TCC Action: See the Technical Correlating Committee action on Comment 13-103.
Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 13-90
Recommendation: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the Technical Correlating Committee action on Proposal 13-77.
Technical Correlating Committee understands that the Panel Action was to add a new second sentence in 695.4(B)(1) and the existing second sentence now becomes the third sentence.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

13-130 Log #1868 NEC-P13 **Final Action: Hold**
(695.4(B)(2)(3))

TCC Action: See the Technical Correlating Committee action on Comment 13-103.
Submitter: Michael Walls, American Chemistry Council
Comment on Proposal No: 13-91
Recommendation: Add text to read as follows:
Exception: In industrial establishments, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, a metal clad disconnecting means may be located within equipment that feeds loads other than the fire pump if the other provisions of 695.4 (B)(2) are met.
Substantiation: The original comment was modified to include the requirement for metal clad equipment addressing the need for a secure enclosure. The addition of separate switchgear, cable/bus, six cable terminators and bus connections to meet the "not located within equipment that feeds other loads..." requirement added in 2005 actually lowers the installation's reliability in these industrial installations since additional equipment must be connected to the bus.
Panel Meeting Action: Reject
Panel Statement: The panel's statement on Proposal 13-91 is still valid; the present wording is clear.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.
Comment on Affirmative:
ZGONENA, T.: In addition to the panel statement, the exception would be in violation of Section 695.4(B)(2)(3).

13-131 Log #1613 NEC-P13 **Final Action: Hold**
(695.4(B)(2)(b))

TCC Action: See the Technical Correlating Committee action on Comment 13-103.
Submitter: Lawrence A. Bey, Cummins Power Generation
Comment on Proposal No: 13-89
Recommendation: Change "full pump room load" to "fire pump" so that the clause reads: "sized to allow for instantaneous pickup of the fire pump" (same wording to the end of the sentence).
Substantiation: Each fire pump is required to have a dedicated transfer switch and other loads are not allowed to be connected to it. Therefore, the generator feeder overcurrent device is sized based on the fire pump only. Where there are additional fire pump rooms loads (jockey pumps, lighting, etc.), they must be served by a separate feeder and transfer switch.
Panel Meeting Action: Reject
Panel Statement: The extracted text is from NFPA 20, and the submitter's intention is not clear regarding placement in Article 695.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

13-132 Log #1612 NEC-P13 **Final Action: Hold**
(695.4(B)(3))

TCC Action: See the Technical Correlating Committee action on Comment 13-103.
Submitter: Lawrence A. Bey, Cummins Power Generation
Comment on Proposal No: 13-89
Recommendation: Change "All disconnecting devices" to "All disconnecting devices except standby generator disconnects" (same wording to the end of sentence).
Substantiation: Confusion exists between service supplied feeders and on-site generator set feeders. Use of the term "all disconnects" in this section is read by some to apply to both. The intent of Proposal 13-89 is to clear up the confusion, but it does not address this point.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 13-131.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13

(695.6(A) and (B))

TCC Action: See the Technical Correlating Committee action on Comment 13-103.
Submitter: James S. Nasby, Master Control Systems, Inc.
Comment on Proposal No: 13-97
Recommendation: Revise text to read as follows

Re-consider Accepting, or Accept in Principle or Accepting In Principle in Part Proposal 13-97. However, do not completely eliminate extant 695.6(B) "Conductor Size."
Substantiation: This Proposal was considered by the panel to be part of the consolidation of Public Proposals on sections of Article 695 into the rewrite of Proposal 13-77 in error. This largely my oversight. In fact, these clauses are not extract text. Note that extant section 695.6 changes to 695.7 under the 13-77 re-write. This section is otherwise untouched by 13-77. The information in extant 695.6(B)(1) regarding other loads is vital. The Voltage Drop information in 695.6(B)(2) is also important since this is a very frequent problem with the Transformer Connection and also with the Alternate Supply.
Panel Meeting Action: Reject
Panel Statement: This comment does not comply with 4.4.5 of the NFPA Regulations Governing Committee Projects in that it does not provide text of the comment, including the wording to be added, revised (and how revised), or deleted.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

13-137 Log #1881 NEC-P13 **Final Action: Reject**
(695.6(B)(2))

Submitter: Mike Holt, Mike Holt Enterprises, Inc.
Comment on Proposal No: 13-99
Recommendation: Continue to accept the proposal, with the following change:
Replace the term "fire-rated" with "fire resistance rated".
Substantiation: The term "fire resistance rated" is more commonly accepted than the term "fire rated", and is used in most adopted building codes.
Panel Meeting Action: Reject
Panel Statement: The panel contends that "fire-rated" in the context of building construction is the correct term.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

13-139 Log #1990 NEC-P13 **Final Action: Accept in Principle**
(695.6(B)(2) & (3))

Submitter: Robert Konnik, Rockbestos-Surprenant
Comment on Proposal No: 13-100
Recommendation: Continue to accept the change to 2 hour fire resistive rating from 1 hour.
Substantiation: NFPA 20 does not contain the requirements for the duration to fire rate circuit conductors. The section which does have time requirements in NFPA 20-2007 for fire ratings is Table 5.121.1.1.2 for equipment protection which requires a 2 hour fire rating unless both the pump room/house and building(s) exposing pump rooms/house are fully sprinklered. Additionally, the fire pump may be required to operate even after the fire department has arrived to provide supplemental pressure in some cases.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 13-99.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 1
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
RAPPAPORT, E.: The substantiation clearly does not support the proposed change for four reasons. First, NFPA 20 has not found it necessary to provide more than a one hour rating. If the attempt is to harmonize NFPA 70 with NFPA 20, why is NFPA 70 more stringent than NFPA 20 requirements? Second, the 2 hour fire rating cited in the substantiation is for the fire pump room, not for any external wiring. Third, there is no direct connection between the 2 hour requirement in NFPA 72 for notification circuit wiring and the requirements for fire pump wiring cited in the substantiation to Proposal 13-100. Fourth, fire protection of feeder circuit wiring in Section 700.9(D)(1) requires 1 hour rating. There are no cited incidents that a 1 hour rating has been found to be inadequate. No justification has been provided to have the requirements of NFPA 70 exceed the requirements of NFPA 20.
Comment on Affirmative:
ZGONENA, T.: It is unclear why the panel statement refers to action on Proposal 13-99 when the submitter's recommendation was covered by action of Proposal 13-100. Also, the panel action should have been "Accept" since the panel made no changes that would conflict with the submitter's recommendation. An "Accept" would eliminate the need for the reference to action on a proposal that only serves to confuse the reader.

13-140 Log #1971 NEC-P13 **Final Action: Reject**
(695.6(B)(2) and (3))

Submitter: Elliot Rappaport, Electro Technology Consultants
Comment on Proposal No: 13-100
Recommendation: Reject the proposal.
Substantiation: The criteria for notification is not the same as the criteria for operation of a fire pump. Within the one hour time window, the fire department has time to connect their equipment and then the fire pump equipment is not critical. Notification is necessary for a longer period.
Panel Meeting Action: Reject
Panel Statement: The panel agrees with the original submitter's substantiation.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 1
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
RAPPAPORT, E.: See my explanation of negative vote on Comment 13-139.

13-141 Log #1131 NEC-P13 **Final Action: Hold**
(695.6(E))

TCC Action: See the Technical Correlating Committee action on Comment 13-103.
Submitter: Andre R. Cartal, Princeton Borough Building Dept.
Comment on Proposal No: 13-105
Recommendation: Please reconsider and accept the proposal.
Substantiation: 348.12(1) permits flexible metal conduit in wet locations when the conductors are approved for the specific conditions and a "W" type conductor would be required. The Panel seems to feel that the installation of a sprinkler head creates a wet location. If that's the case, then we have a problem with all the electrical equipment in the fire pump room and throughout the building.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 13-105.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.
Comment on Affirmative:
ZGONENA, T.: The panel statement in proposal 13-105 does not imply that the pump room is a wet location nor is it identified as such anywhere in Article 695 or NFPA 20. However, dripping and splashing water can occur in the pump room and protection against water intrusion into a raceway is required.

13-142 Log #1132 NEC-P13 **Final Action: Hold**
(695.6(E))

TCC Action: See the Technical Correlating Committee action on Comment 13-103.
Submitter: Andre R. Cartal, Princeton Borough Building Dept.
Comment on Proposal No: 13-106
Recommendation: Please review and reconsider the proposal.
Substantiation: The Panel expresses concern that the EMT from the controller to the pump should not be permitted as EMT does not have "sufficient mechanical strength to prevent damage to the conductors". However, 695.6(B) Exception, does not restrict the use of EMT to supply the controller so where is the logic that the inspector needs for enforcement?
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 13-106.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

13-143 Log #2205 NEC-P13 **Final Action: Hold**
(695.6(E))

TCC Action: See the Technical Correlating Committee action on Comment 13-103.
Submitter: William A. Wolfe, Steel Tube Institute of North America
Comment on Proposal No: 13-106
Recommendation: This Proposal should be Accepted.
Substantiation: The concern in 695.6(E) is for physical protection of the conductors between the controller and the pump. Article 358 allows the use of electrical metallic tubing in areas where it is not exposed to *severe* physical damage. MC cable, even with an impervious covering, is not allowed where subject to any physical damage. The impervious covering only protects the MC against corrosive conditions. The Panel should really remove the permission for MC cable but if they continue to allow that use, EMT should certainly be allowed.

The physical properties of EMT are more robust than those of MC cable. Chapter 3 allows the use of EMT where exposed to physical damage but does not allow the use of MC cable where so exposed. The 1999 NEC was very clear about the use of MC cable. Section 334-3 Uses Permitted stated: *ÒUnless specifically prohibited elsewhere in the Code and* ***where not subject to physical damage,*** *Type MC cables shall be permitted as follows:Ó* During the 2002 NEC cycle, the cable articles were reformatted, leading to current language that causes confusion about the use of MC cables where exposed to physical damage.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Comment 13-142.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.
Comment on Affirmative:

ZGONENA, T.: Although the panel action is correct, rejection of comment 13-142 should not serve as the basis for rejection of this comment, which, in turn, refers to action on a proposal.

Submitter: James S. Nasby, Master Control Systems, Inc.
Comment on Proposal No: 13-107
Recommendation: Continue to Accept in Principle.
Substantiation: This was already correlated with 13.77. It is now clause 695.9(E). Note: This proposal originated with NEMA SC-10, Sub-committee on Fire Pump controllers. This requirement is not the same as the requirement to carry locked rotor current indefinitely. 1) Starting a single Design “B” Code “F” or “G” motor can incur first half cycle offset currents of over 12 times motor FLC (FLA). 2). The OCP in the Emergency (Alternate) power supply path must be able to start a fire pump motor in the Across-the-Line (Full Voltage Starting) mode regardless of whether or not the fire pump controller is of the reduced inrush starting type, due to the use of the Manual Mechanical Emergency Operator. 3) The same OCP must be able to start all such pumps plus any other connected loads. This is especially vital where fire pumps are connected either in series (high rise) or in parallel (large facilities such as aircraft hangers).

Comment on Proposal No: 13-109
Recommendation: Continue to Accept in Principle Proposal 13-109.
Substantiation: This proposal was/is correlated with Proposal 13-77 as clause 695.10.

This is extracted text. This text was added to NFPA-20 due to substantial numbers of compromised installations and confusion in the field over this topic. Junction boxes are frequently used due to the prohibition of using the fire pump controller as a junction box. Numerous controllers have been ruined or compromised regarding both reliability and personnel safety due to the high short circuit ratings -- usually 100,000 Arms Sym., but up to 200 Ka -- of typical controllers. Countless others are in the same condition; but, are unknown. This is to give both guidance and clout to inspection personnel.

Submitter: James S. Nasby, Master Control Systems, Inc.
Comment on Proposal No: 13-110
Recommendation: Continue to Accept in Principle Proposal 13-110.
Substantiation: This proposal was /is correlated with Proposal 13-77 as clause 695.12.

This is extracted text. This text was added to NFPA-20 due to substantial numbers of compromised installations and confusion in the field over this topic. Numerous controllers have been ruined or compromised due to flooding because of inadequate raceway (conduit) terminations. Numerous others are vulnerable to the same problem, especially the use of star nuts on 3” and larger top entry or exit conduit. One instance known which nearly required the evacuation of the top two thirds of a high rise hotel due to a flooded middle zone controller. This is a pervasive problem. Fire protection is often interrupted when a sole source controller needs extensive repair or replacement. This is exacerbated by the fact that many, if not most of these controllers are used as service entrance equipment.
Panel Meeting Action: Accept in Principle

Accept the proposal, but change 695.14(D) to read as follows:

No alterations other than installation of raceway(s) and multiconductor cable(s) shall be made to the fire pump controller.

Panel Statement: The revised text clarifies the requirement.
Number Eligible to Vote: 14

Submitter: James S. Nasby, Master Control Systems, Inc.
Comment on Proposal No: 13-111
Recommendation: Continue to Accept in Principle Proposal 13-110.
Substantiation: This proposal was/is correlated with Proposal 13-77 as clause 695.11.
This is extracted text. This text was added to NFPA-20 due to substantial numbers of compromised installations and confusion in the field over this topic. Numerous controllers have been ruined or compromised due major hacking (modifications by way of large cut-outs to accommodate individual conductors. An unknown number of others exist. This is a poorly understood area. Use of individual conductors is increasing. This is partly due to the placement of fire pumps in the middle of high rise buildings. Both the Normal Source and the Emergency Source are so connected in many cases. Guidance is needed for both installers and inspection agencies. This is a matter of both reliability of the equipment, protecting it from flooding, and personal safety due to the high short circuit ratings of typical fire pump controllers.
Panel Meeting Action: Reject
Panel Statement: This proposal would prohibit the use of conduit and wire to a controller and only permit cable. The panel believes that Comment 13-149 satisfies the submitter's concerns with single conductors entering the controller. In addition the panel recognizes that the submitter's original Comment 13-152 referred to Proposal 13-111 rather than Proposal 13-110 as stated.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.
Comment on Affirmative:
ZGONENA, T.: The panel action should have been to accept in principle. The submitter's recommendation was accepted by the panel action on comment 13-103, specifically, in the changes made to 695.11(B), and in 695.18(D).

13-153 Log #1974 NEC-P13 **Final Action: Hold**
(695.15)

TCC Action: See the Technical Correlating Committee action on Comment 13-103.
Submitter: Elliot Rappaport, Electro Technology Consultants
Comment on Proposal No: 13-111
Recommendation: Reject the proposal.
Substantiation: The proposal would prohibit the use of conduit and wire to a controller and only permit cable. The substantiation does not address any problem with conduit and wire, but only discusses problems with terminating solid conductors.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.
Comment on Affirmative:
ZGONENA, T.: The panel action should have been to accept in principle. The submitter is not reading and correclty interpreting the added text from prpoosal 13-111. The special provisions for terminating conductors apply only when using single conductor cable. The revisions were made to 695.15, which covers only Listed Electrical Circuit Protective System to Controller Wiring. The other wiring methods and raceways referred to by the submitter are covered in 695.6. The submitter's concern was addressed by the panel action on comment 13-103, specifically, in the changes made to 695.11(B), and in 695.18(D).

ARTICLE 700 — EMERGENCY SYSTEMS

13-154 Log #949 NEC-P13 **Final Action: Reject**
(700.6(C))

Submitter: Steven R. Terry, Electronic Theatre Controls Inc.
Comment on Proposal No: 13-117
Recommendation: Change proposed wording to be added as a last sentence of 700.6(C) as follows, including an FPN:
Automatic Transfer Switches, rated at 600 VAC and below and utilized to transfer feeders or branch circuits between two separate, non-synchronized power sources, shall be listed for emergency system use.
FPN: The standard for listed Automatic Transfer Switches in ANSI/UL 1008, Standard for Safety for Transfer Switch Equipment.
Substantiation: The submitter of this proposal is precisely correct in his substantiation, but the proposal does not go far enough in helping to prevent misapplication of inappropriate devices as transfer switches. The original proposal asked that Automatic Transfer Switches be listed "for emergency system use". Unfortunately, recent experience has shown that stand-alone Load Control Relays that have a perfectly valid emergency listing under UL 924, (Emergency Lighting and Power Equipment), are being misapplied as branch circuit Automatic Transfer Switches, where UL 1008 devices should in fact be used. These misapplied Load Control Relays are being used to transfer a load between two non-synchronous power sources, but they are not subject to any of the stringent requirements of UL 1008 that are needed for this application, such as fault current testing and mechanical interlock to prevent inadvertent connection of the two power sources. Thus, "listed for use in emergency systems" does not adequately clarify the listing requirements for transfer switches.
The misapplication of non-UL 1008 devices is happening for the following reasons:
A. The NEC is silent in Article 700 on what equipment is required to transfer a branch circuit between two non-synchronous power sources. NFPA 110 is similarly silent on this issue. Automatic Transfer Switches are most commonly used as feeder-level devices. Therefore, installers and engineers are often unaware that devices used to transfer branch circuits are subject to similar switching phenomena, and thus similar risk concerns, as feeder circuit transfer devices. This can lead them to incorrectly assume that devices used to transfer branch circuits need not be UL 1008 listed Transfer Switches.
B. Branch Circuit Automatic Transfer Switches listed under UL 1008 are relatively new devices, as is the concept of transferring single or multiple branch circuits between utility and emergency power sources. Previously, this type of transfer was almost always handled by an upstream feeder-level UL 1008 transfer switch.
C. Stand-alone Load Control Relays (LCRs) listed under UL 924 have recently become available. These are typically double-pole, double-throw devices, but single-pole, double-throw and single-pole, single-throw devices also exist. They are intended only for load energization during loss of utility power, that is accomplished by performing a bypass of the wall switch or dimmer controlling the branch circuit. In this case, an upstream UL 1008 transfer switch is doing the actual transfer from normal to emergency power. However, engineers and installers often incorrectly assume that these UL 924 devices can be used to actually transfer the branch circuit load between normal and emergency power.
This situation is not helped by the fact that some manufacturers of these devices have produced data sheets that can be misleading, and do not specifically prohibit this type of transfer. Presumably, this is because no standard, including the NEC, speaks directly to the requirements of this

relatively new branch circuit transfer application. UL has publicly asserted that UL 924 Load Control Relays are not to be used to transfer a load between two non-synchronous power sources, and that only a UL 1008 device is suitable for this application. In the Spring 2005 issue of "The Code Authority" (UL's newsletter on Code issues), the article "Focus on Emergency Lighting Equipment" appears on page 3. That article states:

"An important issue to recognize is that an LCR does not switch the load between the normal and emergency supplies. Load switching of this type should only be performed by a transfer switch listed in accordance with UL 1008, Standard for Safety for Transfer Switch Equipment."

I believe that industry, UL, and AHJs all need crystal-clear help from the NEC in this situation. The proposed revised wording above would accomplish the following:

1. Require all Automatic Transfer Switches to be listed.
2. Clarify that a listed ATS is required when it is applied either in feeders or in branch circuits, if the application is transferring a load between two non-synchronous power sources.
3. Provide an informative FPN to point the reader to the applicable standard for Automatic Transfer Switches.

Panel Meeting Action: Reject
Panel Statement: The additional text "... and utilized to transfer..." would add confusion. The FPN is already covered in Annex A. Listed transfer switches are required according to the action on Comment 13-155.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.
Comment on Affirmative:
ZGONENA, T.: We agree that the text of the original proposal should be maintained without the additional text requested in the comment. Although the standard is identified in Annex A, we still contend that the addition of the FPN referring to UL 1008 is helpful in this situation.

13-155 Log #2343 NEC-P13 **Final Action: Reject**
(700.6(C))

Submitter: Alan Manche, Square D Company
Comment on Proposal No: 13-117
Recommendation: Reconsider and Reject Proposal 13-117.
Substantiation: There has been no substantiation presented that equipment failure is an issue where appropriately rated and installed electrical equipment is used. The proposed text only requires a transfer switch to be listed, which is only one of many solutions for transferring power to alternate sources. Multiple switchboards from multiple manufacturers are often employed in large facilities to control the power from multiple power sources. It is not reasonable to require such an installation to have equipment that is specifically listed for the transfer or paralleling of sources.

Let's specifically review the submitter's substantiation:

1) "When the two power sources are not synchronized, as much as twice rated voltage may be seen across the transfer switch contacts." This particular issue does not exist where the transfer equipment or transfer switch is constructed to be a break-before-make configuration. A simple delay between breaking on source and closing on the other addresses this issue. So this substantiation simply inaccurately restricts existing products and technology that is safely used today.

2) "Unless listed, a problem of uncoordinated overcurrent protection may exist should the transfer switch close into a short circuit." This particular test is found in almost all product standards for equipment, however, we still do not require a switchboard, panelboard or circuit breaker to be listed which is just as critical and where this condition is more likely to encounter in the electrical system. Where is the substantiation that a safety issue exists today? Why is the panel moving to potentially exclude product and system solutions that are safely being used today with no reported incidents?

3) "The recognized national standard for testing Automatic Transfer Switch Equipment is ANSI/UL 1008." The panel should also note that number of other product standards address the issues above including UL 67, UL 98, ad UL 891 to name a few. It should be noted that automatic transfer functionality is often embedded in panelboards and switchboards as a secondary function and may not be specifically listed to UL 1008 and still perform safely.

4) "This proposed requirement as placed under 700.6(C) would specifically apply only to automatic transfer switches. The intent is to not rule out other types of transfer system transfer equipment identified for emergency system use and acceptable to the AHJ under 700.6(A)." If the intent of the committee is to place this restriction only on transfer switches and not require listing on other viable options that are currently safely in use today, then a second sentence should be included to clarify that point. "This listing requirement is specific to transfer switches and is not intended to exclude other approved transfer equipment configurations."

The panel should reconsider the lack of substantiation and consider the broader applications of products that control the electrical system. The panel must consider the restriction being placed on the user by requiring listing which inherently will exclude safe product solutions and unnecessarily added cost to products without any substantiation that safety will be enhanced by requiring listing. Proposal 13-117 should be rejected.

Panel Meeting Action: Reject
Panel Statement: Without the requirement for listed transfer equipment, the use of untested combinations is possible and may present a safety hazard or reduce reliability. For example, the use of two electrically interlocked contactors could easily result in a source-to-source fault if transferring under an out-of-phase condition.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 11 Negative: 2
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
ELKINS, D.: This comment requesting that Proposal 13-117 be rejected should have been accepted by the Panel. No substantial justification for the additional listing requirement was provided. The reason noted for requiring listing was an engineering error which can occur whether a switch is listed or not. Listing a transfer switch as required will not prevent misapplication.

RAPPAPORT, E.: The panel statement indicates that the panel intends for the listing requirement to apply to more than the section title, Automatic Transfer Switches, implies. Transfer equipment includes automatic transfer switches but also includes circuit breakers and contactors. To what does this proposal apply? UL may have a different definition of "automatic transfer switches" which may be more inclusive than what was proposed. The present text in section 700.6(A) already requires that transfer equipment (inclusive of all types) "be designed and installed to prevent the inadvertent interconnection of normal and emergency sources". The use of "break before make" operation prevents the misapplication described in the Proposal 13-117 substantiation and the panel statement to this comment. The original proposal should be rejected as it would not increase safety and reliability but would increase cost and eliminate safe product solutions that have been used successfully in the past and that are acceptable to the AHJ.

13-156 Log #110 NEC-P13 **Final Action: Accept**
(700.9)

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 13-118
Recommendation: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal so that the text is in accordance with the NEC Style Manual. This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Revise 700.9(B)(5)(a) of the ROP draft to read as follows:
(a) From separate vertical switchboard sections, with or without a common bus, or from individual disconnects mounted in separate enclosures.
Panel Statement: The panel accepts the direction of the TCC. This change complies with the direction of the TCC to comply with the NEC Style Manual.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

13-157 Log #2342 NEC-P13 **Final Action: Reject**
(700.9(B))

Submitter: Alan Manche, Square D Company
Comment on Proposal No: 13-118
Recommendation: The Panel Action on Proposal 13-118 should continue to be Accepted in Principle, but the text should be revised to read as follows:

Revise existing section 700.9(B) by adding a new Number (5) to (B) to read as follows:

(5) Wiring from an emergency source shall be permitted to supply any combination of emergency, legally required, or optional loads in accordance with (a), (b) and (c).

(a) Wiring ~~From~~ from ~~separate~~ different vertical switchboard sections ~~of a vertical switchboard~~, with or without a common bus, or from individual disconnects mounted in separate enclosures shall be permitted.

(b) The common bus of ~~or separate~~ different vertical switchboard sections ~~of the switchboard~~ or the individual enclosures shall be permitted to be supplied by single or multiple feeders ~~without overcurrent protection at the source~~.

(c) Legally required and optional standby circuits shall not originate from the same vertical switchboard section, panelboard enclosure or individual disconnect enclosure as emergency circuits.

~~Exception to (5) (b). Overcurrent protection shall be permitted at the source or for the equipment, provided the overcurrent protection is selectively coordinated with the down stream overcurrent protection.~~

Substantiation: We agree with Mr. Nasby's contention, in the explanation of his negative vote, that the revision of 700.9(B) if left as it was accepted at the ROP could create confusion. We suggest the proposal should be revised as shown, for the following reasons:

1) The term "sections of a vertical switchboard," used in (a), is not a commonly used term. The phrase "vertical switchboard sections" parallels that

of other article of the NEC such as NEC 695.3.

2) Use of the term "separate sections," as in (a) and (b), may drive and unnecessary expectation of physical barriers between the sections as this is also consistent with other separation requirements such as NEC 695.3. Standard switchboards are typically open between the sections, and there is nothing in the proposal that should cause that open construction to be unacceptable. "Different vertical switchboard sections" conveys the proper message.

3) Item (5)(b) gives permission to omit overcurrent protection in the supply feeders, with the subsequent Exception to (5)(b) allowing overcurrent protection as long as the protective devices are selectively coordinated. Neither of these points are suitable or necessary for this section of Article 700, since 700.9 deals only with the separation of circuits – not the overcurrent protection rules. The presence or absence of overcurrent protection, in this situation, should be governed by the rules in Articles 240 or 445. Any specific deviations from the requirements of Article 240 should be located in Part VI of Article 700, and so noted in Articles 240 and/or 445 by exception where applicable. Selective coordination has nothing to do with the objectives of 700.9, and furthermore selectivity is not a substitute for circuit separation. Based on NFPA 70E and arc-flash events that are always assumed to propagate to the line side of overcurrent protection within a panel, selectivity does nothing to protect the system from a separation concern.

Panel Meeting Action: Reject

Panel Statement: The panel believes that different vertical sections must have barriers, and the panel's previous proposal wording is clearer.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 12 Negative: 1

Ballot Not Returned: 1 Gustafson, R.

Explanation of Negative:

NASBY, J.: NEMA disagrees with the Panel Action with the following reason: The requirement to have barriers between the vertical sections of a switchboard is overly burdensome and not substantiated for the application.

13-158 Log #1478 NEC-P13 **Final Action: Reject**
(700.9(B)(5))

Submitter: James E. Degnan, Sparling

Comment on Proposal No: 13-118

Recommendation: Delete all text for the new proposed 700.9(B)(5).

Substantiation: It is a mistake to describe the emergency feeders to a transfer switch in the same manner as the emergency subsystem served by the transfer switches. Anything on the source side of a transfer switch should be considered as the emergency system, anything downstream of the transfer switch should be identified according to the type of load it serves; 700, 701, or 702. The normal and emergency feeders upstream of a transfer switch offer redundancy and the isolation of a system is not as critical as it is downstream of the switch. In the extremely rare event that a fault on one system would propagate an effect multiple emergency feeders, the emergency systems are complementary and the survival of one may not benefit the public. What good are lights in an exit stair if the stair is full of smoke?

Most faults result in some consumption of material with associated vaporization, hazardous gasses, etc. The materials often leave deposits throughout a switchboard, even if the sections are separated by metal panels this requirement may not accomplish what it is intended to do.

Complying with the proposal will result in onerous design choices:

1. Most buildings utilize single transfer switches to feed the loads of Articles 700, 701, and 702. Often the life safety feeder is rated 100 amps or less. Placing a small single overcurrent device in a dedicated vertical section is not an effective use of resources. A building without a 702 load will need three times the space (main, 701 feeder, 702 feeder) than it did previously. The additional space and the larger switchboard will increase the cost of buildings with a very small potential benefit to the public.

2. The proposed language notes that group mounted switches comply with the code. Considering the expense and space requirements of switchboards using a wireway to serve individual overcurrent devices becomes a cost effective alternative. However, a wireway with field made taps to switches has a much better chance of erroneous assembly than a regulated product like a panelboard. Is this the intent of the code?

3. The code language requires a separate vertical section, but is not really clear on the degree of isolation that the vertical sections are suppose to offer. Switchboards can be constructed with separate vertical sections that are not barried between the sections. If barriers are the intent, then do they extend all the way to the rear and across the horizontal bus or is it adequate to just isolate the feeders? At some point there still must be a separate definition of emergency system vs subsystem, where does this occur?

4. Wouldn't low voltage power circuit breakers in a single vertical switchgear section provide reliable separation that is similar to switchboard vertical sections?

5. Coupling the proposed requirement for vertical sections with the selective coordination requirements is likely to result in low voltage power circuit breakers in dedicated vertical sections that require rear access. Each vertical section will cost $35,000. Will our society truly see benefit by increasing the cost of electrical systems in this manner?

Panel Meeting Action: Reject

Panel Statement: Separation of circuits is necessary.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13

Ballot Not Returned: 1 Gustafson, R.

13-159 Log #2123 NEC-P13 **Final Action: Reject**
(700.9(B)(5) (New))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Comment on Proposal No: 13-118

Recommendation: I disagree with the panel action. Recommend that Proposal 13-118 be Accepted in Principle and be revised to read as follows:

Revise existing 700.9(B) by adding a new (5) to (B) to read as follows:

(5) Wiring from an emergency source shall be permitted to supply any combination of emergency, legally required, or optional loads in accordance with (a), (b), and (c).

(a) Wiring ~~F~~from ~~separate~~ different vertical sections of a ~~vertical~~ switchboard, with or without a common bus, or from individual disconnects mounted in separate enclosures shall be permitted.

(b) The common bus or ~~separate~~ different vertical sections of the switchboard or the individual enclosures shall be permitted to be supplied by single or multiple feeders ~~without overcurrent protection at the source~~.

(c) Legally required and optional standby circuits shall not originate from the same vertical switchboard section, panelboard enclosure or individual disconnect enclosure as emergency circuits.

Exception to (5)(b). Overcurrent protection shall be permitted at the source or for the equipment~~, provided the overcurrent protection is selectively coordinated with the down stream overcurrent protection~~.

Substantiation: As previously stated by Mr. Nasby in the explanation of his negative vote, this proposal may create confusion and thus should be revised as shown. The reasons for these revisions are:

1) The term "vertical switchboard" was used in (a). This is not an industry recognized term. We suggest the panel meant to say, "vertical sections of a switchboard."

2) The term "separate sections" was used in (a) and (b). This may lead AHJs to believe that there must be physical barriers between the sections, however, standard switchboards are typically open between the sections. Better wording would be "different vertical sections of a switchboard."

3) Omission of overcurrent protection in the supply feeders appears to be permitted by (b). This omission could result in improperly protected conductors and equipment. NEMA does not support the omission of overcurrent protection in this situation unless it is covered by a rule in Articles 240 or 445. The intent of (B) is to delineate when separation is required between emergency source/ emergency source overcurrent protection wiring and wiring from other systems and equipment, not to stipulate requirements for overcurrent protection. Any requirement for overcurrent protection or allowed deviation from the requirements of Article 240 should be located in Part VI of Article 700, and so noted in Articles 240 and/or 445 by exception where applicable.

4) The proposed exception to (b) is not suitable for this section of Article 700 as 700.9 deals with the separation of circuits. Selective coordination has nothing to do with this objective. Further, selective coordination is a system design issue, not a Code issue.

NEMA strongly supports selective coordination as a valuable safety asset in the current range where overloads most often occur. However, NEMA does not support the mandate for Selective Coordination for ALL current ranges and ALL overcurrent devices because safety and reliability can both actually be diminished. This is due to increased hazardous arc flash energy with increased equipment damage and potential fire initiation, decreased reliability, and extended downtime before service restoration. Mandates for selective coordination for ALL current ranges and ALL overcurrent devices will not always provide the optimum safety solution or optimum reliability. Such a solution requires the expertise and judgment of a Professional Engineer who can balance the design, safety and operating requirements in order to determine the optimum design for each specific facility.

The wording of this section states that ALL overcurrent devices selectively coordinate, but this is not what the definition in Article 100 implies. The definition deals with localization of an overcurrent and, in many cases, selective coordination for ALL overcurrent devices serves no useful localization purpose such as when: 1) Overcurrent devices are located on the primary and secondary sides of a low voltage transformer with no loads in-between. 2) A feeder overcurrent device is connected in series with the main overcurrent device in a downstream panelboard with no loads in-between. 3) An overcurrent device on a generator is in series with an overcurrent device in a switchboard with no loads in-between. In these instances, requiring both devices to be selectively coordinated does not add to the reliability of the system, which is the stated objective of the CMP.

When overcurrent devices are located on the primary and secondary sides of a low voltage transformer, sized to meet the NEC transformer protection requirements, it is almost impossible to also meet the requirement for selective coordination of this section, regardless of the type of overcurrent protective device chosen.

In many instances,it may not be possible to meet the requirements for generator protection provided by an overcurrent device located on or near the generator and provide selective coordination with downstream overcurrent devices. Further, the generator protection functions provided within the engine-generator controller by the manufacturer might not be able to selectively coordinate with down stream overcurrent devices.

The paralleling of generators is often done to enhance system reliability, which is the stated objective of the CMP, however, in order to meet the requirement for selective coordination each generator overcurrent device and controller must selectively coordinate with all downstream overcurrent devices. This may not be possible if the generators are of unequal size.

The upgrade or expansion of an existing building may require the replacement of existing upstream equipment so that it will selectively coordinate with the new downstream equipment it must feed. The State of Washington has recognized the significant economic burden this is placing on building owners and businesses and has issued an emergency order exempting existing buildings from meeting the selective coordination requirements of the 2005 NEC.

Systems are normally designed for selective coordination in the overload region of the overcurrent device time-current curves. If this were not so, they would not operate under normal conditions, so what is really being called for in this requirement is overload and short circuit selective coordination. In order to achieve total short circuit selective coordination, the size of upstream overcurrent protective devices may need to be increased and/or time delay trip characteristics increased, thereby possibly increasing the arc flash hazard. In other words, by forcing selective coordination for an event that most likely will never occur, namely a bolted fault, the hazards involved in performing tasks which most likely will occur, namely system maintenance, may be increased. This is another reason why system designers need the flexibility to optimize the design of a system, which the current requirement does not allow.

As stated in the original NEMA substantiation to delete the text in proposal 13-137, we wish to once again point out the following:

4. The need for the flexibility to optimize the design of a system is recognized in IEEE Standard 242-2001 (The Buff Book). Section 15.1 states, "In applying protective devices, it is occasionally necessary to compromise between protection and selectivity. While experience may suggest one alternative over another, the preferred approach is to favor protection over selectivity. Which choice is made, however, is dependent on the equipment damage and the affect on the process."

5. The need for the flexibility to optimize the design of a system is also recognized in NFPA 110-2005, Standard for Emergency and Standby Power Systems. Section 6.5.1 states, "The overcurrent protective devices in the EPSS shall be coordinated to optimize selective tripping of the circuit overcurrent protective devices when a short circuit occurs. A further explanation of this statement is given in Annex A section A.6.5.1, "It is important that the various overcurrent devices be coordinated, as far as practicable, to isolate faulted circuits and to protect against cascading operation on short circuit faults. In many systems, however, full coordination is not practicable without using equipment that could be prohibitively costly or undesirable for other reasons."

6. This NEC text conflicts with Chapter 27 of the International Building Code that specifically requires compliance with NFPA 110 for emergency systems. This presents a conundrum for the system design and the AHJ. Which code takes precedence, the IBC or the NEC?

Finally, it must be recognized that the emergency system will typically be fed from the same main overcurrent protective device as the "normal" system. If the "normal" system is not also totally selectively coordinated, there is the possibility that the main device may open unnecessarily due to a fault in the "normal" system, thereby defeating the purpose of having a totally selectively coordinated emergency system. While this may not be of concern in most occupancies where the emergency system feeds primarily egress lighting, an unplanned transfer of power from the normal to the alternate source in the essential electrical system of a healthcare facility could be undesirable. It is unreasonable to require total selective coordination in the emergency system (and essential system in a healthcare facility as required by 517.26) and not also on the "normal" (nonessential) system as well.

In summary, NEMA strongly supports selective coordination as a valuable safety asset in the current range where overloads most often occur. However, NEMA does not support the mandate for Selective Coordination for ALL current ranges and ALL overcurrent devices because safety and reliability can both actually be diminished, thus the section should be deleted.

5. As pointed out by Mr. Swayne in his affirmative comment, (a) is not a complete sentence, hence the words "Wiring" and "shall be permitted" have been added.

Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 13-157.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 1
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:

NASBY, J.: NEMA disagrees with the Panel Action with the following reason: See NEMA Explanation of Negative on Comment 13-157

13-160 Log #296 NEC-P13 **Final Action: Accept (700.9(D))**

TCC Action: The Technical Correlating Committee directs that this comment be reported as Accept since the requirements for hospitals and health care facilities are within the Scope of Article 517, not Article 700.
Submitter: Code-Making Panel 15,
Comment on Proposal No: 13-121
Recommendation: Proposal 13-121, which was Accepted in Principle by CMP-13 should be rejected, returning 700.9(D) to its wording in the 2005 NEC. That would have 700.9(D) ending with the phrase "...business and mercantile."
Substantiation: The statement: "It [fire protection of the emergency system wiring] is common practice in hospital design", which is included in the substantiation for 13-121, is not true - at least, not on a wide spread basis. Additionally, Proposal 13-121, as accepted by CMP-13, would apply to significantly more of the overall health care electrical system - the entire EES - than is the case for other occupancies covered by 700.9(D). 517.26, as modified in Proposal 15-43, properly invokes the requirements of Article 700 for the life safety branch of the emergency system, rather than the entire EES. Proposal 13-121 should be rejected.

This comment was balloted through CMP-15 with the following ballot results:

17 Eligible to Vote
12 Affirmative
5 Not Returned (T. Dunn, D. Marshall, H. Nash, B. Shelly & M. Skinner)

Mr. E. Morgan voted affirmatively stating: "A similar proposal, 15-51 (Log #3025) was rejected by CMP-15. This Proposal 13-121 should also be rejected."

Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 13-161.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 11 Negative: 2
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:

HORNBERGER, B.: This comment from CMP-15 should be accepted. Essential Electrical System requirements for the Health Care industry are the responsibility of Panel 15. Panel 15 should have the authority to reference 700.9(D) in 517 if these systems require fire protection. The comment submitted by Panel 15 indicted that this requirement is not appropriate for hospital and health care Essential Electrical Systems.

RAPPAPORT, E.: The Proposal 13-121 goes beyond the scope of Article 700 by including additional wiring in "hospitals and health care facilities" that are not considered "emergency" circuits. It should be noted that the term "health care facilities" is inclusive of hospitals, nursing homes, limited care facilities, clinics, medial and dental offices, and ambulatory care centers and CMP 15, properly, has jurisdiction over those facilities. Essential electrical systems, included in the proposal, are defined in Section 517.30 to include Life Safety Branch and Critical Branch. Only the Life Safety Branch is intended, by CMP 15, to meet the requirements of Article 700 (see 517.2). There is no substantiation for the Critical Branch to meet Article 700. There is also no need for this change to Section 700.9(D) since it is already clearly coveted in Article 517. CMP 15 properly invoked the requirements of Article 700 for the Life Safety branch in Proposal 15-43. The requirements for emergency systems in all health care facilities should remain with Panel 15.

13-161 Log #1941 NEC-P13 **Final Action: Reject (700.9(D))**

TCC Action: Based on the Technical Correlating Committee action on Comment 13-160, the Technical Correlating Committee directs that this comment be reported as Reject.
Submitter: Barry F. O'Connell, Tyco Thermal Controls
Comment on Proposal No: 13-121
Recommendation: I agree with this Proposal as amended by the Panel Action.
Substantiation: In response to the negatives, a parallel proposal to Panel 15 on Article 517 was Rejected as being more appropriate for this panel, as follows:

CMP 15 Statement: "Fire protection is primarily a function of the Building Code and Life Safety Code. If incorporated into the wiring requirements for an emergency system, it should be done through expanding the occupancy classes listed in 700.9(D).

Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 11 Negative: 2
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:

HORNBERGER, B.: This comment should be rejected. Essential Electrical System requirements for the Health Care industry are the responsibility of Panel 15. The comment submitted by Panel 15 indicted that this requirement is not appropriate for hospital and health care Essential Electrical Systems.

RAPPAPORT, E.: See my explanation of negative vote on Comment 13-160.

13-162 Log #2179 NEC-P13 **Final Action: Hold**
(700.9(D))

Submitter: Edward Walton, Draka Cableteq
Comment on Proposal No: 13-123
Recommendation: Add new text to 700.9(D) as follows:
(3) Branch Circuit Wiring. Branch circuits that originate in a location remote from the area being served shall meet one of the following conditions:
(1) Be installed in spaces or areas that are fully protected by an approved automatic fire suppression system
(2) Be a listed electrical circuit protective system with a minimum 1-hr fire rating
(3) Be protected by a listed thermal barrier system for electrical system components
(4) Be protected by a fire-rated assembly listed to achieve a minimum fire rating of 1 hr
(5) Be embedded in not less than 50 mm (2 in.) of concrete
(6) Be a cable listed to maintain circuit integrity for not less than 1 hr when installed in accordance with the listing requirements.
Revise reference in 700.9(D) to read:
700.9(D)(1), (D)(2
), and (D)(3)
Optional. Add FPN as follows:
FPN: A remote location is defined as an area separate from the Emergency System Circuit load such as a different floor in a multistory building or a different fire zone in a place of assembly or stadium.
Substantiation: This proposal has been modified to resolve the panel's concern that this "level of protection" is not warranted for all branch circuits. The branch circuit for which this protection is required is now defined as a remotely located branch circuit.
5-a. Even though a fire caused circuit failure would be more catastrophic for the feeder cable, the remotely located branch circuit is far more vulnerable if it is run through the protected premises before connected to the load.
5-b. Presently the emergency branch circuit panel could be located in the basement of a multistory building (7 stories or higher) or on the opposite side of an assembly hall or stadium far from the emergency circuit load and without the required fire protection of 700.9(D).
5-c. One code user misinterpretation is that the feeder-circuit wiring terminates at the transfer switch and anything beyond that does not require fire protection. Adopting this proposal would help clarify this misinterpretation.
I have included an optional FPN if the panel feels it needs to define remote location.
This proposal could be located in Section IV if the panel believes this is a more proper location.
Panel Meeting Action: Hold
Panel Statement: This comment was held because it would introduce a concept that has not had public review by being included in a related proposal as published in the Report on Proposals. This action is to hold the comment only.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

13-163 Log #1989 NEC-P13 **Final Action: Accept in Principle**
(700.9(D)(1) (2) FPN)

Ballot Not Returned: 1 Gustafson, R.

13-164 Log #1978 NEC-P13 **Final Action: Accept**
(700.9(D)(1)(2), FPN)

Submitter: Elliot Rappaport, Electro Technology Consultants
Comment on Proposal No: 13-125
Recommendation: Accept the panel action on Proposal 13-101 as a FPN to this section.
Substantiation: The panel action on this proposal does nothing to add the FPN to this article.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

13-165 Log #111 NEC-P13 **Final Action: Accept**
(700.9(D)(1)(4))

TCC Action: The Technical Correlating Committee directs that the panel action be revised to read as follows to comply with the NEC Style Manual:
"(4) Be protected by a listed fire-rated assembly that has a minimum fire rating of 1 hour and contains only emergency wiring circuits."
Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 13-124
Recommendation: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal so that the text is in accordance with the NEC Style Manual. This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Revise the text of 700.9(D)(1)(4) to read as follows:
(4) Be protected by a listed fire-rated assembly that contains only emergency wiring circuits. This assembly shall have a minimum fire rating of 1 hour.
Panel Statement: The panel accepts the direction of the TCC to clarify the statement and comply with the NEC Style Manual.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 1
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
RAPPAPORT, E.: See my explanation of negative vote on Comment 13-166.

13-166 Log #1976 NEC-P13 **Final Action: Reject**
(700.9(D)(1)(4))

Submitter: Elliot Rappaport, Electro Technology Consultants
Comment on Proposal No: 13-124
Recommendation: Reject the proposal.
Substantiation: The proposal mixes the need to maintain electrical separation with the need for physical separation. There is no substantiation that a one hour rated enclosure containing both normal and emergency systems is more susceptible to fire.
Panel Meeting Action: Reject
Panel Statement: The panel believes that there is a need to physically separate normal and emergency circuits.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 1
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
RAPPAPORT, E.: Section 700.9(D)(1) provides for fire protection for feeder circuit wiring by any one of 6 methods. The presence of normal circuit feeders in the same fire rated assembly does not increase the susceptibility of the emergency conductors to damage from fire and no substantiation to that effect has been provided. Section 700.9(B), cited in the proposal substantiation, refers to keeping entirely independent with respect to same "raceway, cable box, or cabinet." There is no reference to maintaining any physical separation of raceways. If a normal circuit raceway or cable located adjacent to an emergency feeder raceway or cable presents increased susceptibility to fire damage, as yet unsubstantiated by test or field experience, then it should apply to all of 700.9(D)(1) not only 700.9(D)(1)(4).

13-167 Log #1302 NEC-P13 **Final Action: Reject**
(700.12(A))

Submitter: David Sroka, Turner Falls, MA
Comment on Proposal No: 1-54
Recommendation: Add a sentence as follows:
"The short-circuit current rating shall be included on the nameplate for battery inverters."
Substantiation: This data is hard to obtain after the original installation. It is important information. The nameplate is the best place for the equipment's rating. Circuit breaker, fuse or transfer switch rating can mistakenly be taken as the unit's rating. Lastly, it is safest to read the nameplate to get this information rather than physical removal of covers.
Panel Meeting Action: Reject
Panel Statement: This language is more appropriate for a product standard.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

13-168 Log #2116 NEC-P13 **Final Action: Accept in Principle**
(700.12(B)(6))

Submitter: Mark R. Hilbert, Wolfeboro, NH
Comment on Proposal No: 13-131
Recommendation: Accept the Proposal.
Substantiation: The new FPN was not intended to identify that the disconnecting means which is the subject of 700.12(B)(6) must disconnect the "service." The FPN is necessary to identify to users of the NEC that this disconnecting means must be rated as "suitable for use as service equipment." As described in Article 100, conductors supplying a building or other structure

from a generator are "feeder" conductors. Seeing that the generator is outdoors, the conductors are "outside feeder conductors" and, therefore, they are included in the scope of Article 225. Section 225.31 requires that a disconnecting means be provided to disconnect all conductors that supply or pass through a building or structure. Section 700.12(B)(6) amends the requirements of 225.32 to locate the disconnecting means required by 225.31 at the building or structure served however, it does not amend the requirements of 225.36 for it to be "suitable for use as service equipment." This requirement is often overlooked and the proposed FPN would go a long way towards identifying that there is another requirement in 225.36 that must be considered.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 13-169.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

13-169 Log #2117 NEC-P13 **Final Action: Accept in Principle (700.12(B)(6))**

Submitter: Mark R. Hilbert, Wolfeboro, NH
Comment on Proposal No: 13-131
Recommendation: Accept the Proposal in Principle and revise 700.12(B)(6) to read:
(6) Outdoor Generator Sets. Where an outdoor housed generator set is equipped with a readily accessible disconnecting means that meets the requirements of 225.36 and is located within sight of the building or structure supplied, an additional disconnecting means shall not be required where ungrounded conductors serve or pass through the building or structure.
Substantiation: The new FPN was not intended to identify that the disconnecting means which is the subject of 700.12(B)(6) must disconnect the "service." This comment is being submitted as an alternative to adding a new FPN. The new text will identify to users of the NEC that this disconnecting means must be rated as "suitable for use as service equipment." As described in Article 100, conductors supplying a building or other structure from a generator are "feeder" conductors. Seeing that the generator is outdoors, the conductors are "outside feeder conductors" and, therefore, they are included in the scope of Article 225. Section 225.31 requires that a disconnecting means be provided to disconnect all conductors that supply or pass through a building or structure. Section 700.12(B)(6) amends the requirements of 225.32 to locate the disconnecting means required by 225.31 at the building or structure served, however, it does not amend the requirements of 225.36 for it to be "suitable for use as service equipment." This requirement is often overlooked and the proposed new text would go a long way towards identifying that there is another requirement in 225.36 that must be considered.
Panel Meeting Action: Accept in Principle
Accept the proposal in principle and revise 700.12(B)(6) to read:
(6) Outdoor Generator Sets. Where an outdoor housed generator set is equipped with a readily accessible disconnecting means located within sight of the building or structure supplied, an additional disconnecting means shall not be required where ungrounded conductors serve or pass through the building or structure. The disconnecting means shall meet the requirements of 225.36.
Panel Statement: The added sentence clarifies that the disconnecting means must comply with 225.36.

Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

13-170 Log #2178 NEC-P13 **Final Action: Reject (700.12(B)(6), FPN (New))**

Submitter: Mark R. Hilbert, Wolfeboro, NH
Comment on Proposal No: 13-130
Recommendation: Accept the Proposal.
Substantiation: This proposal should be accepted as the purpose of the FPN is to direct readers of this section to a requirement that is not obvious. The grounding and bonding conditions when the disconnecting means is remote from the building or other structure it is supplying are often misunderstood and, therefore, this would be an appropriate location for a FPN providing direction to the location of the requirement. In the ROP stage, Panel 5 accepted a proposal to 250.32(D) to include a reference to 700.12(B)(6) to identify that the requirements of that section apply to the condition of 700.12(B)(6). It would be prudent to locate a FPN here to reference 250.32(D).
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 13-130. The panel believes that the addition of the FPN is unnecessary.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

13-171 Log #2263 NEC-P13 **Final Action: Reject (700.12(D))**

Submitter: Aden Lunden, Diversified Electric Services
Comment on Proposal No: 13-131a
Recommendation: I agree with code panel. The word Accepted cannot be changed to Approved by the Panel. The reason that the comment in the recommendation cannot be changed is Accepted and Approved are two different definitions. One cannot be substituted for the other.
Substantiation: I recommend that Acceptable should be a new definition in the Code book. Acceptable defined will resolve any confusion to what is Approved compared to what is Allowable or Acceptable.
Panel Meeting Action: Reject
Panel Statement: This comment does not comply with 4.4.5 of the NFPA Regulations Governing Committee Projects in that it does not provide text of the comment, including the wording to be added, revised (and how revised), or deleted.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 13-133
Recommendation: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal so that the text is in accordance with the NEC Style Manual. This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the direction of the TCC to clarify the statement in accordance with the NEC Style Manual. See panel action and statement on Comment 13-173.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

13-173 Log #347 NEC-P13 **Final Action: Hold (700.16)**

TCC Action: The Technical Correlating Committee directs that comment 13-173 be reported as "Hold" consistent with Section 4.6.2.2 of the NFPA Regulations Governing Committee Projects since the addition of the words "component" and "ballast" constitutes new material that has not had public review.
Submitter: Samuel Goble, Department of General Services / Rep. Commonwealth of Virginia
Comment on Proposal No: 13-133
Recommendation: Revise text to read:
"...failure of any individual lighting ~~element~~ component such as the burning out of a ~~light bulb~~ lamp or ballast, cannot...".
Substantiation: The term "element" is often confused for a "filament". Using an example can often confuse the intent of the code section, such as in this example. Replacing the word "element" with "component" does not change the intent or meaning of this code section and replaces a layman's term such as the "element" often misused as the filament of a lamp. Using the term "component" covers all parts of all types of luminaries.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13

(700.25 and 700.27)

Submitter: John J. MacDonald, TMP Consulting Engineers, Inc.
Comment on Proposal No: 13-135
Recommendation: Frederick P. Hartwell Recommendation

I. 700.25 Add a fine print note as follows:

FPN: Fuses and circuit breakers for emergency circuit overcurrent protection, where coordinated to ensure selective clearing of fault currents, increase overall reliability of the system.

II. 700-27 Delete this section.

Proposal 13-135 should be accepted in principle

Substantiation: The Electrical Consultants that I know are conscientious individuals who know they must obey the rules of the NEC first and foremost. If they do not, they can be sued. They have been raised on the principle that the NEC is not a design manual. However, it would appear that in recent years the NEC is becoming a design manual with its apparent concerns over lack of coordination with MCCB's which have performed admirably for dozens of years and with no major problems. Admittedly, MCCB's have one weakness in the instantaneous region which apparently was exploited by fuse manufacturers in the 2005 NEC. But where is the history of loss experience and where is the benefit to the public in this new requirement?

CMP-13 says that selective coordination increases the reliability of the emergency system, but is that true? If fuses are the only means of meeting this code requirement, then there is a problem, because fuses require replacement to restore the circuit. The use of fuses to achieve selective coordination could result in other problems that only MCCB's can solve. Maintenance people will be replacing fuses in emergency lighting panels not only for faulted conditions but for overloads as well. This has led to numerous problems in the past when replacement fuses are not available. Hence the need to keep issues such as these with the design community. NFPA 110 takes a much better stance with the wording in 6.5.1 where it requires the overcurrent protective devices to be coordinated to optimize selective tripping during a short circuit condition. This requirement should be adequate without the NEC adding more restrictions onto it.

Realistically, 700.27 is addressing a bolted branch circuit fault not a feeder fault. A bolted fault in a branch circuit might happen when the building is under construction when it is being wired by a licensed electrician, who if he should make such a mistake, would fix it immediately, long before the space or building was occupied. Once the building is occupied, such an event is extremely rare.

If this is a safety issue, should this not be made retroactive so that the many thousands of installations around the country can be made safer? If CMP-13 feels that "selective coordination is achievable with the equipment available now" as they state in rejecting Proposal 13-135, maybe they could let the design community in on their secret, because right now the alternatives are fuses or fuses! However, even the new fuse panel offered by one fuse manufacturer does not work for larger downtown network systems where fault currents on a 277 V emergency lighting panel could exceed the published 100K A/C rating of the fuse panel, then you have a Code requirement that cannot be met with either a fuse or an MCCB.

Specifying power air breakers for commercial office buildings with their high cost and space requirements as some have suggested is an absurd solution. Also, there are many owners of large facilities who have spent considerable time and effort to rid themselves of troublesome fuse problems, only to now have their consultants design them back in again.

It is admirable that some of the members of CMP-13 have changed their opinion on this since the 2005 Code and have now voted against it. Let's hope that others will see the light and reverse their vote as well and give design back to the engineering community where it belongs.

Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 13-204.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 9 Negative: 4
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:

ELKINS, D.: The panel action to reaffirm the requirement for selective coordination of emergency systems' overcurrent devices with all supply side overcurrent protective devices provides no exception for installations where the ability to rapidly restore power may be more critical than selective coordination. This may be only achievable in certain installations with fuses which may not be available to restore power after a fuse operation. An exception should be provided to permit flexibility in the design where speed of restoration of power is judged to be more important than a brief outage.

NASBY, J.: See NEMA Explanation of Negative on 13-204.

RAPPAPORT, E.: The suggested FPN provides adequate guidance to the qualified design personnel of the importance of selective coordination along with permitting other considerations essential for safety to human life.

ZGONENA, T.: See My Explanation of Negative on 13-175.

13-178 Log #2048 NEC-P13 **Final Action: Accept**
(700.26)

Submitter: Hugh O. Nash, Jr., Nash Lipsey Burch
Comment on Proposal No: 13-136
Recommendation: Continue to reject 13-136 which applies to 700.26 Ground-Fault Protection of Equipment.
Substantiation: Regardless of the size of the alternate source, ground-fault interruption of the alternate source overcurrent device can cause interruption of the alternate source feed to critical equipment. This is of particular concern to healthcare facilities. The panel statement (reason for reject) states: "Automatic disconnecting may be provided but is not required". In healthcare facilitie,s automatic disconnecting may not be provided under any circumstances. 517.17(B) states, "The additional levels of ground-fault protection shall not be installed as follows: (1) On the load side of the essential electrical system transfer switch, (2) Between the onsite generating unit (as) described in 517.35(B) and the essential electrical system transfer switch(es)". For many years, 517.17 warned the user against placing GFP interruption between the alternate source and the transfer switch(es). This warning has now become a prohibition. There are documented instances where GFP interrupted the normal source and the alternate source, leaving critical care areas without normal or alternate power.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 1
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:

WHITTALL, H.: I would like to vote against the panel action. Selective coordination is a good idea, but mandatory selective coordination in all cases is not. The exception agreed to by Panel 13 in Comments 13-185 and 13-238 is a start. A better change would be for selective coordination for faults over 0.1 second duration.

13-179 Log #491 NEC-P13 **Final Action: Reject**

Submitter: Kevin J. Lippert, Eaton Corporation
Comment on Proposal No: 13-137
Recommendation: I disagree with the Panel Action. Accept Proposal 13-137 as written.
Substantiation: The Panel statements during the 2005 revision cycle, and as stated in the 2008 ROP, indicate that CMP-13's intent for these circuits is to mandate selective coordination of ALL overcurrent devices, across ALL current ranges. This initially appears to support CMP-13's stated goal of increasing safety and reliability of the electrical system. However, an in-depth analysis reveals that it is not ALWAYS the case! There are circumstances where overcurrent devices (both fuses and circuit breakers) selected specifically to comply with the 2005 NEC mandate, will have the unwanted consequence of substantially increasing the hazardous arc flash energy with corresponding increased equipment damage and potential fire initiation with associated decreased reliability, and extended downtime before service restoration. This mandate also eliminates the Professional Engineer's expertise and judgment from determining the optimum design for each specific facility by balancing design, safety and operating requirements. Furthermore, selective coordination is a system design issue, not a Code issue.

Eaton strongly supports selective coordination as a valuable safety asset in the current range where overloads most often occur. However, Eaton does not support the mandate for Selective Coordination for ALL current ranges because safety and reliability can actually be diminished.

Alternatively, CMP-13 could choose to make this a FPN, similar to the 2002 NEC FPN to 700.25, and advising that selective coordination MAY increase overall reliability of the system.
Panel Meeting Action: Reject

WOOD, T.: See My Explanation of Negative on Comment 13-204.
ZGONENA, T.: See My Explanation of Negative on 13-175.
Comment on Affirmative:
SCHAMEL, D.: IEC supports the concept of selective coordination, but feels that more clarity is required on this issue. Other design considerations such as personnel safety, system complexity and current limitations including arch flash need to be considered by the design professional when designing electrical systems. Code Sections 700.27 and 701.18 should be reviewed by the Technical Correlating Committee. It also may be appropriate that another NFPA Code, perhaps NFPA 101, have ownership of this issue in that it is a design and not an installation concern.

13-183 Log #953 NEC-P13 **Final Action: Reject**
(700.27)

TCC Action: The Technical Correlating Committee directs that this Comment be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative as required in 4.4.6.4 of the NFPA Regulations Governing Committee Projects.
Submitter: John Cool, PowerPlus Engineering Inc
Comment on Proposal No: 13-137
Recommendation: The Technical Panel should continue to reject this proposal.
Substantiation: The present selective requirement for emergency systems is important for life safety reasons. It is one more requirement that helps ensure power to important loads during times of emergency. During this time, the building may be on fire or physically damaged which can in itself create faults in the system. Article 700 has other similar requirements with the intent of keeping emergency loads powered as long as possible. For instance, for fire pumps there is no overload protection for the pump motor; the concept is to keep the water flowing as long as possible, even to the point of ruining the motor. Selective coordination is another requirement that provides loads power for the maximum time. Without selective coordination, a branch or feeder fault may unnecessarily take out the entire system or a major portion of the system. This could unnecessarily imperil lives. The present requirement is not in conflict with NFPA 110. However, the scope of NFPA 70 is more comprehensive than NFPA 110. NFPA 110 covers from the emergency power source to the transfer switch and NFPA 70 has the entire system. We have designed many facilities and can engineer the system for selective coordination. There definitely are issues that must be analyzed, but with proper analysis and specification flexibility this selective coordination requirement is achievable. We have found that systems can be designed using fusible or circuit breaker equipment.

13-184 Log #1189 NEC-P13 **Final Action: Reject**
(700.27)

TCC Action: The Technical Correlating Committee directs that this Comment be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative as required in 4.4.6.4 of the NFPA Regulations Governing Committee Projects.
Submitter: Athanasios Papademos, Albert Kahn Associates, Inc.
Comment on Proposal No: 13-137
Recommendation: I disagree with the panel action. Accept Proposal 13-137 as written.
Substantiation: The addition of 700.27 in the 2005 NEC was instituted without the substantiation of any real-world problem. It resulted in an immediate uproar from the electrical industry with regards to its effect on equipment withstand ratings, increased energy to feed arc flash events, and properly engineered coordination. The "substantiation" provided in Proposal 13-137 correctly identifies the concerns with and the undesirable results of full compliance with 700.27. No less than 12 proposals (13-135 and 13-137 through 13-147) have been submitted by individuals such as contractors, manufacturers, consulting engineers, and code and Technical Committee members requesting its revision. It seems that Panel 13 has summarily dismissed all comments from the industry on a section of the code whose creation was based on something other than needs dictated by the real world. As stated in many of the referenced proposals, electrical coordination is a design issue; the NEC is not a design

instrument, but 700.27 dictates it be used as such. The contradictions of the intent of 700.27 with other industry standards PLUS the lack of any standard for determining when a system is totally selectively coordinated should, as a minimum, result in delaying the implementation of 700.27 until such time that the industry's concerns are addressed.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 13-204.
Number Eligible to Vote: 14

13-185 Log #1278 NEC-P13 **Final Action: Accept in Principle (700.27)**

Submitter: Camilo Martinez-Angulo, AmpSafe, LLC
Comment on Proposal No: 13-135
Recommendation: Proposal 13-135 should continue to be rejected by the Panel. The Panel should continue to require selective coordination for emergency systems.
Substantiation: I am a consulting engineer with considerable experience dealing with overcurrent protection and selective coordination. It has been my experience that selective coordination is almost always achievable with relays, circuit breakers, current limiting fuses, or combinations of these devices. Depending upon the type of system and the available short circuit current, I may specify adjustable instantaneous trips, electronic trips and/or short time delay. Whenever the short time delay causes the arc-flash energy to get out-of-hand, I specify zone selective interlocking to minimize the hazard. I will typically specify two levels of ground fault protection whenever the feeder devices are larger than about 200 amperes, so selectively coordinating with ground fault protection has not really been a problem. I find that the main purpose of Articles 700 and 701 is to maximize continuity of service so I find it so very odd that users are trying to figure out ways to eliminate the requirements from the NEC. To me, this requirement for selective coordination is an absolute necessity when it comes to emergency systems and legally required standby systems. It takes work and engineering knowledge/ experience to selectively coordinate an electrical distribution system without compromising safety and protection, and that's what we've been able to do.
Panel Meeting Action: Accept in Principle
Add an exception to read as follows:
Exception: Selective coordination shall not be required in (1) or (2):
(1) Between transformer primary and secondary overcurrent protective devices, where only one overcurrent protective device or set of overcurrent protective devices exist(s) on the transformer secondary,
(2) Between overcurrent protective devices of the same size (ampere rating) in series.
Panel Statement: The exception was added to provide relief for series coordination issues.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 11 Negative: 2
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
ELKINS, D.: See my Explanation of Negative on Comment 13-177 (Log #1340).
WOOD, T.: See My Explanation of Negative on Comment 13-204.
Comment on Affirmative:
STAFFORD, T.: The Panel action was correct and this member agrees with the panel action. The exception(s) allow for the installation of a selectively coordinated system without compromising coordination requirements. Not requiring selective coordination between the primary and secondary overcurrent protective devices of the same transformer and not requiring selective coordination between series overcurrent protective devices of the same ampere rating does not decrease the safety of the system. This panel member understands through reading the comments submitted during the ROC period that selective coordination is required in some instances through local codes and that selective coordination should be required for all systems. Numerous comments submitted stated the effectiveness of selective coordination and numerous comments addressed their respective understanding as to how to achieve the selective coordination required.
ZGONENA, T.: The committee is to be commended for acknowledging that there are conditions where selective coordination does not add any additional reliabilty or safety for the system. The exceptions that were added provide some relief for series coordination issues, and are certainely more desirable than leaving the existing text with no exceptions. There may still be some conditions under which total selective coordination is not the optimum condition with respect to safety and reliability as noted in our comment on 13-175.

13-186 Log #1301 NEC-P13 **Final Action: Reject (700.27)**

TCC Action: The Technical Correlating Committee directs that this Comment be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative as required in 4.4.6.4 of the NFPA Regulations Governing Committee Projects.
Submitter: James Harvey, University of Michigan Hospitals and Health Centers
Comment on Proposal No: 13-135
Recommendation: I disagree with the Panel Action. Accept related Proposal 13-135, (and 13-137) as written. These two proposals are to delete section 700.27 (now in 70-2005), from the 70-2008 edition.
Substantiation: Currently we are operating under NEC 70-2002, and will soon adopt 70-2005 - but with a deletion of the requirement for adhering to section 700.27.
The emergency power systems encountered at our larger facilities (and some of the smaller facilities) are very complex. The current code section removes the option for using engineering judgment, as the deciding factor on how our emergency power systems are to be coordinated. This loss of professional judgment would be detrimental (in certain cases) to the safety of our patients, our staff, and the property themselves. In all of our new facilities, and in existing facilities undergoing major renovation, the design is done by a registered professional engineer, and is also reviewed by a staff registered engineer.
On occasion, we need to select devices that are not completely coordinated over the entire fault range in order to lower arc-flash energies to protect staff. Also, on occasion we need to put two devices in series (but not coordinated with each other), one at source, one at load (when these are separated by large distances). In these cases, the lack of coordination between the devices causes no problem since the same downstream loads are loss regardless of which ones operates.
Panel Meeting Action: Reject

TCC Action: The Technical Correlating Committee directs that this Comment be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative as required in 4.4.6.4 of the NFPA Regulations Governing Committee Projects.
Submitter: Greg Batie, Sparling / Rep. Electric League of the Pacific Northwest - Code Committee
Comment on Proposal No: 13-146
Recommendation: Revise text as follows:
700.27 Coordination. Emergency system(s) overcurrent devices shall be selectively coordinated with all supply side overcurrent protective devices <u>for faults with a duration of 0.1 seconds and longer.</u>
Substantiation: This proposal recognizes the panel's desire to improve the reliability of emergency power systems through selective coordination. The addition of the 0.1 second criterion permits engineers and AHJs to use readily available and published time current curves to determine if a system is selectively coordinated to a substantial degree. It negates the need to rely on unregulated manufacturer testing to determine if devices selectively coordinate in the instantaneous range.
Most faults have enough resistance to limit the amount of current that results in overcurrent device operation in the instantaneous range. It's not that instantaneous faults are less important, but the requirement to design a system to fully coordinate under those circumstances requires burdensome evaluations and cost, with a very small chance of return on the investment.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 13-204.

(700.27)

TCC Action: The Technical Correlating Committee directs that this Comment be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative as required in 4.4.6.4 of the NFPA Regulations Governing Committee Projects.
Submitter: Bruce W. Blouin, Power Analysis Associates Inc
Comment on Proposal No: 13-137
Recommendation: The Panel should continue to reject this Proposal.
Substantiation: New York City has had a requirement for Selective Coordination for decades. The NEC has also required selective coordination for ground faults in health care facilities for decades. Requirements for selectively coordinated overcurrent protective devices in elevator circuits have existed in the NEC since the 1993 edition. Beginning with the 2005 NEC, requirements were added for selective coordination of emergency circuits and legally required standby systems. We've found design solutions to meet these requirements, with both circuit breakers and fused switches, without compromising safety or reliability, and wonder what all the fuss is about.

We are a consulting engineering firm that specializes in short-circuit and coordination studies, so we are intimately familiar with what it takes to selectively coordinate both fuses and circuit breakers. It does take sharp engineering skills to design both a selectively coordinated system and at the same time to minimize arc-flash energies and equipment short-circuit damage, but that is precisely what's needed for critical circuits such as are found in elevator, emergency systems, and legally required standby systems. But, it can be and is achieved on a regular basis. Requiring total selectivity does not tie our hands when it comes to multiple emergency generators. We can design in transfer switches. We've heard of complaints about two devices in series of the same size not coordinating. Simply making the downstream disconnecting means a non-fused switch solves that problem. There is enough latitude in 450.3 to choose the overcurrent protective devices on the line side and load side of a transformer so that they will selectively coordinate. We also do not see any issues with violations of other NFPA Standards that call out for "optimized" selective coordination. To us, optimized means the very best that you can do, and total selectivity is certainly the very best that you can do. Finally, there are arguments that there needn't be a requirement to selectively coordinate in the short-circuit range because short-circuits rarely happen. If that were the case, we don't need Sections 110.9 and 110.10 in the NEC. Nor do we need the new requirements for marked short-circuit current ratings on industrial machinery or industrial control panels. Do you insure your home for just $5,000 because most claims are under that amount? Or, do you insure it for the full value, just in case it does burn to the ground or get blown away in a storm? Of course you insure it for the full value, even though a total loss may be an unusual event. Needless to say, we believe the Panel should continue to support the requirement for selective coordination in elevator circuits.

(700.27)

TCC Action: The Technical Correlating Committee directs that this Comment be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative as required in 4.4.6.4 of the NFPA Regulations Governing Committee Projects.
Submitter: Merrell Young, Herzig Engineering
Comment on Proposal No: 13-135
Recommendation: Panel 13 needs to continue to Reject this and similar proposals that remove the requirement for selective coordination of emergency circuits.
Substantiation: I would consider our consulting firm as experts on arc-flash, short-circuit, and coordination studies. As such, we have been able to meet the selective coordination requirements found in 700.27, 701.18, and 620.62, while at the same time, minimizing arc-flash hazards and improving reliability and continuity of service. We are able to obtain selective coordination for both overload and short-circuit conditions by utilizing various design techniques. For example, we can specify zone selective interlocking with short-time delay on the upstream circuit breaker so that upstream and downstream circuit breakers will coordinate in both the overload zone and the short-circuit zone, and provide for instantaneous reaction time for short circuits (including arcing faults), between the circuit breakers, which keeps arc-flash hazards to a minimum. Where our customers want fuses, we specify current-limiting fuses that can both selectively coordinate and minimize arc-flash hazards. We are able to design with transfer switches and different relaying schemes in order to utilize multiple emergency generators in parallel, for the greatest reliability. As far as ground faults are concerned, we sometimes add an additional layer of ground fault protection in order to selectively coordinate under phase to ground faults, utilizing the same approach as is already required for health care facilities. In short, we don't have to compromise to meet the selective coordination requirements, minimize personnel hazards, and protect equipment. It does take time and requires a thorough understanding of the entire electrical system, and that's what consulting engineers get paid to do.

(700.27)

TCC Action: The Technical Correlating Committee directs that this Comment be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative as required in 4.4.6.4 of the NFPA Regulations Governing Committee Projects.
Submitter: James E. Degnan, Sparling Electrical Engineering & Technology Consulting
Comment on Proposal No: 13-135
Recommendation: Code Panel 13 should accept the proposal to delete 700.27.
Substantiation: While selective coordination may initially sound like a good idea, the problems associated with implementing it outweigh any likely benefits. I've written an article in the September 2006 issue of Consulting Specifying Engineer describing the negative consequences of Sections 700.27 and 701.18, a copy is provided. (Please excuse the transposed section reference in the opening paragraph.) The article points out that selective coordination; is without an independent industry standard, requires engineers to rely on inconsistent manufacturer data, will likely result in a loss of competition, will adversely affect other aspects of electrical design, and will increase the cost of construction. Since the article was published, I've been asked to substantiate my claim that 99.9999% of today's systems are not selectively coordinated. I have provided two simple time current coordination studies for 20 amp circuit breakers with upstream 225 amp circuit breakers, one for a 120 volt system and one for a 277 volt system. If the fault current is above a level as modest as 1000 amperes, the curves show that these two pairs of circuit breakers will not selectively coordinate. The curves do not substantially change with manufacturer or varieties of molded case circuit breakers. The curves are representative of every installation that relies on 15 or 20 amp circuit breakers and upstream circuit breakers rated 225 amps or less. Using an egress lighting load of 0.1 watts/sf. a 277 volt, 3 phase system with a 225 amp feeder can support the egress lighting load in a building with up to 1.2 million square feet. For a 120 volt system, the 225 amp breaker is representative of any building step down transformer rated 75 kVA or less. The 225 amp breaker (or smaller) size with a downstream 20 or 15 amp circuit breaker also represents the electrical system of just about every home, apartment, or condominium in the country. Additional coordination studies will reveal that whenever two molded case circuit breakers are in series the chances are excellent that they will not selectively coordinate. Furthermore, if any 20 amp circuit breaker is downstream of a fuse rated 225 amps or less, the system will not selectively coordinate. At this point, I can leave it up to the reader to argue the exact number of "9s" used in the percentage. The systems that we live in every day are not selectively coordinated, yet when the branch breaker trips we don't have a problem. Why? Because the point where the fault occurs has some resistance and even a very small resistance, say 0.25 ohm, will limit the fault current to a value that is less than 1000 amps, and result in operation of the downstream overcurrent protective device prior to the upstream device. If this was not valid, we all would have some negative experience with non-selectively coordinated systems and the NEC would have addressed it a long time ago.

There are key design issues surrounding selective coordination. I have provided a curve showing that a 20 amp circuit breaker will not coordinate with an upstream 400 amp circuit breaker that has ground fault. Is it intended that the minimum egress circuit size be 600 amps when ground fault is in use?

The circuit breaker coordination tables published this year by Cutler Hammer and Square D generally do not help engineers design a selectively coordinated system. The tables substantially require the fault current at the downstream circuit breaker to be less than the instantaneous region of the upstream circuit breaker. In real world applications, these breakers are in close proximity and they will both see very nearly the same fault current. The upstream circuit breaker has instantaneous trips at 8 to 12 times the rating of the circuit breaker. If a typical 5 percent system impedance is assumed, the available fault current is 20 times the rating of the circuit breaker and the tables do not apply.

Selectively coordinating circuit breakers on a 480 volt system often requires low voltage power circuit breaker (LVPCB) construction, with the circuit breaker's instantaneous trips disabled. On high fault current systems, disabling the instantaneous trips on cascaded LVPCBs results in delays greater than 3 cycles which is beyond the certifications specified for busway and automatic transfer switches. Each LVPCB costs more than $25000. the substantiation for

adding section 700.27 to the 2005 code noted that selective coordination could be achieved with fuses or circuit breakers and while true it implies a level playing field that doesn't exist.

Submitter: Christopher E. Buckner, Vanderbilt University Medical Center
Comment on Proposal No: 13-137
Recommendation: Disagree with the panel action. Accept Proposal 13-137 as written.
Substantiation: Total selective coordination does not always result in the highest reliability and safety for an emergency system in all occupancy types; thus, selective coordination is a decision that should be made by the design engineer. As the lead engineer for a large and nationally respected hospital facility, I have a responsibility to balance the selective operation of our distribution system with the safety of our maintenance personnel and the safety of our equipment. Mandating selective coordination will subject our maintenance personnel to much higher Arc Flash potentials. Additionally, total selective coordination will lead to higher levels of equipment damage which will greatly increase downtime and jeopardize patient safety. In order to have total selective coordination, overcurrent devices will have to stay closed longer. This increases arc flash hazards. In order to minimize arc flash hazards, you must sometimes sacrifice 100 percent selectivity. This is where engineering reason comes in and optimizes the system for patient, personnel and equipment safety on a case-by-case basis. Unfortunately, engineering reason is removed by the 2005 code mandate for total selective coordination. Selective coordination is just one of many considerations for optimizing the design of an emergency distribution system. The NFPA 110 requirement for "optimized selective tripping" is the design approach that has been used for years at our facility with NO incidents of fatalities, injuries, or excessive outages due to a lack of complete selective coordination. It is this code Panel's responsibility to recognize and respect the fact that it is not practical for the code to address all occupancy types with a blanket mandate for total selective coordination since different occupancy types have different needs and priorities for their emergency systems. This is especially true of the healthcare occupancies where patient safety is priority one. Being forced to utilize fuses in lieu of circuit breakers will no doubt increase the duration of outages to an emergency system and will lead to loss of life unnecessarily. This additional liability should not be forced on the design engineers or the facilities. Since total selective coordination does not ALWAYS result in the optimum system design, it should be removed as a code mandate. Let the design engineers do their jobs and not simply be mindless minions to the code. Without this, we have stripped away our intelligence, which is the very thing that makes our profession a service to society. Jeopardizing patient safety is not for the greater good, and as a minimum, healthcare occupancies should be exempt from these requirements.

Comment on Proposal No: 13-137
Recommendation: Continue to REJECT this proposal.
Substantiation: This clearly appears to be a manufacturer's battle between different types of over current protection. Each and every emergency system in a building or facility is vital to personnel life safety and/or property protection. These include, among others: 1) Fire Alarm Systems, to notify the fire department; 2) Building Annunciator Systems, to notify tennants and occupants; 3) Smoke Evacuation Fans or Blowers; 4) Air Pressurization Fans or Blowers, to provide positive pressure fresh air to stair wells; 5) Elevators; 6) Fire Pumps; 7) Emergency Lighting for evacuation. There is no good reason nor necessity for one emergency load to pose a threat to any other such loads. At least one large city has required this coordination for a number of years. No universally compelling evidence has been offered to warrant deleting or weakening this requirement.

TCC Action: The Technical Correlating Committee directs that this Comment be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative as required in 4.4.6.4 of the NFPA Regulations Governing Committee Projects.

Submitter: James S. Nasby, Master Control Systems, Inc.
Comment on Proposal No: 13-141
Recommendation: Continue to REJECT this proposal.
Substantiation: The proposer submitted curves for the seven circuit breakers listed in the substantiation. However, the curves, which range from 20 amps thru 3,000 amps are all drawn on the same plot without regard to wiring impedance or circuit breaker impedance. My calculations show that at 15,000 amperes, 12 inches of #14 AWG wire will drop 60 volts.
The curves on the plot lead me to assume that all seven devices are wired right next to one another.
Also, I believe that there are circuit breakers which can be adjusted and coordinated in all three time ranges (long time, medium time and short time).

Submitter: James S. Nasby, Master Control Systems, Inc.
Comment on Proposal No: 13-142
Recommendation: Continue to REJECT this proposal.
Substantiation: The submitter of this comment gives general reasons why selective coordination can not be achieved. However, it is common for normal electrical service in buildings to be so coordinated. A short in a hair dryer or toaster oven usually does not disrupt power to an entire building.
If there are specific areas of particular difficulty in selective coordination of emergency circuits, these should be brought to the attention of the Panel via Public Proposals or Public Comments. Absent specific instances needing attention, it makes no sense to toss out the entire concept of selective coordination of emergency power.

Submitter: James S. Nasby, Master Control Systems, Inc.
Comment on Proposal No: 13-146
Recommendation: Continue to REJECT this proposal.
Substantiation: The submitter proposes a FPN to indicate that the selective coordination does not apply to events shorter than 0.1 seconds. This is six line cycles at 60 Hz.
To exempt short time coordination would pose a treat to any other, if not all, emergency loads in the event of a short circuit in any one. Wiring for some emergency loads transits the entire height of a high rise building, such as with elevators and smoke or pressurization fans. Others are pervasive throughout the building, such as with emergency lighting. This is far too large a risk absent specifics as to why this can not be achieved.

Comment on Proposal No: 13-137
Recommendation: Delete 700.27. Reinstate FPN from the 2002 NEC.
Substantiation: Comment in support of proposals 13-137, Log #1950 NEC-P13. This comment is in support of the proposal comment to delete 700.27 as written in NEC 2005.

Reasons to support the proposal to delete 700.27

1) Conflict with NFPA 110 recommendations1 and, consequently, conflict with IBC requirements, chapter 27.

2) Conflict with generally adopted electrical design guidelines such as IEEE Recommended practices commonly known as the "Color Books". IEEE standard 242 "Recommended Practice for Protection and Coordination of Industrial and Commercial Power Systems". These conflicts put the selectivity requirement in the NEC in conflict with OSHA regulations2.

3) Maximum reliability for any system is not a matter of simply providing selective tripping. Maximum reliability must take into account minimizing the effect of any abnormal conditions based on the probability of the conditions considered, the immediate effect of the event and the time to remedy the condition and restore needed power to the loads affected by the abnormal event. An industry reference for evaluating the reliability, normally expressed as availability, of power distribution system is IEEE standard 493-1997, "Recommended Practice for Design of Reliable Industrial and Commercial Power Systems". At the highest level, system reliability is dependant on load interruption frequency and expected duration of load interruption events.3 If selectivity is achieved by increasing the size of protective elements or slowing the protection these elements could otherwise provide equipment and conductor damage may be increased and hence the repair time, or down time caused will be increased. This can lower the reliability of system. Good design practice should attempt to take this into consideration. The code requirement as currently written does not allow a designer to make these decisions.

4) Complete selectivity is impossible in most systems when all faults are considered. Specifically low to high magnitude single or three phase faults and zero sequence faults (ground faults), regardless whether circuit breakers or fuses are used.

a. This is due, in part, to the well-supported requirement for ground fault protection in critical power distribution systems of substantial size. This point is further elaborated in attachment A.

b. Also due to the need for transformer primary and secondary protection as defined in the NEC and good engineering practice. The line side main and low side main are similar overcurrent devices that need to handle similar current it is near impossible to make them selective without over-sizing one or under-sizing the other. Furthermore, whether one trips, the other trips, or both trip the impact on the system is exactly the same. Over-sizing the line side device to drive selectivity, however, can decrease the protection afforded to the transformer increasing damage and increasing arc flash energy in the case of an event.

1NFPA 110, Annex A.6.5.1.
"It is important that the various overcurrent devices be coordinated, as far as practicable, to isolate faulted circuits and to protect against cascading operation on short circuit faults. In many systems, however, full coordination is not practicable without using equipment that could be prohibitively costly or undesirable for other reasons. Primary consideration also should be given to prevent overloading of equipment by limiting the possibilities of large current inrushes due to instantaneous reestablishment of connections to heavy loads."

2General Duty Clause (GDC). It is Section 5(a)(1) of the Occupational Safety and Health Act.
"Each employer shall finish to each of his (sic) employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees..."

3IEEE standard 493-1997, Chapter 2, Section 2.1.4, "System reliability indexes.

c. Due to size ratios of circuits used in normal power distribution design. Improving selectivity will normally require devices to have specific size ratios between each other. Fuses for example normally require a ratio of 2 between devices of the same class and manufacturer, greater ratio if the fuses are different class and allowances are made for all fuses that may be installed in a switch. Circuit breakers may need greater ratios. This can make the design of system impractical, larger than necessary with consequential effect on cost, size and protection afforded.

d. Due to considerations for the different fault characteristics of utility versus generator sources. Different configurations of sources create different selectivity and design constraints. As an example, in a double-ended substation that may use closed transitions to maintain system continuity a system may have twice the short circuit rating for a few seconds of each year. How much consideration should be given towards maintaining selectivity during that time? How much cost and building space should be allocated towards these seconds of selectivity?

5) Complete selectivity has no impact on system reliability for some circuit configurations such as when to similarly sized overcurrent protective devices are connected in series with no loads in between. This is the situation with transformer protection on the primary and secondary side of a transformer. Whether fuses or circuit breakers both devices are the same size once the transformer ratio is considered, hence, both devices see the exact same fault current for three phase faults and both may trip in similar time non-selectively. This has the same effect on loads whether one OCPD clears, the other, or both.

6) Safety for electrical personnel and any other personnel near electrical equipment or conductors. The attempt to achieve selectivity for maximum theoretical value of bolted faults will cause the devices to be insensitive or slow for lower value faults that are much more probable and widely acknowledge as being more dangerous. References to this risk, known as "Arc Flash Hazard" are included in the NEC, NFPA 70E and IEEE 1584. Ignoring this risk and the recommendations of NFPA 70E and IEEE 1584 is contrary to the requirements of OSHA. Hence forcing a user to choose selectivity in lieu of following recommendations set forth in widely accepted engineering practices puts the user in a position of either obeying the NEC or OSHA, he cannot do both. This is not a position the NEC should force any user or designer to be in. Attachment B further elaborates on this point and provides an example of this situation.

7) Designing a system that is completely selective, if possible at all, will often require devices to be larger than otherwise needed driving equipment cost, installation space and allotted building space. In many cases to achieve selectivity that is not needed due to the low probability of a fault ever occurring that requires that level of selectivity. Bolted faults are widely acknowledged to be very rare, yet trying to accommodate them in selectivity considerations will drive up cost and size, essentially unnecessarily.

I have submitted Attachment (s) A and B that are more detailed discussions of two of the points listed above. The difficulty caused by ground fault protection and one example of the impact of the selectivity requirement on a simple system with respect to arc flash protection. Many of the other points have been amply described in other comments and supporting documentation provided to this panel regarding this issue.

13-202 Log #1786 NEC-P13 **Final Action: Reject (700.27)**

Submitter: Joseph A. Hertel, Safety and Buildings
Comment on Proposal No: 8-95
Recommendation: I agree with the proposal and the CMP should reconsider their actions.
Substantiation: The CMP rejected the proposal and should reconsider in the comments. Panel comments indicate that selective coordination is a design consideration and they should be reminded that the NEC is not a design manual. We have seen facilities where it is not possible to comply with the NEC requirement for selective coordination. As an AHJ we have allowed installers, designers and owners to comply "to the extent possible" with available equipment. While I can agree selective coordination is an ideal installation it is not at this time practical for all installations.
Panel Meeting Action: Reject
Panel Statement: The committee is unsure as to which proposal the submitter is providing this comment.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 1
Ballot Not Returned: 1 Gustafson, R.

Comment on Proposal No: 13-137
Recommendation: Reconsider and accept Proposal 13-137 to delete NEC 700.27.

~~700.27 Coordination. Emergency system(s) overcurrent devices shall be selectivity coordinated with all supply side overcurrent protective devices.~~
Substantiation: Based on the panel statement which references 13-135, the substantiation of this proposal was not recognized by the panel as there is no panel statement that refutes the submitter's concerns or technical merit. The panel statement states that selectivity increases the reliability of an emergency system with no technical response to the NEMA substantiation with references to IEEE standards examples that are in direct opposition to the panel's statement. The panel did not address or comment on the conflicting NFPA documents where the technical committee for NFPA 110 Emergency and Standby Power Systems does not require all devices to be selective. The Panel did not comment on the additional restriction in NEC 700.27 that requires all devices to be selective as compared to the definition in Article 100 that provides the engineer the necessary latitude to choose the appropriate overcurrent devices and system configuration. Requiring all overcurrent devices to be selective is an over design for the system, which is recognized by the IEEE examples presented in the substantiation. This results in an increase in the size of equipment conductors and raceways, leading to unnecessary equipment cost and size increases, higher available short circuit currents and increased arc flash hazard for the installation. A review of the numerous public proposals to delete and revise NEC 700.27 along with the comments from the voting members of CMP 13 are recognizing that selectivity is not an independent technical solution as it impacts reliability, personnel safety from arc-flash hazard increases, and the removal of isolation devices such as circuit breakers in the electrical system.

I have assisted in the selective coordination of a number of facilities across the country and all of the following points have entered into the discussion at some point. The points discussed below are independent of applying fuses or circuit breakers; as a matter of fact the overcurrent devices in the switchboard and the generator are based on the manufacturer dependent 2:1 fuse ratios. Consider the diagram I have provided and the challenges with selective coordination.

NEC 700.27 must be deleted, leaving selectivity to the engineering community in order to ensure that the most reliable and safest system is installed. Many other technical performance issues are left to the engineering community such as:

1) Voltage drop, where you have an NEC compliant installation that is selectively coordinated and the lights dim and drop out computer systems.

2) Sizing motor overcurrent devices for selectivity, where the motors are unable to start but they are NEC compliant, permitting exhaust fans in the legally required standby system to be code compliant even if they are unable to start.

3) Ground-fault protection, where none is required on the emergency system source but may be found on the normal source. Hence a small ground fault can take down the normal source which is often more reliable than the alternate source. Once again a performance issue that is ignored in the NEC but the engineer addresses the issue in design.

These few examples illustrate reliability issues that are left to the engineer to address. Why is selectivity more important than these examples that are not addressed by the NEC for enhanced safety and reliability?

The panel's action not to revise or delete NEC 700.27 is making a statement that selectivity is more important than reliability and personnel safety from arc-flash and simply ignores the unnecessary increase in the size of equipment and materials that are unnecessary and is ignoring the amendments that are utilized in the industry to address some of these issues:

1) The State of Washington has amended the Selectivity requirement in the 2005 NEC.

2) The healthcare industry in the State of Florida recognizes the challenges of selective coordination and permits overcurrent devices to overlap where no additional isolation is gained in the system. The 2005 NEC fails to address this issue.

3) The inspection community in plan review has recognized this challenge as we have engaged in numerous conversations between engineers and inspectors that are working together to optimize selectivity per NFPA 110. They are recognizing that the 2005 NEC is more restrictive than necessary and are having to address designs through 90.4 by getting permission from the AHJ to permit appropriate latitude to comply with NFPA 110 even though they are not compliant with NEC 700.27. There is no safety or performance compromised and it is easy to recognize enhancements in performance and reliability with enhanced safety as a by-product of a reduction in the size of the overcurrent devices.

The panel should reconsider the action taken on this proposal and the numerous others looking for relief in this section to provide the safest and most reliable system to the facility they are designing. Delete NEC 700.27 and leave the performance issues to the engineer as is done with numerous other aspects of the electrical system.

13-204 Log #2124 NEC-P13 **Final Action: Reject**
(700.27)

TCC Action: The Technical Correlating Committee directs that this Comment be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative as required in 4.4.6.4 of the NFPA Regulations Governing Committee Projects.
Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 13-137
Recommendation: I disagree with the panel action. Accept Proposal 13-137 as written.
Substantiation: NEMA strongly supports selective coordination as a valuable safety asset in the current range where overloads most often occur. However, NEMA does not support the mandate for Selective Coordination for ALL current ranges and ALL overcurrent devices because safety and reliability can both actually be diminished. This is due to increased hazardous arc flash energy with increased equipment damage and potential fire initiation, decreased reliability, and extended downtime before service restoration. Mandates for selective coordination for ALL current ranges and ALL overcurrent devices will not always provide the optimum safety solution or optimum reliability. Such a solution requires the expertise and judgment of a Professional Engineer who can balance the design, safety and operating requirements in order to determine the optimum design for each specific facility.

Selective coordination is a system design issue, not a Code issue.

The wording of this section states the ALL overcurrent devices selectively coordinate, but this is not what the definition Article 100 implies. The definition deals with localization of an overcurrent and, in many cases, selective coordination for ALL overcurrent devices serves no useful localization purpose such as when: 1) Overcurrent devices are located on the primary and secondary sides of a low voltage transformer with no loads in between. 2) A feeder overcurrent device is connected in series with the main overcurrent device in a downstream panelboard with no loads in between. 3) An overcurrent device on a generator is in series with an overcurrent device in a switchboard with no leads in between. In these instances, requiring both devices to be selectively coordinated does not add to the reliability of the system, which is the stated objective of the CMP.

When overcurrent devices are located on the primary and secondary sides of a low voltage transformer, sized to meet the NEC transformer protection requirements, it is almost impossible to also meet the requirement for selective coordination of this section, regardless of the type of overcurrent protective device chosen.

In many instances, it may not be possible to meet the requirements for generator protection provided by an overcurrent device located on or near the generator and provide selective coordination with downstream overcurrent devices. Further, the generator protection functions provided within the engine-generator controller by the manufacturer might not be able to selectively coordinate with downstream overcurrent devices.

The paralleling of generators is often done to enhance system reliability, which is the stated objective of the CMP, however, in order to meet the requirement for selective coordination each generator overcurrent device and controller must selectively coordinate with all downstream overcurrent devices. This may not be possible if the generators are of unequal size.

The upgrade or expansion of an existing building may require the replacement of existing upstream equipment so that it will selectively coordinate with the new downstream equipment it must feed. The State of Washington has recognized the significant economic burden this is placing on building owners and businesses and has issued an emergency order exempting existing buildings from meeting the selective coordination requirements of the 2005 NEC.

Systems are normally designed for selective coordination in the overload region of the overcurrent device time-current curves. If this were not so, they would not operate under normal conditions, so what is really being called for in this requirement is overload and short circuit selective coordination. In order to achieve total short circuit selective coordination, the size of upstream overcurrent protective devices may need to be increased and/or time delay trip characteristics increased, thereby possibly increasing the arc flash hazard. In other words, by forcing selective coordination for an event that most likely will never occur, namely a bolted fault, the hazards involved in performing tasks which most likely will occur, namely system maintenance, may be increased. This is another reason why system designers need the flexibility to optimize the design of a system, which the current requirement does not allow.

Further, as stated in the original NEMA substantiation to delete this text in proposal 13-137, we wish to once again point out the following:

1. The need for the flexibility to optimize the design of a system is recognized in IEEE Standard 242-2001 (The Buff Book). Section 15.1 states, "In applying protective devices, it is occasionally necessary to compromise between protection and selectivity. While experience may suggest one alternative over another, the preferred approach is to favor protection over selectivity. Which choice is made, however, is dependent on the equipment damage and the affect on the process."

2. The need for the flexibility to optimize the design of a system is also recognized in NFPA 110-2005, Standard for Emergency and Standby Power Systems. Section 6.5.1 states, "The overcurrent protective devices in the EPSS shall be coordinated to optimize selective tripping of the circuit overcurrent protective devices when a short circuit occurs. A further explanation of this statement is given in Annex A section A.6.5.1, "It is important that the various overcurrent devices be coordinated, as far as practicable, to isolate faulted circuits and to protect against cascading operation on short circuit faults. In many systems, however, full coordination is not practicable without using equipment that could be prohibitively costly or undesirable for other reasons."

3. This NEC text conflicts with Chapter 27 of the International Building Code that specifically requires compliance with NFPA 110 for emergency systems. This presents a conundrum for the system designer and the AHJ. Which code takes precedence, the IBC or the NEC?

In summary, NEMA strongly supports selective coordination as a valuable safety asset in the current range where overloads most often occur. However, NEMA does not support the mandate for Selective Coordination for ALL current ranges and ALL overcurrent devices because safety and reliability can both actually be diminished, thus the section should be deleted.

Panel Meeting Action: Reject

Panel Statement: The overriding theme of Articles 700 and 701 is to keep the power on throughout an emergency situation, for life safety. Selective coordination increases the reliability of the emergency system. Selective coordination is essential for the continuity of service required in emergency and legally required standby circuits.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 7 Negative: 6

Ballot Not Returned: 1 Gustafson, R.

Explanation of Negative:

ELKINS, D.: See my Explanation of Negative on Comment 13-177 (Log #1340).

NASBY, J.: NEMA disagrees with the Panel action. NEMA supports "sensible" selective coordination, in the range where overloads most often occur. In this range, selective coordination is associated with increased safety without negative consequences. However, as documented in several presentations given to the Panel, there are circumstances where the mandates for total selective coordination across all current ranges can actually result in decreased safety and reliability. The duration time of 0.1 seconds as proposed in Comments 13-187 and 13-233 seems to be a "compromise" position that would have addressed several of the identified safety concerns, while maintaining a mandatory requirement as suggested by CMP-13. NEMA strongly urges reconsideration and acceptance of Comments 13-187 and 13-233. The Panel also discussed adding a statement that selective coordination applies only to the emergency source. For some reason, this did not get into the final text but it should also be reconsidered.

RAPPAPORT, E.: See my explanation of negative vote on Comment 13-177.

WHITTALL, H.: See my explanation of negative vote on Comment 13-178.

WOOD, T.: Proposal 13-137 should have been accepted. The substantiation provided by the submitter of Proposal 13-137 is well founded. Selective coordination is a design consideration. While selectivity may be desirable in some cases, it has not been shown that the lack of coordination has been responsible for the loss of life, injury to persons, or damage to property.

If the Code Making Panel believes that selectivity is sometimes a design consideration, it should be in the Code as a FPN and not as mandatory language that is likely not to be enforced. The use of mandatory language in the Code makes the installer contractually liable for its implementation when this should be a "design-engineering" responsibility.

In all cases, the Proposers and the Commenters advocating the removal of both 700.27 and 701.18 have provided well-documented substantiation for their removal.

ZGONENA, T.: See My Explanation of Negative on Comment 13-175.

13-205 Log #2171 NEC-P13 **Final Action: Reject (700.27)**

TCC Action: The Technical Correlating Committee directs that this Comment be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative as required in 4.4.6.4 of the NFPA Regulations Governing Committee Projects.

Submitter: Douglas Stephens, ASCO Power Technologies

Comment on Proposal No: 13-137

Recommendation: This Comment is merely to add support to the Panel action which was to Reject this Proposal.

Substantiation: Overcurrent conditions (Locked Rotor and/or Short Circuit) in the Fire Pump Room are to be cleared, and be resettable, in the pump room (which, per clause 5.12 of NFPA 20 is required to be "separated or protected by fire-rated construction") and not at some electrically upstream OCPD which may be inaccessible during a fire and possibly disable other emergency loads/ systems.

Submitter: Peter R. Walsh, Peter R. Walsh, P.E. & Associates

Comment on Proposal No: 13-137

Recommendation: The Panel should continue to Reject this Proposal.

Substantiation: The NEC has required selective coordination for elevator circuits for years without major problems. The recent expansion of requirements makes good sense for the users of the buildings. Who wants to suffer from a blackout as a result of non-selective coordination? Engineers have software programs, like Easy Power Version 8.0 that can automate selective coordination.

With Zone Selective Coordination trips, almost anything can be coordinated. Arc flash can be adjusted by proper trips. The code making panel should require reliable power through selective coordination of emergency circuits.

Submitter: Charles Fuellgraf, Fuellgraf Electric Company

Comment on Proposal No: 13-137

Recommendation: We respectfully wish to comment and express our support for Proposal 13-137 and Proposal 13-159 which would reestablish the requirements for Selective Coordination.

Substantiation: We absolutely support selective coordination in lower current ranges. This is essentially where all faults and overloads occur, and the system design engineers practice selective coordination to protect for any such occurrences.

Going to a "total" system coordination can bypass the expertise and judgment of the knowledgeable engineer and contribute to escalated dangers from the various hazards of high energy levels. This can lead to increased risks to operating personnel, plus additional costs of equipment and associated labor.

Thank you for the opportunity to make these remarks which we feel are in the best interests of our industry and those exposed to it.

Comment on Proposal No: 13-137

Recommendation: The proposal should have been Accepted.

Substantiation: This requirement was added in 2005 without technical substantiation and is a design issue, not a safety issue. The proposal was an

attempt by a fuse manufacturer to mandate the use of fuses in applications where circuit breakers are more appropriate for most installations. I would always include selective coordination in things desired of an electrical system design, but in many cases foregoing selective coordination can make for an installation that more clearly meets the safety objectives of the code. In many cases the use of fuses in these systems will dramatically increase the arc flash hazard; is that truly in the interest of safety?

Submitter: Alan Manche, Square D Company
Comment on Proposal No: 13-137
Recommendation: Reconsider and accept in principle proposal 13-137. Delete the present text and replace with revised language as noted in proposal 13-137 that parallels NFPA 110.
~~700.27 Coordination. Emergency system(s) overcurrent devices shall be selectivity coordinated with all supply side overcurrent protective devices.~~
700.27 Coordination. The overcurrent protective devices in the emergency system shall be selected to optimize selective coordination.
Substantiation: Square D continues to support the deletion of NEC 700.27, however, if the panel is reluctant to address the safety, reliability and performance issues by deleting it, it would be prudent for the panel to revise the text to address many of the concerns addressed in not only in this proposal but the many other proposals that were submitted to the panel.
As a member of the NFPA 110 technical committee, the committee has recognized these challenges. Utilizing similar language to that found in NFPA 110 would permit some latitude to address many of these issues found in the proposals that were submitted and would remove the conflicting language and requirements.
This comment simply requests the panel to reconsider the action taken on the numerous proposals to revise NEC 700.27 in order to address the technical issues so the electrical industry can ensure the most reliable and safest system is in place for our communities. The present language does not support our communities in this manner. The proposed language in this comment moves closer to that goal and aligns with NFPA 110.

Submitter: Terry Macalady, Consulting Engineer, LLC
Comment on Proposal No: 13-147
Recommendation: Continue Rejecting this Proposal.
Substantiation: I have worked for manufactures of circuit breakers, fuses and electrical utilities. Now, I am a consultant working with industrial and large commercial accounts. I have been involved in development and testing of CBs and fuses and in the field. I work with electrical engineers and maintenance people. This proposal is based on the premise that circuit breaker systems can be safely restored to power faster than fusible systems and, therefore, the selective coordination requirement should be ignored for molded case circuit breakers. This premise should not be accepted for several reasons including:
1. Since the 2005 NEC, the circuit breaker manufacturers have published selective coordination charts for molded case circuit breakers and numerous application materials on how to achieve selective coordination.
2. A selectively coordinated system reduces the amount of circuits that have to be restored. If a system is selectively coordinated, only the closest upstream overcurrent protective device will open for any overcurrent. There is not an issue about speed of restoration of power for the non-affected portions of the system because selective coordination *prevented* unnecessary outages. In time of emergency, there is great value to not have unnecessary outages; peoples' lives may depend upon it. Also, restoration of power will occur quicker since the electrician does not have to spend a large amount of time troubleshooting and restoring circuits that were unnecessarily disrupted.
3. For the portion of the system that does rightfully get interrupted by the opening of the nearest upstream overcurrent protective device, there is an electrical reason for the opening of this circuit. Proper work practices are required for investigating the cause, rectifying/repairing the circuit, and restoration of the power. To ignore proper work procedures can imperil electrical workers as well as building safety. In specific situations, fuses may permit faster restoration of power and in some cases, circuit breakers may permit faster restoration of power. For instance, it is against the federal law per OSHA regulation 1910.334(b)(2) to merely reset a circuit breaker or replace fuses *"until it has been determined that the equipment and circuit can be safely reenergized. The repetitive manual closing of circuit breakers or reenergizing circuits through replaced fuses is prohibited."* Also, circuit breaker manufacturer's operational manuals advise against merely resetting circuit breakers that have interrupted a fault at or near a circuit breaker's interrupting rating. NFPA 70E requirement 225.3 *"Circuit Breaker Testing. Circuit breakers that interrupt faults approaching their ratings shall be inspected and tested in accordance with the manufacturer's instructions." Of special note! A phase to ground fault (which is the most common beginning of a electrical fault) of 8,000 to 10,000 ampere, the UL listed phase to ground test listing on many commonly used molded case breakers, may seriously damage a three pole breaker with a three phase fault rating of 65,000 ampere rendering the breaker unsafe for further operation.*
The lower level phase to ground fault is more difficult to visually detect and should be the first on site investigation in addition to overload. The accepted procedures would be to take this breaker out of service and send it back to the manufacturer for testing and try to find a replacement.
4. Rejection Style Fuses are devices that when they open, will be replaced by the same rejection case size and interrupting capacity to restore power. Proper ampere spare fuses normally are stored on site, but these rejection style fuses are a common stock item in local electrical distribution inventory and are readily available. This is not the case for most 480 volt breakers of mid to high interrupting capacity. Rarely are these breakers available except from the manufacturer which can cause excessive down time. Ensuring proper spare fuses on site is an important responsibility for the facilities management. Fuse specifiers typically prefer fuses because of their inherent reliability and knowledge that when the circuit protection is restored, the protection level is as originally specified. On the other hand, it cannot be assumed that circuit breakers translate to faster power restoration just because they are resettable. Circuit breakers that have interrupted a circuit should be inspected, tested and possibly replaced. This occurrence depends on the ongoing circuit breaker maintenance practices, history/condition of the circuit breaker, and level of fault interrupted. Molded case breakers are not routinely inspected and maintained in institutional, industrial or governmental installations.
5. Branch circuit over currents typically are overloads or faults (which includes ground faults). My experience is that feeder and main overcurrent protective devices most often open because of phase to ground faults. When an overcurrent protective device opens because of a fault, then the circuit has to be investigated and the fault cause found and remedied. Rarely will this be a fast (matter of a couple of minutes) process.
6. Molded case circuit breakers are not fault current rejection by frame size as well as in some cases voltage rejection by frame size. My recent and past experience is this is a serious problem when there is either breaker failure replacement or additional breaker circuit additions in the field. I have seen critical circuits on new hospital facilities field installed breakers with fault capacity less than available fault values and in one case a 208 volt rated breaker on a 480 volt system causing a major Arc Fault and hospital shut down. In the last few months, site visits on new electrical industrial facilities and additions at a large data center disclosed breakers with less interrupting capacity than the available fault were mixed in with the proper capacity breakers from the factory. Field changes allowed non-rejection fault interrupting breakers that are interchangeable, which other than the fine print, to become a potential serious problem to the installed equipment, down time and possible injury to the electrical worker.
7. Molded case breakers and fuses may be engineered to provide selective coordination if the engineering work is accomplished at the time of design or before purchase of critical circuit electrical equipment. Selective coordination is fault isolation at the point of fault without negatively affecting the rest of the system. To rely on the resetting of an overcurrent device as a procedural process is against standard safe work procedures per OSHA, NFPA 70E, overcurrent manufactures recommendations and common sense. I am not aware of one breaker or fuse manufacturer that will recommend this procedure in writing without a number of exceptions that would keep them out of litigation.

ARTICLE 701 — LEGALLY REQUIRED STANDBY SYSTEMS

13-215 Log #948 NEC-P13 **Final Action: Reject**
(701.7(C))

Submitter: Steven R. Terry, Electronic Theatre Controls Inc.
Comment on Proposal No: 13-150
Recommendation: Change proposed wording to be added as a last sentence of 701.7(C) as follows, including an FPN:
Automatic Transfer Switches, rated at 600 VAC and below and utilized to transfer feeders or branch circuits between two separate, non-synchronized power sources, shall be listed for legally required standby system use.
FPN: The standard for listed Automatic Transfer Switches in ANSI/UL 1008, Standard for Safety for Transfer Switch Equipment.
Substantiation: The submitter of this proposal is precisely correct in his substantiation, but the proposal does not go far enough in helping to prevent misapplication of inappropriate devices as transfer switches. The original proposal asked that Automatic Transfer Switches be listed "for legally required

standby system use". Unfortunately, recent experience has shown that stand-alone Load Control Relays that have a perfectly valid emergency listing under UL 924, (Emergency Lighting and Power Equipment), are being misapplied as branch circuit Automatic Transfer Switches, where UL 1008 devices should in fact be used. These misapplied Load Control Relays are being used to transfer a load between two non-synchronous power sources, but they are not subject to any of the stringent requirements of UL 1008 that are needed for this application, such as fault current testing and mechanical interlock to prevent inadvertent connection of the two power sources. Thus, "listed for legally required standby system use" does not adequately clarify the listing requirements for transfer switches.

The misapplication of non-UL 1008 devices is happening for the following reasons:

A. The NEC is silent in Article 701 on what equipment is required to transfer a branch circuit between two non-synchronous power sources. NFPA 110 is similarly silent on this issue. Automatic Transfer Switches are most commonly used as feeder-level devices. Therefore, installers and engineers are often unaware that devices used to transfer branch circuits are subject to similar switching phenomena, and thus similar risk concerns, as feeder circuit transfer devices. This can lead them to incorrectly assume that devices used to transfer branch circuits need not be UL 1008 listed Transfer Switches.

B. Branch Circuit Automatic Transfer Switches listed under UL 1008 are relatively new devices, as is the concept of transferring single or multiple branch circuits between utility and alternate standby power sources. Previously, this type of transfer was almost always handled by an upstream feeder-level UL 1008 transfer switch.

C. Stand-alone Load Control Relays (LCRs) listed under UL 924 have recently become available. These are typically double-pole, double-throw devices, but single-pole, double-throw and single-pole, single-throw devices also exist. They are intended only for load energization during loss of utility power, that is accomplished by performing a bypass of the wall switch or dimmer controlling the branch circuit. In this case, an upstream UL 1008 transfer switch is doing the actual transfer from normal to alternate standby power. However, engineers and installers often incorrectly assume that these UL 924 devices can be used to actually transfer the branch circuit load between normal and alternate standby power.

This situation is not helped by the fact that some manufacturers of these devices have produced data sheets that can be misleading, and do not specifically prohibit this type of transfer. Presumably, this is because no standard, including the NEC, speaks directly to the requirements of this relatively new branch circuit transfer application. UL has publicly asserted that UL 924 Load Control Relays are not to be used to transfer a load between two non-synchronous power sources, and that only a UL 1008 device is suitable for this application. In the Spring 2005 issue of "The Code Authority" (UL's newsletter on Code issues), the article "Focus on Emergency Lighting Equipment" appears on page 3. That article states:

"An important issue to recognize is that an LCR does not switch the load between the normal and emergency supplies. Load switching of this type should only be performed by a transfer switch listed in accordance with UL 1008, Standard for Safety for Transfer Switch Equipment."

This statement by UL also applies to legally required standby systems, because the application of transferring between two non-synchronous power sources is the same for emergency and legally required standby systems. The proposed revised wording above would accomplish the following:

1. Require all Automatic Transfer Switches to be listed.
2. Clarify that a listed ATS is required when it is applied either in feeders or in branch circuits, if the application is transferring a load between two non-synchronous power sources.
3. Provide an informative FPN to point the reader to the applicable standard for Automatic Transfer Switches.

Panel Meeting Action: Reject
Panel Statement: The additional text "... and utilized to transfer..." would add confusion. The FPN is already covered in Annex A. Listed transfer switches are required according to the action on Proposal 13-150.

13-216 Log #2340 NEC-P13 **Final Action: Reject**
(701.7(C)(1))

Submitter: Alan Manche, Square D Company
Comment on Proposal No: 13-150
Recommendation: Reconsider and Reject Proposal 13-150.
Substantiation: There has been no substantiation presented that equipment failure is an issue where appropriately rated and installed electrical equipment is used. The proposed text only requires a transfer switch to listed, which is only one of many solutions for transferring power to alternate sources. Multiple switchboards from multiple manufacturers are often employed in large facilities to control the power from multiple power sources. It is not reasonable to require such an installation to have equipment that is specifically listed for the transfer or paralleling of sources.

Let's specifically review the submitter's substantiation:

1) "When the two power sources are not synchronized, as much as twice rated voltage may be seen across the transfer switch contacts." This particular issue does not exist where the transfer equipment or transfer switch is constructed to be a break-before-make configuration. A simple delay between breaking on source and closing on the other addresses this issue. So this substantiation simply inaccurately restricts existing products and technology that is safely used today.

2) "Unless listed, a problem of uncoordinated overcurrent protection may exist should the transfer switch close into a short circuit." This particular test is found in almost all product standards for equipment, however, we still do not require a switchboard, panelboard or circuit breaker to be listed which is just as critical and where this condition is more likely to encounter in the electrical system. Where is the substantiation that a safety issue exists today? Why is the panel moving to potentially exclude product and system solutions that are safely being used today with no reported incidents?

3) "The recognized national standard for testing Automatic Transfer Switch Equipment is ANSI/UL 1008." The panel should also note that number of other product standards address the issues above including UL 67, UL 98, ad UL 891 to name a few. It should be noted that automatic transfer functionality is often embedded in panelboards and switchboards as a secondary function and may not be specifically listed to UL 1008 and still perform safely.

4) "This proposed requirement as placed under 701.7(C) would specifically apply only to automatic transfer switches. The intent is to not rule out other types of transfer system transfer equipment identified for emergency system use and acceptable to the AHJ under 700.6(A)." If the intent of the committee is to place this restriction only on transfer switches and not require listing on other viable options that are currently safely in use today, then a second sentence should be included to clarify that point. "This listing requirement is specific to transfer switches and is not intended to exclude other approved transfer equipment configurations."

The panel should reconsider the lack of substantiation and consider the broader applications of products that control the electrical system. The panel must consider the restriction being placed on the user by requiring listing which inherently will exclude safe product solutions and unnecessarily added cost to products without any substantiation that safety will be enhanced by requiring listing. Proposal 13-150 should be rejected.
Panel Meeting Action: Reject

13-217 Log #1304 NEC-P13 **Final Action: Reject**
(701.11(A))

Submitter: David Sroka, Turner Falls, MA
Comment on Proposal No: 1-54
Recommendation: Add a sentence as follows:
"The short-circuit current rating shall be included on the nameplate for battery inverters."
Substantiation: This data is hard to obtain after the original installation. It is important information. The nameplate is the best place for the equipment's rating. Circuit breaker, fuse or transfer switch rating can mistakenly be taken as the unit's rating. Lastly, it is safest to read the nameplate to get this information rather than physical removal of covers.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 13-167.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

13-218 Log #2118 NEC-P13 **Final Action: Accept in Principle**
(701.11(B)(5) (New))

Submitter: Mark R. Hilbert, Wolfeboro, NH
Comment on Proposal No: 13-155
Recommendation: Accept the Proposal.
Substantiation: The new FPN was not intended to identify that the disconnecting means which is the subject of 701.11(B)(5) must disconnect the "service." The FPN is necessary to identify to users of the NEC that this disconnecting means must be rated as "suitable for use as service equipment." As described in Article 100, conductors supplying a building or other structure from a generator are "feeder" conductors. Seeing that the generator is outdoors,

the conductors are "outside feeder conductors" and, therefore, they are included in the scope of Article 225. Section 225.31 requires that a disconnecting means be provided to disconnect all conductors that supply or pass through a building or structure. Section 701.11(B)(5) amends the requirements of 225.32 to locate the disconnecting means required by 225.31 at the building or structure served, however, it does not amend the requirements of 225.36 for it to be "suitable for use as service equipment." This requirement is often overlooked and the proposed FPN would go a long way towards identifying that there is another requirement in 225.36 that must be considered.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 13-219.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 1
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
RAPPAPORT, E.: See my explanation of negative vote on Comment 13-219.

13-219 Log #2119 NEC-P13 **Final Action: Accept in Principle (701.11(B)(5) (New))**

Submitter: Mark R. Hilbert, Wolfeboro, NH
Comment on Proposal No: 13-155
Recommendation: Accept the Proposal in Principle and revise 701.11(B)(5) to read:
(5) Outdoor Generator Sets. Where an outdoor housed generator set is equipped with a readily accessible disconnecting means that meets the requirements of 225.36 and is located within sight of the building or structure supplied, an additional disconnecting means shall not be required where ungrounded conductors serve or pass through the building or structure.
Substantiation: The new FPN was not intended to identify that the disconnecting means which is the subject of 701.11(B)(5) must disconnect the "service." This comment is being submitted as an alternative to adding a new FPN. The new text will identify to users of the NEC that this disconnecting means must be rated as "suitable for use as service equipment." As described in Article 100, conductors supplying a building or other structure from a generator are "feeder" conductors. Seeing that the generator is outdoors, the conductors are "outside feeder conductors" and, therefore, they are included in the scope of Article 225. Section 225.31 requires that a disconnecting means be provided to disconnect all conductors that supply or pass through a building or structure. Section 701.11(B)(5) amends the requirements of 225.32 to locate the disconnecting means required by 225.31 at the building or structure served, however, it does not amend the requirements of 225.36 for it to be "suitable for use as service equipment." This requirement is often overlooked and the proposed new text would go a long way towards identifying that there is another requirement in 225.36 that must be considered.
Panel Meeting Action: Accept in Principle
Accept the proposal in principle and revise 701.11(B)(5) to read:
(5) Outdoor Generator Sets. Where an outdoor housed generator set is equipped with a readily accessible disconnecting means located within sight of the building or structure supplied, an additional disconnecting means shall not be required where ungrounded conductors serve or pass through the building or structure. The disconnecting means shall meet the requirements of 225.36.
Panel Statement: The added sentence clarifies that the disconnecting means must comply with 225.36.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 1
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
RAPPAPORT, E.: The comment, as written is clear. The relocation of the requirement to comply with 225.36 is confusing as it is not clear whether it applies to the generator set disconnecting means or the additional disconnect that is not required.

13-220 Log #2177 NEC-P13 **Final Action: Reject (701.11(B)(5), FPN (New))**

Submitter: Mark R. Hilbert, Wolfeboro, NH
Comment on Proposal No: 13-154
Recommendation: Accept the Proposal.
Substantiation: This proposal should be accepted as the purpose of the FPN is to direct readers of this section to a requirement that is not obvious. The grounding and bonding conditions when the disconnecting means is remote from the building or other structure it is supplying are often misunderstood and, therefore, this would be an appropriate location for a FPN providing direction to the location of the requirement. In the ROP stage, Panel 5 accepted a proposal to 250.32(D) to include a reference to 701.11(B)(5) to identify that the requirements of that section apply to the condition of 701.11(B)(5). It would be prudent to locate a FPN here to reference 250.32(D).
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms their statement on Proposals 13-154 and 13-130. The panel believes that the addition of the FPN is unnecessary.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

13-221 Log #462 NEC-P13 **Final Action: Reject (701.11(E))**

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 13-157
Recommendation: Accept proposal revised:
Except at the point of supply ~~The~~ the legally required standby service shall be sufficiently separated from ~~the normal~~ any other service to ~~prevent~~ minimize simultaneous interruption of supply.
Substantiation: "Normal" is not defined. If a structure is served by a single-phase and three-phase service, which is normal, one or both? Service is defined as including conductors and standby service conductors connected to "normal" service conductors are not "separated." Simultaneous interruption cannot be prevented. Only minimized, as specified in (D) and 695.3(A)(1) and 700.12(D)(2). Separation should be required from any other service since whether "normal" or not an occurrence could also affect the legally required standby service if not separated.
Panel Meeting Action: Reject
Panel Statement: The panel believes that the current wording is clear and the proposed wording will add confusion.
Number Eligible to Vote: 14

Ballot Not Returned: 1 Gustafson, R.

13-222 Log #2049 NEC-P13 **Final Action: Accept (701.17)**

TCC Action: The Technical Correlating Committee understands that the comment recommendation was to continue to reject Proposal 13-158, but actually addressed the text in 701.17 and not 700.17 as indicated in the comment.
Submitter: Hugh O. Nash, Jr., Nash Lipsey Burch
Comment on Proposal No: 13-158
Recommendation: Continue to reject 13-158 which applies to 700.17 Ground-Fault Protection.
Substantiation: Regardless of the size of the alternate source, ground-fault interruption of the alternate source overcurrent device can cause interruption of the alternate source feed to critical equipment. This is of particular concern to healthcare facilities. The panel statement (reason for reject) states: "Automatic disconnecting may be provided but is not required". In healthcare facilities, automatic disconnecting may not be provided under any circumstances. 517.17(B) states, "The additional levels of ground-fault protection shall not be installed as follows: (1) on the load side of the essential electrical system transfer switch. (2) Between the onsite generating unit (as) described in 517.35(B) and the essential electrical system transfer switch(es)". For many year,s the NEC warned the user against placing GFP interruption between the alternate source and the transfer switch(es). This warning has now become a prohibition. There are documented instances where GFP interrupted the normal source and the alternate source, leaving critical care areas without normal or alternate power.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

13-175 Log #2314 NEC-P13 **Final Action: Reject (701.18)**

TCC Action: The Technical Correlating Committee does not agree with the panel statement. The submitter of the comment did correctly identify the proposal number and the paragraph of the document to which the comment was directed.
Submitter: David Beach, Gresham, OR
Comment on Proposal No: 13-159
Recommendation: The proposal should have been Accepted.
Substantiation: This requirement was added in 2005 without technical substantiation and is a design issue, not a safety issue. The proposal was an attempt by a fuse manufacturer to mandate the use of fuses in applications where circuit breakers are more appropriate for most installations. I would always include selective coordination in things desired of an electrical system design, but in many cases foregoing selective coordination can make for an installation that more clearly meets the safety objectives of the code. In many cases the use of fuses in these systems will dramatically increase the arc flash hazard; is that truly in the interest of safety?
Panel Meeting Action: Reject
Panel Statement: This comment does not comply with 4.4.5 of the NFPA Regulations Governing Committee Projects in that it does not identify the document proposal number to which the comment is directed and the paragraph of the document to which the comment is directed.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 10 Negative: 3
Ballot Not Returned: 1 Gustafson, R.

Explanation of Negative:
NASBY, J.: See NEMA Explanation of Negative on 13-204.
RAPPAPORT, E.: The panel statement is not correct. The comment meets the requirements of the NFPA Regulations since it did identify the specific proposal to which the comment is directed. See my explanation of negative vote on Comment 13-177.
ZGONENA, T.: When implemented properly, selective coordination will normally enhance a power system's ability to maintain power to critical loads. Selective coordination is appropriate for specifically determined critical areas and loads. Selective coordination is desirable in order to localize overcurrent conditions, and to limit circuit interruption to the circuits in which the overcurrent is occurring. While selective coordination with all overcurrent protective devices under all overcurrent conditions will provide such localization, there are some conditions under which this coordination may not be desirable from a safety or reliability standpoint. Requiring selective coordination of all overcurrent protective devices under all possible overcurrent conditions will require a selective coordination study be conducted, but does not allow for relaxation of this requirement where such coordination is not necessary. Where a selective coordination study reveals that complete selective coordination introduces safety concerns which are greater than those encountered if the system is not entirely coordinated, a relaxation of the requirement may be appropriate, but the current wording will not allow such a relaxation under any condition. Additional guidance needs to be provided within the code to better define where and how selective coordination is to be implemented.

Submitter: Kevin J. Lippert, Eaton Corporation
Comment on Proposal No: 13-159
Recommendation: I disagree with the Panel Action. Accept Proposal 13-159 as written.
Substantiation: The Panel statements during the 2005 revision cycle, and as stated in the 2008 ROP, indicate that CMP-13's intent for these circuits is to mandate selective coordination of ALL overcurrent devices, across ALL current ranges. This initially appears to support CMP-13's stated goal of increasing safety and reliability of the electrical system. However, an in-depth analysis reveals that it is not ALWAYS the case! There are circumstances where overcurrent devices (both fuses and circuit breakers) selected specifically to comply with the 2005 NEC mandate, will have the unwanted consequence of substantially increasing the hazardous arc flash energy with corresponding increased equipment damage and potential fire initiation with associated decreased reliability, and extended downtime before service restoration. This mandate also eliminates the Professional Engineer's expertise and judgment from determining the optimum design for each specific facility by balancing design, safety and operating requirements. Furthermore, selective coordination is a system design issue, not a Code issue.
Eaton strongly supports selective coordination as a valuable safety asset in the current range where overloads most often occur. However, Eaton does not support the mandate for Selective Coordination for ALL current ranges because safety and reliability can actually be diminished.
Alternatively, CMP-13 could choose to make this a FPN, similar to the 2002 NEC FPN to 700.25, and advising that selective coordination MAY increase overall reliability of the system.

Submitter: John Cool, PowerPlus Engineering Inc
Comment on Proposal No: 13-159
Recommendation: The Technical Panel should continue to reject this proposal.
Substantiation: The present selective requirement for legally required standby systems is important for life safety and maintaining power to important loads upon the loss of the normal power source. Selective coordination is an achievable requirement that provides loads power for the maximum time. Without selective coordination, a branch or feeder fault may unnecessarily take out the entire system or a major portion of the system. This could unnecessarily imperil lives. The present requirement is not in conflict with NFPA 110. However, the scope of NFPA 70 is more comprehensive than NFPA 110. NFPA 110 covers from the emergency power source to the transfer switch and NFPA 70 has the entire system. We have designed many facilities and can engineer the system for selective coordination. There definitely are issues that must be analyzed, but with proper analysis and specification flexibility this selective coordination requirement is achievable. We have found that systems can be designed using fusible or circuit breakers equipment.

TCC Action: The Technical Correlating Committee directs that this Comment be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative as required in 4.4.6.4 of the NFPA Regulations Governing Committee Projects.
Submitter: Robert Gustin, Eaton Corporation
Comment on Proposal No: 13-159
Recommendation: Disagree with the panel action. Accept Proposal 13-159 as written.
Substantiation: For over a hundred years, power system engineers have been trained to understand and design power systems balancing the need for protection with continuity of service (coordination). In one stroke, requirement has legislated a mandate to ignore any protection involved in emergency circuits. Since the NFPA sponsors the NEC as a fire protection document, it is beyond belief that this requirement has been mandated since its definitive results are:

longer arc fault burning times
higher heats of release from burning copper and metal
higher possibility of building burn downs
higher possibility of danger to human life

Beyond that, this requirement ignores real life designs that would in many cases make its compliance impossible. For example, today's manufacturer's of ATSs comply mostly with UL standards for withstand ratings of 3 cycles. Any breaker or fuse feeding an ATS in an emergency circuit would have to trip in less than 3 cycles. For breakers, that is tantamount to requiring an instantaneous trip. That instantaneous tripping would end coordination t 10X of breaker rating - so a 600 amp breaker would have no coordination for currents in excess of 6000 amps. For any major building in America, that is a fraction of the available fault current - therefore you cannot achieve both the protection required for the ATS and full coordination.

This is just one of many examples of applications this requirement simply ignores. There are ground fault issues; double ended substation issues whereby this requirement would make the normal loads' main breakers dramatically increase their tripping times resulting in much higher arc flash values and burn times and many others. This issue and its ramifications needs careful study and analysis before any such requirement should be made.

(701.18)

TCC Action: The Technical Correlating Committee directs that this Comment be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative as required in 4.4.6.4 of the NFPA Regulations Governing Committee Projects.
Submitter: Athanasios Papademos, Albert Kahn Associates, Inc.
Comment on Proposal No: 13-159
Recommendation: I disagree with the panel action. Accept Proposal 13-159 as written.
Substantiation: The addition of 701.18 in the 2005 NEC was instituted without the substantiation of any real world problem. It resulted in an immediate uproar from the electrical industry with regards to its effect on equipment withstand ratings, increased energy to feed arc flash events, and properly engineered coordination. The "substantiation" provided in Proposal 13-159 correctly identifies the concern with and the undesirable results of full compliance with 701.18. No less than 9 proposals (13-159 through 13-167) have been submitted by individuals such as contractors, manufacturers, consulting engineers, and code and Technical Committee members requesting its revision. It seems that Panel 13 has summarily dismissed all comments from the industry on a section of the code whose creation was based on something other than needs dictated by the real world. As stated in many of the referenced proposals, electrical coordination is a design issue; the NEC is not a design instrument, but 701.18 dictates it be used as such. The contradictions of the intent of 701.18 with other industry standards PLUS the lack of any standard for determining when a system is totally selectively coordinated should, as a minimum, result in delaying the implementation of 701.18 until such time that the industry's concerns are addressed.

Submitter: Camilo Martinez-Angulo, AmpSafe, LLC
Comment on Proposal No: 13-159
Recommendation: Proposal 13-159 should continue to be rejected by the Panel. The Panel should continue to require selective coordination for legally required standby systems.
Substantiation: I am a consulting engineer with considerable experience dealing with overcurrent protection and selective coordination. It has been my experience that selective coordination is almost always achievable with relays, circuit breakers, current limiting fuses, or combinations of these devices. Depending upon the type of system and the available short circuit current, I may specify adjustable instantaneous trips, electronic trips and/or short time delay. Whenever the short time delay causes the arc-flash energy to get out-of-hand, I specify zone selective interlocking to minimize the hazard. I will typically specify two levels of ground fault protection whenever the feeder devices are larger than about 200 amperes, so selectively coordinating with ground fault protection has not really been a problem. I find that the main purpose of Articles 700 and 701 is to maximize continuity of service so I find it so very odd that users are trying to figure out ways to eliminate the requirement from the NEC. To me, this requirement for selective coordination is an absolute necessity when it comes to emergency systems and legally required standby systems. It takes work and engineering knowledge/experience to selectively coordinate an electrical distribution system without compromising safety and protection, and that's what we've been able to do.

(701.18)

TCC Action: The Technical Correlating Committee directs that this Comment be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative as required in 4.4.6.4 of the NFPA Regulations Governing Committee Projects.
Submitter: Paul A. Kempf, University of Notre Dame
Comment on Proposal No: 13-159
Recommendation: Disagree with the Panel Action. Accept Proposal 13-159 as written.
Substantiation: Selective coordination for low current magnitudes will in most cases provide the required selective coordination without sacrificing the best possible protection. The decision as to when total protection is required should be left up to the design Professional Engineer based on the type facility and detailed analysis of the electrical system emergency system. Additionally, such total coordination will have a potential to: decrease safety due to increased arc flash hazard, decrease overall system reliability, increase downtime, increase equipment sizing and increase equipment cost. Further, the rare nature of large current faults would render the need for total coordination seldom of value. Selective Coordination of low current devices will provide optimum protection and its application should be left to Professional Engineers to apply while determining the optimum solution of a given legally required standby system application.

Submitter: Greg Batie, Sparling / Rep. Electric League of the Pacific Northwest - Code Committee
Comment on Proposal No: 13-163
Recommendation: Revise text as follows:
700.18 Coordination. Legally required standby system(s) overcurrent devices shall be selectively coordinated with all supply side overcurrent protective devices <u>for faults with a duration of 0.1 seconds and longer.</u>
Substantiation: This proposal recognizes the panel's desire to improve the reliability of emergency power systems through selective coordination. The addition of the 0.1 second criterion permits engineers and AHJs to use readily available and published time current curves to determine if a system is selectively coordinated to a substantial degree. It negates the need to rely on unregulated manufacturer testing to determine if devices selectively coordinate in the instantaneous range.
Most faults have enough resistance to limit the amount of current that results in overcurrent device operation in the instantaneous range. It's not that instantaneous faults are less important, but the requirement to design a system to fully coordinate under those circumstances requires burdensome evaluations and cost, with a very small chance of return on the investment.

TCC Action: The Technical Correlating Committee directs that this Comment be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative as required in 4.4.6.4 of the NFPA Regulations Governing Committee Projects.
Submitter: Bruce W. Blouin, Power Analysis Associates Inc
Comment on Proposal No: 13-159
Recommendation: The Panel should continue to reject this Proposal.
Substantiation: New York City has had a requirement for Selective Coordination for decades. The NEC has also required selective coordination for ground faults in health care facilities for decades. Requirements for selectively coordinated overcurrent protective devices in elevator circuits have existed in the NEC since the 1993 edition. Beginning with the 2005 NEC, requirements were added for selective coordination of emergency circuits and legally required standby systems. We've found design solutions to meet these requirements, with both circuit breakers and fused switches, without compromising safety or reliability, and wonder what all the fuss is about.
We are a consulting engineering firm that specializes in short-circuit and coordination studies, so we are intimately familiar with what it takes to selectively coordinate both fuses and circuit breakers. It does take sharp engineering skills to design both a selectively coordinated system and at the same time to minimize arc-flash energies and equipment short-circuit damage, but that is precisely what's needed for critical circuits such as are found in elevator, emergency systems, and legally required standby systems. But, it can be and is achieved on a regular basis. Requiring total selectivity does not tie our hands when it comes to multiple emergency generators. We can design in transfer switches. We've heard of complaints about two devices in series of the same size not coordinating. Simply making the downstream disconnecting means a non-fused switch solves that problem. There is enough latitude in 450.3 to choose the overcurrent protective devices on the line side and load side of a transformer so that they will selectively coordinate. We also do not see any issues with violations of other NFPA Standards that call out for "optimized" selective coordination. To us, optimized means the very best that you can do, and total selectivity is certainly the very best that you can do. Finally, there are arguments that there needn't be a requirement to selectively coordinate in the short-circuit range because short-circuits rarely happen. If that were the case, we don't need Sections 110.9 and 110.10 in the NEC. Nor do we need the new requirements for marked short-circuit current ratings on industrial machinery or industrial control panels. Do you insure your home for just $5,000 because most claims are under that amount? Or, do you insure it for the full value, just in case it does burn to the ground or get blown away in a storm? Of course you insure it for the full value, even though a total loss may be an unusual event. Needless to say, we believe the Panel should continue to support the requirement for selective coordination in elevator circuits.

(701.18)

TCC Action: The Technical Correlating Committee directs that this Comment be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative as required in 4.4.6.4 of the NFPA Regulations Governing Committee Projects.
Submitter: Merrell Young, Herzig Engineering
Comment on Proposal No: 13-159
Recommendation: Panel 13 needs to continue to Reject this and similar proposals that remove the requirement for selective coordination of legally required standby systems.
Substantiation: I would consider our consulting firm as experts on arc-flash, short-circuit, and coordination studies. As such, we have been able to meet the selective coordination requirements found in 700.27, 701.18, and 620.62, while at the same time, minimizing arc-flash hazards and improving reliability and continuity of service. We are able to obtain selective coordination for both overload and short-circuit conditions by utilizing various design techniques. For example, we can specify zone selective interlocking with short-time delay on the upstream circuit breaker so that upstream and downstream circuit breakers will coordinate in both the overload zone and the short-circuit zone, and provide for instantaneous reaction time for short circuits (including arcing faults), between the circuit breakers, which keeps arc-flash hazards to a minimum. Where our customers want fuses, we specify current-limiting fuses that can both selectively coordinate and minimize arc-flash hazards. We are able to design with transfer switches and various relaying schemes in order to utilize multiple emergency generators in parallel, for the greatest reliability. As far as ground faults are concerned, we sometimes add an additional layer of ground fault protection in order to selectively coordinate under phase to ground faults, utilizing the same approach as is already required for health

care facilities. In short, we don't have to compromise to meet the selective coordination requirements, minimize personnel hazards, and protect equipment. It does take time and requires a thorough understanding of the entire electrical system, and that's what consulting engineers get paid to do.

Submitter: Christopher E. Buckner, Vanderbilt University Medical Center
Comment on Proposal No: 13-159
Recommendation: Disagree with panel action. Accept Proposal 13-159 as written.
Substantiation: Total selective coordination does not always result in the highest reliability and safety for an emergency system in all occupancy types; thus, selective coordination is a decision that should be made by the design engineer. As the lead engineer for a large and nationally respected hospital facility, I have a responsibility to balance the selective operation of our distribution system with the safety of our maintenance personnel and the safety of our equipment. Mandating selective coordination will subject our maintenance personnel to much higher Arc Flash potentials. Additionally, total selective coordination will lead to higher levels of equipment damage which will greatly increase downtime and jeopardize patient safety. In order to have total selective coordination, overcurrent devices will have to stay closed longer. This increases arc flash hazards. In order to minimize arc flash hazards, you must sometimes sacrifice 100 percent selectivity. This is where engineering reason comes in and optimizes the system for patient, personnel and equipment safety on a case by case basis. Unfortunately, engineering reason is removed by the 2005 code mandate for total selective coordination. Selective coordination is just one of many considerations for optimizing the design of an emergency distribution system. The NFPA 110 requirement for "optimized selective tripping" is the design approach that has been used for years at our facility with NO incidents of fatalities, injuries, or excessive outages due to a lack of complete selective coordination. It is this code Panel's responsibility to recognize and respect the fact that it is not practical for the code to address all occupancy types with a blanket mandate for total selective coordination since different occupancy types have different needs and priorities for their emergency systems. This is especially true of the healthcare occupancies where patient safety is priority one. Being forced to utilize fuses in lieu of circuit breakers will no doubt increase the duration of outages to an emergency system and will lead to loss of life unnecessarily. This additional liability should not be forced on the design engineers or the facilities. Since total selective coordination does not ALWAYS result in the optimum system design, it should be removed as a code mandate. Let the design engineers do their jobs and not simply be mindless minions to the code. Without this, we have stripped away our intelligence, which is the very thing that makes our profession a service to society. Jeopardizing patient safety is not for the greater good, and as a minimum, healthcare occupancies should be exempt from these requirements.

Submitter: James S. Nasby, Master Control Systems, Inc.
Comment on Proposal No: 13-159
Recommendation: Continue to REJECT this proposal.
Substantiation: The submitter seeks to completely eliminate the clause requiring selective coordination.
No universally compelling evidence has been offered to warrant deleting or weakening this requirement.
Absent any specifics as to particular instances or problems, life safety and property protection dictate that disruption of emergency services (loads) is unwise. In high rise buildings external fire fighting can be and, based on actual losses, is not possible or effective. Modern high rise buildings rely more on these loads, particularly fire pumps, in lieu of the concept of compartmentalization and non-combustible typical of construction of the past. This places a lot of reliance of these emergency loads for preservation of life and property. There are more than ample examples of substantial loss that can occur when said loads are interrupted. One example is the One Meridan Plaza fire which resulted in loss of life and a total loss of the building. This is not the only such example.

Submitter: James S. Nasby, Master Control Systems, Inc.
Comment on Proposal No: 13-161
Recommendation: Continue to REJECT this proposal.
Substantiation: This proposal should be rejected for the reasons given in my comments on Proposals on clause 700.27 which seek to eliminate or weaken the requirement.
The same applies for the other such proposals on clause 701.18.
Panel Meeting Action: Accept in Principle
Add an exception to read as follows:
Exception: Selective coordination shall not be required in (1) or (2):
(1) Between transformer primary and secondary overcurrent protective devices, where only one overcurrent protective device or set of overcurrent protective devices exist(s) on the transformer secondary,
(2) Between overcurrent protective devices of the same size (ampere rating) in series.
Panel Statement: The exception was added to provide relief for series coordination issues.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 11 Negative: 2
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
RAPPAPORT, E.: See my explanation of negative vote on Comment 13-177.
WHITTALL, H.: See my explanation of negative vote on Comment 13-223.
Comment on Affirmative:
STAFFORD, T.: The Panel action was correct and this member agrees with the panel action. The exception(s) allow for the installation of a selectively coordinated system without compromising coordination requirements. Not requiring selective coordination between the primary and secondary overcurrent protective devices of the same transformer and not requiring selective coordination between series overcurrent protective devices of the same ampere rating does not decrease the safety of the system. This panel member understands through reading the comments submitted during the ROC period that selective coordination is required in some instances through local codes and that selective coordination should be required for all systems. Numerous comments submitted stated the effectiveness of selective coordination and numerous comments addressed their respective understanding as to how achieve the selective coordination required.
ZGONENA, T.: The committee is to be commended for acknowledging that there are conditions where selective coordination does not add any additional reliability or safety for the system. The exceptions that were added provide some relief for series coordination issues, and are certainly more desirable than leaving the existing text with no exceptions. There may still be some conditions under which total selective coordination is not the optimum condition with respect to safety and reliability as noted in our comment on 13-175.

Submitter: Marcelo Valdes, GE
Comment on Proposal No: 13-159
Recommendation: Delete 701.18. Reinstate FPN from the 2002 NEC.
Substantiation: Comment in support of proposals 13-159, Log #1946 NEC-P13. This comment is in support of the proposal comment to delete 701.18 as written in NEC2005.
Reasons to support the proposal to delete 701.18
1) Conflict with NFPA 110 recommendations1 and, consequently, conflict with IBC requirements, chapter 27.

2) Conflict with generally adopted electrical design guidelines such as IEEE Recommended practices commonly known as the "Color Books". IEEE standard 242 "Recommended Practice for Protection and Coordination of Industrial and Commercial Power Systems". These conflicts put the selectivity requirement in the NEC in conflict with OSHA regulations2.

3) Maximum reliability for any system is not a matter of simply providing selective tripping. Maximum reliability must take into account minimizing the effect of any abnormal conditions based on the probability of the conditions considered, the immediate effect of the event and the time to remedy the condition and restore needed power to the loads affected by the abnormal event. An industry reference for evaluating the reliability, normally expressed as availability, of power distribution system is IEEE standard 493-1997, "Recommended Practice for Design of Reliable Industrial and Commercial Power Systems". At the highest level, system reliability is dependant on load interruption frequency and expected duration of load interruption events.3 If selectivity is achieved by increasing the size of protective elements or slowing the protection these elements could otherwise provide equipment and conductor damage may be increased and hence the repair time, or down time caused will be increased. This can lower the reliability of system. Good design practice should attempt to take this into consideration. The code requirement as currently written does not allow a designer to make these decisions.

4) Complete selectivity is impossible in most systems when all faults are considered. Specifically low to high magnitude single or three phase faults and zero sequence faults (ground faults), regardless whether circuit breakers or fuses are used.

a. This is due, in part, to the well-supported requirement for ground fault protection in critical power distribution systems of substantial size. This point is further elaborated in attachment A.

b. Also due to the need for transformer primary and secondary protection as defined in the NEC and good engineering practice. The line side main and low side main are similar overcurrent devices that need to handle similar current it is near impossible to make them selective without over-sizing one or under-sizing the other. Furthermore, whether one trips, the other trips, or both trip the impact on the system is exactly the same. Over-sizing the line side device to drive selectivity, however, can decrease the protection afforded to the transformer increasing damage and increasing arc flash energy in the case of an event.

1NFPA 110, Annex A.6.5.1.

"It is important that the various overcurrent devices be coordinated, as far as practicable, to isolate faulted circuits and to protect against cascading operation on short circuit faults. In many systems, however, full coordination is not practicable without using equipment that could be prohibitively costly or undesirable for other reasons. Primary consideration also should be given to prevent overloading of equipment by limiting the possibilities of large current inrushes due to instantaneous reestablishment of connections to heavy loads."

2General Duty Clause (GDC). It is Section 5(a)(1) of the Occupational Safety and Health Act.

"Each employer shall finish to each of his (sic) employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees..."

3IEEE standard 493-1997, Chapter 2, Section 2.1.4, "System reliability indexes.

c. Due to size ratios of circuits used in normal power distribution design. Improving selectivity will normally require devices to have specific size ratios between each other. Fuses for example normally require a ratio of 2 between devices of the same class and manufacturer, greater ratio if the fuses are different class and allowances are made for all fuses that may be installed in a switch. Circuit breakers may need greater ratios. This can make the design of system impractical, larger than necessary with consequential effect on cost, size and protection afforded.

d. Due to considerations for the different fault characteristics of utility versus generator sources. Different configurations of sources create different selectivity and design constraints. As an example, in a double-ended substation that may use closed transitions to maintain system continuity a system may have twice the short circuit rating for a few seconds of each year. How much consideration should be given towards maintaining selectivity during that time? How much cost and building space should be allocated towards these seconds of selectivity?

5) Complete selectivity has no impact on system reliability for some circuit configurations such as when to similarly sized overcurrent protective devices are connected in series with no loads in between. This is the situation with transformer protection on the primary and secondary side of a transformer. Whether fuses or circuit breakers both devices are the same size once the transformer ratio is considered, hence, both devices see the exact same fault current for three phase faults and both may trip in similar time non-selectively. This has the same effect on loads whether one OCPD clears, the other, or both.

6) Safety for electrical personnel and any other personnel near electrical equipment or conductors. The attempt to achieve selectivity for maximum theoretical value of bolted faults will cause the devices to be insensitive or slow for lower value faults that are much more probable and widely acknowledge as being more dangerous. References to this risk, known as "Arc Flash Hazard" are included in the NEC, NFPA 70E and IEEE 1584. Ignoring this risk and the recommendations of NFPA 70E and IEEE 1584 is contrary to the requirements of OSHA. Hence forcing a user to choose selectivity in lieu of following recommendations set forth in widely accepted engineering practices puts the user in a position of either obeying the NEC or OSHA, he cannot do both. This is not a position the NEC should force any user or designer to be in. Attachment B further elaborates on this point and provides an example of this situation.

7) Designing a system that is completely selective, if possible at all, will often require devices to be larger than otherwise needed driving equipment cost, installation space and allotted building space. In many cases to achieve selectivity that is not needed due to the low probability of a fault ever occurring that requires that level of selectivity. Bolted faults are widely acknowledged to be very rare, yet trying to accommodate them in selectivity considerations will drive up cost and size, essentially unnecessarily.

I have submitted Attachment (s) A and B that are more detailed discussions of two of the points listed above. The difficulty caused by ground fault protection and one example of the impact of the selectivity requirement on a simple system with respect to arc flash protection. Many of the other points have been amply described in other comments and supporting documentation provided to this panel regarding this issue.

Recommendation: Reconsider and accept Proposal 13-159 to delete NEC 701.18.

~~701.18 Coordination. Legally required standby system(s) overcurrent devices shall be selectively coordinated with all supply side overcurrent protective devices.~~

Substantiation: Based on the panel statement which references 13-135, the substantiation of this proposal was not recognized by the panel as there is no panel statement that refutes the submitter's concerns or technical merit. The panel statement states that selectivity increases the reliability of an emergency system with no technical response to the NEMA substantiation with references to IEEE standards examples that are in direct opposition to the panel's statement. The panel did not address or comment on the conflicting NFPA documents where the technical committee for NFPA 110 Emergency and Standby Power Systems does not require all devices to be selective. The Panel did not comment on the additional restriction in NEC 701.18 that requires all devices to be selective as compared to the definition in Article 100 that provides the engineer the necessary latitude to choose the appropriate overcurrent devices and system configuration. Requiring all overcurrent devices to be selective is an over design for the system, which is recognized by the IEEE examples presented in the substantiation. This results in an increase in the size of equipment conductors and raceways, leading to unnecessary equipment cost and size increases, higher available short circuit currents and increased arc flash hazard for the installation. A review of the numerous public proposals to delete and revise NEC 701.18 along with the comments

from the voting members of CMP 13 are recognizing that selectivity is not an independent technical solution as it impacts reliability, personnel safety from arc-flash hazard increases, and the removal of isolation devices such as circuit breakers in the electrical system.

I have assisted in the selective coordination of a number of facilities across the country and all of the following points have entered into the discussion at some point. The points discussed below are independent of applying fuses or circuit breakers; as a matter of fact, the overcurrent devices in the switchboard and the generator are based on the manufacturer dependent 2:1 fuse ratios. Consider the diagram I have provided and the challenges with selective coordination.

NEC 701.18 must be deleted, leaving selectivity to the engineering community in order to ensure that the most reliable and safest system is installed. Many other technical performance issues are left to the engineering community such as:

1) Voltage drop, where you have an NEC compliant installation that is selectively coordinated and the lights dim and drop out computer systems.

2) Sizing motor overcurrent devices for selectivity, where the motors are unable to start but they are NEC compliant, permitting exhaust fans in the legally required standby system to be code compliant even if they are unable to start.

3) Ground-fault protection, where none is required on the emergency system source but may be found on the normal source. Hence a small ground fault can take down the normal source which is often more reliable than the alternate source. Once again a performance issue that is ignored in the NEC but the engineer addresses the issue in design.

These few examples illustrate reliability issues that are left to the engineer to address. Why is selectivity more important than these examples that are not addressed by the NEC for enhanced safety and reliability?

The panel's action not to revise or delete NEC 701.18 is making a statement that selectivity is more important than reliability and personnel safety from arc-flash and simply ignores the unnecessary increase in the size of equipment and materials that are unnecessary and is ignoring the amendments that are utilized in the industry to address some of these issues:

1) The State of Washington has amended the Selectivity requirement in the 2005 NEC.

2) The healthcare industry in the State of Florida recognizes the challenges of selective coordination and permits overcurrent devices to overlap where no additional isolation is gained in the system. The 2005 NEC fails to address this issue.

3) The inspection community in plan review has recognized this challenge as we have engaged in numerous conversations between engineers and inspectors that are working together to optimize selectivity per NFPA 110. They are recognizing that the 2005 NEC is more restrictive than necessary and are having to address designs through 90.4 by getting permission from the AHJ to permit appropriate latitude to comply with NFPA 110 even though they are not compliant with NEC 701.18. There is no safety or performance compromised and it is easy to recognize enhancements in performance and reliability with enhanced safety as a by-product of a reduction in the size of the overcurrent devices.

The panel should reconsider the action taken on this proposal and the numerous others looking for relief in this section to provide the safest and most reliable system to the facility they are designing. Delete NEC 701.18 and leave the performance issues to the engineer as is done with numerous other aspects of the electrical system.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

13-242 Log #2125 NEC-P13 **Final Action: Reject (701.18)**

TCC Action: The Technical Correlating Committee directs that this Comment be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative as required in 4.4.6.4 of the NFPA Regulations Governing Committee Projects.

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Comment on Proposal No: 13-159

Recommendation: I disagree with the panel action. Accept Proposal 13-159 as written.

Substantiation: NEMA strongly supports selective coordination as a valuable safety asset in the current range where overloads most often occur. However, NEMA does not support the mandate for Selective Coordination for ALL current ranges and ALL overcurrent devices because safety and reliability can both actually be diminished. This is due to increased hazardous arc flash energy with increased equipment damage and potential fire initiation, decreased reliability, and extended downtime before service restoration. Mandates for selective coordination for ALL current ranges and ALL overcurrent devices will not always provide the optimum safety solution or optimum reliability. Such a solution requires the expertise and judgment of a Professional Engineer who can balan
ce the design, safety and operating requirements in order to determine the optimum design for each specific facility.

Selective coordination is a system design issue, not a Code issue.

The wording of this section states the ALL overcurrent devices selectively coordinate, but this is not what the definition Article 100 implies. The definition deals with localization of an overcurrent and, in many cases, selective coordination for ALL overcurrent devices serves no useful localization purpose such as when: 1) Overcurrent devices are located on the primary and secondary sides of a low voltage transformer with no loads in between. 2) A feeder overcurrent device is connected in series with the main overcurrent device in a downstream panelboard with no loads in between. 3) An overcurrent device on a generator is in series with an overcurrent device in a switchboard with no leads in between. In these instances, requiring both devices to be selectively coordinated does not add to the reliability of the system, which is the stated objective of the CMP.

When overcurrent devices are located on the primary and secondary sides of a low voltage transformer, sized to meet the NEC transformer protection requirements, it is almost impossible to also meet the requirement for selective coordination of this section, regardless of the type of overcurrent protective device chosen.

In many instances, it may not be possible to meet the requirements for generator protection provided by an overcurrent device located on or near the generator and provide selective coordination with downstream overcurrent devices. Further, the generator protection functions provided within the engine-generator controller by the manufacturer might not be able to selectively coordinate with downstream overcurrent devices.

The paralleling of generators is often done to enhance system reliability, which is the stated objective of the CMP, however, in order to meet the requirement for selective coordination each generator overcurrent device and controller must selectively coordinate with all downstream overcurrent devices. This may not be possible if the generators are of unequal size.

The upgrade or expansion of an existing building may require the replacement of existing upstream equipment so that it will selectively coordinate with the new downstream equipment it must feed. The State of Washington has recognized the significant economic burden this is placing on building owners and businesses and has issued an emergency order exempting existing buildings from meeting the selective coordination requirements of the 2005 NEC.

Systems are normally designed for selective coordination in the overload region of the overcurrent device time-current curves. If this were not so, they would not operate under normal conditions, so what is really being called for in this requirement is overload and short circuit selective coordination. In order to achieve total short circuit selective coordination, the size of upstream overcurrent protective devices may need to be increased and/or time delay trip characteristics increased, thereby possibly increasing the arc flash hazard. In other words, by forcing selective coordination for an event that most likely will never occur, namely a bolted fault, the hazards involved in performing tasks which most likely will occur, namely system maintenance, may be increased. This is another reason why system designers need the flexibility to optimize the design of a system, which the current requirement does not allow.

Further, as stated in the original NEMA substantiation to delete this text in proposal 13-137, we wish to once again point out the following:

1. The need for the flexibility to optimize the design of a system is recognized in IEEE Standard 242-2001 (The Buff Book). Section 15.1 states, "In applying protective devices, it is occasionally necessary to compromise between protection and selectivity. While experience may suggest one alternative over another, the preferred approach is to favor protection over selectivity. Which choice is made, however, is dependent on the equipment damage and the affect on the process."

2. The need for the flexibility to optimize the design of a system is also recognized in NFPA 110-2005, Standard for Emergency and Standby Power Systems. Section 6.5.1 states, "The overcurrent protective devices in the EPSS shall be coordinated to optimize selective tripping of the circuit overcurrent protective devices when a short circuit occurs. A further explanation of this statement is given in Annex A section A.6.5.1, "It is important that the various overcurrent devices be coordinated, as far as practicable, to isolate faulted circuits and to protect against cascading operation on short circuit faults. In many systems, however, full coordination is not practicable without using equipment that could be prohibitively costly or undesirable for other reasons."

3. This NEC text conflicts with Chapter 27 of the International Building Code that specifically requires compliance with NFPA 110 for emergency systems. This presents a conundrum for the system designer and the AHJ. Which code takes precedence, the IBC or the NEC?

In summary, NEMA strongly supports selective coordination as a valuable safety asset in the current range where overloads most often occur. However, NEMA does not support the mandate for Selective Coordination for ALL current ranges and ALL overcurrent devices because safety and reliability can both actually be diminished, thus the section should be deleted.

Panel Meeting Action: Reject
Panel Statement: The overriding theme of Articles 700 and 701 is to keep the power on throughout an emergency situation, for life safety. Selective coordination increases the reliability of the emergency system. Selective coordination is essential for the continuity of service required in emergency and legally required standby circuits.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 7 Negative: 6
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
ELKINS, D.: See my Explanation of Negative on Comment 13-224 (Log #492).
NASBY, J.: See NEMA Explanation of Negative on 13-204.
RAPPAPORT, E.: See my explanation of negative vote on Comment 13-177.
WHITTALL, H.: See my explanation of negative vote on Comment 13-178.
WOOD, T.: Proposal 13-159 should have been accepted. The substantiation provided by the submitter of Proposal 13-159 is well founded. Selective coordination is a design consideration. While selectivity may be desirable in some cases, it has not been shown that the lack of coordination has been responsible for the loss of life, injury to persons, or damage to property.
If the Code Making Panel believes that selectivity is sometimes a design consideration, it should be in the Code as a FPN and not as mandatory language that is likely not to be enforced. The use of mandatory language in the Code makes the installer contractually liable for its implementation when this should be a "design-engineering" responsibility.
In all cases, the Proposers and the Commenters advocating the removal of both 700.27 and 701.18 have provided well-documented substantiation for their removal.
ZGONENA, T.: See My Explanation of Negative on Comment 13-175.

TCC Action: The Technical Correlating Committee directs that this Comment be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative as required in 4.4.6.4 of the NFPA Regulations Governing Committee Projects.
Submitter: Peter R. Walsh, Peter R. Walsh, P.E. & Associates
Comment on Proposal No: 13-159
Recommendation: The Panel should continue to Reject this Proposal.
Substantiation: The NEC has required selective coordination for elevator circuits for years without major problems. The recent expansion of requirements makes good sense for the users of the buildings. Who wants to suffer from a blackout as a result of non-selective coordination? Engineers have software programs, like Easy Power Version 8.0 that can automate selective coordination.
With Zone Selective Coordination trips, almost anything can be coordinated. Arc flash can be adjusted by proper trips. The code making panel should require reliable power through selective coordination of legally required standby systems.
Panel Meeting Action: Accept

Comment on Proposal No: 13-162
Recommendation: The proposal should have been Accepted.
Substantiation: This requirement was added in 2005 without technical substantiation and is a design issue, not a safety issue. The proposal was an attempt by a fuse manufacturer to mandate the use of fuses in applications where circuit breakers are more appropriate for most installations. I would always include selective coordination in things desired of an electrical system design, but in many cases foregoing selective coordination can make for an installation that more clearly meets the safety objectives of the code. In many cases the use of fuses in these systems will dramatically increase the arc flash hazard; is that truly in the interest of safety?

The Technical Correlating Committee understands that the comment recommendation refers to 700.27, but the comment actually addresses 701.18 with the appropriate substantiation to address 701.18.
Submitter: Alan Manche, Square D Company
Comment on Proposal No: 13-159
Recommendation: Reconsider and accept in principle proposal 13-159. Delete the present text and replace with revised language as noted in proposal 13-159 that parallels NFPA 110.
~~700.27 Coordination. Emergency system(s) overcurrent devices shall be selectivity coordinated with all supply side overcurrent protective devices.~~
700.27 Coordination. The overcurrent protective devices in the emergency system shall be selected to optimize selective coordination.
Substantiation: Square D continues to support the deletion of NEC 701.18, however, if the panel is reluctant to address the safety, reliability and performance issues by deleting it, it would be prudent for the panel to revise the text to address many of the concerns addressed in not only in this proposal but the many other proposals that were submitted to the panel.
As a member of the NFPA 110 technical committee, the committee has recognized these challenges. Utilizing similar language to that found in NFPA 110 would permit some latitude to address many of these issues found in the proposals that were submitted and would remove the conflicting language and requirements.
This comment simply requests the panel to reconsider the action taken on the numerous proposals to revise NEC 701.18 in order to address the technical issues so the electrical industry can ensure the most reliable and safest system is in place for our communities. The present language does not support our communities in this manner. The proposed language in this comment moves closer to that goal and aligns with NFPA 110.

Comment on Proposal No: 13-137
Recommendation: Disagree with the Panel Action. Accept Proposal 13-137 as written.
Substantiation: Selective coordination for low current magnitudes will in most cases provide the required selective coordination without sacrificing the best possible protection. The decision as to when total protection is required should be left up to the design Professional Engineer based on the type facility and detailed analysis of the electrical system emergency system. Additionally, such total coordination will have a potential to: decrease safety due to increased arc flash hazard, decrease overall system reliability, increase downtime, increase equipment sizing and increase equipment cost. Further, the rare nature of large current faults would render the need for total coordination seldom of value. Selective Coordination of low current devices will provide optimum protection and its application should be left to Professional Engineers to apply while determining the optimum solution of a given legally required standby system application.

Comment on Proposal No: 13-159
Recommendation: I disagree with the Panel Action. Accept related Proposal 13-159, (and 13-135) as written. These two proposals are to delete section 701.27 (now in 70-2005), from the 70-2008 editon.
Substantiation: Currently we are operating under NEC 70-2002, and will soon adopt 70-2005 - but with a deletion of the requirement for adhering to section 700.27.
The emergency power systems encountered at our larger facilities (and some of the smaller facilities) are very complex. The current code section removes the option for using engineering judgment, as the deciding factor on how our emergency power systems are to be coordinated. This loss of professional judgment would be detrimental (in certain cases) to the safety of our patients, our staff, and the property themselves. In all of our new facilities, and in existing facilities undergoing major renovation, the design is done by a registered professional engineer, and is also reviewed by a staff registered engineer.
On occasion, we need to select devices that are not completely coordinated over the entire fault range in order to lower arc-flash energies to protect staff. Also, on occasion we need to put two devices in series (but not coordinated with each other), one at source, one at load (when these are separated by large distances). In these cases, the lack of coordination between the devices causes no problem since the same downstream loads are loss regardless of which ones operates.

13-256 Log #618 NEC-P13 **Final Action: Accept**
(702.6)

Submitter: Neil A. Czarnecki, Reliance Controls Corporation
Comment on Proposal No: 13-175
Recommendation: Proposal 13-175 should be rejected.
Substantiation: In the 1980's, a number of manufacturers introduced manual transfer equipment for residential portable-generator applications based on a design that placed transfer switching apparatus on the load side of the branch circuit protection. The result of this design was that, when a switch was in the "utility" position, the branch circuit was protected by the branch circuit protector in the panelboard. However, when the switch was placed in the "generator" position, the branch circuit was protected by a supplementary overcurrent protector in the transfer equipment. The rationale for allowing this configuration was that the supplemental protector was capable of interrupting the short circuit current a portable generator could deliver.
There was confusion as to whether these products were code compliant. Some time after the 1990 Code, in an effort to clarify the issue, a change was approved to 702.6, which added the phrase:
"Transfer equipment located on the load side of branch circuit protection shall be permitted to contain supplementary overcurrent protection having an interrupting rating sufficient for the available fault current that the generator can deliver."
Some folks, however, continued to express the position that supplementary overcurrent protection of branch circuits was not acceptable even under the conditions anticipated by Article 702. For the 2002 Code, the Code-Making Panel approved a change, which added the additional phrase:
"The supplementary overcurrent devices shall be part of a listed transfer equipment."
This move effectively eliminated the ability to use supplemental protectors in load-side transfer equipment unless it could be verified by a Listing agency that the supplemental protectors were being applied in a safe and code-compliant manner.
Proposal 13-175 is to remove BOTH sentences from 702.6, resulting in neither specifically allowing nor specifically disallowing the use of supplementary overcurrent devices, and also removing the Listing requirement for such products. As 702.6 stands now, it is clear that a transfer switch that uses supplemental protectors and is not a listed product is unquestionably non-code compliant. Implementation of this change will throw the code compliance of such products back into a state of confusion, and open the door for manufacturers to take advantage of the naïveté of some customers, to the detriment of those customers' safety.
Therefore, proposal 13-175 should be rejected.
Panel Meeting Action: Accept
Panel Statement: Action taken by the panel (accepting the original proposal) was in error. Further review of the proposal shows that it essentially allows the use of supplemental protectors in transfer equipment with no requirement that they be located on the load side of branch circuit protectors. It also would allow the use of supplemental protectors in non-listed equipment. The original language should be reinstated.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

13-257 Log #1186 NEC-P13 **Final Action: Reject**
(702.6 Exception)

TCC Action: The Technical Correlating Committee directs that Comment 13-257 be reported as "Reject" to correlate with the panel action to Reject Comment 3-90 and Proposal 3-131 by Code-Making Panel 3.
Submitter: Neil F. LaBrake, Jr., National Grid / Rep. Edison Electric Insitute-Electric Light & Power Group
Comment on Proposal No: 13-178
Recommendation: Accept Proposal 13-178.
Substantiation: Requirements of Article 702 apply to the installation of optional standby systems that are permanently installed in their entirety and not for temporary installations. The specific requirements for temporary installations in 590.2, 590.3, and 590.4 should cover the temporary connection of portable generators.
The proposed addition of 590.8, in Proposal 3-131, properly deals with the "temporary connection of portable generators", and has additional requirements that are not covered under the provisions of Article 702.
Panel Meeting Action: Accept
Panel Statement: The comment substantiation was sufficient for the panel to reverse the action on Proposal 13-178.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 11 Negative: 2
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
ELKINS, D.: Panel action on this comment was predicated on Panel 3 accepting Comment 3-90 on Proposal 3-131 which would have moved an exception from Article 702 to Article 590. Panel 3 rejected this proposal. Therefore, this Panel 13 comment should be rejected to leave this exception covering temporary connection of portable generators in place in Article 702.
ZGONENA, T.: The use of portable generators is indeed anticipated in Optional Standby Systems, as indicated in the scope (702.1). The scope specifically states "...and those that are arranged for a connection to a premises wiring system from a portable alternate power supply." Changing the exception to refer to Article 590 removes the control of this particular application from CMP 13, which is not appropriate.

13-258 Log #2120 NEC-P13 **Final Action: Accept in Principle (702.11 (New))**

Submitter: Mark R. Hilbert, Wolfeboro, NH
Comment on Proposal No: 13-181
Recommendation: Accept the Proposal.
Substantiation: The new FPN was not intended to identify that the disconnecting means which is the subject of 702.11 must disconnect the "service." The FPN is necessary to identify to users of the NEC that this disconnecting means must be rated as "suitable for use as service equipment." As described in Article 100, conductors supplying a building or other structure from a generator are "feeder" conductors. Seeing that the generator is outdoors, the conductors are "outside feeder conductors" and, therefore, they are included in the scope of Article 225. Section 225.31 requires that a disconnecting means be provided to disconnect all conductors that supply or pass through a building or structure. Section 702.11 amends the requirements of 225.32 to locate the disconnecting means required by 225.31 at the building or structure served, however, it does not amend the requirements of 225.36 for it to be "suitable for use as service equipment." This requirement is often overlooked and the proposed FPN would go a long way towards identifying that there is another requirement in 225.36 that must be considered.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 13-259.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 1
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
RAPPAPORT, E.: See my explanation of negative vote on Comment 13-219.

13-259 Log #2122 NEC-P13 **Final Action: Accept in Principle (702.11)**

Submitter: Mark R. Hilbert, Wolfeboro, NH
Comment on Proposal No: 13-181
Recommendation: Accept the Proposal in Principle and revise 702.11 to read:
Outdoor Generator Sets. Where an outdoor housed generator set is equipped with a readily accessible disconnecting means that meets the requirements of 225.36 and is located within sight of the building or structure supplied, an additional disconnecting means shall not be required where ungrounded conductors serve or pass through the building or structure.
Substantiation: The new FPN was not intended to identify that the disconnecting means, which is the subject of 702.11, must disconnect the "service." This comment is being submitted as an alternative to adding a new FPN. The new text will identify to users of the NEC that this disconnecting means must be rated as "suitable for use as service equipment." As described in Article 100, conductors supplying a building or other structure from a generator are "feeder" conductors. Seeing that the generator is outdoors, the conductors are "outside feeder conductors" and therefore, they are included in the scope of Article 225. 225.31 requires that a disconnecting means be provided to disconnect all conductors that supply or pass through a building or structure. 702.11 amends the requirements of 225.32 to locate the disconnecting means required by 225.31 at the building or structure served, however, it does not amend the requirements of 225.36 for it to be "suitable for use as service equipment." This requirement is often overlooked and the proposed new text would go a long way towards identifying that there is another requirement in 225.36 that must be considered.
Panel Meeting Action: Accept in Principle
Accept the proposal in principle and revise 702.11 to read:
Outdoor Generator Sets. Where an outdoor housed generator set is equipped with a readily accessible disconnecting means located within sight of the building or structure supplied, an additional disconnecting means shall not be required where ungrounded conductors serve or pass through the building or structure. The disconnecting means shall meet the requirements of 225.36.
Panel Statement: The added sentence clarifies that the disconnecting means must comply with 225.36.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 1
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
RAPPAPORT, E.: See my explanation of negative vote on Comment 13-219.

13-260 Log #2176 NEC-P13 **Final Action: Reject (702.11, FPN (New))**

Submitter: Mark R. Hilbert, Wolfeboro, NH
Comment on Proposal No: 13-180
Recommendation: Accept the Proposal.
Substantiation: This proposal should be accepted as the purpose of the FPN is to direct readers of this section to a requirement that is not obvious. The grounding and bonding conditions when the disconnecting means is remote from the building or other structure it is supplying are often misunderstood and, therefore, this would be an appropriate location for a FPN providing direction to the location of the requirement. In the ROP stage, Panel 5 accepted a proposal to 250.32(D) to include a reference to 702.11 to identify that the requirements of that section apply to the condition of 702.11. It would be prudent to locate a FPN here to reference 250.32(D).
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its statement on Proposals 13-154 and 13-130. The panel believes that the addition of the FPN is unnecessary.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

ARTICLE 705 — INTERCONNECTED ELECTRIC POWER PRODUCTION SOURCES

13-261 Log #115 NEC-P13 **Final Action: Accept (705)**

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 13-184
Recommendation: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting.
The Technical Correlating Committee directs that the Action on this Proposal be rewritten to comply with the NEC Style Manual.
This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Gustafson, R.

13-262 Log #687 NEC-P13 **Final Action: Accept in Principle in Part (705)**

Submitter: Timothy M. Croushore, Allegheny Power
Comment on Proposal No: 13-184
Recommendation: Code Making Panel 13 is to be commended for the fine job in the rewrite of Article 705 as it appears in the NEC 2008 Draft. This comment is intended to clarify and correct a few minor issues as published in the NEC 2008 Draft. These issues are as follows:
1. In 705.2 Definitions. The definition of Point of Common Coupling was inadvertently tacked onto the end of the definition for Utility-Interactive Inverter Output Circuit. The definition of Point of Common Coupling should be its own definition and the third definition in 705.2 Definitions.
2. In the Table 705.3 Other Articles. Please list Solar Photovoltaic Systems — Article 690 and Fuel Cell Systems - Article 692 in the table between the existing row Generators — Article 445 and the existing row Emergency systems — Article 700. Once these new row items are added into the table, please delete Exception No. 1 and Exception No. 2 shown below the table in the 2008 NEC Draft.
3. In 705.4 Equipment Approval. Please delete the second sentence. The first sentence should remain.
4. In 705.12 Point of Connection, please revise the text of this section that is published in the 2008 NEC Draft to the text as shown in Mr. Hornberger's affirmative ballot comment for the same section. Mr. Hornberger's text for 705.12 is published in the Report on Proposals for Proposal 13-184.
5. In 705.22 Disconnect Device, please add a new (6) Capable of being locked in the open (off) position after the existing (5) as shown in the 2008 NEC Draft.
6. In 705.30 Overcurrent Protection, please add a new (D) Utility-Interactive Inverters. Utility-Interactive inverters shall be protected in accordance with 705.65.
7. In 705.30 Overcurrent Protection, please add a new (E) Generators. Generators shall be protected in accordance with 705.130.
8. In 705.40 Loss of Primary Source, please delete the word "normally" in the last sentence of this section.
9. In 705.70 Utility-Interactive Inverters Mounted in Not-Readily-Accessible Locations, please delete the phrase "The alternating-current output conductors from the inverter and" from (3) of this section. The revised (3) should read as follows: "(3) An additional alternating-current disconnecting means for the inverter shall comply with 705.22."
10. In 705.130 Overcurrent Protection, please delete the phrase "a sufficient number of" in the second sentence of the text of the section. The revised second sentence should read as follows: "Equipment and conductors connected to more than one electrical source shall have overcurrent devices located so as to provide protection from all sources."

Substantiation: The intent of this comment is to clarify and correct the issues in the rewrite based on the affirmative comments as published in the Report on Proposals. The 2008 NEC Draft was used to see the results of the editor's revisions to the work of CMP-13. Please reference the above 10 item list in the comment section above for the statement of problem and substantiation for the comment.

1. Item #1 is an editorial comment based on the printing of the panel action that is shown on the bottom left column of page 70-788 of the ROP. Apparently, the definition of Point of Common Coupling was accidentally tacked onto the end of the definition of Utility-Interactive Inverter Output Circuit.
2. Item #2 is proposed to eliminate the two exceptions (as indicated in the comment made by Mr. Stafford) by putting the information in positive language in the table.
3. Item #3 is in reference to the comment made by Mr. Swayne as published in his affirmative ballot comment in the ROP.
4. Item #4 is in reference to the comment made by Mr. Hornberger as published in his affirmative ballot comment in the ROP.
5. Item #5 is in reference to the comments made by Mr. Hornberger and Mr. Stafford regarding the ability to lock the disconnecting means in the open position.
6. Item #6 and Item #7 is in reference to a comment made by Mr. Swayne about deleting generators in 705.30(A). These two item add references for overcurrent protection of Generators and Utility-Interactive Inverters.
7. Item #8 is in reference to a comment made by Mr. Swayne about the word "normally".
8. Item #9 is in reference to a comment made by Mr. Swayne about the "alternating-current output conductors" not needing to comply with 705.22.
9. Item #10 is in reference to a comment made by Mr. Swayne about the phrase "a sufficient number of" in his positive ballot comment.

Panel Meeting Action: Accept in Principle in Part

Revise Article 705 from Proposal 13-184 to read as follows:

ARTICLE 705 Interconnected Electric Power Production Sources

I. General

705.1 Scope. This article covers installation of one or more electric power production sources operating in parallel with a primary source(s) of electricity.

FPN: Examples of the types of primary sources include a utility supply or an on-site electric power source(s).

705.2 Definitions.

Hybrid System. A system comprised of multiple power sources. These power sources could include photovoltaic, wind, micro-hydro generators, engine-driven generators, and others, but do not include electrical power production and distribution network systems. Energy storage systems such as batteries, flywheels, or superconducting magnetic storage equipment do not constitute a power source for the purpose of this definition.

Utility-Interactive Inverter Output Circuit. The conductors between the utility interactive inverter and the service equipment or another electric power production source. such as a utility. for electrical production and distribution network.

Point of Common Coupling. The point at which the power production and distribution network and the customer interface occurs in an interactive system. Typically, this is the load side of the power network meter.

705.3 Other Articles. Interconnected electric power production sources shall comply with this article and also with the applicable requirements of the articles in Table 705.3.

Table 705.3 Other Articles

Equipment/System	Article
Generators	445
Solar Photovoltaic Systems	690
Fuel Cell Systems	692
Emergency systems	700
Legally required standby system	701
Optional standby systems◦	702

Exception No.1: Installation of solar photovoltaic systems operated as interconnected power sources shall be in accordance with Article 690.

Exception No.2: Installation of fuel cell systems operated as interconnected power sources shall be in accordance with Article 692.

705.4 Equipment Approval. All equipment shall be approved for the intended use. Utility-Interactive inverters for interconnection systems shall be listed and identified for interconnection service.

705.10 Directory. A permanent plaque or directory, denoting all electrical power sources on or in the premises, shall be installed at each service equipment location and at locations of all electric power production sources capable of being interconnected. Exception: Installations with large numbers of power production sources shall be permitted to be designated by groups.

705.12 Point of Connection. The output of an interconnected electric power source shall be connected as specified in 692.65(A), (B), (C), or (D).

(A) Supply Side. ~~Any interconnected electric power source shall be permitted to be connected at the premises service disconnecting means, beyond the point of common coupling.~~ An electric power production source shall be permitted to be connected to the supply side of the service disconnecting means as permitted in 230.82(6).

(B) Integrated Electric Systems. The outputs shall be permitted to be interconnected at a point or points elsewhere on the premises where the system qualifies as an integrated electrical system and incorporates protective equipment in accordance with all applicable sections of Article 685.

(C) Greater Than 100 KW The outputs shall be permitted to be interconnected at a point or points elsewhere on the premises where all of the following conditions are met:

(1) The aggregate of non-utility sources of electricity has a capacity in excess of 100 KW, or the service is above 1,000 volts.

(2) The conditions of maintenance and supervision ensure that qualified persons service and operate the system.

(3) Safeguards, documented procedures, and protective equipment are established and maintained.

(D) Utility Interactive Inverters. The output of a utility-interactive inverter shall be permitted to be connected to the load side of the service disconnecting means of the other source(s) at any distribution equipment on the premises. Where distribution equipment including switchboards and panelboards is fed simultaneously by a primary source(s) of electricity and one or more utility-interactive inverters, and where this distribution equipment is capable of supplying multiple branch circuits or feeders or both, the interconnecting provisions for the utility-interactive inverter(s) shall comply with (1) through (7).

(1) Dedicated Overcurrent and Disconnect. Each source interconnection shall be made at a dedicated circuit breaker or fusible disconnecting means.

(2) Bus or Conductor Rating. The sum of the ampere ratings of overcurrent devices in circuits supplying power to a busbar or conductor shall not exceed 120 percent of the rating of the busbar or conductor.

(3) Ground Fault Protection. The interconnection point shall be on the line side of all ground-fault protection equipment.

Exception: Connection shall be permitted to be made to the load side of ground-fault protection, provided that there is ground-fault protection for equipment from all ground-fault current sources. Ground-fault protection devices used with supplies connected to the load-side terminals shall be identified and listed as suitable for backfeeding.

(4) Marking. Equipment containing overcurrent devices in circuits supplying power to a busbar or conductor supplied from multiple sources shall be marked to indicate the presence of all sources.

(5) Suitable for Back Feed. Circuit breakers, if backfed, shall be suitable for such operation.

FPN: Circuit breakers that are marked "Line" and "Load" have been evaluated only in the direction marked. Circuit breakers without "Line" and "Load" have been evaluated in both directions.

(6) Fastening. Listed plug-in type circuit breakers backfed from utility-interactive inverters that are listed and identified as interactive shall be permitted to omit the additional fastener normally required by 408.36(F) for such applications.

(7) Inverter Output Connection. Unless the panelboard is rated not less than the sum of the ampere ratings of all overcurrent devices supplying it, a connection in a panelboard shall be positioned at the opposite (load) end from the input feeder location or main circuit location. The bus or conductor rating shall have been sized for the loads connected in accordance with Article 220. A permanent warning label shall be applied to the distribution equipment with the following or equivalent wording:

WARNING
INVERTER OUTPUT CONNECTION
DO NOT RELOCATE THIS OVERCURRENT DEVICE

705.14 Output Characteristics.
The output of a generator or other electric power production source operating in parallel with an electric supply system shall be compatible with the voltage, wave shape, and frequency of the system to which it is connected.

FPN: The term compatible does not necessarily mean matching the primary source wave shape.

705.16 Interrupting and Short-Circuit Current Rating.
Consideration shall be given to the contribution of fault currents from all interconnected power sources for the interrupting and short-circuit current ratings of equipment on interactive systems.

705.20 Disconnecting Means, Sources.
Means shall be provided to disconnect all ungrounded conductors of an electric power production source(s) from all other conductors.

705.21 Disconnecting Means, Equipment. Means shall be provided to disconnect power production equipment, such as utility interactive inverters or transformers associated with a power production source, from all ungrounded conductors of all sources of supply. Equipment intended to be operated and maintained as an integral part of a power production source exceeding 1000 volts shall not be required to have a disconnecting means.
705.22 Disconnect Device. The disconnecting means for ungrounded conductors shall consist of a manually or power operable switch(es) or circuit breaker(s) with the following features:
(1) Located where readily accessible
(2) Externally operable without exposing the operator to contact with live parts and if power operable, of a type that could be opened by hand in the event of a power supply failure
(3) Plainly indicating whether in the open (or closed (on) position
(4) Having ratings not less than the load to be cared and the fault current to be interrupted

For disconnect equipment energized from both sides, a marking shall be provided to indicate that all contacts of the disconnect equipment might be energized.
FPN No. 1: In parallel generation systems, some equipment, including knife blade switches and fuses, is likely to be energized from both directions. See 240.40.
FPN No. 2: Interconnection to an off-premises primary source could require a visibly verifiable disconnecting device.
(5) Simultaneous disconnect of all ungrounded conductors of the circuit.
(6) Capable of being locked in the open (off) position.

705.30 Overcurrent Protection. Conductors shall be protected in accordance with Article 240. Equipment and conductors connected to more than one electrical source shall have a sufficient number of overcurrent devices located so as to provide protection from all sources.

(A) Solar Photovoltaic Systems. Solar photovoltaic systems shall be protected in accordance with Article 690.
(B) Transformers. Overcurrent protection for a transformer with a source(s) on each side shall be provided in accordance with 450.3 by considering first one side of the transformer, then the other side of the transformer, as the primary.
(C) Fuel Cell Systems. Fuel cell systems shall be protected in accordance with Article 692.
(D) Utility Interactive Inverters. Utility interactive inverters shall be protected in accordance with 705.65.
(E) Generators. Generators shall be protected in accordance with 705.130.

705.32 Ground-Fault Protection. Where ground-fault protection is used, the output of an interactive system shall be connected to the supply side of the ground-fault protection.

Exception: Connection shall be permitted to be made to the load side of ground-fault protection, provided that there is ground-fault protection for equipment from all ground-fault current sources.

705.40 Loss of Primary Source. Upon loss of primary source, an electric power production source shall be automatically disconnected from all ungrounded conductors of the primary source and shall not be reconnected until the primary source is restored.

Exception: A listed Utility Interactive Inverter shall be permitted to automatically cease exporting power upon loss of primary source and shall not be required to automatically disconnect all ungrounded conductors from the primary source. A listed Utility Interactive Inverter shall be permitted to automatically or manually resume exporting power to the utility once the primary source is restored.

FPN No. 1: Risks to personnel and equipment associated with the primary source could occur if an utility interactive electric power production source can operate as an intentional island. Special detection methods are required to determine that a primary source supply system outage has occurred and whether there should be automatic disconnection. When the primary source supply system is restored special detection methods can be required to limit exposure of power production sources to out-of-phase reconnection.
FPN No. 2: Induction-generating equipment on systems with significant capacitance can become self-excited upon loss of primary source and experience severe overvoltage as a result.

A utility interactive inverter shall be permitted to operate as a stand-alone system to supply loads that have been disconnected from electrical production and distribution network sources.

705.42 Loss of Three-Phase Primary Source. A 3-phase electric power production source shall be automatically disconnected from all ungrounded conductors of the interconnected systems when one of the phases of that source opens. This requirement shall not be applicable to an electric power production source providing power for an emergency or legally required standby system.
Exception: A listed utility interactive inverter shall be permitted to automatically cease exporting power when one of the phases of the source ovens and shall not be required to automatically disconnect all ungrounded conductors from the primary source. A listed utility interactive inverter shall be permitted to automatically or manually resume exporting power to the utility once all phases of the source is restored.

705.50 Grounding. Interconnected electric power production sources shall be grounded in accordance with Article 250.

Exception: For direct-current systems connected through an inverter directly to a grounded service, other methods that accomplish equivalent system protection and that utilize equipment listed and identified for the use shall be permitted.

II. Utility Interactive Inverters

705.60 Circuit Sizing and Current.
_(A) Calculation of Maximum Circuit Current. The maximum current for the specific circuit shall be calculated in accordance with 705.60(A)(1) though (A)(2).
(1) Inverter Source Circuit Currents. The maximum current shall be maximum rated input current of the inverter.
(2) Inverter Output Circuit Current. The maximum current shall be the inverter continuous output current rating.
(B) Ampacity and Overcurrent Device Ratings. Inverter system currents shall be considered to be continuous.
(1) Sizing of Conductors and Overcurrent Devices. The circuit conductors and overcurrent devices shall be sized to carry not less than 125 percent of the maximum currents as calculated in 705.60(A). The rating or setting of overcurrent devices shall be permitted in accordance with 240.4(B) and(C).

Exception: Circuits containing an assembly together with its overcurrent device(s) that is listed for continuous operation at 100 percent of its rating shall be permitted to be utilized at 100 percent of its rating.

705.65 Overcurrent Protection.
(A) Circuits and Equipment. Inverter input ~~source~~ circuits, inverter output circuit and storage battery circuit conductors and equipment shall be protected in accordance with the requirements of Article 240. Circuits connected to more than one electrical source shall have overcurrent devices located so as to provide overcurrent protection from all sources.

Exception: An overcurrent device shall not be required for circuit conductors sized in accordance with 705.60(B) and located where one of the following apply:
(a) There are no external sources such as parallel-connected source circuits, batteries. or backfeed from inverters.
(b) The short-circuit currents from all sources do not exceed the ampacity of the conductors.

FPN: Possible backfeed of current from any source of supply. including a supply through an inverter into the inverter output circuit and inverter source circuits. is a consideration in determining whether adequate overcurrent protection from all sources is provided for conductors and modules.
(B) Power Transformers. Overcurrent protection for a transformer with a source(s) on each side shall be provided in accordance with 450.3 by considering first one side of the transformer. then the other side of the transformer. as the primary.

Exception: A power transformer with a current rating on the side connected toward the inverter power source not less than the short-circuit output current rating of the inverter shall be permitted without overcurrent protection from that source.

(C) Inverter Source Circuits. Branch-circuit or supplementary-type overcurrent

devices shall be permitted to provide overcurrent protection in inverter source circuits. The overcurrent devices shall be accessible but shall not be required to be readily accessible. Standard values of supplementary overcurrent devices allowed by this section shall be in one ampere size increments. staring at one ampere up to and including 15 amperes. Higher standard values above 15 amperes for supplementary overcurrent devices shall be based on the standard sizes provided in 240.6(A).
(D) Direct-Current Rating. Overcurrent devices. either fuses or circuit breakers. used in any dc portion of a utility interactive inverter power system shall be listed for use in dc circuits and shall have the appropriate voltage, current. and interrupt ratings.
(E) Series Overcurrent Protection. In series-connected strings of two or more modules. a single overcurrent protection device shall be permitted.

705.70 Utility-Interactive Inverters Mounted in Not-Readily-Accessible Locations. Utility-interactive inverters shall be permitted to be mounted on roofs or other exterior areas that are not readily accessible. These installations shall comply with (1) through (4):
(1) A direct-current disconnecting means shall be mounted within sight of, or in the inverter.
(2) An alternating-current disconnecting means shall be mounted within sight of, or in the inverter.
(3) An additional alternating-current disconnecting means for the inverter shall comply with 705.22.
(4) A plaque shall be installed in accordance with 705.10.
705.80 Utility Interactive Power Systems Employing Energy Storage. Utility Interactive power systems employing energy storage shall also be marked with the maximum operating voltage including any equalization voltage and the polarity of the grounded circuit conductor.

705.82 Hybrid Systems. Hybrid Systems shall be permitted to be interconnected ~~at the point-of common coupling~~ with utility-interactive inverters.

705.95 Ampacity of Neutral Conductor. If a single-phase 2-wire inverter output is connected to the neutral and one ungrounded conductor (only) of a 3-wire system or of a 3-phase 4-wire wye-connected system, the maximum load connected between the neutral and anyone ungrounded conductor plus the inverter output rating shall not exceed the ampacity of the neutral conductor.

705.100 Unbalanced Interconnections.
(A) Single Phase. Single-phase inverters for hybrid systems and ac modules in interactive hybrid systems shall not be connected to 3-phase power systems unless the interconnected system is designed so that significant unbalanced voltages cannot result.
(B) Three Phase. Three-phase inverters and 3-phase ac modules in interactive systems shall have all phases automatically de-energized upon loss of. or unbalanced. voltage in one or more phases unless the interconnected system is designed so that significant unbalanced voltages will not result.

III. Generators

705.130 Overcurrent Protection.
Conductors shall be protected in accordance with Article 240. Equipment and conductors connected to more than one electrical source shall have overcurrent devices located so as to provide protection from all sources.
Generators shall be protected in accordance with 445.12.

705.143 Synchronous Generators.
Synchronous generators in a parallel system shall be provided with the necessary equipment to establish and maintain a synchronous condition.
Panel Statement: This revision incorporates cComments 3-262, 13-263, 13-265, 13-266, and 13-267.
• Typographical error - "Point of Common Coupling" definition was removed from the Utility interactive inverter Output Circuit definition.
• Listed Solar Photovoltaic Systems and Fuel Cell Systems in Table 705.3 and removed Exceptions (1) and (2) for these systems, respectively
• Deleted second sentence in 705.4, requiring interconnection system equipment to be listed.
• Revised 705.12 to reflect Hornberger Ballot Comment on proposal 13-184.
• Added requirement for a lockable disconnect in 705.22
• Added overcurrent protection reference for utility interactive inverters to 705.30
• Added overcurrent protection reference for generators to 705.30
• Deleted the word "normally" in the last sentence of 705.40
• Deleted the phrase "the alternating-current output conductors from the inverter and" from 705.70(3).
• Deleted the phrase "a sufficient number of" in the second sentence of the text for 705.130.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 14 Negative: 1
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
HORNBERGER, B.: I agree with the panel action, however, the panel discussed recommending that a Task Group be formed to review the redundant "Point of Connection" requirements for PV in 690, Fuel Cells in 692 and Interconnected Electric Power Sources in 705. There is no mention of this in the panel statements. The panel harmonized most of these requirements through their actions on Comments 13-77, 13-97 and 13-262. Photovoltaic and Fuel Cell systems are "Interconnected Electric Power Sources", when they operate in parallel with another supply source. Article 705 should apply. Point of connection requirements in Articles 690 and 692 should only contain "special" considerations that pertain to the specific power source technologies.
Comment on Affirmative:
BOWER, W.: These comments are primarily editorial in nature.
Under 705.2 Definitions, the term "utility interactive" should be hyphenated and the periods after source and utility should be changed to commas.
Under Table 705.3, the Other Articles should be listed with consistency by capitalizing each term in the titles.
Under 705.4, the term "Utility-Interactive Inverters" should be "Utility-interactive inverters" and I don't understand the identified for interconnection service. This should be changed to reflect UL marking requirements.
Under 705.12, the 692.65 should be deleted as it was likely a carryover from cut and paste editing.
Under 705.12(C) the term "KW" should be "kW". Additionally, the 100kW requirement that is already in 705 seems over restrictive by requiring qualified persons to operate every system above 100kW. This limit should be considered by a task group for future editions.
Under 705.12(D) the term "Utility Interactive" in the title should be "Utility-interactive".
Under 705.12(D)(3) the term "Ground Fault" should be "Ground-fault" and the exception should be italics.
Under 705.21, the term "utility interactive" should be hyphenated.
Under 705.22(4), the term "cared" should be changed to "carried". Also, I believe the numbering 1-4 should be lettered A-D.
Under 705.30(D) the term "utility interactive inverter" should be "Utility-interactive inverters" in both instances.
Under 705.40 Exception and FPNs, correct the terms to "utility-interactive inverter".
Under 705.60(B), the word "system" should be deleted and "currents" changed to "current" since inverter current is sufficient. Inverter system is undefined in the code.
Under 705.65, change the periods after supply, circuits, transformer and transformer to commas.
Under 705.65(C) change the periods after increments and breakers to commas and change the term "staring" to "starting".
Under 705.65(D) change the period after breakers to a comma.
Under 705.65(E), the language does not make sense. It is unclear what is meant by two or more modules for this generic section. It is suggested that 705.65(E) be deleted since it does not make sense and appears to be not applicable to inverters.
Under 705.70, I believe the list should be labeled A through D and not 1 through 4. Also the reference in (3) should be to both 705.21 and 705.22.
Unde
r 705.80 the term utility-interactive should be "Utility-interactive" in both instances.
Under 705.82, the second "Hybrid Systems" should be "Hybrid systems".
Under 705.100, the terms "and ac modules" and "and 3-phase ac modules" should be deleted. AC modules are covered under Article 690. Also the periods after "of" and "unbalanced" should be changed to commas.
Under the "Panel Statement", the exceptions (1) and (2) (as stated) were not removed. However, they should not have been removed since they still apply. The listing of Solar Photovoltaic Systems and Fuel Cells in the table should remain in the table.
GENERAL COMMENT ABOUT ARTICLE 705. THIS ARTICLE IS FULL OF WHOLESALE REFERENCES TO COMPLETE ARTICLES WITHIN THE CODE. IT IS RECOMMENDED THAT A TASK GROUP REVIEW AND REWRITE THE ENTIRE ARTICLE TO COMPLY WITH THE STYLE MANUAL AND TO INCLUDE COMPLETE INDUSTRY INPUTS.
KRASTINS, K.: The following comments should be considered prior to incorporation of the proposal as currently worded in the ballot.
(a) For better clarity, revise the last sentence of 705.4 to read: "Utility-interactive inverters connected in parallel with a primary source of electricity shall be listed as suitable for such applications."
(b) Add the definite article "the" after the word "be" in 705.60(A)(1).
(c) Change "output circuit" to "output circuits" in the first sentence of 705.65(A).
(d) In 705.95, change "anyone" to either "any," "any one," or "any single." Anyone refers to a person; not a conductor.
STAFFORD, T.: The Panel action was correct and this member agrees with the panel action. The increasing use of alternative power sources, other than utility supplied, increases the complexity and the safety requirements for paralleled electric power systems. By including Article 690, Solar Photovoltaic Systems, and Article 692, Fuel Cell Systems, in Article 705, there is a commonality among all power sources and their interconnection requirements with the utility distribution system.

ZGONENA, T.: This affirmative vote will allow us to benefit from the substantial work performed on this proposal. Unfortunately, this large proposal that incorporates many significant issues, was modified by the CMP 13 705 Task Group and is now addressed as a single proposal. The present proposal is not implemented in a manner that addresses all utility interconnected product types equally. One of the revision made to 705.4, deleted the requirement for all interconnection system equipment to be listed. Engine Generators like other utility interactive devices should be evaluated and Listed for utility interconnection, especially since engine generators have significantly more fault current than other DG sources.
To vote against this proposal would jeopardize the significant amount of this valuable work. The requirement for Listed Equipment will need to be addressed in the 2011 code.

13-263 Log #1187 NEC-P13 **Final Action: Accept in Principle (705)**

Submitter: Neil F. LaBrake, Jr., National Grid / Rep. Edison Electric Insitute-Electric Light & Power Group
Comment on Proposal No: 13-184
Recommendation: The Panel action rewrite of the original proposal should be revised to incorporate Mr. Hornberger's ballot comment, revising the proposed sections 705.12 and 705.22. The text from Mr. Hornberger's ballot comment is repeated here for convenience with edits underlined:
705.12 Point of Connection. The output of an interconnected electric power source shall be connected as specified in 692.65(A), (B), (C), or (D).
(A) Supply Side. Any interconnected electric power source shall be permitted to be connected at the premises service disconnecting means, beyond the point of common coupling.
(B) Integrated Electric Systems. The outputs shall be permitted to be interconnected at a point or points elsewhere on the premises where the system qualifies as an integrated electric system and incorporates protective equipment in accordance with all applicable sections of Article 685.
(C) Greater Than 100 KW The outputs shall be permitted to be interconnected at a point or points else where on the premises where all of the following conditions are met:
(1) The aggregate of non-utility sources of electricity has a capacity in excess of 100 KW, or the service is above 1,000 Volts.
(2) The conditions of maintenance and supervision ensure that qualified persons service and operate the system.
(3) Safeguards, documented procedures, and protective equipment are established and maintained.
(D) Utility Interactive Inverters rated less than 100 KW The output of a utility interactive inverter power source with a capacity of less than or equal to 100 KW shall be permitted to be connected as specified in either 705.12(D)(1) or 705.12(D)(2) or 705.12(D)(3).
(1) Load Side. A utility-interactive inverter shall be permitted to be connected to the load side of the service disconnecting means of the other source(s) at any distribution equipment on the premises, provided that all of the following conditions of 705.12(D)(1)(a) through 705.12(D)(1)(e) are met:
(a) Dedicated Overcurrent and Disconnect. Each source interconnection shall be made at a dedicated circuit breaker or fusible disconnecting means.
(b) Ground Fault Protection. The interconnection point shall be on the line side of all ground-fault protection equipment.
(c) Marking. Equipment containing overcurrent devices in circuits supplying power to a busbar or conductor shall be marked to indicate the presence of all sources.
(d) Suitable for Back Feed. Equipment such as circuit breakers, if backfed, shall be identified for such operation.
(e) Bus or Conductor Rating. The rating of the bus or conductor to which the utility-interactive inverter breaker or fusible disconnect is connected shall meet all of the conditions in 705.12(D)(1)(a)(1) or 705.12(D)(1)(a)(2)
(2) End Feed Connection. Where the utility-interactive inverter breaker or fusible disconnect is connected in the distribution equipment at the opposite (load) end from the input feeder connection or main circuit location, the bus or conductor rating shall be equal to or larger than the sum of the ampere ratings of all overcurrent devices connecting premise electric power production sources to the bus or conductor. The bus or conductor rating shall have been sized for the loads connected, in accordance with Article 220. A permanent warning label shall be applied to the distribution equipment with the following or equivalent:
WARNING
ELECTRIC POWER PRODUCTION SOURCE OUTPUT
DO NOT RELOCATE THIS OVERCURRENT DEVICE.
(3) General Connection. Where the utility-interactive inverter breaker or fusible disconnect is not end fed, the bus or
conductor rating shall be equal to or larger than the sum of the ampere ratings of overcurrent devices in circuits
supplying power to the busbar or conductor.
Exception: For a dwelling unit, the sum of the ampere ratings of the overcurrent devices shall not exceed 120 percent of the rating of the busbar or conductor.

705.22 Disconnect Device
The disconnecting means for ungrounded conductors shall consist of a manually or power operable switch or circuit breaker with the following features:
(1) Located where readily accessible
(2) Externally operable without exposing the operator to contact with live parts and if power operable, of a type that can be opened by hand in the event of a power supply failure.(3) Plainly indicating whether in the open (on) or closed (off) position
(4) Having ratings not less than the load to be carried and the fault current to be interrupted
(5) Lockable in the open position.
Substantiation: 705.12 should be reworded as shown to incorporate changes accepted in Proposals 13-61 for 690.64(B)(2) and 13-74 for 692.65(B)(2), and generalized for Utility Interactive Inverters. Also, revise 705.22, as shown, to reinstate the requirement for a "Lockable Disconnect" for the AC output circuits. This disconnect is essential to provide positive and visible confirmation that an interconnected power source has no possible method to backfeed electrical energy into a system which has been de-energized for maintenance or to meet the needs of emergency first response personnel. This requirement is necessary so qualified personnel can lockout the source of electrical current as required in many OSHA and NFPA 70E regulations.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 13-262.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Gustafson, R.

13-264 Log #2199 NEC-P13 **Final Action: Reject (705)**

Submitter: Kenneth Krastins, Plug Power, Inc. / Rep. US Fuel Cell Council
Comment on Proposal No: 13-184
Recommendation: Reject the proposed change.
Substantiation: The panel acknowledged the value of such a proposal and accepted this proposal in principle to permit public comment of the proposal. Comments have been received and will be reviewed further at the CMP-13 ROC meeting in November. But, feedback to this point indicates that to adequately address the concerns of a change of this magnitude and craft language that will neither omit nor introduce wording that will compromise safety for the affected industries that a working group will need to convene to provide a comprehensive proposal for the 2011 NEC. The proposal should be rejected by the panel to ensure that the changes indicated in the 2008 NEC ROP are not inadvertently included in the final publication.
Panel Meeting Action: Reject
Panel Statement: This change to Article 705 would have permitted application of utility-interactive inverter interconnections for technologies other than solar photovoltaic and fuel cells, e.g., wind, micro-hydro, combined heat and power, micro-turbines, etc. This change has had public review with few comments that have been addressed by the panel action on Comment 13-262.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Gustafson, R.

13-265 Log #2299 NEC-P13 **Final Action: Accept in Principle (705)**

Submitter: Todd Stafford, IBEW-NJATC / Rep. IBEW
Comment on Proposal No: 13-184
Recommendation: Revise wording to include the changes, if any, that are made to sections 690.64(B)(2), and 692.65(B)(2), and 705.22 as recommended by Hornberger.
Substantiation: While I agree with the panel action, the comment submitted by Hornberger needs to be addressed. The TCC recommends that additional consideration be given to the comments submitted as well.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 13-262.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Gustafson, R.

13-266 Log #2337 NEC-P13 **Final Action: Accept in Principle (705.4)**

Submitter: Alan Manche, Square D Company
Comment on Proposal No: 13-185
Recommendation: The Panel Action on 13-184 should continue to be "Accept in Principal in Part" but the Panel should reconsider and reject the entire portion of Proposal 13-185 dealing with 705.4.
Substantiation: A requirement for the system to be listed for this particular application has not been justified. And, listing of an electrical system of this

nature is not practical unless the CMP intends to exclude most of the kinds of systems that are installed and operated safely today. 705.4, as it reads in the ROP, would require the system (electrical equipment, alternate power source and controls, raceway, wire size…) to all be a documented assembly.

As accepted at the ROP stage, 705.4 will require listing of "interconnection systems." This term is not defined in the NEC, and where it is defined in standards, it is such a broad term that the ability to obtain listings for all such systems seems highly questionable. 705.4 also calls for identification for "interconnection service." This is an undefined term, and there are no standards requiring such identification.

Mr. Daley's proposed text and substantiation, in an attempt to build support for product listing, lends support to just the contrary. His substantiation "It is necessary to expand the description of what is acceptable because many interconnection systems are site specific and would be comprised of recognized components suitable for the intended use" indicates the need to use various manufacturer's equipment and various components to make the system work safely and reliable. Note his substantiation that these are very "site specific" and are each unique in construction and assembly.

The panel states that "a compilation of components would not necessarily meet the requirements for interconnection systems unless tested as a complete system. In addition, the submitter gave no technical substantiation for this part of the proposal." So if the equipment is required to be listed and Mr. Daley is explaining that it takes various components to make the system work, how does the panel believe the system can now be installed, work appropriately and comply with the NEC?

Paralleling switchgear will often include various manufacturer's sections, which are interconnected on the job, and that are not assembled in a factory location where UL could list the product assembly. Mr. Daley acknowledges the need to have provisions for field installed components that will modify the equipment in the field. As an example, consider the fact that the electrical gear will be supplied without knowing what generator manufacturer is going to be used. Generator controls will be installed in the field within the gear that are not tied to the listing of the gear. The UL Listed assembly will now have been modified.

Now let's review the UL White Book --- **"What happens to the Listing if a UL-Listed product is modified in the field?** An authorized use of the UL Mark is the manufacturer's declaration that the product was originally manufactured in accordance with the applicable requirements when it was shipped from the factory. When a UL-Listed product is modified after it leaves the factory, UL has no way to determine if the product continues to comply with the safety requirements used to certify the product without investigating the modified product. UL can neither indicate that such modifications ''void'' the UL Mark, nor that the product continues to meet UL's safety requirements, unless the field modifications have been specifically investigated by UL. It is the responsibility of the Authority Having Jurisdiction (AHJ) to determine the acceptability of the modification."

In effect the UL mark does not support modifications, such as the above, in the field unless it is field evaluated. The UL mark is a valuable mark to ensure equipment meets specific safety standards, however, in this case what benefit is the listing if the equipment is going to be modified and the third party will not (can not be expected to) stand behind that mark after the system is installed?

Understanding the safe operation of the system is a field installation issue not an equipment issue. The only method to understand if the system will operated safely is to evaluate the completed installation, which includes the assembled equipment in conjunction with the alternate source such as generators and generator controls, to ensure a safe and reliable system.

Concerns expressed in the Proposal somewhat parallel another in the NEC – ground-fault protection of equipment. There is no listing requirement for ground fault protection of equipment in NEC 230.95, even though the concern there, as in this situation, is that it will operate appropriately after the installation is complete.

There is no substantiation that Listed equipment will resolve any safety concerns expressed in the substantiation of this proposal. Based upon the present language, it will be nearly impossible to be NEC compliant due to this listing requirement, except on simple systems. And, the simply system is not what the submitter is targeting in his proposal.

It is recognized that proposed language in 13-185 was incorporated into proposal 13-184 however the comment has been made this proposal since the substantiation and panel statement for acceptance is provided in proposal 13-185.

The proposal to add 705.4 should be Rejected.

Panel Meeting Action: Accept in Principle

Panel Statement: See the panel action on Comment 13-262. The requirement for listing all interconnection equipment was removed, and a requirement to list utility-interactive inverters was added. The remaining requirement for approved equipment is consistent with 110.2.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 15

Ballot Not Returned: 1 Gustafson, R.

Comment on Affirmative:

ZGONENA, T.: See My Affirmative with Comment on 13-262.

13-267 Log #315 NEC-P13 **Final Action: Accept in Part (705.12 and 705.12(B) & (C))**

TCC Action: The Technical Correlating Committee directs that the sentence added to 705.12(C)(6) from Comment 13-75 have the following corrections:

"In systems with ~~series-connected~~ panelboards connected in series, ~~panel-boards~~ or ~~sub-panels~~ the rating of the first overcurrent device directly connected to the output of a utility-interactive inverter(s) shall be used in the calculations for all busbars and conductors." The text will now read as follows:

"(6) Bus or Conductor Rating. Unless the panelboard is rated not less than the sum of the ampere ratings of all overcurrent devices supplying it. a connection in a panelboard shall be positioned at the opposite (load) end from the input feeder location or main circuit location. In systems with ~~series-connected~~ panelboards connected in series, ~~panel boards~~ or ~~sub-panels~~ the rating of the first overcurrent device directly connected to the output of a utility-interactive inverter(s) shall be used in the calculations for all busbars and conductors. A permanent warning label shall be applied to the distribution equipment with the following or equivalent wording:

WARNING
ELECTRIC POWER PRODUCTION SOURCE OUTPUT
DO NOT RELOCATE THIS OVERCURRENT DEVICE

Submitter: Code-Making Panel 9,

Comment on Proposal No: 13-184

Recommendation: Modify the panel action text in 705.12 and 705.12(B) and (C) as follows (legislative format in this comment applies to differences from the CMP-13 action text, and not in respect to the 2005 NEC):

705.12 Point of Connection. The outputs of electric power production systems shall be interconnected with a primary source(s) as specified in either (A) or (B) ~~or (C)~~. Distribution equipment fed by both primary and electric power production sources shall also comply with (C).

~~(B) Greater than 100kW Location. the outputs shall be permitted to be interconnected at a point or points elsewhere on the premises where all of the following conditions are met:~~

~~(1) The aggregate of non-utility sources of electricity has a capacity in excess of 100 kW, or the service is above 1000 volts.~~

~~(2) The conditions of maintenance and supervision ensure that qualified person service and operate the system.~~

~~(3) Safeguards, documented procedures, and protective equipment are established and maintained.~~

~~(C) Less than or equal to 100 kW.~~ The output of an interactive power source ~~with a capacity of less than or equal to 100 kW~~ shall be connected as specified in either (1) or (2):

(1) Supply Side. An electric ~~A photovoltaic~~ power production source shall be permitted to be connected to the supply side of the service disconnecting means as permitted in 230.82(6).

(2) Load Side. An electric ~~A photovoltaic~~ power production source shall be permitted to be connected to the load side of the service disconnecting means of the other source(s) at any distribution equipment on the premises, provided that all of the ~~following~~ conditions in (C) are met.

(C) Interconnection Limitations for Distribution Equipment. Where distribution equipment, including switchboards and panelboards, is fed simultaneously by a primary source(s) of electricity and one or more electric power production sources, and where this distribution equipment is capable of supplying multiple branch circuits or feeders or both, the interconnecting provisions for the electric power production sources shall comply with (1) through (6).

(1) ~~(a)~~ Dedicated Overcurrent and Disconnect. Each source interconnection shall be made at a dedicated circuit breaker or fusible disconnecting means.

(2) ~~(b)~~ The sum of the ampere ratings of overcurrent devices in circuits supplying power to a busbar or conductor shall not exceed 120 percent of the rating of the busbar or conductor.

~~Exception: For a dwelling unit, the sum of the ampere ratings of the overcurrent devices shall not exceed 120 percent of the rating of the busbar or conductor.~~

(3) ~~(c)~~ Ground Fault Protection. The interconnection point shall be on the line side of all ground-fault protection equipment.

Exception: Connection shall be permitted to be made to the load side of ground-fault protection, provided that there is ground-fault protection for equipment from all ground-fault current sources. Ground-fault protection devices used with supplies connected to the load-side terminals shall be identified and listed as suitable for backfeeding.

(4) ~~(d)~~ Marking. Equipment containing overcurrent devices in circuits supplying power to a busbar or conductor supplied from multiple sources shall be marked to indicate the presence of all sources.

~~Exception: Equipment with power supplied from a single point of connection:~~

(5) ~~(e)~~ Suitable for Back Feed. Circuit breakers, if backfed shall be identified for such operation. ~~Dedicated circuit breakers backfed from listed utility interactive inverters complying with 690.60 shall not be required to be individually clamped to the panelboard busbars. A front panel shall clamp all circuit breakers to the panelboard busbars. Main circuit breakers connected directly to energized feeders shall also be individually clamped.~~

(6) Bus or Conductor Rating. Unless the panelboard is rated not less than the sum of the ampere ratings of all overcurrent devices supplying it, a connection in a panelboard shall be positioned at the opposite (load) end from the input feeder location or main circuit location. A permanent warning label shall be applied to the distribution equipment with the following or equivalent wording:

WARNING
ELECTRIC POWER PRODUCTION SOURCE OUTPUT
DO NOT RELOCATE THIS OVERCURRENT DEVICE

Substantiation: Although the Technical Correlating Committee requested CMP-9 comment on Proposal 13-61, and the panel has done so, the technical issues raised in that and in the associated proposals apply to all systems capable of interconnection and parallel operation using multiple sources. For this reason, CMP-9 believes that the CMP-13 actions in Articles 690, 692, and 705 must be correlated in this respect, and is providing comments to the comparable proposals and panel actions in all of these articles.

CMP-9 agrees that it is possible to assure that the busbars of panelboards receiving supply current from two sources can be arranged so the busbars will not exceed their ampacity (the "opposite end" scenario accepted under Proposal 13-6, however, CMP-9 points out that such an arrangement allows for up to double the amount of load to be taken from the panel for the indefinite periods of time. Current product standards do not anticipate the effect of I2R heating losses under these conditions, which could severely impact the performance of essential components within the distribution equipment. Before the NEC recognizes this type of connection, it is essential that careful testing be carried out to determine the acceptable parameters that should be applied in these cases.

For example, if a windmill provides 100 amperes of power to a panel in an interactive system rated 100 amperes, and this panel is supplied by a normal utility supply of 100 amperes the branch circuit and feeder loads supplied by this panel could total 200 amperes. Although such a load should not exist due to required sizing rules relative to Article 220 calculations, the requirement for individual protection for panelboards (now set to apply to all panelboards by virtue of CMP-9 action in this cycle) anticipates that these load calculations are easily circumvented given the relative ease of circuit modifications.

Although the panel action on this proposal did not include the double-ended wording, nevertheless such an arrangement is possible in the current NEC and continues to lurk in the panel action text. This is because the current (and proposed) 705.12(B) allows this (in fact, there isn't even an opposite end requirement in this provision) for larger systems. CMP-9 offers this comment to address this issue, as well as a number of inconsistencies and Style Manual issues within this section as well. This comment does not apply to any wording in Article 705 other than that in 705.12. A detailed analysis follows.

This comment creates a separate subsection to address the double-feed issue, because it is common to both over and under 100 kW systems. In fact, it may be even more compelling on the larger systems. One member of CMP-9 personally wired a 120 kW cogeneration system interconnection into a remote lighting and appliance branch circuit panelboard for no reason other than it was the closest convenient connection point, and the NEC allowed it to happen. These applications are generally more likely to create the conditions for concern expressed in this comment than the relatively limited energy available from typical PV connections.

Therefore, this comment removes the PV language from the panel action text. In addition, CMP-9 points out that since the content of (C) accepted by CMP-13 only addresses PV interconnections, the entirety of (C) as drafted by CMP-13 is beyond the article's reach because 705.3 Exception No. 1 cedes control of PV systems to Article 690. This comment redraws (C) so it coves the sources generally controlled by Article 705. It also removes the language on PV inverters and the associated circuit breaker rules because this language will be in Article 690 and only confuses what should be a rule applicable to all connections unless modified per 705.3, Exception No. 1. Note also that Article 692 will have comparable rules, enforceable here through 705.3, Exception No. 2, but which are not addressed in the panel action text on this proposal. This comment avoids these pitfalls. This comment also builds the exception for single source connections into the parent rule, using positive language and avoiding the Style Manual violation of an exception that fails to use a complete sentence.

This comment removes the distinctions between the over and under 100 kW systems, because the CMP-13 actions to allow a small system interconnection downstream from the service make continuing these distinctions pointless. Under the action on this proposal, both large and small systems can use remote connections by right. It is true that the larger systems have the remote connection allowance conditioned on qualified personnel and the usual safeguards, but a large system connected at the service has the same incident energy (perhaps more since conductor impedance is proportionately lower). Therefore, if CMP-13 wants to continue these qualification and equipment safeguards, etc., it can and should do so in a different section where they would apply regardless of where the point of connection falls.

CMP-9 expresses its willingness to assign a task group to work with CMP-13 and other interested industry parties to provide a carefully substantiated global approach to double-fed distribution equipment applied in interactive settings for the 2011 NEC. This might include specially targeted allowances for equipment listings that would cover such interconnections. In the meantime, this comment does broaden the 120 percent allowance from dwellings to all occupancies. Because of the I2R relationship, an allowance for an additional 20 percent loading (one fifth) would only increase the heating losses by 4 percent (one twenty fifth), which should be tolerated by existing equipment designs even if the interconnection does not occur at the opposite end of the bus from the normal supply. This comment incorporates the opposite-end rule from the CMP-13 action on Proposal 13-74 as a tradeoff for the occupancy expansion, thereby ensuring that an overloaded busbar does not exacerbate the heating problem.

This comment has been balloted through CMP-9 with the following balloting results.

11 Eligible to Vote
10 Affirmative
1 Not Returned (H. deVega)

Panel Meeting Action: Accept in Part

The panel accepts in part as follows:

• Accept the recommendations for the supply side connection point.

• Incorporate the breaker clamping requirement and the 120% source capacity limit for sizing a panel board in the load side to be consistent with changes proposed for the interconnection requirements in 690.64 and 692.65.

• Reject eliminating interconnection requirements to Integrated Systems and General sections as eliminating these sections has not had proper public review.

• The panel requests that the TCC consider including the text from Comment 13-75 regarding series panel board, if included in Article 690 of the 2008 NEC.

Panel Statement: See panel action and statement on Comment 13-262.

ARTICLE 725 — CLASS 1, CLASS 2, AND CLASS 3 REMOTE-CONTROL, SIGNALING, AND POWER-LIMITED CIRCUITS

3-92 Log #758 NEC-P03 **Final Action: Accept in Principle (725.2)**

TCC Action: The Technical Correlating Committee directs that the panel action be revised into a Fine Print Note to read as follows:
"FPN: See 725.21 for voltage and power limitations of Class 1 circuits."
This change is made to comply with 4.1.2 of the NEC Style Manual.

Submitter: David B. Wechsler, The Dow Chemical Company
Comment on Proposal No: 3-142
Recommendation: Revise as follows:

Class 1 Circuit. The portion of the wiring system between the load side of the overcurrent device or power-limited supply and the connected equipment. ~~The voltage and power limitations of the source are in accordance with 725.21.~~

Substantiation: 725.2 is a definition section for Article 725. The text shown as needing to be deleted represents a requirement. NFPA Style Manual prohibits a requirement within a definition. 725.21 contains these requirements.
Panel Meeting Action: Accept in Principle
Revise the second sentence of the existing definition as follows:
The voltage and power limitations of Class I circuits are located in 725.21.
Panel Statement: The panel has revised the second sentence so that it is not mandatory language.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-93 Log #1807 NEC-P03 **Final Action: Reject (725.2, 725.11, 725.15, 725.21, and 725.22)**

Submitter: Michael Walls, American Chemistry Council
Comment on Proposal No: 3-142
Recommendation: Accept this proposal.
Substantiation: The submitter's intent was to delete remote control and signaling from Article 725, rather to better align with similar concepts in other articles so the applications can still be utilized under the appropriate design application. The changes do not delete these applications, uses more general terms that still meet the current intent.
Panel Meeting Action: Reject
Panel Statement: Remote control and signaling circuits may be used in various other parts of the Code, but a single point of reference in an article for Class 1 power limited circuits, as well as non-power-limited Class 1 circuits, are much easier for the user of the Code to understand and access. Class 1,

Class 2, and Class 3 remote control, power limited and signaling circuits must remain in Article 725.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-94 Log #1603 NEC-P03 **Final Action: Accept**
(725.2 and 760.2)

Submitter: Allen C. Weidman, Society of the Plastics Industry, Inc.
Comment on Proposal No: 13-1
Recommendation: The Society of the Plastics Industry supports the removal of abandoned cables. One of our member companies is in the business of removing abandoned cables from buildings.
Substantiation: A single definition of "abandoned cable" is inappropriate to cover audio, information technology, class 2, class 3, fire alarm, optical fiber, communications, CATV and network-powered broadband because each of these cable types has its own installation practices that must be accommodated in the definition of "abandoned cable" to avoid inappropriate and unnecessary removal.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-95 Log #1222 NEC-P03 **Final Action: Accept**
(725.3)

Submitter: John Burke, Fusion Cable Systems
Comment on Proposal No: 3-144
Recommendation: Continue to Reject this Proposal.
Substantiation: We remove old and unused cable as part of our standard business practice especially in retrofit jobs. The amount of old cable on some jobs has caused damage to the building and created unsafe working conditions for our techs. We support continuing the abandoned cable removal requirement in the Code.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-96 Log #1437 NEC-P03 **Final Action: Accept in Principle**
(725.3 and 725.25 (New))

TCC Action: The Technical Correlating Committee directs that the text of the first sentence of 725.3(B) be revised for clarity as follows:
"Installation of Class 1, Class 2, and Class 3 circuits shall comply with 300.21."
Submitter: Allen C. Weidman, The Society of the Plastics Industry, Inc.
Comment on Proposal No: 3-148
Recommendation: Accept this proposal in principle by moving the requirement to remove abandoned cables to new section 725.25.
Substantiation: The Society of the Plastics Industry supports the removal of abandoned cables. One of our member companies is in the business of removing abandoned cables from buildings.
Reconsider this SPI proposal. Moving the requirements to 725.25 will maintain parallelism with Articles 770, 800, 820 and 830.
Panel Meeting Action: Accept in Principle
Remove the last sentence in 725.3(B) and add mandatory text to the reference of 300.21 as follows:
725.3(B) Spread of Fire or Products of Combustion. Section 300.21 shall provide the requirements for installations concerning the spread of fire or products of combustion. ~~The accessible portion of abandoned Class 2, Class 3, and PLTC cables shall be removed.~~
Panel Statement: The added text to 725.3(B) does not change the intent of the reference to 300.21 but provides the mandatory text to require compliance with 300.21 in accordance with the NEC Style Manual. See the panel action on Comment 3-111.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-97 Log #1604 NEC-P03 **Final Action: Accept in Principle**

(725.8)

Submitter: Melvin K. Sanders, Ankeny, IA
Comment on Proposal No: 3-155
Recommendation: Proposal 3-155 should have been Accepted to allow cable ties to be used to secure Class I, Class 2 and Class 3 circuit cables and conductors.
Substantiation: A discussion of this proposal with many electric industry representatives did not indicate any problem with this long standing practice of securing these cables and conductors. In addition, there are no specific spacing requirements for the presently permitted support methods and experience has proven that workmanship recognizes where undue sags or spacing occurs and supports are added at that time. Cable ties would and do provide a quick easy method to do so.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 9 Negative: 4

Explanation of Negative:

CASPARRO, P.: Cable ties were designed to tie cables together not to support cables. I realize that we are talking about Class 1, Class 2 and Class 3 cables and if we start to support multiple cables in a bundle, we are looking at serious safety issues. With no strength requirement and minimum spacing intervals this installation can be an accident waiting to happen.

EGESDAL, S.: This comment should have been rejected, based on the Standards Council's decision on NFPA 90A. UL lists cable ties for installation in HVAC system plenums. Rejecting this comment would be consistent with the action taken by Panel 3 on comments 3-134, 3-164, and 3-176, which suggested a trivial editorial change to NFPA 262 listing requirements. The Panel used the NFPA 90A directive to reject these 3 comments.

Additionally, the submitters of comments did not provide technical substantiation to respond to the panel statement on proposal 3-155, as follows. "It is not acceptable to use a cable tie to serve as a sole support for a cable when there is no spacing requirement provided for the distance between supports." Further, the proposals, comments, and panel statements provide no technical substantiation for panel action that would require all hardware used to support these cables to be listed. Code-making panels 7 and 8 have steadily rejected similar proposals relating to the support of cables and raceways.

KEDEN, R.: I am voting negative to the Committee Actions for Comment No. 3-101, 3-102, 3-105, and 3-107. Since all these comments pertain to the same issue, my following reason is the same for all four comments.

Reason: Cable ties were originally introduced to tie cables together (thus the name "cable tie") into bundles. This application does not require special strength or spacing instructions. Even if one, or all, cable ties in a run of cables degrade or rip apart, there is no safety issue involved, since these bundles are contained in cable trays, surface raceways, J-Hooks and the like.

The picture changes, however, if cable ties, possibly with the addition of an eyelet, are made the sole support for a cable bundle. Imagine this to be cable carrying dangerous levels of energy and running across the ceiling in a factory above a path frequently travelled by a forklift. With no strength requirement and maximum spacing interval, this installation can be a catastrophe in waiting. I know about a plastic cable tie, designed to break at about 25 lbs. so not to indent sensitive data cable bundles. No requirement to not use them for hanging cables? Cable bundles and conduit are attached safely to structures and substructures with listed support hardware tested according to UL 2239 (ANSI approved) "Hardware for the Support of Conduit, Tubing, and Cable". Most cable ties could not pass this standard, however, hangers, staples, straps and beam clamps have to in order to become listed. This is a safety issue and NFPA should not sanction this industry "practice."

OWEN, S.: Cables ties were originally introduced to tie cables together in bundles - not to support cables. Generally when installing cable ties, the application does not require a special strength rating of the cable tie, or spacing instructions. If one or more cable ties installed in a run of cables degrades or rips apart (breaks), there is no safety issue involved when these bundles are contained in cable trays, surface raceways, J-hooks and the like.

The issue of safety changes if the cable ties are installed as the means of support, rather than bundling cables together. With no strength requirement and maximum spacing interval, this installation could become a dangerous installation.

Cable bundles and conduit are attached safely to structures and substructures with listed support hardware tested according to UL 2239 (ANSI approved) Hardware for the Support of Conduit, Tubing, and Cable. Most cable ties could not meet the requirements of this standard, whereas, hangers, staples, straps and beam clamps are required to meet this standard in order to become listed.

The use of cable ties as support devices is a safety issue and should not be permitted.

Comment on Affirmative:

AYER, L.: Cable ties are included in similar text in Articles 320, 330, and 334. These items have provided support for Type AC, Type MC, and Type NM cables for years without incident or hazard. To not allow cable ties to be used to support Class 2 or Class 3 low voltage and low energy wiring would not be consistent with the other parts of the code. Since cable ties can support the far heavier wiring methods mentioned in Chapter 3, they should also be allowed to be used to support Class 2 or Class 3 low voltage wiring methods in Article 725.

EASTER, L.: The panel should have accepted Comment 3-102 by T. McNeieve and specified a minimum loop tensile strength that provides primary support for such cables and that the cable ties need not be listed.

3-102 Log #484 NEC-P03 **Final Action: Accept in Part (725.8)**

Submitter: Timothy P. McNeive, Thomas & Betts Corporation
Comment on Proposal No: 3-155
Recommendation: Change the panel action to Accept in Principle. Add the additional text suggested in the comment on negative vote by Mr. Easter:

"Cable ties that provide primary support for such cables shall have a minimum loop tensile strength of 23 kg (50 lbs)."

Substantiation: "Minimum loop tensile" strength is commonly marked on packages of cable ties. The 23 kg minimum for cable support is well representative of typical straps, hangers and staples listed for flexible conduit and cable support in accordance with UL 2239, Hardware for Support of Conduit, Tubing and Cable. The panel is also asked to follow the long time positions of CMP-7 and 8 and not consider in its final decision, the requirement that cable ties or other support hardware to be listed.

Panel Meeting Action: Accept in Part

The panel accepts adding cable ties as a permitted method to support Class 1, Class 2, and Class 3 cables. The panel rejects the recommendation to add the sentence requiring that cable tie have a minimum tensile strength.

Panel Statement: Cable ties can be used for securing and supporting cables in a number of Chapter 3 wiring methods without any requirements for a minimum loop tensile strength.

Number Eligible to Vote: 13
Ballot Results: Affirmative: 9 Negative: 4
Explanation of Negative:

CASPARRO, P.: See my explanation of negative vote on Comment 3-101.

EASTER, L.: The panel should have accepted this comment to add the minimum loop tensile strength for cable ties that provide primary support for such cables and that cable ties need not be listed.

KEDEN, R.: See my Explanation of Negative Vote on Comment 3-101.

OWEN, S.: See my explanation of negative vote on Comment 3-101.

Comment on Affirmative:

AYER, L.: See my Explanation of Affirmative Vote on Comment 3-101.

3-103 Log #605 NEC-P03 **Final Action: Reject (725.8)**

Submitter: Jamie McNamara, Hastings, MN
Comment on Proposal No: 3-152
Recommendation: The panel should reconsider this proposal and except it.
Substantiation: To harmonize Article 725 with the requirements in Articles 770, 800, 820 and 830 is a goal we should be striving for. To require similar cable types to comply with the same rules makes for good code (understandable and enforceable for all). If there are inconsistent and unnecessary requirements in the code, let's work to change them all in this code cycle and the next. For now, and in the future, let's make the text the same for the same types of cable installations.

Panel Meeting Action: Reject

Panel Statement: Class 1 circuits are required by 725.25 to comply with Part I of Article 300, so the addition of the reference to 300.11 would only affect Class 2 and Class 3 circuits. There was no technical substantiation provided in the proposal to require Class 2 and 3 cables to comply with Section 300.11. For example, to require low-energy thermostat cables to be supported above an accessible ceiling and compy with the same requirements as Types MC and AC cables would be overkill for absolutely no safety reason. The NEC should not be required to be consistent between articles where there are no apparent safety issues involved in the requirement. Power wiring was required to be supported independently since there was a real possibility of damage to the conductors within raceways if the wire support clips were removed without replacement and the raceways were allowed to sag without support.

Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:

EASTER, L.: The comment should have been accepted. Acceptance of this comment will require that signaling cables installed above suspended ceilings be supported in accordance with Section 300.11. Including the requirement in Article 725 is consistent with the requirements for Chapter 3 wiring methods as well as communications cables covered by Articles 770, 800, 820 and 830. There is no reason that Article 725 wiring methods should be exempted.

3-104 Log #847 NEC-P03 **Final Action: Accept (725.8)**

Submitter: John P. Masarick, Independent Electrical Contractors Inc.
Comment on Proposal No: 3-156
Recommendation: The panel is encouraged to continue to Reject Proposal 3-156.
Substantiation: The reasons to continue to Reject the Proposal are as follows:

1. The trend by the CMPs over the last several code cycles has been to limit the use of FPNs.
2. There is also a correlation issue. There is a conflict between those panels that accepted the proposal and those that rejected the proposal.
3. These standards are also covered by a Fine Print Note in 110.12.
4. The FPN should not be accepted because numerous standards and installation manuals exist and to only mention one does not adequately inform the public about accepted industry practices. The NEC is not intended to be an instruction manual for untrained persons. If the FPNs are allowed to reference these standards, then they should list all applicable standards.
5. Since the referenced installation standards are intentionally general to cover different models of equipment, approval of the FPN may lead many to believe these standards can be used instead of listed or labeled manufacturer's instructions which would be in violation of 110.3(B).

6. If the CMP would like to include the reference, it should be placed in the Annex with the other references.
Panel Meeting Action: Accept

EASTER, L.: See NEMA recommendation and my explanation of negative vote on Comment 3-103.

3-107 Log #1805 NEC-P03 **Final Action: Accept**
(725.8)

Submitter: Noel Williams, Herriman, UT
Comment on Proposal No: 3-155
Recommendation: This proposal should have been accepted.
Substantiation: The panel statement is unresponsive to the proposal, and considering the other support methods listed, borders on nonsense. If "it is not acceptable to use a cable tie" because "there is no spacing requirement provided for distance between supports," then none of the other methods (straps, staples, hangers, or similar fittings) should be acceptable either. As noted in the proposal, cable ties are already recognized for numerous other wiring methods that are much heavier than the cables covered by Article 725 and cable ties have been accepted as support methods by Panels 7, 12, and 16, so the rejection of this proposal is highly inconsistent and unjustified. As noted in the Explanations of Negative, cable ties are already permitted in many places under the language "or similar fittings," but consistency in the code is highly desirable and directly addresses the ongoing issue of usability.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 10 Negative: 3

3-108 Log #759 NEC-P03 **Final Action: Reject**
(725.15)

Submitter: David B. Wechsler, The Dow Chemical Company
Comment on Proposal No: 3-142
Recommendation: Revise as follows:
725.15 Class 1, Class 2, and Class 3 Circuit Requirements
~~A remote control, signaling, or power limited circuit shall comply with the following parts of this article:~~
(1) Class 1 Circuits: Parts I and II
(2) Class 2 and Class 3 Circuits: Parts I and III
Substantiation: The intent of this proposal is not to eliminate remote control, etc., but rather clarify within this General Part 1 section of Article 725 to better define what specific sections apply. Therefore the Requirements for Class I Circuits are found in Parts 1 and II of this Article; Class 2 and Class 3 are found in Parts 1 and III of this Article. 725.11 still continues to address remote-control circuits which in some cases need to be considered as Class 1. Power Limited circuits are addressed in the appropriate article parts, as defined by the circuit, and equally so are signaling circuits.
Panel Meeting Action: Reject
Panel Statement: Deleting the introductory text in this section would not be a user friendly change. The mandatory text in 725.15 provides the requirement that Class 1 remote control, signaling, or power-limited circuits must comply with Parts I and II and Class 2 and 3 must comply with Parts I and III. Deleting the mandatory text would take away any requirement for compliance.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-109 Log #2165 NEC-P03 **Final Action: Accept in Principle**
(725.16)

Submitter: Ray R. Keden, Erico, Inc. / Rep. BICSI
Comment on Proposal No: 3-158
Recommendation: Accept the Proposal.
Substantiation: The title of Section 725.3 is "Other Articles". The requirement for the removal of abandoned cables is not in another article; it is in Article 725. It is out of place in section 725.3. This proposal will move it to a new section of Article 725.
The current placement of the requirement for the removal of abandoned cables in sections 640.3, 725.3, 760.3, 770.3, 800.3, and 820.3 is an error. The error was made by Panel 16 in processing the 2002 NEC. Panel 16 recognized these errors and corrected them by accepting the movement of these requirements in its actions on Proposals 16-31, 128, 254, 259, and 361.
Moving the removal requirements to sections 725.25 and 760.25 will create parallelism between Articles 725, 760, 770, 800, 820, and 830.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action on Comment 3-111.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-110 Log #760 NEC-P03 **Final Action: Reject**
(725.21)

Submitter: David B. Wechsler, The Dow Chemical Company
Comment on Proposal No: 3-142
Recommendation: Revise as follows:
725.21 Class 1 Circuit Classifications ~~and Power Source Requirements~~.
Class 1 circuits shall be classified as either Class 1 power-limited circuits where they comply with the power limitations of 725.21(A) or as Class 1 nonpower-limited ~~remote control and signaling circuits~~ where they ~~are used for remote control or signaling purposes and~~ comply with the power limitations of 725.21(B).
FPN: Remote-control and signaling circuits are examples of Class I, nonpower-limited circuits.
(A) Class 1 Power-Limited Circuits. These circuits shall be supplied from a source that has a rated output of not more than 30 volts and 1000 volt-amperes.
(B) Class I Nonpower-Limited ~~Remote Control and Signaling~~ Circuits. These circuits shall not exceed 600 volts. The power output of the source shall not be required to be limited.
Substantiation: The intent of this proposal is not to eliminate remote control, etc., but rather to clarify that just as in Article 760, Article 725, Part II, Class I Circuits come in either of two arrangements: Power limited or Non-Power Limited. Remote-control and signaling are just subsets of either of these types of Class I circuits. The suggested changes simply clarify, but do not delete, any requirements.
Panel Meeting Action: Reject
Panel Statement: Deleting the text and adding a fine print note with similar information as already located in the existing Code, as requested in the comment, does not provide any clarification.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-111 Log #547 NEC-P03 **Final Action: Accept**
(725.25 (New) and 760.25 (New))

TCC action: The Technical Correlating Committee directs that the Fine Print Notes contained in the recommendation be deleted because they contain a statement of intent. The Technical Correlating Committee notes that the rules as written in the recommendation are clear in that they apply to the accessible portion of the abandoned cable.
Submitter: Richard P. Owen, City of St. Paul
Comment on Proposal No: 3-140
Recommendation: Create 725.25 (New) and 760.25(New) as shown below:
725.25 Abandoned Cables. The accessible portion of abandoned Class 2, Class 3, and PLTC cables shall be removed. Where cables are identified for future use with a tag, the tag shall be of sufficient durability to withstand the environment involved.
FPN: See Article 100 for a definition of accessible. It is desirable to remove as much abandoned cable as is practical, but it is not the intent of this section to require construction or renovation specifically to facilitate the removal of abandoned cable.
760.25 Abandoned Cables. The accessible portion of abandoned fire alarm cables shall be removed. Where cables are identified for future use with a tag, the tag shall be of sufficient durability to withstand the environment involved.
FPN: See Article 100 for a definition of accessible. It is desirable to remove as much abandoned cable as is practical, but it is not the intent of this section to require construction or renovation specifically to facilitate the removal of abandoned cable.
Substantiation: This comment was written by a Task Group consisting of Stan Kaufman and Randy Ivans (Panel 16), John Mortimer (Panel 12) and Ron Maassen, Paul Casparro (Panel 3) plus Task Group Chair Richard Owen (Panel 3). The Task Group was directed by the Technical Correlating Committee to examine proposals submitted to all three Panels concerning abandoned cable and other related issues covered by the Panels.

The Task Group came to consensus on the following issues and submitted comments to the Panels as appropriate:

1) On the issue of abandoned cable removal, the task group agreed that only the accessible portions of abandoned cable should be removed. To require removal of all cable could, in some cases, necessitate demolition of the building finish in order to access cables that were properly fastened to the building in accordance with the rules in the various code articles. Furthermore, the task group agreed that the requirements for abandoned cable removal should not be in Section X.3 (Locations and Other Articles) but should be relocated into the general requirements of each article.

2) The task group also agreed to recommend the addition of a new Fine Print Note to further explain the removal requirement. This addition was thought to be necessary to address a common practice of cables that are "fished" inside existing walls. These cables, if abandoned, can be disconnected from their junction point in a wall and pulled out of the wall without having to harm the building finish. At present, in many cases, these cables are being cut off above the wall and left to drop into the wall space.

3) On the issue of "tagged for future use", the Task Group agreed that it was not necessary to require anything more than the cable tag being "...of sufficient durability to withstand the environment involved." This phrase is used in several other places in the NEC and leaves it up to the AHJ as to what is suitable. This language does not add requirements that are difficult, if not impossible, to enforce by adding unclear requirements for rodent-resistance, etc.

The current placement of the requirement for the removal of abandoned cables in sections 640.3, 725.3, 760.3, 770.3, 800.3 and 820.3 is an error. The error was made by panel 16 in processing the 2002 NEC. Panel 16 recognized these errors and corrected them by accepting the movement of these requirements in its actions proposals 16-31,128, 254, 259 and 361.

Panel 3 should not attach too much significance to the fact that the removal requirements are in the "Other Articles" section; it was a mistake that needs to be fixed. Moving the removal requirements to sections 725.25 and 760.25 will create parallelism between Articles 725, 760, 770, 800, 820 and 830.

Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-112 Log #622 NEC-P03 **Final Action: Accept in Principle**
(725.26(B)(4))

Submitter: Richard P. Owen, City Of St. Paul
Comment on Proposal No: 3-160
Recommendation: Revise text to read as follows:
(4) In Cable Trays. ~~In cable trays, where the~~ Class 1 circuit conductors and power-supply conductors, not functionally associated with ~~them~~ the Class 1 circuit conductors, ~~are~~ shall be separated by a solid fixed barrier of a material compatible with the cable tray, or ~~where the power-supply or Class 1 circuit conductors are in a metal-enclosed cable.~~ Class 1 circuit conductors and power-supply conductors, within multiconductor Type AC, Type MC, Type MI or Type TC cables, shall be permitted to be installed in a cable tray without barriers where all the conductors in the cables are insulated at 600 volts.
Substantiation: In following the recommendation of a Task group formed to address previous proposals concerning the installation of Class 1 circuits in a cable tray with and without a barrier, the panel may have made the existing allowance to install the Class 1 conductors with a barrier unclear. By reinstating the original requirement plus adding the new requirement, this would hopefully reinforce that either method is acceptable.
Panel Meeting Action: Accept in Principle
Revise 725.26(B)(4) to read:

(4) In Cable Trays. Installations in cable trays shall comply with 725.26(B)(4)(1) or 725.26(B)(4)(2).

(1) Class 1 circuit conductors and power-supply conductors not functionally associated with the Class 1 circuit conductors shall be separated by a solid fixed barrier of a material compatible with the cable tray.

(2) Class 1 circuit conductors and power-supply conductors not functionally associated with the Class 1 circuit conductors shall be permitted to be installed in a cable tray without barriers where all of the conductors are installed within separate multiconductor Type AC, Type MC, Type MI, or Type TC cables and all of the conductors in the cables are insulated at 600 volts.
Panel Statement: The word "separate" was added after "within" and before "multiconductor" to ensure that where the Class 1 circuits and the power supply conductors are not functionally associated, separate cables will be installed, one for the Class 1 and one for the power-supply conductors. The remainder of the comment was accepted. The text has been rearranged for clarity.

3-113 Log #668 NEC-P03 **Final Action: Reject**
(725.26(B)(4))

Submitter: James M. Daly, Upper Saddle Riv
er, NJ
Comment on Proposal No: 3-160
Recommendation: This Proposal should have been Accepted in Principle in Part by not accepting the addition of "Type TC" and the removal of solid fixed barriers. The only change should be that the last phrase of the existing section be revised to read:

"...or where the power-supply or Class 1 circuit conductors are in a multiconductor Type AC, Type MC, or Type MI cable."

I agree with the panel action to change the word "Multi-conductor" to "multiconductor".
Substantiation: All of the cable types listed in the Proposal, except for Type TC, have a metallic sheath or armor (metal-enclosed) that provides an equipment grounding path in addition to physical protection.

I agree that specifically identifying the cable types permitted is much more useful to the user than merely stating "metal-enclosed".

When 725.26(B)(4) was added, the intent was to not only provide physical protection, but also provide an equipment grounding path between power supply conductors and Class 1 circuit conductors so that, in the event of a malfunction in any power supply conductors, that power would not be imposed onto adjacent Class 1 circuit conductors, particularly onto Class 1 circuit conductors not functionally associated with the power supply conductors. This requirement is consistent with the requirement in 725.26(B)(1).

Also, the text that currently appears in the 2005 NEC has been in the Code since the 1951 NEC, which the Panel pointed out in the panel statement. Type TC cable did not exist at that time and was not added until the 1975 NEC. No technical substantiation has been provided to support the contention that Type TC provides equivalent mechanical and electrical protection as a "metal-enclosed cable", particularly as related to providing equipment grounding and physical protection between power supply conductors and Class 1 circuit conductors not functionally associated with the power supply conductors. This proposed text would be inconsistent with similar requirements in 725.25(B).

The panel rewrite imposes additional restrictions beyond those that appear in the 2005 NEC. The panel rewrite requires that both the Class 1 circuit conductors and the power supply conductors be contained within a multiconductor cable whereas the current text only requires that either "the power-supply or Class 1 circuit conductors are in a metal-enclosed cable." This requirement would apply to "functionally associated" circuit wiring as well as those not "functionally associated". No technical substantiation was provided to support this more stringent requirement.

The panel rewrite deletes one option of providing a "solid fixed barrier" to separate power supply conductors from Class 1 circuit conductors not functionally associated with the power supply conductors. No technical substantiation was provided to support elimination of this option nor that a safety problem exists with the use of a solid fixed barrier.

The change to "multiconductor" provided an editorial correction for consistency. Multiconductor is not hyphenated. In the 2005 NEC, the word "multi-conductor" is only used in Articles 690 and 810 and Annex D. The word "multiconductor" is used in 31 Articles, Chapter 9, and Annex B.
Panel Meeting Action: Reject
Panel Statement: The definition of Power and Control Tray Cable (Type TC) is a factory assembly of two or more insulated conductors, with or without associated bare or covered grounding conductors, under a nonmetallic jacket. TC cable has an overall nonmetallic jacket that acts as mechanical protection

and is not relying just on the insulation of the individual conductors as a means of separation from the other circuits.

3-116 Log #920 NEC-P03 **Final Action: Reject**
(725.26(B)(4))

Submitter: Peter D. Noval, Jr., Philadelphia, PA
Comment on Proposal No: 3-162
Recommendation: This proposal should be rejected. Revise proposed text so that 725.26(B)(4) reads as follows:

(4) In Cable Trays. In cable trays, where the Class 1 circuit conductors and power-supply conductors not functionally associated with them are separated by a solid fixed barrier of a material compatible with the cable tray, or where the power-supply or Class 1 circuit conductors are in a metal-enclosed cable. ~~Multi-conductor Type TC, Type AC, Type MC, or Type MI cables shall be permitted to be installed in cable trays without barriers where all conductors in the cables are insulated at 600 volts or greater.~~
Substantiation: There is no technical substantiation provided for lessening the requirements of this section by allowing the installation of Type TC cable in cable trays without barriers between the Class 1 circuit conductors and power supply conductors not functionally associated with them, regardless of the type of insulation utilized.

To further support rejection of this proposal, refer to the following three panel statements, from NFPA 70 - May 2001 ROC and May 2004 ROP, regarding the originating proposal for 725.26(B)(4) and the intent of the panel:

Panel Statement from Comment #16-57 (May 2001 ROC):

"Proposal 16-51a provides for separation of circuits in cable trays in a manner consistent with other wiring methods in Article 725 and provides restrictions beyond those provided in Chapter 3."

Panel Statement from Comment #16-60 (May 2001 ROC):

"The intent of the panel is to require that in cable tray

1) Physical separation other than insulation, or

2) That the power supply circuits be functionally associated with the Class 1 circuits."

Panel Statement from Proposal #3-151 (May 2004 ROP):

"Requiring a barrier or a metal-enclosed cable separates Class 1 power-limited and nonpower-limited circuits from other circuits that are not functionally associated. Normally, low voltage circuits are isolated from power, lighting, and other higher voltage circuits to keep possible short circuits from the higher rated circuits from affecting the power-limited circuits. This separation rule is relaxed somewhat for Class 1 circuits if the same equipment is powered and controlled by conductors run together. In most instances, the disconnecting means for the equipment and the control circuits will be in close proximity to each other so that power can be shut down for the machine: i.e., functionally associated. Permitting both power and Class 1 control in the same cable tray, raceway, or enclosure provides a more efficient use of the wiring method without seriously compromising safety."

Proposal 3-162, as submitted, would permit insulation as the only means for separation where Type TC cable is installed in cable tray, without barriers between Class 1 circuit conductors and non-functionally associated power-supply conductors.

The revised text above, corrects this.
Panel Meeting Action: Reject
Panel Statement: Revising the proposed text is a better answer than total rejection of the proposal. See the panel action on Comment 3-112. Metal-enclosed cable is more correctly addressed as Type AC (armored cable), MC (metal clad) cable, or MI (mineral insulated) cable. See the panel statement on Comment 3-113 regarding the use of Type TC cable.

3-119 Log #1267 NEC-P03 **Final Action: Reject**
(725.26(B)(4) (New))

Submitter: Sanford Egesdal, Egesdal Associates PLC
Comment on Proposal No: 3-160
Recommendation: Reconsider Proposal 3-160 and Accept in Principle using the text shown below:

(4) In Cable Trays. ~~In cable trays, where the~~ Class 1 circuit conductors and power-supply conductors not functionally associated with them shall be ~~are~~ separated by a solid fixed barrier of a material compatible with the cable tray, or where ~~the power-supply or Class 1 circuit conductors are in a metal-enclosed cable.~~ Class 1 circuit conductors or power-supply conductors not functionally associated with them are installed in a metal enclosed cable, the barrier shall not be required.

Substantiation: The intent of this section is the installation of Class 1 conductors and functionally associated power circuits. Where power-supply conductors not associated with the Class 1 conductors are installed in the same cable tray, a physical barrier is required.

Historically, the voltage rating of insulation has not been permitted as a means of separating Class 1 conductors from conductors not functionally associated with the Class 1 conductors.

Class 1 conductors may be Type TFN. Class 1 circuits are permitted to be installed with non-power-limited fire alarm circuits. Permitting Class 1 and fire alarm conductors to be in physical contact with non-associated power-supply conductors may pose a risk to life safety.

The proposed text is an attempt to clarify that a barrier is not necessary if either the Class 1 conductors or non-associated power-supply conductors are in metal enclosed cable.

Panel Meeting Action: Reject
Panel Statement: Metal-enclosed cable is more correctly addressed as Type AC (Armored Cable), MC (Metal Clad cable, or MI (Mineral Insulated) cable. In 725.26(B)(3)(1), the acceptable cable is metal-covered or UF, a thermoplastic jacketed cable without the flame retardance of a TC cable. TFN conductors are not permitted in cable trays, unless within a jacketed or metal sheathed cable. See the panel statement on Comment 3-113.
Number Eligible to Vote: 13

3-120 Log #1806 NEC-P03 **Final Action: Accept in Principle**
(725.26(B)(4))

Submitter: Noel Williams, Herriman, UT
Comment on Proposal No: 3-160
Recommendation: This proposal should remain accepted in principle with an additional wording change as follows:

"In cable trays Class 1 circuit conductors and power-supply conductors within separate multiconductor Type AC, Type MC,...". (remainder as accepted in principle).

Substantiation: In the form that this proposal was accepted, the language literally allows the Class 1 and power-supply conductors in the same multiconductor cable even where they are not functionally associated, and implies that the 600 V insulation within the cable can be used for separation. The lack of functional association was a significant point according to the panel statement. This proposal, as modified by the panel action and this comment, allows the cable sheaths or jackets to serve as the barrier or separation method as supported by the substantiation.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel action on Comment 3-112 addresses the submitter's recommendation.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-121 Log #918 NEC-P03 **Final Action: Reject**
(725.26(B)(4) Exception (New))

Submitter: Peter D. Noval, Jr., Philadelphia, PA
Comment on Proposal No: 3-163
Recommendation: This proposal should be rejected. Delete the added text entirely as follows:

~~725.26(B)(4) Exception: Where all cables in the cable tray have insulation suitable for 600 V listed multiconductor Type AC, TC, MC and MI cables shall be allowed to be installed together without barriers regardless of function.~~

Substantiation: There is no technical substantiation provided for lessening the requirements of this section by allowing the installation of Type TC cable in cable trays without barriers between the Class 1 circuit conductors and power supply conductors not functionally associated with them, regardless of the type of insulation utilized.

To further support rejection of this proposal, refer to the following three panel statements from NFPA 70 - May 2001 ROC and May 2004 ROP, regarding the originating proposal for 725.26(B)(4) and the intent of the Panel:

Panel Statement from Comment #16-57 (May 2001 ROC):

"Proposal 16-51a provides for separation of circuits in cable trays in a manner consistent with other wiring methods in Article 725 and provides restrictions beyond those provided in Chapter 3."

Panel Statement from Comment #16-60 (May 2001 ROC):

"The intent of the panel is to require that in cable tray

1) Physical separation other than insulation, or

2) That the power supply circuits be functionally associated with the Class 1 circuits."

Panel Statement from Proposal #3-151 (May 2004 ROP):

"Requiring a barrier or a metal-enclosed cable separates Class 1 power-limited and nonpower-limited circuits from other circuits that are not functionally associated. Normally, low voltage circuits are isolated from power, lighting, and other higher voltage circuits to keep possible short circuits from the higher rated circuits from affecting the power-limited circuits. This separation rule is relaxec somewhat for Class 1 circuits if the same equipment is powered and controlled by conductors run together. In most instances, the disconnecting means for the equipment and the control circuits will be in close

proximity to each other so that power can be shut down for the machine: i.e., functionally associated. Permitting both power and Class 1 control in the same cable tray, raceway, or enclosure provides a more efficient use of the wiring method without seriously compromising safety."

Proposal 3-163, as submitted, would permit insulation as the only means for separation where Type TC cable is installed in cable tray, without barriers between Class 1 circuit conductors and non-functionally associated power-supply conductors.

The deleted text, above, corrects this.

Panel Meeting Action: Reject

Panel Statement: Revising the proposed text is a better answer than total rejection of the proposal. See the panel action on Comment 3-112. (725.53 (New))

Submitter: Sanford Egesdal, Egesdal Associates PLC

Comment on Proposal No: 3-164

Recommendation: Reconsider Proposal 3-164 and Accept in Principle using the text shown below. The numbering shown corresponds to the "parallel" renumbering in Article 760 for non-power-limited fire alarm cable.

725.53 Multiconductor Class 1 Cables. Multiconductor Class 1 cables that meet the requirements of 725.176 shall be permitted to be used on remote-control, signaling, and power-limited circuits operating at 150 volts or less and shall be installed in accordance with 725.53(A) and 725.53(B).

(A) Class 1 Wiring Method. Multiconductor Class 1 circuit cables shall be installed in accordance with 725.53(A)(1), (A)(2), and (A)(3).

(1) Exposed or Fished in Concealed Spaces. In raceway or exposed on surface of ceiling and sidewalls or fished in concealed spaces. Cable splices or terminations shall be made in listed fittings, boxes, enclosures, fire alarm devices, or utilization equipment. Where installed exposed, cables shall be adequately supported and installed in such a way that maximum protection against physical damage is afforded by building construction such as baseboards, door frames, ledges, and so forth. Where located within 2.1 m (7 ft) of the floor, cables shall be securely fastened in an approved manner at intervals of not more than 450 mm (18 in.).

(2) Passing Through a Floor or Wall. In metal raceway or rigid nonmetallic conduit where passing through a floor or wall to a height of 2.1 m (7 ft) above the floor unless adequate protection can be afforded by building construction such as detailed in 725.53(A)(1) or unless an equivalent solid guard is provided.

(3) In Hoistways. In rigid metal conduit, rigid nonmetallic conduit, intermediate metal conduit, liquidtight flexible nonmetallic conduit, or electrical metallic tubing where installed in hoistways.

Exception: As provided for in 620.21 for elevators and similar equipment.

(B) Applications of Listed Class 1 Cables. The use of Class 1 circuit cables shall comply with 725.53(B)(1) through (B)(2).

(1) Riser. Cables installed in vertical runs and penetrating more than one floor or cables installed in vertical runs in a shaft shall be Type CL1R. Floor penetrations requiring Type CL1R shall contain only cables suitable for riser or plenum use.

Exception No. 1: Type CL1 or other cables that are specified in Chapter 3 encased in metal raceway.

Exception No. 2: Type CL1 cables located in a fireproof shaft having firestops at each floor.

FPN: See 300.21 for firestop requirements for floor penetrations.

Exception No. 3: Type CL1R-CI cable shall be permitted to be installed to provide a 2-hour circuit integrity rated cable.

(2) Other Wiring Within Buildings. Cables installed in building locations other than the locations covered in 725.53(B)(1), (B)(2), and (B)(3) shall be Type CL1.

Exception No. 1: Other wiring methods in compliance with Chapter 3.

Exception No. 2: Type CL1R cables shall be permitted.

Exception No. 3: Type CL1-CI cable shall be permitted to be installed to provide a 2-hour circuit integrity rated cable.

Substantiation: The Panel Statement indicates that a Listed Class 1 cable does not exist. That's true. Until the Panel provides a listing and marking requirement for a Class 1 cable, it will not exist. The proposed Class 1 cable construction and is identical to non-power-limited fire alarm cable. The application of the Class 1 cable would be very similar to non-power-limited fire alarm cable.

The proposed reference in 725.81 does not exist in the 2005 NEC. That's true. Until Panel provides a listing and marking requirement for a Class 1 cable, it will not exist.

There is an industry need for this cable. Hopefully, the Panel will decide to provide a listing and marking, and application.

In lieu of the research report requested by the Panel, this type of cable has been installed for fire alarm installations for decades. From conversations with cable manufacturers, it appears the many 10's of millions of feet of non-power-limited fire alarm cable has been installed since the cable was permitted in Article 760. The application of the proposed Class 1 cable and non-power-limited fire alarm cable is the same for identical devices, but used for different systems. Here are a couple of examples.

Non-power-limited fire alarm cable can be connected to control a 120 VAC motor that operates a smoke damper. A Class 1 circuit to a 120 VAC motor for a temperature control damper would be installed in raceway (typically, Type TFN or Article 3 conductors in EMT.

A similar application occurs for a mag-lock on a door that requires more power or higher voltage than permitted for Class 2, Class 3, or power-limited fire alarm system circuits. For a fire alarm system, the mag-lock can be connected to the fire alarm system with non-power-limited fire alarm cable. If the VAC mag-lock is part of a security system and the door is not an exit door, the connection to the security panel would be Class 1 circuit conductors in conduit.

There is an additional application that would benefit installers. Class 2 and Class 3 circuits can be reclassified as Class 1 circuits. If a Class 1 cable was available, the reclassified circuits could be installed with the Class 1 circuits in a Class 1 cable. This installation method has worked well for fire alarm systems for many years. That is power-limited fire alarm circuits are reclassified as non-power-limited circuits and permitted to be installed in non-power-limited cable (or in conduit) with non-power-limited circuits.

This type of cable has worked well for fire alarm systems, so it is reasonable to extend the same capability to Article 725 systems, such as security, temperature control, and access control.

Non-power-limited cable was introduced in the 1975 edition of the NEC, along with the first appearance Article 760, Fire Alarm Systems. Prior to 1975, the cable was permitted by NFPA 72-1972 in section 2140, Special Cables for Circuits Operating at 150 volts or Less. That's the extent of my library.

Panel Meeting Action: Reject

Panel Statement: Listing for non-power-limited fire alarm cable is based on UL 1425, Cables for Non-Power-Limited Fire Alarm Circuits, and this listing does not cover Class 1 circuits. A manufacturer could submit a request to the UL Standards Technical Panel (STP) for either a change to the UL standard to permit this application or a separate standard to cover Class 1 cables, but at this point there isn't a Class 1 cable or a standard that would specifically permit this application.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-123 Log #332 NEC-P03 **Final Action: Accept**

(725.56(E))

Submitter: Gerald Lee Dorna, Belden

Comment on Proposal No: 3-170

Recommendation: Reconsider and accept Proposal 3-170.

Substantiation: In my proposal under the substantiation I advised the panel that similar proposals were made to Articles 725, 760, 800, 820 and 830. That similar text is already in Article 770. See below the actions taken on all of my proposals.

Proposal Number	Section	Panel Action
3-170	725.56(E)	Reject
3-248	760.56	Accept
16-180	800.133(A)(1)	Accept
16-314	820.133(A)(1)	Accept
16-407	830.133(A)(1)	Accept

Panel 16 accepted all of the similar proposals. Panel 3 accepted one proposal (3-248) while rejecting another (3-170).

There seems to be inconsistency in the panel and should reconsider and accept proposal 3-170. The submitter may have chosen the wrong words "safely installed" when explaining why these cables should also be allowed in cable trays. I should have stated "Jacketed cables of Class 2 or Class 3 circuits shall be permitted in the same enclosure or raceway", then why not be permitted in the same cable tray? My proposal had nothing to do with installation methods.

All of the following types (CL2P, CL2R, CL2, CL3P, CL3R, CL3) are UL Listed suitable for use in cable trays because they all meet the minimum flame test requirements for cable trays which is the Vertical Tray test per UL-1685. If they are permitted in the same enclosure and raceway as those cables specified in (1), (2), (3), (4), and (5), then they should also be permitted in the same cable tray as those cables specified in (1), (2), (3), (4), and (5).

Panel Meeting Action: Accept

Ballot Results: Affirmative: 13

3-124 Log #803 NEC-P03 **Final Action: Accept**
(725.56(E))

Submitter: John Kincaid, Systimax Solutions
Comment on Proposal No: 3-170
Recommendation: Accept this proposal.
Substantiation: Mr. Dorna mentions in his substantiation that he submitted similar proposals for Articles 725, 760, 800, 820, and 830. He mentions that similar text is already in Article 770. The table below shows the actions taken by Panels 3 and 16.

Proposal Number	Section	Panel Action
3-170	725.56(E)	Reject
3-248	760.56	Accept
16-180	800.133(A)(1)	Accept
16-314	820.133(A)(1)	Accept
16-407	830.133(A)(1)	Accept

Panel 16 accepted all the proposals in the series. Panel 3 accepted the proposal for Article 760 while rejecting this proposal.

All the cable Types shown below are listed as suitable for use in cable trays and should be permitted in the same cable tray in a building. Section 725.61 permits many of these cables to substitute for Class 2 and Class 3 cables.
Panel Meeting Action: Accept

3-125 Log #1812 NEC-P03 **Final Action: Accept**
(725.56(E))

Submitter: Michael Walls, American Chemistry Council
Comment on Proposal No: 3-170
Recommendation: Accept this proposal.
Substantiation: In the panel's own words cable trays provide support for jacketed cables. This section covers jacketed cables. If jacketed cables of Class 2 and Class 3 circuits are permitted to be installed together in raceways then why can't they be installed together in cable trays? There is no justification to exclude cable trays from this application. The panel's implication that a cable tray system does not have to meet installation requirements is incorrect. Article 392 provides strict requirements for the installation of cable tray systems so that cables are not damaged during installation the same as the conduit Articles.

(725.61)

Submitter: Harold C. Ohde, IBEW #134
Comment on Proposal No: 3-171
Recommendation: Continue to Reject.
Substantiation: I commend CMP 3 rejecting this proposal. The submitter's recommendation to create a new cable designation (CL250 and CL350) is nothing more than a marketing ploy. A backdoor approach you might say to get NFPA 255 and NFPA 259 cables in the cable hierarchy. The submitter's substantiation would have misled the designer, installer and code officials to believe, install and enforce that limited combustible cable, conduit or a sprinkler system to be installed in the concealed space or plenums would be a requirement because of NFPA 13 Section 8.14.1. The submitter's substantiation references 2002 NFPA 13 Section 8.14.1. It is important to note that the NEC does not have a definition of "concealed spaces" therefore making it impossible to enforce. What does constitute a concealed space? Is it the space above a dropped ceiling; or is it a space above plastered or drywall ceiling? Is it the wall cavity of typical wall construction.

NFPA 13 just completed their revision process for the 2006 NFPA 13 Standard. 8.14.1 of NFPA 13 has been revised to read as follows:

8.14.1.2 Concealed Spaces not Requiring Sprinkler Protection.

8.14.1.2.1* Concealed spaces of noncombustible and limited combustible construction with minimal combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those as a return air for a plenum. (For additional information on combustible loading see A.8.14.1.2.1)

8.14.1.2.2 Concealed spaces of noncombustible and limited combustible construction with limited access and not permitting occupancy or storage of combustible shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.

A.8.14.1.2.1 Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc... can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1) For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined.

In the 2006 NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.

CMP 3 rejected this proposal based on the Standards Council decision D#05-24 to remain "status quo" on issues that pertain to NFPA 90A.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the recommendation, but this action does not indicate the panel's concurrence with the entire substantiation.

Comment on Proposal No: 3-174
Recommendation: Continue to reject.
Substantiation: The submitter's recommendation to add this FPN to this section is in grave error. This FPN would not provide guidance to designers, installers or code officials. This FPN would have misled the designer, installer and code officials to believe, install and enforce that limited combustible cable, conduit or a sprinkler system to be installed in the concealed space or plenums would be a requirement because of NFPA 13 Section 8.14.1. It is important to note that the NEC does not have a definition of "concealed spaces", therefore, making it impossible to enforce. What constitutes a concealed space? Is it the space above a dropped ceiling; or is it a space above plastered or drywall ceiling? Is it the wall cavity of typical wall construction?

NFPA 13 just completed their revision process for the 2006 NFPA 13 Standard. 8.14.1 of NFPA 13 has been revised to read as follows:

8.14.1.2 Concealed Spaces not Requiring Sprinkler Protection.

8.14.1.2.1* Concealed spaces of noncombustible and limited combustible construction with minimal combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those as a return air for a plenum. (For additional information on combustible loading see A.8.14.1.2.1)

8.14.1.2.2 Concealed spaces of noncombustible and limited combustible construction with limited access and not permitting occupancy or storage of combustible shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.

A.8.14.1.2.1 Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc... can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1). For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined.

In the 2006 NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.

I commend CMP 3 rejecting this proposal. CMP 3 rejected this proposal based on the Standards Council decision D#05-24 to remain "status quo" on issues that pertain to NFPA 90A. Standards Council recently issued another decision (D#06-03) which decided that this FPN may be deleted from Sections 770.154, 800.154 and 820.154 (all under CMP 16 purview) and this deletion will not be in conflict with the Standards Council decision (D#05-24). Standards Council recognizes the 2002 edition of the NEC as being status quo. This FPN referencing NFPA 13 was added to the 2005 NEC therefore it can and should be deleted.

(725.61(D)(4))

Submitter: David Shapiro, Safety First Electrical Contracting Consulting & Safety Education
Comment on Proposal No: 3-177
Recommendation: Revise text to read as follows:
"...~~physical~~ damage of the sort that tends to be readily visible...".
Substantiation: NEC users rely on standard dictionary definitions, augmented by the NEC's explicit definitions. The NEC Style Manual saying in "3.2.5.5 Provisions on Protection Against Physical Damage. If protection against physical damage is to be one of the requirements, this can be standardized by the use of this terminology" this does not benefit the ordinary user. This is permissive language; the Style Manual is offering an option, not a requirement. I assumed the term was being used loosely to mean damage from blows, abrasion, pressure, or tension, but assumptions should not be necessary. An ideal I believe we share is to enforce the Code as written, not "You know what we mean." This CMP's statement indicates that they intended the long-term physical effects of chemicals and radiation, such as embrittlement, to be among types of damage excluded. Other CMPs use the term with somewhat different intentions, if one reads the Panel Statements in this ROP. Webster's definition does not clue us to this, nor does Article 100, nor does the beginning of this chapter. I would hope 110.3(A)(2)'s requirement of suitable "mechanical strength and durability" sufficed. If this additional statement is needed because that is too broad, let's say exactly what the CMP statement indicates is meant.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any additional technical substantiation to delete the word "physical" from the text in 725.61(D)(4). The panel reaffirms its panel statement as follows: "Physical" is used throughout the NEC as a descriptive adjective to the noun "damage." While the submitter feels the phrase "physical damage" is superfluous, the word "physical" seems to provide a certain emphasis and a further description where combined into the phrase "physical damage." This phrase tends to draw more attention than just "damage." In addition, physical damage provides a description of thermal and mechanical damage where the damage can be readily identified, such as a raceway that has been physically damaged versus damage from ultraviolet light where the raceway may be more brittle and thus can be easily damaged physically by impact to the raceway. Chemicals or heat can cause unseen damage to electrical components that can eventually lead to physical damage at a later time. This phrase is used in the NEC Style Manual in 3.2.5.5 as an acceptable method to describe physical damage.

3-133 Log #1700 NEC-P03 **Final Action: Reject**
(725.82)

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association

Comment on Proposal No: 3-194

Recommendation: Revise 725.82 as follows:

(G) Class 2 and Class 3 Cable ~~Voltage~~ Ratings. Class 2 cables shall have a voltage rating of not less than 150 volts and a temperature rating of not less than 60°C (140°F). Class 3 cables shall have a voltage rating of not less than 300 volts and a temperature rating of not less than 60°C (140°F).

(L) Marking. Cables shall be marked in accordance with 310.11(A)(2), (A)(3), (A)(4), and (A)(5) and Table 725.82. Voltage ratings shall not be marked on the cables. Temperature ratings greater than 60°C shall be marked on the cable.

FPN. Voltage markings on cables may be misinterpreted to suggest that the cables may be suitable for Class 1 electric light and power applications.

Exception: Voltage markings shall be permitted where the cable has multiple listings and a voltage marking is required for one or more of the listings.

Substantiation: The proposed changes to 725(G) and (L) provide requirements that match present listing requirements, so will not impose a hardship on cable manufacturers.

Article 725 does not have a temperature rating requirement for cable. The temperature rating on cable is important for some installations. The proposed rating of 60°C (140°F) is used by testing laboratories as the required minimum temperature rating, but the temperature rating is not required to be marked on the cable.

Panel Meeting Action: Reject

Panel Statement: This comment does not add anything new except for marking, which is already covered by the product standard UL 13. The last sentence of the substantiation states that the proposed temperature rating is used by testing laboratories as the required minimum temperature rating, but since it is already in UL 13, adding the temperature rating to 725.82 is unnecessary.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 12 Negative: 1

Explanation of Negative:

EGESDAL, S.: The NEC should not depend on Underwriters Laboratories to set the required temperature rating and marking on cable use for systems having requirements in Articles 725 and 760. Without a marking on the cable or a requirement in the NEC indicating that no marking means 60C, the installer may misapply a cable. Misapplication of cable into an environment that is greater than 60C, such as under a roof deck, may have life safety consequences. Additionally, UL is not the only test lab to list cable. The NEC should set the cable temperature marking requirements.

3-134 Log #655 NEC-P03 **Final Action: Reject**
(725.82(A), FPN)

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council

Comment on Proposal No: 3-189

Recommendation: Revise text to read as follows:

725.82 Listing and Marking of Class 2, Class 3, and Type PLTC Cables. Class 2, Class 3, and Type PLTC cables installed as wiring within buildings shall be listed as being resistant to the spread of fire and other criteria in accordance with 725.82(A) through 725.82 (K) and shall be marked in accordance with 725.82(L).

(A) Types CL2P and CL3P. Types CL2P and CL3P plenum cables shall be listed as being suitable for use in ducts, plenums, and other space used for environmental air and shall also be listed as having adequate fire-resistant and low smoke-producing characteristics.

FPN: One method of defining a cable that is low smoke-producing cable and fire-resistant cable is that the cable exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with NFPA 262, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces. ~~is by establishing an acceptable value of the smoke produced when tested in accordance with NFPA 262-1999, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces, to a maximum peak optical density of 0.5 and a maximum average optical density of 0.15. Similarly, one method of defining fire-resistant cables is by establishing a maximum allowable flame travel distance of 1.52 m (5 ft) when tested in accordance with the same test.~~

No change for 725.82 (B) through 725.82 (K).

Substantiation: This comment recommends a slight change in wording for the existing Fine Print Note, by recognizing that listing of plenum cable by NFPA 262 represents listing to both low smoke and low flame spread, and that cables cannot be listed separately to either property. This is basically an editorial change, as a clarification, to the existing Fine Print Note.

The same change is being proposed to the corresponding Fine Print Notes in article 760. The new language is consistent with the language in the corresponding fine print notes in articles 770, 800, 820 and 830, all of which deal with the same type of cables.

The committee rejected the proposal based on, and I quote: "NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"[S]o as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

However, Standards Council has since issued a new decision, NFPA Standards Council Decision 06-19 (SC #06-7-33) dated 28 July 2006. This decision addresses CMP decisions on Fine Print Notes referencing NFPA 13 and it states, in pertinent part, as follows: "if the fine print notes are not a helpful reference to NFPA 13 or engender confusion, the NEC Project should have the ability to delete them and nothing in the Council's status quo directive prohibits this." The decision also states: "It has also been pointed out that deletion of the fine print notes would provide further consistency within the NEC itself since, currently, the fine print notes at issue only appear in some relevant NEC Articles (Articles 770, 800, and 820), but not in others (Articles 725 and 760)."

I believe that this Standards Council decision, indirectly, applies to the Fine Print Note to which this comment refers, for two reasons:

1. As Tom Guida explains in his negative on this item, "With reference to the Panel Statement, this proposal does not change the "status quo" with regard to plenum cables. The proposal is essentially editorial. The proposed revised FPN actually aligns the wording of the FPN with the existing wording in NFPA 90A for cables in ceiling cavity and raised floor plenums." In other words, retention of the Fine Print Note in its existing form engenders confusion because it gives the erroneous impression that plenum cables could be listed separately for flame spread and for smoke, and that is incorrect.

2. This Fine Print Note is identical to the ones in 760.81 (C) and in 760.82 (D), both of which are equally incorrect and potentially misleading. On the other hand the proposed revised text is identical to the Fine Print Notes in articles 770, 800, 820 and 830, which are correct. Thus, revising this Fine Print Note will provide further consistency within the NEC.

Panel Meeting Action: Reject

Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"So as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-135 Log #1569 NEC-P03 **Final Action: Accept (725.82(G))**

Submitter: Harold C. Ohde, IBEW-NECA Technical Institute

Comment on Proposal No: 3-195

Recommendation: Continue to reject.

Substantiation: I commend CMP 3 rejecting this proposal. The submitter's recommendation to create a new cable designation (concealed space cable) is nothing more than a marketing ploy. A backdoor approach you might say to get NFPA 255 and NFPA 259 cables in the cable hierarchy. The submitter's substantiation would have misled the designer, installer and code officials to believe, install and enforce that limited combustible cable, conduit or a sprinkler system to be installed in the concealed space or plenums would be a requirement because of NFPA 13 Section 8.14.1. It is important to note that the NEC does not have a definition of "concealed spaces", therefore, making it impossible to enforce. CMP 3 panel statement also reflects that the definition for "concealed" in Article 100 does not apply to the proposed text. What does constitute a concealed space? Is it the space above a dropped ceiling; or is it a space above plastered or drywall ceiling? Is it the wall cavity of typical wall construction?

NFPA 13 just completed their revision process for the 2006 NFPA 13 Standard. 8.14.1 of NFPA 13 has been revised to read as follows:

8.14.1.2 Concealed Spaces not Requiring Sprinkler Protection.

8.14.1.2.1* Concealed spaces of noncombustible and limited combustible construction with minimal combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those as a return air for a plenum. (For additional information on combustible loading see A.8.14.1.2.1)

8.14.1.2.2 Concealed spaces of noncombustible and limited combustible construction with limited access and not permitting occupancy or storage of combustible shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.

A.8.14.1.2.1 Minor quantities of combustible materials such as but not limited

to: cabling, nonmetallic plumbing piping, non-structural wood, etc...can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1) For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined.

In the 2006 NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.

CMP 3 rejected this proposal based on the Standards Council decision D#05-24 to remain "status quo" on issues that pertain to NFPA 90A.

Panel Meeting Action: Accept

Panel Statement: The panel accepts the recommendation but this action does not indicate the panel's concurrence with the entire substantiation.

Submitter: Harold C. Ohde, IBEW #134

Comment on Proposal No: 3-193

Recommendation: Continue to Reject.

Substantiation: I commend CMP 3 for rejecting this proposal. The submitter's recommendation to create a new cable designation (CL250 and CL350) is nothing more than a marketing ploy. The submitter's recommendation to add these two FPN's to this section is in grave error. FPN No. 1 is a backdoor approach you might say to get NFPA 255 and NFPA 259 cables in the cable hierarchy. The FPN No. 2 would not provide guidance to designers, installers or code officials. This FPN would have misled the designer, installer and code officials to believe, install and enforce that limited combustible, conduit or a sprinkler system to be installed in the concealed space of plenums would be a requirement because of NFPA 13 Section 8.14.1. It is important to note that the NEC does not have a definition of "concealed spaces" therefore making it impossible to enforce. What does constitute a concealed space? Is it the space above a dropped ceiling; or is it a space above plastered or drywall ceiling? Is it the wall cavity of typical wall construction.

NFPA 13 just completed their revision process for the 2006 NFPA 13 Standard. 8.14.1 of NFPA 13 has been revised to read as follows:

8.14.1.2 Concealed Spaces not Requiring Sprinkler Protection.

8.14.1.2.1* Concealed spaces of noncombustible and limited combustible construction with minimal combustible loading having no access shall not require sprinkler protection. Submitter: Allen C. Weidman, The Society of the Plastics Industry, Inc.

Comment on Proposal No: 3-171

Recommendation: Reconsider and accept the proposals. The section numbers (xxx.154 & xxx.179) are from the Panel's renumbering in Proposals 3-138 & 3-211.

Substantiation: The Panel erred in applying the Council's directive on NFPA 90A, related to materials exposed to airflow in an air distribution system. The cables in each of the proposals did not have an "R" or "P" as the last letter in the type designation, so would not be permitted to be installed in a riser or air distribution system (air ducts and plenums). The cables would only be permitted as other wiring within buildings.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Comment 3-138.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-138 Log #1453 NEC-P03 **Final Action: Reject**
(725.154(1))

Submitter: Sanford Egesdal, Egesdal Associates PLC
Comment on Proposal No: 3-171
Recommendation: Reconsider proposal 3-171 and revise 725.61 as shown below. Note that section 725.61 has been renumbered to 725.154 by panel action on proposal 3-138.
(I) Class 2 and Class 3 Fire Hazard (FHC) Cable. Fire hazard (FHC) cable shall be permitted for use in remote-control, signaling, and power-limited systems as other wiring within buildings in accordance with 725.154(E) to provide reduced potential heat release.
Substantiation: As pointed out in my affirmative comment, I agreed with the Panel's suggestion that the proposed text might be more appropriate in another section; and pointed out that application of the Standards Council's decision on NPFA 90A was an error. The proposed marking on the cable did not include a "P" added to CL2 or CL3. Type CL2P or Type CL3P cables are permitted to be installed in plenums.

This comment creates a new section for the fire hazard cable. The new section provides a requirement that clearly identifies that the fire hazard cable is permitted to be installed as "Other Wiring Within Buildings."

To better clarify that the Standards Council's decision on NFPA 90A does not apply and to better clarify where the cable is permitted to be installed, the marking on the cable is changed to Type CL2-FHC and Type CL3-FHC. The "FHC" suffix stands for fire hazard cable. There is a companion comment to revise the marking found in my comment to Proposal 3-193.

Some installations require large amounts of cable. A typical application of a fire hazard cable would be above a suspended ceiling or under a raised floor, neither of which is a plenum. The proposed cable has a very low fuel load, as compared to other types of cable insulation. Some cable constructions use one type of insulation on the conductor and another type for the jacket.

The Type CL2-FHC and CL3-FHC cables suggested for listing and marking in 725.179 (comment to proposal 3-193) has parameters (e.g. 3500 BTU/lb) that are standard in the building industry and useful to system designers and fire protection engineers.

To put cable insulation heat release in perspective, here are relative values:
Fire Hazard Cable insulation: less than 8 MJ/kg (3,500 BTU/lb)
PVC insulation: As high as 25 MJ/kg (11,000 BTU/lb)
Polyolefin insulation: As high as 46 MJ/kg (20,000 BTU/lb)
Panel Meeting Action: Reject
Panel Statement: The cables recommended in this comment and associated proposal are a variation of limited combustible cables. Limited combustible cables are available and are marked Type CL2P and can therefore be installed in any location a riser or general cable can be installed. There is no restriction in the Code preventing the use of this cable and there is no specific requirement for its use. Therefore, there is no reason at this time to add the recommended text to 725.61.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:

EGESDAL, S.: Six manufacturers have a listing for a robust cable that UL has identified as a limited combustible cable. Yet, CMP 3 has denied Articles 725 and Article 760 from including an application, listing, and marking for this robust cable with an Flame Spread Index less than 25, a Smoke Developed Index less than 50, and a Heat of Combustion less than 3500BTU/lb. The only NEC marking for this robust cable is for a combustible plenum cable (e.g. FPLP). A plenum cable, tested to NFPA 262, has a Smoke Developed Index of 500 or greater and an unknown Heat of Combustion.

This comment did not include an application for installation in plenums to comply with the Standards Council's directive on NFPA 90A.

The panel statement on this comment seems out-of-step with the panel statement to comment 3-122, which follows. "Listing for non-power-limited fire alarm cable is based on UL 1425, Cables for Non-Power-Limited Fire Alarm Circuits, and this listing does not cover Class 1 circuits. A manufacturer could submit a request to the UL Standards Technical Panel (STP) for either a change to the UL standard to permit this application or a separate standard to cover Class 1 cables, but at this point there isn't a Class 1 cable or a standard that would specifically permit this application."

It seems that the NEC TCC needs to provide guidance to the Code Making Panels on whether the NEC of UL should take the lead on requirements included or not included in the NEC.

3-139 Log #1258 NEC-P03 **Final Action: Reject**
(725.176 (New))

Submitter: Sanford Egesdal, Egesdal Associates PLC
Comment on Proposal No: 3-186
Recommendation: Reconsider proposal 3-186 and accept in principal as shown below. The suggested numbering matches the "parallel" section number for non-power-limited cable in 760.176, as renumbered by Panel action on proposal 3-211.

725.176 Listing and Marking of Class 1 Cables.
Class 1 cables installed as wiring within buildings shall be listed in accordance with 725.176(A) and 725.176(B) and as being resistant to the spread of fire in accordance with 725.176(C) through 725.176(D), and shall be marked in accordance with 725.176(F).
(A) Class 1 Conductor Materials. Conductors shall be 18 AWG or larger, solid or stranded copper.
(B) Insulated Conductors. Insulated conductors shall be suitable for 600 volts. Insulated conductors 14 AWG and larger shall be one of the types listed in Table 310.13 or one that is identified for this use. Insulated conductors 18 AWG and 16 AWG shall be in accordance with 725.27.
(C) Type CL1R. Type CL1R riser cable shall be listed as being suitable for use in a vertical run in a shaft or from floor to floor and shall also be listed as having fire-resistant characteristics capable of preventing the carrying of fire from floor to floor.
FPN: One method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is that the cables pass ANSI/UL 1666-2002, Test for Flame Propagation Height of Electrical and Optical-Fiber Cables Installed Vertically in Shafts.
(D) Type CL1. Type CL1 able shall be listed as being suitable for general-purpose use, with the exception of risers, ducts, plenums, and other space used for environmental air, and shall also be listed as being resistant to the spread of fire.
FPN No. 1: One method of defining resistant to the spread of fire is that the cables do not spread fire to the top of the tray in the vertical-tray flame test in ANSI/UL 1581-1991, Reference Standard for Electrical Wires, Cables and Flexible Cords.
FPN No. 2: Another method of defining resistant to the spread of fire is for the damage (char length) not to exceed 1.5 m (4 ft 11 in.) when performing the CSA vertical flame test for cables in cable trays, as described in CSA C22.2 No. 0.3-M-1985, Test Methods for Electrical Wires and Cables.
(E) Circuit Integrity (CI) Cable or Electrical Circuit Protective System. Cables used for survivability of critical circuits shall be listed as circuit integrity (CI) cable. Cables specified in 725.176(C), and (D), and used for circuit integrity shall have the additional classification using the suffix ¡°-CI.¡± Cables that are part of a listed electrical circuit protective system shall be considered to meet the requirements of survivability.
FPN No. 1: Fire alarm circuit integrity (CI) cable and electrical circuit protective systems may be used for fire alarm circuits to comply with the survivability requirements of NFPA 72®-2002, National Fire Alarm Code6.9.4.3 and 6.9.4.6, that the circuit maintain its electrical function during fire conditions for a defined period of time.
FPN No. 2: One method of defining circuit integrity (CI) cable is by establishing a minimum 2-hour fire resistance rating for the cable when tested in accordance with UL 2196-1995, Standard for Tests of Fire Resistive Cables.
(F) Class 1 Cable Markings. Multiconductor non–power-limited cables shall be marked in accordance with Table 725.176(F). Class 1 circuit cables shall be permitted to be marked with a maximum usage voltage rating of 150 volts. Cables that are listed for circuit integrity shall be identified with the suffix ¡°CI¡± as defined in 725.176(E).

Table 725.176(F) Class 1 Cable Markings

Cable Marking	Type
CL1R	Class 1 circuit riser cable725.31(E) and (H)
CL1	Class 1 circuit cable 725.31(F) and (H)

Note: Cables identified in 725.176(C) and(D) and meeting the requirements for circuit integrity shall have the additional classification using the suffix ¡°CI¡± (for example, CL1R-CI, and CL1-CI).
FPN: Cable types are listed in descending order of fire resistance rating.
Substantiation: The Panel Statement indicates that a Listed Class 1 cable does not exist. That's true. Until Panel provides a listing and marking requirement for a Class 1 cable, it will not exist. The proposed Class 1 cable construction is identical to non-power-limited fire alarm cable, less a listing and marking for plenum cable.

Non-power-limited fire alarm cable is found in 760.81 in the 2005 NEC.

In lieu of the research report requested by the Panel, this type of cable has been installed for fire alarm installations for decades. From conversations with cable manufacturers, it appears that many 10's of millions of feet of non-power-limited fire alarm cable has been installed. The application of the proposed Class 1 cable and non-power-limited fire alarm cable may be the same for identical devices, but used for different systems.

Non-power-limited cable was introduced in the 1975 edition of the NEC, along with the first appearance Article 760, Fire Alarm Systems. Prior to 1975,

the cable was permitted by NFPA 72-1972 in section 2140, Special Cables for Circuits Operating at 150 volts or Less. That's the extent of my library.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Comment 3-122.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-140 Log #1456 NEC-P03 **Final Action: Reject**
(725.179(G) (New))

Submitter: Sanford Egesdal, Egesdal Associates PLC
Comment on Proposal No: 3-193
Recommendation: Reconsider proposal 3-193 and revise Section 725.82, as shown below. Note that section 725.82 was renumbered to 725.179 by panel action on proposal 3-138.

Sections 725.179(A), through (F) do not change.

Insert new 760.179(G), renumber existing subsections as follows: "G" to "H", "H" to "I"; and "I" to "J", "J" to "K", "K" to "L", and "L" to "M".
(G) Low Fire Hazard (-FHC) Cable. Cables used to reduce potential heat release shall be listed as fire hazard (-FHC) cable and shall have a low potential heat release. Cables specified in 725.154(E)(1), and used to reduce potential heat release shall have an additional classification using the suffix "-FHC".

FPN No. 1: One method of defining a low potential heat release cable is that the cable exhibits a maximum potential heat value of exceeding 8141 kJ/kg (3500 BTU/lb) when tested in accordance with NFPA 259, *Standard Test Method for Potential Heat of Building Materials*, as well as a maximum flame spread index of 25 and a maximum smoke developed index of 50 when tested in accordance with NFPA 255, *Standard Method of Test of Surface Burning Characteristics of Building Materials*.
Substantiation: As pointed out in my negative comment, I stated out that application of the Standards Council's decision on NPFA 90A was an error. The proposed marking on the cable did not include a "P" added to CL2 or CL3. Type CL2P or Type CL3P cables are permitted to be installed in plenums. To better clarify that the Standards Council's decision on NFPA does not apply and to better clarify where the cable is permitted to be installed, the marking on the cable is changed to Type CL2-FHC and Type CL3-FHC. The "FHC" suffix stands for fire hazard cable. There is a companion comment to revise the application of fire hazard cable in my comment to Proposal 3-171.

The proposed cable provides listing parameters useful to system designers and fire protection engineers.

The key parameter in the listing requirements is potential heat release.

To put cable heat release in perspective, here are relative values:

Fire Hazard Cable insulation: less than 8 MJ/kg (3,500 BTU/lb

PVC insulation: As high as 25 MJ/kg (11,000 BTU/lb)

Polyolefin insulation: As high as 46 MJ/kg (20,000 BTU/lb)

Polyolefin insulation is sometimes used as insulation on conductors, and is covered by a PVC jacket. Polyolefin insulation provides better electrical properties (dielectric constant) than PVC insulation.

Additionally, flame spread and smoke developed parameters identify the robustness of the cable.

A flame spread index of 25 is found in a number of NFPA publications, for example:

NFPA 13-2007

8.15.1 Concealed Spaces.

8.15.1.2.10 Concealed spaces where rigid materials are used and the exposed surfaces have a flame spread index of 25 or less, and the materials have been demonstrated not to propagate fire when tested in accordance with NFPA 255, Standard Method of Test of Surface Burning Characteristics of Building Materials, extended for an additional 20 minutes in the form in which they are installed, shall not require sprinkler protection.

NFPA 13 use of "concealed spaces" corresponds to a typical dictionary definition: out of sight, hidden. This definition add "spaces" to "concealed" and represents a different meaning from how the NEC defines "concealed." Where both the NEC and NFPA 13 apply, "concealed" cable can be removed from a "concealed space." After removal of the cable, the "concealed space" would remain.

A smoke developed index of 50 is more rigorous than the typical smoke developed index of 450 for interior finishes. Interior finishes can be considered a "fixed" application: one sheet or one coat. Cable installations are a "variable" application: one cable or hundreds of cables. It seems reasonable to establish a robust requirement, due to the variable application. Electronic equipment is susceptible to damage from smoke and heat, both components of a fire.

There a number of manufacturers with cable listed to the requirements in the proposed FPN, so these requirements are not a financial hardship.
Panel Meeting Action: Reject

EGESDAL, S.: See my negative vote on comment 3-138.

ARTICLE 727 — INSTRUMENTATION TRAY CABLE: TYPE ITC

3-141 Log #1813 NEC-P03 **Final Action: Accept in Principle**
(727.5)

Submitter: Michael Walls, American Chemistry Council
Comment on Proposal No: 3-208
Recommendation: Accept this proposal.
Substantiation: Power Limited Class 1 circuits provide no more of a fire hazard or shock threat than ITC circuits. In fact Power Limited Class 1circuits are less of a hazard. Power Limited Class 1 circuits must be not more than 30 volts and 1000 volt-amperes. ITC circuits can be 150 volts or less and 5 amperes or less. But the NEC allows a Non-power limited Class 1 circuit (up to 600 volts & no power limitation) and a Power Limted Class 1 circuit to be in the raceway or cable tray. The panel needs re-examine the separation of circuits in raceways, enclosures and cable trays.
Panel Meeting Action: Accept in Principle
Revise the recommended text to read:
727.5 Uses Not Permitted. Type ITC cable shall not be installed on circuits operating at more than 150 volts or more than 5 amperes. Installation of Type ITC cable with other cables shall be subject to the stated provisions of the specific articles for the other cables. Where the governing articles do not contain stated provisions for installation with Type ITC cable, the installation of Type ITC cable with the other cables shall not be permitted.

Type ITC cable shall not be installed with power, lighting, Class 1 circuits that are not power limited, or other non–power-limited circuits.
Panel Statement: The panel has reconsidered and accepts the original proposal with the revision to be compatible with the terminology used in 725.21.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

ARTICLE 760 — FIRE ALARM SYSTEMS

3-142 Log #2221 NEC-P03 **Final Action: Reject**
(760.2)

Submitter: James S. Conrad, Tyco Thermal Controls
Comment on Proposal No: 3-214
Recommendation: Reconsider this proposal as an Accept in Principle and move to 760.61(C)(2) to read as follows:

FPN: See UL Guide info on FHIT systems for CI cable installed in conduit.
Substantiation: The proposed FPN will alert AHJ, installers and system designers that there are specific installation requirements when installing CI cable in a raceway.
Panel Meeting Action: Reject
Panel Statement: Section 110.3(B) already requires listed and labeled equipment to be installed and used in accordance with listing and labeling instructions.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-143 Log #1224 NEC-P03 **Final Action: Accept**
(760.3(A))

Submitter: John Burke, Fusion Cable Systems
Comment on Proposal No: 3-216
Recommendation: Continue to Reject this Proposal.
Substantiation: We remove old and unused cable as part of our standard business practice especially in retrofit jobs. The amount of old cable on some jobs has caused damage to the building and created unsafe working conditions for our techs. We support continuing the abandoned cable removal requirement in the Code.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-144 Log #1808 NEC-P03 **Final Action: Reject**
(760.3(B) Exception)

Submitter: Noel Williams, Herriman, UT
Comment on Proposal No: 3-220
Recommendation: This proposal should have been accepted or alternatively, accepted in principal as suggested in the Explanation of Negative by Mr. Ayer.
Substantiation: The panel statement is incorrect. The exception does not refer to any section that covers power-limited cables and does not modify any section that covers non-power-limited cables. Power-limited plenum FA cables are not for installation in ducts and plenums. As noted in 300.22 and in other articles that cover power-limited circuits, so-called "plenum" cables are for use

in other spaces for environmental air. The Exception in question confuses that issue. Nothing in 760.61 contradicts this because the exception does not refer to 760.61 it only refers to 760.30 which in turn covers only non-power limited cables. So compliance with 300.22 is still required under 760.61 and therefore, 760.61 must be interpreted to permit plenum cables only in other spaces for environmental air. (About the only use that would be permitted in a duct or plenum to comply with 300.22(B) would be a line-type fire detector that has to go in the duct for its function, or perhaps some unusual type of detector that is installed in the duct rather than being outside the duct with a sampling tube inserted in the duct.) Furthermore, the Exception to 760.3(B) does not provide any exception to 300.22 as it purports to do because 730.30(B)(1) and (B)(2) also require compliance with 300.22(C) (other spaces for environmental air). The deletion of this exception will not change anything except to remove a reference that apparently, according to the panel statement, is confusing even to the panel.

Panel Meeting Action: Reject

Panel Statement: Section 300.22(B) does not permit nonmetallic wiring in ducts and plenums. Section 760.30(B)(1) and (2) state that NPLFP is not permitted in the plenum or duct, and 760.61(A) says that FPLP is permitted in plenum or duct. Chapter 7 modifies Chapter 3, so the exception is needed.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-145 Log #486 NEC-P03 **Final Action: Accept in Part (760.8)**

Submitter: Timothy P. McNeive, Thomas & Betts Corporation

Comment on Proposal No: 3-225

Recommendation: Change the panel action to Accept in Principle. Add the additional text suggest in the comment on negative vote by Mr. Easter:

"Cable ties that provide primary support for such cables shall have a minimum loop tensile strength of 23 kg (50 lbs)."

Substantiation: "Minimum loop tensile" strength is commonly marked on packages of cable ties. The 23 kg minimum for cable support is well representative of typical straps, hangers and staples listed for flexible conduit and cable support in accordance with UL 2239, Hardware for Support of Conduit, Tubing and Cable. The panel is also asked to follow the long time position of CMP-7 and not consider in its final decision the requirement that cable ties or other support hardware to be listed.

Panel Meeting Action: Accept in Part

The panel accepts adding cable ties as a permitted method to support fire alarm cables. The panel rejects the recommendation to add the sentence requiring cable ties to have a minimum tensile strength.

Panel Statement: Cable ties can be used for securing and supporting cables in a number of Chapter 3 wiring methods without any requirements for a minimum loop tensile strength.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 12 Negative: 1

Explanation of Negative:

EASTER, L.: See NEMA recommendation and my explanation of negative vote on Comment 3-102.

3-146 Log #1809 NEC-P03 **Final Action: Accept (760.8)**

Submitter: Noel Williams, Herriman, UT

Comment on Proposal No: 3-225

Recommendation: This proposal should have been accepted.

Substantiation: The panel statement is unresponsive to the proposal, and considering the other support methods listed, borders on nonsense. If "it is not acceptable to use a cable tie" because "there is no spacing requirement provided for distance between supports," then none of the other methods (straps, staples, hangers, or similar fittings) should be acceptable either. As noted in the proposal, cable ties are already recognized for numerous other wiring methods that are much heavier than the cables covered by Article 760 and cable ties have been accepted as support methods by Panels 7, 12, and 16, so the rejection of this proposal is highly inconsistent and unjustified. As noted in the Explanations of Negative, cable ties are already permitted in many places under the language "or similar fittings," but consistency in the code is highly desirable and directly addresses the ongoing issue of usability.

Panel Meeting Action: Accept

Number Eligible to Vote: 13

Ballot Results: Affirmative: 12 Negative: 1

Explanation of Negative:

EGESDAL, S.: This comment should have been rejected, based on the Standards Council's decision on NFPA 90A. UL lists cable ties for installation in HVAC system plenums. Rejecting this comment would be consistent with the action taken by Panel 3 on comments 3-134, 3-164, and 3-176, which suggested a trivial editorial change to NFPA 262 listing requirements. The Panel used the NFPA 90A directive to reject these 3 comments.

Additionally, the submitters of comments did not provide technical substantiation to respond to the panel statement on proposal 3-155, as follows. "It is not acceptable to use a cable tie to serve as a sole support for a cable when there is no spacing requirement provided for the distance between supports." Further, the proposals, comments, and panel statements provide no technical substantiation for panel action that would require all hardware used to support these cables to be listed. Code-making panels 7 and 8 have steadily rejected similar proposals relating to the support of cables and raceways.

Comment on Affirmative:

AYER, L.: See my Explanation of Affirmative Vote on Comment 3-101.

3-147 Log #899 NEC-P03 **Final Action: Accept (760.8, FPN)**

Submitter: John P. Masarick, Independent Electrical Contractors Inc.

Comment on Proposal No: 3-228

Recommendation: The Panel is encouraged to accept Proposal 3-228.

Substantiation: 1. The trend by the CMPs over the last several code cycles has been to limit the use of FPNs.

2. There is also a correlation issue. There is a conflict between those panels that accepted the proposal and those that rejected the proposal.

3. These standards are also covered by a fine print note in 110.12.

4. The FPN should not be accepted because numerous standards and installation manuals exist and to only mention one does not adequately inform the public about accepted industry practices. The NEC is not intended to be an instruction manual for untrained persons. If the FPNs are allowed to reference these standards, then they should list all applicable standards.

5. Since the referenced installation standards are intentionally general to cover different models of equipment, approval of the FPN may lead many to believe these standards can be used instead of listed or labeled manufacturer's instructions which would be in violation of 110.3(B).

6. If the CMP would like to include the reference, it should be placed in the Annex with the other references.

Panel Meeting Action: Accept

Panel Statement:

Number Eligible to Vote: 13

Ballot Results: Affirmative: 12 Negative: 1

Explanation of Negative:

EGESDAL, S.: This comment should be rejected. A few code cycles ago, the FPN to this section referenced 3 documents that were not directly related to fire alarm systems. At that time, CMP 16 had jurisdiction over Article 760. Panel 16 declined to remove the 3 documents until a standard on fire alarm system job practices (not NFPA requirements) was available. The NECA/ANSI standard provides information on execution of work that, while generic, is specific to fire alarm systems. The standard has gone through the ANSI process, so has had wide fire alarm industry review.

3-148 Log #1708 NEC-P03 **Final Action: Reject (760.9)**

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association

Comment on Proposal No: 3-231

Recommendation: The proposal should be Accept in Principle. Revise wording as follows:

760.9. Fire Alarm Circuit and Equipment Grounding. Fire alarm circuits and equipment shall be grounded in accordance with Part II and Part VIII of Article 250.

Substantiation: While the present text is a violation of the NEC Style Manual, it seems reasonable to provide NEC users a clue that grounding rules may or may not apply to Article 760 circuits. Deletion of 760.9 creates a conflict with Table 250.3, which points to 760.9.

Panel Meeting Action: Reject

Panel Statement: Section 250.112(I) already states that fire alarm circuits must comply with Parts II and VIII of Article 250 where the fire alarm systems are required to be grounded, so this text is not necessary in Article 760.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 12 Negative: 1

Explanation of Negative:

EGESDAL, S.: Fire alarm system installers understand that fire alarm circuits are not grounded. However, it is important to highlight grounding in Article 760 to assure the fire alarm panel is grounded in compliance with Article 250. The main panel reason for deleting the reference to Article 250 is to comply with the NEC Style Manual. The proposed change to this NEC Section provided a reference to Parts of Article 250 in compliance with the NEC Style Manual.

3-149 Log #1710 NEC-P03 **Final Action: Accept**
(760.10)

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association
Comment on Proposal No: 3-234
Recommendation: Accept the Proposal in Principle and modify 760.10.
760.10 Fire Alarm Circuit Identification. Fire alarm circuits shall be identified at terminal and junction locations in a manner that will help to prevent unintentional ~~interference with the signaling~~ signals on fire alarm system circuits during testing and servicing of other systems.
Substantiation: The Section provides requirements to aid service personnel that are working on systems other than the fire alarm system. Article 760 permits conductors and cables of other systems to be installed with fire alarm conductors and cables. Additionally, the circuit identification is an aid to fire alarm system personnel for effective testing, servicing, or troubleshooting the fire alarm system.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-150 Log #1942 NEC-P03 **Final Action: Reject**
(760.10)

Submitter: Barry F. O'Connell, Tyco Thermal Controls
Comment on Proposal No: 3-232
Recommendation: I urge the Panel to reconsider this Proposal. I agree that a prime purpose of marking at terminals and junction locations is to ensure maintenance personnel do not inadvertently cause problems with the fire alarm; however, this proposal also sought to address another issue: facilitating identification and inspection of the circuits throughout the run to ensure these fire-rated circuits are supported at the correct minimum intervals described in their Electrical Circuit Protective listing, instead of the standard 10 ft spacings.
Substantiation: None given.
Panel Meeting Action: Reject
Panel Statement: This section deals with fire alarm circuit identification, not identification of fire alarm raceways, so the suggested additional sentence would not be appropriate for this section. Requiring a raceway to be identified by painting or some other means is not going to ensure the proper installation, raceway support, or inspection of the system.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-151 Log #1713 NEC-P03 **Final Action: Reject**
(760.15)

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association
Comment on Proposal No: 3-237
Recommendation: The Proposal should be Accept in Principle. Revise wording as follows:
760.15. Fire Alarm Circuit Requirements. Fire alarm circuits and equipment shall comply with 760.15(A) and 760.15(B).
(A) Non-Power-Limited Fire Alarm (NPLFA) Circuits. See Parts I and II.
(B) Power-Limited Fire Alarm (FPLA) Circuits. See Parts I and III.
FPN to (A) and (B): See NFPA 72, National Fire Alarm Code, for "monitoring for integrity" functionality for Class A and Class B fire alarm circuits and separation of outbound and return Class A circuit conductors.
Substantiation: Class A fire alarm circuits have physical separation installation requirements. Unless the system designer and installer is alerted, the outbound and return fire alarm circuit conductors may be installed in the same cable or raceway, thereby defeating the purpose of requiring a Class A circuit.
NFPA 72, National Fire Alarm Code, is not directly adopted in many jurisdictions. It is imperative that the NEC "assist" the fire alarm industry by providing guidance on key fire alarm system functionality.
Panel Meeting Action: Reject
Panel Statement: Section 760.1 already has a fine print note that refers the reader to NFPA 72 for further information on the installation and monitoring for integrity requirements in fire alarm systems. Adding a non-mandatory fine print note in this section will not provide enough information to someone doing a fire alarm installation in a jurisdiction that does not adopt the National Fire Alarm Code (NFPA 72). Class A and Class B circuits are not defined in the NEC.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
EGESDAL, S.: NFPA 72, National Fire Alarm Code, has many installation requirements for the installation fire alarm equipment and wiring. The request for a Fine Print Note on Class A and B fire alarm circuits is in response to incorrect installation occurring. The number of fire alarm devices connected to a fire alarm circuit is usually greater than the number connected to a Class B circuit. It is important that installers understand there is a life safety need for physical separation of the outbound and return Class A circuit, so in the event of a break in the circuit, all devices remain connected to the fire alarm panel.

3-152 Log #2167 NEC-P03 **Final Action: Accept in Principle**
(760.16)

Submitter: Ray R. Keden, Erico, Inc. / Rep. BICSI
Comment on Proposal No: 3-238
Recommendation: Accept this Proposal.
Substantiation: The title of Section 725.3 is "Other Articles". The requirement for the removal of abandoned cables is not in another article; it is in Article 725. It is out of place in section 725.3. This proposal will move it to a new section of Article 725.
The current placement of the requirement for the removal of abandoned cables in sections 640.3, 725.3, 760.3, 770.3, 800.3, and 820.3 is an error. The error was made by Panel 16 in processing the 2002 NEC. Panel 16 recognized these errors and corrected them by accepting the movement of these requirements in its actions on Proposals 16-31, 128, 254, 259, and 361.
Moving the removal requirements to sections 725.25 and 760.25 will create parallelism between Articles 725, 760, 770, 800, 820, and 830.
Panel Meeting Action: Accept in Principle
Accept in Principle
Panel Statement: See the panel action and panel statement in Comment 3-111.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-153 Log #1810 NEC-P03 **Final Action: Reject**
(760.25)

Submitter: Noel Williams, Herriman, UT
Comment on Proposal No: 3-240
Recommendation: This proposal should have been accepted in principle with the following change: Change the added reference to 300.7(A).
Substantiation: The substantiation dealt only with issues of condensation, so the only part of 300.7 that is applicable is the sealing requirement of 300.7(A). The substantiation did not address the issues covered in 300.7(B).
Panel Meeting Action: Reject
Panel Statement: Although the substantiation for the proposal dealt only with the condensation issue, if a conduit is exposed to temperature changes that are extreme enough to cause condensation, the expansion and contraction issue needs to be addressed at the same time.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-154 Log #1599 NEC-P03 **Final Action: Accept**
(760.30(B)(2), FPN)

Submitter: Harold C. Ohde, IBEW-NECA Technical Institute
Comment on Proposal No: 3-243
Recommendation: Continue to reject.
Substantiation: The submitter's recommendation to add this FPN to this section is in grave error. This FPN would not provide guidance to designers, installers or code officials. This FPN would have misled the designer, installer and code officials to believe, install and enforce that limited combustible cable, conduit or a sprinkler system to be installed in the concealed space or plenums would be a requirement because of NFPA 13 Section 8.14.1. It is important to note that the NEC does not have a definition of "concealed spaces", therefore, making it impossible to enforce. What constitutes a concealed space? Is it the space above a dropped ceiling; or is it a space above plastered or drywall ceiling? Is it the wall cavity of typical wall construction?
NFPA 13 just completed their revision process for the 2006 NFPA 13 Standard. 8.14.1 of NFPA 13 has been revised to read as follows:
8.14.1.2 Concealed Spaces not Requiring Sprinkler Protection.
8.14.1.2.1* Concealed spaces of noncombustible and limited combustible construction with minimal combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those as a return air for a plenum. (For additional information on combustible loading see A.8.14.1.2.1)
8.14.1.2.2 Concealed spaces of noncombustible and limited combustible construction with limited access and not permitting occupancy or storage of combustible shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.
A.8.14.1.2.1 Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc... can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1). For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined.

In the 2006 NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.

I commend CMP 3 rejecting this proposal. CMP 3 rejected this proposal based on the Standards Council decision D#05-24 to remain "status quo" on issues that pertain to NFPA 90A. Standards Council recently issued another decision (D#06-03) which decided that this FPN may be deleted from Sections 770.154, 800.154 and 820.154 (all under CMP 16 purview) and this deletion will not be in conflict with the Standards Council decision (D#05-24). Standards Council recognizes the 2002 edition of the NEC as being status quo. This FPN referencing NFPA 13 was added to the 2005 NEC therefore it can and should be deleted.

Panel Meeting Action: Accept

Panel Statement: The panel accepts the recommendation, but this action does not indicate the panel's concurrence with the entire substantiation.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-155 Log #1600 NEC-P03 **Final Action: Accept (760.30(B)(4), FPN)**

3-156 Log #1703 NEC-P03 **Final Action: Reject (760.32(B)(2), 760.32(B)(3), 760.32(B)(4), 760.61(A), 760.61(B)(1), 760.61(C))**

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association

Comment on Proposal No: 3-230

Recommendation: The proposal should be accepted in principal. Add new text in six places.

Add the following fine print note to Exception No. 3 of three Sections: 760.32(B)(2), 760.32(B)(3) and 760.32(B)(4)

FPN to Exception No. 3: It is critical for circuit integrity cable functionality to observe manufacturer's instructions that may require or prohibit installing cable in raceway.

Add a fine print note to 760.61(A).

FPN: It is critical for circuit integrity cable functionality to observe manufacturer's instructions that may require or prohibit installing cable in raceway.

Add a fine print note to immediately following 760.61(B)(1)

FPN to 760.61(B)(1): It is critical for circuit integrity cable functionality to observe manufacturer's instructions that may require or prohibit installing cable in raceway.

Add a fine print note to 760.61(C)

FPN: It is critical for circuit integrity cable functionality to observe manufacturer's instructions that may require or prohibit installing cable in raceway.

Substantiation: Circuit integrity cable is listed for installation exposed, installed in metal raceway, or either installation method. Fire alarm circuit integrity cables provide for survivability of notification circuits during a fire emergency. It is critical that circuit integrity cable be installed according to its listing and manufacturer's installation instructions.

Panel Meeting Action: Reject

Panel Statement: Section 110.3(B) already requires listed and labeled equipment to be installed and used in accordance with listing and labeling instructions.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 12 Negative: 1

Explanation of Negative:

EGESDAL, S.: It is important for system designers, installers, and AHJ's to understand that there are special installation requirements for circuit integrity cable (e.g., Type FPLR-CI), which is installed for survivability of certain fire alarm circuits. The panel statement neglects to mention the information shared by presenters at the ROC meeting. Performance of circuit integrity cable when exposed to fire is dependent on correct installation. That is, the cable may or may not be permitted to be installed in metal raceway. Additionally, the manufacturer's instructions are not shipped with the cable, so installers are not given a "heads-up" as to specific installation requirements.

3-157 Log #1702 NEC-P03 **Final Action: Reject (760.32(B)(2), 760.32(B)(3), 760.32(B)(4), 760.61(A), 760.61(B)(1), and 760.61(C))**

Comment on Proposal No: 3-253
Recommendation: Continue to reject.
Substantiation: The submitter's recommendation to add this FPN to this section is in grave error. This FPN would not provide guidance to designers, installers or code officials. This FPN would have misled the designer, installer and code officials to believe, install and enforce that limited combustible cable, conduit or a sprinkler system to be installed in the concealed space or plenums would be a requirement because of NFPA 13 Section 8.14.1. It is important to note that the NEC does not have a definition of "concealed spaces", therefore, making it impossible to enforce. What constitutes a concealed space? Is it the space above a dropped ceiling; or is it a space above plastered or drywall ceiling? Is it the wall cavity of typical wall construction?
NFPA 13 just completed their revision process for the 2006 NFPA 13 Standard. 8.14.1 of NFPA 13 has been revised to read as follows:
8.14.1.2 Concealed Spaces not Requiring Sprinkler Protection.
8.14.1.2.1* Concealed spaces of noncombustible and limited combustible construction with minimal combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those as a return air for a plenum. (For additional information on combustible loading see A.8.14.1.2.1)
8.14.1.2.2 Concealed spaces of noncombustible and limited combustible construction with limited access and not permitting occupancy or storage of combustible shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.
A.8.14.1.2.1 Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc... can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1). For example, it is not the intent of this section to require sprinklers, which would

not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined.

In the 2006 NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.

I commend CMP 3 rejecting this proposal. CMP 3 rejected this proposal based on the Standards Council decision D#05-24 to remain "status quo" on issues that pertain to NFPA 90A. Standards Council recently issued another decision (D#06-03) which decided that this FPN may be deleted from Sections 770.154, 800.154 and 820.154 (all under CMP 16 purview) and this deletion will not be in conflict with the Standards Council decision (D#05-24). Standards Council recognizes the 2002 edition of the NEC as being status quo. This FPN referencing NFPA 13 was added to the 2005 NEC therefore it can and should be deleted.

Panel Meeting Action: Accept

Comment on Proposal No: 3-255

Recommendation: Continue to Reject.

Substantiation: I commend CMP 3 for rejecting this proposal. The submitter's recommendation to create a new cable designation (FPL50) is nothing more than a marketing ploy. A backdoor approach you might say to get NFPA 255 and NFPA 259 cables in the cable hierarchy. The submitter's recommendation to add this FPN to this section is in grave error. This FPN would not provide to designers, installers or code officials. This FPN would have misled the designer, installer and code officials to believe, install and enforce that limited combustible, conduit or a sprinkler system to be installed in the concealed space or plenums would be a requirements because of NFPA 13 Section 8.14.1. It is important to note that the NEC does not have a definition of "concealed spaces" therefore making it impossible to enforce. What does constitute a concealed space? Is it the space above a dropped ceiling; or is it a space above plastered or drywall ceiling? Is it the wall cavity of typical wall construction.

NFPA 13 just completed their revision process for the 2006 NFPA 13 Standard. 8.14.1 of NFPA 13 has been revised to read as follows:

8.14.1.2 Concealed Spaces not Requiring Sprinkler Protection.

8.14.1.2.1* Concealed spaces of noncombustible and limited combustible construction with minimal combustible loading having no access shall not requ ire sprinkler protection. The space shall be considered a concealed space even with small openings such as those as a return air for a plenum. (For additional information on combustible loading see A.8.14.1.2.1)

8.14.1.2.2 Concealed spaces of noncombustible and limited combustible construction with limited access and not permitting occupancy or storage of combustible shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.

A.8.14.1.2.1 Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc... can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1) For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined.

In the 2006 NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.

CMP 3 rejected this proposal based on the Standards Council decision D#05-24 to remain "status quo" on issues that pertain to NFPA 90A.

(760.81(C), FPN)

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council

Comment on Proposal No: 3-259

Recommendation: Revise text to read as follows:

760.81 Listing and Marking of NPLFA Cables. Non–power-limited fire alarm cables installed as wiring within buildings shall be listed in accordance with 760.81(A) and 760.81(B) and as being resistant to the spread of fire in accordance with 760.81(C) through 760.81(F), and shall be marked in accordance with 760.81(G).

(A) NPLFA Conductor Materials. Conductors shall be 18 AWG or larger solid or stranded copper.

(B) Insulated Conductors. Insulated conductors shall be suitable for 600 volts. Insulated conductors 14 AWG and larger shall be one of the types listed in Table 310.13 or one that is identified for this use. Insulated conductors 18 AWG and 16 AWG shall be in accordance with 760.27.

(C) Type NPLFP. Type NPLFP non–power-limited fire alarm cable for use in other space used for environmental air shall be listed as being suitable for use in other space used for environmental air as described in 300.22(C) and shall also be listed as having adequate fire-resistant and low smoke-producing characteristics.

FPN: One method of defining a cable that is low smoke-producing cable and fire-resistant cable is that the cable exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with NFPA 262, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces. ~~is by establishing an acceptable value of the smoke produced when tested in accordance with NFPA 262-1999, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces, to a maximum peak optical density of 0.5 and a maximum average optical density of 0.15. Similarly, one method of defining fire-resistant cables is by establishing a maximum allowable flame travel distance of 1.52 m (5 ft) when tested in accordance with the same test.~~

No change for 760.81 (D) through 760.81 (G).

Substantiation: This comment recommends a slight change in wording for the existing Fine Print Note, by recognizing that listing of plenum cable by NFPA 262 represents listing to both low smoke and low flame spread, and that cables cannot be listed separately to either property. This is basically an editorial change, as a clarification, to the existing Fine Print Note.

The same change is being proposed to the corresponding Fine Print Notes in article 725 and the other Fine Print Note in article 760. The new language is consistent with the language in the corresponding fine print notes in articles 770, 800, 820 and 830, all of which deal with the same type of cables.

The committee rejected the proposal based on, and I quote: "NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"[S]o as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

However, Standards Council has since issued a new decision, NFPA Standards Council Decision 06-19 (SC #06-7-33) dated 28 July 2006. This decision addresses CMP decisions on Fine Print Notes referencing NFPA 13 and it states, in pertinent part, as follows: "if the fine print notes are not a helpful reference to NFPA 13 or engender confusion, the NEC Project should have the ability to delete them and nothing in the Council's status quo directive prohibits this." The decision also states: "It has also been pointed out that deletion of the fine print notes would provide further consistency within the NEC itself since, currently, the fine print notes at issue only appear in some relevant NEC Articles (Articles 770, 800, and 820), but not in others (Articles 725 and 760)."

I believe that this Standards Council decision, indirectly, applies to the Fine Print Note to which this comment refers, for two reasons:

1. As Tom Guida explains in his negative on this item, "With reference to the Panel Statement, this proposal does not change the "status quo" with regard to plenum cables. The proposal is essentially editorial. The proposed revised FPN actually aligns the wording of the FPN with the existing wording in NFPA 90A for cables in ceiling cavity and raised floor plenums." In other words, retention of the Fine Print Note in its existing form engenders confusion because it gives the erroneous impression that plenum cables could be listed separately for flame spread and for smoke, and that is incorrect.

2. This Fine Print Note is identical to the ones in 725.82 (A) and in 760.82 (D), both of which are equally incorrect and potentially misleading. On the other hand the proposed revised text is identical to the Fine Print Notes in articles 770, 800, 820 and 830, which are correct. Thus, revising this Fine Print Note will provide further consistency within the NEC.

Panel Meeting Action: Reject
Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"So as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

Submitter: James S. Conrad, Tyco Thermal Controls
Comment on Proposal No: 3-230
Recommendation: Reconsider this Proposal as Accept in Principle and move to 760.81(F) FPN No. 3 and 760.82(G) FPN No. 3 to read as follows:

FPN No. 3: UL Guide information for electrical circuit protective systems (FHIT) contains information on proper installations requirements to maintain the fire rating.
Substantiation: The proposed FPN will alert AHJs, installers and system designers that there are specific installation requirements to maintain the fire rating of an electrical circuit protective system.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Comment 3-156.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-166 Log #1715 NEC-P03 **Final Action: Reject**
(760.82)

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association
Comment on Proposal No: 3-263
Recommendation: Revise 760.82 as follows:

(C) Ratings. The cables shall have a voltage rating of not less than 300 volts and a temperature rating of not less than 60°C (140°F).

(I) Cable Marking. The cable shall be marked in accordance with Table 760.82(I). The voltage ratings shall not be marked on the cable. Temperature ratings greater than 60°C shall be marked on the cable. Cables that are listed for circuit integrity shall be identified with the suffix CI as defined in 760.82(G).

FPN. Voltage markings on cables may be misinterpreted to suggest that the cables may be suitable for Class 1, electric light, and power applications.
Exception: Voltage markings shall be permitted where the cable has multiple listings and a voltage marking is required for one or more of the listings.
Substantiation: The proposed changes to 760(C) and (I) provide requirements that match present listing requirements, so will not impose a hardship on cable manufacturers.
Article 760 does not have a temperature rating requirement for cable. The temperature rating on cable is important for some installations. The proposed rating of 60°C (140°F) is used by testing laboratories as the required minimum temperature rating, but the temperature rating is not required to be marked on the cable.
Panel Meeting Action: Reject
Panel Statement: This comment does not add anything new except for marking, which is already covered by the UL product standard. The last sentence of the substantiation states that the proposed temperature rating is used by testing laboratories as the required minimum temperature rating, but since it is already in the standard, adding the temperature rating to 760.82 is unnecessary.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:

EGESDAL, S.: The NEC should not depend on Underwriters Laboratories to set the required temperature rating and marking on cable use for systems having requirements in Articles 725 and 760. Without a marking on the cable or a requirement in the NEC indicating that no marking means 60C, the installer may misapply a cable. Misapplication of cable into an environment that is greater than 60C, such as under a roof deck, may have life safety consequences. Additionally, UL is not the only test lab to list cable. The NEC should set the cable temperature marking requirements.

3-167 Log #657 NEC-P03 **Final Action: Reject**
(760.82(D), FPN)

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Comment on Proposal No: 3-265
Recommendation: Revise as follows:
760.82 Listing and Marking of PLFA Cables and Insulated Continuous Line-Type Fire Detectors.
Type FPL cables installed as wiring within buildings shall be listed as being resistant to the spread of fire and other criteria in accordance with 760.82(A) through 760.82(H) and shall be marked in accordance with 760.82(I). Insulated continuous line-type fire detectors shall be listed in accordance with 760.82(J).
(A) Conductor Materials. Conductors shall be solid or stranded copper.
(B) Conductor Size. The size of conductors in a multiconductor cable shall not be smaller than 26 AWG. Single conductors shall not be smaller than 18 AWG.
(C) Ratings. The cable shall have a voltage rating of not less than 300 volts.
(D) Type FPLP. Type FPLP power-limited fire alarm plenum cable shall be listed as being suitable for use in ducts, plenums, and other space used for environmental air and shall also be listed as having adequate fire-resistant and low smoke-producing characteristics.

FPN: One method of defining a cable that is low smoke-producing cable and fire-resistant cable is that the cable exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with NFPA 262, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces. ~~is by establishing an acceptable value of the smoke produced when tested in accordance with NFPA 262-1999, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces, to a maximum peak optical density of 0.5 and a maximum average optical density of 0.15. Similarly, one method of defining fire-resistant cables is by establishing a maximum allowable flame travel distance of 1.52 m (5 ft) when tested in accordance with the same test.~~
No change for 760.82 (E) through 760.82 (J).
Substantiation: This comment recommends a slight change in wording for the existing Fine Print Note, by recognizing that listing of plenum cable by NFPA 262 represents listing to both low smoke and low flame spread, and that cables cannot be listed separately to either property. This is basically an editorial change, as a clarification, to the existing Fine Print Note.

The same change is being proposed to the corresponding Fine Print Notes in article 725 and the other Fine Print Note in article 760. The new language is consistent with the language in the corresponding fine print notes in articles 770, 800, 820 and 830, all of which deal with the same type of cables.

The committee rejected the proposal based on, and I quote: "NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:
"[S]o as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

However, Standards Council has since issued a new decision, NFPA Standards Council Decision 06-19 (SC #06-7-33) dated 28 July 2006. This decision addresses CMP decisions on Fine Print Notes referencing NFPA 13 and it states, in pertinent part, as follows: "if the fine print notes are not a helpful reference to NFPA 13 or engender confusion, the NEC Project should have the ability to delete them and nothing in the Council's status quo directive prohibits this." The decision also states: "It has also been pointed out that deletion of the fine print notes would provide further consistency within the NEC itself since, currently, the fine print notes at issue only appear in some relevant NEC Articles (Articles 770, 800, and 820), but not in others (Articles 725 and 760)."

I believe that this Standards Council decision, indirectly, applies to the Fine Print Note to which this comment refers, for two reasons:

1. As Tom Guida explains in his negative on the companion proposal to this item, "With reference to the Panel Statement, this proposal does not change the "status quo" with regard to plenum cables. The proposal is essentially editorial. The proposed revised FPN actually aligns the wording of the FPN with the existing wording in NFPA 90A for cables in ceiling cavity and raised floor plenums." In other words, retention of the Fine Print Note in its existing form engenders confusion because it gives the erroneous impression that plenum cables could be listed separately for flame spread and for smoke, and that is incorrect.

2. This Fine Print Note is identical to the ones in 725.82 (A) and in 760.81 (C), both of which are equally incorrect and potentially misleading. On the other hand the proposed revised text is identical to the Fine Print Notes in articles 770, 800, 820 and 830, which are correct. Thus, revising this Fine Print Note will provide further consistency within the NEC.

Panel Meeting Action: Reject
Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"So as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

3-168 Log #1570 NEC-P03 **Final Action: Accept (760.82(H))**

Submitter: Harold C. Ohde, IBEW-NECA Technical Institute
Comment on Proposal No: 3-266
Recommendation: Continue to reject.
Substantiation: I commend CMP 3 rejecting this proposal. The submitter's recommendation to create a new cable designation (concealed space cable) is nothing more than a marketing ploy. A backdoor approach you might say to get NFPA 255 and NFPA 259 cables in the cable hierarchy. The submitter's substantiation would have misled the designer, installer and code officials to believe, install and enforce that limited combustible cable, conduit or a sprinkler system to be installed in the concealed space or plenums would be a requirement because of NFPA 13 Section 8.14.1. It is important to note that the NEC does not have a definition of "concealed spaces", therefore, making it impossible to enforce. CMP 3 panel statement also reflects that the definition for "concealed" in Article 100 does not apply to the proposed text. What does constitute a concealed space? Is it the space above a dropped ceiling; or is it a space above plastered or drywall ceiling? Is it the wall cavity of typical wall construction?

NFPA 13 just completed their revision process for the 2006 NFPA 13 Standard. 8.14.1 of NFPA 13 has been revised to read as follows:

8.14.1.2 Concealed Spaces not Requiring Sprinkler Protection.

8.14.1.2.1* Concealed spaces of noncombustible and limited combustible construction with minimal combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those as a return air for a plenum. (For additional information on combustible loading see A.8.14.1.2.1)

8.14.1.2.2 Concealed spaces of noncombustible and limited combustible construction with limited access and not permitting occupancy or storage of combustible shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.

A.8.14.1.2.1 Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc... can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1) For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined.

In the 2006 NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.

CMP 3 rejected this proposal based on the Standards Council decision D#05-24 to remain "status quo" on issues that pertain to NFPA 90A.

A.8.14.1.2.1 Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc... can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1) For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined.

In the 2006 NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.

CMP 3 rejected this proposal based on the Standards Council decision D#05-24 to remain "status quo" on issues that pertain to NFPA 90A.

Panel Meeting Action: Accept

Panel Statement: The panel accepts the recommendation, but this action does not indicate the panel's concurrence with the entire substantiation.

(760.82(H) and Table 760.82(I))

Submitter: Harold C. Ohde, IBEW #134

Comment on Proposal No: 3-269

Recommendation: Continue to Reject.

Substantiation: I commend CMP 3 for rejecting this proposal. The submitter's recommendation to create a new cable designation (FPL50) is nothing more than a marketing ploy. A backdoor approach you might say to get NFPA 255 and NFPA 259 cables in the cable hierarchy. The submitter's recommendation to add these two FPN's to this section is in grave error. The FPN No. 1 is a backdoor approach you might say to get NFPA 255 and NFPA 259 calbes in the cable in the cable hierarchy. The FPN No. 2 would not provide guidance to designers, installers or code officials. This FPN would have misled the designer, installer and code officials to believe, install and enforce that limited combustible, conduit or a sprinkler system to be installed in the concealed space or plenums would be a requiremetn because of NFPA 13 Section 8.14.1. CMP 3 panel statement also reflects that the definition for "concealed" in Article 100 does not apply to the proposed text. It is important to note that the NEC does not have a definition of "concealed spaces" therefore making it impossible to enforce. What does constitute a concealed space? Is it the space above a dropped ceiling; or is it a space above plastered or drywall ceiling? Is it the wall cavity of typical wall construction.

NFPA 13 just completed their revision process for the 2006 NFPA 13 Standard. 8.14.1 of NFPA 13 has been revised to read as follows:

8.14.1.2 Concealed Spaces not Requiring Sprinkler Protection.

8.14.1.2.1* Concealed spaces of noncombustible and limited combustible construction with minimal combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those as a return air for a plenum. (For additional information on combustible loading see A.8.14.1.2.1)

8.14.1.2.2 Concealed spaces of noncombustible and limited combustible construction with limited access and not permitting occupancy or storage of combustible shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.

A.8.14.1.2.1 Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc... can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1) For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined.

In the 2006 NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.

CMP 3 rejected this proposal based on the Standards Council decision D#05-24 to remain "status quo" on issues that pertain to NFPA 90A.

3-172 Log #1678 NEC-P03 **Final Action: Reject**
(760.154 and 760.179)

Submitter: Richard J. Rockosi, ARKEMA Chemicals

Comment on Proposal No: 3-266

Recommendation: The panel should reconsider these proposals and accept them based upon the substantiations provided with the proposals. The section numbers referenced are from the panel actions on renumbering in proposals 3-138 and 3-211.

Substantiation: The Code Panel applied the Standards Council directive on NFPA 90A related to materials exposed to airflow in an air distribution system when rejecting these proposals. These proposals are not related to the 90A issue. The proposed cables are FPL – CS cables. There is no "P" designation associated with them. They cannot be, nor were they intended to be, used in spaces where they may be exposed to the airflow such as ceiling or raised floor plenums. They are intended for use in concealed or inaccessible (for normal maintenance) spaces as a low fuel load cable providing users with the highest fire performance for cables currently recognized by the code and a fuel load content consistent with building materials exhibiting low fuel properties. The listing addresses the opportunity to reduce the potential for the spread of fire from within these spaces when large quantities of cables are installed and ignited by another source.

Panel Meeting Action: Reject

Panel Statement: These proposals involve a variation of limited combustible cables. Limited combustible cables are available and are marked Type FPLP and can therefore be installed in any location that a riser or general cable can be installed. The definition for "concealed" in Article 100 in the 2005 NEC does not apply to the proposed text. The reference to NFPA 13 in the substantiation does not seem appropriate at this time, since putting a sprinkler head in an inaccessible location inside the wall or above a drywall ceiling would not permit access for servicing. The area above a suspended ceiling is not considered by the NEC to be a concealed space.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-173 Log #1458 NEC-P03 **Final Action: Reject**
(760.154(C) (New))

Submitter: Sanford Egesdal, Egesdal Associates PLC

Comment on Proposal No: 3-250

Recommendation: Reconsider proposal 3-250 and revise 760.61(C) as shown below. Note that section 760.61 has been renumbered to 760.154 by panel action on proposal 3-211.

(C) Other Wiring Within Buildings. Cables installed in building locations other than those covered in 760.154(A) or 760.154(B) shall be as described in either (1), (2), (3), or (4). Type FPL-CI cable shall be permitted to be installed as described in either (1), (2), (3), or (4) to provide a 2-hour circuit integrity rated cable. Type FPL-FHC cable shall be permitted to be installed as described in either (1), (2), (3), or (4) to provide reduced potential heat release.

(1) Type FPL shall be permitted.

(2) Cables shall be permitted to be installed in raceways.

(3) Cables specified in Chapter 3 and meeting the requirements of 760.179(A) and 760.179(B) shall be permitted to be installed in nonconcealed spaces where the exposed length of cable does not exceed 3 m (10 ft).

(4) A portable fire alarm system provided to protect a stage or set when not in use shall be permitted to use wiring methods in accordance with 530.12.

Substantiation: As pointed out in my affirmative comment, I agreed with the Panel's suggestion that the proposed text might be more appropriate in another section; and pointed out that application of the Standards Council's decision on NPFA 90A was an error. The proposed marking on the cable did not include a "P" added to FPL. Type FPLP cable is permitted to be installed in plenums.

This comment adds a sentence to existing 760.61(C) [renumbered as 760.154(C)] to incorporate fire hazard cable. By adding fire hazard cable to this section, it is clear that the cable is permitted to be installed as "Other Wiring Within Buildings."

To better clarify that the Standards Council's decision on NFPA does not apply and to better clarify where the cable is permitted to be installed, the marking on the cable is changed to Type FPL-FHC. The "FHC" suffix stands for fire hazard cable. There is a companion comment to revise the marking found in my comment to Proposal 3-269.

Some installations require large amounts of cable. A typical application of a fire hazard cable would be above a suspended ceiling or under a raised floor, neither of which is a plenum. The proposed cable has a very low fuel load, as compared to other types of cable insulation. Some cable constructions use one type of insulation on the conductor and another type for the jacket.

The Type FPLP-FHC cable suggested for listing and marking in 760.179 (comment to proposal 3-269) has parameters (e.g. 3500 BTU/lb) that are standard in the building industry and useful to system designers and fire protection engineers.

To put cable insulation heat release in perspective, here are relative values:
Fire Hazard Cable insulation: less than 8 MJ/kg (3,500 BTU/lb
PVC insulation: As high as 25 MJ/kg (11,000 BTU/lb)
Polyolefin insulation: As high as 46 MJ/kg (20,000 BTU/lb)

Panel Meeting Action: Reject

Panel Statement: The cables recommended in this comment and associated proposal involve a variation of limited combustible cables. Limited combustible cables are available and are marked Type FPLP and can therefore be installed in any location that a riser or general cable can be installed. There is no restriction in the Code preventing the use of this cable and there is no specific requirement for its use. Therefore there is no reason at this time to add the recommended text to 760.61.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 12 Negative: 1

Explanation of Negative:

EGESDAL, S.: Six manufacturers have a listing for a robust cable that UL has identified as a limited combustible cable. Yet, CMP 3 has denied Articles 725 and Article 760 from including an application, listing, and marking for this robust cable with an Flame Spread Index less than 25, a Smoke Developed Index less than 50, and a Heat of Combustion less than 3500BTU/lb. The only NEC marking for this robust cable is for a combustible plenum cable (e.g. FPLP). A plenum cable, tested to NFPA 262, has a Smoke Developed Index of 500 or greater and an unknown Heat of Combustion.

This comment did not include an application for installation in plenums to comply with the Standards Council's directive on NFPA 90A.

The panel statement on this comment seems out-of-step with the panel statement to comment 3-122, which follows. "Listing for non-power-limited fire alarm cable is based on UL 1425, Cables for Non-Power-Limited Fire Alarm Circuits, and this listing does not cover Class 1 circuits. A manufacturer could submit a request to the UL Standards Technical Panel (STP) for either a change to the UL standard to permit this application or a separate standard to cover Class 1 cables, but at this point there isn't a Class 1 cable or a standard that would specifically permit this application."

It seems that the NEC TCC needs to provide guidance to the Code Making Panels on whether the NEC of UL should take the lead on requirements included or not included in the NEC.

3-174 Log #1459 NEC-P03 **Final Action: Reject**
(760.179(H) (New))

Submitter: Sanford Egesdal, Egesdal Associates PLC
Comment on Proposal No: 3-269
Recommendation: Reconsider proposal 3-269 and revise as shown below. Note that 760.82 was renumbered to 760.179 by panel action on proposal 3-211.

Sections 760.179(A), through (G) do not change.

Insert new 760.179(H), renumber existing subsections as follows: "H" to "I"; and "I" to "J", and renumber "Table 760.179(I) Cable Markings" to "Table 760.179(J) Cable Markings".

(H) Power-Limited Fire Hazard (-FHC) Cable. Cables used to reduce potential heat release shall be listed as fire hazard (-FHC) cable and shall have a low potential heat release. Fire hazard cables specified in 760.154(C), and used to reduce potential heat release shall have an additional classification using the suffix "-FHC".

FPN No. 1: One method of defining a low potential heat release cable is that the cable exhibits a maximum potential heat value of exceeding 8141 kJ/kg (3500 BTU/lb) when tested in accordance with NFPA 259, *Standard Test Method for Potential Heat of Building Materials* as well as a maximum flame spread index of 25 and a maximum smoke developed index of 50 when tested in accordance with NFPA 255, *Standard Method of Test of Surface Burning Characteristics of Building Materials*.

Substantiation: As pointed out in my negative comment, I stated out that application of the Standards Council's decision on NPFA 90A was an error. The proposed marking on the cable did not include a "P" added to FPL. Type FPLP cable is permitted to be installed in plenums.

To better clarify that the Standards Council's decision on NFPA 90A does not apply and to better clarify where the cable is permitted to be installed, the marking on the cable is changed to Type FPL-FHC. The "FHC" suffix stands for fire hazard cable. There is a companion comment to revise the application of fire hazard cable in my comment to Proposal 3-250.

The proposed cable provides listing parameters useful to system designers and fire protection engineers.

The key parameter in the listing requirements is potential heat release.

To put cable heat release in perspective, here are relative values:
Fire Hazard Cable insulation: less than 8 MJ/kg (3,500 BTU/lb
PVC insulation: As high as 25 MJ/kg (11,000 BTU/lb)
Polyolefin insulation: As high as 46 MJ/kg (20,000 BTU/lb)

Polyolefin insulation is sometimes used as insulation on conductors, and is covered by a PVC jacket. Polyolefin insulation provides better electrical properties (dielectric constant) than PVC insulation.

Additionally, flame spread and smoke developed parameters identify the robustness of the cable.

A flame spread index of 25 is found in a number of NFPA publications, for example:

NFPA 13-2007

8.15.1 Concealed Spaces.

8.15.1.2.10 Concealed spaces where rigid materials are used and the exposed surfaces have a flame spread index of 25 or less, and the materials have been demonstrated not to propagate fire when tested in accordance with NFPA 255, Standard Method of Test of Surface Burning Characteristics of Building Materials, extended for an additional 20 minutes in the form in which they are installed, shall not require sprinkler protection.

NFPA 13 use of "concealed spaces" corresponds to a typical dictionary definition: out of sight, hidden. This definition add "spaces" to "concealed" and represents a different meaning from how the NEC defines "concealed." Where both the NEC and NFPA 13 apply, "concealed" cable can be removed from a "concealed space." After removal of the cable, the "concealed space" would remain.

A smoke developed index of 50 is more rigorous than the typical smoke developed index of 450 for interior finishes. Interior finishes can be considered a "fixed" application: one sheet or one coat. Cable installations are a "variable" application: one cable or hundreds of cables. It seems reasonable to establish a robust requirement, due to the variable application. Electronic equipment is susceptible to damage from smoke and heat, both components of a fire.

There a number of manufacturers with cable listed to the requirements in the proposed FPN, so these requirements are not a financial hardship.

Panel Meeting Action: Reject

Panel Statement: See the panel statement on Comment 3-173.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 12 Negative: 1

EGESDAL, S.: See my negative vote on comment 3-173.

ARTICLE 770 — OPTICAL FIBER CABLES AND RACEWAYS

16-2 Log #1530 NEC-P16 **Final Action: Reject**
(770)

Submitter: James E. Brunssen, Telcordia Technologies, Inc. / Rep. Alliance for Telecommunications Industry Solutions
Comment on Proposal No: 16-3
Recommendation: Accept this proposal.
Substantiation: I reiterate my 'Explanation of Negative' expressed during the Panel voting. This proposal should be accepted. The preponderance of optical fiber cable applications today is in the telecommunications industry. A number of telecommunications utilities have either begun, or are contemplating, a "fiber-to-the-home" program whereby optical fiber will be provided directly to the customer's premises. The optical fiber cable will be attached to, and possibly installed within the customer's building. While optical fiber cable is also used for data and control circuits, many of these circuits are similar in nature to communications circuits with respect to their installation and safety requirements. It is therefore appropriate that Article 770 be incorporated in Chapter 8. Relocation of Article 770 to Chapter 8 will facilitate usability of the NEC and have no impact on existing requirements.
Panel Meeting Action: Reject
Panel Statement: The panel reafirms its intent to reject. It is more appropriate for Article 770 to remain in Chapter 7. Optical fiber cable is also used for applications other than communications (e.g. control).
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:
BRUNSSEN, J.: This comment should have been accepted, as should the original Proposal 16-3. The preponderance of optical fiber cable applications is in communications, hence Article 770 belongs in Chapter 8, Communications Systems. For further substantiation see my explanation of negative on Proposal 16-3 and the substantiation accompanying my Comment 16-2.
JOHNSON, S.: I support the commentor's recommendation to relocate Article 770 to Chapter 8. 770 is very similar and largely parallel to Articles 800, 820, and 830 and, therefore, should be similarly located and treated. Articles 770, 800, 820, and 830 all deal with wiring methods used for a variety of telecommunications and communications services.

16-3 Log #153 NEC-P16 **Final Action: Accept**
(770, 800, 810, 820 and 830)

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 16-4
Recommendation: The Technical Correlating Committee understands that the Panel Action on this Proposal should be "Accept in Principle" and further understands the Panel Action text in Proposal 16-4a and Proposal 16-25 provides the additional accepted and modified text. It is also the action of the Technical Correlating Committee that further consideration be given to the comments on the affirmative vote. This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
In 820.100(B)(2)(7) (in the preprint) replace the word "grounded" with the word "connected" as follows: "…. disconnecting means that is grounded connected to an electrode as covered in 250.32."
In 820.106(A) (1) revise the text as follows:
"(1) Where there is no mobile home service equipment located in sight from, and not more than 9.0 m (30 ft) from, the exterior wall of the mobile home it serves, the coaxial cable shield ground, or surge arrester ground, shall be connected to a grounding conductor in accordance with 820.100(B)(2)."
In 820.106(A) (2) revise the text as follows:
"(2) Where there is no mobile home disconnecting means grounded in accordance with 250.32 and located within sight from, and not more than 9.0m (30 ft) from, the exterior wall of the mobile home it serves, the coaxial cable shield ground, or surge arrester ground, shall be connected to a grounding conductor in accordance with 820.100(B)(2)."
Panel Statement: The panel agrees that the action should have been accept in principle.
The panel has considered the comment an affirmative as directed by the TCC and made the indicated revisions to the text of 820.100(B)(2)(7) and 820.106(A)(1) and (2) as currently contained in the preprint. These revisions are consistent with the panel action on proposals affecting similar requirements in 820.93 and Articles 770, 800, and 830.
See panel action and statement on Proposal 16-305.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
BRUNSSEN, J.: The underlined and strikeout text (legislative format) as developed by Panel 16 does not appear in the Panel Meeting Action text of this comment. Revise the text to read as follows:
Revise 820.100(B)(2)(7) to read: "... disconnecting means that is connected to an electrode as covered in 250.32."
Revise 820.106(A)(1) to read: "(1) Where there is no mobile home service equipment located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, the coaxial cable shield ground, or surge arrester ground, shall be connected to a grounding conductor in accordance with 820.100(B)(2)."
Revise 820.106(A)(2) to read: "(2) Where there is no mobile home disconnecting means grounded in accordance with 250.32 and located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, the coaxial cable shield ground, or surge arrester ground, shall be connected to a grounding conductor in accordance with 820.100(B)(2)."

16-4 Log #237 NEC-P16 **Final Action: Reject**
(770.1)

Submitter: Stanley Kaufman, CableSafe Inc.
Comment on Proposal No: 16-3
Recommendation: Accept this proposal.
Substantiation: The submitter's statement that the preponderance of applications for optical fiber cables is for communications is correct. While the panel's statement that optical fiber cables are also used for other applications such as control is also correct, the noncommunications applications are minor.
It is not accidental that the format of Article 770 parallels the format of the communications articles 800 and 820. Article 770 was written with Article 800 as the template.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 16-2.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:
BRUNSSEN, J.: This comment should have been accepted, as should the original Proposal 16-3. See my explanation of negative vote for Comment 16-2.
JOHNSON, S.: See my explanation of negative vote on Comment 16-2.

16-4a Log #CC1600 NEC-P16 **Final Action: Accept**
(770.2)

Submitter: Code-Making Panel 16,
Comment on Proposal No: 16-4a
Recommendation: Revise panel action on Proposal 16-4a to delete new FPNs No. 1 and No. 2.
Substantiation: The FPNs provide unnecessary cross references.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-4b Log #CC1601 NEC-P16 **Final Action: Accept**
(770.2)

Submitter: Code-Making Panel 16,
Comment on Proposal No: 16-4a
Recommendation: Revise 770.2 as follows:
"Point of Entrance. The point within a building at which the cable emerges from an external wall, from a concrete floor slab, or from a rigid metal conduit (Type RMC) or an intermediate metal conduit (Type IMC) connected by a grounding conductor to an electrode in accordance with ~~800.100(B)~~ 770.100(B)."
Substantiation: Proposal 16-25 has incorporated the grounding requirements of 800.100(B) into 770.100(B). Therefore, the appropriate reference is 770.100(B), not 800.100(B). This change correlates with similar text of Articles 800, 820 and 830.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-5 Log #154 NEC-P16 **Final Action: Accept**
(770.2)

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 16-5
Recommendation: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept
Panel Statement: The panel has considered the comments expressed in the voting as directed by the TCC.

The panel has concluded that the added reference to Article 100 is appropriate. Telecommunications constitutes a large portion of optical fiber applications, installed by technicians familiar with Chapter 8 and its independent status. Hence, a reminder to consider the definitions of Article 100 is most helpful and appropriate for these individuals.

While Style Manual conflict is acknowledged, other justifications may warrant the repetitiveness. The application of these references is required for individuals who may not be familiar with other areas of the Code. The Style Manual encourages uniformity of parallel articles.
Number Eligible to Vote: 15

Comment on Proposal No: 16-5
Recommendation: The Panel Action should be to Accept in Part by revising the Proposal as follows:
770.2 Definitions. ~~See Article 100~~. For purposes of this article, the following ~~additional~~ definitions apply.
Substantiation: I agree with the Explanation of Negative by H. Ohde. In accordance with 90.3, Article 100 already applies and there is no need for this additional text reference.
The Panel might want to Reject the Proposal completely in accordance with 2.2.2.2 and the accompanying examples in the NEC Style Manual.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 16-5.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-9 Log #1284 NEC-P16 **Final Action: Reject (770.2)**

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 16-4a
Recommendation: The Proposal should be Rejected.
Substantiation: I agree with the Explanation of Negative by H. Ohde.

Also, while the panel provided a panel statement explaining the addition of the phrase "connected by a grounding conductor", no substantiation or reason was provided for the addition of the two FPNs.

The FPNs should not be included since the user should be knowledgeable enough in the Code and electrical materials to know what Intermediate Metal Conduit (Type IMC) and Rigid Metal Conduit (RMC) are, or, if not, know enough to go to the specific articles on these raceways for additional information.
Panel Meeting Action: Reject
Panel Statement: See Comment 16-4a (Log #CC1600).

See panel action and statement on Comments 16-86, 16-87, 16-201, 16-202, 16-205, 16-284, and 16-285.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-10 Log #1576 NEC-P16 **Final Action: Accept (770.2)**

Submitter: Harold C. Ohde, IBEW-NECA Technical Institute
Comment on Proposal No: 16-9
Recommendation: Continue to reject.
Substantiation: The term "air duct" is not used in Article 770 and, therefore, it does not need to be defined in 770.2. Defining a term that is not being used (such as air duct) in that Article is in direct violation with the National Electrical Code Style Manual. CMP 16 rejected this proposal based on the Standards Council decision D#05-24 to remain "status quo" on issues that pertain to NFPA 90A.

I do believe that expansion of, or, a new definition of, air duct in another Article would be a violation of Standards Council Decision D#05-24. Standards Council recognizes the 2002 edition of the NEC as being status quo.
Panel Meeting Action: Accept
Panel Statement: As there was no opportunity for public review and comment, the panel continues to affirm its original action on the referenced proposal in accordance with the action taken to comply with the Standards Council relative to the 90A Decision.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-11 Log #1577 NEC-P16 **Final Action: Accept (770.2)**

Submitter: Harold C. Ohde, IBEW-NECA Technical Institute
Comment on Proposal No: 16-10
Recommendation: Continue to reject.
Substantiation: The term "air duct" is not used in Article 770 and, therefore, it does not need to be defined in 770.2. Defining a term that is not being used (such as air duct) in that Article is in direct violation with the National Electrical Code Style Manual. CMP 16 rejected this proposal based on the Standards Council decision D#05-24 to remain "status quo" on issues that pertain to NFPA 90A.

I do believe that expansion of, or, a new definition of, air duct in another Article would be a violation of Standards Council Decision D#05-24. Standards Council recognizes the 2002 edition of the NEC as being status quo.
Panel Meeting Action: Accept

16-13 Log #1686 NEC-P16 **Final Action: Accept**
(770.2)

Submitter: Harold C. Ohde, IBEW #134
Comment on Proposal No: 16-13
Recommendation: Continue to Reject.
Substantiation: The submitter's recommendation to add this definition to 770.2 because the term "concealed space" is used in 770.154(A) FPN is misleading. This definition does not belong in the NEC. The 770.154(A) FPN provided no guidance to designers, installers or code officials. This FPN has misled the designer, installer and code officials to believe, install and enforce that limited combustible cable, conduit or a sprinkler system to be installed in the concealed space or plenums would be a requirements because of NFPA 13 Section 8.14.1. It is important to note that the NEC does not have a definition of "concealed spaces", therefore, the confusion and making it impossible to enforce. What does constitute a concealed space? Is it the space above a dropped ceiling; or is it a space above plastered or drywall ceiling? Is it the wall cavity of typical wall construction?

NFPA 13 just completed their revision process for the 2006 NFPA 13 Standard. 8.14.1 of NFPA 13 has been revised to read as follows:

8.14.1.2 Concealed Spaces not Requiring Sprinkler Protection.

8.14.1.2.1* Concealed spaces of noncombustible and limited combustible construction with minimal combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those as a return air for a plenum. (For additional information on combustible loading see A.8.14.1.2.1).

8.14.1.2.2 Concealed spaces of noncombustible and limited combustible construction with limited access and not permitting occupancy or storage of combustible shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.

A.8.14.1.2.1 Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc... can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1). For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined.

In the 2006 NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.

Standards Council recently issued another decision (D#06-03) which decided that this FPN may be deleted from Sections 770.154, 800.154 and 820.154 (all under CMP 16 purview) and this deletion will not be in conflict with the Standards Council decision (D#05-24). Standards Council recognizes the 2002 edition of the NEC as being status quo. This FPN referencing NFPA 13 was added to the 2005 NEC, therefore, it can and should be deleted. There is no need for the term "concealed spaces" to be defined.
Panel Meeting Action: Accept
Panel Statement: As there was no opportunity for public review and comment, the panel continues to affirm its original
action on the referenced proposal in accordance with the action taken to comply with the Standards Council relative to the 90A Decision.

(770.2.Abandoned Fiber Optical Cable)

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 16-6
Recommendation: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel has considered the comments expressed in the voting as directed by the TCC.

The panel accepts the portion of the comments dealing with "Abandoned Optical Fiber Cable" and notes that the term is correct in the preprint. The panel rejects the portion of the comments concerning the fine print note. Equipment is not covered by Article 770; hence the reader must go to Article 100. Usability is enhanced by directing the reader to the definition in Article 100.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:

JENSEN, R.: We agree with the Panel action as to the portion of the comments dealing with "Abandoned Optical Fiber Cable" and notes that the term is correct in the preprint.

However we disagree with including a FPN that duplicates identical normative text that is just a couple of lines above this definition.

CMP 16 accepted proposal 16-5 which will harmonize 770-2, 800-2, 820-2, and 830-2 by including a normative reference to "See Article 100". Adding a FPN to again "See Article 100" is redundant, especially since this FPN will be two lines down from the identical wording in normative text. Additionally, the 2003 NEC Style Guide specifically states to avoid redundant use of references.

16-15 Log #156 NEC-P16 **Final Action: Accept**
(770.2.Optical Fiber Raceway)

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 16-20
Recommendation: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the Panel as a Public Comment. It is the intention of Fine Print Notes to provide explanatory information and they are not intended as a vehicle to provide unnecessary cross-references.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel has considered the comments expressed in the voting as directed by the TCC.

(770.2.Point of Entrance)

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 16-21
Recommendation: The Technical Correlating Committee directs that the Panel clarify the Panel Action with respect to the panel action on Proposal 16-4a.

In addition, it was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. It is the intention of Fine Print Notes to provide explanatory information and they are not intended as a vehicle to provide unnecessary cross-references.

This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept

Delete the FPNs in 770.2.

Revise 770.2 as follows:

Point of Entrance. The point within a building at which the cable emerges from an external wall, from a concrete floor slab, or from a rigid metal conduit (Type RMC) or an intermediate metal conduit (Type IMC) connected by a grounding conductor to an electrode in accordance with 770.100(B).
Panel Statement: The panel accepts the direction of the TCC to clarify the panel action.

The panel deleted the FPNs and updated the definition of Point of Entrance. This satisfies the comments expressed in the voting.

The panel correlated the text with Proposal 16-25.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-17 Log #1282 NEC-P16 **Final Action: Accept in Part**
(770.2, 800.93, and 820.93)

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 16-4
Recommendation: The panel action should be to Accept in Principle and consideration should be given to the Comment on Affirmative vote by J. Brunssen.

In 770.2, delete FPN No. 1 and No. 2.
In 800.93, delete the FPN.
In 820.93, delete FPN No. 1 and revise "FPN No. 2" to read "FPN".

Substantiation: The Affirmative comment by J. Brunssen contains numerous valid revisions that should be made.

The FPNs should be deleted since the user should be knowledgeable enough in the Code and electrical materials to know what Intermediate Metal Conduit (Type IMC) and Rigid Metal Conduit (RMC) are, or, if not, know enough to go to the specific articles on these raceways for additional information.

The FPNs in 800.93 and 820.93 should be deleted since the definition of Point of Entrance is included in the definition section of each article and it should not be necessary to add FPNs throughout the article referring the user back to the definition.

Panel Meeting Action: Accept in Part
Panel Statement: The panel accepts the portion of the comment to consider the affirmative comment by J. Brunssen. See panel action and statement on Comment 16-3.

The panel accepts the portion of the comment that the panel action should be 'accept in principle'. See panel action and statement on Comment 16-3.

The panel accepts the deletion of 770.2, FPN No. 1 and No. 2. See Comment 16-4a (Log #CC1600).

The panel rejects the portion of the comment to delete the fine print note associated with the "point of entrance" in 800.93, as it is existing text and its removal would constitute new material.

The panel rejects deletion of FPN No. 1 in 820.93. See panel action and statement on Comment 16-224

16-18 Log #158 NEC-P16 **Final Action: Accept**
(770.3, 770.133(C) and 770.100 (new))

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 16-25
Recommendation: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal with respect to the use of the word "and" in the sentence "The grounding conductor shall be connected in accordance with 770.100(B)(1), (B)(2), and (B)(3)."

It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 5-20. This action will be considered by the Panel as a Public Comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept

Revise 770.100(B) as follows:

''The grounding conductor shall be connected in accordance with 770.100(B)(1), (B)(2), or (B)(3)."

Revise 770.100(B)(1) as follows:

"(1) In Buildings or Structures with an Intersystem Bonding Termination. If the building or structure served has an intersystem bonding termination, the grounding conductor shall be connected to the intersystem bonding termination."

Revise 770.100(B)(2) as follows:

"(2) In Buildings or Structures with Grounding Means. If the building or structure served has no intersystem
bonding termination, the grounding conductor shall be connected to the nearest accessible location on the following:"

Revise 770.100(B)(3) as follows:

"(3) In Buildings or Structures Without Intersystem Bonding Termination or Grounding Means. If the building or structure served has no intersystem bonding termination or grounding means, as described in 770.100(B)(2), the grounding conductor shall be connected to either of the following:"

Panel Statement: The panel accepts the direction of the TCC to review clarification of the panel action.

The panel has clarified the panel action on Proposal 16-25 with respect to the word "and" as indicated in the panel action on this comment. It is not the intent to accomplish the grounding connections of 770.100 (B)(1), (B)(2), and (B)(3) simultaneously. The panel has reconsidered Proposal 16-25 in light of the panel action on Proposal 5-20 as directed by the TCC and revised "intersystem grounding termination" to "intersystem bonding termination" as indicated in the panel action on this comment.

16-24 Log #2014 NEC-P16 **Final Action: Reject**
(770.3(A), 770.25, and 770.26)

Submitter: Harold C. Ohde, IBEW #134
Comment on Proposal No: 16-29
Recommendation: This Proposal should have been Rejected.
Substantiation: The submitter's recommendation to add a new 770.26 with this FPN No. 2 to this section is in grave error. This FPN would not provide guidance to designers, installers or code officials. This FPN would have misled the designer, installer and code officials to believe, install and enforce that limited combustible cable, conduit or a sprinkler system to be installed in the concealed space or plenums would be a requirement because of NFPA 13, Section 8.14.1. 770.26 also has a term "concealed spaces" and it is important to note that the NEC does not have a definition of "concealed spaces", therefore, making it impossible to enforce. What constitutes a concealed space? Is it the space above a dropped ceiling; or is it a space above plastered or drywall ceiling? Is it the wall cavity of typical wall construction?

NFPA 13 just completed their revision process for the 2006 NFPA 13 Standard. 8.14.1 of NFPA 13 has been revised to read as follows:

8.14.1.2 Concealed Spaces not Requiring Sprinkler Protection.

8.14.1.2.1* Concealed spaces of noncombustible and limited combustible construction with minimal combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those as a return air for a plenum. (For additional information on combustible loading see A.8.14.1.2.1).

8.14.1.2.2 Concealed spaces of noncombustible and limited combustible construction with limited access and not permitting occupancy or storage of combustible shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.

A.8.14.1.2.1 Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc... can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1). For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined.

In the 2006 NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.

CMP 16 should have rejected this proposal based on the Standards Council decision D#05-24 to remain "status quo" on issues that pertain to NFPA 90A. Standards Council recently issued another decision (D#06-03) which decided that this FPN may be deleted from Sections 770.154, 800.154, and 820.154 (all under CMP 16 purview) and this deletion will not be in conflict with the Standards Council decision (D#05-24). Standards Council recognizes the 2002 edition of the NEC as being status quo.

16-26 Log #1286 NEC-P16 **Final Action: Hold**
(770.12 and 770.110 (New))

T**CC Action: The Technical Correlating Committee understands that the panel action was to "Hold" the comment only.**
Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 16-38
Recommendation: The panel action on the Proposal should continue to be Accept in Principle, however, the following additional changes should be made to the panel action:

Revise 770.12 as shown:

770.12 ~~Innerduct for~~ Optical Fiber Cables Installed in Raceways. Listed ~~plenum~~ optical fiber raceways~~, listed riser optical fiber raceway, or listed general purpose optical fiber raceway~~ selected in accordance with the provisions of 770.154 shall be permitted to be installed ~~as innerduct~~ in any type of listed raceway permitted in Chapter 3.

Revise the new 770.110 as follows:

770.110 Raceways for Optical Fiber Cables. Where optical fiber cables are installed in a raceway, the raceway shall be either of a type ~~either~~ permitted in Chapter 3 and installed in accordance with Chapter 3 or a listed ~~plenum~~ optical

fiber raceway~~, listed riser optical fiber raceway, or listed general purpose optical fiber raceway~~ selected in accordance with the provisions of 770.154, and installed in accordance with ~~362.24~~ 362.22 through 362.56, where the requirements applicable to electrical nonmetallic tubing apply. ~~Where optical fiber cables are installed in raceway without current carrying conductors, the raceway fill tables of Chapter 3 and Chapter 9 shall not apply. Where nonconductive optical fiber cables are installed with electric conductors in a raceway, the raceway fill tables of Chapter 3 and Chapter 9 shall apply.~~

Substantiation: "Innerduct" is not defined in the Code and is only used in 770.12. Changing the text as proposed will still permit the installation of listed optical fiber raceways (plenum, riser, or general-purpose) in any type of listed raceway permitted in Chapter 3 without adding an undefined term to the Code. Addition of the term "innerduct" is not necessary to permit the installations proposed, may be confusing to the user since it is not used anywhere else in the Code, and does not add clarity nor enhance usability of the Code.

Relocation of the word "either" provides the consistency between Articles 770, 800, and 820 that the proposer indicated as one of the objectives in the substantiation.

Using the term "listed optical fiber raceways" will also permit the installation of other types of listed optical fiber raceways that may be included in future Codes without having to revise 770.12.

The first sentence in the submitter's substantiation states that "This is an editorial proposal." Deletion of the maximum percentage fill requirements for Chapter 3 raceways is not editorial.

No substantiation was submitted to support the deletion of the maximum percentage fill requirements of Chapters 3 and 9. The fill requirements are based on the physical limitations of being able to pull conductors or cables into raceways without damaging the conductors or cables, particularly when there are bends in the run, and avoiding conductor/cable jamming. The maximum percentage fill requirements are independent of whether they are electrical conductors or not.

The maximum percentage fill requirements in Chapters 3 and 9 are an integral part of the permitted uses of the raceways contained in Chapter 3 and if conductors or cables are to be installed in a Chapter 3 raceway, then the maximum percentage fill requirements must also apply.

The first sentence in proposed 770.10 already states that "installed in accordance with Chapter 3" which would include all of Chapter 3 requirements pertaining to raceways including the maximum percentage fill limitations in Chapter 9. The proposal introduces conflicting requirements between the first and second sentences.

Chapter 9, Table 1 permits 53 percent fill when one conductor or cable is installed in a raceway; 31 percent for two; and 40 percent for three or more.

When electrical conductors are installed in raceways, with or without nonmetallic optical fiber cable or nonmetallic optical fiber raceways, then 310.15 applies and the ampacity adjustment factors in Table 310.15(B)(2)(a) for more than three current-carrying conductors in a raceway or cable would also apply, if applicable.

Panel Meeting Action: Hold

Panel Statement: Changing the installation requirements from "362.24 through 362.56" to "362.22 through 362.56" is new material.

Applying raceway fill requirements to optical fiber cables is new material.

The proposed revision(s) constitute new material that has not had the benefit of public review and cannot be considered at this stage of the code-making cycle. Refer to 4.4.6.2.2 of the Regulations Governing Committee Projects.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-27 Log #368 NEC-P16 **Final Action: Reject**
(770.24)

Submitter: S. D. Kahn, Tri-City Electric Company, Inc. / Rep. NECA

Comment on Proposal No: 16-43

Recommendation: Reject the Proposal.

Substantiation: Although I agree with the proposal and the submitter's intent to introduce consistency, the material is used in plenums and other air handling spaces. Consequently, the proposal should have been subjected to the direction given by the Standards Council, as were many other proposals which were rejected.

As Mr. Dorna noted in his "Explanation of Negative Vote", "The UL Directory (2005), shows that category ZODZ covers "cable ties, cable tie mounts and similar types of related hardware". Likewise, Conduit and Fittings, category DWFV covers "cable ties, conduit straps, staples and similar hardware...". Both categories list as "Suitable for use in air handling spaces in accordance with Sec 300.22(C) and (D) of the National Electrical Code."

This proposal should have been rejected because of the Standards Council decision concerning NFPA 90A. Code Making Panels must be consistent in their handling of all submitted proposals**.**

Panel Meeting Action: Reject

Panel Statement: This is not a 90A issue.

The guide information for ZODZ, Wire Positioning Devices states that:

"The investigation of these products includes consideration of the rated mechanical strength, maximum operating temperature, smoke and heat generation, corrosion resistance and weatherability characteristics as appropriate for the product."

These are all characteristics that we should be concerned about for electrical installations.

The reference to air handling spaces is only a reference and is stated as:

"…for those devices which have been investigated to determine their suitability for use in air handling areas…"

This is a standard statement that is found in a wide variety of listing categories including the category for IT and Telecom equipment to cover situations where a special investigation is done to evaluate a device for air handling spaces. It no way implies that devices in the category are automatically intended for air handling spaces.

Listed devices are evaluated using UL1565 – Standard for Positioning Devices. The scope of this standard states:

"1.1 This standard applies to those metallic and nonmetallic devices used for positioning - which may include bundling and securing - or to a limited extent supporting cable, wire, conduit, or tubing of a wiring system in electrical installations, to reduce the risk of fire, electric shock, or injury to persons."

Devices are evaluated for properties that we are concerned about. It is NOT a requirement for a listed device to be evaluated for use in air handling spaces.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

JOHNSON, S.: I disagree with the panel statement. This is an NFPA 90A issue and, therefore, should not be acted on per the Standards Council directive.

16-28 Log #369 NEC-P16 **Final Action: Reject**
(770.24)

Submitter: S. D. Kahn, Tri-City Electric Company, Inc. / Rep. NECA

Comment on Proposal No: 16-45

Recommendation: Reject the Proposal.

Substantiation: This proposal should be rejected as the term "listed" should not be introduced at this time. The panel accepted moving the abandoned cable requirement but did not accept deleting "The accessible portion of". The panel rejected the remainder of the proposal except for adding the word "listed". Other proposals move the abandoned cable requirement.

I agree with the submitter's intent with reference to "listed" in order to introduce consistency, however the material is used in plenums and other air handling spaces. Consequently, the proposal should have been subjected to the direction given by the Standards Council, as were many other proposals which were rejected because of that direction.

As Mr. Dorna noted in his "Explanation of Negative Vote", "The UL Directory (2005), shows that category ZODZ covers "cable ties, cable tie mounts and similar types of related hardware". Likewise, Conduit and Fittings, category DWFV covers "cable ties, conduit straps, staples and similar hardware..." Both categories list as "Suitable for use in air handling spaces in accordance with Sec 300.22(C) and (D) of the National Electrical Code."

The proposal portion that introduces "listed" should have been rejected because of the Standards Council decision concerning NFPA 90A. Code Making Panels must be consistent in their handling of all submitted proposals.

Panel Meeting Action: Reject

Panel Statement: This is not a 90A issue.

The guide information for ZODZ, Wire Positioning Devices states that:

"The investigation of these products includes consideration of the rated mechanical strength, maximum operating temperature, smoke and heat generation, corrosion resistance and weatherability characteristics as appropriate for the product."

These are all characteristics that we should be concerned about for electrical installations.

The reference to air handling spaces is only a reference and is stated as:

"…for those devices which have been investigated to determine their suitability for use in air handling areas…"

This is a standard statement that is found in a wide variety of listing categories including the category for IT and Telecom equipment to cover situations where a special investigation is done to evaluate a device for air handling spaces. It no way implies that devices in the category are automatically intended for air handling spaces.

Listed devices are evaluated using UL1565 – Standard for Positioning Devices. The scope of this standard states:

"1.1 This standard applies to those metallic and nonmetallic devices used for positioning - which may include bundling and securing - or to a limited extent supporting cable, wire, conduit, or tubing of a wiring system in electrical installations, to reduce the risk of fire, electric shock, or injury to persons."

Devices are evaluated for properties that we are concerned about. It is NOT a requirement for a listed device to be evaluated for use in air handling spaces.

Comment on Proposal No: 16-43
Recommendation: Delete the word "listed".
Substantiation: Refer to my comment in ROP 16-45. The use of the term "listed" is redundant in this section whether or not my comment in 16-45 is accepted. I agree with Mr. Boyer's comment accompanying his Negative Vote. The suggested additional text is not needed, however, in this section, if adopted in 770.24(B) according to my comment on ROP 16-45.
Panel Meeting Action: Reject
Panel Statement: The guide information for ZODZ, Wire Positioning Devices, states:

"The investigation of these products includes consideration of the rated mechanical strength, maximum operating temperature, smoke and heat generation, corrosion resistance and weatherability characteristics as appropriate for the product."

These are all characteristics that we should be concerned about for electrical installations.

Listed devices are evaluated using UL1565, Standard for Positioning Devices. The scope of this standard states:

"1.1 This standard applies to those metallic and nonmetallic devices used for positioning which may include bundling and securing or to a limited extent supporting cable, wire, conduit, or tubing of a wiring system in electrical installations, to reduce the risk of fire, electric shock, or injury to persons."

The evaluation of positioning devices includes:

- Classification by mechanical strength, material, maximum temperature, and environmental conditions
- Required markings giving critical information to the installer / inspector
- Mechanical strength tests
- Flammability classification of polymeric materials and coatings (NOT air-handling space requirements)
- Relative thermal index
- Material requirements (including blending and substitution)
- Corrosion resistance
- Sharp edges
- Installation
- Mechanical strength
- Vibration
- Tests for mounting blocks and other mounting hardware and devices
- Environmental conditioning.....

Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:

BOYER, J.: Proposals, comments nor panel statements provide any technical substantiation for the panel action that would require all hardware used to support these cables to be listed. Code-making Panels 7 and 8 have steadily rejected similar proposals relating to the support of cables and raceways and Code-Making Panel 3 has established no general requirements of this nature. Unlike CMP 7 and 8, CMP 16 has never found it necessary to specify maximum spacing intervals for support of these cables, an indication that reliance on approval of such installations by the authorities having jurisdiction provides sufficient levels of safety. Requiring that all support hardware be listed will provide no appreciable increase in safety but it will decrease the authority of the AHJ and options for supporting the cables, and will increase the cost of cable installations, all without substantiation and consistent treatment of support for cables through the NEC.

JOHNSON, S.: Listing of support hardware is overkill. Requiring brackets, cable ties, bolts, nuts, washers, nails, etc. to be listed where it is obvious that the hardware is suitable for the purpose, does not add to the safety of the installation.

16-30 Log #481 NEC-P16 **Final Action: Reject**
(770.24)

Submitter: Timothy P. McNeive, Thomas & Betts Corporation
Comment on Proposal No: 16-45
Recommendation: Accept the panel action, but delete the requirement that hardware be "listed" in 770.24(B). Add the following sentence before the last sentence in 770.24(B):

"Cable ties that provide primary support for optical fiber cables and raceways shall have a minimum loop tensile strength of 23 kg (50 lbs)."

Substantiation: Adding a requirement that all hardware be "listed" is far from editorial as asserted in the substantiation accompanying the proposal. The panel is asked to consider the long-standing positions of CMP-7 and CMP-8 that do not require support hardware to be "listed". Above all else, consistency in the NEC seems to be what the original submitter values most. No substantiation has been provided in the proposal that would differentiate treatment of antenna television and radio distribution cables from other wiring systems with respect to support. The wide variety of hardware used for supporting cables and raceways are called upon to provide both primary support required in the NEC and very often secondary support or wire management functions. All hardware need not be held to the highest standard.

The comment provided by Mr. Dorna with his negative vote references two UL categories under which cable ties and other hardware are "listed". The correct UL category for Hardware for Support of Conduit, Tubing and Cable (UL 2239) is DWMU, not DWFV. Nevertheless, this standard and UL 1565, Positioning Devices (ZODZ) establishes a 23 kg test load for all support products for flexible conduits and cables in accordance with the requirements for primary support throughout the NEC. For cable ties, "minimum loop tensile strength" is commonly marked on packages. The 23 kg minimum for cable support is well representative of typical straps, hangers and staples listed for flexible conduit and cable support in accordance with UL 2239, Hardware for Support of Conduit, Tubing and Cable. The proposed new text will add value to inspectors in acceptance of appropriate cable ties without requiring lists.

Companion proposals have been submitted for 640.6, 725.8, 760.8, 800.24, 820.24 and 830.24.
Panel Meeting Action: Reject
Panel Statement: There is more to listing than mechanical strength. Also, the mechanical strength should be based on the use and ratings of the device.

Cable ties can be used for securing and supporting cables in a number of Chapter 3 wiring methods without any requirements for a minimum loop tensile strength of 23 kg (50 lbs) or any particular strength. For example, Section 334.30 covering securing and supporting of "nonmetallic-sheathed cable requires supporting and securing by staples, cable ties, straps, hangers, or similar fittings designed and installed so as not to damage the cable, at intervals not exceeding 1.4 m (4 1/ 2 ft) and within 300 mm (12 in.) of every outlet box, junction box, cabinet, or fitting." Notice it does not have any recommendation for the support strength, nor does it need this additional marking or special consideration. The cables may not be providing any support at all where the tie wrap is simply anchoring it to a beam or joist. Types AC and MC cable also give permission to use cable ties for securing and supporting these cables in 320.30 and 330.30, respectively. In addition, this added text could be considered to be new information that has not been reviewed as part of the process.

Listing includes an evaluation of the particular device that goes beyond the ability to support cable. The guide information for ZODZ, Wire Positioning Devices states that:

"The investigation of these products includes consideration of the rated mechanical strength, maximum operating temperature, smoke and heat generation, corrosion resistance and weatherability characteristics as appropriate for the product."

These are all characteristics that we should be concerned about for electrical installations.

Listed devices are evaluated using UL1565 – Standard for Positioning Devices. The scope of this standard states:

"1.1 This standard applies to those metallic and nonmetallic devices used for positioning - which may include bundling and securing - or to a limited extent supporting cable, wire, conduit, or tubing of a wiring system in electrical installations, to reduce the risk of fire, electric shock, or injury to persons."

16-31 Log #1529 NEC-P16 **Final Action: Reject**
(770.24)

Submitter: James E. Brunssen, Telcordia Technologies, Inc. / Rep. Alliance for Telecommunications Industry Solutions
Comment on Proposal No: 16-44
Recommendation: Accept this proposal.
Substantiation: This proposal should be accepted. The requirement added by Panel 16 during the 2005 revision cycle is overly restrictive and inappropriate for optical fiber cables. The Fine Print Note associated with 770.24 directs the reader to the appropriate installation standards. The Panel has enhanced the Fine Print Note during this cycle by the addition of a reference to ANSI/ NECA/FOA 301-2004 covering the installation of optical fiber cables (see Proposal 16-46). These references are all that is necessary and sufficient for such cables without imposing the burdensome requirements of 300.11. Section 300. 11 is directed toward power cable assemblies that are heavier and larger than optical fiber cables. Optical fiber cables contain no power. (Where composite optical fiber cables are used, they are classified as electrical cables in accordance with the type of electrical conductors.) If the Panel continues to reject Proposal 16-44, then, at the very least, 300.11(C) should be excepted. See my companion comment on Proposal 16-48.
Panel Meeting Action: Reject
Panel Statement: The requirements of 300.11 are applicable to optical fiber cables.

The panel recognizes that cables not appropriately secured and supported could pose additional safety hazards.

Number Eligible to Vote: 15
Ballot Results: Affirmative: 12 Negative: 3
Explanation of Negative:
BRUNSSEN, J.: This comment should have been accepted as should the original Proposal 16-44. The securing and supporting requirements of 300.11 are overly restrictive and inappropriate for optical fiber cable. Section 300.11 is directed toward power cables that are physically larger and operate at substantially greater voltage, current and power levels. For further substantiation, see my explanation of negative on Proposal 16-44 and the substantiation accompanying my Comment 16-31.

JOHNSON, S.: I support the submitter's arguments. These are lightweight cables and pose no significant safety risk.

JONES, R.: There is no need to incorporate the requirements of 300.11. The installation requirements of Article 770 are adequate. In addition, the Panel has enhanced the Fine Print Note during this cycle by the addition of a reference to ANSI/NECAIFOA 301-2004 covering the installation of optical fiber cables. Section 300.11 is directed toward power cable assemblies that are heavier and larger than optical fiber cables. Optical fiber cables contain no power. (Where composite optical fiber cables are used, they are classified as electrical cables in accordance with the type of electrical conductors.)

16-32 Log #1532 NEC-P16 **Final Action: Reject**
(770.24)

Submitter: James E. Brunssen, Telcordia Technologies, Inc. / Rep. Alliance for Telecommunications Industry Solutions
Comment on Proposal No: 16-48
Recommendation: Accept this proposal.
Substantiation: This proposal should be accepted. If the Panel continues to support the addition of the requirements of 300.11 to 770.24, then at the very least, the requirements of 300.11(C) should be waived. Section 300.11(C) is clearly not applicable to optical fiber cables. Typical installation practice is to lash optical fiber cables together to form a "cable assembly". This frequently occurs during modifications or additions to an existing installation. Optical fiber cables are physically smaller and lighter than power cables and carry no power. Application of 300.11(C) is overly restrictive and will preclude lashing of optical fiber cables together to form a cable assembly. Optical fiber cables secured in this manner have adequate support (see 300.11(A)), are supported independently of the suspended ceiling grid, and are not likely to collapse in the event the suspended ceiling collapses. Such restriction imposes additional installation costs with no improvement in safety. See my companion comment on Proposal 16-44.
Panel Meeting Action: Reject
Panel Statement: Securing an additional cable to an existing cable does not constitute support. Additional cables must be directly supported by the same structural member that supports the first cable. In such installations, the additional cable is being supported by the same structural member.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 12 Negative: 3
Explanation of Negative:
BRUNSSEN, J.: This comment should have been accepted, as should the original Proposal 16-48. If the panel continues to support the addition of the securing and supporting requirements of 300.11, then at the very least 300.11(C) should be exempted. It is clearly not applicable to optical fiber cables. For further substantiation, see my explanation of negative on Proposal 16-48 and the substantiation accompanying my Comment 16-32. Additionally, the final sentence of the panel statement is unclear.

JOHNSON, S.: See my explanation of negative vote on Comment 16-31.

JONES, R.: See my Explanation of Negative Vote on Comment 16-31.

16-33 Log #2000 NEC-P16 **Final Action: Reject**
(770.24)

Submitter: Noel Williams, Herriman, UT
Comment on Proposal No: 16-43
Recommendation: This Proposal should have been Accepted without modification by the panel.
Substantiation: Cable ties of different types, materials, and configurations are widely used without problems and probably fall under the existing language "or similar fittings," so they would still continue to be used even if the proposal were rejected. However, much of the hardware that was already specifically permitted is not even available as listed products. For example, most straps, staples, and "hangers" are not listed products. Entire lines of one-hole and two-hole straps, standoff brackets, ring hangers, and the strut-type hardware used for all types of even the most heavy electrical wiring methods are not listed. The requirement should rest on the basic requirement of 110.2 - that all such materials be approved. The proposed wording in the Explanation of Negative by Mr. Boyer would also be usable, as there is a listing standard for the cable ties and this language, since it refers to primary support, would not restrict the use of cable ties that are used only for cable management. The language accepted by the panel would eliminate most of the products currently in use by this industry, without any evidence being provided of a problem with those products.
Panel Meeting Action: Reject
Panel Statement: The guide information for ZODZ, Wire Positioning Devices states that:

"The investigation of these products includes consideration of the rated mechanical strength, maximum operating temperature, smoke and heat generation, corrosion resistance and weatherability characteristics as appropriate for the product."

These are all characteristics that we should be concerned about for electrical installations.

Listed devices are evaluated using UL1565 – Standard for Positioning Devices. The scope of this standard states:

"1.1 This standard applies to those metallic and nonmetallic devices used for positioning - which may include bundling and securing - or to a limited extent supporting cable, wire, conduit, or tubing of a wiring system in electrical installations, to reduce the risk of fire, electric shock, or injury to persons."

The evaluation of positioning devices includes:

- Classification by mechanical strength, material, maximum temperature, and environmental conditions
- Required Markings giving critical information to the installer / inspector
- Mechanical strength tests
- Flammability classification of polymeric materials and coatings (NOT air-handling space requirements)
- Relative thermal index
- Material requirements (Including blending and substitution)
- Corrosion resistance
- Sharp edges
- Installation
- Mechanical strength
- Vibration
- Tests for mounting blocks and other mounting hardware and devices
- Environmental conditioning.....

Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
JOHNSON, S.: See my explanation of negative vote on Comment 16-29.

16-34 Log #717 NEC-P16 **Final Action: Reject**
(770.24, FPN)

Submitter: Robert Kelleher, Paramount Electrical Services
Comment on Proposal No: 16-46
Recommendation: The action should be to delete this Fine Print Note.
Substantiation: The addition of these NECA Fine Print Notes, serves no benefit to the user of the National Electrical Code. These are not standards, they are a compilation of generic information and do not serve as information to the user. These must be purchased through NECA. This FPN as written is nothing more than free advertisement for generic, readily available information which must be purchased by the code user. Code Making Panel 16 should consider taking an action to delete this FPN to coordinate with the other technical committees in the NEC project. A total of seventeen new Fine Print Notes were proposed to reference NECA standards. Sixteen were unanimously rejected. Inclusion of this Fine Print Note is in direct conflict with 90.1(C). In the action to reject proposal 8-3, one technical committee member promotes NECA standards as "….a tool to assist untrained electricians to make safer and better installations." The TCC should intervene, uphold the provisions of 90.1(C) and prohibit these types of Fine Print Notes. CMP16 should reject this FPN. Failure to do so will mean adding Fine Print Notes for IEC, EEI, IBEW, IAEI, ACC, NETA, NEI, SEIA, AISI, API, ASHE, AHAM, ICEAI, NYBFU and dozens of others when they decide to develop income through generic standards development. If this type of Fine Print Note is placed anywhere in the NEC an Annex should be included with coupons for the code user. If the NEC is to be used for advertisement purposes, coupons should be included.
Panel Meeting Action: Reject
Panel Statement: Proposal 16-46 pertained to updating the FPN, not to delete it.

The comment requests the FPN be deleted. The FPN provides valuable information, and the panel intends that it be retained but the date updated. The references provided in the FPN provide guidance for installation in a neat and workmanship-like manner.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
PREZIOSO, L.: While I agree with the panel action based on the specific wording of the comment, the proposal referenced a fine print note (FPN) identifying an ANSI/NECA/BICSI Standard as the source for identifying accepted industry practices. The comment writer made the intent of the comment clear in the substantiation, but the panel's action disregarded the substantiation based on an incorrect reference in the recommendation. While it

is true that FPNs are not enforceable, referencing these standards in a FPN as a means for determining the acceptable industry standard is, at best, misleading. I fully support these standards, but on many projects these standards are not incorporated as requirements into the design or the construction of the system or the building. The owners and tenants often waive compliance with these standards as a means of reducing costs. In this situation, referencing the ANSI/ NECA/BICSI Standards as the accepted industry practice for the installation of wires and cables is incorrect, and through the use of the NEC by the AHJ, puts an undue burden on the installer. Accordingly, the comment writer is correct in writing that the FPN should not be in the NEC and panel is correct in rejecting the comment.

16-35 Log #869 NEC-P16 **Final Action: Reject**
(770.24, FPN (New))

Submitter: John P. Masarick, Independent Electrical Contractors Inc.
Comment on Proposal No: 16-47
Recommendation: The panel is encouraged to continue to Accept Proposal 16-47.
Substantiation: The reasons to continue to Accept the Proposal are as follows:
1. The trend by the CMPs over the last several code cycles has been to limit the use of FPNs.
2. There is also a correlation issue. There is a conflict between those panels that accepted the proposal and those that rejected the proposal.
3. These standards are also covered by a Fine Print Note in 110.12.
4. The FPN should not be accepted because numerous standards and installation manuals exist and to only mention one does not adequately inform the public about accepted industry practices. The NEC is not intended to be an instruction manual for untrained persons. If the FPNs are allowed to reference these standards, then they should list all applicable standards.
5. Since the referenced installation standards are intentionally general to cover different models of equipment, approval of the FPN may lead many to believe these standards can be used instead of listed or labeled manufacturer's instructions which would be in violation of 110.3(B).
6. If the CMP would like to include the reference, it should be placed in the Annex with the other references.
Panel Meeting Action: Reject
Panel Statement: The panel has rejected Proposal 16-47 for the reason given in the panel statement. The submitter of this comment encourages the panel to "continue to accept Proposal 16-47", which is inconsistent with the panel action on Proposal 16-47.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
PREZIOSO, L.: See my explanation of affirmative vote on Comment 16-34.

16-36 Log #543 NEC-P16 **Final Action: Accept in Principle**
(770.25(New), 800.25 (New), 820.25 (New), and 830.25 (New))

TCC Action: The Technical Correlating Committee directs that the Fine Print Notes added in the panel action be deleted because they contain a statement of intent.
The Technical Correlating Committee notes that the rules, as written in the main code text, are clear in that they apply to the accessible portion of the abandoned cable.
Submitter: Richard P. Owen, City Of St. Paul
Comment on Proposal No: 16-29
Recommendation: Revise 770.25 (New), 800.25 (New), 820.25 (New) and 830.25 (New) as shown below:
770.25 Abandoned Cables. The accessible portion of abandoned optical fiber cables shall be removed. Where cables are identified for future use with a tag, the tag shall be of sufficient durability to withstand the environment involved.
FPN: See Article 100 for a definition of accessible. It is desirable to remove as much abandoned cable as is practical, but it is not the intent of this section to require construction or renovation specifically to facilitate the removal of abandoned cable.
800.25 Abandoned Cables. The accessible portion of abandoned communications cables shall be removed. Where cables are identified for future use with a tag, the tag shall be of sufficient durability to withstand the environment involved.
FPN: See Article 100 for a definition of accessible. It is desirable to remove as much abandoned cable as is practical, but it is not the intent of this section to require construction or renovation specifically to facilitate the removal of abandoned cable.
820.25 Abandoned Cables. The accessible portion of abandoned coaxial cables shall be removed. Where cables are identified for future use with a tag, the tag shall be of sufficient durability to withstand the environment involved.
FPN: See Article 100 for a definition of accessible. It is desirable to remove as much abandoned cable as is practical, but it is not the intent of this section to require construction or renovation specifically to facilitate the removal of abandoned cable.
830.25 Abandoned Cables. The accessible portion of abandoned network-powered broadband cables shall be removed. Where cables are identified for future use with a tag, the tag shall be of sufficient durability to withstand the environment involved.
FPN: See Article 100 for a definition of accessible. It is desirable to remove as much abandoned cable as is practical, but it is not the intent of this section to require construction or renovation specifically to facilitate the removal of abandoned cable.
Substantiation: This comment was written by a Task Group consisting of Stan Kaufman and Randy Ivans (Panel 16), John Mortimer (Panel 12) and Ron Maassen, Paul Casparro (Panel 3) plus Task Group Chair Richard Owen (Panel 3). The Task Group was directed by the Technical Correlating Committee to examine proposals submitted to all three Panels concerning abandoned cable and other related issues covered by the Panels.
The Task Group came to consensus on the following issues and submitted comments to the Panels as appropriate:
1) On the issue of abandoned cable removal, the task group agreed that only the accessible portions of abandoned cable should be removed. To require removal of all cable could, in some cases, necessitate demolition of the building finish in order to access cables that were properly fastened to the building in accordance with the rules in the various code articles. Furthermore, the task group agreed that the requirements for abandoned cable removal should not be in Section X.3 (Locations and Other Articles) but should be relocated into the general requirements of each article.
2) The task group also agreed to recommend the addition of a new Fine Print Note to further explain the removal requirement. This addition was thought to be necessary to address a common practice of cables that are "fished" inside existing walls. These cables, if abandoned, can be disconnected from their junction point in a wall and pulled out of the wall without having to harm the building finish. At present, in many cases, these cables are being cut off above the wall and left to drop into the wall space.
3) On the issue of "tagged for future use", the Task Group agreed that it was not necessary to require anything more than the cable tag being "...of sufficient durability to withstand the environment involved." This phrase is used in several other places in the NEC and leaves it up to the AHJ as to what is suitable. This language does not add requirements that are difficult, if not impossible, to enforce by adding unclear requirements for rodent-resistance, etc.
Panel Meeting Action: Accept in Principle
Change the FPN of 770.25, 800.25, 820.25, and 830.25 as follows:
" FPN: See Article 100 for a definition of "Accessible (as applied to wiring methods)". It is desirable to remove as much abandoned cable as is practical."
Panel Statement: The panel accepts the submitter's comment with modification to the FPN of 770.25, 800.25, 820.25 and 830.25 only. The definition of "Accessible (as applied to wiring methods)" adequately covers the last part of the FPN that was removed.

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 16-50
Recommendation: The Technical Correlating Committee directs that the Panel clarify the Panel Action and Statement on this Proposal and that further consideration be given to the comments expressed in the affirmative votes. This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the direction of the TCC to review clarification of the panel action.
The panel accepts the direction of the TCC to review clarification of the panel action.
The panel concurs with the affirmative comments that the correct reference is Proposal 16-84, not Proposal 16-184.
The panel clarifies the panel action per the TCC request as follows. The panel accepts in principle the proposed relocation of the abandoned cable removal requirements, but to 770.25, not 770.30 (see Proposals 16-29, -31). The panel rejects the proposed revision to 770.154(A) per Standards Council Decision 05-24 (SC#05-7-4), and accepts the proposed deletion of text in 770.154(B)(1). Hence, the panel action to "accept in principle in part".
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-38 Log #868 NEC-P16 **Final Action: Reject**
(770.42, FPN)

Submitter: John P. Masarick, Independent Electrical Contractors Inc.
Comment on Proposal No: 16-46
Recommendation: The panel is encouraged to continue to Reject Proposal 16-46.
Substantiation: The reasons to continue to Reject the Proposal are as follows:
1. The trend by the CMPs over the last several code cycles has been to limit the use of FPNs.
2. There is also a correlation issue. There is a conflict between those panels that accepted the proposal and those that rejected the proposal.
3. These standards are also covered by a Fine Print Note in 110.12.
4. The FPN should not be accepted because numerous standards and installation manuals exist and to only mention one does not adequately inform the public about accepted industry practices. The NEC is not intended to be an instruction manual for untrained persons. If the FPNs are allowed to reference these standards, then they should list all applicable standards.
5. Since the referenced installation standards are intentionally general to cover different models of equipment, approval of the FPN may lead many to believe these standards can be used instead of listed or labeled manufacturer's instructions which would be in violation of 110.3(B).
6. If the CMP would like to include the reference, it should be placed in the Annex with the other references.
Panel Meeting Action: Reject
Panel Statement: The panel action on Proposal 16-46 was to accept in principle; therefore the panel cannot accept the submitter's recommendation to continue to reject.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
PREZIOSO, L.: See my explanation of affirmative vote on Comment 16-34.

16-39 Log #244 NEC-P16 **Final Action: Accept in Principle**
(770.93)

Submitter: Stanley Kaufman, CableSafe Inc.
Comment on Proposal No: 16-54
Recommendation: Accept this proposal in principle by revising 770.93 as shown below:
~~Where exposed to contact with electric light or power conductors, the non–current-carrying metallic members of optical fiber cables entering buildings shall be grounded as close to the point of entrance as practicable or shall be interrupted as close to the point of entrance as practicable by an insulating joint or equivalent device.~~
Optical fiber cables entering buildings or attaching to buildings shall comply with (A) or (B).
(A) Entering Buildings. In installations where an optical fiber cable is exposed to contact with electric light or power conductors and enters the building, the non–current-carrying met
allic members shall be either grounded or interrupted by an insulating joint or equivalent device. The grounding or interruption shall be as close as practicable to the point of entrance.
(B) Terminating Outside of the Building. In installations where an optical fiber cable is exposed to contact with electric light or power conductors and the cable is terminated outside of the building building, the non–current-carrying metallic members shall be either grounded or interrupted by an insulating joint or equivalent device. The grounding or interruption shall be as close as practicable to the point of attachment or termination of the cable.
Substantiation: The suggested text is an editorial clarification. The text the panel accepted deals with two scenarios, installations where the cable enters the building and installations where the cable is terminated outside of the building. It is clearer to deal with each scenario in a separate sentence. The suggested text retains these options.
The suggested text is an editorial clarification intended to bring this section into compliance with section 3.3.1(2) of the NEC Style Manual which states:
2. Use simple declarative sentence structure, and keep sentences short. Writing rules in long sentences full of commas, dependent clauses, and parenthetical expressions often creates confusion and misunderstanding. The requirement can be written in two or more short sentences, expressed using a list or table, or both.
The existing paragraph deals with two scenarios, 1) installations where the cable enters the building and 2) installations where the cable is terminated outside of the building. It is clearer to deal with each scenario in a separate subsection.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 16-40.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-40 Log #1533 NEC-P16 **Final Action: Accept**
(770.93)

Submitter: James E. Brunssen, Telcordia Technologies, Inc. / Rep. Alliance for Telecommunications Industry Solutions
Comment on Proposal No: 16-4
Recommendation: Accept this proposal in principle by revising 770.93 as shown below:
~~Where exposed to contact with electric light or power conductors, the non–current-carrying metallic members of optical fiber cables entering buildings shall be grounded as close to the point of entrance as practicable or shall be interrupted as close to the point of entrance as practicable by an insulating joint or equivalent device.~~
Optical fiber cables entering the building or terminating on the outside of the building shall comply with (A) or (B).
(A) Entering Buildings. In installations where an optical fiber cable is exposed to contact with electric light or power conductors and the cable enters the building, the non–current-carrying metallic members shall be either grounded as specified in 770.100, or interrupted by an insulating joint or equivalent device. The grounding or interruption shall be as close as practicable to the point of entrance.
(B) Terminating On the Outside of the Building. In installations where an optical fiber cable is exposed to contact with electric light or power conductors and the cable is terminated on the outside of the building, the non–current-carrying metallic members shall be either grounded as specified in 770.100, or interrupted by an insulating joint or equivalent device. The grounding or interruption shall be as close as practicable to the point of termination of the cable.
Substantiation: The Panel, in revising this section, recognized that the cable does not always enter the building. In many cases it is terminated on the outside of the building in an Optical Network Termination (ONT) or similar device. In attempting to accommodate this scenario, the Panel added the text "or attached" and "point of attachment". However, the addition of that text is misleading and will result in impractical and unwieldy grounding and interruption requirements. The suggested text provides editorial clarification by addressing the two scenarios, cables entering the building and cables terminating on the outside of the building, separately. Further, the suggested text eliminates any confusion that may result from the use of the terms "attached" and "point of attachment", and addresses the issue directly: cables that are terminated on the outside of the building. The phrase "connected to an electrode by a grounding conductor" as contained in Proposal 16-4 (770.93) and in the 2008 NEC Draft is unnecessary as the Panel has accepted the addition of the perscriptive grounding requirements of 770.100 (see Proposal 16-25). The text "as specified in 770.100" is added for consistency with the Panel Action on Proposal 16-4 for 800.93, 820.93 and 830.93

Comment on Proposal No: 16-25
Recommendation: Continue to accept the proposal, but change the term "Intersystem Grounding Termination" to "Intersystem Bonding Termination."
Substantiation: This is a correlating comment to correlating with the actions of CMP-5 taken on proposal 5-20 as directed by the TCC. CMP-5 changed the term "Intersystem Grounding Termination" to "Intersystem Bonding Termination."
Panel Meeting Action: Accept
Panel Statement: See panel action and statement on Comment 16-18.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-44 Log #2002 NEC-P16 **Final Action: Reject**
(770.113)

TCC Action: The Technical Correlating Committee understands that the text of 770.113 is to be constructed as follows:

Proposal 16-50 shows the title, proposal 16-57 shows the first sentence, and Proposal 16-52 introduces a new Exception to 770.113.

Proposal 16-52 reworded exceptions in the 2005 NEC into positive language in 770.48(A) and (B).

The Technical Correlating Committee directs that the new Exception be written as a complete sentence in accordance with Section 3.1.4.1 of the NEC Style Manual as follows:

"Exception: Optical fiber cables that comply with 770.48 shall not be required to be listed."

Submitter: Noel Williams, Herriman, UT
Comment on Proposal No: 16-60
Recommendation: This Proposal should have been Rejected.
Substantiation: This proposal conflicts with the language in Proposal 16-57 which was also accepted, and which includes much better language. Proposal 16-57 says where optical fiber cables are installed in buildings they must be listed. This proposal says, literally, listed optical fiber cables must be installed in all buildings. The change in the exception language is unnecessary. If the cable is listed it has to be marked. The change in title is also unnecessary - the content is about listed cables - where they are necessary and where they are not.
Panel Meeting Action: Reject
Panel Statement: The actions on Proposals 16-57 and 16-60 do not conflict. The action on Proposal 16-57 only changed the first sentence of 770.113. The action on Proposal 16-60 left the first sentence of 770.113 unchanged.

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 16-62
Recommendation: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposals 8-53 and 8-78. See Technical Correlating Committee action on Proposals 8-53 and 8-78. This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the direction of the TCC to reconsider and correlate with the action on Proposals 8-53 and 8-78.

See panel action and statement on Comment 16-47. There is no requirement that RTRC have the appropriate fire properties to be suitable for this application.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:

STENE, S.: 770.113, Exception No. 2 currently allows rigid nonmetallic conduit, Type RNC in accordance with Article 352. RNC includes both rigid PVC and RTRC conduit. A new Article 355 is being created to cover RTRC, which will then be removed from Article 352. The panel action to remove RTRC from the list of acceptable raceways effectively removes a product which was previously acceptable.

16-47 Log #361 NEC-P16 **Final Action: Accept in Part**
(770.113 Exception No. 2)

TCC Action: The Technical Correlating Committee understands that the change indicated in the panel action should occur in 770.48(B). There is no change in 770.113 as a result of the panel action on this proposal.
Submitter: Code-Making Panel 8,
Comment on Proposal No: 16-62
Recommendation: CMP-16 should accept Proposal 16-62 as originally proposed.
Substantiation: CMP-16 should accept Proposal 16-62 as originally proposed to correlate with the action taken by CMP-8 on Proposals 8-53 and 8-78.

This comment has been balloted through CMP-8 with the following ballot results:

12 Eligible to Vote
11 Affirmative
1 Negative

Mr. R. Loyd voted negatively stating: "Proposal 16-62 was to Reject. I agree with Mr. Burn's' recommendation to revise the panel action, but it should be Accepted in Principle as follows:

"Recommended change:

Revise 770.113, Exception No. 2 to read as follows: "Exception no. 2: Nonconductive optical fiber cables shall not be required to be listed and marked where the cable enters the building from the outside and is run in raceway systems installed in compliance with any of the following Articles in Chapter 3; Article 342, Intermediate Metal Conduit; Type IMC; Article 344, Rigid Metal Conduit; Type RMC; Article 352, PVC Conduit; Article 355, Reinforced Thermosetting Resin Conduit, Type RTRC; and Article 358, Electrical Metallic Tubing, Type EMT."

Substantiation: This change is necessary to correlate with the actions of CMP-8."
Panel Meeting Action: Accept in Part

Revise 770.113 Exception No. 2 as follows:

Exception No. 2: Nonconductive optical fiber cables shall not be required to be listed and marked where the cable enters the building from the outside and is run in raceway systems installed in compliance with any of the following articles in Chapter 3; Article 342, Intermediate Metal Conduit; Type IMC; Article 344, Rigid Metal Conduit; Type RMC; Article 352, Rigid ~~Nonmetallic~~ PVC Conduit; Type PVC ~~RNC~~; and Article 358, Electrical Metallic Tubing: Type EMT.
Panel Statement: The panel accepts the use of PVC conduit and rejects the use of RTRC. There is no requirement for RTRC to have the appropriate fire properties to be suitable for this application.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:

STENE, S.: See my explanation of negative vote on Comment 16-46.

16-48 Log #393 NEC-P16 **Final Action: Accept in Part**
(770.113 Exception No. 2)

Submitter: David H. Kendall, Carlon
Comment on Proposal No: 16-62
Recommendation: This proposal should be Accept in Principle and revised to read as follows:

Exception No. 2: Nonconductive optical fiber cables shall not be required to be listed and marked where the cable enters the building from the outside and is run in raceway systems installed in compliance with any of the following articles in Chapter 3; Article 342, Intermediate Metal Conduit; Type IMC; Article 344, Rigid Metal Conduit; Type RMC; Article 352, Rigid Polyvinyl Chloride Conduit; ~~Nonmetallic Conduit~~; Type PVC, ~~RNC~~; Article 355, Reinforced Thermosetting Resin Conduit; Type RTRC; and Article 358, Electrical Metallic Tubing; Type EMT.
Substantiation: Panel 8 did Accept in Principle Proposals 8-53 and 8-78. To be consistent with the revised Article 352 "Article 352, Rigid Polyvinyl Chloride Conduit: Type PVC" should be used instead of "Article 352, Rigid PVC Conduit; Type PVC" as proposed.

Panel Meeting Action: Accept in Part
Panel Statement: See panel action and statement on Comment 16-47.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
STENE, S.: See my explanation of negative vote on Comment 16-46.

16-49 Log #1388 NEC-P16 **Final Action: Accept in Part**
(770.113 Exception No. 2)

Submitter: William Wagner, Certification Solutions
Comment on Proposal No: 16-62
Recommendation: This Proposal should Accepted as originally proposed.
Exception No. 2: Nonconductive optical fiber cables shall not be required to be listed and marked where the cable enters the building from the outside and is run in raceway systems installed in compliance with any of the following articles in Chapter 3: Article 342, Intermediate Metal Conduit; Type IMC; Article 344, Rigid Metal Conduit: Type RMC; Article 352, Rigid ~~Nonmetallic~~ PVC Conduit: Type PVC ~~RNC~~; Article 355, Reinforced Thermosetting Resin Conduit: Type RTRC; and Article 358, Electrical Metallic Tubing: Type EMT.
Substantiation: In accordance with CMP-8's actions on Proposals 8-53 and 8-78, Article 352 will now apply to "Rigid Polyvinyl Chloride Conduit: Type PVC", and Article 355 will now apply to "Reinforced Thermosetting Resin Conduit: Type RTRC". Prior to the separation of these Articles both of these conduit Types were included in Article 352 as "Rigid Nonmetallic Conduit: Type RNC." Therefore, it is necessary to revise the reference in Exception No. 2 of 770.113 as noted above.
This will correlate with the TCC Action on Proposal 16-62.
Panel Meeting Action: Accept in Part
Panel Statement: See panel action and statement on Comment 16-47.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1

16-50 Log #1768 NEC-P16 **Final Action: Reject**
(770.154)

Submitter: Robert W. Jensen, dbi
Comment on Proposal No: 16-70
Recommendation: Accept proposal to delete Fine Print Note
~~FPN: See 8.14.1 of NFPA 13 (2002), Installation of Sprinkler Systems, for requirements for sprinklers in concealed spaces containing exposed combustibles.~~
Substantiation: The Standards Council issued two decisions, NFPA Standards Council Decision 06-03 (SC #06-3-18) dated 22 March 2006 and NFPA Standards Council Decision 06-19 (SC #06-7-33) dated 28 July 2006. These decisions address Code Making Panel (CMP) decisions on Fine Print Notes referencing NFPA 13. The former (earlier) decision states, in pertinent part: "Mr. Dollard asks for clarification whether the Standards Council directive prohibits the NEC project from deleting the Fine Print Notes to sections 770.154, 800.154 & 820.154. The Council, after due consideration, believes that clarification is appropriate in this instance and responds that the NEC project would not violate the directive by deleting the fine print notes at issue." The later decision states, in pertinent part, as follows: "if the fine print notes are not a helpful reference to NFPA 13 or engender confusion, the NEC Project should have the ability to delete them and nothing in the Council's status quo directive prohibits this." The decision also states: "It has also been pointed out that deletion of the fine print notes would provide further consistency within the NEC itself since, currently, the fine print notes at issue only appear in some relevant NEC Articles (Articles 770, 800, and 820), but not in others (Articles 725 and 760)." The decision also states: "nothing in NFPA procedures prevents the NEC Project from considering and acting on deletion of the fine print notes during the Comment phase of the code development process. Proposals to the fine print notes were filed and rejected by the responsible CMP based on its then understanding of the Council's directive. The subject was explicitly raised during the Report on Proposals phase of the process and is clearly open for further consideration and action during the Comment phase."
This FPN is being misinterpret and used in aggressive marketing attempts to require the installation of "limited combustible cable" (one such example is found at http://www.dupont.com/cablingsolutions/products/codes.html). The FPN has had a profound effect in which it is used in misleading the AHJ to require limited combustible cable, conduit, or a sprinkler system to be installed within the concealed space.
As an example, an AHJ Massachusetts would not provide a certificate of occupancy until the communications cabling was either replaced with limited combustible cable, the CMP cable was placed in conduit, or a sprinkler system installed above the suspended ceiling.. Although the installer had met the requirements of the NEC, the FPN misled the AHJ causing project delays and the potential of inordinate cost to the project. A plea to the NFPA aided the communications installer in which clarification was given that the CMP cabling was indeed sufficient to meet code and that NFPA 13 allowed some quantities (which is not defined) of communications cabling within concealed spaces. The installation of the CMP cable was allowed.
To further the removal of this FPN, the Report on Proposals A2006 from NFPA 13 (copy provided), the NFPA committee specifically added an annex A.8.14.1.2.1 in 13-284 log #551 stating that, "Some minor quantities of combustible materials, such as communication wiring, can be present in some concealed spaces but should not typically be viewed as requiring sprinklers (see 8.14.1.1). The threshold value at which sprinklers become necessary in the concealed space is not defined. For example, the usual amounts of data or telephone wiring found above a ceiling would not typically constitute a threat. If bundles of unsheathed computer wiring are installed above the ceiling or beneath the floor in a manner where fire propagation in all directions is likely, then the concealed space should be treated the same as a combustible space, thereby requiring appropriate sprinkler protection."
In addition to the above, Panel 3 rejected the last minute introduction of this proposal that was made in the ROC stage. BICSI, which represents 24,000 installers, designers and manufacturers, feels that this last minute interjection of a FPN was not sufficiently vetted to industry and that the TCC should review this matter.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The FPN continues to provide useful guidance. Possibilities of misinterpretation are minimized in the 2007 Edition of NFPA 13.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 12 Negative: 3
Explanation of Negative:
JENSEN, R.: This FPN, as informative text to the NEC, is being used to market limited combustible cable. The NEC should not be used for this purpose. The FPN has had a profound effect in which it is used in misleading the AHJ, designers and installers to require limited combustible cable, conduit, or a sprinkler system to be installed within the concealed space.
In addition to the above, Panel 3 where there is not a marketing influence, rejected the inclusion of this FPN in Article 725. Cables used in 725 and 770 are interchangeable in many applications, yet there is no correlation of such a FPN.
JOHNSON, S.: Various commentors have all indicated that this fine print note causes confusion in the field. FPNs are intended to clarify and are not enforceable. If removing the note will eliminate confusion, I support deletion of the FPN.
OHDE, H.: This comment should have been accepted as this FPN does not provide useful guidance as indicated in the Panel Statement. This FPN which references 8.14.1 of NFPA 13 (2002) Installation of Sprinkler Systems has shown to be problematic and therefore should be deleted as allowed per Standards Council Decision D#06-03. If the FPN were to be deleted this would in effect restore the NEC to the 2002 edition.
The panel statement also included that the 2007 Edition of NFPA 13 would automatically eliminate the possibilities of misinterpretation. There was no opportunity for CMP 16 or the public to review the new proposed edition to see if this would eliminate the possibilities of misinterpretation. The 2007 edition of NFPA 13 also could be in violation of Standards Council Decision D#05-24 to remain status quo on these issues.

16-51 Log #1771 NEC-P16 **Final Action: Reject**
(770.154)

Submitter: Robert W. Jensen, dbi
Comment on Proposal No: 16-70
Recommendation: Accept proposal to delete Fine Print Note
~~FPN: See 8.14.1 of NFPA 13 (2002), Installation of Sprinkler Systems, for requirements for sprinklers in concealed spaces containing exposed combustibles.~~

Substantiation: The Standards Council issued two decisions, NFPA Standards Council Decision 06-03 (SC #06-3-18) dated 22 March 2006 and NFPA Standards Council Decision 06-19 (SC #06-7-33) dated 28 July 2006. These decisions address Code Making Panel (CMP) decisions on Fine Print Notes referencing NFPA 13. The former (earlier) decision states, in pertinent part: "Mr. Dollard asks for clarification whether the Standards Council directive prohibits the NEC project from deleting the Fine Print Notes to sections 770.154, 800.154 & 820.154. Panel Statement: The FPN continues to provide useful guidance. Possibilities of misinterpretation are minimized in the 2007 Edition of NFPA 13.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 12 Negative: 3

Explanation of Negative:

JENSEN, R.: This FPN, as informative text to the NEC, is being used to market limited combustible cable. The NEC should not be used for this purpose. The FPN has had a profound effect in which it is used in misleading the AHJ, designers and installers to require limited combustible cable, conduit, or a sprinkler system to be installed within the concealed space.

In addition to the above, Panel 3 where there is not a marketing influence, rejected the inclusion of this FPN in Article 725. Cables used in 725 and 770 are interchangeable in many applications, yet there is no correlation of such a FPN.

JOHNSON, S.: See my explanation of negative vote on Comment 16-50.

OHDE, H.: See my Explanation of Negative for Comment 16-50.

16-52 Log #1772 NEC-P16 **Final Action: Reject**
(770.154)

Submitter: Robert W. Jensen, dbi
Comment on Proposal No: 16-71
Recommendation: Accept proposal to delete Fine Print Note
~~FPN: See 8.14.1 of NFPA 13 (2002), Installation of Sprinkler Systems, for requirements for sprinklers in concealed spaces containing exposed combustibles.~~
Substantiation: The Standards Council issued two decisions, NFPA Standards Council Decision 06-03 (SC #06-3-18) dated 22 March 2006 and NFPA Standards Council Decision 06-19 (SC #06-7-33) dated 28 July 2006. These decisions address Code Making Panel (CMP) decisions on Fine Print Notes referencing NFPA 13. The former (earlier) decision states, in pertinent part: "Mr. Dollard asks for clarification whether the Standards Council directive prohibits the NEC project from deleting the Fine Print Notes to sections 770.154, 800.154 & 820.154. The Council, after due consideration, believes that clarification is appropriate in this instance and responds that the NEC project would not violate the directive by deleting the fine print notes at issue." The later decision states, in pertinent part, as follows: "if the fine print notes are not a helpful reference to NFPA 13 or engender confusion, the NEC Project should have the ability to delete them and nothing in the Council's status quo directive prohibits this." The decision also states: "It has also been pointed out that deletion of the fine print notes would provide further consistency within the NEC itself since, currently, the fine print notes at issue only appear in some relevant NEC Articles (Articles 770, 800, and 820), but not in others (Articles 725 and 760)." The decision also states: "nothing in NFPA procedures prevents the NEC Project from considering and acting on deletion of the fine print notes during the Comment phase of the code development process. Proposals to the fine print notes were filed and rejected by the responsible CMP based on its then understanding of the Council's directive. The subject was explicitly raised during the Report on Proposals phase of the process and is clearly open for further consideration and action during the Comment phase."

This FPN is being misinterpret and used in aggressive marketing attempts to require the installation of "limited combustible cable" (one such example is found at http://www.dupont.com/cablingsolutions/products/codes.html). The FPN has had a profound effect in which it is used in misleading the AHJ to require limited combustible cable, conduit, or a sprinkler system to be installed within the concealed space.

As an example, an AHJ Massachusetts would not provide a certificate of occupancy until the communications cabling was either replaced with limited combustible cable, the CMP cable was placed in conduit, or a sprinkler system installed above the suspended ceiling.. Although the installer had met the requirements of the NEC, the FPN misled the AHJ causing project delays and the potential of inordinate cost to the project. A plea to the NFPA aided the communications installer in which clarification was given that the CMP cabling was indeed sufficient to meet code and that NFPA 13 allowed some quantities (which is not defined) of communications cabling within concealed spaces. The installation of the CMP cable was allowed.

To further the removal of this FPN, the Report on Proposals A2006 from NFPA 13 (copy provided), the NFPA committee specifically added an annex A.8.14.1.2.1 in 13-284 log #551 stating that, "Some minor quantities of combustible materials, such as communication wiring, can be present in some concealed spaces but should not typically be viewed as requiring sprinklers (see 8.14.1.1). The threshold value at which sprinklers become necessary in the concealed space is not defined. For example, the usual amounts of data or telephone wiring found above a ceiling would not typically constitute a threat. If bundles of unsheathed computer wiring are installed above the ceiling or beneath the floor in a manner where fire propagation in all directions is likely, then the concealed space should be treated the same as a combustible space, thereby requiring appropriate sprinkler protection."

In addition to the above, Panel 3 rejected the last minute introduction of this proposal that was made in the ROC stage. BICSI, which represents 24,000 installers, designers and manufacturers, feels that this last minute interjection of a FPN was not sufficiently vetted to industry and that the TCC should review this matter.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The FPN continues to provide useful guidance. Possibilities of misinterpretation are minimized in the 2007 Edition of NFPA 13.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 12 Negative: 3

16-55 Log #2016 NEC-P16 **Final Action: Accept**
(770.154)

Submitter: Harold C. Ohde, IBEW #134

Comment on Proposal No: 16-69

Recommendation: Continue to Reject.

Substantiation: The submitter's recommendation to create a new cable designation (OFN50 and OFC50) is nothing more than a marketing ploy. A backdoor approach you might say to get NFPA 255 and NFPA 259 cables in the cable hierarchy. The submitter's substantiation would have misled the designer, installer and code officials to believe, install and enforce that limited combustible cable, conduit or a sprinkler system to be installed in the concealed space or plenums would be a requirement because of NFPA 13, Section 8.14.1. The submitter's substantiation references 2002 NFPA 13 Section 8.14.1. It is important to note that the NEC does not have a definition

of "concealed spaces", therefore making it impossible to enforce. What constitutes a concealed space? Is it the space above a dropped ceiling; or is it a space above plastered or drywall ceiling? Is it the wall cavity of typical wall construction?

NFPA 13 just completed their revision process for the 2006 NFPA 13 Standard. 8.14.1 of NFPA 13 has been revised to read as follows:

8.14.1.2 Concealed Spaces not Requiring Sprinkler Protection.

8.14.1.2.1* Concealed spaces of noncombustible and limited combustible construction with minimal combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those as a return air for a plenum. (For additional information on combustible loading see A.8.14.1.2.1).

8.14.1.2.2 Concealed spaces of noncombustible and limited combustible construction with limited access and not permitting occupancy or storage of combustible shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.

A.8.14.1.2.1 Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc... can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1). For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined.

In the 2006 NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.

CMP 16 rejected this proposal based on the Standards Council decision D#05-24 to remain "status quo" on issues that pertain to NFPA 90A.

16-56 Log #1466 NEC-P16 **Final Action: Reject**
(770.154, 770.179, 800.154, 800.179, 820.154, and 820.179)

Submitter: Allen C. Weidman, The Society of the Plastics Industry, Inc.
Comment on Proposal No: 16-69
Recommendation: Reconsider and accept the proposals.
Substantiation: The Panel erred in applying the Council's directive on NFPA 90A, related to materials exposed to airflow in an air distribution system. The cables in each of the proposals did not have an "R" or "P" as the last letter in the type designation, so would not be permitted to be installed in a riser or air distribution system (air ducts and plenums). The cables would only be permitted as other wiring within buildings.
Panel Meeting Action: Reject
Panel Statement: Cable meeting specifications as described in this comment are not prohibited by the Code, and the panel sees no need for an additional marking.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-57 Log #366 NEC-P16 **Final Action: Accept**
(770.154 & 800.154)

TCC Action: The Technical Correlating Committee directs that these comment changes occur in 770.154(E) and the Table titled with 770.154(E) based on the action taken in Proposal 16-68.
Submitter: S. D. Kahn, Tri-City Electric Company, Inc. / Rep. NECA
Comment on Proposal No: 16-74
Recommendation: Accept this proposal in principle. Continue to accept the recommendation in proposal 16-74 and, in addition, making the following changes and renumbering the titles of the Tables and Figures as shown:

770.154(F) Cable Substitutions. The substitutions for optical fiber cables listed in Table 770.154(F) and illustrated in Figure 770.154(F) shall be permitted.

Renumber Table 770.154 to be Table 770.154(F) and Figure 770.154 to be Figure 770.154(F).

800.154(G) Cable Substitutions. The uses and substitutions for communications cables listed in Table 800.154(G) and illustrated in Figure 800.154(G) shall be permitted.

FPN: For information on Types CMP, CMR, CMG, CM, and CMX cables, see 800.179.

~~FPN: See Figure 800.154, Cable Substitution Hierarchy.~~

Renumber Table 800.154 to be Table 800.154(G) and Figure 800.154 to be Figure 800.154(G).

Substantiation: Section 2.3 of the NEC Style Manual provides for two options for figures, either they are mandatory and can have mandatory language (shall) or they are non-mandatory and are in a fine print note and do not contain mandatory language. This comment will bring the cable substitution figures into compliance with the style manual by making the cable substitution figures part of the mandatory text.

Although Proposal 16-74 did not deal with 800.154, this comment also addresses that section as well for consistency. Similar corrections for Articles 725, 760 and 820 are contained in other Comments.

This Comment has been prepared by a Task Group established by the Technical Correlating Committee. The Task Group includes R. Owen, M. Ode, S. Owen, J. Brunssen, S. Kaufman, S. Johnson, S. L. Stene and S. D. Kahn.

16-58 Log #741 NEC-P16 **Final Action: Reject**
(770.154, FPN)

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 16-70
Recommendation: This proposal should be Accepted.
Substantiation: The submitter of this proposal to delete the Fine Print Note referencing NFPA 13 is correct in his substantiation. However, CMP-16 rejected this proposal on the basis of the directive from Standards Council D#05-24, to remain "status quo" on issues with respect to NFPA 90A. The Standards Council has recently decided that the Fine Print Notes under the purview of CMP-16 which reference NFPA 13 may be deleted, and such deletion is not in conflict with the Standards Council directive. This final Standards Council decision is titled D#06-03 and is included for your review. It is important to note that, **Standards Council clearly recognizes the 2002 edition of the NEC, in which these Fine Print Notes were not included, as the status quo.**

An appeal was made by Mr. A. Weidman in an attempt to overturn the previous decision by Standards Council to allow CMP-16 to delete the Fine Print Notes referencing NFPA 13. The appeal was soundly denied by Standards Council. The final decision, D#06-19 is also included for your review. It is extremely interesting to note that the last sentence of the decision by Standards Council provides directions for CMP-16 as follows:

"If the fine print notes are in any way problematic, they should now be deleted, restoring the NEC in this regard to the status quo on plenum cable issues represented by the 2002 edition of the NEC."

These Fine Print Notes are problematic. Following the advice of Standards Council, they should be deleted. These Fine Print Notes exist solely to manipulate, misinform and threaten end users of the NEC. The proponents of flouropolymer products have developed an elaborate, financially driven scheme outlined as follows:

(1) Develop an Association (CFRA), funded by manufacturers, to coordinate and orchestrate unethical marketing plans by manipulation NFPA codes and standards

(2) Place consultants, hired to push flouropolymer interests, on CMP-3 and CMP-16 under the cloak of other organizations

(3) Promote Fine Print Notes referencing NFPA 13 in the NEC

(4) Use the Fine Print Notes to develop deceiving literature and presentations to manipulate the NFPA family of codes and standards to promote products which are not required

(5) Misinform and manipulate building code officials with a propaganda campaign based on Fine Print Notes in the NEC which reference NFPA 13

(6) Label this deceptive literature, designed for building officials, as "Field Guides" and " Inspection Checklists" (See an example field guide that I have submitted)

(7) Provide instructions for building officials to threaten and harass building owners to use the proponents products

In summary, the proponents of retaining these Fine Print Notes are engaged in an effort to misrepresent and manipulate the NFPA Family of Codes and Standards for their own financial gain. Provided for your review is just one many "Field Guides" supplied by the Cable Fire Research Association to Building Officials across the United States. As you read this "field guide" take note of the serious manipulation and misrepresentation of the NEC and NFPA 13, designed specifically to sell products in which the proponents have financial interests.

The efforts of this same group to manipulate the NFPA family of codes and standards in NFPA 90A led to the "return to committee" of the entire document. The NFPA 13 committee has taken serious steps to stop this runaway propaganda campaign by adding informational text explaining ***that usual amounts of cabling do not represent a problem***. This is referenced in the original proposal to delete the Fine Print Note.

CMP-16 has been lied to by the proponents of these Fine Print Notes referencing NFPA 13. The only reason they exist is to fuel a financially driven propaganda campaign. Retaining these Fine Print Note will lead to continued deception, misrepresentation and manipulation which will lead to the lack of adoption of the NEC.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject
Panel Statement: The FPN continues to provide useful guidance. Possibilities of misinterpretation are minimized in the 2007 Edition of NFPA 13.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 12 Negative: 3
Explanation of Negative:

JENSEN, R.: This FPN, as informative text to the NEC, is being used to market limited combustible cable. The NEC should not be used for this purpose. The FPN has had a profound effect in which it is used in misleading the AHJ, designers and installers to require limited combustible cable, conduit, or a sprinkler system to be installed within the concealed space.

In addition to the above, Panel 3 where there is not a marketing influence, rejected the inclusion of this FPN in Article 725. Cables used in 725 and 770 are interchangeable in many applications, yet there is no correlation of such a FPN.

Panel Meeting Action: Reject
Panel Statement: The FPN continues to provide useful guidance. Possibilities of misinterpretation are minimized in the 2007 Edition of NFPA 13.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 12 Negative: 3
Explanation of Negative:

JENSEN, R.: This FPN, as informative text to the NEC, is being used to market limited combustible cable. The NEC should not be used for this purpose. The FPN has had a profound effect in which it is used in misleading the AHJ, designers and installers to require limited combustible cable, conduit, or a sprinkler system to be installed within the concealed space.

In addition to the above, Panel 3 where there is not a marketing influence, rejected the inclusion of this FPN in Article 725. Cables used in 725 and 770 are interchangeable in many applications, yet there is no correlation of such a FPN.

JOHNSON, S.: See my explanation of negative vote on Comment 16-50.

OHDE, H.: See my Explanation of Negative for Comment 16-50.

16-60 Log #743 NEC-P16 **Final Action: Reject**
(770.154, FPN)

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 16-78
Recommendation: This proposal should be Accepted.
Substantiation: The submitter of this proposal to delete the Fine Print Note referencing NFPA 13 is correct in his substantiation. However, CMP-16 rejected this proposal on the basis of the directive from Standards Council D#05-24, to remain "status quo" on issues with respect to NFPA 90A. The Standards Council has recently decided that the Fine Print Notes under the purview of CMP-16 which reference NFPA 13 may be deleted, and such deletion is not in conflict with the Standards Council directive. This final Standards Council decision is titled D#06-03 and is included for your review. It is important to note that, **Standards Council clearly recognizes the 2002 edition of the NEC, in which these Fine Print Notes were not included, as the status quo.**
An appeal was made by Mr. A. Weidman in an attempt to overturn the previous decision by Standards Council to allow CMP-16 to delete the Fine Print Notes referencing NFPA 13. The appeal was soundly denied by Standards Council. The final decision, D#06-19 is also included for your review. It is extremely interesting to note that the last sentence of the decision by Standards Council provides directions for CMP-16 as follows:
"If the fine print notes are in any way problematic, they should now be deleted, restoring the NEC in this regard to the status quo on plenum cable issues represented by the 2002 edition of the NEC."
These Fine Print Notes are problematic. Following the advice of Standards Council, they should be deleted. These Fine Print Notes exist solely to manipulate, misinform and threaten end users of the NEC. The proponents of flouropolymer products have developed an elaborate, financially driven scheme outlined as follows:

(1) Develop an Association (CFRA), funded by manufacturers, to coordinate and orchestrate unethical marketing plans by manipulation NFPA codes and standards

(2) Place consultants, hired to push flouropolymer interests, on CMP-3 and CMP-16 under the cloak of other organizations

(3) Promote Fine Print Notes referencing NFPA 13 in the NEC

(4) Use the Fine Print Notes to develop deceiving literature and presentations to manipulate the NFPA family of codes and standards to promote products which are not required

(5) Misinform and manipulate building code o
fficials with a propaganda campaign based on Fine Print Notes in the NEC which reference NFPA 13

(6) Label this deceptive literature, designed for building officials, as "Field Guides" and " Inspection Checklists" (See an example field guide that I have submitted)

(7) Provide instructions for building officials to threaten and harass building owners to use the proponents products

In summary, the proponents of retaining these Fine Print Notes are engaged in an effort to misrepresent and manipulate the NFPA Family of Codes and Standards for their own financial gain. Provided for your review is just one many "Field Guides" supplied by the Cable Fire Research Association to Building Officials across the United States. As you read this "field guide" take note of the serious manipulation and misrepresentation of the NEC and NFPA 13, designed specifically to sell products in which the proponents have financial interests.

The efforts of this same group to manipulate the NFPA family of codes and standards in NFPA 90A led to the "return to committee" of the entire document. The NFPA 13 committee has taken serious steps to stop this runaway propaganda campaign by adding informational text explaining ***that usual amounts of cabling do not represent a problem***. This is referenced in the original proposal to delete the Fine Print Note.

CMP-16 has been lied to by the proponents of these Fine Print Notes

referencing NFPA 13. The only reason they exist is to fuel a financially driven propaganda campaign. Retaining these Fine Print Note will lead to continued deception, misrepresentation and manipulation which will lead to the lack of adoption of the NEC.
Note: Supporting material is available for review at NFPA Headquarters.

16-62 Log #1585 NEC-P16 **Final Action: Reject**
(770.154, FPN)

Submitter: Harold C. Ohde, IBEW-NECA Technical Institute
Comment on Proposal No: 16-70
Recommendation: This proposal should be accepted.
Substantiation: This FPN should be deleted as the submitter proposed. In the submitter's substantiation he states that this FPN has misled the AHJ to believe and enforce limited combustible cable, conduit or a sprinkler system to be installed in the concealed space or plenums. It is important to note that the NEC does not have a definition of "concealed spaces", therefore, making it impossible to enforce. What constitutes a concealed space? Is it the space above a dropped ceiling; or is it a space above plastered or drywall ceiling? Is it the wall cavity of typical wall construction?
NFPA 13 just completed their revision process for the 2006 NFPA 13 Standard. 8.14.1 of NFPA 13 has been revised to read as follows:
8.14.1.2 Concealed Spaces not Requiring Sprinkler Protection.
8.14.1.2.1* Concealed spaces of noncombustible and limited combustible construction with minimal combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those as a return air for a plenum. (For additional information on combustible loading see A.8.14.1.2.1)
8.14.1.2.2 Concealed spaces of noncombustible and limited combustible construction with limited access and not permitting occupancy or storage of combustible shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.
A.8.14.1.2.1 Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc... can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1). For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined.
In the 2006 NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.
CMP 16 rejected this proposal based on the Standards Council decision D#05-24 to remain "status quo" on issues that pertain to NFPA 90A. Standards Council recently issued another decision (D#06-03) which decided that this FPN may be deleted and this deletion will not be in conflict with the Standards Council decision (D#05-24). Standards Council recognizes the 2002 edition of the NEC as being status quo. This FPN referencing NFPA 13 was added to the 2005 NEC, therefore, it can and should be deleted.

Ballot Results: Affirmative: 12 Negative: 3

Explanation of Negative:

JENSEN, R.: This FPN, as informative text to the NEC, is being used to market limited combustible cable. The NEC should not be used for this purpose. The FPN has had a profound effect in which it is used in misleading the AHJ, designers and installers to require limited combustible cable, conduit, or a sprinkler system to be installed within the concealed space.

In addition to the above, Panel 3 where there is not a marketing influence, rejected the inclusion of this FPN in Article 725. Cables used in 725 and 770 are interchangeable in many applications, yet there is no correlation of such a FPN.

JOHNSON, S.: See my explanation of negative vote on Comment 16-50.

OHDE, H.: See my Explanation of Negative for Comment 16-50.

16-66 Log #241 NEC-P16 **Final Action: Accept in Principle (Figure 770.154)**

TCC Action: The Technical Correlating Committee directs that these comment changes occur to 770.154(E) and the Table titled with 770.154(E) based on the action taken in Proposal 16-68.

Submitter: Stanley Kaufman, CableSafe Inc.

Comment on Proposal No: 16-74

Recommendation: Accept this proposal in principle. Continue to accept the recommendations in proposal 16-74. In addition make the following changes:

770.154(F) Cable Substitutions. The substitutions for optical fiber cables listed in Table 770.154 and illustrated in Figure 770.154 shall be permitted.

800.154(G) Cable Substitutions. The uses and permitted substitutions for communications cables listed in Table 800.154 and illustrated in Figure 800.154 shall be considered suitable for the purpose and shall be permitted.

FPN: For information on Types CMP, CMR, CMG, CM, and CMX cables, see 800.179.

~~FPN: See Figure 800.154, Cable Substitution Hierarchy.~~

Substantiation: Section 2.3 of the NEC Style Manual provides for two options for figures, either they are mandatory and can have mandatory language (shall) or they are nonmandatory and are in a fine print note and do not contain mandatory language. This comment will bring the cable substitution figures into compliance with the style manual by making the cable substitution figures part of the mandatory text.

Similar corrections for Article 820 are in another comment.

Panel Meeting Action: Accept in Principle

Comment on Proposal No: 16-80

Recommendation: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal and that further consideration be given to the comments expressed in the voting. This action will be considered by the Panel as a Public Comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

Panel Statement: The panel has considered the comments expressed in the voting as directed by the TCC.

The panel accepts the direction of the TCC to clarify the panel action.

The panel action on Proposal 16-80 should have read, "The panel accepts the submitter's deletion in subsection (B)".

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-68 Log #658 NEC-P16 **Final Action: Reject (770.154(A), FPN)**

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council

Comment on Proposal No: 16-71

Recommendation: Revise text to read as follows:

770.154 Applications of Listed Optical Fiber Cables and Raceways. Nonconductive and conductive optical fiber cables shall comply with any of the requirements given in 770.154(A) through 770.154(E) or where cable substitutions are made as shown in 770.154(F).

(A) Plenums. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type OFNP or OFCP. Abandoned cables shall not be permitted to remain. Types OFNR, OFCR, OFNG, OFN, OFCG, and OFC cables installed in compliance with 300.22 shall be permitted. Listed plenum optical fiber raceways shall be permitted to be installed in ducts and plenums as described in 300.22(B) and in other spaces used for environmental air as described in 300.22(C). Only type OFNP and OFCP cables shall be permitted to be installed in these raceways.

~~FPN: See 8.14.1 of NFPA 13 (2002), Installation of Sprinkler Systems, for requirements for sprinklers in concealed spaces containing exposed combustibles.~~

Substantiation: This is one of three references to NFPA 13 (it is repeated identically in articles 770, 800 and 820) included in the code that is a meaningless reference. Other references to NFPA 13, in Article 362, are properly included in mandatory sections of the code (section 362.10). Whenever a jurisdiction adopts NFPA 13 they need to adopt it for mandatory sections and not for an unenforceable FPN in one section, which is intended to mislead the user. In fact, NFPA 13 does not require that sprinklers be installed in plenums of "noncombustible or limited combustible construction", even if "the usual amount of cabling" is present. In fact, there have been several documented examples already of misrepresentation in that authorities having jurisdiction have been told that this means that sprinklers are required in plenum areas unless "limited combustible cable" is installed. I have been personally involved in several cases, and have heard of many more cases where this is being stated.

Section 8.14.1 of NFPA 13 (2006) reads as follows:

8.14.1.2 Concealed Spaces Not Requiring Sprinkler Protection.

8.14.1.2.1* Concealed spaces of noncombustible and limited combustible construction with minimal combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum. (For additional information on combustible loading see A.8.14.1.2.1)

8.14.1.2.2 Concealed spaces of noncombustible and limited combustible construction with limited access and not permitting occupancy or storage of combustibles shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.

A.8.14.1.2.1 Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc. can be present in concealed spaces constructed of limited or noncombustible materials but should not typically be viewed as requiring sprinklers (see 8.14.1.1). For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined.

The same change is being proposed to the corresponding Fine Print Notes in articles 800 and 820, all of which deal with the same type of cables.

The committee rejected the proposal based on, and I quote: "NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"[S]o as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

However, Standards Council has since issued two new decisions, NFPA Standards Council Decision 06-03 (SC #06-3-18) dated 22 March 2006 and NFPA Standards Council Decision 06-19 (SC #06-7-33) dated 28 July 2006.

These decisions address CMP decisions on Fine Print Notes referencing NFPA 13. The former (earlier) decision states, in pertinent part: "Mr. Dollard asks for clarification whether the Standards Council directive prohibits the NEC project from deleting the Fine Print Notes to sections 770.154, 800.154 & 820.154. The Council, after due consideration, believes that clarification is appropriate in this instance and responds that the NEC project would not violate the directive by deleting the fine print notes at issue." The later decision states, in pertinent part, as follows: "if the fine print notes are not a helpful reference to NFPA 13 or engender confusion, the NEC Project should have the ability to delete them and nothing in the Council's status quo directive prohibits this." The decision also states: "It has also been pointed out that deletion of the fine print notes would provide further consistency within the NEC itself since, currently, the fine print notes at issue only appear in some relevant NEC Articles (Articles 770, 800, and 820), but not in others (Articles 725 and 760)." The decision also states: "nothing in NFPA procedures prevents the NEC Project from considering and acting on deletion of the fine print notes during the Comment phase of the code development process. The question whether the fine print notes should be in the NEC is hardly new. Aside from the fact that their presence was debated in the previous edition cycle, Proposals to remove them were duly filed and rejected by the responsible Code-Making Panel based on its then understanding of the Council's directive. The subject was explicitly raised during the Report on Proposals phase of the process and is, therefore, clearly open for further consideration and action during the Comment phase."

Thus, clearly these Standards Council decisions directly permit the deletion of the Fine Print Note addressed by this comment.

Technically this Fine Print Note needs to be deleted for two reasons:

1. This Fine Print Note is misleading by pointing the reader to NFPA 13 which does not require the use of sprinklers, as both Bob Jensen and Harry Ohde point out in their negative votes and as is shown by the sections of NFPA 13 reproduced above.

2. This Fine Print Note is identical to the ones in 800.154 (A) and in 820.154 (A), both of which are equally misleading. On the other hand there are no Fine Print Notes in articles 725 and 760. Thus, deleting this Fine Print Note will provide further consistency within the NEC.

Panel Meeting Action: Reject

Panel Statement: The FPN continues to provide useful guidance. Possibilities of misinterpretation are minimized in the 2007 Edition of NFPA 13.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 12 Negative: 3

Explanation of Negative:

JENSEN, R.: This FPN, as informative text to the NEC, is being used to market limited combustible cable. The NEC should not be used for this purpose. The FPN has had a profound effect in which it is used in misleading the AHJ, designers and installers to require limited combustible cable, conduit, or a sprinkler system to be installed within the concealed space.

In addition to the above, Panel 3 where there is not a marketing influence, rejected the inclusion of this FPN in Article 725. Cables used in 725 and 770 are interchangeable in many applications, yet there is no correlation of such a FPN.

JOHNSON, S.: See my explanation of negative vote on Comment 16-50.

OHDE, H.: See my Explanation of Negative for Comment 16-50

16-69 Log #957 NEC-P16 **Final Action: Reject**
(770.154(A), FPN)

Submitter: Donald Hall, Corning Cable Systems

Comment on Proposal No: 16-78

Recommendation: Note: The commenter is also submitting analogous comments to Proposal 16-197 (ROP Log #3097) and Proposal 16-329 (ROP Log #3095) pertaining to FPNs referencing NFPA 13 Section 8.14.1.

Accept the proposal to delete the FPN, leading to the following:

770.154 Applications of Listed Optical Fiber Cables and Raceways. Nonconductive and conductive optical fiber cables shall comply with any of the requirements given in 770.154(A) through 770.154(E) or where cable substitutions are made as shown in 770.154(F).

(A) Plenums. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type OFNP or OFCP. Abandoned cables shall not be permitted to remain. Types OFNR, OFCR, OFNG, OFN, OFCG, and OFC cables installed in compliance with 300.22 shall be permitted. Listed plenum optical fiber raceways shall be permitted to be installed in ducts and plenums as described in 300.22(B) and in other spaces used for environmental air as described in 300.22(C). Only Type OFNP and OFCP cables shall be permitted to be installed in these raceways.

~~FPN: See 8.14.1 of NFPA 13 (2003), Installation of Sprinkler Systems, for requirements for sprinklers in concealed spaces containing exposed combustibles.~~

Substantiation: The committee rejected this proposal without any consideration of its merits, based on its belief at the time that it fell within the scope of Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005. since that time, however, the Standards Council has issued two new decisions as follows: Decison 06-06 (SC #6-3-18) dated 22 March 2006 states: in petinent part; "The Council, after due consideration, believes that clarification is appropriate in this instance and responds that the NEC Project would not violate the directive by deleting the Fine Print Notes as issue."

Decision 06-19 (SC #06-7-33) dated 28 July 2006 states, in pertinent part:

"If the fine print notes are not a helpful reference to NFPA 13 or engender confusion, the NEC Project should have the ability to delete them and nothing in the Council's status quo directive prohibits this."

And

"It has also been pointed out that deletion of the fine print notes would provide further consistency within the NEC itself since, currently, the fine print notes at issue only appear in some relevant NEC Articles (Articles 770, 800 and 820), but not in others (Articles 725 and 760)."

And

"Nothing in NFPA procedures prevents the NEC Project from considering and acting on deletion of the fine print notes during the comment phase of the code development process."

And

"If the fine print notes are in any way problematic, they should now be deleted, restoring the NEC in this regard to the status quo on plenum cable issues represented by the 2002 edition of the NEC".

In view of the above decisions, the commenter requests that the proposal be considered on its merits as stated in the original proposal substantiation and as further substantiated below.

Since the original proposal was submitted, the following Annex Note was added to the 2007 Edition of NFPA 13:

A.8.14.1.2.1 Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic pluming piping, nonstructural wood, etc. can be present in concealed spaces constructed of limited or noncombustible materials but should not typically be viewed as requiring sprinklers (see 8.14.1.1. for example, it is not the intent of this section to require sprinklers which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined.

Additionally, the standard approach of the NEC is to require the use of listed products which are tested and approved by a Nationally Recognized Test Laboratory (NRTL) as being suitable for use in a particular application. Normal fire hazards associated with an application space and the application of wiring products installed within them are duly anticipated during the establishment of listing criteria for these products. Air handling spaces are no different from any other space in this regard. The inclusion and particular placement of this FPN is suggestive of the idea that the NEC or the NRTLs has failed to adequately recognize the hazards associated with these spaces. The safety record of plenum cables within air handling spaces has been debated extensively and is open to continued debate within the NFPA Code making process, but the FPN in question should not be used as a maens to short circuit this process and lead users around the code. When properly understood, the FPNs of 770.154(A), 800.154(A), and 820.154(A) lead to a dead end. When not properly understood, they lead to an unnecessary encumbrance upon the use of listed products installed in accordance with approved NEC wiring methods.

Panel Meeting Action: Reject

Panel Statement: The FPN continues to provide useful guidance. Possibilities of misinterpretation are minimized in the 2007 Edition of NFPA 13.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 12 Negative: 3

Explanation of Negative:

JENSEN, R.: This FPN, as informative text to the NEC, is being used to market limited combustible cable. The NEC should not be used for this purpose. The FPN has had a profound effect in which it is used in misleading the AHJ, designers and installers to require limited combustible cable, conduit, or a sprinkler system to be installed within the concealed space.

In addition to the above, Panel 3 where there is not a marketing influence, rejected the inclusion of this FPN in Article 725. Cables used in 725 and 770 are interchangeable in many applications, yet there is no correlation of such a FPN.

16-70 Log #794 NEC-P16 **Final Action: Reject**
(770.154(A), 800.154(A), and 820.154(A), FPN)

Submitter: Allen C. Weidman, The Society of the Plastics Industry, Inc.

Comment on Proposal No: 16-70

Recommendation: Revise the Fine Print Note in 770.154(A), 800.154(A), and 820.154(A) as follows:

FPN: For cable installations in buildings protected by an automatic sprinkler system, see ~~See~~ 8.14.1 and the annex note A.8.14.1.2.1 of NFPA 13 (200~~2~~5), Installation of Sprinkler Systems, for requirements for sprinklers in concealed spaces containing exposed combustibles.

Substantiation: The submitters of these proposals expressed a concern about misinterpretation of the current FPN. With the issuance of the 2005 edition of NFPA 13, the interpretation of the FPN should no longer be an issue because NFPA 13 now includes an annex note. The suggested text includes referencing that annex note. The suggested text also clarifies that the fine print note applies only to buildings with sprinkler systems and applies to the cable installation, not the sprinkler installation.

Annex note A.8.14.1.2.1 of NFPA 13 (2002~~5~~), Installation of Sprinkler Systems, states:

"A.8.14.1.2.1 Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc... can be present in concealed spaces constructed of limited or noncombustible materials but should not typically be viewed as requiring sprinklers (see 8.14.1.1). For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined".

NFPA 13 does not require sprinklers in certain interstitial spaces as long as the combustible loading in the space is low. Since NFPA 13 does not define the threshold value of combustibles at which additional sprinklers are required, avoiding the installation of too large a combustible loading of cable in a building with sprinkler protection may require consultation with the appropriate AHJ. Installers of cables in interstitial spaces need to be aware that they may impact the sprinkler system requirements.

Panel Meeting Action: Reject

Panel Statement: NFPA Standards Council Decision (D #06-19) dated 28 July 2006 directed the panel to not make a change in the FPN.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

In addition to the above, Panel 3 where there is not a marketing influence, rejected the inclusion of this FPN in Article 725. Cables used in 725 and 770 are interchangeable in many applications, yet there is no correlation of such a FPN.

16-71 Log #1460 NEC-P16 **Final Action: Reject**
(770.154(C) (New))

Submitter: Sanford Egesdal, Egesdal Associates PLC

Comment on Proposal No: 16-69

Recommendation: Reconsider proposal 16-69 and revise 770.154(C) as shown.

(C) Other Wiring Within Buildings. Cables installed in building locations other than the locations covered in 770.154(A) and 770.154(B) shall be Type OFNG, OFN, OFCG, or OFC. Such cables shall be permitted to be installed in listed general-purpose optical fiber raceways. Types OFN-FHC and OFC-FHC cables shall be permitted to be installed to provide reduced potential heat release.

Substantiation: The application of the Standards Council's decision on NPFA 90A was an error. The proposed marking on the cable did not include a "P" added to OFN and OFC. Type OFNP or Type OFCP cables are permitted to be installed in plenums.

This comment adds a sentence to 770.154(C) to incorporate fire hazard cable. By adding fire hazard cable to this section, it is clear that the cable is permitted to be installed as "Other Wiring Within Buildings."

To better clarify that the Standards Council's decision on NFPA does not apply and to better clarify where the cable is permitted to be installed, the marking on the cable is changed to Type OFN-FHC and OFC-FHC. The "FHC" suffix stands for fire hazard cable. There is a companion comment to revise the marking found in my comment to Proposal 16-93.

Some installations require large amounts of cable, although typically much less that an installation of metal conductors. A typical application of a fire hazard cable would be above a suspended ceiling or under a raised floor, neither of which is a plenum. The proposed cable has a very low fuel load, as compared to other types of cable insulation. Some cable constructions use one type of insulation on the conductor and another type for the jacket.

The Types OFN-FHC and OFC-FHC cables suggested for listing and marking in 770.179 (comment to proposal 16-93) have parameters (e.g. 3500 BTU/lb) that are standard in the building industry and useful to system designers and fire protection engineers.

To put cable insulation heat release in perspective, here are relative values:

Fire Hazard Cable insulation: less than 8 MJ/kg (3,500 BTU/lb

PVC insulation: As high as 25 MJ/kg (11,000 BTU/lb)

Polyolefin insulation: As high as 46 MJ/kg (20,000 BTU/lb)

Panel Meeting Action: Reject

Panel Statement: Cable meeting specifications as described in this comment is not prohibited by the Code, and the panel sees no need for an additional marking.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-72 Log #2017 NEC-P16 **Final Action: Accept**
(770.154(F), FPN)

Submitter: Harold C. Ohde, IBEW #134

Comment on Proposal No: 16-89

Recommendation: Continue to Reject.

Substantiation: The submitter's recommendation to create a new cable designation (OFN50 and OFC50) is nothing more than a marketing ploy. A backdoor approach you might say to get NFPA 255 and NFPA 259 cables in the cable hierarchy. The submitter's recommendation to add this FPN to this section is in grave error. This FPN would not provide guidance to designers, installers or code officials. This FPN would have misled the designer, installer and code officials to believe, install and enforce that limited combustible, conduit or a sprinkler system to be installed in the concealed space or plenums would be a requirement because of NFPA 13, Section 8.14.1. It is important to note that the NEC does not have a definition of "concealed spaces", therefore making it impossible to enforce. What constitutes a concealed space? Is it the space above a dropped ceiling; or is it a space above plastered or drywall ceiling? Is it the wall cavity of typical wall construction?

NFPA 13 just completed their revision process for the 2006 NFPA 13 Standard. 8.14.1 of NFPA 13 has been revised to read as follows:

8.14.1.2 Concealed Spaces not Requiring Sprinkler Protection.

8.14.1.2.1* Concealed spaces of noncombustible and limited combustible construction with minimal combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those as a return air for a plenum. (For additional information on combustible loading see A.8.14.1.2.1).

8.14.1.2.2 Concealed spaces of noncombustible and limited combustible construction with limited access and not permitting occupancy or storage of combustible shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.

A.8.14.1.2.1 Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc... can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1). For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined.

In the 2006 NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.

CMP 16 rejected this proposal based on the Standards Council decision D#05-24 to remain "status quo" on issues that pertain to NFPA 90A.

16-76 Log #1461 NEC-P16 **Final Action: Reject**
(770.179(E) (New))

Submitter: Sanford Egesdal, Egesdal Associates PLC
Comment on Proposal No: 16-93
Recommendation: Reconsider proposal 16-93 and revise 770.179 as shown.
(E) Optical Fiber Limited Fire Hazard (-FHC) Cable. Cables used to reduce potential heat release shall be listed as fire hazard (-FHC) cable and shall have a low potential heat release. Fire hazard cables specified in 770.154(C), and used to reduce potential heat release shall have an additional classification using the suffix "-FHC".

FPN No. 1: One method of defining a low potential heat release cable is that the cable exhibits a maximum potential heat value of exceeding 8141 kJ/kg (3500 BTU/lb) when tested in accordance with NFPA 259, *Standard Test Method for Potential Heat of Building Materials*, as well as a maximum flame spread index of 25 and a maximum smoke developed index of 50 when tested in accordance with NFPA 255, *Standard Method of Test of Surface Burning Characteristics of Building Materials*.
Substantiation: The application of the Standards Council's decision on NPFA 90A was an error. The proposed marking on the cable did not include a "P" added to OFN or OFC. Type OFNP or Type OFCP cables are permitted to be installed in plenums.

To better clarify that the Standards Council's decision on NFPA does not apply and to better clarify where the cable is permitted to be installed, the marking on the cable is changed to Type FPL-FHC. The "FHC" suffix stands for fire hazard cable. There is a companion comment to revise the application of fire hazard cable in my comment to Proposal 16-69.

The proposed cable provides listing parameters useful to system designers and fire protection engineers.

The key parameter in the listing requirements is potential heat release.

To put cable heat release in perspective, here are relative values:

Fire Hazard Cable insulation: less than 8 MJ/kg (3,500 BTU/lb

PVC insulation: As high as 25 MJ/kg (11,000 BTU/lb)

Polyolefin insulation: As high as 46 MJ/kg (20,000 BTU/lb)

Polyolefin insulation is sometimes used as insulation on conductors, and is covered by a PVC jacket. Polyolefin insulation provides better electrical properties (dielectric constant) than PVC insulation.

Additionally, flame spread and smoke developed parameters identify the robustness of the cable.

A flame spread index of 25 is found in a number of NFPA publications, for example:

NFPA 13-2007

8.15.1 Concealed Spaces.

8.15.1.2.10 Concealed spaces where rigid materials are used and the exposed surfaces have a flame spread index of 25 or less, and the materials have been demonstrated not to propagate fire when tested in accordance with NFPA 255, Standard Method of Test of Surface Burning Characteristics of Building Materials, extended for an additional 20 minutes in the form in which they are installed, shall not require sprinkler protection.

NFPA 13 use of "concealed spaces" corresponds to a typical dictionary definition: out of sight, hidden. This definition add "spaces" to "concealed" and represents a different meaning from how the NEC defines "concealed." Where both the NEC and NFPA 13 apply, "concealed" cable can be removed from a "concealed space." After removal of the cable, the "concealed space" would remain.

A smoke developed index of 50 is more rigorous than the typical smoke developed index of 450 for interior finishes. Interior finishes can be considered a "fixed" application: one sheet or one coat. Cable installations are a "variable" application: one cable or hundreds of cables. It seems reasonable to establish a robust requirement, due to the variable application. Electronic equipment is susceptible to damage from smoke and heat, both components of a fire.
Panel Meeting Action: Reject
Panel Statement: Cable meeting specifications as described in this comment is not prohibited by the Code, and the panel sees no need for an additional marking.

Submitter: Harold C. Ohde, IBEW-NECA Technical Institute
Comment on Proposal No: 16-95
Recommendation: Continue to reject.
Substantiation: The submitter's recommendation to create a new cable designation (concealed space cable) is nothing more than a marketing ploy. A backdoor approach you might say to get NFPA 255 and NFPA 259 cables in the cable hierarchy. The submitter's substantiation would have misled the designer, installer and code officials to believe, install and enforce that limited combustible cable, conduit or a sprinkler system to be installed in the concealed space or plenums would be a requirement because of NFPA 13 Section 8.14.1. It is important to note that the NEC does not have a definition of "concealed spaces", therefore, the confusion and making it impossible to enforce. What does constitute a concealed space? Is it the space above a dropped ceiling; or is it a space above plastered or drywall ceiling? Is it the wall cavity of typical wall construction?

NFPA 13 just completed their revision process for the 2006 NFPA 13 Standard. 8.14.1 of NFPA 13 has been revised to read as follows:

8.14.1.2 Concealed Spaces not Requiring Sprinkler Protection.

8.14.1.2.1* Concealed spaces of noncombustible and limited combustible construction with minimal combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those as a return air for a plenum. (For additional information on combustible loading see A.8.14.1.2.1)

8.14.1.2.2 Concealed spaces of noncombustible and limited combustible construction with limited access and not permitting occupancy or storage of combustible shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.

A.8.14.1.2.1 Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc... can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1) For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined.

In the 2006 NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.

Comment on Proposal No: 16-93
Recommendation: Continue to Reject.
Substantiation: The submitter's recommendation to create a new cable designation (OFN50 and OFC50) is nothing more than a marketing ploy. The submitter's recommendation to add these three FPNs to this section is in grave error. FPN No. 1 is a backdoor approach you might say to get NFPA 255 and NFPA 259 cables in the cable hierarchy. The FPN No. 2 would not provide guidance to designers, installers or code officials. This FPN would have misled the designer, installer and code officials to believe, install and enforce that limited combustible, conduit or a sprinkler system to be installed in the concealed space or plenums would be a requirement because of NFPA 13, Section 8.14.1. The submitter's substantiation references 2002 NFPA 13 Section 8.14.1. It is important to note that the NEC does not have a definition of "concealed spaces", therefore making it impossible to enforce. What constitutes a concealed space? Is it the space above a dropped ceiling; or is it a space above plastered or drywall ceiling? Is it the wall cavity of typical wall construction?

NFPA 13 just completed their revision process for the 2006 NFPA 13 Standard. 8.14.1 of NFPA 13 has been revised to read as follows:

8.14.1.2 Concealed Spaces not Requiring Sprinkler Protection.

8.14.1.2.1* Concealed spaces of noncombustible and limited combustible construction with minimal combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those as a return air for a plenum. (For additional information on combustible loading see A.8.14.1.2.1).

8.14.1.2.2 Concealed spaces of noncombustible and limited combustible construction with limited access and not permitting occupancy or storage of combustible shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.

A.8.14.1.2.1 Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc... can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1). For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined.

In the 2006 NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.

CMP 16 rejected this proposal based on the Standards Council decision D#05-24 to remain "status quo" on issues that pertain to NFPA 90A.

ARTICLE 780 — CLOSED-LOOP AND PROGRAMMED POWER DISTRIBUTION

7-78 Log #68 NEC-P07 **Final Action: Accept**
(780)

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 10-59
Recommendation: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the
Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action of deleting Article 780.

It was the action of the Technical Correlating Committee that this Proposal be correlated with Code-Making Panel 7 for consideration of how to handle the reference to 780.5 in 334.104. This action will be considered by Code-Making Panel 7 as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel 7 concurs with the Action taken by Panel 10 to Accept Proposal 10-59 which deleted Article 780 and takes the following Actions to correlate with the deletion of Article 780.

(1) In 334.104 in the 2005 Code, deletes the second sentence "The signaling conductors shall comply with 780.5."

(2) In 334.104, as amended by the Panel 7 Meeting Action on Proposal 7-78, deletes "(A) Signaling Conductors shall comply with 780.5." and re-identifies (B) and (C) as (A) and (B) respectively.

(3) In 334.116(C) of the 2005 Code, and in accordance with the Panel 7 Meeting Action on Proposal 7-78, deletes "and signaling" from the second sentence and deletes the third and fourth sentences which read "The signaling conductors shall be permitted to be shielded. An optional outer jacket shall be permitted."
Panel Statement: The Panel Action deleted the references to 780.5 and signaling conductors. 334.116(C) was also revised to correlate with the deletion of Article 780.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

16-79 Log #250 NEC-P16 **Final Action: Accept**
(800.1)

TCC Action: The Technical Correlating Committee directs that the words "For installation requirements" in FPN No. 2 and FPN No. 3 be changed to "For further information" because Articles 725 and 760 refer to Article 800.
Submitter: Stanley Kaufman, CableSafe Inc.
Comment on Proposal No: 16-98
Recommendation: Accept proposal 16-98 in principle by revising the fine print notes in the proposal.

From:

FPN No. 1: For further information for fire alarm, sprinkler waterflow, and sprinkler supervisory systems, see Article 760.

FPN No. 2: For installation requirements of optical fiber cables, see Article 770.

FPN No. 3: For installation requirements for network-powered broadband communications circuits, see Article 830.

FPN No. 4: For installation requirements for equipment and circuits in an information technology equipment room. see Article 645.

FPN No. 5: For further information on remote-control, signaling. and powerlimited circuits. see Article 725.

To:

FPN No. 1: For installation requirements for information technology equipment and systems in an information technology equipment room, see Article 645.

FPN No. 2: For installation requirements for remote-control, signaling. and power-limited circuits, see Article 725.

FPN No. 3: For installation requirements for fire alarm systems see Article 760.

FPN No. 4: For installation requirements of optical fiber cables and raceways, see Article 770.

FPN No. 5: For installation requirements for network-powered broadband communications circuits, see Article 830.

Substantiation: The current scope of Article 800 and proposal 16-98 text refer to some articles "for installation requirements" and to other articles "for further information".

Section 3.3.5 of the NEC Style Manual states:

3.3.5 Parallel Construction. Parallel construction means stating similar requirements in similar ways for greater consistency. This helps makes the *NEC* clear for users. Lack of consistency often creates confusion, causing users to ask: *Does this difference in wording represent a different requirement? Or is it simply two different ways of trying to say the same thing?* There are several kinds of parallel construction:

Organization and Numbering. If practicable, the subsections of similar articles should be numbered in the same order (see 2.4.1).

Sections. Different sections, within the same article, that reflect similar or closely related subjects, should have similar structures.

Lists. All items in a list should be parallel (that is, singular or plural, written in the same verb tense, using phrases or sentences but not a mix).

This comment would make all the fine print note references consistent and parallel and in the same numerical order as the articles referenced.

Other suggested changes are to use the language of the referenced article so as to improve clarity and consistency and to avoid any confusion between the content of the fine print notes and the scopes of the referenced articles.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:

JENSEN, R.: We disagree with the definition of communications circuit as it clouds the scope of the article with other articles. As an example, a telephone circuit can be extended with 820 cable, or 725 cable. Jurisdictions can then apply different rules such as conduit fill requirements, and electrical protection.

We understand and agree that the TCC has responsibility for Article Scope statements. However, the scope has been released into the hands of a Panel by allowing control over such a definition. Additionally, there will now be jurisdictional issues between Panels.

We ask that there be no change to the current scope and definitions involved. We also propose that a Task Group be assigned to approach this issue. As an example, this article may be focused on utility delivery up to the first connection within a building (today up to 50 ft from the entrance of the cable into a building) and building wiring segmented into other articles for coaxial and twisted pair. Fiber optics is already an Article of its own.

ARTICLE 800 — COMMUNICATIONS CIRCUITS

16-80 Log #1534 NEC-P16 **Final Action: Accept (800.1)**

Submitter: James E. Brunssen, Telcordia Technologies, Inc. / Rep. Alliance for Telecommunications Industry Solutions
Comment on Proposal No: 16-98
Recommendation: Revise the text of the proposed new definition of "communications circuit" for clarification as follows:
"800.2 Communications Circuit. The circuit that extends voice, audio, video, data, interactive services, telegraph (except radio), outside wiring for fire alarm and burglar alarm from the communications utility to the customer's communications equipment up to and including terminal equipment such as a telephone, fax machine or answering machine."
Substantiation: The present text is unclear and may be construed as not including all premises communications wiring and equipment, such as a telephone or fax machine. For example, if a customer has a local telecommunications switch or PBX, the communications circuit would include not only the PBX, but all communications cabling and wiring connecting the customer's terminal equipment to the PBX.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
JENSEN, R.: We disagree with the definition of communications circuit as it clouds the scope of the article with other articles. Ballot Results: Affirmative: 15

16-84 Log #660 NEC-P16 **Final Action: Reject (800.2)**

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Comment on Proposal No: 16-100
Recommendation: Delete the following text:
~~**800.2 Air Duct.** A conduit or passageway for conveying air to or from heating, cooling, air conditioning, or ventilating equipment, but not including the plenum~~.
Substantiation: The term "air duct" is not contained in article 800 and should not, thus, be defined.
The same change is being proposed for the definition of "air duct" in article 820.

The committee rejected the proposal based on, and I quote: "NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"[S]o as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

However, Standards Council has since issued two new decisions, NFPA Standards Council Decision 06-03 (SC #06-3-18) dated 22 March 2006 and NFPA Standards Council Decision 06-19 (SC #06-7-33) dated 28 July 2006. These decisions address CMP decisions on Fine Print Notes referencing NFPA 13. The former (earlier) decision states, in pertinent part: "Mr. Dollard asks for clarification whether the Standards Council directive prohibits the NEC project from deleting the Fine Print Notes to sections 770.154, 800.154 & 820.154. The Council, after due consideration, believes that clarification is appropriate in this instance and responds that the NEC project would not violate the directive by deleting the fine print notes at issue." The later decision states, in pertinent part, as follows: "if the fine print notes are not a helpful reference to NFPA 13 or engender confusion, the NEC Project should have the ability to delete them and nothing in the Council's status quo directive prohibits this." The decision also states: "It has also been pointed out that deletion of the fine print notes would provide further consistency within the NEC itself since, currently, the fine print notes at issue only appear in some relevant NEC Articles (Articles 770, 800, and 820), but not in others (Articles 725 and 760)." The decision also states: "nothing in NFPA procedures prevents the NEC Project from considering and acting on deletion of the fine print notes during the Comment phase of the code development process. The question whether the fine print notes should be in the NEC is hardly new. Aside from the fact that their presence was debated in the previous edition cycle, Proposals to remove them were duly filed and rejected by the responsible Code-Making Panel based on its then understanding of the Council's directive. The subject was explicitly raised during the Report on Proposals phase of the process and is, therefore, clearly open for further consideration and action during the Comment phase."

It would appear to me that these Standards Council decisions by implication would indirectly permit the deletion of definitions that violate the NEC manual of style.

Panel Meeting Action: Reject

Panel Statement: As there was no opportunity for public review and comment the panel continues to affirm its original action on the referenced proposal in accordance with the action taken to comply with the Standards Council relative to the 90A Decision.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 13 Negative: 2

Explanation of Negative:

JENSEN, R.: We disagree that there was no opportunity for public review. To the contrary, there were nineteen (19) comments received on proposals involving this definition, thereby showing that this proposal was indeed reviewed.

We believe that the interpretation of whether being allowed to address the original proposal in view of the NFPA Standards Council Long Decision 05-24 (SC #05-7-4) was wrong. Indeed, during the writing of the 2005 NEC, all references where 90A issues were involved were to be untouched in the 2005 NEC. One of these issues was "air duct cable" and the definition of "air duct" (as it pertained to air duct cable). Additionally, having a definition where the term is not used in the text of the code is in violation of the Style Guide.

We agree with deleting the term "air duct" as it was evidently an oversight that it was not removed during the last code cycle. Air duct was introduced for use with "air duct cable" which was not to be used in the 2005 code. Additionally, the term is not used within 800. To further not using this term, in proposal 16-29, the panel revised the proposal to not use "air duct", but instead to harmonize code language by using the term "ventilation or air handling ducts".

OHDE, H.: This comment should have been accepted as this is no need for this definition of "air duct". The term "air duct" is not contained in this Article therefore should not be defined.

The panel statement reflects that Standards Council decision relative to NFPA 90A Decision is remain status quo regarding plenum issues. I do not believe that the Standard Council decision would prohibit the definition of air duct from being deleted.

16-88 Log #1535 NEC-P16 **Final Action: Accept (800.2)**

Submitter: James E. Brunssen, Telcordia Technologies, Inc. / Rep. Alliance for Telecommunications Industry Solutions
Comment on Proposal No: 16-105
Recommendation: Continue to reject this proposal.
Substantiation: This proposal should continue to be rejected as the application of the "block" concept by the telecommunications utilities has resulted in an exemplary safety record. The many reasons for rejecting the proposal as iterated in the Panel Statement accompanying Proposal 16-148 are appropriate and support continued rejection.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-89 Log #1579 NEC-P16 **Final Action: Reject (800.2)**

Submitter: Harold C. Ohde, IBEW-NECA Technical Institute
Comment on Proposal No: 16-99
Recommendation: This proposal should be accepted.
Substantiation: The term "air duct" is not used in Article 800 and, therefore, it should be deleted from 800.2. Defining a term that is not being used (such as air duct) in that Article is in direct violation with the National Electrical Code Style Manual. CMP 16 rejected this proposal based on the Standards Council decision D#05-24 to remain "status quo" on issues that pertain to NFPA 90A.

I do not believe that this Standards Council decision would prohibit the definition of "air duct" from being deleted. I do believe that expansion of, or a new definition of, air duct in another Article would be a violation of Standards Council Decision D#05-24. Standards Council recently issued another decision (D#06-03) which decided that 770.154(A) FPN, 800.154(A) FPN and 820.154(A) FPN may be deleted and this deletion would not be in conflict with the Standards Council decision (D#05-24). Standards Council recognizes the 2002 edition of the NEC as being status quo.
Panel Meeting Action: Reject
Panel Statement: As there was no opportunity for public review and comment, the panel continues to affirm its original action on the referenced proposal in accordance with the action taken to comply with the Standards Council relative to the 90A Decision.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:

JENSEN, R.: We disagree that there was no opportunity for public review. To the contrary, there were nineteen (19) comments received on proposals involving this definition, thereby showing that this proposal was indeed reviewed.

We believe that the interpretation of whether being allowed to address the original proposal in view of the NFPA Standards Council Long Decision 05-24 (SC #05-7-4) was wrong. Additionally, having a definition where the term is not used in the text of the code is in violation of the Style Guide.

We agree with deleting the term "air duct" as it was evidently an oversight that it was not removed during the last code cycle. Air duct was introduced for use with "air duct cable" which was not to be used in the 2005 code. Additionally, the term is not used within 800.

To further not using this term, in proposal 16-29, the panel revised the proposal to not use "air duct", but instead to harmonize code language by using the term "ventilation or air handling ducts".

OHDE, H.: See my Explanation of Negative for Comment 16-84.

16-90 Log #1580 NEC-P16 **Final Action: Reject (800.2)**

Submitter: Harold C. Ohde, IBEW-NECA Technical Institute
Comment on Proposal No: 16-100
Recommendation: This proposal should be accepted.
Substantiation: The term "air duct" is not used in Article 800 and, therefore, it should be deleted from 800.2. Defining a term that is not being used (such as air duct) in that Article is in direct violation with the National Electrical Code Style Manual. CMP 16 rejected this proposal based on the Standards Council decision D#05-24 to remain "status quo" on issues that pertain to NFPA 90A.

I do not believe that this Standards Council decision would prohibit the definition of "air duct" from being deleted. I do believe that expansion of, or a new definition of, air duct in another Article would be a violation of Standards Council Decision D#05-24. Standards Council recently issued another decision (D#06-03) which decided that 770.154(A) FPN, 800.154(A) FPN and 820.154(A) FPN may be deleted and this deletion would not be in conflict with the Standards Council decision (D#05-24). Standards Council recognizes the 2002 edition of the NEC as being status quo.
Panel Meeting Action: Reject
Panel Statement: As there was no opportunity for public review and comment, the panel continues to affirm its original action on the referenced proposal in accordance with the action taken to comply with the Standards Council relative to the 90A Decision.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:

JENSEN, R.: We disagree that there was no opportunity for public review. To the contrary, there were nineteen (19) comments received on proposals involving this definition, thereby showing that this proposal was indeed reviewed.

We believe that the interpretation of whether being allowed to address the original proposal in view of the NFPA Standards Council Long Decision 05-24 (SC #05-7-4) was wrong. Indeed, during the writing of the 2005 NEC, all references where 90A issues were involved were to be untouched in the 2005 NEC. One of these issues was "air duct cable" and the definition of "air duct" (as it pertained to air duct cable). Additionally, having a definition where the term is not used in the text of the code is in violation of the Style Guide.

We agree with deleting the term "air duct" as it was evidently an oversight that it was not removed during the last code cycle. Air duct was introduced for use with "air duct cable" which was not to be used in the 2005 code. Additionally, the term is not used within 800. To further not using this term, in proposal 16-29, the panel revised the proposal to not use "air duct", but instead to harmonize code language by using the term "ventilation or air handling ducts".

OHDE, H.: See my Explanation of Negative for Comment 16-84.

16-91 Log #1688 NEC-P16 **Final Action: Accept (800.2)**

Submitter: Harold C. Ohde, IBEW #134
Comment on Proposal No: 16-110
Recommendation: Continue to Reject.
Substantiation: The submitter's recommendation to add this definition to 800.2 because the term "concealed space" is used 800.154(A) FPN is misleading. This definition does not belong in the NEC. The 800.154(A) FPN provided no guidance to designers, installers or code officials. This FPN has misled the designer, installer and code officials to believe, install and enforce that limited combustible cable, conduit or a sprinkler system to be installed in the concealed space or plenums would be a requirements because of NFPA 13

Section 8.14.1. It is important to note that the NEC does not have a definition of "concealed spaces" therefore the confusion and making it impossible to enforce. What does constitute a concealed space? Is it the space above a dropped ceiling; or is it a space above plastered or drywall ceiling? Is it the wall cavity of typical wall construction.

NFPA 13 just completed their revision process for the 2006 NFPA 13 Standard. 8.14.1 of NFPA 13 has been revised to read as follows:

8.14.1.2 Concealed Spaces not Requiring Sprinkler Protection.

8.14.1.2.1* Concealed spaces of noncombustible and limited combustible construction with minimal combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those as a return air for a plenum. (For additional information on combustible loading see A.8.14.1.2.1)

8.14.1.2.2 Concealed spaces of noncombustible and limited combustible construction with limited access and not permitting occupancy or storage of combustible shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.

A.8.14.1.2.1 Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc... can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1) For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined.

In the 2006 NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.

Standards Council recently issued another decision (D#06-03) which decided that this FPN may be deleted from Sections 770.154, 800.154 and 820.154 (all under CMP 16 purview) and this deletion will not be in conflict with the Standards Council decision (D#05-24). Standards Council recognizes the 2002 edition of the NEC as being status quo. This FPN referencing NFPA 13 was added to the 2005 NEC therefore it can and should be deleted. There is no need for the term "concealed spaces" to be defined.

Panel Meeting Action: Accept

Comment on Proposal No: 16-108
Recommendation: Continue to accept the definition of communications raceway.

Revise the definition of Optical Fiber Raceway as shown:

Optical Fiber Raceway. A raceway ~~designed~~ for enclosing and routing ~~listed~~ optical fiber cables.

Substantiation: The listing requirements for Communications Raceway are in section 800.182. It is appropriate to have a definition in this article.

The listing requirements for Optical fiber Raceways are in section 770.182 and the definition is in section 770.2. The suggested change in the definition of Optical Fiber Raceway will make it parallel to the definition of Communications Raceway that was accepted in proposal 16-108.

See proposal 16-245 where the panel accepted a similar definition for CATV Raceway. The listing requirements for CATV Raceways are in section 820.182.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 16-96.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-102 Log #169 NEC-P16 **Final Action: Accept**
(800.3(A) and (B))

TCC Action: The Technical Correlating Committee directs that item (C) and the FPN in the panel action be deleted to correlate with the action on Proposal 10-59 to delete Article 780 in its entirety.
Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 16-121
Recommendation: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting and that this Proposal be reconsidered and correlated with the action on Proposal 16-221.

The Technical Correlating Committee directs that the panel consider not only the division applications, but also the zone applications.

In addition, the Technical Correlating Committee understands that the word "and" in (A) of the Proposal was not "Accepted."
This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept

Change 800.3 to read as follows:

800.3 Other Articles.

(A) Hazardous (Classified) Locations. Communications circuits and equipment installed in a location that is classified in accordance with 500.5 and 505.5 shall comply with the applicable requirements of Chapter 5.

(B) Equipment in Other Space Used for Environmental Air. Section 300.22(C) shall apply.

(C) Hybrid Power and Communications Cables. The provisions of 780.6 shall apply for listed hybrid power and communications cables in closed-loop and programmed power distribution.

FPN: See 800.179(I) for hybrid power and communications cable in other applications.

Panel Statement: The panel has considered the comments expressed in the voting as directed by the TCC.

Assuming Comments 16-173 and 174 are accepted, the numbering in the panel action on the proposal now becomes correct.

Proposal 16-121 deleted a reference to the entire Article 500 and substituted a reference to 500.5 in order to comply with Section 4.1.1 of the NEC Style Manual.

The panel notes that the text concerning hybrid power and communications cables was mistakenly omitted from the preprint and should be restored as indicated.
Number Eligible to Vote: 15

16-105 Log #2055 NEC-P16 **Final Action: Reject**
(800.3(C), 800.25, and 800.26)

Submitter: Harold C. Ohde, IBEW #134
Comment on Proposal No: 16-129
Recommendation: This Proposal should have been Rejected.
Substantiation: The submitter's recommendation to add a new 800.26 with this FPN No. 2 to this section is in grave error. This FPN would not provide guidance to designers, installers or code officials. This FPN would have misled the designer, installer and code officials to believe, install and enforce that limited combustible cable, conduit or a sprinkler system to be installed in the concealed space or plenums would be a requirement because of NFPA 13, Section 8.14.1. The submitter's substantiation references 2002 NFPA 13 Section 8.14.1. It is important to note that the NEC does not have a definition of "concealed spaces", therefore making it impossible to enforce. What constitutes a concealed space? Is it the space above a dropped ceiling; or is it a space above plastered or drywall ceiling? Is it the wall cavity of typical wall construction?

NFPA 13 just completed their revision process for the 2006 NFPA 13 Standard. 8.14.1 of NFPA 13 has been revised to read as follows:

8.14.1.2 Concealed Spaces not Requiring Sprinkler Protection.

8.14.1.2.1* Concealed spaces of noncombustible and limited combustible construction with minimal combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those as a return air for a plenum. (For additional information on combustible loading see A.8.14.1.2.1).

8.14.1.2.2 Concealed spaces of noncombustible and limited combustible construction with limited access and not permitting occupancy or storage of combustible shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.

A.8.14.1.2.1 Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc... can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1). For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined.

In the 2006 NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.

CMP 16 should have rejected this proposal based on the Standards Council decision D#05-24 to remain "status quo" on issues that pertain to NFPA 90A. Standards Council recently issued another decision (D#06-03) which decided that this FPN may be deleted from Sections 770.154, 800.154, and 820.154 (all under CMP 16 purview) and this deletion will not be in conflict with the Standards Council decision (D#05-24). Standards Council recognizes the 2002 edition of the NEC as being status quo.

Panel Meeting Action: Reject

Ballot Results: Affirmative: 15

16-106 Log #2056 NEC-P16 **Final Action: Reject**
(800.3(C), 800.25, and 800.26)

Submitter: Harold C. Ohde, IBEW #134

Comment on Proposal No: 16-130

Recommendation: This Proposal should have been Rejected.

Substantiation: The submitter's recommendation to add a new 800.26 with this FPN No. 2 to this section is in grave error. This FPN would not provide guidance to designers, installers or code officials. This FPN would have misled the designer, installer and code officials to believe, install and enforce that limited combustible cable, conduit or a sprinkler system to be installed in the concealed space or plenums would be a requirement because of NFPA 13, Section 8.14.1. The submitter's substantiation references 2002 NFPA 13 Section 8.14.1. It is important to note that the NEC does not have a definition of "concealed spaces", therefore making it impossible to enforce. What constitutes a concealed space? Is it the space above a dropped ceiling; or is it a space above plastered or drywall ceiling? Is it the wall cavity of typical wall construction?

NFPA 13 just completed their revision process for the 2006 NFPA 13 Standard. 8.14.1 of NFPA 13 has been revised to read as follows:

8.14.1.2 Concealed Spaces not Requiring Sprinkler Protection.

8.14.1.2.1* Concealed spaces of noncombustible and limited combustible construction with minimal combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those as a return air for a plenum. (For additional information on combustible loading see A.8.14.1.2.1).

8.14.1.2.2 Concealed spaces of noncombustible and limited combustible construction with limited access and not permitting occupancy or storage of combustible shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.

A.8.14.1.2.1 Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc... can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1). For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined.

In the 2006 NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expan
ded the list of combustibles to provide examples of potential combustible loading.

CMP 16 should have rejected this proposal based on the Standards Council decision D#05-24 to remain "status quo" on issues that pertain to NFPA 90A. Standards Council recently issued another decision (D#06-03) which decided that this FPN may be deleted from Sections 770.154, 800.154, and 820.154 (all under CMP 16 purview) and this deletion will not be in conflict with the Standards Council decision (D#05-24). Standards Council recognizes the 2002 edition of the NEC as being status quo.

Panel Meeting Action: Reject

Panel Statement: The panel rejected the text that the submitter of the comment objected to.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-107 Log #247 NEC-P16 **Final Action: Accept in Part**
(800.3(D))

TCC Action: The Technical Correlating Committee has revised this comment by changing the accepted text from "(D)" to (C)" to correlate with the action taken by the Technical Correlating Committee in Comment 16-102 and Proposal 10-59.

Submitter: Stanley Kaufman, CableSafe Inc.

Comment on Proposal No: 16-131

Recommendation: Accept proposal 16-131 in principle by continuing to re-letter the current 800.3(D) to 800.3(C) and establishing a new 800.3(D) as follows:

(D) Network-Powered Broadband Communications Systems. Article 830 shall apply to network-powered broadband communications systems.

Substantiation: With the acceptance of proposal 16-98 it may not be clear that Article 830 applies to network-powered broadband communications systems. Addition of the suggested text will add clarity.

Panel Meeting Action: Accept in Part

Add 800.3(D) as follows:

(D) Network-Powered Broadband Communications Systems. Article 830 shall apply to network-powered broadband communications systems.

Panel Statement: The panel rejects the submitter's comment on Proposal 16-131, as it conflicts with the panel action and statement on Comment 16-102. The panel accepts the addition of 800.3(D).

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-107a Log #CC1602 NEC-P16 **Final Action: Accept**
(800.24, 820.24 and 830.24 FPN)

TCC Action: The Technical Correlating Committee understands that the updates apply to the ANSI/BICSI/NECA Standard in the FPN text as accepted by the panel action on Proposal 16-139.

Submitter: Code-Making Panel 16,

Comment on Proposal No:

Recommendation: Revise the Fine Print Note in 800.24, 820.24 and 830.24 to read as follows:

FPN: Accepted industry practices are described in ANSI/NECA/BICSI 568-2006, Standard for Installing Commercial Building Telecommunications Cabling, and other ANSI-approved installation standards

Substantiation: ANSI/NECA/BICSI 568-2006, Standard for Installing Commercial Building Telecommunications Cabling has now been published. The Panel intends to update to the now-current dated document.

Panel Meeting Action: Accept

Ballot Results: Affirmative: 15

16-108 Log #171 NEC-P16 **Final Action: Accept**
(800.24)

Submitter: Technical Correlating Committee on National Electrical Code

Comment on Proposal No: 16-135

Recommendation: The Technical Correlating Committee notes that neither the panel statement nor the revised statement shown in the affirmative vote are responsive to the submitter's substantiation for the recommendation. The Technical Correlating Committee directs the panel to act on the merits of the recommendation. This action will be considered by the Panel as a Public Comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

Panel Statement: The panel accepts the direction of the TCC to reconsider the comments expressed in the voting and continues to reject the proposal.

The requirements of 300.11 are applicable to communications cables, are not overly restrictive and are appropriate.

Requiring any and all cables to be properly supported is not overly restrictive and is appropriate. Securing an additional cable to an existing properly supported cable does not constitute support. Additional cables must be directly supported by the same structural member that supports the first cable. In such installations, the additional cable is being supported by the same structural member.

Comment on Affirmative:

BRUNSSEN, J.: Proposal 16-135 should have been accepted. See my explanation of negative vote on Comment 16-114.

16-109 Log #372 NEC-P16 **Final Action: Reject**
(800.24)

Submitter: S. D. Kahn, Tri-City Electric Company, Inc. / Rep. NECA
Comment on Proposal No: 16-134
Recommendation: Reject the Proposal.
Substantiation: Although I agree with the proposal and the submitter's intent to introduce consistency, the material is used in plenums and other air handling spaces. Consequently, the proposal should have been subjected to the direction given by the Standards Council, as were many other proposals which were rejected.

As Mr. Dorna noted in his "Explanation of Negative Vote", "The UL Directory (2005), shows that category ZODZ covers "cable ties, cable tie mounts and similar types of related hardware". Likewise, Conduit and Fittings, category DWFV covers "cable ties, conduit straps, staples and similar hardware..." Both categories list as "Suitable for use in air handling spaces in accordance with Sec 300.22(C) and (D) of the National Electrical Code."

This proposal should have been rejected because of the Standards Council decision concerning NFPA 90A. Code Making Panels must be consistent in their handling of all submitted proposals.
Panel Meeting Action: Reject
Panel Statement: This is not a 90A issue.

The guide information for ZODZ, Wire Positioning Devices states that:

"The investigation of these products includes consideration of the rated mechanical strength, maximum operating temperature, smoke and heat generation, corrosion resistance and weatherability characteristics as appropriate for the product."

These are all characteristics that we should be concerned about for electrical installations.

The reference to air handling spaces is only a reference and is stated as:

"…for those devices which have been investigated to determine their suitability for use in air handling areas…"

This is a standard statement that is found in a wide variety of listing categories including the category for IT and Telecom equipment to cover situations where a special investigation is done to evaluate a device for air handling spaces. It no way implies that devices in the category are automatically intended for air handling spaces.

Listed devices are evaluated using UL1565 – Standard for Positioning Devices. The scope of this standard states:

"1.1 This standard applies to those metallic and nonmetallic devices used for positioning - which may include bundling and securing - or to a limited extent supporting cable, wire, conduit, or tubing of a wiring system in electrical installations, to reduce the risk of fire, electric shock, or injury to persons."

Devices are evaluated for properties that we are concerned about. It is NOT a requirement for a listed device to be evaluated for use in air handling spaces.

16-111 Log #477 NEC-P16 **Final Action: Reject**
(800.24)

Submitter: Timothy P. McNeive, Thomas & Betts Corporation
Comment on Proposal No: 16-137
Recommendation: Accept the panel action but delete the requirement that hardware be "listed" in 800.24. Add the following sentence before the last sentence in 800.24:

"Cable ties that provide primary support for optical fiber cables and raceways shall have a minimum loop tensile strength of 23 kg (50 lbs)."
Substantiation: Adding a requirement that all hardware be "listed" is far from editorial as asserted in the substantiation accompanying the proposal. The panel is asked to consider the long-standing positions of CMP-7 and CMP-8 that do not require support hardware to be "listed". Above all else, consistency in the NEC seems to be what the original submitter values most. No substantiation has been provided in the proposal that would differentiate treatment of communication circuit cables from other wiring systems with respect to support. The wide variety of hardware used for supporting cables and raceways are called upon to provide both primary support required in the NEC and very often secondary support or wire management functions. All hardware need not be held to the highest standard.

The comment provided by Mr. Dorna with his negative vote, references two UL categories, under which cable ties and other hardware are "listed". The correct UL category for Hardware for Support of Conduit, Tubing and Cable (UL2239) is DWMU, not DWFV. Nevertheless, this standard and UL 1565, Positioning Devices (ZODZ) establishes a 23 kg test load for all support products for flexible conduits and cables in accordance with the requirements for primary support throughout the NEC. For cable ties, "minimum loop tensile strength" is commonly marked on packages. The 23 kg minimum for cable support is well representative of typical straps, hangers and staples listed for flexible conduit and cable support in accordance with UL 2239, Hardware for Support of Conduit, tubing and Cable. The proposed new text will add value to inspectors in acceptance of appropriate cable ties without requiring listing.

Companion comments have been submitted for 640.6; 725.8, 760.8; 770.24; 820.24 and 830.24.
Panel Meeting Action: Reject
Panel Statement: There is more to listing than mechanical strength. Also, the mechanical strength should be based on the use and ratings of the device.

Cable ties can be used for securing and supporting cables in a number of Chapter 3 wiring methods without any requirements for a minimum loop tensile strength of 23 kg (50 Ib) or any particular strength. For example, 334.30 covering securing and supporting of "nonmetallic-sheathed cable requires supporting and securing by staples, cable ties, straps, hangers, or similar fittings designed and installed so as not to damage the cable, at intervals not exceeding 1.4 m (4 1/ 2 ft) and within 300 mm (12 in.) of every outlet box, junction box, cabinet, or fitting." Notice that it does not have any recommendation for the support strength, nor does it need this additional marking or special consideration. The cables may not be providing any support at all where the tie wrap is simply anchoring it to a beam or joist. Types AC and MC cable also give permission to use cable ties for securing and supporting these cables in 320.30 and 330.30, respectively. In addition, this added text could be considered to be new information that has not been reviewed as part of the process.

Listing includes an evaluation of the particular device that goes beyond the ability to support cable. The guide information for ZODZ, Wire Positioning Devices, states:

"The investigation of these products includes consideration of the rated mechanical strength, maximum operating temperature, smoke and heat generation, corrosion resistance, and weatherability characteristics as appropriate for the product."

These are all characteristics that we should be concerned about for electrical installations.

Listed devices are evaluated using UL1565, Standard for Positioning Devices. The scope of this standard states:

"1.1 This standard applies to those metallic and nonmetallic devices used for positioning which may include bundling and securing or to a limited extent supporting cable, wire, conduit, or tubing of a wiring system in electrical installations, to reduce the risk of fire, electric shock, or injury to persons."

16-112 Log #482 NEC-P16 **Final Action: Reject (800.24)**

Submitter: Timothy P. McNeive, Thomas & Betts Corporation
Comment on Proposal No: 16-134
Recommendation: Accept the panel action, accept in principle, but delete the word "listed". Add the following sentence, as proposed in Mr. Boyer's comment on negative, before the last sentence in 800.24(B):

"Cable ties that provide primary support for optical fiber cables and raceways shall have a minimum loop tensile strength of 23 kg (50 lbs.)"

Substantiation: See my comment on ROP 16-45.

The panel is asked to consider the long-standing positions of CMP-7 and CMP-8 that do not require support hardware to be "listed". No substantiation has been provided in the panel action that would differentiate treatment of fiber optic cables and raceways from other wiring systems with respect to support. The wide variety of hardware used for supporting cables and raceways are called upon to provide both primary support required in the NEC and very often secondary support or wire management functions. All hardware need not be held to the highest standard.

The comment provided by Mr. Dorna with his negative vote on ROP 16-45, references two UL categories under which cable ties and other hardware are "listed". The correct UL category for Hardware for Support of Conduit, Tubing and Cable (UL 2239) is DWMU, not DWFV. Nevertheless, this standard and UL 1565, Positioning Devices (ZODZ) establishes a 23 kg test load for all support products for flexible conduits and cables in accordance with the requirements for primary support throughout the NEC. For cable ties, "minimum loop tensile strength" is commonly marked on packages. The 23 kg minimum for cable support is well representative of typical straps, hangers and staples listed for flexible conduit and cable support in accordance with UL 2239, Hardware for Support of Conduit, Tubing and Cable. The proposed new text will add value to inspectors in acceptance of appropriate cable ties without requiring listing.

Companion comments have been submitted for 640.6, 725.8, 760.8, 770.24, 820.24 and 830.24.

Panel Meeting Action: Reject
Panel Statement: There is more to listing than mechanical strength. Also, the mechanical strength should be based on the use and ratings of the device.

Cable ties can be used for securing and supporting cables in a number of Chapter 3 wiring methods without any requirements for a minimum loop tensile strength of 23 kg (50 Ibs) or any particular strength. For example, Section 334.30 covering securing and supporting of "nonmetallic-sheathed cable requires supporting and securing by staples, cable ties, straps, hangers, or similar fittings designed and installed so as not to damage the cable, at intervals not exceeding 1.4 m (4 1/ 2 ft) and within 300 mm (12 in.) of every outlet box, junction box, cabinet, or fitting." Notice it does not have any recommendation for the support strength, nor does it need this additional marking or special consideration. The cables may not be providing any support at all where the tie wrap is simply anchoring it to a beam or joist. Types AC and MC cable also give permission to use cable ties for securing and supporting these cables in 320.30 and 330.30, respectively. In addition, this added text could be considered to be new information that has not been reviewed as part of the process.

Listing includes an evaluation of the particular device that goes beyond the ability to support cable. The guide information for ZODZ, Wire Positioning Devices states that:

"The investigation of these products includes consideration of the rated mechanical strength, maximum operating temperature, smoke and heat generation, corrosion resistance and weatherability characteristics as appropriate for the product."

These are all characteristics that we should be concerned about for electrical installations.

Listed devices are evaluated using UL1565 – Standard for Positioning Devices. The scope of this standard states:

"1.1 This standard applies to those metallic and nonmetallic devices used for positioning - which may include bundling and securing - or to a limited extent supporting cable, wire, conduit, or tubing of a wiring system in electrical installations, to reduce the risk of fire, electric shock, or injury to persons."

16-113 Log #870 NEC-P16 **Final Action: Reject (800.24)**

Submitter: John P. Masarick, Independent Electrical Contractors Inc.
Comment on Proposal No: 16-137
Recommendation: The panel is encouraged to continue to Accept in Principle Proposal 16-137.
Substantiation: The reasons to continue to Accept in Principle the Proposal are as follows:

1. The trend by the CMPs over the last several code cycles has been to limit the use of FPNs.
2. There is also a correlation issue. There is a conflict between those panels that accepted the proposal and those that rejected the proposal.
3. These standards are also covered by a Fine Print Note in 110.12.
4. The FPN should not be accepted because numerous standards and installation manuals exist and to only mention one does not adequately inform the public about accepted industry practices. The NEC is not intended to be an instruction manual for untrained persons. If the FPNs are allowed to reference these standards, then they should list all applicable standards.
5. Since the referenced installation standards are intentionally general to cover different models of equipment, approval of the FPN may lead many to believe these standards can be used instead of listed or labeled manufacturer's instructions which would be in violation of 110.3(B).
6. If the CMP would like to include the reference, it should be placed in the Annex with the other references.

Panel Meeting Action: Reject
Panel Statement: The action of Proposal 16-137 was to accept in principle in part. This is not consistent with the submitter's request.
Number Eligible to Vote: 15

Explanation of Negative:

JOHNSON, S.: See my explanation of negative vote on Comment 16-29.

16-114 Log #1536 NEC-P16 **Final Action: Reject (800.24)**

Submitter: James E. Brunssen, Telcordia Technologies, Inc. / Rep. Alliance for Telecommunications Industry Solutions
Comment on Proposal No: 16-135
Recommendation: Accept this proposal.
Substantiation: This proposal should be accepted. The requirement added by Panel 16 during the 2005 revision cycle is overly restrictive and inappropriate for communications cables. The Fine Print Note associated with 800.24 directs the reader to the appropriate installation standards. The Panel has enhanced the Fine Print Note during this cycle by the addition of three new references covering the installation of communications cables (see Proposal 16-139). These references are all that is necessary and sufficient for such cables without imposing the burdensome requirements of 300.11. Section 300.11 is directed toward power cable assemblies that are heavier and larger than communications cables, operate at much greater power levels, and present a greater risk of injury if not properly installed. If the Panel continues to reject Proposal 16-135 then, at the very least, 300.11(C) should be excepted. See my companion comment on Proposal 16-141.

Panel Meeting Action: Reject
Panel Statement: Securing an additional cable to an existing cable does not constitute support. Additional cables must be directly supported by the same structural member that supports the first cable. In such installations, the additional cable is being supported by the same structural member.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 12 Negative: 3
Explanation of Negative:

BRUNSSEN, J.: This comment should have been accepted, as should the original Proposal 16-135. Lashing (tie-wrapping) of additional communications cables to existing communications cables is accepted industry practice, and has been done extensively without detriment to safety. The communications cables in question are of small diameter, light in weight and operate at very low voltage, current and power levels. The argument is not one of whether to support the additional communications cable, but the adequacy of lashing (tie-wrapping) to existing communications cable(s). For further substantiation, see my explanation of negative on Proposal 16-135 and my substantiation to Comment 16-114. Additionally, the final sentence of the panel statement is unclear.

JOHNSON, S.: See my explanation of negative vote on Comment 16-31.

JONES, R.: The requirement added by Panel 16 during the 2005 revision cycle is overly restrictive and inappropriate for communications cables. The panel has added three new references covering the installation of communications cables in a fine print note. These and the installation requirements in Article 800 are adequate without the requirements of 300.11. The panel has not made any exceptions for small single circuit cables. New technology does not require the heavy multi-conductor cables used in the past.

16-115 Log #1537 NEC-P16 **Final Action: Reject**
(800.24)

Submitter: James E. Brunssen, Telcordia Technologies, Inc. / Rep. Alliance for Telecommunications Industry Solutions
Comment on Proposal No: 16-141
Recommendation: Accept this proposal.
Substantiation: This proposal should be accepted. If the Panel continues to support the addition of the requirements of 300.11 to 800.24, then at the very least, the requirements of 300.11(C) should be waived. Section 300.11(C) is clearly not applicable to communications cables. Installation practice is to lash communications cables together to form a "cable assembly". This frequently occurs during modifications or additions to an existing installation. Communications cables are physically smaller and lighter than power cables, operate at much lower voltages and are power-limited. Application of 300.11(C) is overly restrictive and will preclude lashing of communications cables together to form a cable assembly. Communications cables secured in this manner have adequate support (see 300.11 (A)), are supported independently of the suspended ceiling grid, and are not likely to collapse in the event the suspended ceiling collapses. Such restriction imposes additional installation costs with no improvement in safety. See my companion comment on Proposal 16-135.
Panel Meeting Action: Reject
Panel Statement: Securing an additional cable to an existing cable does not constitute support. Additional cables must be directly supported by the same structural member that supports the first cable. In such installations, the additional cable is being supported by the same structural member.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 12 Negative: 3
Explanation of Negative:
BRUNSSEN, J.: This comment should have been accepted, as should the original Proposal 16-141. If the panel continues to support the addition of the securing and supporting requirements of 300.11, then at the very least 300.11(C) should be exempted. It is clearly not applicable to communications cables. For further substantiation, see my explanation of negative on Proposal 16-141 and the substantiation accompanying my Comment 16-115. Additionally, the final sentence of the panel statement is unclear.
JOHNSON, S.: See my explanation of negative vote on Comment 16-31.
JONES, R.: See my Explanation of Negative Vote on Comment 16-114.

16-116 Log #2003 NEC-P16 **Final Action: Reject**
(800.24)

Submitter: Noel Williams, Herriman, UT
Comment on Proposal No: 16-134
Recommendation: This Proposal should have been Accepted without modification by the panel.
Substantiation: Cable ties of different types, materials, and configurations are widely used without problems and probably fall under the existing language "or similar fittings," so they would still continue to be used even if the proposal were rejected. However, much of the hardware that was already specifically permitted are not even available as listed products. For example, most straps, staples, and "hangers" are not listed products. Entire lines of one-hole and two-hole straps, standoff brackets, ring hangers, and the strut-type hardware used for all types of even the most heavy electrical wiring methods are not listed. The requirement should rest on the basic requirement that all such materials be acceptable to the authority having jurisdiction (approved). The proposed wording in the Explanation of Negative by Mr. Boyer would also be usable, as there is a listing standard for the cable ties and this language, since it refers to primary support, would not restrict the use of cable ties that are used only for cable management. The language accepted by the panel would eliminate most of the products currently in use by this industry, without any evidence being provided of a problem with those products.
Panel Meeting Action: Reject
Panel Statement: The guide information for ZODZ, Wire Positioning Devices states that:
"The investigation of these products includes consideration of the rated mechanical strength, maximum operating temperature, smoke and heat generation, corrosion resistance and weatherability characteristics as appropriate for the product."
These are all characteristics that we should be concerned about for electrical installations.
Listed devices are evaluated using UL1565 – Standard for Positioning Devices. The scope of this standard states:
"1.1 This standard applies to those metallic and nonmetallic devices used for positioning - which may include bundling and securing - or to a limited extent supporting cable, wire, conduit, or tubing of a wiring system in electrical installations, to reduce the risk of fire, electric shock, or injury to persons."
The evaluation of positioning devices includes:
• Classification by mechanical strength, material, maximum temperature, and environmental conditions
• Required Markings giving critical information to the installer / inspector
• Mechanical strength tests
• Flammability classification of polymeric materials and coatings (NOT air-handling space requirements)
• Relative thermal index
• Material requirements (Including blending and substitution)
• Corrosion resistance
• Sharp edges
• Installation
• Mechanical strength
• Vibration
• Tests for mounting blocks and other mounting hardware and devices
• Environmental conditioning.....

Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
JOHNSON, S.: See my explanation of negative vote on Comment 16-29.

16-117 Log #716 NEC-P16 **Final Action: Reject**
(800.24, FPN)

Submitter: Robert Kelleher, Paramount Electrical Services
Comment on Proposal No: 16-138
Recommendation: The action should be to delete this Fine Print Note.
Substantiation: The addition of these NECA Fine Print Notes, serves no benefit to the user of the National Electrical Code. These are not standards, they are a compilation of generic information and do not serve as information to the user. These must be purchased through NECA. This FPN as written is nothing more than free advertisement for generic, readily availble information which must be purchased by the code user. Code Making Panel 16 should consider taking an action to delete this FPN to coordinate with the other technical committees in the NEC project. A total of seventeen new Fine Print Notes were proposed to reference NECA standards. Sixteen were unanimously rejected. Inclusion of this Fine Print Note is in direct conflict with 90.1(C). In the action to reject proposal 8-3, one technical committee member promotes NECA standards as "….a tool to assist untrained electricians to make safer and better installations." The TCC should intervene, uphold the provisions of 90.1(C) and prohibit these types of Fine Print Notes. CMP16 should reject this FPN. Failure to do so will mean adding Fine Print Notes for IEC, EEI, IBEW, IAEI, ACC, NETA, NEI, SEIA, AISI, API, ASHE, AHAM, ICEAI, NYBFU and dozens of others when they decide to develop income through generic standards development. If this type of Fine Print Note is placed anywhere in the NEC an Annex should be included with coupons for the code user. If the NEC is to be used for advertisement purposes, coupons should be included.
Panel Meeting Action: Reject
Panel Statement: Proposal 16-138 pertained to updating the FPN and not to delete it.
The comment requests the FPN be deleted. The FPN provides valuable information and the panel intends for it to be retained but the date updated. The references provided in the FPN provide guidance for installation in a neat and workmanship like manner.
See panel action and statement on Comment 16-107a (Log #CC1602).

PREZIOSO, L.: See my explanation of affirmative vote on Comment 16-34.

16-118 Log #871 NEC-P16 **Final Action: Reject**
(800.24, FPN)

Submitter: John P. Masarick, Independent Electrical Contractors Inc.
Comment on Proposal No: 16-138
Recommendation: The panel is encouraged to continue to Reject Proposal 16-138.
Substantiation: The reasons to continue to Reject the Proposal are as follows:
1. The trend by the CMPs over the last several code cycles has been to limit the use of FPNs.
2. There is also a correlation issue. There is a conflict between those panels that accepted the proposal and those that rejected the proposal.
3. These standards are also covered by a Fine Print Note in 110.12.
4. The FPN should not be accepted because numerous standards and installation manuals exist and to only mention one does not adequately inform the public about accepted industry practices. The NEC is not intended to be an instruction manual for untrained persons. If the FPNs are allowed to reference these standards, then they should list all applicable standards.
5. Since the referenced installation standards are intentionally general to cover different models of equipment, approval of the FPN may lead many to believe these standards can be used instead of listed or labeled manufacturer's instructions which would be in violation of 110.3(B).

6. If the CMP would like to include the reference, it should be placed in the Annex with the other references.
Panel Meeting Action: Reject
Panel Statement: The comment substantiation is inconsistent with the recommended action. The panel does not agree to delete the FPN. The panel did not delete that FPN, as the original proposal was to update the reference date.
See the panel action and statement on Comment 16-107a (Log #CC1602).

16-120 Log #172 NEC-P16 **Final Action: Accept**
(800.24 Exception)

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 16-141
Recommendation: The Technical Correlating Committee notes that neither the panel statement nor the revised statement shown in the affirmative vote are responsive to the submitter's substantiation for the recommendation. The Technical Correlating Committee directs the panel to act on the merits of the recommendation. This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the direction of the TCC to reconsider the comments expressed in the voting and continues to reject the proposal.
The requirements of 300.11(C) are applicable to communications cables, are not overly restrictive and are appropriate.
Requiring any and all cables to be properly supported is not overly restrictive and is appropriate. Securing an additional cable to an existing properly supported cable does not constitute support. Additional cables must be directly supported by the same structural member that supports the first cable. In such installations, the additional cable is being supported by the same structural member.

16-123 Log #1262 NEC-P16 **Final Action: Accept**
(800.90(A)(1)(b))

TCC Action: The Technical Correlating Committee directs that the FPN should appear following 800.90(A)(1)(e).
Submitter: Neil F. LaBrake, Jr., Syracuse, NY
Comment on Proposal No: 16-97
Recommendation: Accept the Panel's action and add a new FPN to 800.90(A)(1):
FPN: Section 9 of ANSI C2-2007, *National Electrical Safety Code*, provides an example of methods of protective grounding that can achieve effective grounding of telecommunications cable sheaths for cables from which communications circuits are extended.
Substantiation: CMP 16 rejected the deletion of the term "effectively" in this section because the National Electrical Safety Code uses this term in Section 215(C)(I). This comment proposed a FPN to help explain the meaning of the term "effectively" in this context. Note, that besides NESC, there are other state regulations or utility practices that can also accomplish "effective grounding." Placement of the FPN is such that it will refer to "effectively grounded" where it appears in both subsections (b) and (e) of 800.90(A)(1).
This Comment was developed by a Task Group assigned by the NEC Technical Correlating Committee to address actions that were other than "accept" taken by Code-Making Panels on proposals from the TCC to resolve 2005 NEC Proposal 5-1 and Comment 5-1. Members of the Task Group on Grounding and Bonding for this Comment included: C. Douglas White; Michael Johnston; Jeffrey Boksiner; Daleep Mohla; Phil Simmons; Christopher Hutchings; James Carroll; Alan Rebeck; Richard Loyd; Paul Dobrowsky; and Neil F. LaBrake, Jr.

16-124 Log #245 NEC-P16 **Final Action: Accept in Principle**
(800.93)

Submitter: Stanley Kaufman, CableSafe Inc.
Comment on Proposal No: 16-157
Recommendation: Accept this proposal in principle by revising 800.93 as shown below:
~~The metallic sheath of communications cables entering buildings shall be grounded as close as practicable to the point of entrance or shall be interrupted as close to the point of entrance as practicable by an insulating joint or equivalent device.~~
Communications cables entering buildings or attaching to buildings shall comply with (A) or (B).
(A) Entering Buildings. In installations where the communications cable enters the building, the metallic sheath of the cable shall be either grounded, or interrupted by an insulating joint or equivalent device. The grounding or interruption shall be as close as practicable to the point of entrance.
(B) Terminating Outside of the Building. In installations where the communications cable is terminated outside of the building, the metallic sheath

of the cable shall be either grounded or interrupted by an insulating joint or equivalent device. The grounding or interruption shall be as close as practicable to the point the point of attachment or termination of the cable.
Substantiation: The suggested text is an editorial clarification. The text the panel accepted deals with two scenarios, installations where the cable enters the building and installations where the cable is terminated outside of the building. It is clearer to deal with each scenario in a separate sentence. The suggested text retains these options.
The suggested text is an editorial clarification intended to bring this section into compliance with section 3.3.1(2) of the NEC Style Manual which states:
2. Use simple declarative sentence structure, and keep sentences short. Writing rules in long sentences full of commas, dependent clauses, and parenthetical expressions often creates confusion and misunderstanding. The requirement can be written in two or more short sentences, expressed using a list or table, or both.
The existing paragraph deals with two scenarios, 1) installations where the cable enters the building and 2) installations where the cable is terminated outside of the building. It is clearer to deal with each scenario in a separate subsection.
This comment includes deletion of the current fine print note because it is no longer needed.
Panel Meeting Action: Accept in Principle

16-126 Log #1541 NEC-P16 **Final Action: Accept (800.93)**

Submitter: James E. Brunssen, Telcordia Technologies, Inc. / Rep. Alliance for Telecommunications Industry Solutions
Comment on Proposal No: 16-158
Recommendation: Accept this proposal in principle by revising 800.93 as shown below:
~~The metallic sheath of communications cables entering buildings shall be grounded as close as practicable to the point of entrance or shall be interrupted as close to the point of entrance as practicable by an insulating joint or equivalent device.~~
Communications cables entering the building or terminating on the outside of the building shall comply with (A) or (B).
(A) Entering Buildings. In installations where the communications cable enters the building, the metallic sheath members of the cable shall be either grounded as specified in 800.100, or interrupted by an insulating joint or equivalent device. The grounding or interruption shall be as close as practicable to the point of entrance.
(B) Terminating On the Outside of the Building. In installations where the communications cable is terminated on the outside of the building, the metallic sheath members of the cable shall be either grounded as specified in 800.100, or interrupted by an insulating joint or equivalent device. The grounding or interruption shall be as close as practicable to the point of termination of the cable.
Substantiation: The Panel, in revising this section, recognized that the communications cable does not always enter the building. In many cases it is terminated on the outside of the building in a Network Interface Device (NID) or similar device. In attempting to accommodate this scenario, the Panel added the text "or attached" and "point of attachment". However, the addition of this text is misleading and will result in impractical and unwieldy grounding and interruption requirements. The suggested text provides editorial clarification by addressing the two scenarios, cables entering the building and cables terminating on the outside of the building, separately. Further, the suggested text eliminates any confusion that may result from the use of the terms "attached" and "point of attachment", and addresses the issue directly: cables that are terminated on the outside of the building.

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 16-167
Recommendation: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal with respect to the use of the word "and" in the sentence "The grounding conductor shall be connected in accordance with 800.100(B)(1), (B)(2), and (B)(3)."
It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 5-20. This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Revise 800.100(B) as follows:
"(B) Electrode. The grounding conductor shall be connected in accordance with 800.100(B)(1), (B)(2), and or(B)(3)."
Revise 800.100(B)(1) as follows:
"(1) In Buildings or Structures with an Intersystem Grounding Bonding Termination. If the building or structure served has an intersystem grounding bonding termination, the grounding conductor shall be connected to the intersystem grounding bonding termination."
Revise 800.100(B)(2) as follows:
"(2) In Buildings or Structures with Grounding Means. If the building or structure served has no intersystem grounding bonding termination, the grounding conductor shall be connected to the nearest accessible location on the following:"
Retain existing list and text
Revise 800.100(B)(3) as follows:

"(3) In Buildings or Structures Without Intersystem Grounding Bonding Termination or Grounding Means. If the building or structure served has no intersystem grounding bonding termination or grounding means, as described ….".

Revise 800.100(B)(3)(2) as follows:

"(2) If the building or structure served has no intersystem grounding bonding termination or has no grounding means, as described in 800.100(B)(2) or …".

Panel Statement: The panel accepts the direction of the TCC to review clarification of the panel action.

The panel has clarified the panel action on Proposal 16-167 with respect to the word "and" as indicated in the panel action on this comment. It is not the intent to accomplish the grounding connections of 800.100 (B)(1), (B)(2), and (B)(3) simultaneously.

The panel has reconsidered Proposal 16-167 in light of the panel action on Proposal 5-20 as directed by the TCC and has revised "intersystem grounding termination" to "intersystem bonding termination" as indicated in the panel action on this comment.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

Comment on Affirmative:

BRUNSSEN, J.: The underlined and strikeout text (legislative format) as developed by Panel 16 does not appear in the panel meeting action text. Revise the text to read as follows:

Revise 800.100(B) to read: "(B) Electrode. The grounding conductor shall be connected in accordance with 800.100(B)(1), (B)(2) or (B)(3)".

Revise 800.100(B)(1) to read:

"(1) In Buildings or Structures with an Intersystem Bonding Termination. If the building or structure served has an intersystem bonding termination, the grounding conductor shall be connected to the intersystem bonding termination."

Revise 800.100(B)(2) to read:

"(2) In Buildings or Structures with Grounding Means. If the building or structure served has no intersystem bonding termination, the grounding conductor shall be connected to the nearest accessible location on the following:".

Revise 800.100(B)(3) to read:

"(3) In Buildings or Structures without Intersystem Bonding Termination or Grounding Means. If the building or structure served has no intersystem bonding termination or grounding means, as described...".

Revise 800.100(B)(3)(2) to read:

"(2) If the building or structure served has no intersystem bonding termination or has no grounding means, as described in 800.100(B)(2) or...".

16-129 Log #175 NEC-P16 **Final Action: Accept**
(800.100(B))

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 16-168
Recommendation: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 16-167 and the comments expressed in the voting on 16-168. This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept

Relocate the text as new paragraph to follow 800.100(B)(2)(7) and revise as follows: "A bonding device intended to provide a termination point for the grounding conductor (inter-system bonding) shall not interfere with the opening of an equipment enclosure. A bonding device shall be mounted on non-removable parts. A bonding device shall not be mounted on a door or cover even if the door or cover is non-removable."

Panel Statement: The panel has considered the comments expressed in the voting as directed by the TCC.

The panel action on Proposal 16-168 to 'accept in principle' is correct. The panel has reviewed the comment expressed in the voting and determined that the proper location of the text is following 800.100(B)(2)(7), not 800.100(B)(5) as indicated in the comment. That is where equipment (service) enclosures are discussed. The panel has also added editorial clarification as indicated in the panel action on this comment. The panel notes that the text is presently located incorrectly in the preprint.

16-135 Log #1287 NEC-P16 **Final Action: Hold**
(800.110)

TCC Action: The Technical Correlating Committee understands that the panel action was to Hold the Comment only.
Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 16-171
Recommendation: The panel action on the Proposal should continue to be Accept in Principle, however, the following additional changes should be made to the panel action:

Revise 800.110 as shown:

800.110 Raceways for Communications Wires and Cables. Where communications wires and cables are installed in a raceway, the raceway shall be either of a type permitted in Chapter 3 and installed in accordance with Chapter 3 or a ~~listed plenum~~ communications raceway listed in accordance with 800.182 and~~, listed riser communications raceway, or listed general-purpose communications raceway~~ installed in accordance with 800.154~~, and a listed nonmetallic raceway complying with 800.182,~~ and ~~installed in accordance with 362.24~~ 362.22 through 362.56, where the requirements applicable to electrical nonmetallic tubing apply. ~~The raceway fill tables of Chapter 3 and Chapters shall not apply.~~

Substantiation: The revisions in the first sentence clarify that the listing requirements are specified in 800.182 and the installation requirements in 800.154. 362.22 should also apply if the requirements for ENT are to be utilized.

Revising the text as proposed will still permit the installation of communications wires and cables in communications raceways (plenum riser, or general-purpose) or in any type of listed raceway permitted in Chapter 3 without adding additional text to the Code.

Using the term "listed communications raceways" will also permit the installation of other types of listed communications raceways that may be included in future Codes without having to revise 800.110.

The Exception should have been deleted rather than including it as positive text in the last sentence.

No substantiation was submitted to support the deletion of the conduit fill restrictions or raceway fill tables of Chapters 3 and 9. The fill restrictions are based on the physical limitations of being able to pull conductors or cables into raceways without damaging the conductors or cables, particularly when there are bends in the run, and to avoid conductor/cable jamming. The maximum percentage fill requirements are independent of whether they are electrical conductors or not.

The maximum percentage fill requirements in Chapters 3 and 9 are an integral part of the permitted uses of the raceways contained in Chapter 3 and if conductors or cables are to be installed in a Chapter 3 raceway, then the maximum percentage fill requirements must also apply.

The first sentence in 800.110, as modified by the panel action, already states "installed in accordance with Chapter 3" which would include all of Chapter 3 requirements pertaining to raceways including the maximum percentage fill limitations in Chapter 9. The proposal introduces conflicting requirements between the two sentences in 800.110.

Chapter 9, Table 1 permits 53 percent fill when one conductor or cable is installed in a raceway; 31 percent for two; and 40 percent for three or more.

The panel action to change "conduit" to "raceway" was appropriate since raceway is defined in Article 100 and includes, but is not limited to, conduit and tubing. Also, 800.110 references the applicable Sections of Article 362 which addresses Electrical Nonmetallic Tubing (ENT).
Panel Meeting Action: Hold
Panel Statement: Changing the installation requirements for raceways is new material.

The proposed revision(s) constitute new material that have not had the benefit of public review and cannot be considered at this stage of the Code-making cycle. Refer to 4.4.6.2.2 of the Regulations Governing Committee Projects.

See panel action and statement on Comment 16-26.

16-137 Log #1543 NEC-P16 **Final Action: Accept**
(800.110)

Submitter: James E. Brunssen, Telcordia Technologies, Inc. / Rep. Alliance for Telecommunications Industry Solutions
Comment on Proposal No: 16-171
Recommendation: Revise the text of 800.110 Raceways for Communications Wires and Cables as follows:

"…general-purpose communications raceway installed in accordance with 800.154~~, and a listed nonmetallic raceway complying with 800.182(A), (B), or (C), as applicable,~~ and installed in accordance with 362.24 through 362.56, where …".

Substantiation: This text is in error and is redundant. Section 800.182 contains the listing requirements for plenum, riser and general-purpose communications raceways.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-138 Log #450 NEC-P16 **Final Action: Reject**
(800.110 Exception)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 16-174
Recommendation: Accept revised:

Exception: Communication wires and cables shall not be required to comply with raceway fill restrictions specified elsewhere in this code.

Substantiation: If conduit fill restrictions do not apply, why would the restrictions of 372.11, 374.5, 376.22, 378.22, 384.22, 386.22, 388.22, 390.5, Chapter 9 Tables for Articles 358 and 362 not be covered by the exception?
Panel Meeting Action: Reject
Panel Statement: Raceway fill restrictions are already covered in 800.110. The text as requested by the submitter would be redundant to current text.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-139 Log #1289 NEC-P16 **Final Action: Reject**
(800.110 Exception)

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 16-174
Recommendation: The panel action should have been Accept.
Substantiation: The submitter's substantiation is correct and the panel action on Proposal 16-171 did exactly what the submitter requested.

See definition of "raceway" in Article 100.
Panel Meeting Action: Reject
Panel Statement: Raceway fill restrictions are already covered in 800.110. The action as requested would be redundant with text of 800.110 as modified by the panel action of Proposal 16-171.

Due to familiarity of the Code usage, problems may arise by making the change as requested and would add confusion rather than clarify.

The fill tables of Chapter 9 only apply to conduit and tubing. The fill limitations for other types of raceways are included in Chapter 3. Retaining the exception makes clear that both are covered by 800.110 (text and exception).
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-140 Log #178 NEC-P16 **Final Action: Accept**
(800.113, 800.179 and Table 800.179)

TCC Action: The Technical Correlating Correlating directs that the new Exception be written as a complete sentence in accordance with Section 3.1.4.1 of the NEC Style Manual as follows:
"Exception: Communications cables that comply with 800.48 shall not be required to be listed."
Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 16-178
Recommendation: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposals 16-145 and 16-209. This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept

The panel clarifies that the text of 800.48, 800.113 and the first two paragraphs of 800.179 should be as follows:

800.48. Unlisted Cables Entering Buildings. Unlisted outside plant communications cables shall be permitted to be installed in locations as described in 800.154(C) where the length of the cable within the building, measured from its point of entrance, does not exceed 15 m (50 ft) and the cable

enters the building from the outside and is terminated in an enclosure or on a listed primary protector.

FPN No. 1: Splice cases or terminal boxes, both metallic and nonmetallic types, are typically used as enclosures for splicing or terminating telephone cables.

FPN No. 2: This section limits the length of unlisted outside plant cable to 15 m (50 ft), while 800.90(B) requires that the primary protector be located as close as practicable to the point at which the cable enters the building. Therefore, in installations requiring a primary protector, the outside plant cable may not be permitted to extend 15 m (50 ft) into the building if it is practicable to place the primary protector closer than 15 m (50 ft) to the entrance point.

FPN No. 3: See 800.2 for the definition of point of entrance.

800.113 Installation of Communications Wires and Cables. Communications cables installed in buildings shall be listed.

Exception: As permitted in 800.48.

800.179 Communications Wires and Cables. Communications wires and cables shall be listed in accordance with 800.179(A) through 800.179(J) and marked in accordance with Table 800.179. Conductors in communications cables, other than in a coaxial cable, shall be copper.

Communications wires and cables shall have a voltage rating of not less than 300 volts. The insulation for the individual conductors, other than the outer conductor of a coaxial cable, shall be rated for 300 volts minimum. The cable voltage rating shall not be marked on the cable or on the undercarpet communications wire.

Exception: Voltage markings shall be permitted where the cable has multiple listings and voltage marking is required for one or more of the listings.

FPN No. 1: Voltage markings on cables may be misinterpreted to suggest that the cables may be suitable for Class 1, electric light, and power applications.

FPN No. 2: See 800.170 for listing requirement for equipment.

Panel Statement: The panel accepts the direction of the TCC to reconsider and correlate with the action on Proposals 16-145 and 16-209.

The panel also correlated the text of Proposal 16-187 renumbering.

Section 800.113 has been revised to establish parallelism between sections. The text of Proposal 16-209 has been changed to exempt the outer conductor of a coaxial cable from the requirement to have 300 V insulation because the outer conductor of a coaxial cable is always grounded.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-141 Log #447 NEC-P16 **Final Action: Accept in Part**
(800.113 and 800.179)

TCC Action: The Technical Correlating Committee understands that the effect of the panel action is to add the following new sentence to the second paragraph of 800.179 shown in the panel action on comment 16-140:

"Communications wires and cables shall have a temperature rating of not less than 60°C."

Submitter: Allen C. Weidman, The Society of the Plastics Industry, Inc.

Comment on Proposal No: 16-177

Recommendation: Accept these proposals in principle by modifying the second paragraph in 800.179 as shown below. (Note- CMP 16 action on proposal 16-178 introduced a second paragraph.)

Communications wires and cables shall have a voltage rating of not less than 300 volts. The cable voltage rating shall not be marked on the cable or on the undercarpet communications wire. Communications wires and cables shall have a temperature rating of not less than 60° C. When the temperature rating of the cable is greater than 60°C, the temperature rating shall be marked on the cable.

Also, add the following text to 800.133. (Note-The current 800.133(D) was renumbered by panel action on proposal 16-185.)

800.133(D). **Temperature Limitation of Communications Wires and Cables.** Communications wires and cables shall be used in such a manner that their operating temperature does not exceed their temperature rating.

Substantiation: Traditional telecommunications involves minimal powering over communications cables. However, Power over Ethernet (POE) applications are proliferating and using communications cables for powering as well as signaling. Overheating of communications cables is a real concern.

Since Chapter 8 is independent of the rest of the code, section 310.10 does not apply.

"310.10 Temperature Limitation of Conductors. No conductor shall be used in such a manner that its operating temperature exceeds that designated for the type of insulated conductor involved. In no case shall conductors be associated together in such a way, with respect to type of circuit, the wiring method employed, or the number of conductors, that the limiting temperature of any conductor is exceeded."

The suggested text for 800.133(E) is a common-sense requirement to use cables consistently with their temperature rating; it correlates with 310.10.

The suggested text for 800.179 is consistent with the UL standard for listing of communications cables (UL 444), which requires a minimum temperature rating of 60 °C and no temperature marking unless a higher temperature rating is obtained.

It is important for system designers, installers, local authorities and building owners to know the temperature rating of cables so they can assure that cables are used consistently with their temperature rating.

Panel Meeting Action: Accept in Part

Add the following text as the second paragraph of 800.179:

Communications wires and cables shall have a voltage rating of not less than 300 volts. The cable voltage rating shall not be marked on the cable or on the undercarpet communications wire. Communications wires and cables shall have a temperature rating of not less than 60°C.

Panel Statement: The panel rejects the text for 800.133(D) because it is unenforceable.

The panel rejects second suggested sentence in the second paragraph of 800.179.

The panel retained the recommended text that states that the minimum temperature rating is 60°C and deleted the recommended text related to temperature marking for cables rated higher than 60°C. If a manufacturer has a higher temperature rating than 60°C, the manufacturer will ordinarily mark the cable to differentiate it.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-142 Log #1957 NEC-P16 **Final Action: Reject**
(800.133(A)(1)(c) Exception No. 1)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Comment on Proposal No: 16-183

Recommendation: Accept the proposal as submitted.

Substantiation: The submitter is well aware of the differences between circuit separation as covered in this location and as covered for adjacent snap switches. However, the CMP 9 approach will accommodate CMP 16's requirements without disadvantaging one segment of the market. By using the term "identified" as the standard of product acceptance (See Article 100), you can have a plastic divider in a plastic box (both will be listed because nonmetallic boxes must be listed); or you have a steel divider in a steel box (the box will likely be listed but doesn't have to be and the divider probably won't be listed.) The CMP 16 conclusion that this wording would allow a barrier to be installed such that it would void a box listing is untrue. The identification requirement means that the partitions will be covered on factory cut sheets, etc. describing the boxes for which they were designed. You will not find a divider that will meet this standard and be unsuitable for this application. And, in the case of nonmetallic boxes, all identified products will also be listed, so any improper barrier would provoke a citation under 110.3(B). In the case of steel boxes, the barriers will probably not be listed, but the anchoring methods are obvious to any installer and inspector, and they can easily be made secure for obvious reasons. The submitter has been an electrician for a long time, and has never encountered any problems securely installing steel dividers into the boxes for which they are identified.

Panel Meeting Action: Reject

Panel Statement: The listing of dividers is important given current trends and wiring methods.

"Identified" is not the same as "listed" which means that some sort of evaluation for suitability of the divider and its installation has been performed. Mounting, compatibility, material type and thickness, maintenance of spacings, etc. are all items of concern that a listing would address.

In recent years there has been a flood of devices and configurations utilizing standard outlet box dimensions and configurations for mix and matching of ac outlets, Ethernet, CATV and telecom connectors and receptacles. There is great concern regarding the separation of circuits, "storage" of excess cabling, routing of cables through or within the box, lack of expertise related to the installation of non-power cabling, and the like.

16-143 Log #873 NEC-P16 **Final Action: Reject**
(800.154)

Submitter: John P. Masarick, Independent Electrical Contractors Inc.

Comment on Proposal No: 16-189

Recommendation: The panel is encouraged to continue to Accept Proposal 16-189.

Substantiation: The reasons to continue to Accept the Proposal are as follows:

1. The trend by the CMPs over the last several code cycles has been to limit the use of FPNs.

2. There is also a correlation issue. There is a conflict between those panels that accepted the proposal and those that rejected the proposal.

3. These standards are also covered by a Fine Print Note in 110.12.

4. The FPN should not be accepted because numerous standards and installation manuals exist and to only mention one does not adequately inform the public about accepted industry practices. The NEC is not intended to be an instruction manual for untrained persons. If the FPNs are allowed to reference these standards, then they should list all applicable standards.

5. Since the referenced installation standards are intentionally general to cover different models of equipment, approval of the FPN may lead many to believe these standards can be used instead of listed or labeled manufacturer's instructions which would be in violation of 110.3(B).

6. If the CMP would like to include the reference, it should be placed in the Annex with the other references.

Panel Meeting Action: Reject
Panel Statement: The FPN continues to provide useful guidance. Possibilities of misinterpretation are minimized in the 2007 Edition of NFPA 13.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 12 Negative: 3
Explanation of Negative:
JENSEN, R.: This FPN, as informative text to the NEC, is being used to market limited combustible cable. The NEC should not be used for this purpose. The FPN has had a profound effect in which it is used in misleading the AHJ, designers and installers to require limited combustible cable, conduit, or a sprinkler system to be installed within the concealed space.
In addition to the above, Panel 3 where there is not a marketing influence, rejected the inclusion of this FPN in Article 725. Cables used in 725 and 800 are interchangeable in many applications, yet there is no correlation of such a FPN.
JOHNSON, S.: See my explanation of negative vote on Comment 16-50.
OHDE, H.: See my Explanation of Negative for Comment 16-144.

16-144 Log #1780 NEC-P16 **Final Action: Reject**
(800.154)

Submitter: Robert W. Jensen, dbi
Comment on Proposal No: 16-189
Recommendation: Accept proposal to delete Fine Print Note__
~~FPN: See 8.14.1 of NFPA 13 (2002), Installation of Sprinkler Systems, for requirements for sprinklers in concealed spaces containing exposed combustibles.~~
Substantiation: The Standards Council issued two decisions, NFPA Standards Council Decision 06-03 (SC #06-3-18) dated 22 March 2006 and NFPA Standards Council Decision 06-19 (SC #06-7-33) dated 28 July 2006. These decisions address Code Making Panel (CMP) decisions on Fine Print Notes referencing NFPA 13. The former (earlier) decision states, in pertinent part: "Mr. Dollard asks for clarification whether the Standards Council directive prohibits the NEC project from deleting the Fine Print Notes to sections 770.154, 800.154 & 820.154. The Council, after due consideration, believes that clarification is appropriate in this instance and responds that the NEC project would not violate the directive by deleting the fine print notes at issue." The later decision states, in pertinent part, as follows: "if the fine print notes are not a helpful reference to NFPA 13 or engender confusion, the NEC Project should have the ability to delete them and nothing in the Council's status quo directive prohibits this." The decision also states: "It has also been pointed out that deletion of the fine print notes would provide further consistency within the NEC itself since, currently, the fine print notes at issue only appear in some relevant NEC Articles (Articles 770, 800, and 820), but not in others (Articles 725 and 760)." The decision also states: "nothing in NFPA procedures prevents the NEC Project from considering and acting on deletion of the fine print notes during the Comment phase of the code development process. Proposals to the fine print notes were filed and rejected by the responsible CMP based on its then understanding of the Council's directive. The subject was explicitly raised during the Report on Proposals phase of the process and is clearly open for further consideration and action during the Comment phase."
This FPN is being misinterpret and used in aggressive marketing attempts to require the installation of "limited combustible cable" (one such example is found at http://www.dupont.com/cablingsolutions/products/codes.html). The FPN has had a profound effect in which it is used in misleading the AHJ to require limited combustible cable, conduit, or a sprinkler system to be installed within the concealed space.
As an example, an AHJ Massachusetts would not provide a certificate of occupancy until the communications cabling was either replaced with limited combustible cable, the CMP cable was placed in conduit, or a sprinkler system installed above the suspended ceiling.. Although the installer had met the requirements of the NEC, the FPN misled the AHJ causing project delays and the potential of inordinate cost to the project. A plea to the NFPA aided the communications installer in which clarification was given that the CMP cabling was indeed sufficient to meet code and that NFPA 13 allowed some quantities (which is not defined) of communications cabling within concealed spaces. The installation of the CMP cable was allowed.
To further the removal of this FPN, the Report on Proposals A2006 from NFPA 13 (copy provided), the NFPA committee specifically added an annex A.8.14.1.2.1 in 13-284 log #551 stating that, "Some minor quantities of combustible materials, such as communication wiring, can be present in some concealed spaces but should not typically be viewed as requiring sprinklers (see 8.14.1.1). The threshold value at which sprinklers become necessary in the concealed space is not defined. For example, the usual amounts of data or telephone wiring found above a ceiling would not typically constitute a threat. If bundles of unsheathed computer wiring are installed above the ceiling or beneath the floor in a manner where fire propagation in all directions is likely, then the concealed space should be treated the same as a combustible space, thereby requiring appropriate sprinkler protection."
In addition to the above, Panel 3 rejected the last minute introduction of this proposal that was made in the ROC stage. BICSI, which represents 24,000 installers, designers and manufacturers, feels that this last minute interjection of a FPN was not sufficiently vetted to industry and that the TCC should review this matter.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The FPN continues to provide useful guidance. Possibilities of misinterpretation are minimized in the 2007 Edition of NFPA 13.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 12 Negative: 3
Explanation of Negative:
JENSEN, R.: This FPN, as informative text to the NEC, is being used to market limited combustible cable. The NEC should not be used for this purpose. The FPN has had a profound effect in which it is used in misleading the AHJ, designers and installers to require limited combustible cable, conduit, or a sprinkler system to be installed within the concealed space.
In addition to the above, Panel 3 where there is not a marketing influence, rejected the inclusion of this FPN in Article 725. Cables used in 725 and 800 are interchangeable in many applications, yet there is no correlation of such a FPN.
JOHNSON, S.: See my explanation of negative vote on Comment 16-50.
OHDE, H.: This comment should have been accepted as this FPN does not provide useful guidance as indicated in the Panel Statement. This FPN which references 8.14.1 of NFPA 13 (2002) Installation of Sprinkler Systems has shown to be problematic and therefore should be deleted as allowed per Standards Council Decision D#06-03. If the FPN were to be deleted this would in effect restore the NEC to the 2002 edition.
The panel statement also included that the 2007 Edition of NFPA 13 would automatically eliminate the possibilities of misinterpretation. There was no opportunity for CMP 16 or the public to review the new proposed edition to see if this would eliminate the possibilities of misinterpretation. The 2007 edition of NFPA 13 also could be in violation of Standards Council Decision D#05-24 to remain status quo on these issues.

16-145 Log #2019 NEC-P16 **Final Action: Accept**
(800.154)

Submitter: Harold C. Ohde, IBEW #134
Comment on Proposal No: 16-188
Recommendation: Continue to Reject.
Substantiation: The submitter's recommendation to create a new cable designation (CM50) is nothing more than a marketing ploy. A backdoor approach you might say to get NFPA 255 and NFPA 259 cables in the cable hierarchy. The submitter's substantiation would have misled the designer, installer and code officials to believe, install and enforce that limited combustible cable, conduit or a sprinkler system to be installed in the concealed space or plenums would be a requirement because of NFPA 13, Section 8.14.1. The submitter's substantiation references 2002 NFPA 13 Section 8.14.1. It is important to note that the NEC does not have a definition of "concealed spaces", therefore making it impossible to enforce. What constitutes a concealed space? Is it the space above a dropped ceiling; or is it a space above plastered or drywall ceiling? Is it the wall cavity of typical wall construction?
NFPA 13 just completed their revision process for the 2006 NFPA 13 Standard. 8.14.1 of NFPA 13 has been revised to read as follows:
8.14.1.2 Concealed Spaces not Requiring Sprinkler Protection.
8.14.1.2.1* Concealed spaces of noncombustible and limited combustible construction with minimal combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those as a return air for a plenum. (For additional information on combustible loading see A.8.14.1.2.1).
8.14.1.2.2 Concealed spaces of noncombustible and limited combustible construction with limited access and not permitting occupancy or storage of combustible shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.
A.8.14.1.2.1 Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc...can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1). For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined.
In the 2006 NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.
CMP 16 rejected this proposal based on the Standards Council decision D#05-24 to remain "status quo" on issues that pertain to NFPA 90A.

16-146 Log #745 NEC-P16 **Final Action: Reject**
(800.154, FPN)

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 16-189
Recommendation: This proposal should be Accepted.
Substantiation: The submitter of this proposal to delete the Fine Print Note referencing NFPA 13 is correct in his substantiation. However, CMP-16 rejected this proposal on the basis of the directive from Standards Council D#05-24, to remain "status quo" on issues with respect to NFPA 90A. The Standards Council has recently decided that the Fine Print Notes under the purview of CMP-16 which reference NFPA 13 may be deleted, and such deletion is not in conflict with the Standards Council directive. This final Standards Council decision is titled D#06-03 and is included for your review. It is important to note that, **Standards Council clearly recognizes the 2002 edition of the NEC, in which these Fine Print Notes were not included, as the status quo.**
An appeal was made by Mr. A. Weidman in an attempt to overturn the previous decision by Standards Council to allow CMP-16 to delete the Fine Print Notes referencing NFPA 13. The appeal was soundly denied by Standards Council. The final decision, D#06-19 is also included for your review. It is extremely interesting to note that the last sentence of the decision by Standards Council provides directions for CMP-16 as follows:
"If the fine print notes are in any way problematic, they should now be deleted, restoring the NEC in this regard to the status quo on plenum cable issues represented by the 2002 edition of the NEC."
These Fine Print Notes are problematic. Following the advice of Standards Council, they should be deleted. These Fine Print Notes exist solely to manipulate, misinform and threaten end users of the NEC. The proponents of flouropolymer products have developed an elaborate, financially driven scheme outlined as follows:
(1) Develop an Association (CFRA), funded by manufacturers, to coordinate and orchestrate unethical marketing plans by manipulation NFPA codes and standards
(2) Place consultants, hired to push flouropolymer interests, on CMP-3 and CMP-16 under the cloak of other organizations
(3) Promote Fine Print Notes referencing NFPA 13 in the NEC
(4) Use the Fine Print Notes to develop deceiving literature and presentations to manipulate the NFPA family of codes and standards to promote products which are not required
(5) Misinform and manipulate building code officials with a propaganda campaign based on Fine Print Notes in the NEC which reference NFPA 13
(6) Label this deceptive literature, designed for building officials, as "Field Guides" and " Inspection Checklists" (See an example field guide that I have submitted)
(7) Provide instructions for building officials to threaten and harass building owners to use the proponents products
In summary, the proponents of retaining these Fine Print Notes are engaged in an effort to misrepresent and manipulate the NFPA Family of Codes and Standards for their own financial gain. Provided for your review is just one many "Field Guides" supplied by the Cable Fire Research Association to Building Officials across the United States. As you read this "field guide" take note of the serious manipulation and misrepresentation of the NEC and NFPA 13, designed specifically to sell products in which the proponents have financial interests.
The efforts of this same group to manipulate the NFPA family of codes and standards in NFPA 90A led to the "return to committee" of the entire document. The NFPA 13 committee has taken serious steps to stop this runaway propaganda campaign by adding informational text explaining ***that usual amounts of cabling do not represent a problem***. This is referenced in the original proposal to delete the Fine Print Note.
CMP-16 has been lied to by the proponents of these Fine Print Notes referencing NFPA 13. The only reason they exist is to fuel a financially driven propaganda campaign. Retaining these Fine Print Note will lead to continued deception, misrepresentation and manipulation which will lead to the lack of adoption of the NEC.
Note: Supporting material is available for review at NFPA Headquarters.

The proponents of flouropolymer products have developed an elaborate, financially driven scheme outlined as follows:
(1) Develop an Association (CFRA), funded by manufacturers, to coordinate and orchestrate unethical marketing plans by manipulation NFPA codes and standards
(2) Place consultants, hired to push flouropolymer interests, on CMP-3 and CMP-16 under the cloak of other organizations
(3) Promote Fine Print Notes referencing NFPA 13 in the NEC
(4) Use the Fine Print Notes to develop deceiving literature and presentations to manipulate the NFPA family of codes and standards to promote products which are not required
(5) Misinform and manipulate building code officials with a propaganda campaign based on Fine Print Notes in the NEC which reference NFPA 13
(6) Label this deceptive literature, designed for building officials, as "Field Guides" and " Inspection Checklists" (See an example field guide that I have submitted)
(7) Provide instructions for building officials to threaten and harass building owners to use the proponents products
In summary, the proponents of retaining these Fine Print Notes are engaged in an effort to misrepresent and manipulate the NFPA Family of Codes and Standards for their own financial gain. Provided for your review is just one many "Field Guides" supplied by the Cable Fire Research Association to Building Officials across the United States. As you read this "field guide" take note of the serious manipulation and misrepresentation of the NEC and NFPA 13, designed specifically to sell products in which the proponents have financial interests.
The efforts of this same group to manipulate the NFPA family of codes and standards in NFPA 90A led to the "return to committee" of the entire document. The NFPA 13 committee has taken serious steps to stop this runaway propaganda campaign by adding informational text explaining ***that usual amounts of cabling do not represent a problem***. This is referenced in the original proposal to delete the Fine Print Note.
CMP-16 has been lied to by the proponents of these Fine Print Notes referencing NFPA 13. The only reason they exist is to fuel a financially driven propaganda campaign. Retaining these Fine Print Note will lead to continued deception, misrepresentation and manipulation which will lead to the lack of adoption of the NEC.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The FPN continues to provide useful guidance. Possibilities of misinterpretation are minimized in the 2007 Edition of NFPA 13.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 12 Negative: 3
Explanation of Negative:
JENSEN, R.: This FPN, as informative text to the NEC, is being used to market limited combustible cable. The NEC should not be used for this purpose. The FPN has had a profound effect in which it is used in misleading the AHJ, designers and installers to require limited combustible cable, conduit, or a sprinkler system to be installed within the concealed space.

In addition to the above, Panel 3 where there is not a marketing influence, rejected the inclusion of this FPN in Article 725. Cables used in 725 and 800 are interchangeable in many applications, yet there is no correlation of such a FPN.

JOHNSON, S.: See my explanation of negative vote on Comment 16-50.

OHDE, H.: See my Explanation of Negative for Comment 16-144.

16-148 Log #747 NEC-P16 **Final Action: Reject**
(800.154, FPN)

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 16-197
Recommendation: This proposal should be Accepted.
Substantiation: The submitter of this proposal to delete the Fine Print Note referencing NFPA 13 is correct in his substantiation. However, CMP-16 rejected this proposal on the basis of the directive from Standards Council D#05-24, to remain "status quo" on issues with respect to NFPA 90A. The Standards Council has recently decided that the Fine Print Notes under the purview of CMP-16 which reference NFPA 13 may be deleted, and such deletion is not in conflict with the Standards Council directive. This final Standards Council decision is titled D#06-03 and is included for your review. It is important to note that, **Standards Council clearly recognizes the 2002 edition of the NEC, in which these Fine Print Notes were not included, as the status quo.**
An appeal was made by Mr. A. Weidman in an attempt to overturn the previous decision by Standards Council to allow CMP-16 to delete the Fine Print Notes referencing NFPA 13. The appeal was soundly denied by Standards Council. The final decision, D#06-19 is also included for your review. It is extremely interesting to note that the last sentence of the decision by Standards Council provides directions for CMP-16 as follows:
"If the fine print notes are in any way problematic, they should now be deleted, restoring the NEC in this regard to the status quo on plenum cable issues represented by the 2002 edition of the NEC."
These Fine Print Notes are problematic. Following the advice of Standards Council, they should be deleted. These Fine Print Notes exist solely to manipulate, misinform and threaten end users of the NEC. The proponents of flouropolymer products have developed an elaborate, financially driven scheme outlined as follows:

(1) Develop an Association (CFRA), funded by manufacturers, to coordinate and orchestrate unethical marketing plans by manipulation NFPA codes and standards

(2) Place consultants, hired to push flouropolymer interests, on CMP-3 and CMP-16 under the cloak of other organizations

(3) Promote Fine Print Notes referencing NFPA 13 in the NEC

(4) Use the Fine Print Notes to develop deceiving literature and presentations to manipulate the NFPA family of codes and standards to promote products which are not required

(5) Misinform and manipulate building code officials with a propaganda campaign based on Fine Print Notes in the NEC which reference NFPA 13

(6) Label this deceptive literature, designed for building officials, as "Field Guides" and " Inspection Checklists" (See an example field guide that I have submitted)

(7) Provide instructions for building officials to threaten and harass building owners to use the proponents products

In summary, the proponents of retaining these Fine Print Notes are engaged in an effort to misrepresent and manipulate the NFPA Family of Codes and Standards for their own financial gain. 16-150 Log #1589 NEC-P16 **Final Action: Reject**
(800.154, FPN)

Submitter: Harold C. Ohde, IBEW-NECA Technical Institute
Comment on Proposal No: 16-189
Recommendation: This proposal should be accepted.
Substantiation: This FPN should be deleted as the submitter proposed. In the submitter's substantiation he states that this FPN has misled the AHJ to believe and enforce limited combustible cable, conduit or a sprinkler system to be installed in the concealed space or plenums. It is important to note that the NEC does not have a definition of "concealed spaces", therefore, making it impossible to enforce. What constitutes a concealed space? Is it the space above a dropped ceiling; or is it a space above plastered or drywall ceiling? Is it the wall cavity of typical wall construction?
NFPA 13 just completed their revision process for the 2006 NFPA 13 Standard. 8.14.1 of NFPA 13 has been revised to read as follows:
8.14.1.2 Concealed Spaces not Requiring Sprinkler Protection.
8.14.1.2.1* Concealed spaces of noncombustible and limited combustible construction with minimal combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those as a return air for a plenum. (For additional information on combustible loading see A.8.14.1.2.1)
8.14.1.2.2 Concealed spaces of noncombustible and limited combustible construction with limited access and not permitting occupancy or storage of combustible shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.
A.8.14.1.2.1 Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc...can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1). For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined.
In the 2006 NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.
CMP 16 rejected this proposal based on the Standards Council decision D#05-24 to remain "status quo" on issues that pertain to NFPA 90A. Standards Council recently issued another decision (D#06-03) which decided that this FPN may be deleted and this deletion will not be in conflict with the Standards Council decision (D#05-24). Standards Council recognizes the 2002 edition of the NEC as being status quo. This FPN referencing NFPA 13 was added to the 2005 NEC, therefore, it can and should be deleted.

(800.154(A))

Submitter: Robert W. Jensen, dbi
Comment on Proposal No: 16-195
Recommendation: Accept proposal to delete Fine Print Note__
~~FPN: See 8.14.1 of NFPA 13 (2002), Installation of Sprinkler Systems, for requirements for sprinklers in concealed spaces containing exposed combustibles.~~
Substantiation: The Standards Council issued two decisions, NFPA Standards Council Decision 06-03 (SC #06-3-18) dated 22 March 2006 and NFPA Standards Council Decision 06-19 (SC #06-7-33) dated 28 July 2006. These decisions address Code Making Panel (CMP) decisions on Fine Print Notes referencing NFPA 13. The former (earlier) decision states, in pertinent part: "Mr. Dollard asks for clarification whether the Standards Council directive prohibits the NEC project from deleting the Fine Print Notes to sections 770.154, 800.154 & 820.154. The Council, after due consideration, believes that clarification is appropriate in this instance and responds that the NEC project would not violate the directive by deleting the fine print notes at issue." The later decision states, in pertinent part, as follows: "if the fine print notes are not a helpful reference to NFPA 13 or engender confusion, the NEC Project should have the ability to delete them and nothing in the Council's status quo directive prohibits this." The decision also states: "It has also been pointed out that deletion of the fine print notes would provide further consistency within the NEC itself since, currently, the fine print notes at issue only appear in some relevant NEC Articles (Articles 770, 800, and 820), but not in others (Articles 725 and 760)." The decision also states: "nothing in NFPA procedures prevents the NEC Project from considering and acting on deletion of the fine print notes during the Comment phase of the code development process. Proposals to the fine print notes were filed and rejected by the responsible CMP based on its then understanding of the Council's directive. The subject was explicitly raised during the Report on Proposals phase of the process and is clearly open for further consideration and action during the Comment phase."

This FPN is being misinterpret and used in aggressive marketing attempts to require the installation of "limited combustible cable" (one such example is found at http://www.dupont.com/cablingsolutions/products/codes.html). The FPN has had a profound effect in which it is used in misleading the AHJ to require limited combustible cable, conduit, or a sprinkler system to be installed within the concealed space.

As an example, an AHJ Massachusetts would not provide a certificate of occupancy until the communications cabling was either replaced with limited combustible cable, the CMP cable was placed in conduit, or a sprinkler system installed above the suspended ceiling.. Although the installer had met the requirements of the NEC, the FPN misled the AHJ causing project delays and the potential of inordinate cost to the project. A plea to the NFPA aided the communications installer in which clarification was given that the CMP cabling was indeed sufficient to meet code and that NFPA 13 allowed some quantities (which is not defined) of communications cabling within concealed spaces. The installation of the CMP cable was allowed.

To further the removal of this FPN, the Report on Proposals A2006 from NFPA 13 (copy provided), the NFPA committee specifically added an annex A.8.14.1.2.1 in 13-284 log #551 stating that, "Some minor quantities of combustible materials, such as communication wiring, can be present in some concealed spaces but should not typically be viewed as requiring sprinklers (see 8.14.1.1). The threshold value at which sprinklers become necessary in the concealed space is not defined. For example, the usual amounts of data or telephone wiring found above a ceiling would not typically constitute a threat. If bundles of unsheathed computer wiring are installed above the ceiling or beneath the floor in a manner where fire propagation in all directions is likely, then the concealed space should be treated the same as a combustible space, thereby requiring appropriate sprinkler protection."
In addition to the above, Panel 3 rejected the last minute introduction of this proposal that was made in the ROC stage. BICSI, which represents 24,000 installers, designers and manufacturers, feels that this last minute interjection of a FPN was not sufficiently vetted to industry and that the TCC should review this matter.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject
Panel Statement: The FPN continues to provide useful guidance. Possibilities of misinterpretation are minimized in the 2007 Edition of NFPA 13.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 12 Negative: 3
Explanation of Negative:

JENSEN, R.: This FPN, as informative text to the NEC, is being used to market limited combustible cable. The NEC should not be used for this purpose. The FPN has had a profound effect in which it is used in misleading the AHJ, designers and installers to require limited combustible cable, conduit, or a sprinkler system to be installed within the concealed space.

In addition to the above, Panel 3 where there is not a marketing influence, rejected the inclusion of this FPN in Article 725. Cables used in 725 and 820 are interchangeable in many applications, yet there is no correlation of such a FPN.

JOHNSON, S.: See my explanation of negative vote on Comment 16-50.

OHDE, H.: See my Explanation of Negative for Comment 16-144.

16-155 Log #1785 NEC-P16 **Final Action: Reject (800.154(A))**

Submitter: Robert W. Jensen, dbi
Comment on Proposal No: 16-197
Recommendation: Accept proposal to delete Fine Print Note__
~~FPN: See 8.14.1 of NFPA 13 (2002), Installation of Sprinkler Systems, for requirements for sprinklers in concealed spaces containing exposed combustibles.~~
Substantiation: The Standards Council issued two decisions, NFPA Standards Council Decision 06-03 (SC #06-3-18) dated 22 March 2006 and NFPA Standards Council Decision 06-19 (SC #06-7-33) dated 28 July 2006. These decisions address Code Making Panel (CMP) decisions on Fine Print Notes referencing NFPA 13. The former (earlier) decision states, in pertinent part: "Mr. Dollard asks for clarification whether the Standards Council directive prohibits the NEC project from deleting the Fine Print Notes to sections 770.154, 800.154 & 820.154. The Council, after due consideration, believes that clarification is appropriate in this instance and responds that the NEC project would not violate the directive by deleting the fine print notes at issue." The later decision states, in pertinent part, as follows: "if the fine print notes are not a helpful reference to NFPA 13 or engender confusion, the NEC Project should have the ability to delete them and nothing in the Council's status quo directive prohibits this." The decision also states: "It has also been pointed out that deletion of the fine print notes would provide further consistency within the NEC itself since, currently, the fine print notes at issue only appear in some relevant NEC Articles (Articles 770, 800, and 820), but not in others (Articles 725 and 760)." The decision also states: "nothing in NFPA procedures prevents the NEC Project from considering and acting on deletion of the fine print notes during the Comment phase of the code development process. Proposals to the fine print notes were filed and rejected by the responsible CMP based on its then understanding of the Council's directive. The subject was explicitly raised during the Report on Proposals phase of the process and is clearly open for further consideration and action during the Comment phase."

This FPN is being misinterpret and used in aggressive marketing attempts to require the installation of "limited combustible cable" (one such example is found at http://www.dupont.com/cablingsolutions/products/codes.html). The FPN has had a profound effect in which it is used in misleading the AHJ to require limited combustible cable, conduit, or a sprinkler system to be installed within the concealed space.
As an example, an AHJ Massachusetts would not provide a certificate of occupancy until the communications cabling was either replaced with limited combustible cable, the CMP cable was placed in conduit, or a sprinkler system installed above the suspended ceiling.. Although the installer had met the requirements of the NEC, the FPN misled the AHJ causing project delays and the potential of inordinate cost to the project. A plea to the NFPA aided the communications installer in which clarification was given that the CMP cabling was indeed sufficient to meet code and that NFPA 13 allowed some quantities (which is not defined) of communications cabling within concealed spaces. The installation of the CMP cable was allowed.

(800.154(A), FPN)

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Comment on Proposal No: 16-195
Recommendation: Revise text to read as follows:

800.154 Applications of Listed Communications Wires and Cables and Communications Raceways. Communications wires and cables shall comply with the requirements of 800.154(A) through 800.154(F) or where cable substitutions are made in accordance with 800.154(G).

(A) Plenum. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type CMP. Abandoned cables shall not be permitted to remain. Types CMP, CMR, CMG, CM, and CMX and communications wire installed in compliance with 300.22 shall be permitted. Listed plenum communications raceways shall be permitted to be installed in ducts and plenums as described in 300.22(B) and in other spaces used for environmental air as described in 300.22(C). Only Type CMP cable shall be permitted to be installed in raceways.
~~FPN: See 8.14.1 of NFPA 13 (2002), Installation of Sprinkler Systems, for requirements for sprinklers in concealed spaces containing exposed combustibles.~~
Substantiation: This is one of three references to NFPA 13 (it is repeated identically in articles 770, 800 and 820) included in the code that is a meaningless reference. Other references to NFPA 13, in Article 362, are properly included in mandatory sections of the code (section 362.10). Whenever a jurisdiction adopts NFPA 13 they need to adopt it for mandatory sections and not for an unenforceable FPN in one section, which is intended to mislead the user. In fact, NFPA 13 does not require that sprinklers be installed in plenums of "noncombustible or limited combustible construction", even if "the usual amount of cabling" is present. In fact, there have been several documented examples already of misrepresentation in that authorities having jurisdiction have been told that this means that sprinklers are required in plenum areas unless "limited combustible cable" is installed. I have been personally involved in several cases, and have heard of many more cases where this is being stated.

Section 8.14.1 of NFPA 13 (2006) reads as follows:

8.14.1.2 Concealed Spaces Not Requiring Sprinkler Protection.

8.14.1.2.1* Concealed spaces of noncombustible and limited combustible construction with minimal combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum. (For additional information on combustible loading see A.8.14.1.2.1)

8.14.1.2.2 Concealed spaces of noncombustible and limited combustible construction with limited access and not permitting occupancy or storage of combustibles shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.

A.8.14.1.2.1 Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc. can be present in concealed spaces constructed of limited or noncombustible materials but should not typically be viewed as requiring sprinklers (see 8.14.1.1). For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined.

The same change is being proposed to the corresponding Fine Print Notes in articles 770 and 820, all of which deal with the same type of cables.

The committee rejected the proposal based on, and I quote: "NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"[S]o as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

However, Standards Council has since issued two new decisions, NFPA Standards Council Decision 06-03 (SC #06-3-18) dated 22 March 2006 and NFPA Standards Council Decision 06-19 (SC #06-7-33) dated 28 July 2006. These decisions address CMP decisions on Fine Print Notes referencing NFPA 13. The former (earlier) decision states, in pertinent part: "Mr. Dollard asks for clarification whether the Standards Council directive prohibits the NEC project from deleting the Fine Print Notes to sections 770.154, 800.154 & 820.154. The Council, after due consideration, believes that clarification is appropriate in this instance and responds that the NEC project would not violate the directive by deleting the fine print notes at issue." The later decision states, in pertinent part, as follows: "if the fine print notes are not a helpful reference to NFPA 13 or engender confusion, the NEC Project should have the ability to delete them and nothing in the Council's status quo directive prohibits this." The decision also states: "It has also been pointed out that deletion of the fine print notes would provide further consistency within the NEC itself since, currently, the fine print notes at issue only appear in some relevant NEC Articles (Articles 770, 800, and 820), but not in others (Articles 725 and 760)." The decision also states: "nothing in NFPA procedures prevents the NEC Project from considering and acting on deletion of the fine print notes during the Comment phase of the code development process. The question whether the fine print notes should be in the NEC is hardly new. Aside from the fact that their presence was debated in the previous edition cycle, Proposals to remove them were duly filed and rejected by the responsible Code-Making Panel based on its then understanding of the Council's directive. The subject was explicitly raised during the Report on Proposals phase of the process and is, therefore, clearly open for further consideration and action during the Comment phase."

Thus, clearly these Standards Council decisions directly permit the deletion of the Fine Print Note addressed by this comment.

Technically this Fine Print Note needs to be deleted for two reasons:

1. This Fine Print Note is misleading by pointing the reader to NFPA 13 which does not require the use of sprinklers, as both Bob Jensen and Harry Ohde point out in their negative votes and as is shown by the sections of NFPA 13 reproduced above.

2. This Fine Print Note is identical to the ones in 770.154 (A) and in 820.154 (A), both of which are equally misleading. On the other hand there are no Fine Print Notes in articles 725 and 760. Thus, deleting this Fine Print Note will provide further consistency within the NEC.

Panel Meeting Action: Reject

Panel Statement: The FPN continues to provide useful guidance. Possibilities of misinterpretation are minimized in the 2007 Edition of NFPA 13.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 12 Negative: 3

Explanation of Negative:

JENSEN, R.: This FPN, as informative text to the NEC, is being used to market limited combustible cable. The NEC should not be used for this purpose. The FPN has had a profound effect in which it is used in misleading the AHJ, designers and installers to require limited combustible cable, conduit, or a sprinkler system to be installed within the concealed space.

In addition to the above, Panel 3 where there is not a marketing influence, rejected the inclusion of this FPN in Article 725. Cables used in 725 and 800 are interchangeable in many applications, yet there is no correlation of such a FPN.

JOHNSON, S.: See my explanation of negative vote on Comment 16-50.

OHDE, H.: See my Explanation of Negative for Comment 16-144

16-159 Log #956 NEC-P16 **Final Action: Reject**
(800.154(A), FPN)

Submitter: Donald Hall, Corning Cable Systems

Comment on Proposal No: 16-197

Recommendation: Note: The commenter is also submitting analogous comments to Proposal 16-78 (ROP Log #3098) and Proposal 16-329 (ROP Log #3095) pertaining to FPNs referencing NFPA 13 Section 8.14.1 Accept the proposal to delete the FPN, leading to the following:

770.154 Applications of Listed Communications Wires and Cables and Communications Raceways. Communications wires and cables shall comply with any of the requirements of 800.154(A) through 800.154(F) or where cable substitutions are made in accordance with 800.154(G).

(A) Plenum. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type CMP. Abandoned cables shall not be permitted to remain. Types CMP, CMR, CMG, CM and CMX cables installed in compliance with 300.22 shall be permitted. Listed plenum communications raceways shall be permitted to be installed in ducts and plenums as described in 300.22(B) and in other spaces used for environmental air as described in 300.22(C). Only type CMP cable shall be permitted to be installed in these raceways.

~~FPN: See 8.14.1 of NFPA 13 (2202), Installation of Sprinkler Systems, for requirements for sprinklers in concealed space containing exposed combustibles.~~

Substantiation: The committee rejected this proposal without any consideration of its merits, based on its belief at the time that it fell within the scope of Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005. since that time, however, the Standards Council has issued two new decisions as follows: Decison 06-06 (SC #6-3-18) dated 22 March 2006 states: in petinent part; "The Council, after due consideration, believes that clarification is appropriate in this instance and responds that the NEC Project would not violate the directive by deleting the Fine Print Notes as issue."

Decision 06-19 (SC #06-7-33) dated 28 July 2006 states, in pertinent part:

"If the fine print notes are not a helpful reference to NFPA 13 or engender confusion, the NEC Project should have the ability to delete them and nothing in the Council's status quo directive prohibits this."

And

"It has also been pointed out that deletion of the fine print notes would provide further consistency within the NEC itself since, currently, the fine print notes at issue only appear in some relevant NEC Articles (Articles 770, 800 and 820), but not in others (Articles 725 and 760)."

And

"Nothing in NFPA procedures prevents the NEC Project from considering and acting on deletion of the fine print notes during the comment phase of the code development process."

And

"If the fine print notes are in any way problematic, they should now be deleted, restoring the NEC in this regard to the status quo on plenum cable issues represented by the 2002 edition of the NEC".

In view of the above decisions, the commenter requests that the proposal be considered on its merits as stated in the original proposal substantiation and as further substantiated below.

Since the original proposal was submitted, the following Annex Note was added to the 2007 Edition of NFPA 13:

A.8.14.1.2.1 Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic pluming piping, nonstructural wood, etc. can be present in concealed spaces constructed of limited or noncombustible materials but should not typically be viewed as requiring sprinklers (see 8.14.1.1. for example, it is not the intent of this section to require sprinklers which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined.

Additionally, the standard approach of the NEC is to require the use of listed products which are tested and approved by a Nationally Recognized Test Laboratory (NRTL) as being suitable for use in a particular application. Normal fire hazards associated with an application space and the application of wiring products installed within them are duly anticipated during the establishment of listing criteria for these products. Air handling spaces are no different from any other space in this regard. The inclusion and particular placement of this FPN is suggestive of the idea that the NEC or the NRTLs has failed to adequately recognize the hazards associated with these spaces. The safety record of plenum cables within air handling spaces has been debated extensively and is open to continued debate within the NFPA Code making process, but the FPN in question should not be used as a maens to short circuit this process and lead users around the code. When properly understood, the FPNs of 770.154(A), 800.154(A), and 820.154(A) lead to a dead end. When not properly understood, they lead to an unnecessary encumbrance upon the use of listed products installed in accordance with approved NEC wiring methods.

Panel Meeting Action: Reject

Panel Statement: The FPN continues to provide useful guidance. Possibilities of misinterpretation are minimized in the 2007 Edition of NFPA 13.

16-160 Log #238 NEC-P16 **Final Action: Reject**
(800.154(B))

Submitter: Stanley Kaufman, CableSafe Inc.

Comment on Proposal No: 16-187

Recommendation: Accept this proposal in principle. Continue to accept the recommendation in proposal 16-187. In addition make the following change:

800.154(B)(2) Metal Raceways or Fireproof Shafts. Listed communications cables shall be <u>permitted to be</u> encased in a metal raceway or located in a fireproof shaft having firestops at each floor.

Substantiation: The purpose of proposal 18-187 is to establish parallelism between sections 770.154, 800.154 and 820.154.

770.154(B)(2) Type OFNG, OFN, OFCG, and OFC cables **shall be permitted to be encased** in a metal raceway or located in a fireproof shaft having firestops at each floor.

800.154(B)(2) Metal Raceways or Fireproof Shafts. Listed communications cables **shall be encased** in a metal raceway or located in a fireproof shaft having firestops at each floor.

820.154(B)(2) Metal Raceways or Fireproof Shafts. Types CATV and CATVX cables **shall be permitted to be encased** in a metal raceway or located in a fireproof shaft having fire-stops at each floor.

830.154(C)(2) Metal Raceways or Fireproof Shafts. Type BLX cables **shall be permitted to be encased** in a metal raceway or located in a fireproof shaft having firestops at each floor.

The words "shall be permitted" were omitted from the text in 800.154(B)(2). Acceptance of this comment will correct that typographical error.

Panel Meeting Action: Reject

Panel Statement: The submitter intended to establish parallelism between CMP-16 Articles, however, upon careful scrutiny of the text, it appears that greater clarity can be achieved by rejection of the comment.

If the language of the comment is accepted, cables could be installed without protection.

The submitter is encouraged to submit a new proposal.

(800.154(G), FPN)

Submitter: Harold C. Ohde, IBEW #134
Comment on Proposal No: 16-206
Recommendation: Continue to Reject.
Substantiation: The submitter's recommendation to create a new cable designation (CMP50) is nothing more than a marketing ploy. A backdoor approach you might say to get NFPA 255 and NFPA 259 cables in the cable hierarchy. The submitter's recommendation to add this FPN to this section is in grave error. This FPN would not provide guidance to designers, installers or code officials. This FPN would have misled the designer, installer and code officials to believe, install and enforce that limited combustible, conduit or a sprinkler system to be installed in the concealed space or plenums would be a requirement because of NFPA 13, Section 8.14.1. The submitter's substantiation references 2002 NFPA 13 Section 8.14.1. It is important to note that the NEC does not have a definition of "concealed spaces", therefore making it impossible to enforce. What constitutes a concealed space? Is it the space above a dropped ceiling; or is it a space above plastered or drywall ceiling? Is it the wall cavity of typical wall construction?

NFPA 13 just completed their revision process for the 2006 NFPA 13 Standard. 8.14.1 of NFPA 13 has been revised to read as follows:

8.14.1.2 Concealed Spaces not Requiring Sprinkler Protection.

8.14.1.2.1* Concealed spaces of noncombustible and limited combustible construction with minimal combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those as a return air for a plenum. (For additional information on combustible loading see A.8.14.1.2.1).

8.14.1.2.2 Concealed spaces of noncombustible and limited combustible construction with limited access and not permitting occupancy or storage of combustible shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.

A.8.14.1.2.1 Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc... can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1). For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined.

In the 2006 NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.

CMP 16 rejected this proposal based on the Standards Council decision D#05-24 to remain "status quo" on issues that pertain to NFPA 90A.

16-163 Log #1462 NEC-P16 **Final Action: Reject**
(800.154(H) (New))

Submitter: Sanford Egesdal, Egesdal Associates PLC
Comment on Proposal No: 16-188
Recommendation: Reconsider Proposal 16-188 and revise 800.154 as shown below.
(H) Communications Fire Hazard (FHC) Cable. Communications Fire hazard (FHC) cable shall be permitted for use in communications systems as other wiring within buildings in accordance with 800.154(E) to provide reduced potential heat release.
Substantiation: The application of the Standards Council's decision on NPFA 90A was an error. The proposed marking on the cable did not include a "P" added to CM. Type CMP cable is permitted to be installed in plenums.

This comment creates a new section for the fire hazard cable. The new section provides a requirement that clearly identifies that the fire hazard cable is permitted to be installed as "Other Wiring Within Buildings."

To better clarify that the Standards Council's decision on NFPA does not apply and to better clarify where the cable is permitted to be installed, the marking on the cable is changed to Type CM-FHC. The "FHC" suffix stands for fire hazard cable. There is a companion comment to revise the marking found in my comment to Proposal 16-223.

Some installations require large amounts of cable. A typical application of a fire hazard cable would be above a suspended ceiling or under a raised floor, neither of which is a plenum. The proposed cable has a very low fuel load, as compared to other types of cable insulation. Some cable constructions use one type of insulation on the conductor and another type for the jacket.
The Type CM-FHC cable suggested for listing and marking in 800.179(K) (comment to proposal 16-223) has parameters (e.g. 3500 BTU/lb) that are standard in the building industry, and useful to system designers and fire protection engineers.

To put cable insulation heat release in perspective, here are relative values:
Fire Hazard Cable insulation: less than 8 MJ/kg (3,500 BTU/lb)
PVC insulation: As high as 25 MJ/kg (11,000 BTU/lb)
Polyolefin insulation: As high as 46 MJ/kg (20,000 BTU/lb)
Panel Meeting Action: Reject
Panel Statement: Cable meeting specifications as described in this comment is not prohibited by the Code, and the panel sees no need for an additional marking.

Comment on Proposal No: 16-220
Recommendation: Accept the Proposal in Principle and refer to Proposal 16-221 and Comment submitted by S.D. Kahn.
Substantiation: It is questionable whether the Standards Council directives apply to this Proposal. The Standards Council directive was to maintain the status quo with respect to plenum cables; this Proposal does not alter that status quo. The original Substantiation is correct and the Proposal is essentially editorial in that multipurpose cables are no longer recognized. Listing requirements for multipurpose cables were only permitted until July 1, 2003.

If section 800.179(G) remains in the Code there will be no new multipurpose cable listings. If proposal 16-221 is accepted there still will not be any new multipurpose cable listings, but we will have a better code. Since the outcome is the same, i.e., no multipurpose cable listings regardless of whether or not this proposal is accepted, it should be clear that accepting the proposal does not violate the Standards Council directive to maintain the status quo relative to plenum cables. The status quo is that there have been no new multipurpose cable listings since July 1, 2003.

(800.179(K) (New))

Submitter: Sanford Egesdal, Egesdal Associates PLC
Comment on Proposal No: 16-223
Recommendation: Reconsider proposal 16-223 and revise 800.179 as shown below.
(K) Communications Limited Fire Hazard (-FHC) Cable. Cables used to reduce potential heat release shall be listed as fire hazard (-FHC) cable and shall have a low potential heat release. Fire hazard cables specified in 800.154(E), and used to reduce potential heat release shall have an additional classification using the suffix "-FHC".

FPN No. 1: One method of defining a low potential heat release cable is that the cable exhibits a maximum potential heat value of exceeding 8141 kJ/kg (3500 BTU/lb) when tested in accordance with NFPA 259, *Standard Test Method for Potential Heat of Building Materials*, as well as a maximum flame spread index of 25 and a maximum smoke developed index of 50 when tested in accordance with NFPA 255, *Standard Method of Test of Surface Burning Characteristics of Building Materials*.
Substantiation: The application of the Standards Council's decision on NPFA 90A was an error. The proposed marking on the cable did not include a "P" added to CM. Type CMP cable is permitted to be installed in plenums.

To better clarify that the Standards Council's decision on NFPA does not apply and to better clarify where the cable is permitted to be installed, the marking on the cable is changed to Type CM-FHC. The "FHC" suffix stands for fire hazard cable. There is a companion comment to revise the application of fire hazard cable in my comment to Proposal 16-188.

The proposed cable provides listing parameters useful to system designers and fire protection engineers.

The key parameter in the listing requirements is potential heat release.

To put cable heat release in perspective, here are relative values:

Fire Hazard Cable insulation: less than 8 MJ/kg (3,500 BTU/lb

PVC insulation: As high as 25 MJ/kg (11,000 BTU/lb)

Polyolefin insulation: As high as 46 MJ/kg (20,000 BTU/lb)

Polyolefin insulation is sometimes used as insulation on conductors, and is covered by a PVC jacket. Polyolefin insulation provides better electrical properties (dielectric constant) than PVC insulation.

Additionally, flame spread and smoke developed parameters identify the robustness of the cable.

A flame spread index of 25 is found in a number of NFPA publications, for example:

NFPA 13-2007

8.15.1 Concealed Spaces.

8.15.1.2.10 Concealed spaces where rigid materials are used and the exposed surfaces have a flame spread index of 25 or less, and the materials have been demonstrated not to propagate fire when tested in accordance with NFPA 255, Standard Method of Test of Surface Burning Characteristics of Building Materials, extended for an additional 20 minutes in the form in which they are installed, shall not require sprinkler protection.

NFPA 13 use of "concealed spaces" corresponds to a typical dictionary definition: out of sight, hidden. This definition add "spaces" to "concealed" and represents a different meaning from how the NEC defines "concealed." Where both the NEC and NFPA 13 apply, "concealed" cable can be removed from a "concealed space." After removal of the cable, the "concealed space" would remain.

A smoke developed index of 50 is more rigorous than the typical smoke developed index of 450 for interior finishes. Interior finishes can be considered a "fixed" application: one sheet or one coat. Cable installations are a "variable" application: one cable or hundreds of cables. It seems reasonable to establish a robust requirement, due to the variable application. Electronic equipment is susceptible to damage from smoke and heat, both components of a fire.

Panel Meeting Action: Reject
Panel Statement: Cable meeting specifications as described in this comment is not prohibited by the Code, and the panel sees no need for an additional marking.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-178 Log #1574 NEC-P16 **Final Action: Accept (800.179(K))**

Submitter: Harold C. Ohde, IBEW-NECA Technical Institute
Comment on Proposal No: 16-225
Recommendation: Continue to reject.
Substantiation: The submitter's recommendation to create a new cable designation (concealed space cable) is nothing more than a marketing ploy. A backdoor approach you might say to get NFPA 255 and NFPA 259 cables in the cable hierarchy. The submitter's substantiation would have misled the designer, installer and code officials to believe, install and enforce that limited combustible cable, conduit or a sprinkler system to be installed in the concealed space or plenums would be a requirement because of NFPA 13 Section 8.14.1. It is important to note that the NEC does not have a definition of "concealed spaces", therefore, the confusion and making it impossible to enforce. What does constitute a concealed space? Is it the space above a dropped ceiling; or is it a space above plastered or drywall ceiling? Is it the wall cavity of typical wall construction?

NFPA 13 just completed their revision process for the 2006 NFPA 13 Standard. 8.14.1 of NFPA 13 has been revised to read as follows:

8.14.1.2 Concealed Spaces not Requiring Sprinkler Protection.

8.14.1.2.1* Concealed spaces of noncombustible and limited combustible construction with minimal combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those as a return air for a plenum. (For additional information on combustible loading see A.8.14.1.2.1)

8.14.1.2.2 Concealed spaces of noncombustible and limited combustible construction with limited access and not permitting occupancy or storage of combustible shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.

A.8.14.1.2.1 Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc... can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1) For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined.

In the 2006 NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.

The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.

A.8.14.1.2.1 Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc... can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1). For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined.

In the 2006 NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.

CMP 16 rejected this proposal based on the Standards Council decision D#05-24 to remain "status quo" on issues that pertain to NFPA 90A.

ARTICLE 810 — RADIO AND TELEVISION EQUIPMENT

16-180 Log #181 NEC-P16 **Final Action: Accept (810)**

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 16-227
Recommendation: The Technical Correlating Committee understands that the revisions in 810.54, Exception were to be made to the existing Exception text.

The Technical Correlating Committee directs the panel to correct the Exceptions to 810.57 to make them into complete sentences. This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Revise 810.54 Exception as follows:

"Exception: Where the lead-in conductors are enclosed in a continuous metallic shield that is grounded with a conductor in accordance with 810.58, they shall not be required to comply with these requirements. Where grounded, the metallic shield shall also be permitted to be used as a conductor."

Revise 810.57 Exception Nos. 1 and 2 as follows:

"Exception No. 1: Where the lead-in is protected by a continuous metallic shield that is grounded with a conductor in accordance with 810.58, an antenna discharge unit or other suitable means shall not be required."

"Exception No. 2: Where the antenna is grounded with a conductor in accordance with 810.58, an antenna discharge unit or other suitable means shall not be required."
Panel Statement: The panel accepts the direction of the TCC to revise the exceptions to 810.54 and 810.57.

The exception to 810.54 is derived from the existing text. The panel understands that 810.54 is to have only one exception, as it only had one exception in the original text.

The panel has revised the text into complete sentences as indicated in the panel action on this comment.
Number Eligible to Vote: 15

Submitter: James Daly, Upper Saddle River, NJ
Comment on Proposal No: 16-227
Recommendation: The Panel Action should be to Accept in Principle with the following additional revision.
In 810.21(F)(3)(b), change "has no" to "does not have a".
Substantiation: This is a grammatical change that makes the sentence read better and does not change any requirements.
Panel Meeting Action: Reject
Panel Statement: The requirements are clear as presented and are not improved by the submitter's suggested editorial revision.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-182 Log #776 NEC-P16 **Final Action: Reject**
(810.15 Exception (New))

Submitter: David Lettkeman, Dish Network Service, LLC
Comment on Proposal No: 16-230
Recommendation: Add new text to read as follows:
810.15 Grounding. Masts and metal structures supporting antennas shall be grounded in accordance with 810.21.
Exception: In installations where dish antennas are one point two (1.2) meters or less in diameter, and the masts and metal structures supporting antennas are not electrically connected to lead-in conductors and are mounted to a non conductive surface material, grounding of the mast or supporting metal structure is not required.
Substantiation: Problem: As stated in the Code, 90.1 Purpose (A) Practical Safeguarding, the purpose of this Code is the practical safeguarding of persons and property from hazards arising from the use of electricity. The purpose of 810.15 is to help prevent the introduction of voltage and current which may be the result of lightning or surge, by requiring masts and metal structures supporting antennas to be grounded in accordance with 810.21. This section was originally written to provide protection for masts and antennas which were made of metal and had a direct connection to the lead in cables. The word Dish was added to Section 810 in 1999 to include the many new installations which were not covered in other sections. The technology of these dishes and the mounting procedures are not the same as the old transmitting and receiving antennas, for which this section seems to be written. These small antennas are not mounted on masts which extend many feet above the supporting structure which made the antennas of old more susceptible to making contact with wiring of higher voltages and at times could be perceived as an attractant to lightning.
Substantiation: The proposed addition of the exception to 810.15, would allow the mast or metal supporting structure which is mounted on a non-conductive surface and all electrical components are electrically isolated from the mast to be excluded from this requirement. The grounding of these types of antennas actually increases the likelihood of lightning or surge voltage and current being introduced into the structure, thereby endangering the customer and their structure.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The panel reiterates the concern expressed in the panel statement to Proposal 16-230. A metallic structure (mast, metallic supports, etc.) that is exposed to a potential lightning strike should be grounded.
The physical separation between the dish and supporting metalwork and the coaxial conductors is of little significance when it comes to lightning.
Mounting on a non-conductive surface (such as wood or vinyl siding, roofing) does not preclude arcing and flash-over to other conductive media in the structure (plumbing, electrical and communications wiring) and the accompanying fire hazard.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-183 Log #778 NEC-P16 **Final Action: Reject**
(810.15 Exception (New))

Submitter: Steve C. Hill, Satellite Broadcast and Communications Association
Comment on Proposal No: 16-230
Recommendation: Add new text to read as follows:
810.15 Grounding. Masts and metal structures supporting antennas shall be grounded in accordance with 810.21.
Exception: In installations where masts and metal structures supporting antennas are not electrically connected to lead-in conductors and are mounted to a non-conductive surface material, grounding of the mast or supporting metal structure is not required.
Substantiation: Problem: The type of satellite antenna and mast used in residential installations are electrically isolated from the power source. Therefore, grounding these components to current code creates a potential ground source for lightning or electrical surge.
Substantiation: During the installation process on dishes that are 1.2 meters in diameter or less, when the mast and/or metal mounting plate is mounted on a non-conductive surface such as wood or brick the dish is effectively isolated from the power source. In addition, all other electrical components are electrically isolated from the mast and antenna. This design (if left ungrounded) provides no conduit for high voltage electrical current to enter the residence.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 16-182.

(810.21(F))

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 16-236
Recommendation: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 5-20. This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept
Revise the text of 810.21(F) as follows:
"(F) Electrode. The grounding conductor shall be connected as follows:
(1) In Buildings or Structures with an Intersystem ~~Grounding~~ Bonding Termination. If the building or structure served has an intersystem ~~grounding~~ bonding termination, the grounding conductor shall be connected to the intersystem ~~grounding~~ bonding termination.
(2) In Buildings or Structures with Grounding Means. If the building or structure served has no intersystem ~~grounding~~ bonding termination, the grounding conductor shall be connected to the nearest accessible location on the following:"
Retain existing list and text:
"(3) In Buildings or Structures Without Intersystem ~~Grounding~~ Bonding Termination or Grounding Means. If the building or structure served has no intersystem ~~grounding~~ bonding termination or grounding means, as described in 810.21(F)(1)."
Panel Statement: The panel has reconsidered this proposal per the TCC comment and has revised the text as indicated to correlate with the panel action on Proposal 5-20.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-188 Log #183 NEC-P16 **Final Action: Accept (810.21(F))**

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 16-237
Recommendation: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 16-236. This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Relocate the text to follow 810.21(F)(2)(f) and revise as follows:
"A bonding device intended to provide a termination point for the grounding conductor (intersystem bonding) shall not interfere with the opening of an equipment enclosure. A bonding device shall be mounted on non-removable parts. A bonding device shall not be mounted on a door or cover even if the door or cover is non-removable."
Panel Statement: The panel has reconsidered Proposal 16-188 and has also considered the affirmative comment expressed in the voting. The panel has determined that the proper location of the text is 810.21(F)(2)(f), not 810.21(F)(e), as indicated in the affirmative comment. That is where equipment (service) enclosures are discussed. The panel has also added editorial clarification as indicated in the panel action on this comment. The panel notes that the text is presently located incorrectly in the preprint.
Number Eligible to Vote: 15

ARTICLE 820 — COMMUNITY ANTENNA TELEVISION AND RADIO DISTRIBUTION SYSTEMS

16-191 Log #252 NEC-P16 **Final Action: Accept in Part (820.2)**

Submitter: Stanley Kaufman, CableSafe Inc.
Comment on Proposal No: 16-250
Recommendation: Accept this proposal in principle in part by continuing to accept the modification to the definition of the point of entrance and rejection the addition of the fine print notes. Add the following additional definitions:
Intermediate Metal Conduit (Type IMC). The definition in 342.2 shall apply.
Rigid Metal Conduit (Type RMC). The definition in 344.2 shall apply.
Substantiation: Article 820 uses the terms Intermediate Metal Conduit and Rigid Metal Conduit. These terms are defined in Articles 342 and 344 respectively. Because of 90.3 (excerpted below), these definitions do not apply to Chapter 8. They will apply if this comment is accepted.
"Chapter 8 covers communications systems and is not subject to the requirements of Chapters 1 through 7 except where the requirements are specifically referenced in Chapter 8."
Panel Meeting Action: Accept in Part
Delete FPNs No. 1 and No. 2.
Panel Statement: The panel accepts the deletion of the FPNs and rejects the addition of the two definitions, as they are covered by references to Chapter 3 within 820.110.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-192 Log #253 NEC-P16 **Final Action: Reject (820.2)**

Submitter: Stanley Kaufman, CableSafe Inc.
Comment on Proposal No: 16-245
Recommendation: Continue to accept the definition of CATV raceway.
Substantiation: The listing requirements for CATV Raceway are in section 820.182. It is appropriate to have a definition in this article.
The listing requirements for Optical fiber Raceways are in section 770.182 and the definition is in section 770.2.
See proposal 16-108 where the panel accepted a similar definition for Communications Raceway. The listing requirements for CATV Raceways are in section 800.182.
Panel Meeting Action: Reject
Panel Statement: The panel rejects Proposal 16-245. The panel intends to delete the definition. The listing requirements in 820.182 adequately describe a CATV raceway. See Comment 16-280a (Log #CC1603).

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Comment on Proposal No: 16-252
Recommendation: Delete text to read as follows:
~~**820.2 Air Duct.** A conduit or passageway for conveying air to or from heating, cooling, air conditioning, or ventilating equipment, but not including the plenum~~.
Substantiation: The term "air duct" is not contained in Article 820 and should not, thus, be defined in the Article.
The same change is being proposed for the definition of "air duct" in article 800.
The committee rejected the proposal based on, and I quote: "NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:
"[S]o as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."
However, Standards Council has since issued two new decisions, NFPA Standards Council Decision 06-03 (SC #06-3-18) dated 22 March 2006 and NFPA Standards Council Decision 06-19 (SC #06-7-33) dated 28 July 2006. These decisions address CMP decisions on Fine Print Notes referencing NFPA 13. The former (earlier) decision states, in pertinent part: "Mr. Dollard asks for clarification whether the Standards Council directive prohibits the NEC project from deleting the Fine Print Notes to sections 770.154, 800.154 & 820.154.

The Council, after due consideration, believes that clarification is appropriate in this instance and responds that the NEC project would not violate the directive by deleting the fine print notes at issue." The later decision states, in pertinent part, as follows: "if the fine print notes are not a helpful reference to NFPA 13 or engender confusion, the NEC Project should have the ability to delete them and nothing in the Council's status quo directive prohibits this." The decision also states: "It has also been pointed out that deletion of the fine print notes would provide further consistency within the NEC itself since, currently, the fine print notes at issue only appear in some relevant NEC Articles (Articles 770, 800, and 820), but not in others (Articles 725 and 760)." The decision also states: "nothing in NFPA procedures prevents the NEC Project from considering and acting on deletion of the fine print notes during the Comment phase of the code development process. The question whether the fine print notes should be in the NEC is hardly new. Aside from the fact that their presence was debated in the previous edition cycle, Proposals to remove them were duly filed and rejected by the responsible Code-Making Panel based on its then understanding of the Council's directive. The subject was explicitly raised during the Report on Proposals phase of the process and is, therefore, clearly open for further consideration and action during the Comment phase."

It would appear to me that these Standards Council decisions by implication would indirectly permit the deletion of definitions that violate the NEC manual of style.

Panel Meeting Action: Reject

Panel Statement: As there was no opportunity for public review and comment, the panel continues to affirm its original action on the referenced proposal in accordance with the action taken to comply with the Standards Council relative to the 90A Decision.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 13 Negative: 2

Explanation of Negative:

JENSEN, R.: We disagree that there was no opportunity for public review. To the contrary, there were nineteen (19) comments received on proposals involving this definition, thereby showing that this proposal was indeed reviewed.

We believe that the interpretation of whether being allowed to address the original proposal in view of the NFPA Standards Council Long Decision 05-24 (SC #05-7-4) was wrong. Indeed, during the writing of the 2005 NEC, all references where 90A issues were involved were to be untouched in the 2005 NEC. One of these issues was "air duct cable" and the definition of "air duct" (as it pertained to air duct cable). Additionally, having a definition where the term is not used in the text of the code is in violation of the Style Guide.

We agree with deleting the term "air duct" as it was evidently an oversight that it was not removed during the last code cycle. Air duct was introduced for use with "air duct cable" which was not to be used in the 2005 code. Additionally, the term is not used within 800. To further not using this term, in proposal 16-29, the panel revised the proposal to not use "air duct", but instead to harmonize code language by using the term "ventilation or air handling ducts".

OHDE, H.: This comment should have been accepted as this is no need for this definition of "air duct". The term "air duct" is not contained in this Article therefore should not be defined.

The panel statement reflects that Standards Council decision relative to NFPA 90A Decision is remain status quo regarding plenum issues. I do not believe that the Standard Council decision would prohibit the definition of air duct from being deleted.

16-194 Log #1581 NEC-P16 **Final Action: Reject (820.2)**

Submitter: Harold C. Ohde, IBEW-NECA Technical Institute
Comment on Proposal No: 16-239
Recommendation: This proposal should be accepted.
Substantiation: The term "air duct" is not used in Article 800 and, therefore, it should be deleted from 800.2. Defining a term that is not being used (such as air duct) in that Article is in direct violation with the National Electrical Code Style Manual. CMP 16 rejected this proposal based on the Standards Council decision D#05-24 to remain "status quo" on issues that pertain to NFPA 90A.

I do not believe that this Standards Council decision would prohibit the definition of "air duct" from being deleted. I do believe that expansion of, or a new definition of, air duct in another Article would be a violation of Standards Council Decision D#05-24. Standards Council recently issued another decision (D#06-03) which decided that 770.154(A) FPN, 800.154(A) FPN and 820.154(A) FPN may be deleted and this deletion would not be in conflict with the Standards Council decision (D#05-24). Standards Council recognizes the 2002 edition of the NEC as being status quo.

Panel Meeting Action: Reject

Panel Statement: As there was no opportunity for public review and comment, the panel continues to affirm its original action on the referenced proposal in accordance with the action taken to comply with the Standards Council relative to the 90A Decision.

JENSEN, R.: We disagree that there was no opportunity for public review. To the contrary, there were nineteen (19) comments received on proposals involving this definition, thereby showing that this proposal was indeed reviewed.

We believe that the interpretation of whether being allowed to address the original proposal in view of the NFPA Standards Council Long Decision 05-24 (SC #05-7-4) was wrong. Indeed, during the writing of the 2005 NEC, all references where 90A issues were involved were to be untouched in the 2005 NEC. One of these issues was "air duct cable" and the definition of "air duct" (as it pertained to air duct cable). Additionally, having a definition where the term is not used in the text of the code is in violation of the Style Guide.

We agree with deleting the term "air duct" as it was evidently an oversight that it was not removed during the last code cycle. Air duct was introduced for use with "air duct cable" which was not to be used in the 2005 code. Additionally, the term is not used within 800. To further not using this term, in proposal 16-29, the panel revised the proposal to not use "air duct", but instead to harmonize code language by using the term "ventilation or air handling ducts".

OHDE, H.: See my Explanation of Negative for Comment 16-193.

16-197 Log #1689 NEC-P16 **Final Action: Accept (820.2)**

Submitter: Harold C. Ohde, IBEW #134

Comment on Proposal No: 16-247

Recommendation: Continue to Reject.

Substantiation: The submitter's recommendation to add this definition to 820.2 because the term "concealed space" is used 820.154(A) FPN is misleading. This definition does not belong in the NEC. The 820.154(A) FPN provided no guidance to designers, installers or code officials. This FPN has misled the designer, installer and code officials to believe, install and enforce that limited combustible cable, conduit or a sprinkler system to be installed in the concealed space or plenums would be a requirements because of NFPA 13 Section 8.14.1. It is important to note that the NEC does not have a definition of "concealed spaces" therefore the confusion and making it impossible to enforce. What does constitute a concealed space? Is it the space above a dropped ceiling; or is it a space above plastered or drywall ceiling? Is it the wall cavity of typical wall construction.

NFPA 13 just completed their revision process for the 2006 NFPA 13 Standard. 8.14.1 of NFPA 13 has been revised to read as follows:

8.14.1.2 Concealed Spaces not Requiring Sprinkler Protection.

8.14.1.2.1* Concealed spaces of noncombustible and limited combustible construction with minimal combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those as a return air for a plenum. (For additional information on combustible loading see A.8.14.1.2.1)

8.14.1.2.2 Concealed spaces of noncombustible and limited combustible construction with limited access and not permitting occupancy or storage of combustible shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.

A.8.14.1.2.1 Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc... can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1) For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined.

In the 2006 NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.

Standards Council recently issued another decision (D#06-03) which decided that this FPN may be deleted from Sections 770.154, 800.154 and 820.154 (all under CMP 16 purview) and this deletion will not be in conflict with the Standards Council decision (D#05-24). Standards Council recognizes the 2002 edition of the NEC as being status quo. This FPN referencing NFPA 13 was added to the 2005 NEC therefore it can and should be deleted. There is no need for the term "concealed spaces" to be defined.

Panel Meeting Action: Accept

Panel Statement: As there was no opportunity for public review and comment, the panel continues to affirm its original action on the referenced proposal in accordance with the action taken to comply with the Standards Council relative to the 90A Decision.

16-201 Log #1114 NEC-P16 **Final Action: Accept in Part**
(820.2.Point of Entrance)

Submitter: James Daly, Upper Saddle River, NJ
Comment on Proposal No: 16-250
Recommendation: The Panel Action should continue to be Accept in Principle with the following additional revisions to the Panel Action.
In the definition for Point of Entrance, delete the last phrase in the Proposal "grounded to an electrode in accordance with 820.100(B)"
Delete the two FPNs.
Substantiation: The deletion of the phrase is required to comply with 2.2.2 of the NEC Style Manual which states "Definitions shall not contain requirements or recommendations." and 2.3.2.2 of the Manual of Style for NFPA Technical Committee Documents which states "Definitions shall not contain requirements."
The comments expressed by the Technical Correlating Committee on Proposals 16-116 and 16-117 provide valid reasons for the deletion of the FPNs.
It is assumed that the Panel Action on Proposal 16-251 supersedes the Panel Action on this Proposal.
Panel Meeting Action: Accept in Part
Panel Statement: The panel accepts the deletion of the FPNs. See panel action and statement on Comments 16-100 and 16-191.

The panel rejects the deletion of the phrase "connected by a grounding conductor to an electrode in accordance with 820.100(B)" because it is an integral and necessary part of the definition. See panel action and statement on Comment 16-87.

(820.3(A), 820.25 (new) & 820.26 (new))

TCC Action: The Technical Correlating Committee understands that 820.3(C) should not be deleted.
Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 16-261
Recommendation: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept

Revise the panel meeting action for Proposal 16-261 as follows: "The panel accepts the submitter's deletion of 820.3(C), and 820.3(A), the addition of 820.25 (new), and the addition of 820.26 (new), but revises "air ducts" to "ventilation or air-handling duct" in keeping with the existing NEC text. The panel accepts FPN No. 1 but rejects the addition of FPN No 2.
Panel Statement: The panel has considered the comments expressed in the voting as directed by the TCC.

The action corrects a typographical error.

The substantiation for the change to 300.21 is in Proposal 16-259.

The panel took parallel action in Articles 770, 800, and 830.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-208 Log #2058 NEC-P16 **Final Action: Reject**
(820.3(A), 820.25, and 820.26)

Submitter: Harold C. Ohde, IBEW #134
Comment on Proposal No: 16-260
Recommendation: This Proposal should have been Rejected.
Substantiation: The submitter's recommendation to add a new 800.26 with this FPN No. 2 to this section is in grave error. This FPN would not provide guidance to designers, installers or code officials. This FPN would have misled the designer, installer and code officials to believe, install and enforce that limited combustible cable, conduit or a sprinkler system to be installed in the concealed space or plenums would be a requirement because of NFPA 13, Section 8.14.1. The submitter's substantiation references 2002 NFPA 13 Section 8.14.1. It is important to note that the NEC does not have a definition of "concealed spaces", therefore making it impossible to enforce. What constitutes a concealed space? Is it the space above a dropped ceiling; or is it a space above plastered or drywall ceiling? Is it the wall cavity of typical wall construction?

NFPA 13 just completed their revision process for the 2006 NFPA 13 Standard. 8.14.1 of NFPA 13 has been revised to read as follows:

8.14.1.2 Concealed Spaces not Requiring Sprinkler Protection.

8.14.1.2.1* Concealed spaces of noncombustible and limited combustible construction with minimal combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those as a return air for a plenum. (For additional information on combustible loading see A.8.14.1.2.1).

8.14.1.2.2 Concealed spaces of noncombustible and limited combustible construction with limited access and not permitting occupancy or storage of combustible shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.

A.8.14.1.2.1 Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc... can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1). For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined.

In the 2006 NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.

CMP 16 should have rejected this proposal based on the Standards Council decision D#05-24 to remain "status quo" on issues that pertain to NFPA 90A. Standards Council recently issued another decision (D#06-03) which decided that this FPN may be deleted from Sections 770.154, 800.154, and 820.154 (all under CMP 16 purview) and this deletion will not be in conflict with the Standards Council decision (D#05-24). Standards Council recognizes the 2002 edition of the NEC as being status quo.

16-212 Log #374 NEC-P16 **Final Action: Reject (820.24)**

Submitter: S. D. Kahn, Tri-City Electric Company, Inc. / Rep. NECA
Comment on Proposal No: 16-272
Recommendation: Reject the Proposal.
Substantiation: Although I agree with the proposal and the submitter's intent to introduce consistency, the material is used in plenums and other air handling spaces. Consequently, the proposal should have been subjec
ted to the direction given by the Standards Council, as were many other proposals which were rejected.

As Mr. Dorna noted in his "Explanation of Negative Vote", "The UL Directory (2005), shows that category ZODZ covers "cable ties, cable tie mounts and similar types of related hardware". Likewise, Conduit and Fittings, category DWFV covers "cable ties, conduit straps, staples and similar hardware..." Both categories list as "Suitable for use in air handling spaces in accordance with Sec 300.22(C) and (D) of the National Electrical Code."

This proposal should have been rejected because of the Standards Council decision concerning NFPA 90A. Code Making Panels must be consistent in their handling of all submitted proposals.
Panel Meeting Action: Reject
Panel Statement: This is not a 90A issue.

The guide information for ZODZ, Wire Positioning Devices states that:

"The investigation of these products includes consideration of the rated mechanical strength, maximum operating temperature, smoke and heat generation, corrosion resistance and weatherability characteristics as appropriate for the product."

These are all characteristics that we should be concerned about for electrical installations.

The reference to air handling spaces is only a reference and is stated as:

"…for those devices which have been investigated to determine their suitability for use in air handling areas…"

This is a standard statement that is found in a wide variety of listing categories including the category for IT and Telecom equipment to cover situations where a special investigation is done to evaluate a device for air handling spaces. It no way implies that devices in the category are automatically intended for air handling spaces.

Listed devices are evaluated using UL1565 – Standard for Positioning Devices. The scope of this standard states:

"1.1 This standard applies to those metallic and nonmetallic devices used for positioning - which may include bundling and securing - or to a limited extent supporting cable, wire, conduit, or tubing of a wiring system in electrical installations, to reduce the risk of fire, electric shock, or injury to persons."

Devices are evaluated for properties that we are concerned about. It is NOT a requirement for a listed device to be evaluated for use in air handling spaces.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-213 Log #478 NEC-P16 **Final Action: Reject (820.24)**

Submitter: Timothy P. McNeive, Thomas & Betts Corporation
Comment on Proposal No: 16-272
Recommendation: Delete the word "listed".
Substantiation: Refer to my comment in ROP 16-275. The use of the word "listed" is redundant whether or not my comment in 16-275 is accepted. I agree with Mr. Boyer's comment accompanying his negative vote. His suggested additional text is not needed, however, in this section, if adopted in 820.24 according to my comment in ROP 16-275.
Panel Meeting Action: Reject
Panel Statement: The guide information for ZODZ, Wire Positioning Devices states that:

"The investigation of these products includes consideration of the rated mechanical strength, maximum operating temperature, smoke and heat generation, corrosion resistance and weatherability characteristics as appropriate for the product."

These are all characteristics that we should be concerned about for electrical installations.

Listed devices are evaluated using UL1565 – Standard for Positioning Devices. The scope of this standard states:

"1.1 This standard applies to those metallic and nonmetallic devices used for positioning - which may include bundling and securing - or to a limited extent supporting cable, wire, conduit, or tubing of a wiring system in electrical installations, to reduce the risk of fire, electric shock, or injury to persons."

The evaluation of positioning devices includes:

- Classification by mechanical strength, material, maximum temperature, and environmental conditions
- Required Markings giving critical information to the installer / inspector
- Mechanical strength tests
- Flammability classification of polymeric materials and coatings (NOT air-handling space requirements)
- Relative thermal index
- Material requirements (Including blending and substitution)
- Corrosion resistance
- Sharp edges
- Installation
- Mechanical strength
- Vibration
- Tests for mounting blocks and other mounting hardware and devices
- Environmental conditioning.....

Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:

BOYER, J.: See my explanation of vote on Comment 16-29.

16-214 Log #479 NEC-P16 **Final Action: Reject**
(820.24)

Submitter: Timothy P. McNeive, Thomas & Betts Corporation
Comment on Proposal No: 16-275
Recommendation: Accept the panel action but delete the requirement that hardware be "listed" in 820.24. Add the following sentence before the last sentence in 820.24:

"Cable ties that provide primary support for optical fiber cables and raceways shall have a minimum loop tensile strength of 23 kg (50 lbs).

Substantiation: Adding a requirement that all hardware be "listed" is far from editorial as asserted in the substantiation accompanying the proposal. The panel is asked to consider the long-standing positions of CMP-7 and CMP-8 that do not require support hardware to be "listed". Above all else, consistency in the NEC seems to be what the original submitter values most. No substantiation has been provided in the proposal that would differentiate treatment of antenna television and radio distribution cables from other wiring systems with respect to support. The wide variety of hardware used for supporting cables and raceways are called upon to provide both primary support required in the NEC and very often secondary support or wire management functions. All hardware need not be held to the highest standard.

The comment provided by Mr. Dorna with his negative vote references two UL categories under which cable ties and other hardware are "listed". The correct UL category for Hardware for Support of Conduit, Tubing and Cable (UL 2239) is DWMU, not DWFV. Nevertheless, this standard and UL 1565, Positioning Devices (ZODZ) establishes a 23 kg test load for all support products for flexible conduits and cables in accordance with the requirements for primary support throughout the NEC. For cable ties, "minimum loop tensile strength" is commonly marked on packages. The 23 kg minimum for cable support is well representative of typical straps, hangers and staples listed for flexible conduit and cable support in accordance with UL 2239, Hardware for Support of Conduit, Tubing and Cable. The proposed new text will add value to inspectors in acceptance of appropriate cable ties without requiring lists.

Companion proposals have been submitted for 640.6, 725.8, 760.8, 770.24, 800.24 and 830.24.

Panel Meeting Action: Reject
Panel Statement: There is more to listing than mechanical strength. Also, the mechanical strength should be based on the use and ratings of the device.

Cable ties can be used for securing and supporting cables in a number of Chapter 3 wiring methods without any requirements for a minimum loop tensile strength of 23 kg (50 Ibs) or any particular strength. For example, Section 334.30 covering securing and supporting of "nonmetallic-sheathed cable requires supporting and securing by staples, cable ties, straps, hangers, or similar fittings designed and installed so as not to damage the cable, at intervals not exceeding 1.4 m (4 1/ 2 ft) and within 300 mm (12 in.) of every outlet box, junction box, cabinet, or fitting." Notice it does not have any recommendation for the support strength, nor does it need this additional marking or special consideration. The cables may not be providing any support at all where the tie wrap is simply anchoring it to a beam or joist. Types AC and MC cable also give permission to use cable ties for securing and supporting these cables in 320.30 and 330.30, respectively. In addition, this added text could be considered to be new information that has not been reviewed as part of the process.

Listing includes an evaluation of the particular device that goes beyond the ability to support cable. The guide information for ZODZ, Wire Positioning Devices states that:

"The investigation of these products includes consideration of the rated mechanical strength, maximum operating temperature, smoke and heat generation, corrosion resistance and weatherability characteristics as appropriate for the product."

These are all characteristics that we should be concerned about for electrical installations.

Listed devices are evaluated using UL1565 – Standard for Positioning Devices. The scope of this standard states:

"1.1 This standard applies to those metallic and nonmetallic devices used for positioning - which may include bundling and securing - or to a limited extent supporting cable, wire, conduit, or tubing of a wiring system in electrical installations, to reduce the risk of fire, electric shock, or injury to persons."

16-215 Log #874 NEC-P16 **Final Action: Reject**
(820.24)

Submitter: John P. Masarick, Independent Electrical Contractors Inc.
Comment on Proposal No: 16-275
Recommendation: The panel is encouraged to continue to Accept in Principle Proposal 16-275 and continue to Reject the addition of the FPN.
Substantiation: The reasons to continue to Accept in Principle the Proposal and the addition of the FPN are as follows:

1. The trend by the CMPs over the last several code cycles has been to limit the use of FPNs.
2. There is also a correlation issue. There is a conflict between those panels that accepted the proposal and those that rejected the proposal.
3. These standards are also covered by a Fine Print Note in 110.12.
4. The FPN should not be accepted because numerous standards and installation manuals exist and to only mention one does not adequately inform the public about accepted industry practices. The NEC is not intended to be an instruction manual for untrained persons. If the FPNs are allowed to reference these standards, then they should list all applicable standards.
5. Since the referenced installation standards are intentionally general to cover different models of equipment, approval of the FPN may lead many to believe these standards can be used instead of listed or labeled manufacturer's instructions which would be in violation of 110.3(B).
6. If the CMP would like to include the reference, it should be placed in the Annex with the other references.

Panel Meeting Action: Reject
Panel Statement: The action on Proposal 16-275 was to accept in principle in part. This is not consistent with the submitter's request.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-216 Log #1544 NEC-P16 **Final Action: Reject**
(820.24)

Submitter: James E. Brunssen, Telcordia Technologies, Inc. / Rep. Alliance for Telecommunications Industry Solutions
Comment on Proposal No: 16-273
Recommendation: Accept this proposal.
Substantiation: This proposal should be accepted. If the Panel continues to support the addition of the requirements of 300.11 to 820.24, then at the very least, the requirements of 300.11(C) should be waived. Section 300.11(C) is clearly not applicable to CATV cables. Installation practice is to lash CATV cables together to form a "cable assembly". This frequently occurs during modifications or additions to an existing installation. CATV cables are physically smaller and lighter than power cables and typically contain no electrical power. Application of 300.11(C) is overly restrictive and will preclude lashing of CATV cables together to form a cable assembly. CATV cables secured in this manner have adequate support (see 300.11 (A)), are supported independently of the suspended ceiling grid, and are not likely to collapse in the event the suspended ceiling collapses. Such restriction imposes additional installation costs with no improvement in safety. See my companion comment on proposal 16-274.
Panel Meeting Action: Reject
Panel Statement: Securing an additional cable to an existing cable does not constitute support. Additional cables must be directly supported by the same structural member that supports the first cable. In such installations, the additional cable is being supported by the same structural member.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 12 Negative: 3
Explanation of Negative:

BRUNSSEN, J.: This comment should have been accepted, as should the original Proposal 16-273. If the panel continues to support the addition of the securing and supporting requirements of 300.11, then at the very least 300.11(C) should be exempted. It is clearly not applicable to CATV coaxial cables. For further substantiation, see my explanation of negative on Proposal 16-273 and the substantiation accompanying my Comment 16-216. Additionally, the final sentence of the panel statement is unclear.

JOHNSON, S.: See my explanation of negative vote on Comment 16-31.

JONES, R.: The requirement added by Panel 16 during the 2005 revision cycle is overly restrictive and inappropriate for CATV cables. CATV cables are physically smaller and lighter than power cables and typically contain no electrical power. Application of 300.11 (C) is overly restrictive and will preclude lashing of CATV cables together to form a cable assembly. The Panel has enhanced the Fine Print Note during this cycle by the addition of three new references covering the installation of CATV cables, these and the installation requirements in Article 820 are adequate without the requirements of 300.11.

16-217 Log #1545 NEC-P16 **Final Action: Reject**
(820.24)

Submitter: James E. Brunssen, Telcordia Technologies, Inc. / Rep. Alliance for Telecommunications Industry Solutions
Comment on Proposal No: 16-274
Recommendation: Accept this proposal.
Substantiation: This proposal should be accepted. The requirement added by Panel 16 during the 2005 revision cycle is overly restrictive and inappropriate for CATV cables. The Fine Print Note associated with 820.24 directs the reader to the appropriate installation standards. The Panel has enhanced the Fine Print Note during this cycle by the addition of three new references covering the installation of CATV cables (see Proposal 16-277). These references are all that is necessary and sufficient for such cables without imposing the burdensome requirements of 300.11. Section 300.11 is directed toward power cable

assemblies that are heavier and larger than communications cables, operate at much greater power levels (CATV cables often contain no power), and present a greater risk of injury if not properly installed. If the Panel continues to reject Proposal 16-274 then, at the very least, 300.11(C) should be excepted. See my companion comment on Proposal 16-273.
Panel Meeting Action: Reject
Panel Statement: Securing an additional cable to an existing cable does not constitute support. Additional cables must be directly supported by the same structural member that supports the first cable. In such installations, the additional cable is being supported by the same structural member.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 12 Negative: 3
Explanation of Negative:
BRUNSSEN, J.: This comment should have been accepted, as should the original Proposal 16-274. Lashing (tie-wrapping) of additional CATV coaxial cables to existing CATV coaxial cables is accepted industry practice, and has been done extensively without detriment to safety. The CATV coaxial cables in question are of small diameter, light in weight and operate at very low voltage, current and power levels. The argument is not one of whether to support the additional CATV coaxial cable, but the adequacy of lashing (tie-wrapping) to existing CATV coaxial cable(s). For further substantiation, see my explanation of negative on Proposal 16-274 and my substantiation to Comment 16-217. Additionally, the final sentence of the panel statement is unclear.
JOHNSON, S.: See my explanation of negative vote on Comment 16-31.
JONES, R.: See my Explanation of Negative Vote on Comment 16-216.

16-218 Log #2009 NEC-P16 **Final Action: Reject**
(820.24)

Submitter: Noel Williams, Herriman, UT
Comment on Proposal No: 16-272
Recommendation: This Proposal should have been Accepted without modification by the panel.
Substantiation: Cable ties of different types, materials, and configurations are widely used without problems and probably fall under the existing language "or similar fittings," so they would still continue to be used even if the proposal were rejected. However, much of the hardware that was already specifically permitted are not even available as listed products. For example, most straps, staples, and "hangers" are not listed products. Entire lines of one-hole and two-hole straps, standoff brackets, ring hangers, and the strut-type hardware used for all types of even the most heavy electrical wiring methods are not listed. The requirement should rest on the basic requirement that all such materials be acceptable to the authority having jurisdiction (approved). The proposed wording in the Explanation of Negative by Mr. Boyer would also be usable, as there is a listing standard for the cable ties and this language, since it refers to primary support, would not restrict the use of cable ties that are used only for cable management. The language accepted by the panel would eliminate most of the products currently in use by this industry, without any evidence being provided of a problem with those products.
Panel Meeting Action: Reject
Panel Statement: The guide information for ZODZ, Wire Positioning Devices states that:
"The investigation of these products includes consideration of the rated mechanical strength, maximum operating temperature, smoke and heat generation, corrosion resistance and weatherability characteristics as appropriate for the product."
These are all characteristics that we should be concerned about for electrical installations.
Listed devices are evaluated using UL1565 – Standard for Positioning Devices. The scope of this standard states:
"1.1 This standard applies to those metallic and nonmetallic devices used for positioning - which may include bundling and securing - or to a limited extent supporting cable, wire, conduit, or tubing of a wiring system in electrical installations, to reduce the risk of fire, electric shock, or injury to persons."
The evaluation of positioning devices includes:
- Classification by mechanical strength, material, maximum temperature, and environmental conditions
- Required Markings giving critical information to the installer / inspector
- Mechanical strength tests
- Flammability classification of polymeric materials and coatings (NOT air-handling space requirements)
- Relative thermal index
- Material requirements (Including blending and substitution)
- Corrosion resistance
- Sharp edges
- Installation
- Mechanical strength
- Vibration
- Tests for mounting blocks and other mounting hardware and devices
- Environmental conditioning.....

Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
JOHNSON, S.: See my explanation of negative vote on Comment 16-50.

16-219 Log #715 NEC-P16 **Final Action: Reject**
(820.24, FPN)

Submitter: Robert Kelleher, Paramount Electrical Services
Comment on Proposal No: 16-276
Recommendation: The action should be to delete this Fine Print Note.
Substantiation: The addition of these NECA Fine Print Notes, serves no benefit to the user of the National Electrical Code. These are not standards, they are a compilation of generic information and do not serve as information to the user. These must be purchased through NECA. This FPN as written is nothing more than free advertisement for generic, readily available information which must be purchased by the code user. Code Making Panel 16 should consider taking an action to delete this FPN to coordinate with the other technical committees in the NEC project. A total of seventeen new Fine Print Notes were proposed to reference NECA standards. Sixteen were unanimously rejected. Inclusion of this Fine Print Note is in direct conflict with 90.1(C). In the action to reject proposal 8-3, one technical committee member promotes NECA standards as "….a tool to assist untrained electricians to make safer and better installations." The TCC should intervene, uphold the provisions of 90.1(C) and prohibit these types of Fine Print Notes. CMP16 should reject this FPN. Failure to do so will mean adding Fine Print Notes for IEC, EEI, IBEW, IAEI, ACC, NETA, NEI, SEIA, AISI, API, ASHE, AHAM, ICEAI, NYBFU and dozens of others when they decide to develop income through generic standards development. If this type of Fine Print Note is placed anywhere in the NEC an Annex should be included with coupons for the code user. If the NEC is to be used for advertisement purposes, coupons should be included.
Panel Meeting Action: Reject
Panel Statement: Proposal 16-276 pertained to updating the FPN, not to delete it.
The comment requests that the FPN be deleted. The FPN provides valuable information and the panel intends for it to be retained but the date updated. The references provided in the FPN provide guidance for installation in a neat and workmanship like manner.
See panel action and statement on Comment 16- 107a (Log #CC1602).

(820.93)

Submitter: Stanley Kaufman, CableSafe Inc.
Comment on Proposal No: 16-286
Recommendation: Accept this proposal in principle by revising 820.93 and 820.100 as shown below:
~~**820.93 Grounding of Outer Conductive Shield of a Coaxial Cable.**~~
~~The outer conductive shield of the coaxial cable shall be grounded at the building premises as close to the point of cable entrance or attachment as practicable.~~
~~For purposes of this section, grounding located at mobile home service equipment located in sight from, and not more than 9.0 m (30 ft) from, the exterior wall of the mobile home it serves, or at a mobile home disconnecting means grounded in accordance with 250.32 and located in sight from and not more than 9.0 m (30 ft) from the exterior wall of the mobile home it serves, shall be considered to meet the requirements of this section.~~
~~FPN: Selecting a grounding location to achieve the shortest practicable grounding conductor helps limit potential differences between CATV and other metallic systems.~~
~~**(A) Shield Grounding.** Where the outer conductive shield of a coaxial cable is grounded, no other protective devices shall be required.~~
~~**(B) Shield Protection Devices.** Grounding of a coaxial drop cable shield by means of a protective device that does not interrupt the grounding system within the premises shall be permitted.~~
820.93 Grounding of the Outer Conductive Shield of Coaxial Cables.
Coaxial cables entering buildings or attaching to buildings shall comply with (A), (B) or (C). Where the outer conductive shield of a coaxial cable is grounded, no other protective devices shall be required.
(A) Entering Buildings. In installations where the coaxial cable enters the building, the outer conductive shield shall be grounded as close as practicable to the point of entrance.
(B) Terminating Outside of the Building. In installations where the coaxial cable is terminated outside of the building, the outer conductive shield shall be grounded as close as practicable to the point of attachment or termination.
(C) Mobile Homes. For purposes of this section, grounding located at mobile home service equipment located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, or at a mobile home disconnecting means grounded in accordance with 250.32 and located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, shall be considered to meet the requirements of this section.
FPN: Selecting a grounding location to achieve the shortest practicable grounding conductor helps limit potential differences between CATV and other metallic systems.
Move the current 820.93(B) to 820.100 and renumber it to be 820.100(E).
Substantiation: The suggested text is an editorial clarification intended to bring this section into compliance with section 3.3.1(2) of the NEC Style Manual which states:
2. Use simple declarative sentence structure, and keep sentences short. Writing rules in long sentences full of commas, dependent clauses, and parenthetical expressions often creates confusion and misunderstanding. The requirement can be written in two or more short sentences, expressed using a list or table, or both.
The existing paragraph deals with three scenarios, 1) installations where the cable enters the building, 2) installations where the cable is terminated outside of the building and 3) cables serving mobile homes. It is clearer to deal with each scenario in a separate subsection. The suggested text retains these options. The current 820.93(A) is merged into the opening paragraph of the recommended text. The current 820.93(B) should be moved to 820.100(E).
The changes accepted in proposal 16-287 are incorporated into (C).
Panel Meeting Action: Accept in Principle
Move the current 820.93(B) to 820.100 and renumber it to 820.100(E).
Revise 820.93 to read as follows:
"820.93 Grounding of the Outer Conductive Shield of Coaxial Cables.
Coaxial cables entering buildings or attached to buildings shall comply with (A) or (B). Where the outer conductive shield of a coaxial cable is grounded, no other protective devices shall be required. For purposes of this section, grounding located at mobile home service equipment located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, or at a mobile home disconnecting means grounded in accordance with 250.32 and located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, shall be considered to meet the requirements of this section.
FPN: Selecting a grounding location to achieve the shortest practicable grounding conductor helps limit potential differences between CATV and other metallic systems.
(A) Entering Buildings. In installations where the coaxial cable enters the building, the outer conductive shield shall be grounded in accordance with 820.100. The grounding shall be as close as practicable to the point of entrance.
(B) Terminating Outside of the Building. In installations where the coaxial cable is terminated outside of the building, the outer conductive shield shall be grounded in accordance with 820.100. The grounding shall be as close as practicable to the point of attachment or termination."
Panel Statement: This revised text achieves the submitter's purpose with improved clarity and achieves parallelism with the text the panel accepted in Comments 16-40 and 16-126. Section 820.93(B) Shield Protection Devices in Part III Protection is moved to 820.100 Cable Grounding in Part IV Grounding Methods because a shield protection device is a grounding method.

Ballot Results: Affirmative: 15

16-226 Log #192 NEC-P16 **Final Action: Accept**
(820.94 (New))

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 16-290
Recommendation: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal. The first sentence in new (C) references compliance with (B)(1) and there is not a (B)(1). This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the direction of the TCC to review clarification of the panel action.

The panel is unable to make a change as it was a rejected Proposal.

The panel rejected Proposal 16-290 as the submitter neither provided text for the new section nor justification for the proposed new requirements.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-227 Log #563 NEC-P16 **Final Action: Accept in Principle**
(820.94 (New))

TCC Action: The Technical Correlating Committee directs that 820.93(C) be revised to correct an error in the panel action as follows:

"820.93(C) Location. Where installed, a listed primary protector shall be applied on each community antenna and radio distribution the CATV cable external to the premises. The listed primary protector shall be located as close as practicable to the entrance point of the cable on either side or integral to the ground block."

Submitter: Steven C. Johnson, Time Warner Cable / Rep. National Cable & Telecommunications Assoc.
Comment on Proposal No: 16-289
Recommendation: Correct the panel action text as indicated.
Substantiation: The panel action was to reject the part of the proposal requiring a primary protector. The added text was intended to indicate the location where the protector was to be installed, when optionally used. Therefore, the word "required" is incorrect and should be replaced with the word "installed".
Panel Meeting Action: Accept in Principle
Revise 820.93(C) as follows:

(C) Location. Where a listed primary protector shall be applied on each community antenna and radio distribution the CATV cable external to the premises. The listed primary protector should be located as close as practicable to the entrance point of the cable on either side or integral to the ground block.
Panel Statement: The panel agrees with the submitter's comment but revised the text as shown in the panel action to correlate with similar text in 820.93(D) (of the draft).
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:

BRUNSSEN, J.: The underlined and strikeout text (legislative format) as developed by Panel 16 does not appear in the panel meeting action text. Revise the text to read as follows:

"(C) Location. Where a listed primary protector is used it shall be applied on the CATV cable as close as practicable or integral to the ground block."

16-228 Log #1133 NEC-P16 **Final Action: Reject**
(820.100(8) (New))

Submitter: George Bish, Mastec
Comment on Proposal No: 16-302
Recommendation: Insert: (8) the noncurrent carrying metal parts of cord and plug connected equipment, if grounded per 250.138(A) or (B).
Substantiation: This would allow for a coaxial cable to use the receiver as a ground point.
Panel Meeting Action: Reject
Panel Statement: Grounding protects insulation in the equipment and reduces electric shock hazards.

These comments should be rejected even if limited only to satellite dish installations on the basis that where grounding is required a cord connected product ground is a poor substitute for a more permanent grounding method.

• The receptacle itself may not be grounded properly (Many older buildings, especially those built before the 1960's, were not even required to have branch circuit equipment grounding provisions.)

• If a grounded receptacle is not be available a "cheater" plug may be used with no ground connection

• If the equipment is unplugged you lose the ground

• The equipment may be replaced by a non-grounded piece of equipment

• The grounding methods described in Sec 810.21 (and 820.100) are considerably more robust than the typical branch circuit equipment grounding conductor as described in Parts VI and VII of Art. 250. The Art. 810 grounding conductor is larger in size, mechanically protected, and run in a straight line as opposed to an equipment grounding conductor in a typical 15- or 20-ampere residential branch circuit. In Art. 810, the grounding conductor(s) is connected to (or very closely to) the building's grounding electrode system. This system is typically very robust, reliable, free from splices, and of low impedance. The branch circuit equipment grounding conductor can travel long distances and in various directions, oftentimes spliced or connected several times.

Ballot Results: Affirmative: 15

16-229 Log #1392 NEC-P16 **Final Action: Reject**
(820.100(8) (New))

Submitter: Raymond D. Edwards, DIRECTV, Inc.
Comment on Proposal No: 16-302
Recommendation: Revise text to read as follows:

820.100 Cable Grounding.

(B) Electrode. The grounding conductor shall be connected in accordance with 820.100(B)(1) and (B)(2).

(1) In Buildings or Structures with Grounding Means. To the nearest accessible location on the following:

(1) The building or structure grounding electrode system as covered in 250.50

(2) The grounded interior metal water piping system, within 1.52 m (5 ft) from its point of entrance to the building, as covered in 250.52

(3) The power service accessible means external to enclosures as covered in 250.94

(4) The metallic power service raceway

(5) The service equipment enclosure

(6) The grounding electrode conductor or the grounding electrode conductor metal enclosure, or

(7) The grounding conductor or the grounding electrode of a building or structure disconnecting means that is grounded to an electrode as covered in 250.32

(8) The non-current-carrying metal parts of cord- and-plug-connected equipment, if grounded as covered in 250.138(A) or (B).

250.138 reads as follows:

"250.138 Cord-and-Plug-Connected Equipment. Non-current-carrying metal parts of cord-and-plug-connected equipment, if grounded, shall be grounded by one of the methods in 250.138(A) or (B).

(A) By Means of an Equipment Grounding Conductor. By means of an equipment grounding conductor run with the power supply conductors in a cable assembly or flexible cord properly terminated in a grounding-type attachment plug with one fixed grounding contact.

Exception: The grounding contacting pole of ground-type plug-in ground-fault circuit interrupters shall be permitted to be of the movable, self-restoring type on circuits operating at not over 150 volts between any two conductors or over 150 volts between any conductor and ground.'
Substantiation: Problem: In some circumstances grounding as listed in 820.100(B)(1) 1-7 cannot be done in accordance with that section. Therefore we are proposing another alternative the meets NEC requirements and is contained within another section of the National Electrical Code.

Substantiation: Since the ground connection listed in 250.138 sufficiently protects the occupants and equipment within the building, it should be accepted when used in the manner proposed within that section.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 16-228.

Comment on Proposal No: 16-296
Recommendation: Accept in Part the proposed revision to (A)(3), second sentence.
Substantiation: Present wording is vague and subjective; proposed wording is specific.
Panel Meeting Action: Reject
Panel Statement: The panel has reviewed and affirms their panel action on Proposal 16-296. The present wording ensures that the grounding conductor will be no smaller than AWG # 14 and is consistent with similar requirements in 800.100(A)(3) and 830.100(A)(3).
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-231 Log #193 NEC-P16 **Final Action: Accept**
(820.100(B))

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 16-299
Recommendation: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal with respect to the use of the word "and" in the sentence "The grounding conductor shall be connected in accordance with 820.100(B)(1), (B)(2), and (B)(3)." This action will be considered by the Panel as a Public Comment.

It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 5-20.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Revise 820.100(B) as follows:

"(B) Electrode. The grounding conductor shall be connected in accordance with 820.100(B)(1), (B)(2), ~~and~~ or (B)(3)."

Revise 820.100(B)(1) as follows:

"(1) In Buildings or Structures with an Intersystem ~~Grounding~~ Bonding Termination. If the building or structure served has an intersystem ~~grounding~~ bonding termination, the grounding conductor shall be connected to the intersystem ~~grounding~~ bonding termination."

Revise 820.100(B)(2) as follows:

"(2) In Buildings or Structures with Grounding Means. If the building or structure served has no intersystem ~~grounding~~ bonding termination, the grounding conductor shall be connected to the nearest accessible location on the following:"

Retain existing list and text

Revise 820.100(B)(3) as follows: "(3) In Buildings or Structures Without Intersystem ~~Grounding~~ Bonding Termination or Grounding Means. If the building or structure served has no intersystem ~~grounding~~ bonding termination or grounding means, as described ….".

Revise 820.100(B)(3)(2) as follows:

"(2) If the building or structure served has no intersystem ~~grounding~~ bonding termination or has no grounding means, as described in 800.100(B)(2) or …"
Panel Statement: The panel accepts the direction of the TCC to clarify the panel action.

The panel has clarified the panel action on Proposal 16-299 with respect to the word "and" as indicated in the panel action on this comment. It is not the intent to accomplish the grounding connections of 820.100 (B)(1), (B)(2), and (B)(3) simultaneously.

The panel has reconsidered Proposal 16-299 in light of the panel action on Proposal 5-20 as directed by the TCC and has revised "intersystem grounding termination" to "intersystem bonding termination" as indicated in the panel action on this comment.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-232 Log #194 NEC-P16 **Final Action: Accept**
(820.100(B))

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 16-300
Recommendation: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal based on the placement of the recommended text as indicated in the affirmative comment. This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept

Relocate the text to follow 820.100(B)(2)(7) and revise as follows:

"A bonding device intended to provide a termination point for the grounding conductor (intersystem bonding) shall not interfere with the opening of an equipment enclosure. A bonding device shall be mounted on non-removable parts. A bonding device shall not be mounted on a door or cover even if the door or cover is non-removable."
Panel Statement: The panel accepts the direction of the TCC to review clarification of the panel action.

The panel action on Proposal 16-300 to accept in principle is correct. The panel has reviewed the comment expressed in the voting and determined that the proper location of the text is 820.100(B)(2)(7), not 820.100(B)(5), as indicated in the comment. That is where equipment (service) enclosures are discussed. The panel has also added editorial clarification as indicated in the panel action on this comment. The panel notes that the text is presently located incorrectly in the preprint.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-233 Log #685 NEC-P16 **Final Action: Accept in Part**
(820.100(B))

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 16-299
Recommendation: The Proposal should be Accepted in Principle by incorporating the following changes:

In 820.100(B), change "and" to "or" so it reads:

"...with 820.100(B)(1), (B)(2), or (B)(3)."

Change "has no" to "does not have an" in 820.100(B)(2), (B)(3), and (B)(3)(2).

Revise 820.100(B)(3)(2) as follows:

"~~If the building or structure served has no intersystem grounding termination of grounding means, as described in 820.100(B)(2) or~~ If none of the individual electrodes listed in (B)(3)(1) exist, to any one of the individual electrodes described in 250.52(A)(5), (A)(6), ~~and~~ or (A)(7)."
Substantiation: While the 2005 Code erroneously contains the word "and" in reference to two conditions, the installation can only comply with one of the three conditions so "or" is appropriate. This change will also address the first part of the TCC Action.

The text revision is editorial.

The deleted phrase in 820.100(B)(3)(2) is identical to the first phrase in 820.100(B)(3) so it has already been determined that the condition exists. The revised text now states that if the individual electrodes in (B)(3)(1) exist, one of them must be used. If none of those electrodes exist, then the individual electrodes in (B)(3)(2) must be used. The change from "and" to "or" is appropriate since there is a choice between the three electrodes. This change is for editorial clarity and was not intended to change any of the requirements.

If the revision to 820.100(B)(3)(2) is accepted, then the editorial text revision to that section is no longer necessary.
Panel Meeting Action: Accept in Part

Revise "and" to "or" in 820.100(B).
Panel Statement: The panel has accepted the part to revise "and" to "or" in 820.100(B). See panel action and statement on Comment 16-231. The panel accepts the editorial revisions to 820.100(B)(3)(2).

The panel rejects the portion of the comment to revise "has no" to "does not have an" in 820.100(B)(2), (B)(3), and (B)(3)(2). The text is clear as written. See panel action and statement on Comments 16-17 and 16-189.

(820.100(B)(8) (New))

Submitter: David Lettkeman, Dish Network Service, LLC
Comment on Proposal No: 16-302
Recommendation: Add new text to read as follows:
820.100 Cable Grounding.
(B) Electrode. The grounding conductor shall be connected in accordance with 820.100(B)(1) and (B)(2).
(1) In Buildings or Structures with Grounding Means. To the nearest accessible location on the following:
(1) The building or structure grounding electrode system as covered in 250.50
(2) The grounded interior metal water piping system, within 1.52 m (5 ft) from its point of entrance to the building, as covered in 250.52
(3) The power service accessible means external to enclosures as covered in 250.94
(4) The metallic power service raceway
(5) The service equipment enclosure
(6) The grounding electrode conductor or the grounding electrode conductor metal enclosure, or
(7) The grounding conductor or the grounding electrode of a building or structure disconnecting means that is grounded to an electrode as covered in 250.32
(8) The non-current-carrying metal parts of cord-and-plug-connected equipment, if grounded as covered in 250.138(A) or (B)
Substantiation: Problem: Some locations do not allow for one of the grounding connections listed in 820.100(B)(1) 1-7, therefore, we are proposing the addition of another alternative.
Substantiation: The ground connection listed in 250.138 is substantial enough to protect the equipment and the occupants of the building, therefore, it should be adequate to be used as a connection point for the coaxial cable.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject

Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-242 Log #1290 NEC-P16 **Final Action: Hold**
(820.110)

TCC Action: The Technical Correlating Committee understands that the panel action was to Hold the Comment only.
Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 16-306
Recommendation: The panel action on the Proposal should have been Accept in Principle with the following changes:

820.110 Raceways for Coaxial Cables. Where coaxial cables are installed in a raceway, the raceway shall be either of a type permitted in Chapter 3 and installed in accordance with Chapter 3 or a ~~listed plenum~~ CATV raceway~~, listed riser CATV raceway, or listed general purpose CATV raceway~~ listed in accordance with 820.182 and installed in accordance with 820.154~~, and with 362.24~~ and 362.22 through 362.56, where the requirements applicable to electrical nonmetallic tubing apply.

Delete the Exception.

Substantiation: The revisions in the first sentence clarify that the listing requirements are specified in 820.182 and the installation requirements in 820.154. These revisions will also provide consistency with 770.110 and 800.110.

362.22 should also apply if the requirements for ENT are to be utilized.

Using the term "listed CATV raceways" will still permit the installation of CATV coaxial cables in CATV raceways (plenum, riser, or general-purpose) or in any type of listed raceway permitted in Chapter 3 without adding additional text to the Code. This revision will also permit the installation of other types of listed CATV coaxial cables and CATV raceways that may be included in future Codes without having to revise 820.110.

The Exception should have been deleted rather than including it as positive text in the last sentence. The first sentence in 820.110 already states "installed in accordance with Chapter 3" which would include all of Chapter 3 requirements pertaining to raceways including the maximum percentage fill limitations in Chapter 9. The Proposal and the panel action perpetuates conflicting requirements between that sentence and the Exception.

No substantiation was submitted to support the deletion of the conduit fill restrictions of Chapters 3 and 9. The fill restrictions are based on the physical limitations of being able to pull conductors or cables into raceways without damaging the conductors or cables, particularly when there are bends in the run, and to avoid conductor/cable jamming. The maximum percentage fill requirements are independent of whether they are electrical conductors or not; they could be empty tubes.

The maximum percentage fill requirements in Chapters 3 and 9 are an integral part of the permitted uses of the raceways contained in Chapter 3 and if CATV cables are to be installed in a Chapter 3 raceway, then the maximum percentage fill requirements must also apply.

Chapter 9, Table 1 permits 53 percent fill when one conductor or cable is installed in a raceway; 31 percent for two; and 40 percent for three or more.
Panel Meeting Action: Hold
Panel Statement: Changing the installation requirements for raceways is new material.

The proposed revision(s) constitutes new material that has not had the benefit of public review and cannot be considered at this stage of the code-making cycle. Refer to 4.4.6.2.2 of the Regulations Governing Committee Projects.

See panel action and statement on Comment 16-26.

16-243 Log #196 NEC-P16 **Final Action: Accept**
(820.113 and 820.179)

TCC Action: The Technical Correlating Committee directs that the new Exception to 820.113 be written as a complete sentence in accordance with the Section 3.1.4.1 of the NEC Style Manual as follows:
"Exception: Coaxial cables that comply with 800.48 shall not be required to be listed."
The Technical Correlating Committee directs that Fine Print Note No.1 be deleted since it is more than explanatory, and that Fine Print Note No. 2 also be deleted to be consistent with the Technical Correlating Committee action on Comment 16-41.
Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 16-309
Recommendation: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 16-284. This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept

The panel clarifies that the text of 820.48 and 820.113, and the first paragra ph of 820.179 should be as follows:

"820.48. Unlisted Cables Entering Buildings. Unlisted outside plant coaxial cables shall be permitted to be installed in locations as described in 820.154(C) where the length of the cable within the building, measured from its point of entrance, does not exceed 15 m (50 ft) and the cable enters the building from the outside and is terminated at a grounding block.

FPN No. 1: This section limits the length of unlisted outside plant cable to 15 m (50 ft), while 820.93 requires that the outer conductive shield of the coaxial cable be grounded at the building premises as close to the point of cable entrance or attachment as practicable. Therefore the outside plant coaxial cable may not be permitted to extend 15 m (50 ft) into the building if it is practicable to ground the outer conductive shield closer than 15 m (50 ft) to the entrance point.

FPN No. 2: See 820.2 for the definition of Point of Entrance.

820.113 Installation of Coaxial Cables. Coaxial cables installed in buildings shall be listed.

Exception: As permitted in 820.48.

820.179 Coaxial Cables. Coaxial cables shall be listed in accordance with 820.179(A) through 820.179(D) and marked in accordance with Table 820.179. The cable voltage rating shall not be marked on the cable.

FPN: Voltage markings on cables could be misinterpreted to suggest that the cables may be suitable for Class 1, electric light, and power applications.

Exception: Voltage markings shall be permitted where the cable has multiple listings and voltage marking is required for one or more of the listings."
Panel Statement: The panel accepts the direction of the TCC to reconsider and correlate with the action on Proposal 16-284.

The panel also correlated the text with Proposal 16-319 renumbering.

Section 820.113 has been revised to establish parallelism with 770.113.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-244 Log #2286 NEC-P16 **Final Action: Hold**
(820.113 and 820.179)

TCC Action: The Technical Correlating Committee understands that the panel action was to Hold the Comment only.
Submitter: James Daly, Upper Saddle River, NJ
Comment on Proposal No: 16-309
Recommendation: The Panel action should have been to Accept in Part by not accepting the FPN to 820.179.
Substantiation: The FPN is not necessary since the reason for not marking the voltage rating on the cable is obvious. There are numerous other instances in the Code where similar requirements to the last sentence in 820.179 are included and there are no explanatory FPNs included with them.
Panel Meeting Action: Hold
Panel Statement: Proposal 16-309 is an editorial proposal that relocated the cable marking requirements from 820.113 to 820.179. The FPN is not new text; it is relocated text. Deleting it would be a concept that has not had public review.

The proposed revision(s) constitutes new material that had not had the benefit of public review and cannot be considered at this stage of the code-making cycle. Refer to 4.4.6.2.2 of the Regulations Governing Committee Projects.

See panel action and statement on Comment 16-26.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-245 Log #1958 NEC-P16 **Final Action: Reject**
(820.133(A)(1)(2) Exception No.1)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 16-315
Recommendation: Accept the proposal as submitted.
Substantiation: The submitter is well aware of the differences between circuit separation as covered in this location and as covered for adjacent snap switches. However, the CMP 9 approach will accommodate CMP 16's requirements without disadvantaging one segment of the market. By using the term "identified" as the standard of product acceptance (See Article 100), you can have a plastic divider in a plastic box (both will be listed because nonmetallic boxes must be listed); or you have a steel divider in a steel box (the box will likely be listed but doesn't have to be and the divider probably

won't be listed.) The CMP 16 conclusion that this wording would allow a barrier to be installed such that it would void a box listing is untrue. The identification requirement means that the partitions will be covered on factory cut sheets, etc. describing the boxes for which they were designed. You will not find a divider that will meet this standard and be unsuitable for this application. And, in the case of nonmetallic boxes, all identified products will also be listed, so any improper barrier would provoke a citation under 110.3(B). In the case of steel boxes, the barriers will probably not be listed, but the anchoring methods are obvious to any installer and inspector, and they can easily be made secure for obvious reasons. The submitter has been an electrician for a long time, and has never encountered any problems securely installing steel dividers into the boxes for which they are identified.

Panel Meeting Action: Reject

Panel Statement: The listing of dividers is important given current trends and wiring methods.

"Identified" is not the same as "listed" which means that some sort of evaluation for suitability of the divider and its installation has been performed. Mounting, compatibility, material type and thickness, maintenance of spacings, etc. are all items of concern that a listing would address.

In recent years there has been a flood of devices and configurations utilizing standard outlet box dimensions and configurations for mix and matching of ac outlets, Ethernet, CATV and telecom connectors and receptacles. There is great concern regarding the separation of circuits, "storage" of excess cabling, routing of cables through or within the box, lack of expertise related to the installation of non-power cabling, and the like.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-246 Log #197 NEC-P16 **Final Action: Accept (820.154)**

Submitter: Technical Correlating Committee on National Electrical Code

Comment on Proposal No: 16-322

Recommendation: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the panel as a public comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

Panel Statement: The panel has considered the comments expressed in the voting as directed by the TCC.

The panel action on Proposal 16-322 should have read, "The panel accepts the submitter's deletion in subsection (B) and (D)."

Number Eligible to Vote: 15

Comment on Proposal No: 16-321

Recommendation: Accept proposal to delete Fine Print Note

~~FPN: See 8.14.1 of NFPA 13 (2002), Installation of Sprinkler Systems, for requirements for sprinklers in concealed spaces containing exposed combustibles.~~

Substantiation: The Standards Council issued two decisions, NFPA Standards Council Decision 06-03 (SC #06-3-18) dated 22 March 2006 and NFPA Standards Council Decision 06-19 (SC #06-7-33) dated 28 July 2006. These decisions address Code Making Panel (CMP) decisions on Fine Print Notes referencing NFPA 13. The former (earlier) decision states, in pertinent part: "Mr. Dollard asks for clarification whether the Standards Council directive prohibits the NEC project from deleting the Fine Print Notes to sections 770.154, 800.154 & 820.154. The Council, after due consideration, believes that clarification is appropriate in this instance and responds that the NEC project would not violate the directive by deleting the fine print notes at issue." The later decision states, in pertinent part, as follows: "if the fine print notes are not a helpful reference to NFPA 13 or engender confusion, the NEC Project should have the ability to delete them and nothing in the Council's status quo directive prohibits this." The decision also states: "It has also been pointed out that deletion of the fine print notes would provide further consistency within the NEC itself since, currently, the fine print notes at issue only appear in some relevant NEC Articles (Articles 770, 800, and 820), but not in others (Articles 725 and 760)." The decision also states: "nothing in NFPA procedures prevents the NEC Project from considering and acting on deletion of the fine print notes during the Comment phase of the code development process. Proposals to the fine print notes were filed and rejected by the responsible CMP based on its then understanding of the Council's directive. The subject was explicitly raised during the Report on Proposals phase of the process and is clearly open for further consideration and action during the Comment phase."

This FPN is being misinterpret and used in aggressive marketing attempts to require the installation of "limited combustible cable" (one such example is found at http://www.dupont.com/cablingsolutions/products/codes.html). The FPN has had a profound effect in which it is used in misleading the AHJ to require limited combustible cable, conduit, or a sprinkler system to be installed within the concealed space.

As an example, an AHJ Massachusetts would not provide a certificate of occupancy until the communications cabling was either replaced with limited combustible cable, the CMP cable was placed in conduit, or a sprinkler system installed above the suspended ceiling.. Although the installer had met the requirements of the NEC, the FPN misled the AHJ causing project delays and the potential of inordinate cost to the project. A plea to the NFPA aided the communications installer in which clarification was given that the CMP cabling was indeed sufficient to meet code and that NFPA 13 allowed some quantities (which is not defined) of communications cabling within concealed spaces. The installation of the CMP cable was allowed.

To further the removal of this FPN, the Report on Proposals A2006 from NFPA 13 (copy provided), the NFPA committee specifically added an annex

A.8.14.1.2.1 in 13-284 log #551 stating that, "Some minor quantities of combustible materials, such as communication wiring, can be present in some concealed spaces but should not typically be viewed as requiring sprinklers (see 8.14.1.1). The threshold value at which sprinklers become necessary in the concealed space is not defined. For example, the usual amounts of data or telephone wiring found above a ceiling would not typically constitute a threat. If bundles of unsheathed computer wiring are installed above the ceiling or beneath the floor in a manner where fire propagation in all directions is likely, then the concealed space should be treated the same as a combustible space, thereby requiring appropriate sprinkler protection."

In addition to the above, Panel 3 rejected the last minute introduction of this proposal that was made in the ROC stage. BICSI, which represents 24,000 installers, designers and manufacturers, feels that this last minute interjection of a FPN was not sufficiently vetted to industry and that the TCC should review this matter.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The FPN continues to provide useful guidance. Possibilities of misinterpretation are minimized in the 2007 Edition of NFPA 13.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 12 Negative: 3

Explanation of Negative:

JENSEN, R.: This FPN, as informative text to the NEC, is being used to market limited combustible cable. The NEC should not be used for this purpose. The FPN has had a profound effect in which it is used in misleading the AHJ, designers and installers to require limited combustible cable, conduit, or a sprinkler system to be installed within the concealed space.

In addition to the above, Panel 3 where there is not a marketing influence, rejected the inclusion of this FPN in Article 725. Cables used in 725 and 820 are interchangeable in many applications, yet there is no correlation of such a FPN.

JOHNSON, S.: See my explanation of negative vote on Comment 16-50.

OHDE, H.: This comment should have been accepted as this FPN does not provide useful guidance as indicated in the Panel Statement. This FPN which references 8.14.1 of NFPA 13 (2002) Installation of Sprinkler Systems has shown to be problematic and therefore should be deleted as allowed per Standards Council Decision D#06-03. If the FPN were to be deleted this would in effect restore the NEC to the 2002 edition.

The panel statement also included that the 2007 Edition of NFPA 13 would automatically eliminate the possibilities of misinterpretation. There was no opportunity for CMP 16 or the public to review the new proposed edition to see if this would eliminate the possibilities of misinterpretation. The 2007 edition of NFPA 13 also could be in violation of Standards Council Decision D#05-24 to remain status quo on these issues.

16-251 Log #2057 NEC-P16 **Final Action: Accept**
(820.154)

Submitter: Harold C. Ohde, IBEW #134

Comment on Proposal No: 16-320

Recommendation: Continue to Reject.

Substantiation: The submitter's recommendation to create a new cable designation (CATV50) is nothing more than a marketing ploy. A backdoor approach you might say to get NFPA 255 and NFPA 259 cables in the cable hierarchy. The submitter's substantiation would have misled the designer, installer and code officials to believe, install and enforce that limited combustible cable, conduit or a sprinkler system to be installed in the concealed space or plenums would be a requirement because of NFPA 13, Section 8.14.1. The submitter's substantiation references 2002 NFPA 13 Section 8.14.1. It is important to note that the NEC does not have a definition of "concealed spaces", therefore making it impossible to enforce. What constitutes a concealed space? Is it the space above a dropped ceiling; or is it a space above plastered or drywall ceiling? Is it the wall cavity of typical wall construction?

NFPA 13 just completed their revision process for the 2006 NFPA 13 Standard. 8.14.1 of NFPA 13 has been revised to read as follows:

8.14.1.2 Concealed Spaces not Requiring Sprinkler Protection.

8.14.1.2.1* Concealed spaces of noncombustible and limited combustible construction with minimal combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those as a return air for a plenum. (For additional information on combustible loading see A.8.14.1.2.1).

8.14.1.2.2 Concealed spaces of noncombustible and limited combustible construction with limited access and not permitting occupancy or storage of combustible shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.

A.8.14.1.2.1 Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc...can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1). For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined.

In the 2006 NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.

CMP 16 rejected this proposal based on the Standards Council decision D#05-24 to remain "status quo" on issues that pertain to NFPA 90A.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-252 Log #2287 NEC-P16 **Final Action: Accept**
(820.154, 820.179)

Submitter: James Daly, Upper Saddle River, NJ

Comment on Proposal No: 16-324

Recommendation: The Panel action should continue to be Reject.

Substantiation: The proposed FPNs to 820.179(A) and (B) do not comply with the NEC Style Manual.

3.1.3 of the NEC Style Manual stipulates that "Fine print notes contain explanatory information. They shall not contain requirements and shall not be written in mandatory language."

The Proposal as submitted defines the damage and specifies performance requirements in the FPNs.

Panel Meeting Action: Accept

Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air-handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"So as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-253 Log #749 NEC-P16 **Final Action: Reject**
(820.154, FPN)

Submitter: James T. Dollard, Jr., IBEW Local 98

Comment on Proposal No: 16-321

Recommendation: This proposal should be Accepted.

Substantiation: The submitter of this proposal to delete the Fine Print Note referencing NFPA 13 is correct in his substantiation. However, CMP-16 rejected this proposal on the basis of the directive from Standards Council D#05-24, to remain "status quo" on issues with respect to NFPA 90A. The Standards Council has recently decided that the Fine Print Notes under the purview of CMP-16 which reference NFPA 13 may be deleted, and such deletion is not in conflict with the Standards Council directive. This final Standards Council decision is titled D#06-03 and is included for your review. It is important to note that, **Standards Council clearly recognizes the 2002 edition of the NEC, in which these Fine Print Notes were not included, as the status quo.**

An appeal was made by Mr. A. Weidman in an attempt to overturn the previous decision by Standards Council to allow CMP-16 to delete the Fine Print Notes referencing NFPA 13. The appeal was soundly denied by Standards Council. The final decision, D#06-19 is also included for your review. It is extremely interesting to note that the last sentence of the decision by Standards Council provides directions for CMP-16 as follows:

"<u>If the fine print notes are in any way problematic, they should now be deleted, restoring the NEC in this regard to the status quo on plenum cable issues represented by the 2002 edition of the NEC.</u>"

These Fine Print Notes are problematic. Following the advice of Standards Council, they should be deleted. These Fine Print Notes exist solely to manipulate, misinform and threaten end users of the NEC. The proponents of flouropolymer products have developed an elaborate, financially driven scheme outlined as follows:

(1) Develop an Association (CFRA), funded by manufacturers, to coordinate and orchestrate unethical marketing plans by manipulation NFPA codes and standards

(2) Place consultants, hired to push flouropolymer interests, on CMP-3 and CMP-16 under the cloak of other organizations

(3) Promote Fine Print Notes referencing NFPA 13 in the NEC

(4) Use the Fine Print Notes to develop deceiving literature and presentations to manipulate the NFPA family of codes and standards to promote products which are not required

(5) Misinform and manipulate building code officials with a propaganda campaign based on Fine Print Notes in the NEC which reference NFPA 13

(6) Label this deceptive literature, designed for building officials, as "Field Guides" and " Inspection Checklists" (See an example field guide that I have submitted)

(7) Provide instructions for building officials to threaten and harass building owners to use the proponents products

In summary, the proponents of retaining these Fine Print Notes are engaged in an effort to misrepresent and manipulate the NFPA Family of Codes and Standards for their own financial gain. Provided for your review is just one many "Field Guides" supplied by the Cable Fire Research Association to Building Officials across the United States. As you read this "field guide" take note of the serious manipulation and misrepresentation of the NEC and NFPA 13, designed specifically to sell products in which the proponents have financial interests.

The efforts of this same group to manipulate the NFPA family of codes and standards in NFPA 90A led to the "return to committee" of the entire document. The NFPA 13 committee has taken serious steps to stop this runaway propaganda campaign by adding informational text explaining ***that usual amounts of cabling do not represent a problem***. This is referenced in the original proposal to delete the Fine Print Note.

CMP-16 has been lied to by the proponents of these Fine Print Notes referencing NFPA 13. The only reason they exist is to fuel a financially driven propaganda campaign. Retaining these Fine Print Note will lead to continued deception, misrepresentation and manipulation which will lead to the lack of adoption of the NEC.

Note: Supporting material is available for review at NFPA Headquarters.

Comment on Proposal No: 16-331
Recommendation: This proposal should be Accepted.
Substantiation: The submitter of this proposal to delete the Fine Print Note referencing NFPA 13 is correct in his substantiation. However, CMP-16 rejected this proposal on the basis of the directive from Standards Council D#05-24, to remain "status quo" on issues with respect to NFPA 90A. The Standards Council has recently decided that the Fine Print Notes under the purview of CMP-16 which reference NFPA 13 may be deleted, and such deletion is not in conflict with the Standards Council directive. This final Standards Council decision is titled D#06-03 and is included for your review. It is important to note that, **Standards Council clearly recognizes the 2002 edition of the NEC, in which these Fine Print Notes were not included, as the status quo.**
An appeal was made by Mr. A. Weidman in an attempt to overturn the previous decision by Standards Council to allow CMP-16 to delete the Fine Print Notes referencing NFPA 13. The appeal was soundly denied by Standards Council. The final decision, D#06-19 is also included for your review. It is extremely interesting to note that the last sentence of the decision by Standards Council provides directions for CMP-16 as follows:
"If the fine print notes are in any way problematic, they should now be deleted, restoring the NEC in this regard to the status quo on plenum cable issues represented by the 2002 edition of the NEC."

These Fine Print Notes are problematic. Following the advice of Standards Council, they should be deleted. These Fine Print Notes exist solely to manipulate, misinform and threaten end users of the NEC. The proponents of flouropolymer products have developed an elaborate, financially driven scheme outlined as follows:

(1) Develop an Association (CFRA), funded by manufacturers, to coordinate and orchestrate unethical marketing plans by manipulation NFPA codes and standards

(2) Place consultants, hired to push flouropolymer interests, on CMP-3 and CMP-16 under the cloak of other organizations

(3) Promote Fine Print Notes referencing NFPA 13 in the NEC

(4) Use the Fine Print Notes to develop deceiving literature and presentations to manipulate the NFPA family of codes and standards to promote products which are not required

(5) Misinform and manipulate building code officials with a propaganda campaign based on Fine Print Notes in the NEC which reference NFPA 13

(6) Label this deceptive literature, designed for building officials, as "Field Guides" and " Inspection Checklists" (See an example field guide that I have submitted)

(7) Provide instructions for building officials to threaten and harass building owners to use the proponents products

In summary, the proponents of retaining these Fine Print Notes are engaged in an effort to misrepresent and manipulate the NFPA Family of Codes and Standards for their own financial gain. Provided for your review is just one many "Field Guides" supplied by the Cable Fire Research Association to Building Officials across the United States. As you read this "field guide" take note of the serious manipulation and misrepresentation of the NEC and NFPA 13, designed specifically to sell products in which the proponents have financial interests.

The efforts of this same group to manipulate the NFPA family of codes and standards in NFPA 90A led to the "return to committee" of the entire document. The NFPA 13 committee has taken serious steps to stop this runaway propaganda campaign by adding informational text explaining ***that usual amounts of cabling do not represent a problem***. This is referenced in the original proposal to delete the Fine Print Note.

CMP-16 has been lied to by the proponents of these Fine Print Notes referencing NFPA 13. The only reason they exist is to fuel a financially driven propaganda campaign. Retaining these Fine Print Note will lead to continued deception, misrepresentation and manipulation which will lead to the lack of adoption of the NEC.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The FPN continues to provide useful guidance. Possibilities of misinterpretation are minimized in the 2007 Edition of NFPA 13.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 12 Negative: 3

Explanation of Negative:

JENSEN, R.: This FPN, as informative text to the NEC, is being used to market limited combustible cable. The NEC should not be used for this purpose. The FPN has had a profound effect in which it is used in misleading the AHJ, designers and installers to require limited combustible cable, conduit, or a sprinkler system to be installed within the concealed space.

In addition to the above, Panel 3 where there is not a marketing influence, rejected the inclusion of this FPN in Article 725. Cables used in 725 and 820 are interchangeable in many applications, yet there is no correlation of such a FPN.

JOHNSON, S.: See my explanation of negative vote on Comment 16-50.

OHDE, H.: See my Explanation of Negative for Comment 16-250.

16-256 Log #752 NEC-P16 **Final Action: Reject**

16-257 Log #1593 NEC-P16 **Final Action: Reject**
(820.154, FPN)

Submitter: Harold C. Ohde, IBEW-NECA Technical Institute
Comment on Proposal No: 16-321
Recommendation: This proposal should be accepted.
Substantiation: This FPN should be deleted as the submitter proposed. In the submitter's substantiation he states that this FPN has misled the AHJ to believe and enforce limited combustible cable, conduit or a sprinkler system to be installed in the concealed space or plenums. It is important to note that the NEC does not have a definition of "concealed spaces", therefore, making it impossible to enforce. What constitutes a concealed space? Is it the space above a dropped ceiling; or is it a space above plastered or drywall ceiling? Is it the wall cavity of typical wall construction?

NFPA 13 just completed their revision process for the 2006 NFPA 13 Standard. 8.14.1 of NFPA 13 has been revised to read as follows:

8.14.1.2 Concealed Spaces not Requiring Sprinkler Protection.

8.14.1.2.1* Concealed spaces of noncombustible and limited combustible

construction with minimal combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those as a return air for a plenum. (For additional information on combustible loading see A.8.14.1.2.1)

8.14.1.2.2 Concealed spaces of noncombustible and limited combustible construction with limited access and not permitting occupancy or storage of combustible shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.

A.8.14.1.2.1 Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc...can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1). For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined.

In the 2006 NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.

CMP 16 rejected this proposal based on the Standards Council decision D#05-24 to remain "status quo" on issues that pertain to NFPA 90A. Standards Council recently issued another decision (D#06-03) which decided that this FPN may be deleted and this deletion will not be in conflict with the Standards Council decision (D#05-24). Standards Council recognizes the 2002 edition of the NEC as being status quo. This FPN referencing NFPA 13 was added to the 2005 NEC, therefore, it can and should be deleted.

Panel Meeting Action: Reject

Panel Statement: The FPN continues to provide useful guidance. Possibilities of misinterpretation are minimized in the 2007 Edition of NFPA 13.

(820.154(A))

Submitter: Robert W. Jensen, dbi
Comment on Proposal No: 16-332
Recommendation: Accept proposal to delete Fine Print Note

~~FPN: See 8.14.1 of NFPA 13 (2002), Installation of Sprinkler Systems, for requirements for sprinklers in concealed spaces containing exposed combustibles.~~

Substantiation: The Standards Council issued two decisions, NFPA Standards Council Decision 06-03 (SC #06-3-18) dated 22 March 2006 and NFPA Standards Council Decision 06-19 (SC #06-7-33) dated 28 July 2006. These decisions address Code Making Panel (CMP) decisions on Fine Print Notes referencing NFPA 13. The former (earlier) decision states, in pertinent part: "Mr. Dollard asks for clarification whether the Standards Council directive prohibits the NEC project from deleting the Fine Print Notes to sections 770.154, 800.154 & 820.154. The Council, after due consideration, believes that clarification is appropriate in this instance and responds that the NEC project would not violate the directive by deleting the fine print notes at issue." The later decision states, in pertinent part, as follows: "if the fine print notes are not a helpful reference to NFPA 13 or engender confusion, the NEC Project should have the ability to delete them and nothing in the Council's status quo directive prohibits this." The decision also states: "It has also been pointed out that deletion of the fine print notes would provide further consistency within the NEC itself since, currently, the fine print notes at issue only appear in some relevant NEC Articles (Articles 770, 800, and 820), but not in others (Articles 725 and 760)." The decision also states: "nothing in NFPA procedures prevents the NEC Project from considering and acting on deletion of the fine print notes during the Comment phase of the code development process. Proposals to the fine print notes were filed and rejected by the responsible CMP based on its then understanding of the Council's directive. The subject was explicitly raised during the Report on Proposals phase of the process and is clearly open for further consideration and action during the Comment phase."

This FPN is being misinterpret and used in aggressive marketing attempts to require the installation of "limited combustible cable" (one such example is found at http://www.dupont.com/cablingsolutions/products/codes.html). The FPN has had a profound effect in which it is used in misleading the AHJ to require limited combustible cable, conduit, or a sprinkler system to be installed within the concealed space.

As an example, an AHJ Massachusetts would not provide a certificate of occupancy until the communications cabling was either replaced with limited combustible cable, the CMP cable was placed in conduit, or a sprinkler system installed above the suspended ceiling.. Although the installer had met the requirements of the NEC, the FPN misled the AHJ causing project delays and the potential of inordinate cost to the project. A plea to the NFPA aided the communications installer in which clarification was given that the CMP cabling was indeed sufficient to meet code and that NFPA 13 allowed some quantities (which is not defined) of communications cabling within concealed spaces. The installation of the CMP cable was allowed.

To further the removal of this FPN, the Report on Proposals A2006 from NFPA 13 (copy provided), the NFPA committee specifically added an annex A.8.14.1.2.1 in 13-284 log #551 stating that, "Some minor quantities of combustible materials, such as communication wiring, can be present in some concealed spaces but should not typically be viewed as requiring sprinklers (see 8.14.1.1). The threshold value at which sprinklers become necessary in the concealed space is not defined. For example, the usual amounts of data or telephone wiring found above a ceiling would not typically constitute a threat. If bundles of unsheathed computer wiring are installed above the ceiling or beneath the floor in a manner where fire propagation in all directions is likely, then the concealed space should be treated the same as a combustible space, thereby requiring appropriate sprinkler protection."

In addition to the above, Panel 3 rejected the last minute introduction of this proposal that was made in the ROC stage. BICSI, which represents 24,000 installers, designers and manufacturers, feels that this last minute interjection of a FPN was not sufficiently vetted to industry and that the TCC should review this matter.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject
Panel Statement: The FPN continues to provide useful guidance. Possibilities of misinterpretation are minimized in the 2007 Edition of NFPA 13.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 12 Negative: 3
Explanation of Negative:

JENSEN, R.: This FPN, as informative text to the NEC, is being used to market limited combustible cable. The NEC should not be used for this purpose. The FPN has had a profound effect in which it is used in misleading the AHJ, designers and installers to require limited combustible cable, conduit, or a sprinkler system to be installed within the concealed space.

In addition to the above, Panel 3 where there is not a marketing influence, rejected the inclusion of this FPN in Article 725. Cables used in 725 and 800 are interchangeable in many applications, yet there is no correlation of such a FPN.

JOHNSON, S.: See my explanation of negative vote on Comment 16-50.

OHDE, H.: See my Explanation of Negative for Comment 16-250.

16-263 Log #1794 NEC-P16 **Final Action: Reject**
(820.154(A))

Submitter: Robert W. Jensen, dbi
Comment on Proposal No: 16-331
Recommendation: Accept proposal to delete Fine Print Note__
~~FPN: See 8.14.1 of NFPA 13 (2002), Installation of Sprinkler Systems, for requirements for sprinklers in concealed spaces containing exposed combustibles.~~
Substantiation: The Standards Council issued two decisions, NFPA Standards Council Decision 06-03 (SC #06-3-18) dated 22 March 2006 and NFPA Standards Council Decision 06-19 (SC #06-7-33) dated 28 July 2006. These decisions address Code Making Panel (CMP) decisions on Fine Print Notes referencing NFPA 13. The former (earlier) decision states, in pertinent part: "Mr. Dollard asks for clarification whether the Standards Council directive prohibits the NEC project from deleting the Fine Print Notes to sections 770.154, 800.154 & 820.154. The Council, after due consideration, believes that clarification is appropriate in this instance and responds that the NEC project would not violate the directive by deleting the fine print notes at issue." The later decision states, in pertinent part, as follows: "if the fine print notes are not a helpful reference to NFPA 13 or engender confusion, the NEC Project should have the ability to delete them and nothing in the Council's status quo directive prohibits this." The decision also states: "It has also been pointed out that deletion of the fine print notes would provide further consistency within the NEC itself since, currently, the fine print notes at issue only appear in some relevant NEC Articles (Articles 770, 800, and 820), but not in others (Articles 725 and 760)." The decision also states: "nothing in NFPA procedures prevents the NEC Project from considering and acting on deletion of the fine print notes during the Comment phase of the code development process. Proposals to the fine print notes were filed and rejected by the responsible CMP based on its then understanding of the Council's directive. The subject was explicitly raised during the Report on Proposals phase of the process and is clearly open for further consideration and action during the Comment phase."

This FPN is being misinterpret and used in aggressive marketing attempts to require the installation of "limited combustible cable" (one such example is found at http://www.dupont.com/cablingsolutions/products/codes.html). The FPN has had a profound effect in which it is used in misleading the AHJ to require limited combustible cable, conduit, or a sprinkler system to be installed within the concealed space.
As an example, an AHJ Massachusetts would not provide a certificate of occupancy until the communications cabling was either replaced with limited combustible cable, the CMP cable was placed in conduit, or a sprinkler system installed above the suspended ceiling.. Although the installer had met the requirements of the NEC, the FPN misled the AHJ causing project delays and the potential of inordinate cost to the project. A plea to the NFPA aided the communications installer in which clarification was given that the CMP cabling was indeed sufficient to meet code and that NFPA 13 allowed some quantities (which is not defined) of communications cabling within concealed spaces. The installation of the CMP cable was allowed.
To further the removal of this FPN, the Report on Proposals A2006 from NFPA 13 (copy provided), the NFPA committee specifically added an annex A.8.14.1.2.1 in 13-284 log #551 stating that, "Some minor quantities of combustible materials, such as communication wiring, can be present in some concealed spaces but should not typically be viewed as requiring sprinklers (see 8.14.1.1). The threshold value at which sprinklers become necessary in the concealed space is not defined. For example, the usual amounts of data or telephone wiring found above a ceiling would not typically constitute a threat. If bundles of unsheathed computer wiring are installed above the ceiling or beneath the floor in a manner where fire propagation in all directions is likely, then the concealed space should be treated the same as a combustible space, thereby requiring appropriate sprinkler protection."
In addition to the above, Panel 3 rejected the last minute introduction of this proposal that was made in the ROC stage. BICSI, which represents 24,000 installers, designers and manufacturers, feels that this last minute interjection of a FPN was not sufficiently vetted to industry and that the TCC should review this matter.

Note: Supporting material is available for review at NFPA Headquarters.

16-264 Log #662 NEC-P16 **Final Action: Reject**
(820.154(A), FPN)

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Comment on Proposal No: 16-332
Recommendation: Revise text to read as follows:

820.154 Applications of Listed CATV Cables and CATV Raceways. CATV cables shall comply with the requirements of 820.154(A) through 820.154(D) or where cable substitutions are made as shown in Table 820.154.

(A) Plenums. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type CATVP. Abandoned cables shall not be permitted to remain. Types CATVP, CATVR, CATV, and CATVX cables installed in compliance with 300.22 shall be permitted. Listed plenum CATV raceways shall be permitted to be installed in ducts and plenums as described in 300.22(B) and in other spaces used for environmental air as described in 300.22(C). Only Type CATVP cable shall be permitted to be installed in these raceways.
~~FPN: See 8.14.1 of NFPA 13 (2002), Installation of Sprinkler Systems, for requirements for sprinklers in concealed spaces containing exposed combustibles.~~
Substantiation: This is one of three references to NFPA 13 (it is repeated identically in articles 770, 800 and 820) included in the code that is a meaningless reference. Other references to NFPA 13, in Article 362, are properly included in mandatory sections of the code (section 362.10). Whenever a jurisdiction adopts NFPA 13 they need to adopt it for mandatory sections and not for an unenforceable FPN in one section, which is intended to mislead the user. In fact, NFPA 13 does not require that sprinklers be installed in plenums of "noncombustible or limited combustible construction", even if "the usual amount of cabling" is present. In fact, there have been several documented examples already of misrepresentation in that authorities having jurisdiction have been told that this means that sprinklers are required in plenum areas unless "limited combustible cable" is installed. I have been personally involved in several cases, and have heard of many more cases where this is being stated.

Section 8.14.1 of NFPA 13 (2006) reads as follows:

8.14.1.2 Concealed Spaces Not Requiring Sprinkler Protection.

8.14.1.2.1* Concealed spaces of noncombustible and limited combustible construction with minimal combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum. (For

additional information on combustible loading see A.8.14.1.2.1)

8.14.1.2.2 Concealed spaces of noncombustible and limited combustible construction with limited access and not permitting occupancy or storage of combustibles shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.

A.8.14.1.2.1 Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc. can be present in concealed spaces constructed of limited or noncombustible materials but should not typically be viewed as requiring sprinklers (see 8.14.1.1). For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined.

The same change is being proposed to the corresponding Fine Print Notes in articles 770 and 800, all of which deal with the same type of cables.

The committee rejected the proposal based on, and I quote: "NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"[S]o as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

However, Standards Council has since issued two new decisions, NFPA Standards Council Decision 06-03 (SC #06-3-18) dated 22 March 2006 and NFPA Standards Council Decision 06-19 (SC #06-7-33) dated 28 July 2006. These decisions address CMP decisions on Fine Print Notes referencing NFPA 13. The former (earlier) decision states, in pertinent part: "Mr. Dollard asks for clarification whether the Standards Council directive prohibits the NEC project from deleting the Fine Print Notes to sections 770.154, 800.154 & 820.154. The Council, after due consideration, believes that clarification is appropriate in this instance and responds that the NEC project would not violate the directive by deleting the fine print notes at issue." The later decision states, in pertinent part, as follows: "if the fine print notes are not a helpful reference to NFPA 13 or engender confusion, the NEC Project should have the ability to delete them and nothing in the Council's status quo directive prohibits this." The decision also states: "It has also been pointed out that deletion of the fine print notes would provide further consistency within the NEC itself since, currently, the fine print notes at issue only appear in some relevant NEC Articles (Articles 770, 800, and 820), but not in others (Articles 725 and 760)." The decision also states: "nothing in NFPA procedures prevents the NEC Project from considering and acting on deletion of the fine print notes during the Comment phase of the code development process. The question whether the fine print notes should be in the NEC is hardly new. Aside from the fact that their presence was debated in the previous edition cycle, Proposals to remove them were duly filed and rejected by the responsible Code-Making Panel based on its then understanding of the Council's directive. The subject was explicitly raised during the Report on Proposals phase of the process and is, therefore, clearly open for further consideration and action during the Comment phase."

Thus, clearly these Standards Council decisions directly permit the deletion of the Fine Print Note addressed by this comment.

Technically this Fine Print Note needs to be deleted for two reasons:

1. This Fine Print Note is misleading by pointing the reader to NFPA 13 which does not require the use of sprinklers, as both Bob Jensen and Harry Ohde point out in their negative votes and as is shown by the sections of NFPA 13 reproduced above.

2.This Fine Print Note is identical to the ones in 770.154 (A) and in 800.154 (A), both of which are equally misleading. On the other hand there are no Fine Print Notes in articles 725 and 760. Thus, deleting this Fine Print Note will provide further consistency within the NEC.

Panel Meeting Action: Reject

Panel Statement: The FPN continues to provide useful guidance. Possibilities of misinterpretation are minimized in the 2007 Edition of NFPA 13.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 12 Negative: 3

Explanation of Negative:

JENSEN, R.: This FPN, as informative text to the NEC, is being used to market limited combustible cable. The NEC should not be used for this purpose. The FPN has had a profound effect in which it is used in misleading the AHJ, designers and installers to require limited combustible cable, conduit, or a sprinkler system to be installed within the concealed space.

In addition to the above, Panel 3 where there is not a marketing influence, rejected the inclusion of this FPN in Article 725. Cables used in 725 and 820 are interchangeable in many applications, yet there is no correlation of such a FPN.

JOHNSON, S.: See my explanation of negative vote on Comment 16-50.

OHDE, H.: See my Explanation of Negative for Comment 16-250.

16-265 Log #955 NEC-P16 **Final Action: Reject**
(820.154(A), FPN)

Submitter: Donald Hall, Corning Cable Systems

Comment on Proposal No: 16-329

Recommendation: Note: The commenter is also submitting analogous comments to Proposal 16-197 (ROP Log #3097) and Proposal 16-78 (ROP Log #3098) pertaining to FPNs referencing NFPA 13 section 8.14.1. Accept the proposal to delete the FPN, leading to the following:

820.154 Applications of Listed CATV Cables and CATV Raceways.

CATV cables shall comply with the requirements of 820.154(A) through 820.154(D) or where cable substitutions are made as shown in 820.154(F).

(A) Plenums. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type CATVP. Abandoned cables shall not be permitted to remain. Types CATVP, CATVR, CATV, and CATVX cables installed in compliance with 300.22 shall be permitted. Listed plenum CATV raceways shall be permitted to be installed in ducts and plenums as described in 300.22(B) and in other spaces used for environmental air as described in 300.22(C). Only Type CATVP cables shall be permitted to be installed in these raceways.

~~FPN: See 8.14.1 of NFPA 13 (2002), Installations of Sprinkler Systems, for requirements for sprinklers in concealed spaces containing exposed combustibles.~~

Substantiation: The committee rejected this proposal without any consideration of its merits, based on its belief at the time that it fell within the scope of Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005. since that time, however, the Standards Council has issued two new decisions as follows: Decison 06-06 (SC #6-3-18) dated 22 March 2006 states: in petinent part; "The Council, after due consideration, believes that clarification is appropriate in this instance and responds that the NEC Project would not violate the directive by deleting the Fine Print Notes as issue."

Decision 06-19 (SC #06-7-33) dated 28 July 2006 states, in pertinent part:

"If the fine print notes are not a helpful reference to NFPA 13 or engender confusion, the NEC Project should have the ability to delete them and nothing in the Council's status quo directive prohibits this."

And

"It has also been pointed out that deletion of the fine print notes would provide further consistency within the NEC itself since, currently, the fine print notes at issue only appear in some relevant NEC Articles (Articles 770, 800 and 820), but not in others (Articles 725 and 760)."

And

"Nothing in NFPA procedures prevents the NEC Project from considering and acting on deletion of the fine print notes during the comment phase of the code development process."

And

"If the fine print notes are in any way problematic, they should now be deleted, restoring the NEC in this regard to the status quo on plenum cable issues represented by the 2002 edition of the NEC".

In view of the above decisions, the commenter requests that the proposal be considered on its merits as stated in the original proposal substantiation and as further substantiated below.

Since the original proposal was submitted, the following Annex Note was added to the 2007 Edition of NFPA 13:

A.8.14.1.2.1 Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic pluming piping, nonstructural wood, etc. can be present in concealed spaces constructed of limited or noncombustible materials but should not typically be viewed as requiring sprinklers (see 8.14.1.1. for example, it is not the intent of this section to require sprinklers which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined.

Additionally, the standard approach of the NEC is to require the use of listed products which are tested and approved by a Nationally Recognized Test Laboratory (NRTL) as being suitable for use in a particular application. Normal fire hazards associated with an application space and the application of wiring products installed within them are duly anticipated during the establishment of listing criteria for these products. Air handling spaces are no different from any other space in this regard. The inclusion and particular placement of this FPN is suggestive of the idea that the NEC or the NRTLs has failed to adequately recognize the hazards associated with these spaces. The safety record of plenum cables within air handling spaces has been debated extensively and is open to continued debate within the NFPA Code making process, but the FPN in question should not be used as a maens to short circuit this process and lead users around the code. When properly understood, the FPNs of 770.154(A), 800.154(A), and 820.154(A) lead to a dead end. When not properly understood, they lead to an unnecessary encumbrance upon the use of listed products installed in accordance with approved NEC wiring methods.

16-266 Log #1595 NEC-P16 **Final Action: Reject**
(820.154(A), FPN)

Submitter: Harold C. Ohde, IBEW-NECA Technical Institute
Comment on Proposal No: 16-331
Recommendation: This proposal should be accepted.
Substantiation: This FPN should be deleted as the submitter proposed. In the submitter's substantiation he states that this FPN has misled the AHJ to believe and enforce limited combustible cable, conduit or a sprinkler system to be installed in the concealed space or plenums. It is important to note that the NEC does not have a definition of "concealed spaces", therefore, the confusion. What constitutes a concealed space? Is it the space above a dropped ceiling; or is it a space above plastered or drywall ceiling? Is it the wall cavity of typical wall construction?

NFPA 13 just completed their revision process for the 2006 NFPA 13 Standard. 8.14.1 of NFPA 13 has been revised to read as follows:

8.14.1.2 Concealed Spaces not Requiring Sprinkler Protection.

8.14.1.2.1* Concealed spaces of noncombustible and limited combustible construction with minimal combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those as a return air for a plenum. (For additional information on combustible loading see A.8.14.1.2.1)

8.14.1.2.2 Concealed spaces of noncombustible and limited combustible construction with limited access and not permitting occupancy or storage of combustible shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.

A.8.14.1.2.1 Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc...can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1). For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined.

In the 2006 NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.

CMP 16 rejected this proposal based on the Standards Council decision D#05-24 to remain "status quo" on issues that pertain to NFPA 90A. Standards Council recently issued another decision (D#06-03) which decided that this FPN may be deleted and this deletion will not be in conflict with the Standards Council decision (D#05-24). Standards Council recognizes the 2002 edition of the NEC as being status quo. This FPN referencing NFPA 13 was added to the 2005 NEC, therefore, it can and should be deleted.
Panel Meeting Action: Reject

Ballot Results: Affirmative: 15

16-268 Log #1464 NEC-P16 **Final Action: Reject**
(820.154(E) (New))

Submitter: Sanford Egesdal, Egesdal Associates PLC
Comment on Proposal No: 16-320
Recommendation: Reconsider proposal 16-320 and revise 820.154 as shown below.
(E) CATV Fire Hazard (FHC) Cable. CATV Fire hazard (FHC) cable shall be permitted for use in communications systems as other wiring within buildings in accordance with 820.154(D) to provide reduced potential heat release.
Substantiation: The application of the Standards Council's decision on NPFA 90A was an error. The proposed marking on the cable did not include a "P" added to CATV. Type CATVP cable is permitted to be installed in plenums.

This comment creates a new section for the fire hazard cable. The new section provides a requirement that clearly identifies that the fire hazard cable is permitted to be installed as "Other Wiring Within Buildings."

To better clarify that the Standards Council's decision on NFPA does not apply and to better clarify where the cable is permitted to be installed, the marking on the cable is changed to Type CATV-FHC. The "FHC" suffix stands for fire hazard cable. There is a companion comment to revise the marking found in my comment to Proposal 16-344.

Some installations require large amounts of cable. A typical application of a fire hazard cable would be above a suspended ceiling or under a raised floor, neither of which is a plenum. The proposed cable has a very low fuel load, as compared to other types of cable insulation. Some cable constructions use one type of insulation on the conductor and another type for the jacket.

The Type CATV-FHC cable suggested for listing and marking in 820.179(E) (comment to proposal 16-244) has parameters (e.g. 3500 BTU/lb) that are standard in the building industry, and useful to system designers and fire protection engineers.

To put cable insulation heat release in perspective, here are relative values:
Fire Hazard Cable insulation: less than 8 MJ/kg (3,500 BTU/lb)
PVC insulation: As high as 25 MJ/kg (11,000 BTU/lb)
Polyolefin insulation: As high as 46 MJ/kg (20,000 BTU/lb)
Panel Meeting Action: Reject
Panel Statement: Cable meeting specifications as described in this comment is not prohibited by the Code, and the panel sees no need for an additional marking.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-269 Log #2060 NEC-P16 **Final Action: Accept**
(820.154(E))

Submitter: Harold C. Ohde, IBEW #134
Comment on Proposal No: 16-337
Recommendation: Continue to Reject.
Substantiation: The submitter's recommendation to create a new cable designation (CATV50) is nothing more than a marketing ploy. A backdoor approach you might say to get NFPA 255 and NFPA 259 cables in the cable hierarchy. The submitter's recommendation to add this FPN to this section is in grave error. This FPN would not provide guidance to designers, installers or code officials. This FPN would have misled the designer, installer and code officials to believe, install and enforce that limited combustible cable, conduit or a sprinkler system to be installed in the concealed space or plenums would be a requirement because of NFPA 13, Section 8.14.1. The submitter's substantiation references 2002 NFPA 13 Section 8.14.1. It is important to note that the NEC does not have a definition of "concealed spaces", therefore making it impossible to enforce. What constitutes a concealed space? Is it the space above a dropped ceiling; or is it a space above plastered or drywall ceiling? Is it the wall cavity of typical wall construction?

NFPA 13 just completed their revision process for the 2006 NFPA 13 Standard. 8.14.1 of NFPA 13 has been revised to read as follows:

8.14.1.2 Concealed Spaces not Requiring Sprinkler Protection.

8.14.1.2.1* Concealed spaces of noncombustible and limited combustible construction with minimal combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those as a return air for a plenum. (For additional information on combustible loading see A.8.14.1.2.1).

8.14.1.2.2 Concealed spaces of noncombustible and limited combustible construction with limited access and not permitting occupancy or storage of combustible shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.

A.8.14.1.2.1 Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc... can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1). For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined.

In the 2006 NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.

CMP 16 rejected this proposal based on the Standards Council decision D#05-24 to remain "status quo" on issues that pertain to NFPA 90A.

TCC Action: The Technical Correlating Committee understands that the panel action was to Hold the Comment only.
Submitter: James Daly, Upper Saddle River, NJ
Comment on Proposal No: 16-340
Recommendation: The Panel Action should have been to Accept in Principle and reword the FPN as shown:

FPN: One method of determining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is ~~that the raceways pass the requirements of the test for Flame Propagation (riser) in~~ ANSI/UL 1666-2002, *Standard Test for Flame Propagation Height of Electrical and Optical-Fiber Cable Installed Vertically in Shafts.*

Substantiation: 3.1.3 of the NEC Style Manual stipulates that "Fine print notes contain explanatory information. They shall not contain requirements and shall not be written in mandatory language."

The FPN defines the damage and specifies performance requirements.

Panel Meeting Action: Hold
Panel Statement: The proposal was editorial, seeking no changes to the fine print note. A technical change in the fine print note would be new material that has not had public review.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-272 Log #2290 NEC-P16 **Final Action: Hold**
(820.179(C))

TCC Action: The Technical Correlating Committee understands that the panel action was to Hold the Comment only.
Submitter: James Daly, Upper Saddle River, NJ
Comment on Proposal No: 16-341
Recommendation: The Panel Action should have been to Accept in Principle and reword the FPN to read:

FPN: One method of determining that the cable is resistant to the spread of fire is the UL Flame Exposure, Vertical Tray Flame Test in UL1685-2000 *Standard for Safety for Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables.*

Another method of determining that the cable is resistant to the spread of fire is the "Vertical Flame Test - Cables in Cable Trays," in CSA C22.2 No. 0.3-M-2001, *Test Methods for Electrical Wires and Cables.*

Substantiation: 3.1.3 of the NEC Style Manual stipulates that "Fine print notes contain explanatory information. They shall not contain requirements and shall not be written in mandatory language."

The Proposal as submitted defines the damage and specifies performance requirements.

The number, title, and the date of the latest edition of the UL standard were corrected to reflect the current applicable standard. The reference in the CSA standard and the date of the CSA standard were also corrected.

Panel Meeting Action: Hold
Panel Statement: The proposal was editorial, seeking no changes to the fine print note. A technical change in the fine print note would be new material that has not had public review.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

(820.179(C), FPN)

TCC Action: The Technical Correlating Committee understands that the panel action was to Hold the Comment only.
Submitter: James Daly, Upper Saddle River, NJ
Comment on Proposal No: 16-342
Recommendation: The Panel Action should have been to Accept in Principle and reword the FPN to read:

FPN: One method of determining that the cable is resistant to the spread of fire is the UL Flame Exposure, Vertical Tray Flame Test in UL1685-2000 *Standard for Safety for Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables.*

Another method of determining that the cable is resistant to the spread of fire is the "Vertical Flame Test - Cables in Cable Trays", in CSA C22.2 No. 0.3-M-2001, *Test Methods for Electrical Wires and Cables*.

Substantiation: 3.1.3 of the NEC Style Manual stipulates that "Fine print notes contain explanatory information. They shall not contain requirements and shall not be written in mandatory language."

The Proposal as submitted defines the damage and specifies performance requirements.

The sentence "The smoke measurements in the test method are not applicable." is mandatory language.

Panel Meeting Action: Hold
Panel Statement: A technical change in the fine print note as proposed in this comment would be new material that has not had public review.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-274 Log #2294 NEC-P16 **Final Action: Hold**
(820.179(D))

TCC Action: The Technical Correlating Committee understands that the panel action was to Hold the Comment only.
Submitter: James Daly, Upper Saddle River, NJ
Comment on Proposal No: 16-343
Recommendation: The Panel Action should have been to Accept in Principle and reword the FPN to read:

FPN: One method of determining that the cable is resistant to flame spread is the VW-1 (vertical-wire) flame test in ANSI/UL 1581-2001, *Reference Standard for Electrical Wires, Cables and Flexible Cords.*

Substantiation: 3.1.3 of the NEC Style Manual stipulates that "Fine print notes contain explanatory information. They shall not contain requirements and shall not be written in mandatory language."

The FPN as submitted in the Proposal includes mandatory language by requiring that the cable be tested to UL 1581. The revised wording provides explanatory information without any requirements.

The date of the latest edition of the UL standard was updated from 1991 to 2001.

Panel Meeting Action: Hold

Panel Statement: The proposal was editorial, seeking no changes to the fine print note. A technical change in the fine print note would be new material that has not had public review.
Number Eligible to Vote: 15

16-275 Log #1465 NEC-P16 **Final Action: Reject**
(820.179(E) (New))

Submitter: Sanford Egesdal, Egesdal Associates PLC
Comment on Proposal No: 16-344
Recommendation: Reconsider proposal 16-344 and revise 820.179 as shown below.
(E) CATV Limited Fire Hazard (-FHC) Cable. Cables used to reduce potential heat release shall be listed as fire hazard (-FHC) cable and shall have a low potential heat release. Fire hazard cables specified in 820.154(E), and used to reduce potential heat release shall have an additional classification using the suffix "-FHC".

FPN No. 1: One method of defining a low potential heat release cable is that the cable exhibits a maximum potential heat value of exceeding 8141 kJ/kg (3500 BTU/lb) when tested in accordance with NFPA 259, *Standard Test Method for Potential Heat of Building Materials*, as well as a maximum flame spread index of 25 and a maximum smoke developed index of 50 when tested in accordance with NFPA 255, *Standard Method of Test of Surface Burning Characteristics of Building Materials*.
Substantiation: The application of the Standards Council's decision on NPFA 90A was an error. The proposed marking on the cable did not include a "P" added to CATV. Type CATVP cable is permitted to be installed in plenums.

To better clarify that the Standards Council's decision on NFPA does not apply and to better clarify where the cable is permitted to be installed, the marking on the cable is changed to Type CATV-FHC. The "FHC" suffix stands for fire hazard cable. There is a companion comment to revise the application of fire hazard cable in my comment to Proposal 16-329.

The proposed cable provides listing parameters useful to system designers and fire protection engineers.

The key parameter in the listing requirements is potential heat release.

To put cable heat release in perspective, here are relative values:

Fire Hazard Cable insulation: less than 8 MJ/kg (3,500 BTU/lb

PVC insulation: As high as 25 MJ/kg (11,000 BTU/lb)

Polyolefin insulation: As high as 46 MJ/kg (20,000 BTU/lb)

Polyolefin insulation is sometimes used as insulation on conductors, and is covered by a PVC jacket. Polyolefin insulation provides better electrical properties (dielectric constant) than PVC insulation.

Additionally, flame spread and smoke developed parameters identify the robustness of the cable.

A flame spread index of 25 is found in a number of NFPA publications, for example:

NFPA 13-2007

8.15.1 Concealed Spaces.

8.15.1.2.10 Concealed spaces where rigid materials are used and the exposed surfaces have a flame spread index of 25 or less, and the materials have been demonstrated not to propagate fire when tested in accordance with NFPA 255, Standard Method of Test of Surface Burning Characteristics of Building Materials, extended for an additional 20 minutes in the form in which they are installed, shall not require sprinkler protection.

NFPA 13 use of "concealed spaces" corresponds to a typical dictionary definition: out of sight, hidden. This definition add "spaces" to "concealed" and represents a different meaning from how the NEC defines "concealed." Where both the NEC and NFPA 13 apply, "concealed" cable can be removed from a "concealed space." After removal of the cable, the "concealed space" would remain.

A smoke developed index of 50 is more rigorous than the typical smoke developed index of 450 for interior finishes. Interior finishes can be considered a "fixed" application: one sheet or one coat. Cable installations are a "variable" application: one cable or hundreds of cables. It seems reasonable to establish a robust requirement, due to the variable application. Electronic equipment is susceptible to damage from smoke and heat, both components of a fire.
Panel Meeting Action: Reject
Panel Statement: Cable meeting specifications as described in this comment is not prohibited by the Code, and the panel sees no need for an additional marking.

16-276 Log #1575 NEC-P16 **Final Action: Accept**
(820.179(E))

Submitter: Harold C. Ohde, IBEW-NECA Technical Institute
Comment on Proposal No: 16-346
Recommendation: Continue to reject.
Substantiation: The submitter's recommendation to create a new cable designation (concealed space cable) is nothing more than a marketing ploy. A backdoor approach you might say to get NFPA 255 and NFPA 259 cables in the cable hierarchy. The submitter's substantiation would have misled the designer, installer and code officials to believe, install and enforce that limited combustible cable, conduit or a sprinkler system to be installed in the concealed space or plenums would be a requirement because of NFPA 13 Section 8.14.1. It is important to note that the NEC does not have a definition of "concealed spaces", therefore, the confusion and making it impossible to enforce. What does constitute a concealed space? Is it the space above a dropped ceiling; or is it a space above plastered or drywall ceiling? Is it the wall cavity of typical wall construction?

NFPA 13 just completed their revision process for the 2006 NFPA 13 Standard. 8.14.1 of NFPA 13 has been revised to read as follows:

8.14.1.2 Concealed Spaces not Requiring Sprinkler Protection.

8.14.1.2.1* Concealed spaces of noncombustible and limited combustible construction with minimal combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those as a return air for a plenum. (For additional information on combustible loading see A.8.14.1.2.1)

8.14.1.2.2 Concealed spaces of noncombustible and limited combustible construction with limited access and not permitting occupancy or storage of combustible shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.

A.8.14.1.2.1 Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc... can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1) For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined.

In the 2006 NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.

(830.3)

Submitter: John P. Masarick, Independent Electrical Contractors Inc.
Comment on Proposal No: 16-360
Recommendation: The panel is encouraged to continue to Reject Proposal 16-360.
Substantiation: The reasons to continue to Reject the Proposal are as follows:
1. The trend by the CMPs over the last several code cycles has been to limit the use of FPNs.
2. There is also a correlation issue. There is a conflict between those panels that accepted the proposal and those that rejected the proposal.
3. These standards are also covered by a Fine Print Note in 110.12.
4. The FPN should not be accepted because numerous standards and installation manuals exist and to only mention one does not adequately inform the public about accepted industry practices. The NEC is not intended to be an instruction manual for untrained persons. If the FPNs are allowed to reference these standards, then they should list all applicable standards.
5. Since the referenced installation standards are intentionally general to cover different models of equipment, approval of the FPN may lead many to believe these standards can be used instead of listed or labeled manufacturer's instructions which would be in violation of 110.3(B).
6. If the CMP would like to include the reference, it should be placed in the Annex with the other references.

(830.3(A), 830.25, and 830.26)

Submitter: Harold C. Ohde, IBEW #134
Comment on Proposal No: 16-365
Recommendation: This Proposal should have been Rejected.
Substantiation: The submitter's recommendation to add a new 830.26 with this FPN No. 2 to this section is in grave error. This FPN would not provide guidance to designers, installers or code officials. This FPN would have misled the designer, installer and code officials to believe, install and enforce that limited combustible cable, conduit or a sprinkler system to be installed in the concealed space or plenums would be a requirement because of NFPA 13, Section 8.14.1. The submitter's substantiation references 2002 NFPA 13 Section 8.14.1. It is important to note that the NEC does not have a definition of "concealed spaces", therefore making it impossible to enforce. What constitutes a concealed space? Is it the space above a dropped ceiling; or is it a space above plastered or drywall ceiling? Is it the wall cavity of typical wall construction?
NFPA 13 just completed their revision process for the 2006 NFPA 13 Standard. 8.14.1 of NFPA 13 has been revised to read as follows:
8.14.1.2 Concealed Spaces
not Requiring Sprinkler Protection.
8.14.1.2.1* Concealed spaces of noncombustible and limited combustible construction with minimal combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those as a return air for a plenum. (For additional information on combustible loading see A.8.14.1.2.1).
8.14.1.2.2 Concealed spaces of noncombustible and limited combustible construction with limited access and not permitting occupancy or storage of combustible shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.
A.8.14.1.2.1 Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc... can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1). For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined.
In the 2006 NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.

CMP 16 should have rejected this proposal based on the Standards Council decision D#05-24 to remain "status quo" on issues that pertain to NFPA 90A. Standards Council recently issued another decision (D#06-03) which decided that this FPN may be deleted from Sections 770.154, 800.154, and 820.154 (all under CMP 16 purview) and this deletion will not be in conflict with the Standards Council decision (D#05-24). Standards Council recognizes the 2002 edition of the NEC as being status quo.

Panel Meeting Action: Reject

Panel Statement: The panel rejected the text that the submitter of the comment objected to.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-290 Log #200 NEC-P16 **Final Action: Accept (830.3(E))**

Submitter: Technical Correlating Committee on National Electrical Code

Comment on Proposal No: 16-367

Recommendation: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal and give further consideration to the comments expressed in the voting. This action will be considered by the Panel as a Public Comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

Panel Statement: The panel has considered the comments expressed in the voting as directed by the TCC.

The panel accepts the direction of the TCC to clarify the panel action.

The panel accepts the part of the proposal to delete existing subsection (A) from 830.3, as it has been moved to 830.26. This was accomplished by panel action on Proposal 16-361.

It was not clearly stated in the panel action that the text was relocated in Proposal 16-367.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-291 Log #201 NEC-P16 **Final Action: Accept (830.24)**

Submitter: Technical Correlating Committee on National Electrical Code

Comment on Proposal No: 16-373

Recommendation: The Technical Correlating Committee notes that neither the panel statement nor the revised statement shown in the affirmative vote are responsive to the submitter's substantiation for the recommendation. The Technical Correlating Committee directs the panel to act on the merits of the recommendation. This action will be considered by the Panel as a Public Comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

Panel Statement: The panel accepts the direction of the TCC to reconsider the comments expressed in the voting and continues to reject the proposal.

The requirements of 300.11 are applicable to network-powered broadband cables, are not overly restrictive, and are appropriate.

Requiring any and all cables to be properly supported is not overly restrictive and is appropriate. Securing an additional cable to an existing properly supported cable does not constitute support. Additional cables must be directly supported by the same structural member that supports the first cable. In such installations, the additional cable is being supported by the same structural member.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

Comment on Affirmative:

BRUNSSEN, J.: Proposal 16-373 should have been accepted. See my explanation of negative on Comment 16-297.

16-292 Log #377 NEC-P16 **Final Action: Reject (830.24)**

Submitter: S. D. Kahn, Tri-City Electric Company, Inc. / Rep. NECA

Comment on Proposal No: 16-372

Recommendation: Reject the Proposal.

Substantiation: Although I agree with the proposal and the submitter's intent to introduce consistency, the material is used in plenums and other air handling spaces. Consequently, the proposal should have been subjected to the direction given by the Standards Council, as were many other proposals which were rejected.

As Mr. Dorna noted in his "Explanation of Negative Vote", "The UL Directory (2005), shows that category ZODZ covers "cable ties, cable tie mounts and similar types of related hardware". Likewise, Conduit and Fittings, category DWFV covers "cable ties, conduit straps, staples and similar hardware..." Both categories list as "Suitable for use in air handling spaces in accordance with Sec 300.22(C) and (D) of the National Electrical Code."

This proposal should have been rejected because of the Standards Council decision concerning NFPA 90A. Code Making Panels must be consistent in their handling of all submitted proposals.

Panel Meeting Action: Reject

Panel Statement: This is not a 90A issue.

The guide information for ZODZ, Wire Positioning Devices states that:

"The investigation of these products includes consideration of the rated mechanical strength, maximum operating temperature, smoke and heat generation, corrosion resistance and weatherability characteristics as appropriate for the product."

These are all characteristics that we should be concerned about for electrical installations.

The reference to air handling spaces is only a reference and is stated as:

"…for those devices which have been investigated to determine their suitability for use in air handling areas…"

This is a standard statement that is found in a wide variety of listing categories including the category for IT and Telecom equipment to cover situations where a special investigation is done to evaluate a device for air handling spaces. It no way implies that devices in the category are automatically intended for air handling spaces.

Listed devices are evaluated using UL1565 – Standard for Positioning Devices. The scope of this standard states:

"1.1 This standard applies to those metallic and nonmetallic devices used for positioning - which may include bundling and securing - or to a limited extent supporting cable, wire, conduit, or tubing of a wiring system in electrical installations, to reduce the risk of fire, electric shock, or injury to persons."

Devices are evaluated for properties that we are concerned about. It is NOT a requirement for a listed device to be evaluated for use in air handling spaces.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

JOHNSON, S.: See my explanation of negative vote on Comment 16-27.

16-293 Log #378 NEC-P16 **Final Action: Reject (830.24)**

Submitter: S. D. Kahn, Tri-City Electric Company, Inc. / Rep. NECA

Comment on Proposal No: 16-374

Recommendation: Reject the Proposal.

Substantiation: This proposal should be rejected as the term "listed" should not be introduced at this time. The panel accepted moving the abandoned cable requirement but did not accept deleting "The accessible portion of". The panel rejected the remainder of the proposal except for adding the word "listed". Other proposals move the abandoned cable requirement.

I agree with the submitter's intent with reference to "listed" in order to introduce consistency, however the material is used in plenums and other air handling spaces. Consequently, the proposal should have been subjected to the direction given by the Standards Council, as were many other proposals which were rejected because of that direction.

As Mr. Dorna noted in his "Explanation of Negative Vote", "The UL Directory (2005), shows that category ZODZ covers "cable ties, cable tie mounts and similar types of related hardware". Likewise, Conduit and Fittings, category DWFV covers "cable ties, conduit straps, staples and similar hardware..." Both categories list as "Suitable for use in air handling spaces in accordance with Sec 300.22(C) and (D) of the National Electrical Code."

The proposal portion that introduces "listed" should have been rejected because of the Standards Council decision concerning NFPA 90A. Code Making Panels must be consistent in their handling of all submitted proposals.

Panel Meeting Action: Reject

Panel Statement: This is not a 90A issue.

The guide information for ZODZ, Wire Positioning Devices states that:

"The investigation of these products includes consideration of the rated mechanical strength, maximum operating temperature, smoke and heat generation, corrosion resistance and weatherability characteristics as appropriate for the product."

These are all characteristics that we should be concerned about for electrical installations.

The reference to air handling spaces is only a reference and is stated as:

"…for those devices which have been investigated to determine their suitability for use in air handling areas…"

This is a standard statement that is found in a wide variety of listing categories including the category for IT and Telecom equipment to cover situations where a special investigation is done to evaluate a device for air handling spaces. 16-294 Log #480 NEC-P16 **Final Action: Reject**
(830.24)

Submitter: Timothy P. McNeive, Thomas & Betts Corporation
Comment on Proposal No: 16-372
Recommendation: Delete the word "listed".
Substantiation: Refer to my comment in ROP 16-374. The use of the word "listed" is redundant whether or not my comment in 16-275 is accepted. I agree with Mr. Boyer's comment accompanying his negative vote. His suggested additional text is not needed, however, in this section, if adopted in 830.24 according to my comment in ROP 16-374.
Panel Meeting Action: Reject
Panel Statement: The guide information for ZODZ, Wire Positioning Devices states that:

"The investigation of these products includes consideration of the rated mechanical strength, maximum operating temperature, smoke and heat generation, corrosion resistance and weatherability characteristics as appropriate for the product."

These are all characteristics that we should be concerned about for electrical installations.

Listed devices are evaluated using UL1565 – Standard for Positioning Devices. The scope of this standard states:

"1.1 This standard applies to those metallic and nonmetallic devices used for positioning - which may include bundling and securing - or to a limited extent supporting cable, wire, conduit, or tubing of a wiring system in electrical installations, to reduce the risk of fire, electric shock, or injury to persons."

The evaluation of positioning devices includes:

• Classification by mechanical strength, material, maximum temperature, and environmental conditions
• Required Markings giving critical information to the installer / inspector
• Mechanical strength tests
•Flammability classification of polymeric materials and coatings (NOT air-handling space requirements)
• Relative thermal index
• Material requirements (Including blending and substitution)
• Corrosion resistance
• Sharp edges
• Installation
• Mechanical strength
• Vibration
•Tests for mounting blocks and other mounting hardware and devices
• Environmental conditioning.....

Number Eligible to Vote: 15

JOHNSON, S.: See my explanation of negative vote on Comment 16-29.

16-295 Log #483 NEC-P16 **Final Action: Reject**
(830.24)

Submitter: Timothy P. McNeive, Thomas & Betts Corporation
Comment on Proposal No: 16-374
Recommendation: Accept the panel action but delete the requirement that hardware be "listed" in 830.24. Add the following sentence before the last sentence in 830.24:

"Cable ties that provide primary support for optical fiber cables and raceways shall have a minimum loop tensile strength of 23 kg (50 lbs)".

Substantiation: Adding a requirement that all hardware be "listed" is far from editorial as asserted in the substantiation accompanying the proposal. The panel is asked to consider the long-standing positions of CMP-7 and CMP-8 that do not require support hardware to be "listed". Above all else, consistency in the NEC seems to be what the original submitter values most. No substantiation has been provided in the proposal that would differentiate treatment of antenna television and radio distribution cables from other wiring systems with respect to support. The wide variety of hardware used for supporting cables and raceways are called upon to provide both primary support required in the NEC and very often secondary support or wire management functions. All hardware need not be held to the highest standard.

The comment provided by Mr. Dorna with his negative vote references two UL categories under which cable ties and other hardware are "listed". The correct UL category for Hardware for Support of Conduit, Tubing and Cable (UL 2239) is DWMU, not DWFV. Nevertheless, this standard and UL 1565, Positioning Devices (ZODZ) establishes a 23 kg test load for all support products for flexible conduits and cables in accordance with the requirements for primary support throughout the NEC. For cable ties, "minimum loop tensile strength" is commonly marked on packages. The 23 kg minimum for cable support is well representative of typical straps, hangers and staples listed for flexible conduit and cable support in accordance with UL 2239. Hardware for Support of Conduit, Tubing and Cable. The proposed new text will add value to inspectors in acceptance of appropriate cable ties without requiring lists.

Companion proposals have been submitted for 640.6, 725.8, 770.24, 800.24 and 820.24.

Panel Meeting Action: Reject
Panel Statement: There is more to listing than mechanical strength. Also, the mechanical strength should be based on the use and ratings of the device.

Cable ties can be used for securing and supporting cables in a number of Chapter 3 wiring methods without any requirements for a minimum loop tensile strength of 23 kg (50 Ibs) or any particular strength. For example, Section 334.30 covering securing and supporting of "nonmetallic-sheathed cable requires supporting and securing by staples, cable ties, straps, hangers, or similar fittings designed and installed so as not to damage the cable, at intervals not exceeding 1.4 m (4 1/ 2 ft) and within 300 mm (12 in.) of every outlet box, junction box, cabinet, or fitting." Notice it does not have any recommendation for the support strength, nor does it need this additional marking or special consideration. The cables may not be providing any support at all where the tie wrap is simply anchoring it to a beam or joist. Types AC and MC cable also give permission to use cable ties for securing and supporting these cables in 320.30 and 330.30, respectively. In addition, this added text could be considered to be new information that has not been reviewed as part of the process.

Listing includes an evaluation of the particular device that goes beyond the ability to support cable. The guide information for ZODZ, Wire Positioning Devices states that:

"The investigation of these products includes consideration of the rated mechanical strength, maximum operating temperature, smoke and heat generation, corrosion resistance and weatherability characteristics as appropriate for the product."

These are all characteristics that we should be concerned about for electrical installations.

Listed devices are evaluated using UL1565 – Standard for Positioning Devices. The scope of this standard states:

"1.1 This standard applies to those metallic and nonmetallic devices used for positioning - which may include bundling and securing - or to a limited extent supporting cable, wire, conduit, or tubing of a wiring system in electrical installations, to reduce the risk of fire, electric shock, or injury to persons."

16-296 Log #878 NEC-P16 **Final Action: Reject**
(830.24)

Submitter: John P. Masarick, Independent Electrical Contractors Inc.
Comment on Proposal No: 16-374
Recommendation: The panel is encouraged to continue to Reject Proposal 16-374.
Substantiation: The reasons to continue to Reject the Proposal are as follows:

1. The trend by the CMPs over the last several code cycles has been to limit the use of FPNs.
2. There is also a correlation issue. There is a conflict between those panels that accepted the proposal and those that rejected the proposal.
3. These standards are also covered by a Fine Print Note in 110.12.
4. The FPN should not be accepted because numerous standards and installation manuals exist and to only mention one does not adequately inform the public about accepted industry practices. The NEC is not intended to be an instruction manual for untrained persons. If the FPNs are allowed to reference these standards, then they should list all applicable standards.
5. Since the referenced installation standards are intentionally general to cover different models of equipment, approval of the FPN may lead many to believe these standards can be used instead of listed or labeled manufacturer's instructions which would be in violation of 110.3(B).
6. If the CMP would like to include the reference, it should be placed in the Annex with the other references.

Panel Meeting Action: Reject
Panel Statement: The action on proposal 16-374 was to accept in principle in part. This is not consistent with the submitter's request.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-297 Log #1552 NEC-P16 **Final Action: Reject**
(830.24)

Submitter: James E. Brunssen, Telcordia Technologies, Inc. / Rep. Alliance for Telecommunications Industry Solutions
Comment on Proposal No: 16-373
Recommendation: Accept this proposal.
Substantiation: This proposal should be accepted. The requirement added by Panel 16 during the 2005 revision cycle is overly restrictive and inappropriate for network-powered broadband communications cables. The Fine Print Note associated with 830.24 directs the reader to the appropriate installation standards. The Panel has enhanced the Fine Print Note during this cycle by the addition of three new references covering the installation of network-powered broadband communications cables (see Proposal 16-376). These references are all that is necessary and sufficient for such cables without imposing the burdensome requirements of 300.11. Section 300.11 is directed toward power cable assemblies that are heavier and larger than network-powered broadband communications cables, operate at much greater power levels and present a greater risk of injury if not properly installed. If the Panel continues to reject Proposal 16-373 then, at the very least, 300.11(C) should be excepted. See my companion comment on Proposal 16-377.
Panel Meeting Action: Reject
Panel Statement: Securing an additional cable to an existing cable does not constitute support. Additional cables must be directly supported by the same structural member that supports the first cable. In such installations, the additional cable is being supported by the same structural member.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 12 Negative: 3
Explanation of Negative:
BRUNSSEN, J.: This comment should have been accepted, as should the original Proposal 16-373. Lashing (tie-wrapping) of additional network-powered broadband communications cables to existing network-powered broadband communications cables is accepted industry practice without detriment to safety. The network-powered broadband communications cables in question are of minimal diameter and light in weight. The argument is not one of whether to support the additional network-powered broadband communications cable, but the adequacy of lashing (tie-wrapping) to existing network-powered broadband communications cable(s). For further substantiation, see my explanation of negative on Proposal 16-373 and my substantiation to Comment 16-297. Additionally, the final sentence of the panel statement is unclear.
JOHNSON, S.: See my explanation of negative vote on Comment 16-31.
JONES, R.: The requirement added by Panel 16 during the 2005 revision cycle is overly restrictive and inappropriate for network-powered broadband communications cables. The Panel has enhanced the Fine Print Note during this cycle by the addition of three new references covering the installation of network-powered broadband communications cables. The installation requirements of Article 830 and the references are adequate without the requirements of 300.11.

16-298 Log #1553 NEC-P16 **Final Action: Reject**
(830.24)

Submitter: James E. Brunssen, Telcordia Technologies, Inc. / Rep. Alliance for Telecommunications Industry Solutions
Comment on Proposal No: 16-377
Recommendation: Accept this proposal.
Substantiation: This proposal should be accepted. If the Panel continues to support the addition of the requirements of 300.11 to 830.24, then at the very least, the requirements of 300.11(C) should be waived. Section 300.11(C) is clearly not applicable to network-powered broadband communications cables. Installation practice is to lash network-powered broadband communications cables together to form a "cable assembly". This frequently occurs during modifications or additions to an existing installation. Network-powered broadband communications cables are physically smaller and lighter than power cables and contain limited power. Application of 300.11(C) is overly restrictive and will preclude lashing of network-powered broadband communications cables together to form a cable assembly. Network-powered broadband communications cables secured in this manner have adequate support (see 300.11 (A)), are supported independently of the suspended ceiling grid, and are not likely to collapse in the event the suspended ceiling collapses. Such restriction imposes additional installation costs with no improvement in safety. See my companion comment on Proposal 16-373.
Panel Meeting Action: Reject
Panel Statement: Securing an additional cable to an existing cable does not constitute support. Additional cables must be directly supported by the same structural member that supports the first cable. In such installations, the additional cable is being supported by the same structural member.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 12 Negative: 3
Explanation of Negative:
BRUNSSEN, J.: This comment should have been accepted, as should the original Proposal 16-377. If the panel continues to support the addition of the securing and supporting requirements of 300.11, then at the very least 300.11(C) should be exempted. It is clearly not applicable to network-powered broadband communications cables. For further substantiation, see my explanation of negative on Proposal 16-377 and the substantiation accompanying my Comment 16-298. Additionally, the final sentence of the panel statement is unclear.
JOHNSON, S.: See my explanation of negative vote on Comment 16-31.
JONES, R.: See my Explanation of Negative Vote on Comment 16-297.

16-299 Log #714 NEC-P16 **Final Action: Reject**
(830.24, FPN)

Submitter: Robert Kelleher, Paramount Electrical Services
Comment on Proposal No: 16-375
Recommendation: The action should be to delete this Fine Print Note.
Substantiation: The addition of these NECA Fine Print Notes, serves no benefit to the user of the National Electrical Code. These are not standards, they are a compilation of generic information and do not serve as information to the user. These must be purchased through NECA. This FPN as written is nothing more than free advertisement for generic, readily available information which must be purchased by the code user. Code Making Panel 16 should consider taking an action to delete this FPN to coordinate with the other technical committees in the NEC project. A total of seventeen new Fine Print Notes were proposed to reference NECA standards. Sixteen were unanimously rejected. Inclusion of this Fine Print Note is in direct conflict with 90.1(C). In the action to reject proposal 8-3, one technical committee member promotes NECA standards as "….a tool to assist untrained electricians to make safer and better installations." The TCC should intervene, uphold the provisions of 90.1(C) and prohibit these types of Fine Print Notes. CMP16 should reject this FPN. Failure to do so will mean adding Fine Print Notes for IEC, EEI, IBEW, IAEI, ACC, NETA, NEI, SEIA, AISI, API, ASHE, AHAM, ICEAI, NYBFU and dozens of others when they decide to develop income through generic standards development. If this type of Fine Print Note is placed anywhere in the NEC an Annex should be included with coupons for the code user. If the NEC is to be used for advertisement purposes, coupons should be included.
Panel Meeting Action: Reject
Panel Statement: Proposal 16-375 pertained to updating the FPN, not to delete it.
The comment requests that the FPN be deleted. The FPN provides valuable information, and the panel intends that it be retained but the date updated. The references provided in the FPN provide guidance for installation in a neat and workmanship like manner.
See panel action and statement on Comment 16-107a (Log #CC1602).

(830.93)

Submitter: Stanley Kaufman, CableSafe Inc.
Comment on Proposal No: 16-386
Recommendation: Accept this proposal in principle by revising 830.93 as shown below:
830.93 Grounding or Interruption of Metallic Members of Network-Powered Broadband Communications Cables.
~~The shields of network-powered broadband communications cables used for communications or powering shall be grounded at the building as close as practicable to the point of entrance or attachment of the NIU. Metallic cable members not used for communications or powering shall be grounded or interrupted by an insulating joint or equivalent device as close as practicable to the point of entrance or attachment of the NIU.~~

Network-powered communications cables entering buildings or attaching to buildings shall comply with (A), (B) or (C).

(A) Entering Buildings. In installations where the network-powered communications cable enters the building, the shield shall be grounded and metallic members of the cable not used for communications or powering shall be grounded or interrupted by an insulating joint or equivalent device. The grounding or interruption shall be as close as practicable to the point of entrance.

(B) Terminating Outside of the Building. In installations where the network-powered communications cable is terminated outside of the building, the shield shall be grounded and metallic members of the cable not used for communications or powering shall be grounded or interrupted by an insulating joint or equivalent device. The grounding or interruption shall be as close as practicable to the point of attachment of the NIU.

(C) Mobile Homes….(The only change this comment suggests for the second paragraph and the FPN is to add this section title. Other proposals change the text.)
Substantiation: The suggested text is an editorial clarification intended to bring this section into compliance with section 3.3.1(2) of the NEC Style Manual which states:

2. Use simple declarative sentence structure, and keep sentences short. Writing rules in long sentences full of commas, dependent clauses, and parenthetical expressions often creates confusion and misunderstanding. The requirement can be written in two or more short sentences, expressed using a list or table, or both.

The existing paragraph deals with three scenarios, 1) installations where the cable enters the building, 2) installations where the cable is terminated outside of the building and 3) cables serving mobile homes. It is clearer to deal with each scenario in a separate subsection. The current text requires grounding of a shield (if the cable has a shield) and allows interruption as an alternate to grounding for other non-current-carrying members. The suggested text retains these options.
Panel Meeting Action: Accept in Principle

Revise 830.93 to read as follows:

830.93 Grounding or Interruption of Metallic Members of Network-Powered Broadband Communications Cables.

Network-powered communications cables entering buildings or attaching to buildings shall comply with (A) or (B).

For purposes of this section, grounding located at mobile home service equipment located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, or at a mobile home disconnecting means grounded in accordance with 250.32 and located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, shall be considered to meet the requirements of this section.

FPN: Selecting a grounding location to achieve the shortest practicable grounding conductor helps limit potential differences between the network-powered broadband communications circuits and other metallic systems.

(A) Entering Buildings. In installations where the network-powered communications cable enters the building, the shield shall be grounded in accordance with 830.100 and metallic members of the cable not used for communications or powering shall be grounded in accordance with 830.100, or interrupted by an insulating joint or equivalent device. The grounding or interruption shall be as close as practicable to the point of entrance.

(B) Terminating Outside of the Building. In installations where the network-powered communications cable is terminated outside of the building, the shield shall be grounded in accordance with 830.100 and metallic members of the cable not used for communications or powering shall be grounded in accordance with 830.100 or interrupted by an insulating joint or equivalent device. The grounding or interruption shall be as close as practicable to the point of attachment of the NIU.
Panel Statement: This revised text achieves the submitter's purpose with improved clarity and achieves parallelism with the text the panel accepted in Comments 16-40 and 16-126.

Ballot Results: Affirmative: 15

16-307 Log #205 NEC-P16 **Final Action: Accept**
(830.100(B))

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 16-394
Recommendation: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal. The Panel Action text addresses the change in 830.110(B), rather than the correct section of 830.100(B). This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the direction of the TCC to clarify the panel action.

The panel action on Proposal 16-394 referenced 830.110(B) in error. The correct reference is 830.100(B). See panel action and statement on Proposal 16-395 and Comment 16-308.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-308 Log #206 NEC-P16 **Final Action: Accept**
(830.100(B))

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 16-395
Recommendation: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal with respect to the use of the word "and" in the sentence "The grounding conductor shall be connected in accordance with 830.100(B)(1), (B)(2), and (B)(3)."

It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 5-20.

This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Revise 830.100(B) as follows:

"(B) Electrode. The grounding conductor shall be connected in accordance with 830.100(B)(1), (B)(3), or (B)(2)."

Revise 830.100(B)(1) as follows:

"(1) In Buildings or Structures with an Intersystem Bonding Termination. If the building or structure served has an intersystem bonding termination, the grounding conductor shall be connected to the intersystem bonding termination."

Revise 830.100(B)(2) as follows:

"(2) In Buildings or Structures with Grounding Means. If the building or structure served has no intersystem bonding termination, the grounding conductor shall be connected to the nearest accessible location on the following."

Revise 830.100(B)(3) as follows:

"(3) In Buildings or Structures Without Intersystem Bonding Termination or Grounding Means. If the building or structure served has no intersystem bonding termination or grounding means, as described...".

Revise 830.100(B)(3)(2) as follows:

"(2) If the building or structure served has no intersystem bonding termination or has no grounding means, as described in 830.100(B)(2) or...". or …".
Panel Statement: The panel has clarified the panel action on Proposal 16-395 with respect to the word "and" as indicated in the panel action on this comment. It is not the intent to accomplish the grounding connections of 830.100 (B)(1), (B)(2), and (B)(3) simultaneously.

The panel has reconsidered Proposal 16-395 in light of the panel action on Proposal 5-20 as directed by the TCC and has revised "intersystem grounding termination" to "intersystem bonding termination" as indicated in the panel action on this comment.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-309 Log #207 NEC-P16 **Final Action: Accept**
(830.100(B))

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 16-396
Recommendation: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal based on the affirmative comment. This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Relocate the text to follow 830.100(B)(2)(7) and revise as follows:

"A bonding device intended to provide a termination point for the grounding conductor (intersystem bonding) shall not interfere with the opening of an equipment enclosure. A bonding device shall be mounted on non-removable parts. A bonding device shall not be mounted on a door or cover even if the door or cover is non-removable."
Panel Statement: The panel action on Proposal 16-396 to accept in principle is correct. The panel has reviewed the comment expressed in the voting and determined that the proper location of the text is 830.100(B)(2)(7), not 830.100(B)(5) as indicated in the proposal. That is where equipment (service) enclosures are discussed. The panel has also added editorial clarification as indicated in the panel action on this comment. The panel notes that the text is presently located incorrectly in the draft.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

(830.106(A))

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 16-401
Recommendation: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal by determining whether an "and" should be used or an "or" should be used in the accepted text as follows: "shall comply with 830.106(A)(1) and (A)(2)" or "shall comply with 830.106(A)(1) or (A)(2)". The Technical Correlating Committee also directs that consideration be given to the comments expressed in the voting. This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Revise 830.106(A) as follows:
"(A) Grounding. Grounding shall comply with 830.106(A)(1) or (A)(2)."
Revise 830.106(A)(1) as follows:
"(1) Where there is no mobile home service equipment located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, the network-powered broadband communications cable, network interface unit, and primary protector ground shall be connected to a grounding conductor in accordance with 830.100(B)(2)."
Revise 830.106(A)(2) as follows:
"(2) Where there is no mobile home disconnecting means grounded in accordance with 250.32 and located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, the network powered broadband communications cable, network interface unit, and primary protector ground shall be connected to a grounding conductor in accordance with 830.100(B)(2)."
Panel Statement: The panel has considered the comments expressed in the voting as directed by the TCC.
The panel has clarified the panel action on Proposal 16-401 with respect to the word "and", revising 830.106(A) as indicated in the panel action on this comment. It is not the intent to accomplish the grounding connections of 830.106(A)(1) and (2) simultaneously.
The panel has considered the comment on affirmative as directed by the TCC and made the indicated revisions to the text of 830.106(A)(1) and (2) as currently contained in the draft. These revisions are consistent with the panel action on proposals affecting similar requirements in Articles 770, 800, and 820.

16-314 Log #1294 NEC-P16 **Final Action: Reject**
(830.110)

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 16-402
Recommendation: The Proposal should have been Accept in Part.
Accept the addition of 830.110 but do not accept the Exception.
Substantiation: No substantiation was submitted to support the deletion of the conduit fill restrictions that apply to Chapter 3 raceways. While I support the effort to correlate similar text between articles, new material cannot be introduced without providing technical substantiation.
The first sentence in 830.110 states "installed in accordance with Chapter 3" which would include all of Chapter 3 requirements pertaining to raceways including the maximum percentage fill limitations in Chapter 9. Including the Exception introduces a conflict between the 830.110 rule and the Exception.
The fill restrictions are based on the physical limitations of being able to pull conductors or cables into raceways without damaging the conductors or cables, particularly when there are bends in the run, and to avoid conductor/cable jamming. The maximum percentage fill requirements are independent of whether they are electrical conductors or not.
The maximum percentage fill requirements in Chapters 3 and 9 are an integral part of the permitted uses of the raceways contained in Chapter 3 and if broadband communications cables are to be installed in a Chapter 3 raceway, then the maximum percentage fill limitations must also apply.
Chapter 9, Table 1 permits 53 percent fill when one conductor or cable is installed in a raceway; 31 percent for two; and 40 percent for three or more.
Panel Meeting Action: Reject
Panel Statement: Throughout Article 830 low-power network-powered communications cables have the same requirements as communications cables.
The fill requirements are not applicable to communications cables.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-315 Log #1959 NEC-P16 **Final Action: Reject**
(830.133(A)(1)(d) Exception No. 1)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 16-408
Recommendation: Accept the proposal as submitted.
Substantiation: The submitter is well aware of the differences between circuit separation as covered in this location and as covered for adjacent snap switches. However, the CMP 9 approach will accommodate CMP 16's requirements without disadvantaging one segment of the market. By using the term "identified" as the standard of product acceptance (See Article 100), you can have a plastic divider in a plastic box (both will be listed because nonmetallic boxes must be listed); or you have a steel divider in a steel box (the box will likely be listed but doesn't have to be and divider probably won't be listed.) The CMP 16 conclusion that this wording would allow a barrier to be installed such that it would void a box listing is untrue. The identification requirement means that the partitions will be covered on factory cut sheets, etc. describing the boxes for which they were designed. You will not find a divider that will meet this standard and be unsuitable for this application. and, in the case of nonmetallic boxes, all identified products will also be listed, so any improper barrier would provoke a citation under 110.3(B). In the case of steel boxes, the barriers will probably not be listed, but the anchoring methods are obvious to any installer and inspector, and they can easily be made secure for obvious reasons. The submitter has been an electrician for a long time, and has never encountered any problems securely installing steel dividers into the boxes for which they are identified.
Panel Meeting Action: Reject
Panel Statement: The listing of dividers is important given current trends and wiring methods.
"Identified" is not the same as "listed" which means that some sort of evaluation for suitability of the divider and its installation has been performed. Mounting, compatibility, material type and thickness, maintenance of spacings, etc. are all items of concern that a listing would address.

In recent years there has been a flood of devices and configurations utilizing standard outlet box dimensions and configurations for mix and matching of ac outlets, Ethernet, CATV and telecom connectors and receptacles. There is great concern regarding the separation of circuits, "storage" of excess cabling, routing of cables through or within the box, lack of expertise related to the installation of non-power cabling, and the like.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-316 Log #209 NEC-P16 **Final Action: Accept**
(830.154)

Submitter: Technical Correlating Committee on National Electrical Code
Comment on Proposal No: 16-412
Recommendation: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal. The accepted action changes the title of old "(B) Ducts, Plenums and Other Air Handling Spaces." to "(A) Plenums." However, all three applications are still within the subsection. This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the direction of the TCC to clarify the panel action.

The panel has reviewed the panel action on Proposal 16-412 and determined that it is indeed correct. The editorial revision of the title of old "830.154(B)" to new "830.154(A) Plenums", while leaving the text of the subsection unchanged is consistent with similar text in 770, 800, and 820.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-317 Log #2300 NEC-P16 **Final Action: Hold**
(830.179)

TCC Action: The Technical Correlating Committee understands that the panel action was to Hold the Comment only.
Submitter: James Daly, Upper Saddle River, NJ
Comment on Proposal No: 16-415
Recommendation: The Panel Action should have been to Accept in Principle and revise the Fine Print Notes to read as follows:

830.179(A)(1)

FPN No. 1: One method of determining that the cable is resistant to the spread of fire is the UL Flame Exposure, Vertical Tray Flame Test in UL1685-2000 *Standard for Safety for Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables.*

Another method of determining that the cable is resistant to the spread of fire is the "Vertical Flame Test - Cables in Cable Trays," in CSA C22.2 No. 0.3-M-2001, *Test Methods for Electrical Wires and Cables*.

FPN No. 2: One method of determining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is ANSI/UL 1666-2002, *Standard Test for Flame Propagation Height of Electrical and Optical-Fiber Cable Installed Vertically in Shafts*.

830.179(A)(2)

FPN No. 1: One method of determining that the cable is resistant to flame spread is the VW-1 (vertical-wire) flame test in ANSI/UL 1581-2001, *Reference Standard for Electrical Wires, Cables and Flexible Cords.*

FPN No. 2: One method of determining that the cable is resistant to the spread of fire is the UL Flame Exposure, Vertical Tray Flame Test in UL1685-2000 *Standard for Safety for Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables.*

FPN No. 3: One method of determining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is ANSI/UL 1666-2002, *Standard Test for Flame Propagation Height of Electrical and Optical-Fiber Cable Installed Vertically in Shafts.*

FPN No. 4: One method of determining that the cable has fire-resistant and low-smoke-producing characteristics is NFPA 262-2002, *Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces*.
Substantiation: 3.1.3 of the NEC Style Manual stipulates that "Fine print notes contain explanatory information. They shall not contain requirements and shall not be written in mandatory language."

The FPNs in the Proposal define the damage, specify performance requirements, and include mandatory language by requiring that the cable be tested to a particular standard or pass the requirements of a particular test. The revised wording provides explanatory information without any requirements.

830.179(A)(1) FPN No. 1 – In accordance with the Panel action to Accept Proposal 16-416, the number, title, and the date of the latest edition of the UL 1685 standard were corrected to reflect the current applicable standard; the title of the reference within the CSA standard was corrected and the date of the CSA standard was updated. This Comment also incorporates my Comments on Proposals 16-416 and 16-417.

In 830.179(A)(2): FPN No. 1 – the date was updated. FPN No. 2 – the UL standard was corrected from UL1584 to UL 1581 and then updated to UL 1685 to incorporate the current effective standard as explained in Accepted Proposal 16-416.
Panel Meeting Action: Hold
Panel Statement: The proposal was editorial, seeking no changes to the fine print note. A technical change in the fine print note would be new material that has not had public review.
Number Eligible to Vote: 15

TABLES

8-87 Log #525 NEC-P08 **Final Action: Accept**
(Chapter 9, Table 1)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 8-200
Recommendation: Accept as revised:

A multiconductor cable or flexible cord of two or more conductors shall be treated as a single conductor for calculating ~~conduit~~ raceway fill.
Substantiation: Where cords are permitted or not prohibited in raceways other than conduit, this rule should also apply.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 3

Explanation of Negative:

DABE, J.: The panel should have rejected this proposal and comment. The Submitter has not supplied any technical substantiation supporting this change.

DWIGHT, J.: The action taken should have been to reject this comment and the panel should not have changed "conduit fill" to "raceway fill" in Note 9, Chapter 9, Table 1.

Table 1 clearly applies to conduit and tubing and in every place in this section the term "conduit" and not "raceway" is used, with a single exception FPN No. 2 which likely is an error.

Changing Note 9 to "raceway" will mislead users and lead to possible misinterpretation and confusion in the field.

Finally, the original ROP 8-200 was to add flexible cords to Note (9). The ROC substantiation implies that the addition of flexible cords to this note should broaden the applicability to all raceways, a conclusion that is not justified by the substantiation provided.

GRIFFITH, M.: Panel action should have been to "Reject" this comment rather than "Accept". Upon close examination of Table 1 in Chapter 9, it is apparent that the table applies to conduit (only) and not raceways in general. Note 9, therefore, should not be changed from how it now reads.

Comment on Affirmative:

BURNS, J.: I recognize the concerns of Mr. Dabe, Mr. Dwight, and Mr. Griffith for not accepting the panel action on Comment 8-87, however, Article 100 does not define "Conduit", but does define "Raceway."

There are also other areas of the NEC that use the term "raceway" and would imply conduit; such as Table 310.15(B)(2)(a). Therefore, the panel action was correct, and I continue to vote Affirmative on the panel action.

8-88 Log #1383 NEC-P08 **Final Action: Accept**
(Chapter 9, Table 4)

Submitter: William Wagner, Certification Solutions
Comment on Proposal No: 8-204a
Recommendation: This Proposal should continue to be Accepted as proposed.
Substantiation: The panel's statement indicated that it disagreed with the substantiation provided for Proposal 8-204a, which indicated that HDPE is RNC. However, prior to the separation of Article 352 for the 2005 and 2008 editions of the NEC, Type PVC, Type HDPE, and Type RTRC were each included in Article 352 as "Rigid Nonmetallic Conduit: Type RNC." Type HDPE was first covered as a Rigid Nonmetallic Conduit in Article 347 of the 1993 NEC. Therefore, I do not believe that the panel's statement on this issue is correct.
Panel Meeting Action: Accept
Panel Statement: The panel does not necessarily agree with all points of the submitter's substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

6-72 Log #2011 NEC-P06 **Final Action: Reject**
(Chapter 9, Table 9)

Submitter: Noel Williams, Herriman, UT
Comment on Proposal No: 6-102
Recommendation: This Proposal should have been Accepted and the table should be deleted or moved to an annex where material for "informational purposes" should be located.
Substantiation: There is no rule stated in Table 9. Additionally, there is no reference anywhere in the 9 Chapters of the NEC that refers to Table 9. In the absence of any reference in rule, it is difficult to get to Table 9 under any requirement of the Code. Therefore, it appears that this table belongs in an Annex. According to the notes of Table 9, it does provide a way to approximate line-to-neutral voltage drop, but only under the specified conditions, and unlike Table 8, it does not include any method of correcting for other temperatures or other power factors, which limits it only to estimations, not to comply with any required mathematical calculation. Also, there are only two requirements (FPNs are not requirements) in the NEC that relate to voltage drop. This table could, perhaps be useful for such calculations in Article 647, but there is no reference there, and no reason to assume that Table 9 would provide the best or even an appropriate method for calculating voltage drop for Article 647. Line-to-neutral voltage drop is not the issue in Article 695, the only other place where there is an actual voltage drop requirement. The panel statement was not helpful. The panel made the assertion that the table is used for "various mathematical calculations required throughout the code" without providing one piece of evidence to support that assertion.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms the panel statement in Proposal 6-102. The information contained in Table 9 is used to perform various mathematical calculations required throughout the Code. This table may be used for voltage drop calculations for fire pumps and is more easily found with the other tables.

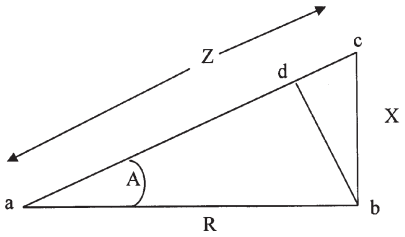
6-73 Log #881 NEC-P06 **Final Action: Reject**
(Chapter 9, Table 9)

Submitter: Arturo Moliha-Cahalet, Sta. Catariha, NL
Comment on Proposal No: 6-101
Recommendation: In formula Z = RCOS0+XSEN0
~~0 is the power factor angle~~
but 0 is Tan-1 (X/R)
OBJECTIVE
To show that in the formula **Z = (RCOSØ+XSENØ)**
Ø is not COS-1(P.F.) but Ø Tan-1 (X\R)
CONSIDERATIONS:
The impedance Z represent the vectorial summ of R and X where R and X are 90' desphased forming a rectangle triangle.



If we draw. A line from point b perpendicular to line ac on point d
Impedance (Z) is equal the summ of line ad and line dc
if ad= RcosØ and dc = XsenØ
Then Z = RcosØ+ xsenØ When **Ø = Tan-1 (X\R)** **Important!**
I think the confusión Ø=Cos PF instead Ø=Tan-1 (X\R
Started by using Ø instead another letter to name the angle, because Ø normally is used to mention the power factor of a Load.
Substantiation: POINTS TO PONDER DURING Z CALCULATIONS
1. Impedance ever should be higher than X or than R
2. Impedance doesnt change with the power factor of load
3. Impedance depends only from resistance and physical disposition of conductors

EXAMPLE OF CALCULATION

Impedance of cables 4\0 Aluminum in PVC ducts
*By revised method
R = 0.203
X = 0.135
X/R=0.665
A = Tan-1(X\R) = 0.586 rad
Cos A =0.832
Sen A = .553
Z = RCosA + X SenA =(,203*.832)+(.135*.553)= 0.168 + 0.074 = 0.242 Ohm/km
By Pithágoras Theorem
Z= raiz (R2 + X2) = raiz (.203*.203) + (.135* .135)= Raiz(0.041+0.018) = 0.242
Ohm/Km
Conclusión: Revised method is correct
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The power factor of the load is the proper variable for voltage drop calculations, and theta is the angle of the impedence to the load.

ANNEX A

1-115 Log #838 NEC-P01 **Final Action: Accept in Principle (Annex A)**

Submitter: Jim Pauley, Square D Company
Comment on Proposal No: 1-169
Recommendation: Reject the addition of UL 60947-1 to the product standards list. (Item 5 in the proposal recommendation)
Substantiation: This standard is a set of general rules applicable to industrial control equipment only. However, it is a horizontal standard that must be used in conjunction with other standards in the 60947 series (e.g. 60947-5-1). None of these other standards have been added to the list. As such, it is inappropriate to add the horizontal standard because it has no application and is misleading to indicate that a listing can be completed to that standard only.

In addition, although the title proposed for this standard reflects the title used by UL, it is misleading in this context. The title is Low-Voltage Switchgear and Controlgear. However, the UL adoption is for control products only. Since the list in Annex A does not have (and wasn't intended to have) a cross reference to specific NEC sections, the title implies that the standard is used for LV switchgear as well. This, of course, is incorrect.
Panel Meeting Action: Accept in Principle

The panel replaces the reference to "UL 60947-1" with "UL 60947-4-1, Electromechanical Contactors and Motor-Starters".
Panel Statement: The submitter is correct that UL 60947-1 is a horizontal standard, containing requirements that are applicable to a broad range of switchgear and controlgear. UL 60947-1 itself is not used alone to list equipment. As is the case with many standards harmonized with IEC standards, UL 60947-1 is supplemented by many daughter standards that apply to specific product types and include inherent references to the applicable requirements of UL 60947-1. One of these daughter standards, UL 60947-4-1, Electromechanical Contactors and Motor-Starters has a very specific scope that is relevant for users of the Code and is a valid alternative for UL 508, which is referenced in Annex A.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ANNEX G ADMINISTRATION AND ENFORCEMENT

20-17a Log #CC2005 NEC-P20 **Final Action: Accept (Annex G)**

TCC Action: The Technical Correlating Committee directs that the following text be added to Annex G, after the title, to read as follows:

"This annex is not a part of the requirements of this NFPA document, but is included for informational purposes only."

The Technical Correlating Committee directs that a new FPN No. 7 be added to the Scope of the Article that reads:

"FPN No. 7: See Annex G for information on Supervisory Control and Data Acquisition".
Submitter: Code-Making Panel 20,
Comment on Proposal No: 20-1
Recommendation: Place the text on testing and maintenance of SCADA systems shown in 585.6(F) of Proposal 20-1 (page 70-616 in the Report on Proposals) in Annex I as shown in the panel meeting action on Proposal 20-1 (page 70-624 in the Report on Proposals). The text will be identified as 585.60(D) in Annex I. The text is as follows:
(D) Maintenance and Testing. SCADA systems shall be maintained and tested in accordance with 585.60(D)(1) and 585.60(D)(2)
(1) Maintenance. The maintenance program for SCADA systems shall consist of the following components:
(1) Shall have a documented Preventive Maintenance program.
(2) Shall have concurrent maintenance capabilities, so that the testing, troubleshooting, repair, and/or replacement of a component or subsystem while redundant component(s) or subsystem(s) are serving the load.
(3) Operational data shall be retained – the deleted material goes well beyond requirements to ensure proper maintenance and operation.
(2) Testing. SCADA systems shall be tested periodically under actual or simulated contingency conditions.
FPN No. 1: Periodic system testing procedures can duplicate or be derived from the recommended functional performance testing procedures of individual components, as provided by the manufacturers.
FPN No. 2: For more information on Maintenance and Testing of SCADA, see NFPA 70B-2002, Recommended Practice for Electrical Equipment Maintenance.
Substantiation: The text was deleted from 585.6(F) in the panel meeting action and was supposed to be relocated to the informational Annex I covering SCADA systems as shown in the panel meeting action on Proposal 20-1. This comment corrects that inadvertent ommission.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
