
(334.15(B))

Submitter: Code-Making Panel 8,
Comment on Proposal No: 7-62
Recommendation: CMP-8 supports the action on this proposal by CMP-7.
Substantiation: CMP-8 supports the action on this proposal and agrees with omitting the word "rigid" in two places.

This comment has been balloted through CMP-8 with the following ballot results:

12 Eligible to Vote
11 Affirmative
1 Negative

Mr. J. Dabe voted negatively stating: "CMP-8 recommends that CMP-7 reconsider this proposal and Accept it. The word "rigid" is correctly used here and is used in 300.5 also. CMP-8 has Accepted proposal to change nonmetallic to PVC."

Mr. R. Loyd voted affirmatively stating: "Proposal 7-62 was to Accept in Principle in Part. I agree with the CMP-7 action.

Comment on Proposal No: 7-63
Recommendation: The Technical Correlating Committee directs the panel to reconsider this proposal and correlate with action taken on Proposal 7-58. This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the direction of the TCC. The panel action on Proposal 7-58 modifies the panel action on Proposal 7-63.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-36 Log #408 NEC-P07 **Final Action: Hold**
(334.15(C))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 7-63
Recommendation: Revise panel third sentence:

NM cable installed on the wall of a ~~an unfinished~~ basement or garage shall be permitted...(remainder unchanged).

Substantiation: While this is apparently not prohibited by present code and has been a common practice, it is worthwhile as clarification. However, it should not be limited to unfinished basements. It is applicable to garage walls, finished walls etc., where NM cable is permitted.
Panel Meeting Action: Hold
Panel Statement: The panel holds Comment 7-36 for further study in accordance with 4.4.6.2.2(a) of NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-37 Log #944 NEC-P07 **Final Action: Reject**
(334.15(C))

Submitter: Samuel R. LaDart, City of Memphis / Rep. IBEW Local 474
Comment on Proposal No: 7-67
Recommendation: The panel should have rejected this proposal. The panel accepted it in principal in part.
Substantiation: The panel should not allow the lessening of a current code requirement on the installation of type NM cable in a crawl space. Our concern is that a crawl space is not defined. What's the difference between a crawl space and a similar area? How is the AHJ going to make his or her ruling?
Panel Meeting Action: Reject
Panel Statement: The term "crawl space" is accepted construction industry terminology while the term "similar area" is a possibly unenforceable and a vague term which 3.2.1 of the NEC Style Manual states should not be used in the NEC.

NM cable needs to be protected from physical damage in crawl spaces just as it is in other locations.

Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-38 Log #1076 NEC-P07 **Final Action: Reject**
(334.15(C))

Submitter: David Shapiro, Safety First Electrical Contracting Consulting & Safety Education
Comment on Proposal No: 7-67
Recommendation: Revise text to read as follows:

(C) Unfinished Basements, and Crawl Spaces ~~and Similar Areas~~. Where cable is run at angles with joists in unfinished basements or areas of buildings that are too low to be legal for habitation nor suitable for storage...".

Substantiation: I agree with Mr. Brown that "crawlspaces" should be defined.
Panel Meeting Action: Reject
Panel Statement: The phrase "legal for habitation nor suitable for storage" is vague and unenforceable. This phrase leaves too much subject to interpretation and would not be permitted by 3.2.1 of the NEC Style Manual.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-39 Log #44 NEC-P07 **Final Action: Accept**
(334.80)

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 7-72
Recommendation: It was the action of the Technical Correlating Committee that this proposal be reconsidered based on the action taken on Proposal 1-19. This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The Panel reconsidered its Action on Proposal 7-72 to Accept in Principle and the wording as modified in the Panel Action on Proposal 7-72 eliminates any conflict with the Action taken by Panel 1 on Proposal 1-19.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-40 Log #679 NEC-P07 **Final Action: Accept**
(334.80)

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 7-72
Recommendation: The Panel should continue to Accept in Principle, however, the wording should be revised as follows:

Where more than two NM cables containing two or more current-carrying conductors ~~pass~~ are installed, without maintaining spacing between cables, through the same opening in wood framing that is to be fire- or draft-stopped using thermal insulation, caulk, or sealing foam, the allowable ampacity of each conductor shall be adjusted in accordance with Table 310.15(B)(2)(a) and the provisions of 310.15(A)(2), Exception, shall not apply.

Substantiation: The revised wording provides additional clarity regarding the specific installation conditions and consistency with the text used in the third paragraph.

The Panel Action eliminated the word "bundled" and, as indicated in the panel statement, the revised wording more accurately describes the installation so there is no conflict with Proposal 1-19. The definition proposed in Proposal 1-19 is not appropriate nor applicable to the installation conditions addressed in this section since there is no requirement that the cables be physically bound together.

Panel Meeting Action: Accept
Number Eligible to Vote: 14

(334.80)

Submitter: Mike Holt, Mike Holt Enterprises, Inc.
Comment on Proposal No: 7-74
Recommendation: Reject this Proposal.
Substantiation: There is still no historical data of that shows any real life instances of this being a problem. The tests that are cited were most probably done with the cables subjected to currents at 100 percent of their rated values. The heating of the cable varies with the square of the current ratio. 90% current = 81% heating; 80% current = 54% heating; 70% current = 49% heating, and so forth. Considering the provisions of 210.19 and 210.20, it is very seldom that cables are every carrying their full ampacity for any substantial length of time. With that in mind, the 2002 NEC and previous editions had excellent track records, hence the lack of any real documented fire incidents. Until this proves to be more of a real world problem and not a hypothetical issue, the NEC should not require this drastic reduction in cable ampacities.
Panel Meeting Action: Reject
Panel Statement: The test data submitted with Proposal 7-74 supported the addition of this paragraph to 334.80 and recorded that the cables were never loaded more than 80% of their rated values and some cables failed when the load was as low as 60%.

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 7-75
Recommendation: Accept the proposal.
Substantiation: The reference in the panel statement to Proposal 7-74 actually supports this proposal. It appears that Mr. Lindsay has come to appreciate the dramatic effect of thermal insulation on ampacity. However, the next logical step is to address insulation generally, not just in the case where cables are bundled, and not just where the cables are touching the insulation, but where they are surrounded by it. If two bundled cables touching insulation exceeded their temperature ratings (Proposal 7-74) at 0.8 times table ampacity (assume "eight" in 7-74 is actually "eighty"), then the 80% should have been applied to the 60°C rating, and then that diminished current level would have not produced excessive temperatures on the cable conductors.

This is what I have been trying to get across to CMP 7 for the last several code cycles. A rule that says (as at present) that the final calculated ampacity cannot be used to justify based on anything higher than the 60°C column number is irrelevant. The fact that you started in the 90°C column in the first place is dangerous. Cables run in thermal insulation need a radically different ampacity calculation protocol than those that run in free air. This proposal provides the place to start. It is consistent with the technical experience underling Proposal 7-74. Two cables run through a common set of holes through framing members are bundled for the purposes of 310.15(B)(2)(a), and, therefore, two two-wire cables are subject to the 80% factor. If the cables are within insulation, then start in the 60°C. If they are in free air, start in the 90°C column.

The action on Proposal 7-90 makes this issue even more pressing, because 334.80 will now apply to SE cables. If this section doesn't change, SER cables will be taken at the 60°C column values in all instances. This is appropriate for embedment in insulation, but far too low for most common applications for those cables. For example, traditional 4/0 A1 SER cable (180A nominal ampacity for terminations; 205A for derating start point; 150A for final ampacity) taken as the final allowable ampacity for a cable that is an industry workhorse for 200A feeders (200A being the next higher standard size above the 75°C column). NEC users will be very concerned to find out their 200A cable just lost 25% of its ampacity.

The 150A number is completely defensible for 4/0 A1 cabling in insulation. The 200A number is perfectly defensible for the same cable run across the open floor joists. This proposal fully addresses the issues.
Panel Meeting Action: Reject
Panel Statement: With the action taken on proposal 7-74, it is not necessary to begin derating the conductors at the 60 degree C ampacity. The thermal insulation issue has been addressed.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-45 Log #239 NEC-P07 **Final Action: Hold**
(334.104(C))

TCC Action: The Technical Correlating Committee directs that this comment and Proposal 7-78 be reported as "hold" as they introduce inconsistencies between the reference to Part II of Article 334 in 334.104(C) and the lack of a similar reference in 334.104(B).

The Technical Correlating Committee further directs that the existing Fine Print Note in 334.116(C) of the 2005 NEC be deleted to correlate with the panel actions on Proposals 16-51 and 16-60.

Submitter: Stanley Kaufman, CableSafe Inc.
Comment on Proposal No: 7-78
Recommendation: Continue to accept this proposal in principle in part by modifying the action as shown.

(C) Optical Fibers. Optical fibers shall be permitted in Type NMS ~~cable as permitted in 770.9(C) and 770.113~~.

Substantiation: Panel 16 action on proposal 16-36 eliminated section 770.9(C).

Panel 16 action on proposals 16-51 and 16-60 modified section 770.113. Section 770.13, currently and as modified by proposals 16-51 and 16-60, has no requirements dealing with composite optical fiber cable. Section 770.113 requires the use of listed optical fiber cables with an exception for a limited length of unlisted outside plant cable to enter the building.
Panel Meeting Action: Accept in Principle
The panel accepts the deletion of the phrase "as permitted in 770.9(C) and 770.113" and revises 334.104(C) to read "(C) Optical Fibers. Optical fibers shall be permitted in Type NMS cable provided the requirements of Part II of Article 334 apply to the installation."
Panel Statement: When optical fibers are included in NMS cable, the requirements of Part II of Article 334 and, specifically, 334.10 (Uses Permitted) and 334.12 (Uses Not Permitted) apply to the installation of the cable.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 336 — POWER AND CONTROL TRAY CABLE: TYPE TC

7-46 Log #1831 NEC-P07 **Final Action: Reject**
(336.10(7))

Submitter: Michael Walls, American Chemistry Council
Comment on Proposal No: 7-81
Recommendation: The ACC agrees with Mr. Runyon's explanation of negative vote on proposal 7-81. In the panel substantiation, concern is raised about damage to the cable, "Expansion of the use of TC beyond those specific applications will expose the cable to damage that it is not designed to withstand." However, the first sentence of the proposal states, "where the cable is not subject to physical damage." The panel should accept the proposal to use Type TC cable under the conditions listed.
Substantiation: The panel action is inconsistent with that of Panel 3 on Proposal 3-205.

Panel Meeting Action: Reject
Panel Statement: TC cables are designed for installation in cable trays. They have nonmetallic outer jackets to facilitate installation without damage to the cabled conductors within. The cables are not designed for exposed installations. The differences in the physical properties nonmetallic and metallic outer coverings are very different. The tensile strength of steel and aluminum is typically 72,000 and 42,000 psi, respectively. The tensile strength of a nonmetallic covering is typically 2,000 psi. Simply meeting a crush and impact requirement does not encompass the abilities of a metallic outer covering on the cable.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
RUNYON, G.: The panel does not seem to be recognizing the proposed installations would be in areas "where the cable is not subject to physical damage." The "-ER" in TC-ER stands for exposed run, and is UL listed for such installations. The panel should have voted to accept this comment and its corresponding proposal to allow this wiring method.

7-47 Log #1875 NEC-P07 **Final Action: Reject**
(336.10(7))

Submitter: Donald A. Voltz, Mustang Engineering, Inc.
Comment on Proposal No: 7-80
Recommendation: Revise the new Exception 336.10(7) that was Accepted in Principal by the Panel as follows (underlined portion):
Exception: Where not subject to physical damage, Type TC-ER shall be permitted to transition between cable trays and between cable trays and utilization equipment or devices for a distance not to exceed 1.8 m (6 ft) without continuous support. **Where this distance exceeds 1.8 m (6 ft) continuous support shall be required**. **Where Type TC-ER cable that complies with the crush and impact requirements for Type MC-HL is used; the maximum distance without continuous support shall be increased to 15.2 m (50 ft) and the cable shall be supported in accordance with Article 330.** The cable shall be mechanically supported where exiting the cable tray to ensure that the minimum bending radius is not exceeded."
Substantiation: As written, the wording of the new Exception is confusing. Users may think that type TC-ER shall be permitted to be run only 6 ft period (i.e. between cable rays, between cable trays and utilization equipment or devices). The new second sentence clears up this confusion by requiring continual support where the cable runs beyond 6 ft.
The new third sentence would recognize an improved Type TC-ER that meets the more stringent crush and impact tests for Type MC-HL cable as outlined in UL 2225. As the Panel probably knows, the 1999 NEC allowed a standard Type TC-ER that met the crush and impact requirements of Type MC to be run 50ft outside of tray without the need for continuous support or mechanical protection as long as it was supported in accordance with Article 330. Over the last two Code cycles, the Panel has put unnecessary restrictions on it use. With the increased properties offered by this improved cable, the Panel should recognized it by allowing the original 50ft exception as was found in the 1999 Code. The Panel should take note that this cable can only be used in industrial establishments under the maintenance or supervision of qualified persons (i.e. a supervised installation). There are several cable manufacturers that offer this product.
Panel Meeting Action: Reject
Panel Statement: Type TC-ER that meets the crush and impact requirements of MC-HL are not equal to the true performance of the crush and impact of MC-HL. The 50-foot rule previously allowed was removed since it was considered unsafe. This is inconsistent with the requirement of securing and supporting in Article 336 which is 6 feet.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
RUNYON, G.: Mr. Voltz correctly points out that the panel has increased the restrictions on the use of this cable over the last 2 code cycles without technical documentation or documented incidents where the previously allowed installation practices caused a problem. I question the intent behind the panel's statement that TC-ER is not equal to the "true performance of the crush and impact of MC-HL." Does that mean that if manufacturers of MC-HL were only to meet and not exceed the requirements, that MC-HL also would be an unacceptable wiring method?

7-48 Log #1991 NEC-P07 **Final Action: Accept**
(336.104)

Submitter: Robert Konnik, Rockbestos-Surprenant
Comment on Proposal No: 7-83
Recommendation: Add allowance for nickel and nickel-coated copper conductors to 336.104 as shown below:
336.104 Conductors. The insulated conductors of Type TC cables shall be in sizes 18 AWG to 1000 kcmil copper, nickel, or nickel-coated copper, and sizes 12 AWG through 1000 kcmil aluminum or copper-clad aluminum. Insulated conductors of sizes 14 AWG and larger copper, nickel, or nickel-coated copper, and sizes 12 AWG through 1000 kcmil aluminum or copper-clad aluminum shall be one of the types listed in Table 310.13 or Table 310.62 that is suitable for branch circuit and feeder circuits or one that is identified for such use.
Substantiation: TC singles can be from Table 310.18 which could use nickel or nickel-coated coper. Some fire rated TC cables require nickel or nickel coated copper conductors. This harmonizes with the allowance of nickel and nickel-coated copper in 332.104 for MI cable. Note, many singles from Table 310.13 are high temperature rated, such as SA, FEP, FEPB, PFA, PFAH, TFE, Z and ZW. A variety of fixture wires singles are also rated for high temperatures and these may be used in Type TC cables. Additionally, PFAH and TFE can only use nickel coated conductors.
Panel Meeting Action: Accept
Panel Statement: The panel understands that the table references "Table 310.13 and Table 310.62" will be revised by the panel action on Comment 6-43.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
DALY, J.: NEMA votes in agreement with the panel action to accept Comment 7-48 with the following comment:
Through the acceptance of this comment the panel has not taken into consideration the ampacities to be used when nickel and nickel-coated copper conductors are used. Since the resistivity of nickel is 4 times higher than that of copper, the ampacity for these conductors needs to be addressed.
Table 310.18 presently covers ampacities for nickel or nickel-coated conductors for two insulation types, PFAH and TFE. It is, therefore, expected that these would be the only types that can be used with nickel and nickel-coated conductors for sizes 14 AWG and above.
However, Table 310.18 only covers conductor sizes 14 AWG through 4/0 AWG. This table would need to be extended up to 1000 kcmil in order to agree with the panel action.

ARTICLE 338 — SERVICE-ENTRANCE CABLE: TYPES SE AND USE

7-49 Log #45 NEC-P07 **Final Action: Accept**
(338.10(B)(2))

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 7-86
Recommendation: It was the action of the Technical Correlating Committee that this proposal be reconsidered and correlated with the action on Proposal 5-119. This action will be considered by the panel as a public comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the direction to reconsider and the panel accepts Proposal 7-86.

7-53 Log #1767 NEC-P07 **Final Action: Reject**
(338.12(B)(1) Exception)

Submitter: Michael Cole, MRC Electric
Comment on Proposal No: 7-92
Recommendation: Add to proposed 338.12(B)(1):

Exception k: Service entrance cable shall be permitted to be exposed to corrosive fumes or vapors provided that 1 or more of these measures are used:

1. All of the conductors of the SE cable are insulated.

2. A cable with a bare conductor is sealed at both ends. The sealant shall be placed between the wire strands of the bare conductor regardless of whether the conductor is concentric stranded or compact stranded and the exposed bare conductor shall be insulated using rubber electrical tape or a heat shrink sleeve up to the point of connection.

3. The cable and connected enclosures are purged and pressurized with a noncorrosive atmosphere

. 4. The cable is sealed at one end and connected to a purged and pressurized enclosure at the other end.

5. SE cable that is constructed with strand blocking compound and filler compound that blocks transmission of unwanted liquids and gases.

Substantiation: a. Thanks to catalytic converters there is a way for a quite ordinary outdoor environment to be corrosive to copper wire. Therefore, SE cable could be accidentally banned for buildings that are within 1/2 of a mile of an Interstate highway or alongside a main street.

b. Alcan makes a 5-wire SER cable that can be used in a corrosive environment by either ignoring the bare wire or by insulating the bare wire at each end. Likewise, the Type MC cable that Alcan makes has a bare equipment grounding wire and this would need to be insulated in the field. Type UF cable also would need to have its equipment grounding conductor insulated in the field particularly if ammonia gas is present. Ammonia gas is murder on copper wire.

c. Theoretically, MC cable cannot be used with nonmetallic boxes. This is a possible interpretation of NEC 314.3 Exception No. 1 because of the difficulty of fastening MC cable to a nonmetallic box and providing a grounding means that works - larger nonmetallic boxes have thick walls that preclude the use of grounding bushings which means that an aluminum plate would need to be hacked in which would void the listing of the box.

d. Where ammonia gas is present a very good solution is to purge and pressurize electrical rooms, enclosures, cables and conduits.

One source of ammonia gas is the clay (aluminum oxide) powder that foundries use as molding material instead of sand which is very hard on machine tools. The combination of ammonia, oxygen, water, and fluxing chlorides dissolves or tarnishes all useful metals except indium and possibly also bismuth and very remotely copper free aluminum. However, aluminum alloys need a bit of magnesium for structural strength which means that corrosives will pockmark aluminum castings, boxes, and conduits. Steel beams have to be heavily painted in such an environment. The wastewater treatment building of one such facility where I worked had the ability to dissolve stainless steel and was 3 times as bad as how an oceangoing vessel needs to be rewired once every 10 years.

Presence of ammonia gas or chlorine gas is a very difficult corrosion problem and most devices that are listed as corrosion resistant are corrosion resistant in the presence of chlorides only. Presence of ammonia gas or chlorine gas with or without chlorides is beyond the listing and requires additional protection such as purging and pressurization. For some corrosive areas there is a lot in the way of electrical engineering that is more on the side of chemical engineering.

In some corrosive environments ALL wiring methods are unsatisfactory which means that the lest unsatisfactory method needs to be used or a throwaway wiring method needs to be used.

e. One way to avoid pockmarking of aluminum boxes, wireways, and cable trays is to paint the object with urethane varnish. Urethane varnish is transparent enough that corrosion will not be hidden. Urethane varnish is chemically related to crazy glue which makes it as impervious to gases and liquids as a protective coating can get. Similarly, luminaire threads can be treated with silicone lubricant to prevent glass to aluminum and aluminum to aluminum seizing.

However, this does not work for the interior of aluminum rigid conduit or liquidtight flexible metal conduit which would require urging and pressurization.

Electrically insulating varnish is also one of the classic methods of protecting busbars and so forth against corrosion and excessive moisture such as in tropical climates.

f. One way to protect wire terminations is to pot the termination with Type 1 Room Temperature Vulcanizing silicone sealant.

g. A foundry environment can use UF and SE cables as an exposed wiring method by pretending that the bottom flange of a steel beam is a mini cable tray. See 336.10(7) for this concept.

398.10 allows the use of open wiring on insulators which has to be one grade lower than UF, SE, and TC cables.

396.10 allows the use of exposed SE, UF, TC, MV, and individual conductors as messenger supported wiring in an industrial establishment.

UF, SE, and MV cables are allowed in cable tray without enclosing the cable tray in Type X drywall.

With all of these provisions for using Type UF and SE cables as exposed wiring in a factory, application of 334.10(3) is a bit illogical, electric, and down right silly.

h. One of the advantages of using UF cable for exposed wiring in a corrosive area is that 3 ft of slack can be folded up at each end so that even if Dryconn wire connectors or split bolts go bad the splice can be redone without disturbing other splices. Similar things can be done with SE and TC cables particularly since most TC cables are dual rated as Type UF. Cables type wiring methods in a factory are more repairable than raceway wiring methods which is an advantage in some instances.

i. According to some people in the oil industry whom I met online through www.eng-tips.com, PVC coated steel conduit corrodes in a brine processing facility and is absolutely useless.

j. At this foundry waste reprocessing and recycling facility where I worked PVC rigid conduit has a tendency to fall apart for several reasons:

1. Foundry dirt jams expansion couplings.
2. Conduit fasteners are so tight that an expansion coupling does not work.
3. Expansion couplings were omitted.
4. The combination of purple primer and all weather solvent cement was not used to produce superior joints.
5. The gray PVC cement that is alleged to be the best thing for PVC conduit breaks down after a few years allowing joints to break when exposed to cold outdoor temperatures or even worse the inside of a blast freezer.
6. Foundry dirt contaminates primer and solvent cement.
7. The stranded wire that is used for circuits up to 30 amperes in conduit is more susceptible to corrosion than the solid wire in UF cable as follows:

a. Building wire is not available in tin plated or nickel plated copper wire like with tray cable or control cable.

b. Stranded wire has more surface area for corrosive to attack than solid wire.

c. The silicon carbide paper elbow grease electrical grease is more likely to be used on solid wire.

d. Stranded wire can have problems with only 1/4 of the wire strands conducting such that a 20-ampere circuit has effectively 5 ampere wiring leading to a burn down. One PVC conduit in the truck unloading building of this foundry waste facility actually exploded even though the ammonia in the atmosphere was breathable and nonflammable.

e. Corrosive gases can flow in between the strands of stranded conductor hence the invention of Pirelli Strandseal conductor. Same effect can be done using purging and pressurization.

8. Ericson makes watertight/gastight female cord connectors that are UL listed for use with UF cable using an oval grommet. This is 1 wiring grade better than rubber cord. When made up with silicone lubricant such as Dow Corning number 111 a separable connection such as for a light fixture is absolutely watertight and gastight.

k. Flexible PVC conduit has to be supported just as often as UF cable and does not really provide any extra protection against mechanical damage.

l. Mice and rats can chew through steel and concrete which means that there is no such thing as rodent proof wiring. I have also vacuumed out enough street lighting handholes to know that saliva is semiconductirve enough that you cannot electrocute a mouse by sticking 480 volts into its mouth which means that they can chew right through live circuits.

m. At this foundry waste reprocessing facility where I worked there were 3 other buildings that were twice as bad as how an oceangoing vessel needs to be rewired once every 10 years if using conventional wiring methods. There are a lot of new products on the market such as nonmetallic channel strut and threaded rod that is intended to function under this kind of condition such that a complete rewire need only be done once every 15 years.

Let us who have extremely corrosive conditions figure out how to cope with the problem and to solve the safety and durability hazards and costs.

Panel Meeting Action: Reject
Panel Statement: The panel is not sure exactly where the submitter intends the exception to be located. The comment proposes adding an exception to 338.12(B)(1) on the use of Service Entrance (SE) cable, however, 338.12(B) addresses Underground Service Entrance Cable (USE). 338.12(A) addresses SE cable and 338.10(A)(1) already refers to 230.50(A) for protection where subject to physical damage.

ARTICLE 342 — INTERMEDIATE METAL CONDUIT: TYPE IMC

8-3 Log #850 NEC-P08 **Final Action: Accept**
(342)

Submitter: John P. Masarick, Independent Electrical Contractors Inc.
Comment on Proposal No: 8-3
Recommendation: The panel is encouraged to continue to Reject Proposal 8-3.
Substantiation: The reasons to continue to Reject the Proposal are as follows:
1. The trend by the CMPs over the last several code cycles has been to limit the use of FPNs.
2. There is also a correlation issue. There is a conflict between those panels that accepted the proposal and those that rejected the proposal.
3. These standards are also covered by a Fine Print Note in 110.12.
4. The FPN should not be accepted because numerous standards and installation manuals exist and to only mention one does not adequately inform the public about accepted industry practices. The NEC is not intended to be an instruction manual for untrained persons. If the FPNs are allowed to reference these standards, then they should list all applicable standards.
5. Since the referenced installation standards are intentionally general to cover different models of equipment, approval of the FPN may lead many to believe these standards can be used instead of listed or labeled manufacturer's instructions which would be in violation of 110.3(B).
6. If the CMP would like to include the reference, it should be placed in the Annex with the other references.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the comment to continue to reject the proposal and reiterates its substantation for that rejection as stated in the ROP: "As 90.1(C) states: This Code is not intended as a design specification or instruction manual for untrained persons." The panel does not necessarily agree with all points of the submitter's substantiation.

Ballot Results: Affirmative: 12

8-7 Log #781 NEC-P08 **Final Action: Accept**
(342.30(C))

Submitter: David G. Humphrey,
Comment on Proposal No: 8-9
Recommendation: Revise text to read as follows:
Where oversized, concentric or eccentric knockouts are not encountered, Type IMC shall be permitted to be unsupported where the raceway is not more than ~~900 mm (3 ft)~~ 450 mm (18 in.) and remains in unbroken lengths (without coupling). Such raceways shall terminate in an outlet box, device box, cabinet, or other termination at each end of the raceway.
Substantiation: The existing text does not address issues that could have a direct negative impact on the durability of the installation. The affects of weight and vibration of the raceway, especially with larger raceway sizes, may cause loosening at the raceway termination points. This loosening would certainly impose an impediment to the raceways ability to safely carry the maximum fault current likely to be imposed on the raceway. Reducing the length to 450 mm (18 in.) would half the weight of the raceway in the current text, and still provide ample room to install normal supporting and securing hardware for longer lengths. Prohibiting unsupported raceways where oversized, concentric, or eccentric knockouts are encountered would serve to maintain the integrity of the equipment grounding function of the raceway.
In summation, the proposed revised text would meet the submitter's intent and address system durability issues.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
GRIFFITH, M.: Panel action on this Comment should have been to "Reject" rather than to "Accept" for the following reasons:
1. The new language suggesting an 18 in. limit completely changes the intent of the original proposal which was to clarify a widespread practice in industry that is already implied to be acceptable by existing code language and for which there is no evidence to change.
2. The spacing of 18 in. is new material that has not had public review and is not substantiated.
3. The limitation to installations "where oversized...knockouts are not encountered" has not been substantiated. In addition, concerns about knockouts can be addressed by any of several installation methods representing good workmanship that result in adequate support.
Panel action on the original Proposal 8-9 should continue to apply.

8-8 Log #983 NEC-P08 **Final Action: Accept**
(342.30(C))

Submitter: Mark C. Ode, Underwriters Laboratories Inc.
Comment on Proposal No: 8-9
Recommendation: Add an introduction to the new (C) provided in the proposal to read as follows:
342.30 Securing and Supporting
IMC shall be installed as a complete system in accordance with 300.18 and shall be securely fastened in place and supported in accordance with 342.30(A) and (B) or permitted to be unsupported in accordance with 342.30(C).
(C) Unsupported raceways. Type IMC shall be permitted to be unsupported where the raceway is not more than 900 mm (3 ft) in length and remains in unbroken lengths (without coupling). Such raceway shall terminate in an outlet box, junction box, device box, cabinet, or other termination at each end of the raceway.
Substantiation: The added text helps provide an introduction to the new (C) for unsupported IMC.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-9 Log #1077 NEC-P08 **Final Action: Accept in Principle**
(342.30(C))

Submitter: David Shapiro, Safety First Electrical Contracting Consulting & Safety Education
Comment on Proposal No: 8-9
Recommendation: Accept (C) but change the last sentence to "Such raceway shall terminate in ~~an outlet box, junction box, device box, cabinet, or other termination~~ a threaded opening or a single knockout at each end."
Substantiation: This modification addresses Mr. Humphrey's concern about concentric and eccentric knockouts, etc. It also eliminates the use of a laundry list ending in "or other termination," which seems a plus.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Comment 8-7. The panel believes that the action on Comment 8-7 meets the intent of the submitter.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
GRIFFITH, M.: Panel action should have been to "Reject" this Comment. There is no substantiation for the limit(s) imposed by the submitter's suggested revision. See also my Explanation of Negative Vote on Comment 8-7.

8-10 Log #1393 NEC-P08 **Final Action: Accept in Principle in Part**
(342.30(C))

Submitter: James M. Imlah, City of Hillsboro
Comment on Proposal No: 8-9
Recommendation: Revise text to read as follows:
(c) Unsupported raceways: Type IMC shall be permitted to be unsupported where the raceways is not more than 600 mm (2 ft) ~~900 mm (3 ft)~~ in length and remains in unbroken lengths (without coupling). Such raceway shall terminate, where oversized, eccentric or concentric knockout are not encountered in an outlet box, junction box, device box, cabinet, or other termination at each end of the raceway.
Substantiation: This allowance should only be allowed for 24" nipples or less in length. Many times IMC nipples, as described in Table 9 Note 4, are installed for the intent of allowing additional conductor conduit fill. By following the 24" length of this note for nipples provides consistency for short sections of raceway being installed and meet submitters intent. Additionally, support shall be installed if oversized, eccentric, or concentric knockouts are encountered to maintain assured grounding and bonding continuity due to vibration or loose oversized knockouts.
Panel Meeting Action: Accept in Principle in Part
Panel Statement: The panel action on Comment 8-7 satisfies the eccentric or concentric issue of the submitter; however, the panel rejects the recommendation to increase the unsupported length to 2 feet.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
GRIFFITH, M.: Panel action should have been to "Reject" this Comment. The revision suggested by the submitter is new material and is not substantiated. See also my Explanation of Negative Vote on Comment 8-7.

8-11 Log #1920 NEC-P08 **Final Action: Reject**
(342.30(C) (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 8-9
Recommendation: Reject the proposal.
Substantiation: The concept of a special support rule for short lengths of raceway run between enclosures of various sorts is without technical substantiation, and at variance from routine trade practice. No such requirement has ever been in the NEC. Raceways generally require support within 3 ft of terminations, and when the entire length is just that long, then no additional support is ever required. In effect, the locknuts and bushings or connectors and locknuts at each end are supports. This is not a new concept for the NEC: CMP 7 just added the wording "(wiring method) fittings shall be permitted as a means of cable support" in a number of cable articles. In addition, this section allows up to 5 ft of raceway to be unsupported, except at the outer end. In the case of IMC and RMC, that 5-ft length can be broken and contain any number of short segments coupled together. This proposal is without precedent, and addresses a nonexistent problem.
Panel Meeting Action: Reject
Panel Statement: Section 342.30(A) specifically states, "Each IMC shall be securely fastened within 900 mm (3 ft) of each outlet box, junction box, device box, cabinet, conduit body, or other conduit termination." There is no special support rule, just the already existing securely fastened rule. See also panel action on Comment 8-7.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
GRIFFITH, M.: Panel action should have been "Accept in Principle" for this Comment. The submitter's substantiation is correct except for his (likely unintended) reference to "support" instead of "secured in place" as identified in the Panel statement. See also my Explanation of Negative Vote on Comment 8-7.

(Note: The sequence no. 8-13 was not used.)

8-14 Log #984 NEC-P08 **Final Action: Accept in Principle in Part**
(344.10(A), (B), and (C))

Submitter: Mark C. Ode, Underwriters Laboratories Inc.
Comment on Proposal No: 8-15
Recommendation: Revise as follows:
344.10 Uses Permitted
(A) Atmospheric Conditions and Occupancies.
(1) Galvanized Steel and Stainless Steel RMC. Galvanized steel and stainless steel RMC shall be permitted under all atmospheric conditions and occupancies.
(2) Red brass RMC. Red brass RMC shall be permitted to be installed for direct burial and swimming pool applications.
(3) Aluminum RMC. Aluminum RMC shall be permitted to be installed where judged suitable for the environment. Rigid aluminum conduit encased in concrete or in direct contact with the earth shall be provided with approved supplementary corrosion protection.
(4) Ferrous Raceways and Fittings. Ferrous raceways and fittings protected from corrosion solely by enamel shall be permitted only indoors and in occupancies not subject to severe corrosive influences.
(B) ~~Corrosion~~ Corrosive Environments.
(1) Galvanized Steel, Stainless Steel and Red Brass RMC, Elbows, Couplings, and Fittings. Galvanized steel, stainless steel and red brass RMC, elbows, couplings, and fittings shall be permitted to be installed in concrete, in direct contact with the earth, or in areas subject to severe corrosive influences where protected by corrosion protection and judged suitable for the condition.
(2) Supplementary Protection of Aluminum RMC. Aluminum RMC shall be provided with approved supplementary corrosion protection where encased in concrete or in direct contact with the earth.
FPN: The galvanizing on steel (ferrous) RMC provides corrosion protection. The AHJ may require supplementary corrosion protection for severely corrosive environments. Where aluminum (non-ferrous) RMC is encased in concrete or direct-buried, approved supplementary corrosion protection ~~is~~ may be required. This protection can be provided in a variety of ways including factory PVC-coating, tape-wrapping, or painting with a zinc-rich paint.
(C) Cinder Fill. Galvanized steel, stainless steel and red brass RMC shall be permitted to be installed in or under cinder fill where subject to permanent moisture where protected on all sides by a layer of noncinder concrete not less than 50 mm (2 in.) thick; where the conduit is not less than 450 mm (18 in.) under the fill; or where protected by corrosion protection and judged suitable for the condition.
Substantiation: Titles were added to the sub-sections to comply with the NEC Style Manual. The text was changed in the FPN from mandatory text to non-mandatory text in compliance with the NEC Style Manual.

Panel Meeting Action: Accept in Principle in Part
Accept the title changes as recommended, reject the revision proposed to the FPN, and in addition, delete the FPN in its entirety.
Panel Statement: The FPN creates a conflict with the requirement.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-15 Log #730 NEC-P08 **Final Action: Accept**
(344.13)

Submitter: Robert Kelleher, Paramount Electrical Services
Comment on Proposal No: 8-19
Recommendation: Continue to Reject .
Substantiation: Continue to Reject. The addition of these NECA Fine Print Notes, serves no benefit to the user of the National Electrical Code. These are not standards, they are a compilation of generic information and do not serve as information to the user. These must be purchased through NECA. This FPN as written is nothing more than free advertisement for generic, readily available information which must be purchased by the code user. A total of seventeen new Fine Print Notes were proposed to reference NECA standards. Sixteen were unanimously rejected. Inclusion of this Fine Print Note is in direct conflict with 90.1(C). The TCC should intervene to prohibit these types of Fine Print Notes. CMP 8 should continue to reject this FPN. Failure to do so will mean adding Fine Print Notes for IEC, EEI, IBEW, IAEI, ACC, NETA, NEI, SEIA, AISI, API, ASHE, AHAM, ICEAI, NYBFU and dozens of others when they decide to develop income through generic standards development. If this type of Fine Print Note is placed anywhere in the NEC an Annex should be included with coupons for the code user. If the NEC is to be used for advertisement purposes, coupons should be included.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the comment to continue to reject the proposal and reiterates its substantiation for that rejection as stated in the ROP: "As 90.1(C) states: This Code is not intended as a design specification or instruction manual for untrained persons." The panel does not necessarily agree with all points of the submitter's substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

If the NEC is to be used for advertisement purposes, coupons should be included.
It is interesting to note that the American Iron and Steel Institute publicly endorses NECA publications as a "tool to assist untrained electricians to make safer and better installations." However, 90.1(C) states that the NEC is not intended "as a design specification or an instruction manual for untrained persons." The TCC should step in to remove all Fine Print Notes of this type.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the comment to continue to reject the proposal and reiterates its substantiation for that rejection as stated in the ROP: "As 90.1(C) states: This Code is not intended as a design specification or instruction manual for untrained persons." 8-18 Log #853 NEC-P08 **Final Action: Accept**
(344.13 (New))

Submitter: John P. Masarick, Independent Electrical Contractors Inc.
Comment on Proposal No: 8-18
Recommendation: The panel is encouraged to continue to Reject Proposal 8-18.
Substantiation: The reasons to continue to Reject the Proposal are as follows:
1. The trend by the CMPs over the last several code cycles has been to limit the use of FPNs.
2. There is also a correlation issue. There is a conflict between those panels that accepted the proposal and those that rejected the proposal.
3. These standards are also covered by a Fine Print Note in 110.12.
4. The FPN should not be accepted because numerous standards and installation manuals exist and to only mention one does not adequately inform the public about accepted industry practices. The NEC is not intended to be an instruction manual for untrained persons. If the FPNs are allowed to reference these standards, then they should list all applicable standards.
5. Since the referenced installation standards are intentionally general to cover different models of equipment, approval of the FPN may lead many to believe these standards can be used instead of listed or labeled manufacturer's instructions which would be in violation of 110.3(B).
6. If the CMP would like to include the reference, it should be placed in the Annex with the other references.
Panel Meeting Action: Accept

Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-20 Log #782 NEC-P08 **Final Action: Accept**
(344.30(C))

Submitter: David G. Humphrey, Midlothian, VA
Comment on Proposal No: 8-23
Recommendation: Revise text to read as follows:
Where oversized, concentric or eccentric knockouts are not encountered, Type RMC shall be permitted to be unsupported where the raceway is not more than ~~900 mm (3 ft)~~ 450 mm (18 in.) and remains in unbroken lengths (without coupling). Such raceways shall terminate in an outlet box, device box, cabinet, or other termination at each end of the raceway.
Substantiation: The existing text does not address issues that could have a direct negative impact on the durability of the installation. The affects of weight and vibration of the raceway, especially with larger raceway sizes, may cause loosening at the raceway termination points. This loosening would certainly impose an impediment to the raceways ability to safely carry the maximum fault current likely to be imposed on the raceway. Reducing the length to 450 mm (18 in.) would half the weight of the raceway in the current text, and still provide ample room to install normal supporting and securing hardware for longer lengths. Prohibiting unsupported raceways where oversized, concentric, or eccentric knockouts are encountered would serve to maintain the integrity of the equipment grounding function of the raceway.
In summation, the proposed revised text would meet the submitter's intent and address system durability issues.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
GRIFFITH, M.: Panel action on this Comment should have been to "Reject" rather than to "Accept" for the following reasons:
1. The new language suggesting an 18 in. limit completely changes the intent of the original proposal which was to clarify a widespread practice in industry that is already implied to be acceptable by existing code language and for which there is no evidence to change.
2. The spacing of 18 in. is new material that has not had public review and is not substantiated.
3. The limitation to installations "where oversized...knockouts are not encountered" has not been substantiated. In addition, concerns about knockouts can be addressed by any of several installation methods representing good workmanship that result in adequate support.
Panel action on the original Proposal 8-23 should continue to apply.

8-21 Log #966 NEC-P08 **Final Action: Accept**
(344.30(C))

Submitter: Mark C. Ode, Underwriters Laboratories Inc.
Comment on Proposal No: 8-23
Recommendation: Add an introduction to the new (C) provided in the proposal to read as follows:
344.30 Securing and Supporting
RMC shall be installed as a complete system in accordance with 300.18 and shall be securely fastened in place and supported in accordance with 344.30(A) and (B) or permitted to be unsupported in accordance with 344.30(C).
(C) Unsupported raceways. Type RMC shall be permitted to be unsupported where the raceway is not more than 900 mm (3 ft) in length and remains in unbroken lengths (without coupling). Such raceway shall terminate in an outlet box, junction box, device box, cabinet, or other termination at each end of the raceway.
Substantiation: This added new subsection (C) needs an introduction in the main text to comply with the NEC Style Manual.

Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-22 Log #1078 NEC-P08 **Final Action: Accept in Principle (344.30(C))**

Submitter: David Shapiro, Safety First Electrical Contracting Consulting & Safety Education
Comment on Proposal No: 8-23
Recommendation: Accept (C) but change the last sentence to "Such raceway shall terminate in ~~an outlet box, junction box, device box, cabinet, or other termination~~ a threaded opening or a single knockout at each end."
Substantiation: This modification addresses Mr. Humphrey's concern about concentric and eccentric knockouts, etc. It also eliminates the use of a laundry list ending in "or other termination," which seems a plus.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Comment 8-20. The panel believes that the action on Comment 8-20 meets the intent of the submitter.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
GRIFFITH, M.: Panel action should have been to "Reject" this Comment. There is no substantiation for the limit(s) imposed by the submitter's suggested revision. See also my Explanation of Negative Vote on Comment 8-20.

8-23 Log #1395 NEC-P08 **Final Action: Accept in Principle in Part (344.30(C))**

Submitter: James M. Imlah, City of Hillsboro
Comment on Proposal No: 8-23
Recommendation: Revise text to read as follows:
(c) Unsupported raceways: Type RMC shall be permitted to be unsupported where the raceways is not more than 600 mm (2 ft) ~~900 mm (3 ft)~~ in length and remains in unbroken lengths (without coupling). Such raceway shall terminate, where oversized, eccentric or concentric knockout are not encountered in an outlet box, junction box, device box, cabinet, or other termination at each end of the raceway.
Substantiation: This allowance should only be allowed for 24" nipples or less in length. Many times RMC nipples, as described in Table 9 Note 4, are installed for the intent of allowing additional conductor conduit fill. By following the 24" length of this note for nipples provides consistency for short sections of raceway being installed and meet submitters intent. Additionally, support shall be installed if oversized, eccentric, or concentric knockouts are encountered to maintain assured grounding and bonding continuity due to vibration or loose oversized knockouts.
Panel Meeting Action: Accept in Principle in Part
Panel Statement: The panel action on Comment 8-20 satisfies the eccentric or concentric issue of the submitter; however, the panel rejects the recommendation to increase the unsupported length to two feet.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
GRIFFITH, M.: Panel action should have been to "Reject" this Comment. The revision suggested by the submitter is new material and is not substantiated. See also my Explanation of Negative Vote on Comment 8-20.

8-24 Log #1922 NEC-P08 **Final Action: Reject**
(344.30(C) (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 8-23
Recommendation: Reject the proposal.
Substantiation: The concept of a special support rule for short lengths of raceway run between enclosures of various sorts is without technical substantiation, and at variance from routine trade practice. No such requirement has ever been in the NEC. Raceways generally require support within 3 ft of terminations, and when the entire length is just that long, then no additional support is ever required. In effect, the locknuts and bushings or connectors and locknuts at each end are supports. This is not a new concept for the NEC: CMP 7 just added the wording "(wiring method) fittings shall be permitted as a means of cable support" in a number of cable articles. In addition, this section allows up to 5 ft of raceway to be unsupported, except at the outer end. In the case of IMC and RMC, that 5-ft length can be broken and contain any number of short segments coupled together. This proposal is without precedent, and addresses a nonexistent problem.
Panel Meeting Action: Reject
Panel Statement: Section 344.30(A) specifically states, "Each RMC shall be securely fastened within 900 mm (3 ft) of each outlet box, junction box, device box, cabinet, conduit body, or other conduit termination." There is no special support rule, just the already existing securely fastened rule. See also panel action on Comment 8-20.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
GRIFFITH, M.: Panel action should have been "Accept in Principle" for this Comment. The submitter's substantiation is correct except for his (likely unintended) reference to "support" instead of "secured in place" as identified in the panel statement. See also my Explanation of Negative Vote on Comment 8-20.

ARTICLE 348 — FLEXIBLE METAL CONDUIT: TYPE FMC

8-25 Log #2041 NEC-P08 **Final Action: Accept in Principle (348.30)**

Submitter: James M. Imlah, City of Hillsboro
Comment on Proposal No: 8-35
Recommendation: Revise as follows:
FMC shall be securely fastened in place and supported in accordance with 348.30(A) and (B).
(A) Securely Fastened. FMC shall be securely fastened in place by an approved means within 300 mm (12 in.) of each box, cabinet, conduit body, or other conduit termination and shall be supported and secured at intervals not to exceed 1.4 m (4 ft).
Exception No. 1: Where FMC is fished.
Exception No. 2: At terminals where installed for flexibility is required, lengths shall not exceed the following:
Substantiation: There are installations of metallic flex being installed under exception 2 with the allowance for increased distance for supports. Permanently attached electrical equipment and appliances are being connected under the guise of "where flexibility is required." "Is required" is not enforceable term. Additionally, there have been instances that engineers, architects, and installers are determining what type of flexibility is required and specify the allowance for expanded support allowances,. Why should the "exception" allowing for flexibility when equipment is permanently attached to structure and there is no need for flexibility? The intent of this section is for equipment that requires flexibility such as motors with belt tension adjustments, or equipment that has constant movement in normal operations. See attached picture as an example.
Panel Meeting Action: Accept in Principle
Revise 348.30(A), Exception 2, to read as follows:
"Exception No. 2: Where flexibility is necessary after installation, lengths shall not exceed the following: (remainder of existing text remains unchanged)."

In addition, in (A), the comment incorrectly states the English measurement as 4 feet; it should be 4 l/2 feet.

Panel Statement: The revised panel wording clarifies the intent of the submitter.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-26 Log #2035 NEC-P08 **Final Action: Reject**
(348.30(A) Exception No. 4)

Submitter: Donald Cook, Shelby County Building Inspections
Comment on Proposal No: 8-39
Recommendation: Accept proposal as submitted.
Substantiation: While I understand and agree with the panel statement that a raceway that closely follows the surface upon which it is installed is less likely to become damaged by penetration of screws, nails, etc., I fail to understand how that statement is different in an accessible or non-accessible ceiling. As an installer and an AHJ, I have worked above accessible and non-accessible ceilings and found both to sometimes have building surfaces where raceways could be secured and found both to sometimes be suspended and not have building surfaces where raceways could be secured. Available building surfaces is not directly related to the accessibility of the ceiling.
Panel Meeting Action: Reject
Panel Statement: Accessible ceilings are drop ceilings with removal panels and are not likely to have screws or nails driven through them and penetrating the FMC. Also 300.11(A) states that cables and raceways shall not be supported by the ceiling grids.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-27 Log #1079 NEC-P08 **Final Action: Accept**
(348.60)

Submitter: David Shapiro, Safety First Electrical Contracting Consulting & Safety Education
Comment on Proposal No: 8-41
Recommendation: I support the panel in accepting the new text as written.
Substantiation: I am concerned about the "accept in principle" comments. If there are field reports of inspectors rejecting jobs where flexibility is required not due to continuous movement but due to vibration or occasional movement or adjustment, then the wording ought to be modified. As it stands, "flexibility after installation" is a useful clarification, and encompasses all these.
Panel Meeting Action: Accept
Panel Statement: Panel 8 agrees that the panel action on Proposal 8-41 should have been "Accept in Principle". The panel statement would remain the same.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-28 Log #2042 NEC-P08 **Final Action: Reject**
(348.60)

Submitter: James M. Imlah, City of Hillsboro
Comment on Proposal No: 8-40
Recommendation: Revise as follows:
348.60 Grounding and Bonding.
Where used to connect equipment where installed for flexibility ~~is required,~~ an equipment grounding conductor shall be installed.
~~Where~~ FMC not installed for flexibility ~~is not required~~, ~~FMC~~ shall be permitted to be used as an equipment grounding conductor when installed in accordance with 250.118(5).
Where ~~required~~ or installed for flexibility, equipment grounding conductors shall be installed in accordance with 250.134(B).
Where required or installed for flexibility, equipment bonding jumpers shall be installed in accordance with 250.102.
Substantiation: Required is applied to this section as a mandatory requirement. Additionally, as with earlier substantiation, "where required" is not enforceable. The sentence states that an "Equipment grounding conductor shall be installed" so the requirement for conductor installation should be when a wiring method is installed as needed for specific connection conditions. There are wiring methods that can be installed that provides flexibility, but determining where flexibility is required is subjective between inspectors, installers, engineers creating confusion. As stated by CMP-7 (7-32), even M/C cable is a general wiring method and is not limited to installations for flexibility. Normally, inspectors find these types of corrections after the fact which creates hardship and loss of production time to end users if the FMC installation is not "for flexibility."
Panel Meeting Action: Reject
Panel Statement: The new text in the 2008 draft for 348.60 based on ROP 8-40 and 8-41 makes it clear when an equipment grounding conductor is or is not required.
348.60 Grounding and Bonding. Where used to connect equipment where flexibility is required after installation, an equipment grounding conductor shall be installed.
[ROP 8–40]
Where flexibility is not required after installation, FMC shall be permitted to be used as an equipment grounding conductor when installed in accordance with 250.118(5).
[ROP 8–41]
Where required or installed, equipment grounding conductors shall be installed in accordance with 250.134(B). Where required or installed, equipment bonding jumpers shall be installed in accordance with 250.102.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 350 — LIQUIDTIGHT FLEXIBLE METAL CONDUIT: TYPE LFMC

8-29 Log #2044 NEC-P08 **Final Action: Accept in Principle**
(350.30)

Submitter: James M. Imlah, City of Hillsboro
Comment on Proposal No: 8-47
Recommendation: Revise as follows:
A) Securely Fastened. LFMC shall be securely fastened in place by an approved means within 300 mm (12 in.) of each box, cabinet, conduit body, or other conduit termination and shall be supported and secured at intervals not to exceed 1.4 m (4 ft).
Exception No. 1: Where LFMC is fished.
Exception No. 2: ~~Lengths not exceeding 900 mm (3 ft) at~~ At terminals where installed for flexibility is ~~necessary. required~~, lengths shall not exceed the following:
Substantiation: The committee approved the change for exception 2 to replace "necessary" with "required" as part of 8-44. By removing "required" and replacing with "installed for" flexibility provides a clear intended purpose for the less restrictive support. There is still confusion between installers, engineers and inspectors of "required" flexibility. Who makes the decision of "required" flexibility. There are instances where LFMC is attached to electrical equipment and appliances that are physically attached to structure and the raceway flexibility is installed as a convenience, not a necessity for protection from repetitive vibration or motion. Where "required" makes enforcement extremely difficult due to the different interpretations between inspectors, installers and engineers. Inspectors determine "required" differently causing inconsistency between inspectors and AHJ's.
Note: Supporting material is available for review at NFPA headquarters.
Panel Meeting Action: Accept in Principle
Revise 350.30(A), Exception 2, to read as follows:
"Exception No. 2: Where flexibility is necessary after installation, lengths shall not exceed the following: (remainder of existing text remains unchanged)."
In addition, in (A), the comment incorrectly states the English measurement as 4 feet; it should be 4 l/2 feet.
Panel Statement: The revised panel wording clarifies the intent of the submitter.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-30 Log #1080 NEC-P08 **Final Action: Accept**
(350.60)

Submitter: David Shapiro, Safety First Electrical Contracting Consulting & Safety Education
Comment on Proposal No: 8-50
Recommendation: I support the panel in accepting the new text as written.
Substantiation: I am concerned about the "accept in principle" comments. If there are field reports of inspectors rejecting jobs where flexibility is required not due to continuous movement but due to vibration or occasional movement or adjustment, then the wording ought to be modified. As it stands, "flexibility after installation" is a useful clarification, and encompasses all these.
Panel Meeting Action: Accept
Panel Statement: Panel 8 agrees that the panel action on Proposal 8-50 should have been "Accept in Principle". The panel statement would remain the same.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-31 Log #2043 NEC-P08 **Final Action: Reject**
(350.60)

Submitter: James M. Imlah, City of Hillsboro
Comment on Proposal No: 8-51
Recommendation: Revise as follows:
350.60 Grounding and Bonding.
Where used to connect equipment ~~where~~ installed for flexibility ~~is required~~, an equipment grounding conductor shall be installed.
~~Where~~ LFMC not installed for flexibility ~~is not required~~, ~~LFMC~~ shall be permitted to be used as an equipment grounding conductor when installed in accordance with 250.118(6).
Where ~~required~~ or installed for flexibility, equipment grounding conductors shall be installed in accordance with 250.134(B).
Where ~~required or~~ installed for flexibility, equipment bonding jumpers shall be installed in accordance with 250.102.
FPN: See 501.30(B), 502.30(B), and 503.30(B) for types of equipment grounding conductors.
Substantiation: The submitted original proposal comments were crossed from another article. The substantiation is the same for the removal of "required" and replacing with the words "for flexibility." The language uses "require" and "shall" within the same description that is a mandatory requirement. Where "required" is applied becomes un-enforceable as to what an each inspector, installer, or contractor believes what their interpretation of "required." Where "installed for flexibility" would provide consistency of intent for installing LFMC raceway to electrical equipment or appliances where vibration or continuous movement occurs.
Panel Meeting Action: Reject
Panel Statement: The new text in the 2008 draft for 350.60 based on ROP 8-49 and 8-50 makes it clear where an equipment grounding conductor is or is not required.
350.60 Grounding and Bonding. Where used to connect equipment where flexibility is required after installation, an equipment grounding conductor shall be installed.
[ROP 8–49]
Where flexibility is not required after installation, LFMC shall be permitted to be used as an equipment grounding conductor when installed in accordance with 250.118(6).
[ROP 8–50]

Where required or installed, equipment grounding conductors shall be installed in accordance with 250.134(B). Where required or installed, equipment bonding jumpers shall be installed in accordance with 250.102.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 352 RIGID — NONMETALLIC CONDUIT: TYPE RNC

8-32 Log #1378 NEC-P08 **Final Action: Accept**
(352)

Submitter: William Wagner, Certification Solutions
Comment on Proposal No: 8-53
Recommendation: This Proposal should be Accepted as revised by CMP-8.
Substantiation: The submitter of Proposal 8-53 agrees with the panel statement that the panel's action on this proposal meets the original intent.
Panel Meeting Action: Accept

Ballot Results: Affirmative: 12

8-45a Log #CC801 NEC-P08 **Final Action: Accept**
(352.10(G))

Submitter: Code-Making Panel 8,
Comment on Proposal No: 8-68
Recommendation: 1. Revise 352.10(G) to read as follows:

352.10(G) Underground Installations. For underground installations, homogenous and non-homogenous PVC shall be permitted for direct burial and underground encased in concrete, see 300.5 and 300.50.

2. Revise the proposed text in 352.100 to read as follows:

352.100 Construction. PVC conduit shall be made of rigid (nonplasticized) polyvinyl chloride (PVC) The material shall be homogeneous without the use of foaming agents, except as permitted in 352.10(G), for direct burial and underground encased in concrete. PVC conduit and fittings shall be composed of suitable nonmetallic material that is resistant to moisture and chemical atmospheres. For use above ground, it shall also be flame retardant, resistant to impact and crushing, resistant to distortions from heat under conditions likely to be encountered in service and resistant to low temperature and sunlight effects. For use underground, the material shall be acceptably resistant to moisture and corrosive agents and shall be of sufficient strength to withstand abuse, such as by impact and crushing, in handling and during installation. Where intended for direct burial, without encasement in concrete, the material shall also be capable of withstanding continued loading that is likely to be encountered after installation.
Substantiation: The panel believes that additional testing is needed to satisfy the panel's concerns that the non-homogeneous product is equal to the products currently covered in Article 352 and is suitable for the uses permitted throughout the NEC. Supporting data showed that testing was not completed. This action will permit the use of non-homogenous PVC to be used in direct burial and underground encased in concrete. This comment is based on the supporting documentation provided to the panel in Comment 8-42 and at the panel ROC meeting.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:

DWIGHT, J.: The action taken should have been to reject Proposal 8-68.

I understand the Panel's concerns that the "non-homogenous" product may not be equal to the Type RNC products covered in Article 352 and may not be suitable for all uses for Type RNC products permitted throughout the NEC. The ROC panel statement indicates that additional testing could satisfy this concern.

My primary objection is to the inclusion of language such as "homogeneous without the use of foaming agents" in the construction specification of this installation code article. The basis for my objection is that the NEC's purpose is to cover electrical installations in order to safeguard persons and property and that it is not intended to extend to individual product examination, specification or testing for safety. It is my belief that the language "homogenous without the use of foaming agents" is a product description. furthermore, UL has developed an appropriate product standard, ANSI/UL 651, Standard for Schedule 40 and 80 Rigid PVC Conduit and Fittings, which has been used safely for many years. This product standard clearly defines the materials of construction and performance requirements.

Additionally, the panel should strive for clarity and insist that terms such as "homogeneous" or "non-homogeneous" denote specific and clearly understood characteristics. These terms are not currently defined either in the code or in any accepted technical literature. Excluding a product in the construction specification section by singling out a characteristic specific to the product, such as "without the use of foaming agents" sets a precedent. After all, most products can be distinguished by specific characteristics which have no bearing on the performance of the product. The panel should insist on objective, technically sound basis for differentiation.

The manufacturer of the cellular-core PVC conduit system had originally listed and labeled their product according to the product standard for Schedule 40 and 80 Rigid PVC Conduit and Fittings, ANSI/UL 651. The UL accepted testing indicated that the "non-homogenous" PVC conduit met all the performance requirements of "homogenous" PVC conduit, with the possible exception of sunlight resistance. The code panel has neither test data nor technical substantiation to indicate sufficient performance different to warrant excluding the cellular-core PVC conduit from PVC Construction specification in Article 352.

The proposed revision will add very detailed and confusing material requirements within the NEC, with the practical result of effective suppression of suitable alternative technologies - and repetitive future work in Panel 8 to address product level details better addressed in the applicable product standard forum.

KENDALL, D.: The panel comment 8-45a (CC801) should never have been created nor accepted. Instead, Comment 8-45 should have been accepted. By approving Comment 8-45a, the panel set a precedent to allow new products, or other wiring methods to be accepted for applications without NRTL testing. Comment 8-42 utilized a substantiation based completely on non-NRTL testing.
Comment on Affirmative:

GRIFFITH, M.: See my Affirmative with Comment on Panel Action on Comment 8-42.

8-33 Log #1677 NEC-P08 **Final Action: Reject**
(352.12 Exception (New))

Submitter: Joseph S. Zimnoch, The Okonite Company
Comment on Proposal No: 8-58
Recommendation: Accept the original Proposal.
Substantiation: A temperature drop exists from the conductor to the outer insulation or jacket surface of any wire or cable. For medium voltage cables, when the conductor is operating at 105°C, the outer jacket surface operates at 90°C or less due to the greater insulation thickness and other components like the inner and outer semiconducting screens plus the shield or neutral wires. The worst case scenario for medium voltage cables is 5 kV cables with a thin (90 mil wall).

I have submitted calculation results for 5 kV cables (with 90 mils of insulation) in ductbank configurations from Figure 310.60 for both Detail 2 and Detail 3 (3 x 2). The calculations were made using USAmps Ampacity program that uses the Nehr-McGrath method. The column titled "Tdw" is the temperature of the inner duct wall. In all calculations, this temperature is below 90oC. Additionally since the introduction of the 105oC rated MV cables into the code, many 105oC rated cables have been installed in 90oC NM ducts without incident. Also submitted are copies of the ductbank dimensions and a legend to read the USAmps output data.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: As stated in the panel statement for Proposal 8-58, 352.12(E) Exception permits 105 degree C medium voltage cables to be used with rigid nonmetallic conduit, Type PVC, when the cable is operated at a temperature lower than the conduit's listed temperature rating.

The panel does not wish to establish a precedent of revising the exception for a single condition based solely on computer calculations instead of actual test data.

(352.12(A))

Submitter: Michael Walls, American Chemistry Council
Comment on Proposal No: 8-59
Recommendation: Based on the actions taken on Proposal 14-33a, the American Chemistry Council supports CMP-8 actions on Proposals 8-59 and 8-60. CMP-14 supports text in Articles 352 for Rigid Nonmetallic Polyvinyl Chloride Conduit and Article 355 for Reinforced Thermosetting Resign Conduit that recognizes the wiring methods permitted in Chapter 5. Also as appropriate in the Article 500 series, revise the term PVC Conduit to Rigid Nonmetallic Polyvinyl Chloride Conduit: Type PVC RNC, as for example in 501.10(B)(1)(7).
Substantiation: None given.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the first sentence of the comment and recognizes that the remainder of the comment more properly belongs in the substantiation for the comment, not as part of the recommendation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-35 Log #302 NEC-P08 **Final Action: Accept**
(352.12(A)(1))

Submitter: Code-Making Panel 14,
Comment on Proposal No: 8-60
Recommendation: Based on the actions taken on Proposal 14-33a, CMP-14 supports CMP-8's actions on Proposals 8-59 and 8-60. CMP-14 supports text in Articles 352 for Rigid Polyvinyl chloride Conduit and proposed Article 355 for Reinforced Thermosetting Resin Conduit that recognizes the wiring methods permitted in Chapter 5.
Substantiation: This comment supports correlation of the requirements in Chapters 3 and 5.
