5-1 Log #160 NEC-P05 **Final Action: Reject**
(Entire Document)

NOTE: The following proposal consists of Comment 5-1 on Proposal 5-1 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 5-1 was:
Change the term "equipment grounding conductor" to "equipment bonding conductor" throughout the NEC.
Submitter: Glenn W. Zieseniss, Crown Point, IN
Recommendation: The recommendation to change the term "equipment grounding conductor" to "equipment bonding conductor" throughout the NEC should have been accepted.
Substantiation: A descriptive designation of EGC and EBC is a necessity to using the NEC effectively. I agree with the comments of Messers. Dobrowsky, Johnston, Mello, Skuggevig, and White. In just the last 3 months, had reviewed plans for 3 cell towers and equipment. Two of the plans specifically stated the installation to be installed per the NEC and local codes, then went on to specifically have an Isolated ground rod for the Service Equipment and another Isolated ground rod for the Telco (telephone) service to the building. The third installation showed very well detail ground ring with all of the connections to it and the Grounding Bar detail, then did not connect the Service Equipment to the grounding ring which is only inches away. These plans were stamped by Electrical Engineer(s).

Comments by some of the "Explanation of Negative", such as "the terms ground, grounding and equipment ground conductor have been used in the NEC for years and are widely understood". But it is not widely understood by all electrical people!
Panel Meeting Action: Reject
Panel Statement: The panel does not accept the proposal and comment to globally change the term "equipment grounding conductor" to "equipment bonding conductor" throughout the 2008 NEC. The NEC Technical Correlating Committee formed a Task Group on Grounding and Bonding with the assignment to explore the issues identified in Proposal/Comment 5-1 (from the 2005 Code cycle) regarding "grounding" and "bonding", and to consider development of proposals for the 2008 NEC to establish consistent use of the terms as outlined in Proposal/Comment 5-1.

The Technical Correlating Committee Task Group on Grounding and Bonding developed the following proposals: 5-2, 5-6, 5-8, 5-9, 5-12, 5-14, 5-38, 5-48, 5-61, 5-76, 5-77, and 5-337. These proposals to CMP-5 revise definitions in Article 100 and sections of Article 250 to improve and clarify requirements related to grounding and bonding. Additional proposals were submitted to other articles.

All of these proposals were balloted through the TCC. After the ballot, the Task Group considered each of the negative comments received. The task group responded to and addressed each negative comment and clarified its intentions. See panel actions and statements on Proposals 5-2, 5-6, 5-8, 5-9, 5-12, 5-14, 5-38, 5-48, 5-61, 5-76, 5-77, and 5-337.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:

DOBROWSKY, P.: The work of the task group on bonding and grounding made many changes that help clarify where items are connected to instead of simply saying they need to be grounded. Changing the term "equipment grounding conductor" to "equipment bonding conductor" is still necessary because presently the terms are not clear.

18-1 Log #161 NEC-P18 **Final Action: Reject**
(Entire Document)

NOTE: The following proposal consists of Comment 18-1 on Proposal 18-1 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 18-1was:

Change the term "equipment grounding conductor" to "equipment bonding conductor" throughout the NEC.
Submitter: John Stricklin, International Assoc. of Electrical Inspectors
Recommendation: Equipment grounding conductor to be changed to equipment bonding conductor.
Substantiation: Eustace Soares stated in his book "Grounding Electrical Distribution Systems for Safety", if I were asked to describe what it is that is responsible for the mystery in "Grounding" my answer could be given in ONE word. That word would be TRADITION. Tradition has been the nemesis of the progress of civilization for centuries. The only way we can fight the enemy of tradition is to view the facts with an open mind and not let tradition close our eyes to the truth.

TRADITION says we did something fifty years or more ago so we became hide-bound (having an inflexible character) and continue to do it despite the changes over the years, which dictate otherwise.

Eustace Soares states in the preface of his book on grounding, "The effectiveness and safety of any system finally rests on the methods of installations. The book covers pitfalls that must be avoided in order to comply with the rules as set down in the Code."

One of these pitfalls is to separate the differences between "Ground, grounded and grounding" and "Bond, bonded, and bonding."

Ground, grounded and grounding relate to "Electrical systems that are grounded shall be connected to earth in a manner that will limit the voltage imposed by lightning, line surges, or unintentional contact with higher-voltage lines and that will stabilize the voltage to earth during normal operation." Is it not the power supplier that needs, "line surges, or unintentional contact with higher-voltage lines and that will stabilize the voltage to earth during their noraml operations?"

Bond, bonded, and bonding relate to "Non-current-carrying conductive materials enclosing electrical conductors or equipment, or forming part of such equipment, shall be connected together and to the electrical supply source in a manner that establishes an effective fault current path."

Until the users of the National Electrial Code, change grounding and bonding to what they really are and mean, nearly everyone that trys to use the present NEC is always confused. Ground, grounded and grounding relate to lightning protection. Bond, bonded, bonding relates to fault current protection. When grounding and bonding are separated, that could be the first step in making grounding workable.
Panel Meeting Action: Reject
Panel Statement: The term Equipment Bonding Conductor as proposed is not consistent with the TCC Task Group Proposal 18-8, which is accepted by the panel. The work of the TCC Task Group shown in Proposal 18-8 establishes common definitions and guidance for these terms throughout the Code.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-2 Log #162 NEC-P18 **Final Action: Reject**
(Entire Document)

NOTE: The following proposal consists of Comment 18-2 on Proposal 18-1 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 18-1 was:

Change the term "equipment grounding conductor" to "equipment bonding conductor" throughout the NEC.
Submitter: John Stricklin, International Assoc. of Electrical Inspectors
Recommendation: Change equipment grounding conductor to equipment bonding conductor.
Substantiation: The NEC is supposed to be "THE BOOK" for electricians and the users of electricity. The biggest part of the NEC is easy to understand but "GROUNDING" is another subject. How many people have been injured or killed, or had personal property destroyed by the misunderstanding of grounding? This little three word (equipment bonding conductor) change could be the most important change ever made in the NEC.
Panel Meeting Action: Reject
Panel Statement: The term Equipment Bonding Conductor as proposed is not consistent with the TCC Task Group Proposal 18-8, which is accepted by the panel. The work of the TCC Task Group shown in Proposal 18-8 establishes common definitions and guidance for these terms throughout the Code.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-3 Log #163 NEC-P18 **Final Action: Reject**
(Entire Document)

NOTE: The following proposal consists of Comment 18-2a on Proposal 18-1 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 18-1 was:

Change the term "equipment grounding conductor" to "equipment bonding conductor" throughout the NEC.
Submitter: Paul Dobrowsky, Holley, NY
Recommendation: Accept the proposal.
Substantiation: I still believe changing the term equipment grounding conductor (EGC) to equipment bonding conductor (EBC) remains the best thing to do, and understand there is still much to do. Although the necessary 2/3 vote by CMP5 was not achieved, a majority vote was, indicating that there is support for the change. Using the present term, one must "ignore" the actual language. It is amazing how many individuals shared verbal comments that using the proposed term is much clearer. These comments came from those that are very experienced. Some indicate that the existing terms are acceptable and have been used for many years. That doesn't make them correct, and to understand the function and concept, one must actually ignore the definitions. What about the new user of the NEC? We need to think of the future and whether this change is helpful.

Some have argued that a great expense will be incurred, but what about the hidden expense of misunderstanding. If a FPN is included with the new definition (EBC) indicating that the term equipment grounding conductor was for this purpose in past editions of the NEC, product standards and manufacturers instructions can be changed as part of the normal revision process. In the 2002 NEC, the term "lighting fixture" was changed to "luminaire" with no indication of a tremendous expense to the industry. Retailers continue to advertise they are selling lighting fixtures. In many applications, the device terminal described as that intended for the connection of the equipment grounding conductor actually is "grounded" using equipment bonding jumper. That jumper doesn't get connected to ground; it completes the fault current path by bonding. In many instances, the fault can be cleared with no current passing through "ground." Electricians will continue to connect the green colored or bare conductor to the green device terminal regardless of whether the manufacturer's literature describes it as an equipment grounding terminal.

Some have argued that there will be a fortune to be made in seminars. I believe that this will be fairly easy to explain and will actually decrease the amount of education necessary in the future because the terms will be more self evident of what they are being used for. In 250.80 and 250.84 we provide exceptions that "do not require elbows buried in the earth to be grounded." They are in the earth! Isn't that grounded by the definition?

The discussions related to the proposed concept have been very interesting and enlightening and has already increased the awareness of the differences between grounding and bonding. The true quality of many individuals was very evident, and exemplifies the NEC process. Even those individuals that disagree with this change continue to remain good friends.

Panel Meeting Action: Reject

Panel Statement: The term Equipment Bonding Conductor as proposed is not consistent with the TCC Task Group Proposal 18-8, which is accepted by the panel. The work of the TCC Task Group shown in Proposal 18-8 establishes common definitions and guidance for these terms throughout the Code.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

18-4 Log #1121 NEC-P18 **Final Action: Reject**

(Entire Document)

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Change "luminaire(s)" to "lighting fixtures".

Substantiation: There is no definition for a lighting fixture which does not conform to the definition of luminaire. A chandelier with unenclosed (not protected) lamps does not conform to the definition nor does a fluorescent fixture without a lens. The proposed definition does not include equipments which are basically lampholders, such as sign receptacles, pendant supported brass screw shell lampholders, or porcelain and plastic lampholders designed for mounting on an outlet box, or weatherproof type lampholders.

Panel Meeting Action: Reject

Panel Statement: The proposal would change the term "Luminaire" to "Light Fixture". Making this change would not address the concerns expressed in the substantiation.

There are luminaire designs that do not include a diffuser. In these instances the light is "distributed" by the lamp alone.

"Luminaire" is the term specified by the IESNA, in the ANSI/UL safety standards and the ANSI/NEMA performance standards for lighting products that were previously referred to as "light fixtures" in the U.S. "Luminaire" is also the term used in IEC standards and accepted globally. It is the panel's intent to use the internationally accepted term in this Code.

The panel also agrees that lampholders and sign receptacles are not luminaires. See panel action and statement on Proposal 18-44, which deletes the term "(fixture)" throughout the Code. See also Panel Proposal 18-4b (log CP1800) which revises the definition of luminaire as follows: Luminaire – A complete lighting unit consisting of a light source such as a lamp or lamps, together with the parts designed to position the light source and connect it to the power supply. It may also include parts to protect the light source, ballast, or distribute the light. A lampholder itself is not a luminaire.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

ARTICLE 90 — INTRODUCTION

1-1 Log #808 NEC-P01 **Final Action: Reject**

(90 and and 110)

Submitter: John MacLennan, Prescott, WI

Recommendation: Since the NFPA Standards do exist and are written to further define the NEC 70 why then aren't they mentioned as a requirement in their associated articles of the NEC 70? I am now retired but I still keep myself active in the codes. As the proud holder of a MN Master Electrician's/Contractors License I speak out whenever the need arises on a given subject as to the further requirements of the NFPA Bulletins on various subjects!

Substantiation: I discussed inspection discrepancies I have come across through my 50 years in the trades, with the the promoters of the seminar I attended in Jan 2005 in MN. I was told by the heirarchy from the MN Electrical State Board that although the NFPA does go a step further, MN laws only allow us to enforce the NEC70! So my question is why muddy the waters with un enforced recommendations?

Panel Meeting Action: Reject

Panel Statement: The submitter does not provide specific locations for the recommended changes or proposed text, as required by 4-3.3(b) and 4-3.3(c) of the Regulations Governing Committee Projects.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-2 Log #3561 NEC-P01 **Final Action: Reject**

(90.2(D) & (E) (New))

Submitter: Jeffrey Boksiner, Telcordia Technologies, Inc.

Recommendation: Add new 90.2(D) and 90.2(E) as follows:

<u>(D) Existing Installations. Existing electrical installations that do not comply with the provisions of this code shall be permitted to be continued in use unless the authority having jurisdiction for enforcing this code determines that the lack of conformity with this code presents an imminent danger to occupants. Where changes are required for correction of hazards, a reasonable amount of time shall be given for compliance, depending on the degree of the hazard.</u>

<u>(E) Additions, Alterations, or Repairs. Additions, alterations, or repairs to any building, structure, or premises shall conform to that required of a new building without requiring the existing building to comply with all the requirements of this code. Additions, alterations, installations, or repairs shall not cause an existing building to become unsafe or to adversely affect the performance of the building as determined by the authority having jurisdiction. Electrical wiring added to an existing service, feeder, or branch circuit shall not result in an installation that violates the provisions of the code in force at the time the additions are made.</u>

Substantiation: The proposed text is intended to clarify in the scope of the code that the NEC is not retroactive. The proposed wording is based on 80.9(B) and (C) of Annex G. Presently, Annex G is informative unless specifically adopted by the local jurisdiction. However, there is confusion and uncertainty about application of the code, and the proposed text should be a normative part of the NEC. The application of the NEC described in the proposed wording is the established practice in the majority of jurisdictions. The assumption that the NEC is not retroactive is sometimes the basis for acceptance or rejection of NEC change proposals.

Other standards that are adopted into law by reference contain sections on application. An example is rule 013 of the National Electrical Safety Code (NESC).

Panel Meeting Action: Reject

Panel Statement: Retroactive application is within the purview of the adopting jurisdictions, such as Annex G, which may be specifically adopted by the local authority having jurisdiction adopting the NEC. The Code itself cannot usurp the authority of these jurisdictions. The submitter's concerns are addressed by 90.1(A) and (B) and in other NFPA standards such as NFPA 73.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

MCCARVER, R.: While retroactive application may be in the purview of adopting jurisdictions, it is seldom their practice to make retroactive applications. It is difficult to see how moving this statement from Annex G into the Code could be seen as usurping the authority of an adopting jurisdiction. All a jurisdiction has to do is adopt the Code without this clause if it desires. There is no authority being usurped. The NFPA Manual of Style, paragraph 1.6.1.5, provides that "retroactivity statements shall be used as applicable." Annex A of that document even provides suggested language for retroactivity statements.

Questions continually arise from Code users as to whether the NEC is retroactive. Frequently the NEC is interpreted incorrectly on this issue leading to unnecessary added installation and maintenance procedures and costs. The proposed revision clarifies the scope of the NEC relevant to retroactivity and re-institutes retroactivity considerations as normative text.

1-3 Log #3346 NEC-P01 **Final Action: Reject**

(90.2(1)(3))

TCC Action: The Technical Correlating Committee advises that Article Scope statements and are the responsibility of the Technical Correlating Committee, however, 90.2 covers the scope of the NEC and is not an Article Scope statement.

Submitter: Paula Walach, P&G/Gillette

Recommendation: Revise text to read:

Exception to railway rolling stock. This would be limited to railway rolling stock that runs confined in railway territory with overhead electric catenary,and or third rail or street running conduit slot. Only where the rolling stock cars are occupied in the same manor as a place of public assembly,and are equipped with bathrooms and restaurant facilities or sleeping quarters, that as rolling stock defined only that carries passenger for hire. It also may address station facilities and waiting rooms, that are connected with electric railway systems. It does not cover substations, locomotive, or general power distribution. Power for such electric railway can have power derived from a local utility grid.

Substantiation: With the advent of such electric railway rolling stock having being equipped for lap top computers, lavatories having Ground fault circuit interrupter, food service cars having all sorts of electrical appliances that is normally supplied by on board electric power, there has to be regulation of installation and repair of such on board conviences. Then qualified people (licensed electricians in jurisdictions that such rolling stock is maintained or built) that work in building premise wiring would carry out a same safe standard.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The requirements of the Code have been developed, recognizing that railway rolling stock is not covered, as 90.2(B)(3) is specific to only railways operating rolling stock associated with generation, transformation, transmission, or distribution of power. The proposed language is general and makes an exception to the scope of the Code. As such it is not specific as to which Code requirements would be applicable to rolling stock and which would not be applicable. The concerns of the submitter would best be directed to those industry standards governing railway rolling stock. In addition, the substantiation addresses station facilities and waiting rooms that are presently covered by the Code under 90.2(A).

The Manual of Style for NFPA Technical Documents, Section 2.3.5.4, states that "exceptions shall not be permitted to be used where the exception covers the predominate use or application and would more appropriately be addressed as a requirement." CMP-1 notes that the NEC Style Manual, Section 2.2.1, requires that "the approval of the article scope statements is the responsibility of the Technical Correlating Committee."

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-4 Log #3203 NEC-P01 **Final Action: Reject**

(90.2(A)(2), FPN 2)

Submitter: Donald Cook, Shelby County Development Services

Recommendation: Delete this FPN completely.

Substantiation: A review of 90.2 (A) and (B), the Article 100 definition of service point, the complete NEC text and specifically the text in Articles 225, and 230 leads one to believe that electrical wiring and equipment located on the load side of the service point is under the scope of the NEC. This FPN, which based on the text in 90.5(C) is not enforceable, provides no value to the NEC user.

If industry believes information in the NESC is necessary for installations on the load side of the service point, that information should included as requirements of the NEC, not as a FPN. As an FPN, it only adds to the confusion of designers, installers, and AHJ's working on installations working on premises wiring.

Panel Meeting Action: Reject

Panel Statement: The FPN provides the user of the Code an applicable resource that can be adopted by governmental bodies to cover industrial substations or multibuilding complexes. Although the submitter recognizes these rules are not covered fully in the Code, ANSI C2 provides the specific information for those installations.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

HICKMAN, P.: We are voting negative to the panel action to reject proposal 1-4. Our explanation is as follows:

While we agree that a FPN reference to the NESC may be helpful, we agree with the submitter that "as an FPN, it only adds to the confusion of designers, installers, and AHJ's working on installations working on premises wiring." We further agree with the submitter that "if industry believes information in the NESC is necessary for installations on the load side of the service point, that information should included as requirements of the NEC, not as a FPN."

1-5 Log #2018 NEC-P01 **Final Action: Reject**

(90.2(B)(5)(b))

Submitter: Wayne Robinson, Lothian, MD

Recommendation: Delete the following text:

Are located in legally established easements, rights-of-way, <u>or by other agreements either</u> designated by or recognized by the public service commissions, utility commissions, or other regulatory agencies having jurisdiction for such installations.

Substantiation: 90.2(B)(5)(b) Allows public utilities to work in established easements and rights of ways. Public Utilities are interpreting that the present language allows the utility to install lighting installations in private parking areas, without proper permitting or oversight by the AHJ. The removal of "or by other agreements either" will limit the public service commission and utility commissions authority to establish easements or rights-of-way for the distribution of electricity, not for electrical installations on private property covered by 90.2(A). Utilities in Maryland have been granted the ability to supersede the NEC by the public service commission and install private area lighting without service disconnects, branch circuit protection or proper grounding means under Article 250 NEC. I believe this is unsafe and wrong.

Panel Meeting Action: Reject

Panel Statement: The text "or by other agreements" allows for the installation of utility facilities directed by their regulatory commissions on other than easements or right of ways through applications executed for service to the premise. These facilities include private area lighting, the safety of which is covered through utility conformance with the requirements of the authorities having jurisdiction over the utility.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

HICKMAN, P.: We are voting negative to the panel action to reject proposal 1-5. Our explanation is as follows:

Accepting this Proposal will, in our opinion, go a long way towards achieving a primary goal of a still-convened electrical industry coalition. The electrical industry continues to struggle to find ways to stem the tide of the erosion of installations installed and inspected in accordance with the requirements of the NEC. It is important to note that this is not a debate on who should or who will be making electrical installations, rather what installation codes are to be followed and enforced. The presentation given by Mr. Mark Ode during the CMP-1 ROP meeting on the proliferation of industrial machinery installations built and installed outside the scope of the NEC and its enforcement is very relevant example of that erosion of NEC installations and enforcement.

The use of difficult to enforce, potentially vague, and open-ended language such as "or by other agreements" could be compared to writing a blank check. Using words such as these and hoping they mean what CMP1 thought they meant in the future does not seem prudent. As utilities continue to deregulate and the electrical industry as a whole continues to seek its own level, it is hard to imagine what the scope and implications of the words "or by other agreements" could one day mean. An excellent picture of what could happen was eloquently painted in the hypothetical example offered by the Chairman of CMP-1, Mr. John Minnick, in the code making panel deliberations on this issue. My notes indicate that he asked us to envision the Hilton Head Crowne Plaza complex where we were meeting being installed per the NESC under other agreements that are designated or recognized by regulatory agencies. Imagine an entire complex of that size and complexity installed without the requirements and enforcement of the NEC. The words "or by other agreements could permit an "agreement" with a utility to completely disregard the safety driven provisions of the NEC. Enforcement may no longer be necessary and the electrical inspector may no longer be needed.

We continue to agree with Mr. Ivory's vote to reject TC Comment 1-26a in the 2002 NEC cycle and his Explanation of Negative where he disagrees with the TC-generated substantiation's general assertion that the "…amended wording adds more clarity…." Furthermore, it is extremely important to note that the term "or by other agreements" did not have public review when it went into the NEC. The term "or by other agreements" first appeared in the 2002 NEC. The term did not appear in the 1999 NEC or prior editions of the NEC. Researching this fact clearly points out that this text was not incorporated into NFPA-70 through an ANSI consensus process. The term "or by other agreements" does not appear in a public Proposal or Comment in the 2002 NEC cycle. That term was introduced in a Technical Committee Comment (Comment 1-26a). Therefore, it is our position that introduction of this term was in violation of Section 4-4.3.2 (now 4.4.3.2) of the NFPA Rules Governing Committee Projects. It states that "Technical Committee-generated Comments shall not introduce a concept that has not had public review."

It is virtually impossible to argue or contemplate that in the context of proposals and comments submitted in the 2002 cycle of the NEC that the term "or by other agreements" was intended. A review of all proposals and comments clearly reveals that no submitter suggested language that would allow any entity to make an "agreement" with the utility to completely disregard the NEC and eliminate electrical inspections. It is the position of the IBEW that a very serious error has occurred in the NFPA consensus process. We are of the opinion that the term "or by other agreements" did not have public review and was therefore not appropriately introduced by the Technical Committee (TC) in a TC-generated Comment. We ask that the TCC, Standards Council and NFPA legal counsel review this issue.

HITTINGER, D.: Electrical work that is done on the load side of the utility is subject to the NEC rules regardless of who does the work. The submitter indicates in the substantiation that work is being done by utilities without permits or inspections that enforce the NEC requirements resulting in unsafe installations. The panel statement addresses "or by other agreements" to allow for the installation of utility facilities through applications executed for service to the premises but does not address the concerns raised by the submitter for parking lot lighting installations on private property by a utility company. If that is the intent of the statement, a utility could wire an entire building "by other agreements." The panel should accept the deletion of the statement to limit the utilities' work to legally established easements or rights of way.

Comment on Affirmative:

LABRAKE, JR., N.: Deleting the text "or by other agreements" could cause a conflict with existing governing laws; i.e., local, state, federal. Out sourcing of work by utilities is controlled by the utilities methods and procedures within their tariffs and rules.

1-6 Log #839 NEC-P01 **Final Action: Accept in Principle**

(90.3)

Submitter: Stephen W. Drayton, Eastern Idaho Electrical JATC

Recommendation: Revise as follows:

Chapter 9 consists of tables and shall be applicable only as referenced elsewhere in the NEC.

Substantiation: The rest of 90.3 and Figure 91.3 states how each of the chapters are arranged and how they apply except for the Chapter 9 statement.
Panel Meeting Action: Accept in Principle
Revise this proposal as follows:
"Chapter 9 consists of tables applicable as referenced."
Panel Statement: The mandatory text of "shall" is not required for this statement and the text is revised according to the NEC Style Manual.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-7 Log #3037 NEC-P01 **Final Action: Reject**
(90.3)

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Recommendation: Revise text to read as follows:

90.3 Code Arrangement.

This Code is divided into the introduction and nine chapters, as shown in Figure 90.3. Chapters 1, 2, 3, and 4 apply generally; Chapters 5, 6, and 7 apply to special occupancies, special equipment, or other special conditions. These latter chapters supplement or modify the general rules. Chapters 1 through 4 apply except as amended by Chapters 5, 6, and 7 for the particular conditions. Chapter 8 covers communications systems and is ~~not~~ subject to the requirements of Chapters 1 through 7 ~~except where~~ unless the requirements are specifically excluded ~~referenced~~ in Chapter 8.

Chapter 9 consists of tables.

Annexes are not part of the requirements of this Code but are included for informational purposes only.

The same changes are needed in Figure 90.3, as shown below.

Substantiation: It is important to make this change because the fire safety implications of the wiring in Chapter 8 should be discussed at a level that exceeds that of CMP 16, which has total responsibility now (subject, of course, to the oversight of the Technical Correlating Committee).

A key issue is the issue of grounding of wires, cables and conductors, which is addressed, of course, in Article 250, which Chapter does not need to follow. The wiring covered by Chapter 8 is often not low voltage wiring and it is inappropriate that Chapter 2, for example, should not apply. Chapter 8 should become a special condition type of chapter, just like Chapters 5 through 7. This may have implications in other areas, which will have to be looked into in detail, probably. However, the safety considerations are critical here.

With regard to wiring in ducts, for example, Chapter 3, in article 300, states that there shall be no wiring in ducts, as follows:

300.22 (A) Ducts for Dust, Loose Stock, or Vapor Removal. "No wiring systems of any type shall be installed in ducts used to transport dust, loose stock, or flammable vapors. No wiring system of any type shall be installed in any duct, or shaft containing only such ducts, used for vapor removal or for ventilation of commercial-type cooking equipment."

At present this is consistent with the statements in each one of the articles in Chapter 8, as follows, for articles 800, 820 and 830:

800.133 Installation of Communications Wires, Cables, and Equipment.
(D) Wiring in Ducts for Dust, Loose Stock, or Vapor Removal. Section 300.22(A) shall apply.
800.154 Applications of Listed Communications Wires and Cables and Communications Raceways.
Communications wires and cables shall comply with the requirements of 800.154(A) through 800.154(F) or where cable substitutions are made in accordance with 800.154(G)
(A) Plenum. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type CMP. Abandoned cables shall not be permitted to remain. Types CMP, CMR, CMG, CM, and CMX and communications wire installed in compliance with 300.22 shall be permitted. Listed plenum communications raceways shall be permitted to be installed in ducts and plenums as described in 300.22(B) and in other spaces used for environmental air as described in 300.22(C). Only Type CMP cable shall be permitted to be installed in raceways.
FPN: See 8.14.1 of NFPA 13-2002, Installation of Sprinkler Systems, for requirements for sprinklers in concealed spaces containing exposed combustibles.
820.3 Other Articles.
Circuits and equipment shall comply with 820.3(A) through 820.3(G).
(A) Spread of Fire or Products of Combustion. Section 300.21 shall apply. The accessible portion of abandoned coaxial cables shall be removed.
(B) Ducts, Plenums, and Other Air-Handling Spaces. Section 300.22, where installed in ducts, plenums, or other spaces used for environmental air, shall apply.
Exception: As permitted in 820.154(A).
820.154 Applications of Listed CATV Cables and CATV Raceways.
CATV cables shall comply with the requirements of 820.154(A) through 820.154(D) or where cable substitutions are made as shown in Table 820.154.
(A) Plenums. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type CATVP. Abandoned cables shall not be permitted to remain. Types CATVP, CATVR, CATV, and CATVX cables installed in compliance with 300.22 shall be permitted. Listed plenum CATV raceways shall be permitted to be installed in ducts and plenums as described in 300.22(B) and in other spaces used for environmental air as described in 300.22(C). Only Type CATVP cable shall be permitted to be installed in these raceways.
FPN: See 8.14.1 of NFPA 13-2002, Installation of Sprinkler Systems, for requirements for sprinklers in concealed spaces containing exposed combustibles.
830.3 Other Articles.
Circuits and equipment shall comply with 830.3(A) through 830.3(E).
(A) Spread of Fire or Products of Combustion. Section 300.21 shall apply. The accessible portion of abandoned network-powered broadband communications cables shall be removed.
(B) Ducts, Plenums, and Other Air-Handling Spaces. Section 300.22 shall apply where installed in ducts, plenums, or other spaces used for environmental air.
Exception: As permitted in 830.154(B).
830.151 Medium Power Network-Powered Broadband Communications System Wiring Methods.
Medium power network-powered broadband communications systems shall be installed within buildings using listed Type BM or Type BMR, network-powered broadband communications medium power cables.
(A) Ducts, Plenums, and Other Air-Handling Spaces. Section 300.22 shall apply.

However, CMP 16 added into articles 800 and 820 the definition of a new term, which is actually not used in the articles, namely "air duct", as follows:

Air Duct. A conduit or passageway for conveying air to or from heating, cooling, air conditioning, or ventilating equipment, but not including the plenum.

Since air ducts are neither defined in Chapter 100 of the NEC nor in Chapter 3, clearly, the intent of the addition of this definition is to add requirements for wiring in air ducts. In fact, CMP 16, responsible for Chapter 8, approved proposals for the last edition of the NEC that would have allowed wiring methods into air ducts, before Standards Council imposed a moratorium.

Figure 90.3 Code Arrangement

Chapter 1 - General Chapter 2 - Wiring and Protection Chapter 3 - Wiring Methods and Materials Chapter 4 - Equipment for General Use	Applies Generally to All Electrical Installations
Supplements or Modifies Chapters 1 through 4	Chapter 5 - Special Occupancies Chapter 6 - Special Equipment Chapter 7 - Special Conditions
Chapter 8 - Communications Systems	Chapter 8 is ~~not~~ subject to the requirements of Chapters 1 through 7 ~~except where~~ unless the requirements are specifically ~~referenced~~ excluded in Chapter 8.
Chapter 9 - Tables	Applicable as Referenced
Annex A through Annex G	Informational only; not mandatory

Another example of potential problems is that the communications wiring methods defined in 300.22 would, at first sight, appear to exclude the use of the type of cables that is normally used in plenums (or in "other spaces used for environmental air"), namely CL2P, CL3P, FPLP, NPLFP, OFNP, OFCP, CMP, CATVP and BLP. In fact, however, the CATVP and BLP wiring systems are covered confusingly in articles 820 and 830 by the exclusion of Chapter 8 from requiring compliance with article 300.22, with added exceptions, as follows:

820.3 Other Articles.
Circuits and equipment shall comply with 820.3(A) through 820.3(G).
(A) Spread of Fire or Products of Combustion. Section 300.21 shall apply. The accessible portion of abandoned coaxial cables shall be removed.
(B) Ducts, Plenums, and Other Air-Handling Spaces. Section 300.22, where installed in ducts, plenums, or other spaces used for environmental air, shall apply.
Exception: As permitted in 820.154(A).
820.154 Applications of Listed CATV Cables and CATV Raceways.
CATV cables shall comply with the requirements of 820.154(A) through 820.154(D) or where cable substitutions are made as shown in Table 820.154.
(A) Plenums. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type CATVP. Abandoned cables shall not be permitted to remain. Types CATVP, CATVR, CATV, and CATVX cables installed in compliance with 300.22 shall be permitted. Listed plenum CATV raceways shall be permitted to be installed in ducts and plenums as described in 300.22(B) and in other spaces used for environmental air as described in 300.22(C). Only Type CATVP cable shall be permitted to be installed in these raceways.
FPN: See 8.14.1 of NFPA 13-2002, Installation of Sprinkler Systems, for requirements for sprinklers in concealed spaces containing exposed combustibles.
830.3 Other Articles.
Circuits and equipment shall comply with 830.3(A) through 830.3(E).
(A) Spread of Fire or Products of Combustion. Section 300.21 shall apply. The accessible portion of abandoned network-powered broadband communications cables shall be removed.
(B) Ducts, Plenums, and Other Air-Handling Spaces. Section 300.22 shall apply where installed in ducts, plenums, or other spaces used for environmental air.
Exception: As permitted in 830.154(B).
830.154 Low-Power Network-Powered Broadband Communications System Wiring Methods.
Low-power network-powered broadband communications systems shall comply with any of the requirements of 830.154(A) through 830.154(D).
(A) In Buildings. Low-power network-powered broadband communications systems shall be installed within buildings using listed Type BLX, Type BL, Type BLR, or Type BLP network-powered broadband communications low-power cables.
(B) Ducts, Plenums, and Other Air-Handling Spaces. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type BLP. Type BLX cable installed in compliance with 300.22 shall be permitted.

However, CMP cables are also covered confusingly in Article 800, which states as follows:

800.3 Other Articles.
(A) Hybrid Power and Communications Cables. The provisions of 780.6 shall apply for listed hybrid power and communications cables in closed-loop and programmed power distribution.
FPN: See 800.179(J) for hybrid power and communications cable in other applications.
(B) Hazardous (Classified) Locations. Communications circuits and equipment installed in a location that is classified in accordance with Article 500 shall comply with the applicable requirements of Chapter 5.
(C) Spread of Fire or Products of Combustion. Section 300.21 shall apply. The accessible portion of abandoned communications cables shall not be permitted to remain.
(D) Equipment in Other Space Used for Environmental Air. Section 300.22(C) shall apply.
800.154 Applications of Listed Communications Wires and Cables and Communications Raceways.
Communications wires and cables shall comply with the requirements of 800.154(A) through 800.154(F) or where cable substitutions are made in accordance with 800.154(G)
(A) Plenum. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type CMP. Abandoned cables shall not be permitted to remain. Types CMP, CMR, CMG, CM, and CMX and communications wire installed in compliance with 300.22 shall be permitted. Listed plenum communications raceways shall be permitted to be installed in ducts and plenums as described in 300.22(B) and in other spaces used for environmental air as described in 300.22(C). Only Type CMP cable shall be permitted to be installed in raceways.

Going to articles 725, 760 and 770, thecables are covered by exceptions as follows:

725.3 Other Articles.
Circuits and equipment shall comply with the articles or sections listed in 725.3(A) through 725.3(G). Only those sections of Article 300 referenced in this article shall apply to Class 1, Class 2, and Class 3 circuits.
(A) Number and Size of Conductors in Raceway. Section 300.17.
(B) Spread of Fire or Products of Combustion. Section 300.21. The accessible portion of abandoned Class 2, Class 3, and PLTC cables shall be removed.
(C) Ducts, Plenums, and Other Air-Handling Spaces. Class 1, Class 2, and Class 3 circuits installed in ducts, plenums, or other space used for environmental air shall comply with 300.22. Type CL2P or CL3P cables and plenum signaling raceways shall be permitted for Class 2 and Class 3 circuits installed in other spaces used for environmental air.
760.3 Other Articles.
Circuits and equipment shall comply with 760.3(A) through 760.3(F). Only those sections of Article 300 referenced in this article shall apply to fire alarm systems.
(A) Spread of Fire or Products of Combustion. Section 300.21. The accessible portion of abandoned fire alarm cables shall be removed.
(B) Ducts, Plenums, and Other Air-Handling Spaces. Section 300.22, where installed in ducts or plenums or other spaces used for environmental air.
Exception: As permitted in 760.30(B)(1) and (B)(2) and 760.61(A).
760.30 Multiconductor NPLFA Cables.
Multiconductor non–power-limited fire alarm cables that meet the requirements of 760.81 shall be permitted to be used on fire alarm circuits operating at 150 volts or less and shall be installed in accordance with 760.30(A) and 760.30(B).
(B) Applications of Listed NPLFA Cables. The use of non–power-limited fire alarm circuit cables shall comply with 760.30(B)(1) through (B)(4).
(1) Ducts and Plenums. Multiconductor non–power-limited fire alarm circuit cables, Types NPLFP, NPLFR, and NPLF, shall not be installed exposed in ducts or plenums.
FPN: See 300.22(B).
(2) Other Spaces Used for Environmental Air. Cables installed in other spaces used for environmental air shall be Type NPLFP.
Exception No. 1: Types NPLFR and NPLF cables installed in compliance with 300.22(C).
Exception No. 2: Other wiring methods in accordance with 300.22(C) and conductors in compliance with 760.27(C).
Exception No. 3: Type NPLFP-CI cable shall be permitted to be installed to provide a 2-hour circuit integrity rated cable.
760.61 Applications of Listed PLFA Cables.
PLFA cables shall comply with the requirements described in either 760.61(A), (B), or (C) or where cable substitutions are made as shown in 760.61(D).
(A) Plenum. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type FPLP. Types FPLP, FPLR, and FPL cables installed in compliance with 300.22 shall be permitted. Type FPLP-CI cable shall be permitted to be installed to provide a 2-hour circuit integrity rated cable.
770.3 Other Articles.
Circuits and equipment shall comply with 770.3(A) and 770.3(B). Only those sections of Article 300 referenced in this article shall apply to optical fiber cables and raceways.
(A) Spread of Fire or Products of Combustion. The requirements of 300.21 for electrical installations shall also apply to installations of optical fiber cables and raceways. The accessible portion of abandoned optical fiber cables shall be removed.
(B) Ducts, Plenums, and Other Air-Handling Spaces. The requirements of 300.22 for electric wiring shall also apply to installations of optical fiber cables and raceways where they are installed in ducts or plenums or other space used for environmental air.
Exception: As permitted in 770.154(A).
770.154 Applications of Listed Optical Fiber Cables and Raceways.
Nonconductive and conductive optical fiber cables shall comply with any of the requirements given in 770.154(A) through 770.154(E) or where cable substitutions are made as shown in 770.154(F).
(A) Plenums. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type OFNP or OFCP. Abandoned cables shall not be permitted to remain. Types OFNR, OFCR, OFNG, OFN, OFCG, and OFC cables installed in compliance with 300.22 shall be permitted. Listed plenum optical fiber raceways shall be permitted to be installed in ducts and plenums as described in 300.22(B) and in other spaces used for environmental air as described in 300.22(C). Only type OFNP and OFCP cables shall be permitted to be installed in these raceways.
FPN: See 8.14.1 of NFPA 13 (2002), Installation of Sprinkler Systems, for requirements for sprinklers in concealed spaces containing exposed combustibles.

In consequence, it is important to ensure that proper guidance for wiring systems is given throughout the NEC and that CMP 16 not be able to set its own rules in a vacuum.

In many ways, the responsibility of overall requirements for Chapter 8 wiring (which is, indeed, low voltage wiring, in most cases, albeit not in all cases) is not that different from the responsibility of overall requirements for Chapters 5, 6, and 7 wiring and communications systems should be treated the same way as the "special occupancies", "special equipment" and "special conditions" systems. In fact, communications systems could easily be considered special equipment just like the equipment in Chapter 6.

When chapter 8 was initially being treated differently, it was thought that it would include only low voltage wiring. However, there are now "medium power wiring" systems in articles 800, 820 and 830, as well as in articles 725, 760 and 770. Thus, there is actually less difference between the wiring systems of articles 725, 760 and 770 and those of articles 800, 820 and 830 than is apparent initially. In fact, network-powered broadband communications systems can have up to 150 V and should be required to meet all grounding requirements of article 250, rather than having a selection of rules made in article 820: this is a worker safety issue.

The changes proposed to article 90 need to be correlated with a proposed change to section 300.22 that specifically includes the permitted wiring systems, such as the following, which is a proposal I am making to CMP 3. With these changes, further clarity is added to the NEC.

300.22 Wiring in Ducts, Plenums, and Other Air-Handling Spaces. The provisions of this section apply to the installation and uses of electric wiring and equipment in ducts, plenums, and other air-handling spaces.

FPN: See Article 424, Part VI, for duct heaters.

(C) Other Space Used for Environmental Air. This section applies to space used for environmental air-handling purposes other than ducts and plenums as specified in 300.22(A) and (B). It does not include habitable rooms or areas of buildings, the prime purpose of which is not air handling.

FPN: The space over a hung ceiling used for environmental air-handling purposes is an example of the type of other space to which this section applies.

Exception: This section shall not apply to the joist or stud spaces of dwelling units where the wiring passes through such spaces perpendicular to the long dimension of such spaces.

(1) Wiring Methods. The wiring methods for such other space shall be limited to the following:

(a) Totally enclosed, nonventilated, insulated busway having no provisions for plug-in connections

(b) Type MI cable

(c) Type MC cable without an overall nonmetallic covering

(d) Type AC cable

(e) Factory-assembled multiconductor control or power cable that is specifically listed for the use

(f) Listed prefabricated cable assemblies of metallic manufactured wiring systems without nonmetallic sheath

(g) Cables and conductors installed in electrical metallic tubing, flexible metallic tubing, intermediate metal conduit, rigid metal conduit without an overall nonmetallic covering, flexible metal conduit, or, where accessible, surface metal raceway or metal wireway with metal covers or solid bottom metal cable tray with solid metal covers

(h) Cables listed as low smoke-producing cable and fire-resistant cable, because the cable exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with NFPA 262-2002, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces.

~~***totally enclosed, nonventilated, insulated busway having no provisions for plug-in connections, Type MI cable, Type MC cable without an overall nonmetallic covering, Type AC cable, or other factory-assembled multiconductor control or power cable that is specifically listed for the use, or listed prefabricated cable assemblies of metallic manufactured wiring systems without nonmetallic sheath. Other types of cables and conductors shall be installed in electrical metallic tubing, flexible metallic tubing, intermediate metal conduit, rigid metal conduit without an overall nonmetallic covering, flexible metal conduit, or, where accessible, surface metal raceway or metal wireway with metal covers or solid bottom metal cable tray with solid metal covers***~~ .

(2) Equipment. Electrical equipment with a metal enclosure, or with a nonmetallic enclosure listed for the use and having adequate fire-resistant and low-smoke-producing characteristics, and associated wiring material suitable for the ambient temperature shall be permitted to be installed in such other space unless prohibited elsewhere in this Code.

Exception: Integral fan systems shall be permitted where specifically identified for such use.

(D) Information Technology Equipment. Electric wiring in air-handling areas beneath raised floors for information technology equipment shall be permitted in accordance with Article 645.

I understand that the responsibility for scopes belongs to the NEC Technical Correlating Committee, but this is being brought to the NEC TCC attention for CMP 1 and TCC action

Panel Meeting Action: Reject

Panel Statement: CMP-1 rejects this proposal because it is incomplete and would create conflicts with other panels for which there are no proposals to resolve in this code cycle. However, the Panel concludes that the intent of the submitter would be met as editorially modified by CMP-1 as follows:

90.3 Code Arrangement.

This Code is divided into the introduction and nine chapters, as shown in Figure 90.3. Chapters 1, 2, 3, and 4 apply generally; Chapters 5, 6, ~~and~~ 7 , and 8 apply to special occupancies, special equipment, ~~or other~~ special conditions , or communications systems . These latter chapters supplement or modify the general rules. Chapters 1 through 4 apply except as amended by Chapters 5, 6, ~~and~~ 7 , and 8 for the particular conditions.

~~Chapter 8 covers communications systems and is not subject to the requirements of Chapters 1 through 7 except where the requirements are specifically referenced in Chapter 8.~~

The remainder of 90.3 would be unchanged by this proposal except for Figure 90.3.

Chapter 8 articles include references to other parts of the Code as deemed applicable by CMP-16 to communications systems. If additional references or other requirements in Chapter 8 are deemed necessary, specific proposals should be made to CMP-16 for its consideration.

This proposal is being referred to the Technical Correlating Committee for their consideration of: (1) the submitter's contention that "…the fire safety implications of the wiring in Chapter 8 should be discussed at a level that exceeds that of CMP-16…"; and (2) whether Chapter 8 should remain a stand-alone chapter. If the TCC disagrees with having Chapter 8 as a stand-alone chapter, it is recommended that the TCC form a task group to generate the necessary correlating proposals for the next code cycle.

The panel does not agree with all of the submitter's substantiation.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

HICKMAN, P.: While we agree that this proposal has merit, we agree with the Panel Action to Reject and the Panel Statement recognizing that the proposal, as submitted, could create conflicts with requirements beyond the purview of CMP1.

MCCARVER, R.: The Panel's action to reject this proposal is the correct one. Its statement, however, includes a suggestion to change the code arrangement to treat Chapter 8 like Chapters 5 through 7. There is insufficient substantiation for this suggestion. It is curious that panel members provide this suggestion in a reject action, rather than addressing the merits of the original proposal. Chapter 8 deals with communications systems, which are uniquely different from power systems. It does not make sense to require the whole of the Code to apply to communications systems when they differ so significantly from power systems. Communications systems conductors and cables operate at current and power levels greatly reduced from those of power circuits, and are power-limited thereby greatly reducing the likelihood of electrical fire. The grounding requirements of Chapter 8 have been in place for many years, yielding an exemplary safety record. Some grounding considerations are unique to Chapter 8 and it is appropriate that communications systems have their own grounding requirements. However, where the requirements of Article 250 are applicable, they are referenced (see for example 800.100(B)(1), 800.100(B)(2), 800.100(C), 800.106(A) and similar sections in 820 and 830). Article 770 references Article 250 for grounding as well. Hence, there are no "fire safety implications" to the present requirements of Chapter 8 (and 770) as the submitter alleged. Chapter 8 goes beyond other sections of the Code in that it contains requirements for lightning protection. The present requirements have a long-established exemplary safety record. The submitter failed to provide any evidence refuting this, and the Panel failed in not recognizing that.

CMP16 contains balanced representation from the electrical industry including electrical inspection, manufacturing, installation, power distribution and communications. As such, CMP16 does not "set its own rules in a vacuum," but is specifically constituted to address both electrical and communications safety issues. The submitter has indicated in his substantiation that there are medium power wiring systems in Articles 800, 820, 830 and 770. This is incorrect. Only Article 830 contains medium power systems; electrical safety concerns have been properly addressed. Furthermore, Article 770 has no power whatsoever. The submitter's statements about wiring in air ducts are confusing. Articles 725 and 800 have permitted plenum cables to be installed in air ducts since the 1975 NEC. Currently, Articles 725, 760, 770, 800, 820 and 830 permit wiring in air ducts. The requirements are the same in these articles notwithstanding the fact that three of them are in Chapter 7 and three are in Chapter 8.

Finally, revisions suggested by either the original submitter or in the Panel statement would result in pure chaos unless each and every requirement in Chapters 1 through 6 were considered and addressed by CMP 16. There are no proposals to do so.

1-8 Log #1397 NEC-P01 **Final Action: Reject**
(90.4)

Submitter: George Stolz, II, Pierce, CO

Recommendation: Add the following statement to 90.4:

The authority having jurisdiction of enforcement of the Code shall accept listed and labeled equipment or materials where used or installed in accordance with instructions included with the listing or labeling. The authority shall have the responsibility for deciding upon the approval of unlisted or unlabeled equipment and materials, and for granting the special permission contemplated in a number of the rules.

Substantiation: As it is currently written, per 90.4 and 110.2, the authority having jurisdiction has the final say and the authority to reject listed materials and equipment. If listed products are used in accordance with their listing, then these items should automatically be acceptable to the AHJ according to the NEC. This would greatly clarify the roles of the parties involved. It would ease the burden on inspectors who currently have to determine if they agree with the

listing, and would greatly ease the burden on the installers in the field. Listing should stand as a guarantee to the installer that they are compliant with the NEC. A similar rule has been adopted in Massachusetts to the benefit of all parties involved.
Panel Meeting Action: Reject
Panel Statement: The Title of Section 90.4 is Enforcement. Enforcement of the NEC and determining the approval of equipment and materials is the responsibility of the authority having jurisdiction. Adding wording to require automatic approval of equipment or materials is in direct conflict with this section and the definition of “Authority Having Jurisdiction.” The submitter’s concern relative to unlisted equipment is already addressed in the last sentence of the first paragraph of 90.4.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-9 Log #3545 NEC-P01 **Final Action: Reject**
(90.5(D))

Submitter: Redwood Kardon, Code Check Institute
Recommendation: Revise as follows:
90.5 Mandatory Rules, Permissive Rules, ~~and~~ Explanatory and Changed Material.
(A) Mandatory Rules...
(B) Permissive Rules...
(C) Explanatory Martial ...
(D) Changed Material. Changes other than editorial are indicated by a vertical rule beside the paragraph, table, or figure in which the change occurred. Where one or more complete paragraphs have been deleted, the deletion is indicated by a bullet (●) between the paragraphs that remain.
Substantiation: To help make the code more “user friendly”, protocols, on how to use the code, should be located together in the introduction to the code. The present location for instructions on the protocol for changes is located in a section of the code unrelated to usage.
Panel Meeting Action: Reject
Panel Statement: The panel agrees with the submitter’s position on users identifying modifications to new editions of the NEC. This information already appears in the title page of the NEC, and the panel concludes it does not need to be included in Article 90.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
HITTINGER, D.: I believe the proposed text to add item (D) “Changed Material” to 90.5 would provide helpful information. Providing the protocols in the code rather than the title page would alert users to these important modifications when they occur in the code.

1-10 Log #3153 NEC-P01 **Final Action: Reject**
(90.8(A))

Submitter: Ernest Hohengasser, Electrical Inspector
Recommendation: Revise the first sentence of (A) as follows:
(A) Future Expansion and Convenience. Plans and specifications that provide ample spaces in raceways, and additional spaces in electric rooms to allow for future increases in electric power and communication circuits.
Substantiation: Where space is at a premium, it has become quite common that electric rooms are designed just large enough for the initial construction needs with hardly any room for future expansion or for additional equipment. This proposal is intended as a “heads up” and for designers to have somewhere to “hang their hat” when requiring additional space in electric rooms for future expansion
Panel Meeting Action: Reject
Panel Statement: Adding the words, “in electric rooms” to 90.8(A) provides no additional clarification of the section and, in essence, limits the intent of the section to electric rooms only.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-11 Log #431 NEC-P01 **Final Action: Reject**
(90.8(B))

Submitter: Daniel Hipsher, Logansport, IN
Recommendation: Revise text to read as follows:
It is elsewhere provided in this code that the number of wires and circuits confined in a single enclosure be varyingly restricted. ~~Limiting the number of circuits in a single enclosure minimizes the effects from a short circuit or ground fault in one circuit.~~ Following the manufacturer’s limit of available circuit space in an enclosure minimizes the effect from a short circuit or a ground fault in one circuit.
Substantiation: The current text of 90.8(B) is unclear in suggesting that fewer circuits are safer. Is it recommending to not use all available circuit space in a given enclosure? Is it suggesting that enclosures have a given available space in them for circuits and this is not to be increased by any method or means?
Panel Meeting Action: Reject
Panel Statement: The current language in the subject section first appeared in the 1975 NEC edition and was developed by a Special Subcommittee on Clarification of Mandatory Applications. The intent of this subcommittee was to remove recommendations from the NEC whether the recommendation language was deleted or converted into mandatory text. The current 2005 NEC wording does not address any type of circuit limitation in an enclosure but is rather intended to provide recommendations that electrical designers take into account the effects from breakdowns such as short circuits or grounds that could involve the entire service to a premise or where such breakdowns cause damage or interruption of essential circuits and independent services such as fire pump or emergency systems. Insufficient substantiation has been provided in accordance with 4.3.3(d) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-12 Log #1658 NEC-P01 **Final Action: Reject**
(90.9)

Submitter: Earl Dean, Griswold, CT
Recommendation: Change SI designated measurements to U.S. Customary units first with the SI in parenthesis in the version intended for use in the U.S.
Substantiation: This document is primarily used in the USA where the prevalent measurement system is English. For the non-English printings of the NEC, the metrics should be used first.
The only thing printing SI first has done is to make the NEC cumbersome to use for American Electricians. Years from now, when we truly have an international stage, is the time to have the NEC be SI first.
Panel Meeting Action: Reject
Panel Statement: The submitter does not provide specific locations for the recommended changes or proposed text, as required by 4-3.3(b) and 4-3.3(c) of the Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 100 — DEFINITIONS

16-1 Log #3027 NEC-P16 **Final Action: Reject**
(100.Abandoned (as applied to cable))

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Recommendation: Add text to read as follows:
100 Definitions (I General)
Abandoned (as applied to cable). Installed cable that is not terminated at equipment and not identified for future use with a tag.
Substantiation: The definitions of abandoned cable in every article should be identical. The relevant articles are: 640, 645, 725, 760, 770, 800, 820 and 830. The definitions at articles 640 and 725 are already correct as follows:
640.2: Abandoned Audio Distribution Cable. Installed audio distribution cable that is not terminated at equipment and not identified for future use with a tag.
725.2: Abandoned Class 2, Class 3, and PLTC Cable. Installed Class 2, Class 3, and PLTC cable that is not terminated at equipment and not identified for future use with a tag.
The additional wording in the definitions in articles 760, 770, 800, 820 and 830 cause confusion. Proposals are being made to make changes to the definitions in articles 770, 800, 820 and 830, and to add a general definition into article 645 and into article 100 (the present one). The advantage inherent in having a definition in article 100 (which could then lead to delete all the others) is that a new definition is not needed every time a new cable comes into use.
Panel Meeting Action: Reject
Panel Statement: A single definition of “abandoned cable” is inappropriate to cover optical fiber, communications, CATV and network-powered broadband. Each of these has its own installation practices that must be accommodated in the definition of “abandoned cable” to avoid inappropriate and unnecessary removal. For example, buildings are often “pre-wired” for telecommunications. The wiring may be terminated in a connector or “terminal block”, but not necessarily “equipment”. Nothing may be plugged into the connector. While the current tenant may not require all the communications pre-wiring, future tenants may have additional needs and require the additional wiring. It is inappropriate to remove “pre-wiring”, which the proposed single definition of “abandoned cable” may lead to. A similar argument may be made for OF, CATV, and network-powered broadband cabling.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-1 Log #2673 NEC-P03 **Final Action: Reject**
(100.Abandoned Cable)

Submitter: Dorothy Kellogg, American Chemistry Council
Recommendation: Revise text to read:
Abandoned Cable. An installed cable that is not terminated at equipment other than a connector and not identified for future use with a tag.
Substantiation: Despite the efforts of the TCC Task Group during the last code cycle to provide individual definitions for “abandoned cable” based on the cable type, the term “abandoned cable” is still used in eight different locations

in the 2005 NEC. These include 645.5(D)(6), 770.154(A), 770.154(B), 800.154(A), 800.154(B), 820.154(A), 820.154(B)(1), 820.154(D). Also, the seven new definitions based on cable types are basically the same in all cases. Adding the definition in Article 100 would eliminate the need to have it defined in every cable Article. The similarity in each definition to the proposed is evident below.

640.2 Abandoned Audio Distribution Cable. Installed audio distribution cable that is not terminated at equipment and not identified for future use with a tag.

725.2 Abandoned Class 2, Class 3, and PLTC Cable. Installed Class 2, Class 3, and PLTC cable that is not terminated at equipment and not identified for future use with a tag.

760.2 Abandoned Fire Alarm Cable. Installed fire alarm cable that is not terminated at equipment other than a connector and not identified for future use with a tag.

770.2 Abandoned Optical Fiber Cable. Installed optical fiber cable that is not terminated at equipment other than a connector and not identified for future use with a tag.

800.2 Abandoned Communications Cable. Installed communications cable that is not terminated at both ends at a connector or other equipment and not identified for future use with a tag.

820.2 Abandoned Coaxial Cable. Installed coaxial cable that is not terminated at equipment other than a coaxial connector and not identified for future use with a tag.

830.2 Abandoned Network-Powered Broadband Communications Cable. Installed network-powered broadband communications cable that is not terminated at equipment other than a connector and not identified for future use with a tag.

Panel Meeting Action: Reject

Panel Statement: There are enough subtle differences between each one of the abandoned cable definitions in each article that these definitions should stay within their own articles. For example, an abandoned cable for a Class 2 or a Class 3 cable does not require a connector to be installed, since most of these cables are stripped and terminated directly at equipment, whereas optical fiber cable is most often terminated at a connector. Both cables must be labeled or tagged to indicate future use for this cable to remain.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 12 Negative: 1

Explanation of Negative:

PACE, D.: The panel should have accepted this proposal.

As stated in the submitter’s substantiation, the term “abandoned cable” appears in “definitions” sections of eight different articles of the NEC. Although there are some slight differences in wording, the defiitions are essentially the same.

The panel statement says there are enough subtle differences that having the term defined in eight diffeent places is substantiated. The “subtle differences” provided by the panel statement are not differences relating to whether or not the cable is abandoned, they are differences due to the type of the cable and how it is usually installed. Also, the differences are not mandatory. For example, the fact that the definition for optical fiber cable includes provisions for a connector (i.e., “not terminted at equipment other than a connector”) does not require the cable to have a connector to be defined as “abandoned cable”. In fact, the definition would still apply if the cable did <u>not</u> have a connector and, therefore, would be identical to other definitions in other articles. The panel should accept this propsoal.

1-13 Log #1632 NEC-P01 **Final Action: Reject**
(100.Accessible, Immediately (Immediately Accessible))

Submitter: Jim Davis, Electrical Education Services, LLC

Recommendation: Add new definition as follows:

<u>Accessible, Immediately (Immediately Accessible). Capable of being reached instantly for emergency operation without requiring those to whom immediate access is requisite to climb over or remove obstacles, remove locks, or to resort to portable ladders, and so forth.</u>

Substantiation: The 2003 edition of the NEC Style Manual, in Table 3.2.1, describes the word “readily” as “possibly unenforceable and vague.” Therefore, the existing term “Readily Accessible” is in conflict with the style manual. The NFPA Handbook for the 2005 NEC describes the term “Readily Accessible” in such a way as to NOT connote a sense of urgency (use of locks) in those who might choose to operate such equipment (usually a disconnect). In addition, the explanatory text in the NFPA Handbook for the 2005 NEC, in the justification of the revised text in 680.41 Emergency Switch for Spas and Hot Tubs for the term “readily accessible,” describes a situation which clearly indicates the need for the proposed new definition of “Immediately Accessible” rather than just “readily accessible.”

Panel Meeting Action: Reject

Panel Statement: The proposed term “Immediately Accessible” is not used in the Code and does not require a definition.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-14 Log #51 NEC-P01 **Final Action: Reject**
(100. Air Duct)

Submitter: Stanley Kaufman, Cable Safe Inc.

Recommendation: Add a definition to read as follows:

Air Duct. A conduit or passageway for conveying air to or from heating, cooling, air conditioning, or ventilating equipment, but not including the plenum. [NFPA 97:1.26]

Substantiation: The definition of an air duct is in the definitions section of Articles 800 and 820. The style manual requires that a definition be placed in Article 100 rather than multiple articles. Furthermore, the term “air duct” is used in sections 454.58 and 551.56(F).

Panel Meeting Action: Reject

Panel Statement: The Panel refers to NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

“[S]o as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A.”

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

6-1 Log #557 NEC-P06 **Final Action: Reject**
(100.Ampacity)

Submitter: John E. Conley, Stratford, CT

Recommendation: Revise ampacity definition to read:

Ampacity. <u>Conductor current limit expressed in amperes. Where the limit is determined only by conductor thermal capability and is calculated mathematically,</u> the current, in amperes, that a conductor can carry continuously under the conditions of use without exceeding its temperature rating.

Substantiation: The originators of the term ampacity did not think of its derivation in terms of current, they thought of it in terms of heat. Current generates heat that warms the conductor. This heat is continually dissipated into the environment by convection, conduction and radiation. With continuous current, the generated heat drives the conductor temperature to some stable level where the rate of heat dissipation equals the rate of heat input. When the current is such that the stabilized temperature is equal to the rated conductor temperature (the highest temperature at which the insulation remains functional), that ampere level is called the current carrying capacity, or ampacity, of the conductor in that environment. Such an ampacity has two important aspects: (1) it is established by nature, involving no human judgment, and (2) it can be mathematically calculated when all critical environmental factors are known. It is an important limit to know from both a safety standpoint and an economic standpoint. Exceeding the limit (overheating the conductor insulation) can have dire consequences.

Considerable human effort has been expended trying to calculate ampacities for a variety of conductors in differing environments. In some ampacity publications no specific definition is offered, but the definition is intrinsic in the calculations.

Several ampacity definitions have appeared over the years, all trying to define the term as explained above. For clarity, precision and conciseness, the NEC definition is the best. Ironically, it is not suitable for the NEC because regulatory needs differ from the definition’s strict technological focus. The NEC must consider all factors related to safety. The NEC recognizes this, and, in its own words, essentially explains the shortcomings of the definition. See FPN in 310.15(B). Some examples are illustrative:

-The ampacities for flexible cords, Table 400.5(A), are set to protect end connectors from overheating, not conductors. See (1) in the FPN. The definition deals only with conductors. Code ampacities come about through experience and judgment beyond the scope of the definition. Note that many cord types are available in several temperature ratings that would normally justify different ampacities if not for the connector problem. Also note that the NEC does not specify a temperature rating for flexible cords, making it impossible to calculate any ampacity as defined. (Cord temperature ratings are used to match cords with environments, not to adjust ampacities).

-The effective ampacities of 14-10 AWG conductors are well below what the definitions would suggest, set there by experience and judgment, not calculation. The primary reason for the adjustment is to reduce the amount of heat released into panelboards. Excess heat is known to adversely affect overcurrent devices. See FPN (2).

-UL conductor listings, for example, do not permit 90C rated conductors to carry more current than 75C rated conductors. See FPN (3).

-Advancements in the science of ampacity calculation has made many of the values in bellwether tables like 310.16 through 310.20 obsolete, but the tables have been retained because of their traditional worth. See FPN (4). Also these tables do not provide enough specificity in regard to environmental conditions to satisfy the precision demanded by ampacity calculations.

-NEC Table 310.21 has ampacities for bare conductors. The definition applies only to insulated conductors. Table 610.14(A) has ampacities for short time, fluctuating or intermittent currents. The definition applies only for continuous current.

Code ampacities that comply with the definition are those in Tables 310.67 through 310.86 and appendix Tables B310.1 through B310.10. (Some of the tabulated values have been rounded from those calculated, so are not as precise as a purist might prefer). Other Code ampacities get their name authority from pre-1981 usage when the definition was substantially identical to that in the initial sentence of this proposal. It was the 1981 change in definition that put things out of kilter.

By any analysis, the rate of noncompliance with the definition is very high. While my numerous past proposals to correct the problem were all rejected (for largely technical reasons), no one has ever challenged my basic assertion. I have not and do not claim any demonstrable hazard. Almost a quarter century of usage has not created any. I am embarrassed, as an NFPA member, with the seemingly blithe acceptance of the situation by NFPA. It surprises me because I know the rigorous requirements that NFPA normally insists on. Rightly so. One questionable definition casts doubt on all definitions. While the present definition is admirable, it simply does not mesh with NFPA's usage or needs. Strict compliance would make it impossible for NFPA to fulfill its regulatory function. Somehow a way must be found to expand the definition to fit the circumstances of use, while retaining the valuable present definition. Yes, I would like to make the proposal a bit less awkward, but the situation itself is awkward. This proposal offers a distinct improvement over what we have.

Panel Meeting Action: Reject

Panel Statement: The existing definition is technically correct, and the additional wording will not add to clarity. The panel directs the submitter to 3.2.5.1 of the NEC Style Manual.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

1-15 Log #2322 NEC-P01 **Final Action: Reject**

(100.Arc Resistant Switchgear (New))

Submitter: Daleep C. Mohla, DCM Electrical Consulting Services, Inc.

Recommendation: Add a new definition to read:

Arc Resistant Switchgear. Switchgear in an enclosure that is capable of withstanding the effects of an internal arcing fault.

FPN: See IEEE Standard C37.20.7 for performance and testing requirements.

Substantiation: Arc resistant switchgear is being utilized in the industry. This term is not recognized or defined in the NEC. Inclusion of this definition will provide users a consistent definition.

Panel Meeting Action: Reject

Panel Statement: The proposed term "Arc Resistant" is not used in the Code and does not require a definition.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

FLOYD, II, H.: The applicatin of Arc Resistant Switchgear in US markets has grown over the past decade, to the point that all major manufacturers now offer this design. Experience in installations in the US and longer-term experience in other global regions demonstrates that arc resistant designs can reduce the frequency of personnel exposure to hazardous arcing faults. While I support the concept of recognizing this type of equpment in the NEC, I agree with the panel action for rejection. If above and below 600V arc fault resistant enclosures had a NEMA enclosure designation, such as NEMA 21, then the NEC could incorporate this concept in Table 110.20 Enclosure Types. The proposal submitter should consider working with the appropriate manufacturers to designate a NEMA enclosure type for arc fault resistant enclosures.

9-1 Log #3379 NEC-P09 **Final Action: Reject**

(100.Auto Transformer (New))

Submitter: Jason Guza, Bad Axe, MI

Recommendation: Add a new definition to read:

Auto Transformer. An electrical transformer in which the primary and secondary coils have some or all windings in common. It converts 120 volts to 240 volts, or 240 volts to 120 volts.

Substantiation: Auto transformer is referred to many times in the code, but there is no definition for auto transformer.

Panel Meeting Action: Reject

Panel Statement: The term is commonly understood. CMP-9 notes that the term "transformer" is not defined either. There is no evidence of confusion in the field that would require a definition.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10

Ballot Not Returned: 1 de Vega, H.

1-16 Log #1663 NEC-P01 **Final Action: Reject**

(100.Bedroom)

Submitter: Todd Wilson, Employee of 1st Priority Electric-Barrington NH

Recommendation: Please define "bedroom".

Substantiation: With more and more references to the safeguarding of bedrooms (i.e., smoke detects/arc faults). I wish we could have a concrete definition included in the NEC 2008. I realize it is not a very clear-cut definition to come-up with, but I feel it high time we come-up with one.

Panel Meeting Action: Reject

Panel Statement: No proposed text was submitted, as required by 4-3.3(c) of the Regulations Governing Committee Projects.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-17 Log #3411 NEC-P01 **Final Action: Reject**

(100.Bedroom)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 2 for comment.

Submitter: Fred Tyler, Minneapolis, MN

Recommendation: Add a new definition to read:

Bedroom. An area separated by walls or partitions from other similar parts of the structure or building which are, or could be, used primarily for sleeping.

Substantiation: Contractors will not be able to get out of following the Code when wiring bedrooms by calling the room a study, office, library, or other, when it really is a bedroom. (for AFCIs)

Panel Meeting Action: Reject

Panel Statement: Currently, the building codes only define "habitable space", which includes a space for sleeping but does not specifically define a bedroom. In addition, the area described in the proposed definition where such areas are separated by walls or partitions would disqualify a number of bedroom areas currently utilized in both dwellings and in hotel and motel rooms. In response to the submitter's substantiation, Section 90.4 states that the authority having jurisdiction for enforcement of the Code has the responsibility for making interpretations of the rules and the NEC does not provide any such authority to contractors.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

ANTHONY, M.: This would have been a proposal that could have been accepted in principle and in part had the substantiation been stronger. A bedroom, by any other name, still contains individuals who are vulnerable injury or death due to fire, smoke inhalation and the like. The term "bedroom" is used as a criterion for the application of 210.12(B). (The 120VAC smoke detector plugged into an AFCI-protected circuit is a particular application problem of interest.) In fact the term bedroom meets the necessary criterion for inclusion in the NEC because the word "bedroom" shows up twice in Chapter 2 (210-52(A)) and as well as three more times in 517.2, 517.33(A)(8), and 550.25(B). .

I believe that we serve the AHJ better by adding a definition of bedroom in a code cycle in the near future. Adaptations of the NEC, which frequently appear as local residential building codes, will be improved with a definition of "bedroom" or a similar practical, or culturally sensitive term such as "sleeping unit" which appears in the 2003 IBC. The NFPA's own building code, NFPA-5000 uses the term "sleeping area" in contexts that have implications for electrical installations.

HICKMAN, P.: While we do not necessarily agree with all of the substantiation of the submitter, we feel that this proposal raises an issue that needs to be addressed. Since the TCC has channeled definitions to panels having primary jurisdiction over definitions, perhaps this proposal should have been sent to CMP2.

5-2 Log #1512 NEC-P05 **Final Action: Accept**

(100.Bonding (Bonded))

Submitter: Technical Correlating Committee on National Electrical Code®,

Recommendation: Revise the definition of bonding (bonded) as follows:

~~**Bonding (Bonded)**~~ **Bonded (Bonding)** . ~~The permanent joining of metallic parts to form an electrically conductive path that ensures electrical continuity and the capacity to conduct safely any current likely to be imposed.~~ Connected to establish electrical continuity and conductivity.

Substantiation: This is the result of the TCC Task Group on Grounding and Bonding in resolve of the 2005 NEC cycle actions related to Proposal 5-1 and Comment 5-1 as directed by the Technical Correlating Committee. This is a companion proposal to others throughout the NEC relative to this Task Group's recommendations. The substantiation of this proposal is as follows.

It is proposed that the present definition for bonding be rewritten to apply generally throughout the NEC and simply describe its purpose and function. The purpose of **bonding** is to connect two or more conductive objects together to:

(1) ensure the electrical continuity of the fault current path, and
(2) provide the capacity and ability to conduct safely any fault current likely to be imposed, and
(3) minimize potential differences (voltage) between conductive components.

The intent of the term **bonding** is to convey that normally non-current carrying conductive materials likely to become energized must be electrically connected together and to the supply source in a manner that establishes an effective fault current path. "Normally non-current carrying conductive materials likely to become energized" include:
(1) conductive materials enclosing electrical conductors or equipment, or
(2) forming part of such equipment, or
(3) other electrically conductive materials and equipment that may present a shock hazard.

There are conditions in the Code where specific bonding is required solely to minimize the difference of potential (voltage) between conductive components.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:

HAMMEL, D.: The panel should consider adding the term (connecting) to create parallel syntax. This would be consistent with the definition of Grounded (Grounding). Bonded (Bonding): Connected (connecting) to establish electrical continuity and conductivity .

5-3 Log #2932 NEC-P05 **Final Action: Accept**
(100.Bonding Jumper, System)

Submitter: Philip Simmons, Simmons Electrical Services
Recommendation: Move existing definition of "System Bonding Jumper" from Article 100 to 250.2.
Substantiation: The term is used in only Article 250 and should be located in 250.2 in accordance with the NEC Style Manual.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

10-1a Log #1259 NEC-P10 **Final Action: Accept in Principle**
(100.Branch Circuit Overcurrent Device)

Submitter: Frank G. Ladonne, Underwriters Laboratories Inc.
Recommendation: Add new text to read:

Branch-circuit Cvercurrent Device. A device capable of providing protection for branch circuit conductors and equipment over the full range of overcurrents between its rated current and its interrupting rating. Branch circuit overcurrent protective devices are provided with interrupting ratings appropriate for the intended use but no less than 5,000 amperes.

Substantiation: The current edition of the National Electric Code (NEC) has a definition for Supplementary Overcurrent Protective Device but no complementary definition for Branch-circuit Overcurrent Device exists in the Code though the term Branch Circuit Overcurrent Device is used in several NEC Articles. The ambiguity caused by the lack of a determinative definition for this term leads to undesirable subjectivity by users of the Code in ascertaining and asserting the acceptability of an overcurrent device for use in a branch-circuit application with potentially hazardous consequences.

At present, certification organizations categorize their fuse certifications by physical attributes, i.e., cartridge fuses, plug fuses, miscellaneous, miniature and microfuses, special purpose fuses, etc. They do not, however categorize fuses by use, i.e., branch circuit fuses vs. supplementary fuses. Until very recently, all fuses acknowledged to be suitable for branch circuit protection belonged to well defined classes, i.e., Class J, Class K, Class H, etc., where the physical and electrical sizes, geometries and performance characteristics were well defined. Recently, there have been submittals (and in a few cases actual certifications) for fuses that have all of the electrical performance characteristics of branch circuit fuses but have a size and/or shape that is very different from the fuse class emulated by the electrical performance. Conversely, there are also fuses that are the same size and shape as a class fuse but have electrical performance characteristics different from those specified for the class. This puts certification organizations in the position of needing to internally track sizes, geometries and performance characteristics to ensure that they don't inadvertently certify fuses that constitute a violation of the noninterchangeability provision of the NEC (240.60(B). As you can well appreciate, there is significant potential for some unfortunate results when fuses are casually interchanged.

Providing a definition within the Code addresses the needs of the following constituencies:

–From an end-product application standpoint, the ambiguity over the appropriate fuse type is removed both for end-product manufacturers as well as for product certification engineering staff.

–From an AHJ standpoint, again, the ambiguity and uncertainty surrounding the suitability of a given fuse for branch circuit application is removed.

–From the standpoint of safety, this strategy provides a greater level of comfort that fuses would not be misapplied.

Panel Meeting Action: Accept in Principle

Revise the wording in the proposal as follows:

"Branch-Circuit Overcurrent Device. A device capable of providing protection for service, feeder, and branch circuits ~~circuit conductors~~ and equipment over the full range of overcurrents between its rated current and its interrupting rating."

The second sentence of the proposal is to remain unchanged.

Panel Statement: The phrase "service, feeder, and" was added so as not to confuse the user into thinking that a branch-circuit overcurrent device could only be utilized to protect branch circuits, and that these devices could not protect service and feeder circuits.

The phrase "circuit conductors" was replaced with "circuits" so as not to confuse the user into thinking that only conductors and equipment could be protected. This change makes it clear that such devices can protect the entire branch circuit, not just conductors.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

KIMBLIN, C.: This definition is unnecessary. In particular, Branch Circuit and Overcurrent are already defined in Article 100. Further, the proposed definition is confusing because it defines a Branch-Circuit Overcurrent Device but then deals with service, feeder and branch circuit protection. Here it is noted, for example, that the protection of service equipment over the full range of overcurents frequently involves the additional feature of ground fault protection (240.13).

(Note: Sequence 2-1 was not used)

2-2 Log #1113 NEC-P02 **Final Action: Reject**
(100.Branch Circuit, Individual)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise as follows:

A branch circuit that supplies only one utilization equipment or a single receptacle .

Substantiation: A branch circuit with multiple unused receptacles but supplying only one equipment literally meets the present definition. An individual branch circuit may supply any load for which it is rated. A branch circuit supplying two or more receptacles (could be a duplex) is limited to loads specified in 210.23(A)(1) and (A)(2). By special permission, a circuit with multiple receptacles (could be other than parallel blade type) to supply utilization equipment that is normally or regularly moved (such as a welder or floor polisher) may still be considered as an individual circuit. An approved utilization equipment with two supply cords/caps is still one utilization equipment and could utilize a multiple receptacle, per the proposal.

Panel Meeting Action: Reject
Panel Statement: The definition proposed by the submitter is too restrictive. A receptacle other than a single receptacle could be used and other means such as configuration or arrangement of the equipment could limit the application to a single utilization equipment.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-18 Log #1204 NEC-P01 **Final Action: Reject**
(100.Building)

Submitter: James Tente, City of Naperville
Recommendation: Revise as follows:

A structure that stands alone or that is cut off from adjoining structures by firewalls with all openings therein protected by approved means . ~~fire doors~~ .

Substantiation: The phrase "fire doors" is too specific, whereas a firewall may contain several different types of openings all of which would be required to be protected. Some fire walls may have no openings to protect whatsoever and still create multiple buildings.

Panel Meeting Action: Reject
Panel Statement: The term "fire doors" is referring to openings in the fire wall, so the use of the term is correct. The term "fire wall" is defined in the NFPA Glossary of Terms; the term "approved means" is not. The NEC Style Manual Section 3.3.4, requires that words and terms used in the NEC shall be specific and clear in meaning. CMP-1 notes that the definition of "building" is the responsibility of the NFPA 101 Life Safety Code committee.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-19 Log #497 NEC-P01 **Final Action: Accept**
(100. Bundled)

TCC Action: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting and also be referred to Code-Making Panels 6, 7, 12, and 15 for comment. This action will be considered by the Panel as a Public Comment.
Submitter: Bryan P. Holland, Holland Electric
Recommendation: Move the definition of "Bundled" in Section 520.2 to Article 100 Definitions.
Substantiation: Per Section 2.2.2.1 Article 100 of the NEC Style Manual, "In

general, Article 100 shall contain definitions of terms that appear in two or more other articles of the NEC." There are at least three uses of the term "bundled" in the NEC - sections 310.15(B)(2); 334.80 and 520.53(H)(2). This will add clarity to the NEC at large.

Panel Meeting Action: Accept

Panel Statement: The panel recommends that the TCC refer this proposal to CMPs 6 and 7 for comment.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

LABRAKE, JR., N.: This proposal should be rejected. The definition of "bundled" in 520.2 is appropriate to the use of the term in Article 520, but is not necessarily suitable for its application in the other sections referenced.

MINICK: This proposal should be rejected. The definition of bundled is specific in its application to Article 520. The definition does not necessarily reflect all of the possible bundling configurations that may require derating in accordance with 310.15, particularly when the bundling does not include a "physical" means of bundling.

1-20 Log #358 NEC-P01 **Final Action: Accept in Principle**
(100. Clothes Closet (New))

Submitter: Michael J. Johnston, Plano, TX

Recommendation: Add a new definition to read as follows:

<u>Clothes Closet. A small room, chamber, or area used primarily for storage of clothes.</u>

Substantiation: This proposed definition is intended to provide clarification in the Code as to the installations that the rules in 240.24(D), 410.8, and 550.11(A) apply to. If the area in question meets the criteria provided in the proposed definition, then the rules apply. If the area in question does not meet the criteria of the proposed definition, then all other rules applicable to rooms or living spaces, such as those provided in 210.52 and 210.70, 210.12, etc., would be applicable. It seems to be a problem for those encountering larger rooms that are intended to function as closets for clothes and storage. Folks typically want relief from the clothes closet rules in the NEC, but do not want to adhere to the other rules that would apply if the area in question is determined not to be a clothes closet. The majority of the wording in the definition was derived from the International Building Code. The words "or area" have been added to cover common applications encountered in the field where the situation is an area and not a room.

Panel Meeting Action: Accept in Principle

The panel has revised the submitter's definition as follows:

"A non-habitable room or space intended primarily for storage of garments and apparel."

Panel Statement: CMP-1 concurs that a need exists to define the term "clothes closet." CMP-1 notes that In accordance with the NEC Style Manual, Section 2.2.2, definitions shall not contain the term that is being defined. The panel believes this action meets the intent of the submitter.

Number Eligible to Vote: 12

(100.Concealed Space)

Submitter: Allen C. Weidman, The Society of the Plastics Industry, Inc.

Recommendation: Add new text to read as follows:

<u>**Concealed Space.** That portion(s) of a building behind walls, over suspended ceilings, in pipe chases, attics, and in whose size might normally range from 44.45 mm (1 3/4 in.) stud spaces to 2.44 m (8 ft) interstitial truss spaces and that might contain combustible materials such as building structural members, thermal and/or electrical insulation, and ducting. [NFPA 96:3.3.42.1]</u>

Substantiation: This definition is an extract from NFPA 96, Standard for Ventilation Control and Fire Protection of Commercial Cooking Operations. It is the only definition of concealed space in the NFPA Glossary.

While the NEC has a definition for "concealed," it is important to also define "concealed space." The term "concealed space" is used in 320.30(D)(1), 330.30(D)(1), 332.30(B), 334.30(B), 376.10, 604.4, 760.30(A)(1), 760.52(B)(1), 770.154(A), 800.154(A) and 820.154(A).

It is important to understand what constitutes a concealed space. For example, NFPA 13, ***Installation of Sprinkler Systems*** has a requirement to install an automatic sprinkler system in concealed spaces where combustible loading is present. With the significant quantities of combustible cable being installed in concealed spaces (hollow spaces or HVAC system ducts and plenums), system designers and installers need this guidance.

Panel Meeting Action: Reject

Panel Statement: The panel refers to NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"[S]o as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

4-1a Log #164a NEC-P04 **Final Action: Reject**
(100. Conductor, open, Cable, open multiconductor)

NOTE: The following proposal consists of Comment 1-53 on Proposal 1-74 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 1-74 was:

In 100.1 General, add a definition for "conductor open: insulated or bare conductor installed exposed, i.e. not installed in a raceway or cabletray" and add a definition for "cable, open multiconductor: insulated cable installed exposed i.e. not installed in a raceway or cable tray".

Submitter: Eric G. Schneier, Bechtel Savannah River Inc. (BSRI)

Recommendation: Please have proposal number 1-74 (Log #3476) redirected to CMP #4 for inclusion in Article 225.

Substantiation: In submitting the original proposal, the submitter was unaware that the NEC style manual prohibited the inclusion of new definitions in Article 100 unless they are used in two or more NEC articles. Since the terms proposed to be added only appear in Article 225, this is where they should be defined.

Panel Meeting Action: Reject

Panel Statement: The recommendations for the definitions are not complete and the concepts are incorrect. Open conductors can be insulated, covered, or bare. These conductors could be installed in cable trays and raceways where there is a transition between the use of open conductors and a Chapter 3 wiring method. These conductors are permitted in a cable tray according to Section 230.44.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-1b Log #165a NEC-P04 **Final Action: Reject**

(100.Conduit Body)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise as follows:
A separate fitting ~~portion~~ of a ~~conduit or tubing~~ wiring system that permits access...(remainder unchanged).
Substantiation: Edit. Conduit bodies are apparently restricted to use with conduit or tubing systems by this definition; however, they are not prohibited by any section for use with cables or flexible cords.
Panel Meeting Action: Reject
Panel Statement: Although a cord might enter a conduit body, the conduit body (if properly used) will be attached to a raceway at another end. Therefore the use described in the substantiation agrees with the definition, and no change is warranted.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

5-4 Log #1726 NEC-P05 **Final Action: Reject**
(100.Connect, Connected, & Connecting)

Submitter: John Stricklin, Meridian, ID
Recommendation: Change Bond, Bonded and Bonding to Connect, Connected, and Connecting throughout the National Electrical Code.
Substantiation: "Connect" is a lot easier to understand as everyone has used this word in their vocabulary.
An instance for comparison "equipment bonding conductor" would become "equipment connecting conductor."
Grounding and bonded has been so entangled in the NEC that it has become hard for the average journeyman electrician to understand.
Panel Meeting Action: Reject
Panel Statement: The Technical Correlating Committee Task Group on Grounding & Bonding implemented this change in certain situations. Globally changing all terms as proposed creates language that loses the meaning intended by these specifically defined terms. See the panel action on Proposal 5-2.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

2-3 Log #1101 NEC-P02 **Final Action: Reject**
(100.Connected Load (New))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Add:
CONNECTED LOA d. Utilization equipment that is connected to supply circuit conductors.
Substantiation: Some loads are calculated on the basis of square foot area, purpose, (laundry circuit, small appliance circuit, clothes dryers, ranges, number of receptacles, etc.) which do not specifically relate to actual utilization equipment load but to usage or number of outlets. "Connected load" is used in 210.11(B), 220.32(C) and 220.84(C).
Panel Meeting Action: Reject
Panel Statement: Connected load is well understood in the context in which it is used. There is no need to add a definition when no specific need is substantiated.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-24 Log #1392 NEC-P01 **Final Action: Reject**
(100.Connection, Permanent (Direct), Connection, Cord-and-Plug (New))

Submitter: George Stolz, II, Pierce, CO
Recommendation: Add the following definitions:
Connection, Permanent (Direct). Connected in a permanent method, such as by means of approved connectors or terminals.
Connection, Cord-and-Plug. A non-permanent connection by means of an attachment plug and matching receptacle.
Substantiation: Without definition, a cord-and-plug-connection could be viewed as a direct connection. There has been debate among instructors as to whether a cord-and-plug connection is a direct connection, as opposed to induced connections. This will eliminate any ambiguity on the subject in the NEC.
Panel Meeting Action: Reject
Panel Statement: Generally, the term "Cord-and-Plug Connection" is understood, as it requires the use of a flexible cord. The definition as proposed would be overly restrictive, as some permanent equipment is cord-and-plug connected. The word non-permanent would conflict with the use of flexible cords for the connection of specific fixed equipment, such as kitchen waste disposers, built-in dishwashers, trash compactors, and range hoods. The proposed definition would necessitate that all electric vehicles be tethered to the premises wiring system. See 625.29(A). In addition, CMP-1 notes that the

NEC Style Manual, Section 2.2.2, states that definitions shall not contain the term that is being defined – the definitions contain "connection, permanent and plug."
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

(Note: The sequence 14-1 was not used)

15-1 Log #CP1 NEC-P15 **Final Action: Accept**
(100. Definitions (GOT))

TCC Action: The Technical Correlating Committee directs the panel to correlate the text with the definition of "Hospital" in the 2006 edition of NFPA 101.
Submitter: Code-Making Panel 15,
Recommendation: Adopt the preferred definitions from the NFPA Glossary of Terms for the following terms:
Hospital. (preferred) NFPA 101, 2003 ed.
A building or portion thereof used on a 24-hour basis for the medical, psychiatric, obstetrical, or surgical care of four or more inpatients.
Nursing Home. (preferred) NFPA 99, 2004, ed.
A building or portion of a building used on a 24-hour basis for the housing and nursing care of four or more persons who, because of mental or physical incapacity, might be unable to provide for their own needs and safety without the assistance of another person.
Patient Bed Location. (preferred) NFPA 99, 2005 ed.
The location of a patient sleeping bed, or the bed or procedure table of a critical care area.
Patient Equipment Grounding Point. (preferred) NFPA 99, 2005 ed.
A jack or terminal that serves as the collection point for redundant grounding of electric appliances serving a patient care vicinity or for grounding other items in order to eliminate electromagnetic interference problems.
Substantiation: Adoption of preferred definitions will assist the user by providing consistent meaning of defined terms throughout the National Fire Codes.
The following procedure must be followed when acting on defined terms (extract from the Glossary of Terms Definitions Procedure):
2.1 Revising Definitions.
2.1.1 Prior to revising Preferred definitions, the Glossary of Terms should be consulted to avoid the creation of additional Secondary definitions.
2.1.2 All Secondary definitions should be reviewed and eliminated where possible by the following method (in order of preference):
a) adopt the preferred definition if suitable.
b) modify the secondary term and/or definition to limit its use to a specific application within the scope of the document.
c) request that the Standards Council determine responsibility for the term.
d) request that the Standards Council authorize a secondary definition.
(extract from the NFPA Manual of Style):
2.3.2.6 Existing general definitions contained in the NFPA Glossary of Terms shall be used where technically accurate and correct.
Panel Meeting Action: Accept
Panel Statement: The panel also reviewed the primary and secondary definitions for the terms "Anesthetizing Location," "Critical Care Areas," "General Care Areas," and "Health Care Facilities" and chose to keep the secondary definitions used in NFPA 70 since their differences are significant to their usage in NFPA 70.
Number Eligible to Vote: 12

(100. Definitions (GOT))

TCC Action: It was the action of the Technical Correlating Committee that the panel reconsider the proposal and make clear the intended status of the existing second paragraph. This action will be considered by the panel as a public comment.
Submitter: Code-Making Panel 19,
Recommendation: Adopt the preferred definitions from the NFPA Glossary of Terms for the following term:
Manufactured Home . (preferred) NFPA 501, 2003 ed.
A structure, transportable in one or more sections, that, in the traveling mode, is 8 body-ft (2.4 m) or more in width or 40 body-ft (12.2 m) or more in length or, when erected on site, is 320 ft^2 (29.7 m^2) or more and that is built on a permanent chassis and designed to be used as a dwelling, with or without a permanent foundation, when connected therein. The term manufactured home includes any structure that meets all the provisions of this paragraph except the size requirements and with respect to which the manufacturer voluntarily files a certification required by the regulatory agency, and except that such term shall not include any self-propelled recreational vehicle. Calculations used to determine the number of square feet (square meters) in a structure are based on the structure's exterior dimensions, measured at the largest horizontal projections when erected on site. These dimensions include all expandable rooms, cabinets, and other projections containing interior space, but do not include bay windows.
Substantiation: Adoption of preferred definitions will assist the user by providing consistent meaning of defined terms throughout the National Fire Codes.
The following procedure must be followed when acting on defined terms (extract from the Glossary of Terms Definitions Procedure):
2.1 Revising Definitions.
2.1.1 Prior to revising Preferred definitions, the Glossary of Terms should be consulted to avoid the creation of additional Secondary definitions.
2.1.2 All Secondary definitions should be reviewed and eliminated where possible by the following method (in order of preference):
a) adopt the preferred definition if suitable.
b) modify the secondary term and/or definition to limit its use to a specific application within the scope of the document.
c) request that the Standards Council determine responsibility for the term.
d) request that the Standards Council authorize a secondary definition.
(extract from the NFPA Manual of Style):
2.3.2.6 Existing general definitions contained in the NFPA Glossary of Terms shall be used where technically accurate and correct.

9-7 Log #86 NEC-P09 **Final Action: Accept in Principle in Part**
(100.Device, FPN (New))

Submitter: Warren Austin, Western Area Power Admin
Recommendation: Revise as follows:
Device. A unit of an electrical system that is intended to carry or control but not utilize electric energy.
FPN: To include devices with internal lumination and/or control in programmable devices with minimal power consumption.
Substantiation: Luminated switches, swamp cooler controllers, etc...
Panel Meeting Action: Accept in Principle in Part
Change the definition of "Device" to read as follows:
Device. A unit of an electrical system that carries or controls electric energy as its principal function.
Panel Statement: CMP-9 accepts the concept of making an accommodation in the definition for incidental consumption of electrical energy, but rejects the fine print note.
The proposed fine print note modifies the definition and therefore would have mandatory impact, which is not appropriate' see 90.5(C). CMP-9 has revised the definition to allow for incidental functions that consume electric energy.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H

(Note: The sequence 1-25 was not used)

1-26 Log #1488 NEC-P01 **Final Action: Reject**
(100.Disconnecting Means)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Add:
"...without provisions for automatic reconnection."
Substantiation: Many devices meet the present definition, such as time switches, pressure switches, temperature switches, proximity switches, light sensitive switches, limit switches, flow switches, etc. which should be specifically not permitted as a means to isolate a circuit or equipment from its supply.
Panel Meeting Action: Reject
Panel Statement: Section 2.2.2 of the NEC Style Manual states: "Definitions shall not contain requirements or recommendations."
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-27 Log #512 NEC-P01 **Final Action: Accept**
(100. Dwelling Unit)

TCC Action: The Technical Correlating Committee directs that this Proposal be referred to the NFPA 1 Committee, the NFPA 101 Committee and the NFPA 5000 Committee for information.
Submitter: John D. Minick, National Electrical Manufacturers Association
Recommendation: Revise text to read:
Dwelling Unit. One or more rooms arranged for ~~the use of one or more individuals living together, providing~~ complete, independent housekeeping purposes, with space for ~~living facilities, including permanent provisions for living;~~ eating, living, and sleeping, ~~eating,~~ : facilities for cooking, and provisions for sanitation.
Substantiation: The NEC TCC requested that Panels 1 and 2 and SAF/BLD-RES form a task group to revise and correlate the definition of Dwelling Unit. The task group met twice via teleconference calls along with numerous e-mails to resolve the issue. It is the task group's opinion that this one definition will meet the needs of the NEC, NFPA 1, NFPA 101, and NFPA 5000 with regard to dwelling units. The task group believes that this definition does not change the intent of any of the codes, while at the same time simplifies and clarifies what a dwelling unit is and correlates the four documents. Members of the task group included David Hittinger and Lanny McMahill from NEC CMP-1,

Donald King and Susan Porter from NEC CMP-2, and James Lathrop and Harry Bradley from the SAF/BLD-RES committee.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

5-5 Log #559 NEC-P05 **Final Action: Reject**
(100.Electrical Bond (New))

Submitter: Ben Jacks, Seattle, WA
Recommendation: Add:
Electrical Bond. The faying surface connection between metal or semi-conductive parts to allow a safe current-carrying capacity through a circuit or ground.
Substantiation: Solves problem of confusing "bond" as "ground" and establishes the clarity of a joined connection as a surface condition and not a "jumper".
(Faying surface is still common terminology in all aspects of electronics, welding, construction bonding matrix's, etc.)
Panel Meeting Action: Reject
Panel Statement: The term is used only once in the current edition of the NEC according to a search of the Code. The work of the Task Group on Grounding and Bonding resulted in removal of the term and revision that clarifies that provision where it was used. Article 100 of the NEC indicates that it contains only those definitions essential to the proper application of this Code. It is not intended to include commonly defined general terms or commonly defined technical terms from related codes and standards. In general, only those terms that are used in two or more articles are defined in Article 100. Other definitions are included in the article in which they are used but may be referenced in Article 100. See also Section 2.2.2.1 of the NEC Style Manual.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

1-28 Log #2577 NEC-P01 **Final Action: Accept**
(100.Electrical Power Production and Distribution Network)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 13 for action. This action will be considered by Code-Making Panel 13 as a public comment.
Submitter: Timothy M. Croushore, Allegheny Power
Recommendation: Please add new definition to Article 100 for Electrical Power Production and Distribution Network. The definition is as follows:
Electrical Power Production and Distribution Network. Power production, distribution, and utilization equipment and facilities, such as a electric utility system that deliver electric power to the connected loads, that is external to and not controlled by an Interactive System.
Substantiation: The purpose of this change is to add a new definition of Electrical Power Production and Distribution Network that will be used in Article 690, 692, and Article 705. Code Making Panel 13 should be given authority for this definition to appear in Article 100. The definition is the same as the definition in section 2.41 of Underwriter Laboratory Standard 1741 – Inverters, Converters and Controllers for Use in Independent Power Systems.
This new definition will replace the three different definitions of "Electrical Power Production and Distribution Network" used in Article 690, 692 and Article 705. This change is being proposed as part of a re-write of Article 690, 692 and Article 705 with respect to the interconnection of systems and equipment for use with distributed energy resources.
UL 1741 is currently under revision with a title change from "Inverters, Converts, and Controllers for Use in Independent Power Systems" to "Inverters, Converters, Controllers and Interconnection Systems Equipment for Use with Distributed Energy Resources." However, the definition of Electrical power prodction and distribution network remains unchanged.
Panel Meeting Action: Accept
Panel Statement: The panel recommends that the TCC assign responsibility for this definition to CMP-13.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
BARRIOS, JR., L.: The following editorial changes should be made. Modify ", such as a electric utility system…" to ",such as electric utility systems…" and modify ",that is external to…" to ", that are external to…".

1-29 Log #261 NEC-P01 **Final Action: Reject**
(100. Enclosure)

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
Enclosure. The case of housing of apparatus, or the fence or walls surrounding an installation to prevent personnel from accidentally contacting energized parts, or to protect the equipment from ~~physical~~ damage.
Substantiation: The word is superfluous. Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."
Panel Meeting Action: Reject
Panel Statement: "Physical damage" is a common term used in industry. Generally, it is damage caused to property from external events, such as accidents, vandalism, destruction, and other potential hazards. CMP-1 notes to the submitter that an enclosure does not protect equipment from internal events, such as caused by short-circuit and ground-fault conditions or computer and data errors. In addition, this proposal is in violation of 3.2.5.5 of the NEC Style Manual, as the term "physical damage" is a special term identified in that section.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-30 Log #1979 NEC-P01 **Final Action: Accept**
(100.Enclosure, FPN)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Correct cross reference within FPN, as a result of new Table location, as follows:
FPN: See Table ~~430.91~~ 110.20 for examples of enclosure types.
Substantiation: This is a companion proposal to the proposal to move text form 430.91 and Table 430.91 into a new 110.20. It should be done ONLY IF that proposal is accepted.
Panel Meeting Action: Accept
Panel Statement: The panel recommends that the TCC forward this proposal to CMP-11 for comment.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-31 Log #2869 NEC-P01 **Final Action: Accept in Principle**
(100.Equipment)

Submitter: Robert D. Osborne, Underwriters Laboratories Inc.
Recommendation: Revise definition of "Equipment" as follows:
Equipment. A general term including material, fittings, devices, appliances, utilization equipment, luminaries (fixtures), apparatus, and the like used as a part of, or in connection with, an electrical installation.
Substantiation: Article 100 contains definitions essential to the proper application of the Code. The Code is intended to be suitable for mandatory application by government bodies that exercise legal jurisdiction over electrical installations (Sec. 90.4). Addition of the term "utilization equipment" to the definition of equipment is needed to ensure proper application of the Code and provide clear direction to governmental bodies enforcing the text. In response to an appeal brought before the North Carolina Building Code Council, a review by that Council raised questions as to whether industrial machinery was covered by the NEC. To illustrate the source of this dilemma, I have constructed a summary of the applicable requirements:
I) Section 90.2(A)(3) notes that the Code covers "Installations of conductors and equipment that connect to the supply of electricity". It is acknowledged that an industrial machine is not a conductor, but is "equipment".
II) "Equipment" as defined in Article 100 is "A general term including material, fittings, devices, appliances, luminaires (fixtures), apparatus, and the like used as a part of, or in connection with, an electrical installation". This definition does not include "industrial machinery".
III) In review of the definitions provided for: fittings, devices, appliances, and luminaire; it is noted that an industrial machine is none of these. Definitions are not provided for "material" or "apparatus".
IV) An industrial machine, being not specifically mentioned in the definition for "equipment", or covered by one of the terms identified as "equipment", is not covered by the Code.
It is acknowledged by the submitter that the definition of "equipment" notes that the term is general and that the list is not intended to be an all inclusive summary of all things identified as "equipment"; however, the list provided does exclude one of the general terms used to define equipment that utilizes electric energy. "Utilization Equipment' is defined in Article 100, and is a general term that covers equipment not included in other definitions such as devices or appliances. It is this general term that would apply to industrial machinery.
It is the intent of the requirements to include industrial machinery as "equipment" which is covered by the Code. This would seem evident by, among other things, incorporation of Article 670 for Industrial Machinery. Rather than propose a change that would begin a list of specific "equipment",

this proposal includes reference to a generic type of equipment that is already defined in Article 100 and satisfactorily addresses this concern.
Panel Meeting Action: Accept in Principle
Revise definition of "Equipment" as follows:
Equipment. A general term including material, fittings, devices, appliances, luminaires (fixtures), apparatus, machinery, and the like used as a part of, or in connection with, an electrical installation.
Panel Statement: CMP-1 agrees that expanding the definition of "equipment" to include machinery is needed; however, they disagree that "utilization equipment" is the appropriate term to add. The panel concludes that machinery and all other types of utilization equipment are included within the scope of the definition of "Equipment."

5-6 Log #1513 NEC-P05 **Final Action: Accept**
(100.Equipment Grounding Conductor)

Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Revise the definition of equipment grounding conductor as follows:
Equipment Grounding Conductor <u>(EGC)</u> . The <u>conductive path installed to connect normally</u> non–current-carrying metal parts of equipment, ~~raceways, and other enclosures~~ <u>together</u> and to the system grounded conductor or to the grounding electrode conductor ~~, or both, at the service equipment or at the source of a separately derived system~~ .
<u>FPN No.1: It is recognized that the equipment grounding conductor also performs bonding.</u>
<u>FPN No.2: See 250.118 for a list of acceptable equipment grounding conductors.</u>
Substantiation: This is the result of the TCC Task Group on Grounding and Bonding in resolve of the 2005 NEC cycle actions related to Proposal 5-1 and Comment 5-1 as directed by the Technical Correlating Committee. This is a companion proposal to others throughout the NEC relative to this Task Group's recommendations. The substantiation of this proposal is as follows.
It is proposed that the present definition for Equipment Grounding Conductor be rewritten to more accurately describe its purpose and function. The Equipment Grounding Conductor performs grounding and bonding functions as follows:
(1) to facilitate the operation of an overcurrent device by providing a low impedance fault current path between the normally non–current-carrying metal parts of equipment, raceways, and other enclosures to the system grounded conductor, the grounding electrode conductor, or both, at the service equipment, or at a separately derived system, or at a building or structure disconnecting means where supplied by a feeder(s) or branch circuit(s),
(2) to connect all normally non–current-carrying metal parts of equipment and conductive material enclosing electrical conductors together so that potential differences (voltage) between equipment enclosures is minimized.
(3) to connect all normally non–current-carrying metal parts of equipment and conductive material enclosing electrical conductors to ground so that potential differences (voltage) to ground are minimized.
The following are specific examples of Equipment Grounding Conductor function.
(1) During a line to ground fault condition, the Equipment Grounding Conductor serves as an adequate and effective fault current path to facilitate the operation of the overcurrent device.
(2) Where installed with the circuit conductors between enclosures, the Equipment Grounding Conductor provides a means of bonding (connecting) enclosures together.
(3) Where installed between enclosures and the grounding electrode conductor, the Equipment Grounding Conductor provides a path to ground.
The words "raceways, and other enclosures" within the definition are being removed because types of Equipment Grounding Conductors are listed in 250.118 and does not need to be repeated. The words "or both, at the service equipment or at the source of a separately derived system" within the definition are being removed because the installation rules are found elsewhere in the ***Code*** .
The FPN No. 1 was added to inform the user that the equipment grounding conductor also performs bonding. The FPN No. 2 was added to inform the user where to find the acceptable list of equipment grounding conductors.
It is concluded that the equipment grounding conductor serves in a dual role in bonding equipment together as well as extending the earth connection. The definition is proposed to be revised to include this concept and to include a FPN explaining the role of the equipment grounding conductor.
The use of the acronym EGC has been introduced into the definition for usability and in accordance with the NEC style manual.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
DOBROWSKY, P.: This term should be deleted and a new term "equipment bonding conductor" should be inserted.

5-7 Log #3254 NEC-P05 **Final Action: Reject**
(100.Equipotential Plane)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reported as "Reject" because Code-Making Panel 19 did not agree with the placement of a general definition of "equipotential plane" in Article 100.
Submitter: Donald Dekker, N. Muskegon, MI
Recommendation: Add text to read as follows:
Equipotential Plane. An area where wire mesh or other conductive elements are embedded in or placed under the walk surface, within 75 mm (3 in.) and bonded to all metal structures and fixed nonelectrical equipment that may become energized, and connected to the electrical grounding system to prevent a difference in voltage from developing within the plane.
Substantiation: The term Equipotential Plane is defined in 2 separate sections of the Code and its methods are utilized in 3 distinct articles. I recommend deleting the 2 separate definitions and adding the definition of Equipotential Plane to 100-1. See companion proposals.
Panel Meeting Action: Accept in Principle
Revise the proposal text to read as follows: An area where wire mesh or other conductive elements are embedded in or placed under concrete or other conductive surface, are bonded together and to all metal structures and fixed nonelectrical equipment that may become energized, and are connected to the electrical grounding system.
Panel Statement: Code Making Panel 5 recognizes that the term "equipotential plane" is defined in Articles 547 and 682. This definition is intended to incorporate the concepts contained in those definitions but does not include the purpose served by the equipotential plane, as the purpose is inappropriate for the definition. Code Making Panel 5 refers this proposal to Code Making Panels 17 and 19 for information.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

13-1 Log #CP3 NEC-P13 **Final Action: Accept in Principle**
(100.Fault Tolerant External Control Circuit (GOT))

TCC Action: The Technical Correlating Committee understands that the Panel Action was to accept the proposed secondary definition which is the same text that appears in the 2005 Code.
The Technical Correlating Committee directs that the definition remain in 695.2, since it is only used in Article 695.
This action will be considered by the Panel as a Public Comment.
Submitter: Code-Making Panel 13,
Recommendation: Adopt the preferred definitions from the NFPA Glossary of Terms for the following terms:
Fault Tolerant External Control Circuit. (preferred) NFPA 20, 2003 ed.
Those control circuits entering and/or leaving the fire pump controller enclosure, which if broken, disconnected, or shorted will not prevent the controller from starting the fire pump and may cause the controller to start the pump under these conditions.
Fault Tolerant External Control Circuit . (secondary) NFPA 70, 2005 ed.
Those control circuits either entering or leaving the fire pump controller enclosure, which if broken, disconnected, or shorted will not prevent the controller from starting the fire pump from all other internal or external means and may cause the controller to start the pump under these conditions.
Substantiation: Adoption of preferred definitions will assist the user by providing consistent meaning of defined terms throughout the National Fire Codes.
The following procedure must be followed when acting on defined terms (extract from the Glossary of Terms Definitions Procedure):
2.1 Revising Definitions.
2.1.1 Prior to revising Preferred definitions, the Glossary of Terms should be consulted to avoid the creation of additional Secondary definitions.
2.1.2 All Secondary definitions should be reviewed and eliminated where possible by the following method (in order of preference):
a) adopt the preferred definition if suitable.
b) modify the secondary term and/or definition to limit its use to a specific application within the scope of the document.
c) request that the Standards Council determine responsibility for the term.
d) request that the Standards Council authorize a secondary definition.
(extract from the NFPA Manual of Style):
2.3.2.6 Existing general definitions contained in the NFPA Glossary of Terms shall be used where technically accurate and correct.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel requests that NFPA 20 editorially revise its definition to agree with the working definition in the NEC.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 1
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
SWAYNE, R.: This proposal should be rejected because it is used in only one article and the definition already exists in Article 695. In addition, the Panel did not indicate which of the two recommendations was accepted.

2-4 Log #2055 NEC-P02 **Final Action: Reject**
(100.Feeder)

Submitter: James T. Dollard, Jr., IBEW Local 98
Recommendation: Revise text to read as follows:
Add a new informational FPN to the definition of "Feeder" in Article 100 as follows:
Feeder. All circuit conductors between the service equipment, the source of a separately derived system, or other power supply source and the final branch-circuit overcurrent device.
FPN: For installation requirements of transformer secondary conductors, see 240.4(F) and 240.21(C).
Substantiation: The proposed FPN is suggested to improve clarity, usability and proper enforcement of the existing definition of "Feeder."
The existing definition of "Feeder" can cause quite a bit of confusion for installers and designing engineers. The existing definition leads the user of this code to believe, that "Feeders" are, as written in the definition: "All circuit conductors between the ….. source of a separately derived system ….. and the final branch-circuit overcurrent device.
The text of the definition in the previous sentence is modified to look at this definition the way that the code user reads this when applying this definition to "transformer secondary conductors." This definition leads the user of this code to believe that ALL conductors between the primary overcurrent protective device (OCPD) protecting the transformer to the final OCPD are feeders.
One thing is for sure, transformer secondary conductors are always transformer secondary conductors. However in most cases transformer secondary conductors are not considered to be protected by the transformer primary OCPD and therefore the transformer secondary conductors are not feeders. These conductors meet the definition of "Tap Conductors" in 240.2, because they are not protected at their rated ampacity at the point of supply.
The intent of this proposal is only to clear up the existing confusion. I do not believe a modification to the definition of "Feeder" is necessary. An informational FPN should solve this problem. Other "separately derived system" conductors are not subject to the confusion addressed by this proposal.
In accordance with 240.4(F) and 240.21(C)(1) transformer secondary conductors may be considered, under specific conditions, as protected by the primary overcurrent protective device. These conditions are limited to "two-wire primaries to two-wire secondary" and "delta three-wire primaries to delta three-wire secondary." This means that all, three-wire single phase secondary conductors and all four wire delta and wye connected secondary conductors are not considered protected by the primary OCPD. The fact that the definition of "Feeder" names transformer secondary conductors via "separately derived systems," as "feeders," leads the user of this code to believe that they are protected. Transformer secondary conductors must meet the provisions of 240.21(C).
For example, it is typical for an inspector to find an installation of a 3-phase wye connected transformer secondary with the transformer secondary conductors taken into a wireway and multiple disconnects or panelboards "tapped" from the transformer secondary conductors in the wireway. This is a violation of the last sentence of the mother text in 240.21 which prohibits "tapping a tap."
The enforcement community in the Philadelphia area has recently run into staunch opposition to the provisions of 240.21(C) in some cases, from designing engineers who claim that as per the definition of "Feeder," ALL transformer secondary conductors are feeders. This leads to major problems in enforcement.
This FPN is necessary to aid both the user of this code and the enforcement community.
Panel Meeting Action: Reject
Panel Statement: There are numerous requirements for feeders through out the NEC. Adding a specific FPN reference to the definition implies that the additional requirements are limited to Article 240. Transformer secondary conductors are, by definition, feeder conductors. The requirements in Article 240 deal with acceptable means to locate and provide overcurrent protection for transformer secondary conductors.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
KING, D.: This proposal should have been accepted. The submitter has substantiated a problem that exists in the interpretation of this definition where the tap rules of Section 240.21 are applied. The fine print note is not intended to list a particular requirement for feeders as is indicated in the panel statement, but rather provides information for the code user to distinguish between feeders and transformer secondary tap conductors.

3-2 Log #2377 NEC-P03 **Final Action: Reject**
(100.Fire Stop)

Submitter: Allen C. Weidman, The Society of the Plastics Industry, Inc.
Recommendation: Add new text to read as follows:
Fire Stop: A fire-resistant material, barrier, or construction installed in concealed spaces or
between structural elements of a building to prevent the extension of fire through walls,
ceilings, and so forth. [NFPA 914: 3.2.34]
Substantiation: This definition is an extract from NFPA 914-2001, ***Code for Fire Protection of Historic Structures.*** The term firestop is used in numerous places in the NEC including 530.18(C)(2), 725.61(B), 760.30(B)(3), 760.61(B), 770.154(B)(3), 800.154(B)(3), 820.154(B)(3). It should be defined.
Panel Meeting Action: Reject
Panel Statement: "Fire Stop" is a common phrase used in the building industry, similar to "fire rating" and "fire resistance" used in various sections in the NEC, that does not require a definition be inserted into Article 100 for the user of the NEC. Where these terms are used, the user of the Code can access other documents, such as NFPA 914 and the various building codes, to determine the meaning of these terms, if he or she doesn't already know the definition. Inserting all the building code definitions would make Article 100 totally unwieldy and difficult to use.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

1-32 Log #3224 NEC-P01 **Final Action: Reject**
(100.Flexible)

Submitter: Steve Walser, Chesaning, MI
Recommendation: (Flexible) Add to definitions, section 100 NEC. (Capable of being flexed or bent, bowed or twisted without breaking. Pliable, yielding to pressure, not stiff or brittle.)
Substantiation: There is no definition in the NEC about flexible. Flexible is used several times in the code.
Panel Meeting Action: Reject
Panel Statement: The Scope of Article 100 states that it "is not intended to include commonly defined general terms."
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

5-8 Log #1515 NEC-P05 **Final Action: Accept**
(100.Ground)

Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Revise the term ground as follows:
Ground. ~~A conducting connection, whether intentional or accidental, between an electrical circuit or equipment and the earth or to some conducting body that serves in place of t~~ T he earth.
Substantiation: This is the result of the TCC Task Group on Grounding and Bonding in resolve of the 2005 NEC cycle actions related to Proposal 5-1 and Comment 5-1 as directed by the Technical Correlating Committee. This is a companion proposal to others throughout the NEC relative to this Task Group's recommendations. The substantiation of this proposal is as follows.
It is proposed that the present definition for ground be rewritten to simply describe its function. The purpose of **ground** is to serve as a common electrical potential reference for an electrical system or equipment. The intent of ground is to describe the earth for premises wiring systems.
The phrase "some conducting body that serves in place of the earth" in the present definition of "ground" is concluded to leave Code users wondering what that conducting body serving as a substitute for the earth really is. Vehicles such as airplanes and automobiles have a metal frame that is often used as a reference for the onboard electrical wiring. It is often referred to as "ground." These types of installations are not covered by the rules of the NEC as indicated in Section 90.2(B). Where the NEC refers to "ground" it implies a connection to the earth and not something that serves as an earth substitute.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
BRETT, JR., M.: I believe this proposal should have been rejected. There was no substantiation to revise the current definition for the purpose of enforcing the NEC. In many applications, we make this connection to something that provides a low impedance path to earth but is not earth. In other applications, we make the connection to something that serves in place of earth such as a chassis ground. This definition is well understood and has served our industry for many years. The committee, over the years, has received very few public comments on the current definition and it should not be changed for without substantiation.
Comment on Affirmative:
DOBROWSKY, P.: This definition is a good improvement because it provides a simple description. Something is either connected to ground (earth) or it is not. Other conducting bodies may be used as a reference point but if they are not connected to the earth they are not grounded.

2-5 Log #1746 NEC-P02 **Final Action: Accept**
(100.Ground-Fault Circuit Interrupter, FPN)

Submitter: John W. Young, Siemens Energy & Automation
Recommendation: Revise text to read as follows:
FPN: Class A ground-fault circuit interrupters trip when the current to ground is 6 mA or higher and do not trip when the current to ground is less than 4 mA . ~~has a value in the range of 4 mA to 6 mA.~~ For further information, see UL

943, Standard for Ground-Fault Circuit Interrupters.
Substantiation: The present wording is apparently misunderstood in some instances. Some readers have interpreted the wording to mean that tripping only occurs when the value is between 4 and 6 mA and that the device will not trip when the current is above 6 mA. The proposed change in wording clearly states the current levels at which the GFCI will not trip and at which it will trip. The GFCI may or may not trip when the current is between 4 and 6 mA.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-6 Log #1727 NEC-P02 **Final Action: Reject**
(100.Ground-Fault Circuit Interrupter System, Three-Phase (GFCIS-3Ph) (New))

Submitter: Paul S. Hamer, Chevron Texaco Energy Research and Technology Company
Recommendation: Add a new definition:
Ground-Fault Circuit-Interrupter System, Three-Phase (GFCIS-3Ph). A system intended to provide protection of personnel from line-to-ground fault currents on three-phase systems. The system operates to cause a disconnecting means to open all ungrounded conductors of the faulted feeder or branch circuit within an established period of time when a sensed fault current to ground exceeds a current of 6 mA. For secure operation during ground faults, the system: (1) simultaneously processes and discriminates the sensed currents (to ground) of all of the feeder or branch circuits of the service, or of the protected separately-derived system; (2) only initiates disconnection of the circuit that has the highest magnitude of sensed current to ground; and (3) inhibits disconnection of the "non-faulted" circuits at the same time the "faulted" circuit disconnecting means is opened.
FPN No. 1: On three-phase systems that operate above 150 volts to ground, the capacitive-charging current of a non-faulted individual feeder or branch circuit (a current that is also sensed during a system ground fault) can exceed the 6 mA current threshold for a circuit of normal length. The GFCIS-3Ph discriminates between the normal capacitive charging current of the "healthy" three-phase feeder or branch circuits during a ground fault, and the genuine ground-fault current on the faulted feeder or branch circuit.
FPN No. 2: The GFCIS-3Ph may also be used to selectively detect and isolate incipient insulation failure of electrical equipment connected to three-phase feeder or branch circuits.
Substantiation: A new definition is required to accompany companion proposals also submitted for the GFCIS-3Ph in 210.8(D), 215.9, 430.59, and 430.64. See the proposals for details of the system. There is no present NRTL standard for GFCI devices applied above 125 volts to ground; hence the pickup level of 6 mA is defined in the proposed definition. It is expected that a new NRTL (e.g., Underwriters Laboratories) standard will be developed for the GFCIS-3Ph that will establish the required opening time of the disconnecting means of the system, expected to be a inverse-time characteristic between 6 mA and approximately 30 mA, and a definite time (between 0.025 and 0.10 second, depending on the application) for sensed ground-fault currents that exceed 30 mA.
FPN No. 1 is proposed to provide information on how the system functions. FPN No. 2 is proposed to describe an alternate use of the system beyond the primary use for personnel protection.
The basis of this proposal and the associated proposals is "A ground-fault circuit-interrupter method and system for three-phase electrical power systems," for which patent applications have been submitted. Refer to my proposal for 210.8(D) for details of how the system operates and the problem it resolves. Chevron Corporation will be the owner of the patents, if granted. If this proposal is accepted for inclusion in the NEC, Chevron will comply with the NFPA and ANSI Patent Policy, namely:
a) A license will be made available without compensation to the applicants desiring to utilize the license for the purpose of implementing the standard; or
b) A license will be made available to applicants under reasonable terms and conditions that are demonstrably free of any unfair discrimination.
Panel Meeting Action: Reject
Panel Statement: The companion proposal (2-88) submitted was rejected by the panel therefore there is no applicability of this definition in the NEC.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
KING, D.: This proposal should have been accepted. The addition of this new technology to the NEC would save many lives. See my explanation of negative for Proposal 2-88.
WEBER, R.: The panel has rejected companion proposal (2-88) and, therefore, the panel vote to reject the definition is justifiable due to the fact that without a code requirement, permissive use statement or language in the code a definition is not warranted. However, further consideration should be given to the proposal and my negative vote. See my comments and explanation for the Negative vote on Proposal 2-8.
Comment on Affirmative:
BROWN, L.: In all, see Panel Action on related Proposals: 2-6; 2-88; and 2-285.

5-9 Log #1517 NEC-P05 **Final Action: Accept in Principle**
(100.Grounded)

TCC Action: The Technical Correlating Committee directs that the action on this proposal be sent to the Technical Correlating Committee Grounding and Bonding task group for review and comment.
Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Revise the term grounded as follows:
Grounded (Grounding) : Connected to ~~earth~~ ground or to ~~some conducting~~ a conductive body ~~that serves in place of the earth~~ that extends the ground connection .
Substantiation: This is the result of the TCC Task Group on Grounding and Bonding in resolve of the 2005 NEC cycle actions related to Proposal 5-1 and Comment 5-1 as directed by the Technical Correlating Committee. This is a companion proposal to others throughout the NEC relative to this Task Group's recommendations. The substantiation of this proposal is as follows.
It is proposed that the present definition for grounded be rewritten to more accurately describe its purpose and function. The phrase "… that extends the ground connection" was added to emphasize that the conductive body actually extends the ground connection such as the items in 250.118 for the purpose of "grounding" in premises wiring.
The phrase "some conducting body that serves in place of the earth" in the present definition of "grounded" may leave Code users wondering what a conducting body serving as a substitute for the earth really is. Vehicles such as airplanes and automobiles have a metal frame that is often used as a reference for the onboard electrical wiring. It is often referred to as "ground." These types of installations are not covered by the rules of the NEC as indicated in Section 90.2(B). Where the NEC refers to "ground" it implies a connection to the earth and not something that serves as an earth substitute. Where an item is "grounded" it is connected to the earth either directly through a grounding electrode and grounding electrode conductor, or it is connected to the earth through the equipment grounding conductor. The equipment grounding conductor extends the ground (earth) connection. Where the NEC uses the word "grounded" in the rules, it implies a connection to the ground (earth) or a conductive body that extends the earth connection and not to a ground (earth) substitute such as a vehicle or airplane frame as the present definition of "grounded" implies literally.
It is proposed that a new term for "grounding" be added with the term "grounded" to describe the action of grounding. The term **grounding** describes the action of connecting a system or a conductive part to ground. The reason for **grounding** a system is to:
(A) Limit the magnitude of voltages imposed by:
(1) Lightning, or
(2) line surges, or
(3) unintentional contact with higher voltage lines.
(B) Stabilize the voltage to ground during normal operations.
The reason for **grounding** equipment is to limit the magnitude of voltage to ground imposed by:
(1) Lightning, or
(2) line surges, or
(3) unintentional contact with energized parts, or
(4) capacitive coupling.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
Revise the term grounded as follows:
Grounded (Grounding) : Connected (connecting) to ~~earth~~ ground or to ~~some conducting~~ a conductive body ~~that serves in place of the earth~~ that extends the ground connection .
Panel Statement: Adding the term (connecting) creates parallel syntax.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
DOBROWSKY, P.: The proposal should be accepted in principle in part. The definition should read: Grounded (Grounding) Connected (connecting to ground.
The portion about "a conductive body that extends the ground connection should be deleted. Definitions need to be kept simple with out multiple conditions where possible. The concept of a conducting body that extends the earth is vague.
Comment on Affirmative:
HARDING, G.: I agree with the panel action of Accept in Principle except that I think that the word "body" should be replaced with "object" to be consistent with the revised definition for Grounding Electrode on Proposal 5-14.

5-10 Log #3555 NEC-P05 **Final Action: Accept in Principle**
(100.Grounded)

Submitter: Paul Dobrowsky, Holley, NY
Recommendation: Revise the definitation as follows:
Grounded. Connected to earth ~~or to some conducting body that serves in place of the earth~~ .

Substantiation: The concept of using some other body in place of the earth should be deleted because it causes confusion. Systems or equipment is either connected to earth or they are considered ungrounded. If a conducting path is provided to make this connection it serves as the connection, not in place of the earth. Equipment such as generator frames that are not grounded do not serve in place of the earth, they are actually ungrounded but are bonded to the conductor that provides for an effective fault current path.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 5-9 which satisifes the submitter's intent.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:
BRETT, JR., M.: See my explanation of negative vote on Proposal 5-8.
DOBROWSKY, P.: See my comment on 5-9.

5-12 Log #1516 NEC-P05 **Final Action: Accept**
(100.Grounded, Effectively)

Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Delete the term "grounded, effectively" and its definition entirely from Article 100.
Substantiation: This is the result of the TCC Task Group on Grounding and Bonding in resolve of the 2005 NEC cycle actions related to Proposal 5-1 and Comment 5-1 as directed by the Technical Correlating Committee. This is a companion proposal to others throughout the NEC relative to this Task Group's recommendations. The substantiation of this proposal is as follows.

The term "Effectively Grounded" is used 29 times in the NEC. It appears as though in the majority of the locations where it is used, the word "grounded" or phrase "connected to an equipment grounding conductor" could be used. Other proposals are submitted to make those changes.

The 1996 NEC in Section 250.51 used the term "effective grounding path," and those concepts were incorporated in 250.2 (1999 NEC) and then expanded in 250.4(A) and (B) in the 2002 NEC. The performance criteria of grounding and bonding are currently provided in Section 250.4 and include the concepts contained in the vague definition of the term "effectively grounded."

The definition "Effectively Grounded" is very subjective and without any defined values or parameters for one to judge grounding as either "effective" or "ineffective." "Effective" is described in Section 250.4(A) and (B), but it relates to the effective ground-fault current path as a performance criteria. Deleting the term in the NEC and the definition is logical because there are no definitive parameters for Code users to make a determination on what constitutes "effectively grounded." Systems are solidly grounded, grounded through a resistor or impedance, or ungrounded. Equipment (normally noncurrent-carrying metal parts are grounded where connected to an equipment grounding conductor.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-13 Log #357 NEC-P05 **Final Action: Accept in Principle**
(100. Grounding (New))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Add a new definition to read as follows:
<u>Grounding. The process of connecting equipment or the grounded circuit conductor of a wiring system to the earth through a grounding electrode or electrode(s).</u>
Substantiation: No definition of the word "grounding" currently exists in the NEC, yet it is used several times throughout the Code. This proposed definition should help users by providing clear description (in a definition) of the action or process of grounding. Grounding (connecting to the earth) should not be considered as an effective ground-fault current path. That path is produced through the ongoing action or process of "bonding" as defined in Article 100 and described in 250.90.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 5-9 which satisifes the submitter's intent.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-11 Log #3556 NEC-P05 **Final Action: Reject**
(100.Grounding Conductor)

Submitter: Paul Dobrowsky, Holley, NY
Recommendation: Delete the term "Grounding Conductor" and its definition.
Substantiation: This proposal is intended to be combined with the proposal to revise the existing definition of "Grounding Electrode Conductor". The term Grounding Conductor is sometimes used in place of the term grounding electrode conductor and at other times is used to describe all types of grounding conductors.
Panel Meeting Action: Reject
Panel Statement: The term "grounding conductor" is necessary to describe the full set of grounding conductors. Not all "grounding conductors" are necessarily "grounding electrode conductors."
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
DOBROWSKY, P.: This proposal should be accepted or accepted in principle. The present definitions of "grounding conductor" and "grounding electrode conductor" are too similar. Possibly the term grounding conductor can be modified to describe the conductor used with the Intersystem Bonding Termination.
Comment on Affirmative:
MELLO, C.: The actions of the panel were correct to reject the deletion of this definition. After the full deliberations it appears the definition of "grounding conductor" should be considered for revision to ensure the concept of being all-inclusive as follows:
Grounding Conductor. ~~A conductor used to connect equipment or the grounded circuit of a wiring system to a grounding electrode or electrodes~~ A general term used to include all conductors that connect equipment or systems to ground and that connect normally non-current carrying metal parts of equipment together.
FPN: Grounding electrode conductors, bonding conductors, and equipment grounding conductors all are types of grounding conductors.

5-14 Log #1514 NEC-P05 **Final Action: Accept in Principle**
(100.Grounding Electrode)

TCC Action: The Technical Correlating Committee directs that the action on this proposal be sent to the Technical Correlating Committee Grounding and Bonding task group for review and comment.
Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Revise the definition of grounding electrode as follows:
Grounding Electrode. ~~A device that establishes an electrical connection to the earth.~~ <u>A conducting element, material, or device through which a direct connection to earth is established.</u>
Substantiation: This is the result of the TCC Task Group on Grounding and Bonding in resolve of the 2005 NEC cycle actions related to Proposal 5-1 and Comment 5-1 as directed by the Technical Correlating Committee. This is a companion proposal to others throughout the NEC relative to this Task Group's recommendations. The substantiation of this proposal is as follows.

It is proposed that the present definition for grounding electrode be rewritten to better describe its function. The **Grounding Electrode** establishes and maintains a direct connection to earth. For examples of grounding electrodes, see Section 250.52(A).

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
Revise the definition of grounding electrode to read as follows:
Grounding Electrode. ~~A device that establishes an electrical connection to the earth.~~ <u>A conducting object through which a direct connection to earth is established.</u>
Panel Statement: The term "object" was substituted for "element, material or device" because "object" includes all the items listed in the recommendation.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-15 Log #1705 NEC-P05 **Final Action: Reject**
(100.Grounding Electrode (New))

Submitter: Charles M. Trout, Maron Electric Company
Recommendation: Add new definition as follows:
Supplementary Grounding Electrode. A grounding electrode permitted to be installed, but not required to be installed.
FPN: Refer to NFPA 70, 250.54 for additional information.
Substantiation: There is considerable confusion in the field relating to the meaning of supplementary in Article 250. Webster's dictionary defines supplementary as forming a supplement. It defines supplement as something added to complete a thing or forming an addition to. Article 250 uses the term supplemental in 250.53(D)(2) requiring that a metal underground water pipe be supplemented by an additional electrode. Webster's dictionary defines additional as being supplementary.
Panel Meeting Action: Reject
Panel Statement: The term "supplementary grounding electrode" only appears twice in Code rules. It appears one time in Section 250.54 and once in Section 692.47. The requirements are different between these two sections. In 692.47 the supplementary grounding electrode becomes a required electrode by the manufacturer. Section 692.47, Grounding Electrode System, indicates that any supplementary grounding electrode required by the manufacturer shall be connected to the equipment grounding conductor specified in 250.118. By the requirements of Section 110.3(B) and the specific requirements of this section, the supplementary grounding electrode becomes a required grounding electrode that must be installed.

Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
HAMMEL, D.: It is worth noting the panel action on 5-170. The panel has deleted the term supplementary in favor of the term "Auxiliary" in 250.54.

5-16 Log #2933 NEC-P05 **Final Action: Accept in Principle**
(100.Grounding Electrode)

Submitter: Philip Simmons, Simmons Electrical Services
Recommendation: Revise the definition of Grounding Electrode as follows:
Grounding Electrode: A conductive object ~~device~~ that establishes an electrical connection to the earth.
Substantiation: The term "device" does not work in this definition as 250.52(A) describes several conductive objects that do not meet the present definition of "device" in Article 100. For example, underground metal water pipes are not a unit of an electrical system, they are a unit of a plumbing system. A metal frame of a building or structure is likewise not a unit of an electrical system, but rather a unit of a building structure. The same logic applies to concrete encased grounding electrodes. These are used as grounding electrodes but are a structural component of a building or structure but are not a unit of an electrical system.
250.52(A) lists the grounding electrodes that are required to be used for the grounding electrode system if they are present on the premises. All are objects but all are not an electrical device. Grounding electrodes include:
(1) Metal Underground Water Pipes. (Not a "device")
(2) Metal Frames of the Building or Structure. (Not a "device")
(3) Concrete-Encased Electrodes. (Not a "device"
(4) Ground Ring. (Perhaps a "device")
(5) Rod and Pipe Electrodes. (Perhaps a "device")
(6) Plate Electrodes. (Perhaps a "device")
(7) Other Local Metal Underground Systems or Structures (Not "devices")
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 5-14.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-17 Log #3582 NEC-P05 **Final Action: Accept in Principle**
(100.Grounding Electrode)

Submitter: Eugene E. Morgan, Clakamas County, Building Codes Divison
Recommendation: Revise as follows:
Grounding Electrode. A device that establishes an intentional electrical connection to earth.
Substantiation: Addition of the word "intentional" to this definition wold make it clear that devices in casual, or unintentional contact with the earth may not qualify as a grounding electrode. It would also help with consistency between this definition and the definitions in 250.2.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action and statement on Proposal 5-14. The panel concludes that the term "direct connection" is more appropriate.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-18 Log #3554 NEC-P05 **Final Action: Accept in Principle**
(100.Grounding Electrode Conductor)

TCC Action: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the Code-Making Panel as a public comment.
Submitter: Paul Dobrowsky, Holley, NY
Recommendation: Replace the existing definition with the following
Grounding Electrode Conductor. A conductor used to connect the grounding electrode(s) to a system grounded conductor or to equipment.
~~Grounding Electrode Conductor. The conductor used to connect the grounding electrode(s) to the equipment grounding conductor, to the grounded conductor, or to both, at the service, at each building or structure where supplied by a feeder(s) or branch circuit(s), or at the source of a separately derived system.~~
Substantiation: The grounding electrode conductor should be simply described without the existing limited components where is can be connected. This will help provide clarity so this term can be used instead of the term "grounding conductor" which is sometimes used to include equipment grounding conductors, grounding electrode conductors and in other situations is used instead of the term "grounding electrode conductor."
Panel Meeting Action: Accept in Principle
Replace the existing definition with the following
Grounding Electrode Conductor. The conductor used to connect the grounding electrode(s) to a system conductor or to equipment.
~~Grounding Electrode Conductor. The conductor used to connect the grounding electrode(s) to the equipment grounding conductor, to the grounded conductor, or to both, at the service, at each building or structure where supplied by a feeder(s) or branch circuit(s), or at the source of a separately derived system.~~
Panel Statement: "The conductor" is more appropriate than "a conductor." The term "grounded" was removed from the recommendation because it is not a grounded conductor until it is connected.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 11 Negative: 4
Explanation of Negative:
BOKSINER, J.: The proposal to broaden the definition of Grounding Electrode Conductor was intended to be editorial, but the acceptance of this proposal will result in significant changes to NEC requirements unless additional correlating revisions are made.
NEC section 250.62, 250.64, 250.66, and 250.68 are titled Grounding Electrode Conductor Material, Grounding Electrode Conductor Installation, Size of Alternating-Current Grounding Electrode Conductor, and Grounding Electrode Conductor and Bonding Jumper Connection to Grounding Electrodes. These sections have specific requirements that make sense only for the grounding electrode conductors that ground the service or the separately derived system as such conductors perform an essential safety function. However, certain installations, particularly installations for information technology and communications technology equipment, often have various supplementary (auxiliary) grounding conductors installed for reasons of electromagnetic compatibility, lightning protection, establishing ground planes for antennas, etc. The proposed change in the definition would define these supplementary grounding conductors as grounding electrode conductors. Thus, the proposed definition would imply that requirements of 250.62 through 250.68 apply to these supplementary grounding conductors.
I do not believe that CMP 5 intended to change the application of 250.62 through 250.68. Therefore if this proposal is accepted, the term grounding electrode conductor in 250.62 through 250.68 should be qualified by the phrase "at the service, at each building or structure where supplied by a feeder(s) or branch circuit(s), or at the source of a separately derived system."
I cannot support this proposal until its unintended ramifications for other NEC requirements are corrected.
BRETT, JR., M.: I agree with the other explanations of negative votes.
MELLO, C.: The revised definition effectively prevents the connection of the grounding electrode conductor to the building "master" or "central" ground bus that is specifically permitted in 250.64(C) and 250.64(F). Under the revised definition the ends of the grounding electrode conductor can terminate only either on a grounding electrode, defined in Article 100 and specified in 250.52, or on a system conductor, to establish a system grounded conductor, or on equipment enclosures. A better definition would be as follows which does not limit the terminations that are allowed by prescriptive text:
Grounding Electrode Conductor. A conductor used to connect the system grounded conductor or the equipment to a grounding electrode or to a point on the grounding electrode system.
WHITE, C.: This proposal should have been rejected. This new definition is overly restrictive and would not permit a connection of the grounding electrode conductor to some other place on the grounding electrode system such as that permitted by 250.64(C) or 250.64 (F).
Comment on Affirmative:
HARDING, G.: I agree with the panel action of Accept in Principle. However, though I agree that the panel statement is technically correct, I believe the elimination of the word "grounded" from the recommnedation will add confusion rather than improve clarity. Suggestion for text: "The conductor used to connect the grounding electrode(s) to a system grounded conductor or to equipment."

(Note: Sequence 5-19 was not used)

9-3 Log #439 NEC-P09 **Final Action: Accept**
(100. Handhole Enclosure)

Submitter: John D. Minick, National Electrical Manufacturers Association
Recommendation: Revise the definition to read as follows:
Handhole Enclosure. An enclosure ~~identified~~ for use in underground systems, provided with an open or closed bottom, and sized to allow personnel to reach into, but not enter, for the purpose of installing, operating, or maintaining equipment or wiring or both.
Substantiation: The NEC TCC requested that NEC Panel 1 submit a proposal for the 2008 Code cycle to correct the wording in the definition of "handhole enclosure" so that the definition complies with the NEC Style Manual. A joint effort was undertaken by CMP-1 members John Troglia and John Minick to resolve the issue. This effort resulted in a proposal to delete the word "identified", which is a word that is in violation of NEC Style Manual Section 2.2.2. A companion proposal has also been made to revise Section 314.30 by adding the word "identified" plus additional wording for clarification so that this section will read, "Handhole Enclosures. Handhole enclosures shall be identified for use in underground systems and shall be designed and installed to withstand all loads likely to be imposed." These revisions should not affect the current intended requirements in or uses permitted in 314.30 for such enclosures and retains the requirement that handhole enclosures be identified as well as being designed and installed to withstand all loads likely to be imposed.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-4 Log #3375 NEC-P09 **Final Action: Accept**
(100.Handhole Enclosure)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Delete the word "identified."
Substantiation: This is a companion proposal to one that locates the identification requirement in 314.30. Definitions are not permitted to contain requirements, per 2.2.2 of the NEC Style Manual. This proposal and its companion taken together do not change any requirements in the NEC.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

18-4a Log #2317 NEC-P18 **Final Action: Reject**
(100.High mA Cathode/HMC (New))

Submitter: Jimmie Evanisko, National Cathode Corporation
Recommendation: Add a new definition to read:
High mA Cathode/HMC. An electric discharge lighting system utilizing one inch (25 mm) diameter lamps or larger used as a luminare for general illumination that are physically connected to the output of a ballast or transformer with operating currents of 96 mA to 240 mA (120 mA to 300 mA rated currents) through the means of ferrule or Slimline lamp caps into ferrule or Slimline lampholders. Any other lighting systems with less than 25 mm diameter lamps, lower mA currents, and no ferrule/Slimline caps or lampholders are not used for general illumination.
Substantiation: Over the past few years and the recent IEC proposal #60958-2-27 34/D 843/CD, the lighting consultants, architects, engineers and myself have seen an unbelievable amount of miniature fluorescent used in displays, computers, LCD backlights and neon power sources with very low mA current markings being marketed as cold cathode components which contradicts UL, CSA, NEC, 410.73 through 410.87 and does not fall into the scope of electric signs or outline lighting in Article 100 Definitions.
To substantiate please review the IESNA 8th edition pages 203, 205, 206, and 307, IESNA 9th edition pages 6-21, 6-26, 6-27, 6-29, 6-30, 6-41, and 6-42 which both describe in depth the definition of cold cathode as the IESNA has described in all of their previous editions since 1948.
Panel Meeting Action: Reject
Panel Statement: Parts XIII and XIV of Article 410 are not intended to address the installation of electric discharge lighting in appliances. The rules in Parts XIII and XIV provide guidance for safe installations of electric discharge lighting based on the limitations specified. No safety reason is given for excluding electric discharge lighting systems that operate within the limitations.
The IEC proposal referenced in the substantiation is subject to change. Also, it does not contain a definition for high mA cathode / HMC.
How products are marketed is not valid substantion to change a safety standard.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-33 Log #1213 NEC-P01 **Final Action: Reject**
(100.In Sight From (Within Sight From, Within Sight))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise as follows:
In Sight From (Within Sight From, Within Sight). Where this code specifies that one equipment shall be "in sight from," "within sight from," or "within sight", and so forth, of another equipment, the specified equipment is to be visible, accessible from , and not more than 15 m (50 ft) distant from the other.
Substantiation: This term appears multiple times throughout the NEC and installations required to meet the objectives of the defined term should be consistent where this term is used for that given requirement. There are many instances that arise in the field where a window or transparent obstruction is located between the motor and the disconnecting means as an example, yet if a workman had to access it or monitor it from being closed (turned on) while he or she were working on the motor or driven machinery, it could present a safety issue. Adding the proposed text in the definition that equipment must not only be visible and meet the distance parameters in the definition, but also be accessible from each other, would provide enforcement and industry clear guidelines as to the intended objectives of the requirements continuing the term and promote more consistent application of the rules containing these terms in the field by installers and inspectors.
Panel Meeting Action: Reject
Panel Statement: Adding the words "accessible from" in essence places unnecessary restriction on the term "in sight from." The NEC requires that switches and circuit-breakers used as switches be readily accessible. The submitter's substantiation is apparently based on the presumption that a worker should be able to change the on-off position of a disconnecting means from the point where the worker is performing his/her function. This is incorrect. The purpose of in-sight-from requirements is to ensure that the worker knows the position of the disconnecting means (i.e., open or closed).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
HICKMAN, P.: We are voting negative to the panel action to reject proposal 1-33. Our explanation is as follows:
This proposal should have been accepted. Accepting this Proposal will, in our opinion, greatly enhance electrical safety. We agree with submitter that the proposal "would provide enforcement and industry clear guidelines as to the intended objectives of the requirements continuing the term and promote more consistent application of the rules containing these terms in the field by installers and inspectors." We do not agree with the entire Panel Statement. For example, we do not agree that this proposal would place an unnecessary burden on the definition. We feel that having the disconnecting means accessible from the equipment being worked on will enhance safety.

1-34 Log #1642 NEC-P01 **Final Action: Reject**
(100.In Sight From (Within Sight From, Within Sight))

Submitter: L. Keith Lofland, International Association of Electrical Inspectors
Recommendation: Add new text as follows:
In Sight From (Within Sight From, Within Sight). Where this Code specifies that one equipment shall be "in sight from," "within sight from," or "within sight," and so forth, of another equipment, the specified equipment is to be readily accessible , visible and not more than 15 m (50 ft) distant from the other.
Substantiation: Consider this scenario. A motor is located at grade level on the outside of a building. The disconnecting means for this motor is located inside on the second floor beside a window. The disconnecting means is within 15 m (50 ft) and is also visible from the outside motor. 430.102(B) requires the disconnecting means for this motor to be located in sight from the motor location and the driven machinery location. If the safety and the control of the disconnecting means for the worker is the purpose of this definition, it would seem that this is not being accomplished in the scenario described above, yet it meets the current definition as describe in Article 100. The addition of the phrase "readily accessible" would eliminate a disconnecting means from being located on one side of a glass door, window or partition and the equipment located on the other side.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 1-33.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
HICKMAN, P.: We are voting negative to the panel action to reject proposal 1-34. This proposal should have been accepted. See our Explanation of Negative on Proposal 1-33.

13-2 Log #2579 NEC-P13 **Final Action: Accept in Principle**
(100. Interactive System)

Submitter: Timothy M. Croushore, Allegheny Power
Recommendation: Please add new definition to Article 100 for Interactive System. The definition is as follows:
Interactive System. An electric power production system that operates in parallel with and capable of delivering energy to an Electrical Power Production and Distribution Network.
Substantiation: The purpose of this change is to add a new definition of Interactive System that will be used in Article 690, 692, and Article 705. Code Making Panel 13 should be given authority for this definition to appear in Article 100. The definition is the same as the definition in section 2.41 of Underwriter Laboratory Standard 1741 – Inverters, Converters and Controllers for Use in Independent Power Systems.
This new definition will replace the three different definitions of "Interactive System" used in Article 690, 692 and Article 705. This change is being proposed as part of a re-write of Article 690, 692 and Article 705 with respect to the interconnection of systems and equipment for use with distributed energy resources.
UL 1741 is currently under revision with a title change from "Inverters, Converts, and Controllers for Use in Independent Power Systems" to "Inverters, Converters, Controllers and Interconnection Systems Equipment for Use with Distributed Energy Resources." However the definition of Interactive System remains unchanged.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel action and statement on Proposal 13-184 should satisfy the intent of the submitter.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

5-20 Log #1885 NEC-P05 **Final Action: Accept in Principle**
(100. Intersystem Grounding Termination (New))

Submitter: Jeffrey Boksiner, Telcordia Technologies, Inc. / Rep. Alliance for Telecommunications Industry Solutions
Recommendation: Propose new definition:
Intersystem Grounding Termination. Terminal, bar or bus that provides a means of grounding for Communications System(s) at the premises and permits

connection between equipment of different systems such as connection between Communications System(s) and the service equipment or the disconnecting means for any additional buildings or structures.
Substantiation: This is one of several correlated proposals (100 Definitions, 250.95, Chapter 8 Articles) to improve the requirements related to intersystem bonding and grounding of communication systems. The intent is to create a dedicated and well-defined location for terminating the grounding conductors required in Chapter 8 Articles and 770.93. These grounding conductors also provide between communication and power systems (intersystem bonding). The proposed termination would have sufficient capacity to handle multiple communication systems (telecom, satellite, CATV) on premises. See the illustrations which I have provided.

Intersystem bonding accomplished by connection of a communication grounding conductor to the power system is an important safety measure to prevent occurrences of voltages between communication system and power system. However, the existing requirements are not adequate. Bonding is becoming difficult to implement due to changes in building construction practices such as increased prevalence of flush construction and use of PVC conduits. Frequently, in new construction, the grounding electrode, the raceway and the grounding electrode conductor are hidden behind walls and not accessible for bonding connection.

Even in older construction with accessible equipment, the requirement for installation of intersystem bonding connection is subject to varying interpretation because there is not a clearly defined dedicated bonding location. The connection to the power system is sometimes haphazard. Installers are sometimes confused over where the connection should be made especially if multiple Communication Systems are present on premises.

Note that the Intersystem Grounding Termination might have been called the Intersystem Bonding Termination since it performs both bonding and grounding functions. The term Intersystem Grounding Termination is proposed for consistency with the results of the Task Group on Grounding & Bonding.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle

Revise the recommended definition to read as follows:
Intersystem Bonding Termination. A device that provides a means of bonding communications equipment at the service equipment or the disconnecting means for any additional buildings or structures.
Panel Statement: "Terminal bus and bars" was changed to "device" to make it more general. "Grounding" was changed to "bonding" to accurately reflect the definitions.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:

BRETT, JR., M.: There was no substantiation to add the word "device". This adds a requirement and expense to the contractor (installer) that is not necessary and will not be used in many normal installations. When this section was added, it was to ensure that the communications installers could tie their ground to the structure grounding electrode system. On most installations, there is nothing required of the electrical installer, only where all connections and service equipment are concealed is a means required to be added to make the connection accessible. For example, in my new home all service equipment is concealed, however, the contractor elected to run a separate conductor for the telephone and the CATV. If this change is accepted, he would be forced to add a device for these connections on an exterior wall.

This proposal should be rejected as the present language is sufficient and the change is not necessary.
Comment on Affirmative:

HAMMEL, D.: I agree with the panel action. I would, however, like the panel to consider the recommended definition to read as follows:

Intersystem Bonding Termination: A means of bonding communications equipment at the service equipment or the disconnecting means for any additional building or structures.

1-35 Log #1738 NEC-P01 **Final Action: Reject**
(100.Isolated, Separate, & Dedicated)

Submitter: Ray C. Mullin, Ray C. Mullin Books
Recommendation: Add definitions for the words isolated, separate, and dedicated.
Substantiation: I propose that the staff at NFPA headquarters do an entire editorial study of NFPA 70.

The purpose of my proposal is to establish a clear cut, easy to understand the meaning of certain terms. There is too much confusion out there. Many hours of discussion time is wasted because of the cloudiness of the meaning of certain words. Webster defines all of these terms, but the definitions do not necessarily describe the intent of the NEC.

In Article 100, we find a very precise definition of an individual branch circuit specifically aimed at the electrical arena.

Elsewhere in the NEC we find use of the terms isolated, separate, and dedicated. But these words are not defined, leading to interpretations all over the map.

At electrical inspector meetings, we listen to discussions about what an individual branch circuit is...such as the receptacle for a refrigerator. Is it a single receptacle...or could it be a duplex receptacle? It all depends on the intent of the individual.

Webster's definitions very well are met by the term separate and dedicated. But since these words have specific meaning for the electrical industry, we need to have definitions added to Article 100 for each of these words to define the true intent of the meaning as applied to the NEC.

I sincerely believe that adding definitions for isolated, separate, and dedicated found throughout the NEC will reduce wasted time on the part of electrical inspectors, electricians, consulting engineers, etc. and will reduce if not eliminate "Red Tags" relative to these terms.
Panel Meeting Action: Reject
Panel Statement: The proposal does not include proposed text as required by 4-3.3(c) of the Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-36 Log #356 NEC-P01 **Final Action: Accept**
(100. Kitchen (New))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 2 for action. This action will be considered by Code-Making Panel 2 as a public comment.
Submitter: Michael J. Johnston, Plano, TX
Recommendation: Add a new definition to read as follows:

Kitchen. An area with a sink and permanent facilities for food preparation and cooking.
Substantiation: The word kitchen as used in 210.8(B)(2) is described as provided in the proposed new definition. The word kitchen is used many more times in the Code which necessitates a common definition for this word so uniform and consistent application of rules in the Code can be established. CMP-2 found this definition to be sufficient for use in 210.8(B)(2).
Panel Meeting Action: Accept
Panel Statement: The panel recommends that the TCC forward this proposal to CMP-2 for comment relative to removing 210.8(B)(2).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-37 Log #2110 NEC-P01 **Final Action: Reject**
(100.Labeled)

Submitter: Herbert Moulton, Masters Technology Inc.
Recommendation: Revise the definition of "Labeled" and add a new FPN as follows:

Labeled. Equipment or materials to which has been attached a label, symbol, or other identifying mark of an organization that is acceptable to the authority having jurisdiction. ~~and concerned with product evaluation, that maintains periodic inspection of production of labeled equipment or materials, and by whose labeling the manufacturer indicates compliance with appropriate standards or performance in a specified manner.~~

FPN: A product may be identified for use having met the requirements of its labeling such as listed, recognized, or classified.
Substantiation: The deleted text is unnecessary as the requirements for certification and/or accredited would entail these actions as part of their acceptance for licensing. In addition to clarifying the use of the word "listed" in the NEC, the use of the wording "certified and/or accredited organization" is consistent with larger efforts to harmonize with standards and conformance assessment internationally.
Panel Meeting Action: Reject
Panel Statement: The panel rejects the substantiation that the deleted text is not necessary. The deleted text constitutes an essential element of a labeling program. Additionally, the word "Labeled" is an official NFPA definition -- see the NFPA Regulations Governing Committee Projects, Section 3.3.6.1, and the NFPA Glossary of Terms. Official definitions shall not be altered unless approved by the Standards Council.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-38 Log #573 NEC-P01 **Final Action: Reject**
(100.Lighting Outlet)

Submitter: Alan H. Nadon, City of Elkhart, IN
Recommendation: Revise as follows:

Lighting Outlet. An outlet having ~~intended for the direct connection of~~ a lampholder, a luminaire (lighting fixture), or a pendant cord terminating in a lampholder, that is directly connected .
Substantiation: Intent cannot be determined during an inspection. A junction box with a blank cover, even one containing switched conductors, does not provide the illumination needed for persons to move about safely thus preventing accidents.
Panel Meeting Action: Reject

Panel Statement: The proposed definition would require a luminaire wherever a lighting outlet is installed. Code rules dictate where lighting is required. CMP-1 refers the submitter to the panel action and statement on Proposal 1-39.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-39 Log #1299 NEC-P01 **Final Action: Accept in Principle**
(100.Lighting Outlet)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panels 2 and 18 for comment.
Submitter: Joseph Whitt, JW Electric
Recommendation: Revise text to read:

Lighting Outlet. An outlet intended for the direct connection of ~~a~~ or a permanently installed cord and plug connected lampholder, ~~a~~ luminaire (lighting fixture), or a pendant cord terminating in a lampholder.

Substantiation: As worded, a lighting outlet would require a direct connection to the premises wiring. This could be interpreted to mean that the luminary would be required to be installed to a box with wire nuts which would leave out a cord and plug connected luminary as outlined in 410.30.

This would also negate Exception No. 1 of 210.70(A)(1).

This would also clear up the confusion for inspectors and electrical contractors as to whether a receptacle used for the sole purpose to supply current to a luminary is a lighting outlet or not. This will help in clearing up the confusion over the use and switching of small appliance and laundry receptacles for permanently installed under cabinet luminaries.

As an instructor of inspector classes in the state of North Carolina, I see those inspectors coming through my classes are split about fifty/fifty on this issue. This issue needs clarity.

Panel Meeting Action: Accept in Principle

Revise the definition to read as follows:

"Lighting Outlet. An outlet intended for the connection of a lampholder, a luminaire (lighting fixture), or a pendant cord terminating in a lampholder.

Panel Statement: The panel concludes this action meets the intent of the submitter. CMP-1 agrees that the definition may conflict with the requirement in 410.30(C)(1) and other code sections that allow for the use of attachment plugs for the connection of luminaires. CMP-1 disagrees that the existing definition negates 210.70(A)(1), Exception No. 1. CMP-1 has revised the definition by deleting the word "direct." The panel recommends that the TCC forward this action to CMP-18.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-40 Log #2109 NEC-P01 **Final Action: Reject**
(100.Listed)

Submitter: Herbert Moulton, Masters Technology Inc.
Recommendation: Revise the definition of "Listed" and FPN as follows:

Listing ~~Listed~~ . Equipment, materials, or services included in a list published by a certified and/or accredited ~~an~~ organization that is acceptable to the authority having jurisdiction and concerned with evaluation of products or services. ~~that maintains periodic inspection of production of listed equipment or materials or periodic evaluation f service,s and whose listing states that the equipment, materials, or services either meets appropriate designated standards or has been tested and found suitable for a specified purpose.~~

The listing states that the equipment materials or services meets the appropriate designated standards or has been tested and found suitable for the intended use.

~~FPN: The means for identifying listed equipment may vary for each organization concerned with product evaluation, some of which do not recognize equipment as listed unless it is also labeled.~~ Use of the system employed by the listing organization allows the authority having jurisdiction to identify a listed product for the intended use .

Substantiation: The deleted text is unnecessary as the requirements for certification and/or accredited would entail these actions as part of their acceptance for licensing. In addition to clarifying the use of the word "listed" in the NEC, the use of the wording "certified and/or accredited organization" is consistent with larger efforts to harmonize standards and conformance assessment internationally.

The words "for the intended use" need to be incorporated in this FPN. Many products are being used in applications that the product has not been evaluated for the intended use. This will allow the authority having jurisdiction to request that the intended use has met the certified and/or accredited organizations conditions of acceptability in the manner being used.

Panel Meeting Action: Reject
Panel Statement: The panel rejects the substantiation that the revised text is necessary. The deleted text constitutes an essential element of a listing program. Additionally, the word "Listed" is an official NFPA definition -- see the NFPA Regulations Governing Committee Projects, Section 3.3.6.1, and the NFPA Glossary of Terms. Official definitions shall not be altered unless approved by the Standards Council. Furthermore, the proposal includes a requirement in a definition, in violation of 2.2.2 of the NEC Style Manual.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-4b Log #CP1800 NEC-P18 **Final Action: Accept**
(100.Luminaire)

Submitter: Code-Making Panel 18,
Recommendation: Luminaire – A complete lighting unit consisting of a light source such as a lamp or lamps, together with the parts designed to position the light source and connect it to the power supply. It may also include parts to protect the light source, ballast, or distribute the light. A lampholder itself is not a luminaire.
Substantiation: This revised definition will address the concerns expressed in the substantiation of Proposals 18-4 and 18-5. The panel reiterates that "lampholders" are not "luminaires."
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-5 Log #1030 NEC-P18 **Final Action: Reject**
(100.Luminaire)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Delete present definition and substitue the following:

LIGHTING FIXTURE. A lighting unit (fixture) consisting of a lampholder(s), with or without integral switching means, which may have provisions for enclosing the lamp(s) or distributing the light, and with provisions for connection to a lighting outlet.

Substantiation: Edit. There is no definition for a lighting unit that doesn't conform to the definition of luminaire. A chandelier with unenclosed (unprotected) lamps, a fluorescent fixture without a lens (unprotected lamps), pendant fixtures without a lens (unprotected lamps), porcelain and plastic type lampholders designed for mounting on an outlet box, lampholders for floodlight lamps, do not conform to the present definition and the requirements for luminaires in Article 410 literally do not apply to lighting units that do not conform to the definition of luminaire.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 18-4.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-6 Log #1412 NEC-P18 **Final Action: Accept**
(100.Luminaire)

Submitter: George Stolz, II, Pierce, CO
Recommendation: Remove the parenthetic term "Fixture" from "Luminaire (Fixture)" and use only the term "Luminaire" for all related references.
Substantiation: The wording of this term is redundant and adds nothing to the interpretation or use of the NEC. The use of the term "Lighting Fixture" or "Fixture" should have been removed during the 2005 cycle.
Panel Meeting Action: Accept
Panel Statement: See panel action and statement on Proposal 18-44.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-7 Log #3413 NEC-P18 **Final Action: Reject**
(100.Luminaire)

Submitter: Fred Tyler, Minneapolis, MN
Recommendation: Revise text to read:

Luminaire (fixture) (lighting fixture) . A complete lighting unit consisting of a lamp or lamps together with the parts designed to distribute the light to position and protect the lamps and ballast (where applicable), and to connect the lamps to the power supply.

Substantiation: Every other instance of luminaire in the Code (ex: 410.1, 410.3) is followed by "fixture" or "lighting fixture" in parenthesis. To prevent confusion, the term in the definition should also be followed by the parenthesis.
Panel Meeting Action: Reject
Panel Statement: The parenthetical use of the term "fixture" in the 2005 NEC was provided to assist in transitioning the replacement term "luminaire." The panel action on 18-44 eliminates the parenthetical terms "fixture" and "lighting fixture."
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-5 Log #2323 NEC-P09 **Final Action: Accept in Principle in Part**
(100.Metal Enclosed Power Switchgear, FPN (New))

Submitter: Daleep C. Mohla, DCM Electrical Consulting Services, Inc.
Recommendation: Add a FPN to the definition of Metal Enclosed Switchgear to read:

FPN: Metal Enclosed Switchgear is available in non-arc resistant or Arc Resistant construction (See IEEE C37.20.1 and C37.20.2 for testing requirements of non-arc resistant and C37.20.7 for testing requirements of arc resistant switchgear).

Substantiation: Metal enclosed switchgear is available in various constructions with different testing requirements for enclosure integrity. Non arc resistant switchgear is tested to withstand effects of the three phase bolted faults. Arc resistant switchgear enclosure is designed and tested to withstand effects of internal arcing faults in addition to the three phase bolted faults.
Panel Meeting Action: Accept in Principle in Part
Add new last sentence to the current defiintion of "Metal-Enclosed Power Switchgear" as follows:
Metal Enclosed Power Switchgear is available in Non-arc Resistant or Arc Resistant constructions.
Panel Statement: Identification of both Arc Resistant and Non-arc Resistant Switchgear is appropriate. This information should be included as part of the definition.
References to product safety standards should be included in Annex A. This Annex documents those standards used for product listing where listing is required by the Code. As listing of Metal-Enclosed Power Switchgear is not required by the Code, inclusion of the referenced standards is not appropriate. As such, CMP-9 added a new last sentence.
CMP-9 does not accept the submitter's request to include the testing documents.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-6 Log #3520 NEC-P09 **Final Action: Accept in Principle in Part**
(100.Metal-Enclosed Power Switchgear, FPN (New))

Submitter: James R. White, Shermco Industries, Inc.
Recommendation: Add a FPN to the definition of the Metal Enclosed Switchgear.
FPN: Metal enclosed switchgear is available in non-arc resistant or Arc Resistant construction (See IEEE C37.20.1 and, C37.20.2 for testing requirements of non arc resistant and C37./20.7 for testing requirements of arc resistant switchgear.)
Substantiation: Arc-resistant, metal enclosed switchgear is available and has been tested to withstand the effects of an internal arcing fault in addition to a three phase bolted fault. Non arc resistant switchgear is tested to withstand effects of a three phase bolted fault only.
Panel Meeting Action: Accept in Principle in Part
Panel Statement: See panel action and statement on Proposal 9-5.

(100.Neutal Conductor (New))

Submitter: Fred W. Brown, HI Electron
Recommendation: Add a new definition:
Neutral Conductor. A grounded conductor that is connected to the common point of a symmetrical electrical system and carries the vectorial summation currents of the ungrounded to grounded conductor loads in multiwire branch circuit, feeder, and service entrance conductors.
Substantiation: The use of the terms "grounded conductor" and "neutral conductor" are problematic in nature in the electrical industry. It is a concept that needs to be distinguishing between the two principles in order to properly apply the National Electrical Code. In a single branch circuit which contains an ungrounded conductor (black in color) and a grounded conductor (white in color) the grounded conductor is frequently called a "neutral". In this application, the grounded is not a neutral and leads to miss applications by electricians.
In the past, the electrical industry has envisioned the "neutral" as neutralizing voltages or neutralizing currents. I have seen multiwire branch circuits installations that were installed with six three-phase conductors (two A-phase, two B-phase, and two C-phase conductors) and one grounded conductor all the same size. The electricians were convinced that the grounded conductor would neutralize all the currents.
The code is in dire need of an accurate definition of this conductor.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 5-36.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-22 Log #166 NEC-P05 **Final Action: Accept in Principle**
(100. Neutral)

NOTE: The following proposal consists of Comment 1-136 on Proposal 1-122 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 1-122 was:
Add a new definition as follows:
Neutral Conductor. A conductor that is connected to the neutral point of a system and is intended for carrying current during normal conditions.
Submitter: Paul Dobrowsky, Holley, NY
Recommendation: Accept the proposal as submitted.
Substantiation: The revision made does not improve usability and could cause confusion as indicated in the negative ROP ballot comments.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 5-36.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-23 Log #167 NEC-P05 **Final Action: Reject**
(100. Neutral)

NOTE: The following proposal consists of Comment 1-137 on Proposal 1-122 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 1-122 was:
Add a new definition as follows:
Neutral Conductor. A conductor that is connected to the neutral point of a system and is intended for carrying current during normal conditions.
Submitter: Donald A. Ganiere, Ottawa, IL
Recommendation: Panel should reject this proposal.
Substantiation: While I tend to agree that a definition of the term "neutral" should be in the code, I don't think this is the one that we need. The acceptance of this proposal would require that the grounded conductor of a 120/240 volt 3 phase 4 wire high leg delta system be counted as a current carrying conductor for the purpose of ampacity adjustment because the grounded conductor of this system does not meet the proposed definition of "neutral."
Panel Meeting Action: Reject
Panel Statement: This panel concludes that the definition of the neutral conductor will add clarity to the understanding and use of the NEC. See panel action and statement on Proposal 5-36.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-24 Log #168 NEC-P05 **Final Action: Accept in Principle**
(100. Neutral)

NOTE: The following proposal consists of Comment 1-138 on Proposal 1-122 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 1-122 was:
Add a new definition as follows:
Neutral Conductor. A conductor that is connected to the neutral point of a system and is intended for carrying current during normal conditions.
Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Accept the proposal in principle and in part. Accept the need to define a neutral conductor. Reject the definition developed by CMP 1 and replace it as follows:
"The conductor (where one exists) of a polyphase circuit or single-phase three-wire circuit that is intended to have a voltage such that the nominal voltage between it and each of the other conductors are equal, and less than the nominal voltage between any two of the other conductors."
Substantiation: The definition in the panel action on the proposal misapplies the IEEE definition and is technically incorrect. A two-wire circuit does not and never will have a neutral conductor because the circuit has no neutral point. Nevertheless, CMP 1 has proposed misapplying the term "neutral" to one of those conductors only because it eventually connects to a neutral point of something. This will make countless training manuals obsolete. This is not the time to lose our intestinal fortitude and rationalize inaccurate trade slang.
This comment adapts a successful and long-standing definition in the Canadian Electrical Code, modified only editorially to accommodate our distribution systems and NEC editorial practice. It is technically correct without the complexities (over 100 words) in the IEEE definition.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel does not necessarily agree with the submitter's substantiation. See panel action and statement on Proposal 5-36.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-25 Log #2826 NEC-P05 **Final Action: Reject**
(100.Neutral)

Submitter: Mick Erickson, Minnesota State Community & Technical College
Recommendation: Define neutral.
Substantiation: As an educator of new entrants to the Electrical Industry, I have come to loathe some of the language of the NEC. Please don't misunderstand my comment. I am in awe of the NEC and the job the CMPs do. I have had the privilege to get to know some of the members and have great respect for them and their work.
This is my first proposal and I will make it brief. Switzerland remained neutral (or so we were taught) during the Great War. This meant they were not involved with any "side." The neutral position of the shifting leveler on my truck removes the transmission from any involvement with the engine. Yet, we

use the word "neutral" in an entirely different fashion and do so ***without a clear definition.*** If I could have my druthers, I would get rid of it entirely. I believe it has steadily crept into the code and now appears in at least 180 places.

Try teaching this to a young student day after day and explain to him/her: That when the code mentions the "Neutral or Grounded Conductors" it is talking about a conductor that is intentionally grounded but no, it is not the EGC or the GEC or an EBJ. Teach them that the neutral is "common" to some other conductors that are ungrounded but, no, this common isn't always grounded. I know this because the code specifically rules about a "Grounded Neutral" and leads me to believe that this, not-so-common conductor is sometimes "not grounded." Of course the code also talks about a "solidly" grounded neutral so I guess it is sometimes grounded but not "solidly" grounded. And then there is the "Common neutral" talked about in other references.

The only time any conductor is neutral is when it is common to two or more other conductors and NOT carrying current...unbalanced or otherwise. Since the EGC only carries current when a fault occurs, it technically is far more "neutral" and it is grounded so why don't you call it the neutral? If this "common" conductor of a single-phase 3-wire Edison or a Polyphase system begins to carry any current it is no longer neutral. Yet we continue to call it neutral.

I haven't mentioned all of the terms/phrases such as "High-impedance grounded neutral systems as specified in 250.36." But you get the picture. In addition, the function of the "neutral" is grossly misunderstood by many licensed electricians. This miss-understanding has brought us to the place where safety is an issue. MANY journeymen electricians believe there is little or no danger from the neutral as they do not clearly understand its function.

STOP THE MADNESS!! Define the term and all of its variants, so we can all get on the same page. We know definitions are extremely important to a good understanding of grounding, overcurrent protection and so on.

There seems to be two options:

1. DEFINE NEUTRAL and all variants. Include in Article 100.
2. Get rid of the term altogether.

I understand that the effort to rename the EGC to the EBC (just when we thought there was progress) is moving forward. Defining the neutral (dare I say neutrals) should have such attention.

Panel Meeting Action: Reject

Panel Statement: No specific text was proposed. The proposal does not meet the requirements of Section 4.3.3 of the NFPA Regulations Governing Committee Projects.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-26 Log #110 NEC-P05 **Final Action: Accept in Principle**

(100. Neutral Conductor (New))

Submitter: Matthew Karpuk, Chesaning, MI

Recommendation: Add a new definition of neutral conductor:

"Neutral Conductor. A conductor other than a grounding conductor, that is connected to the common point of a wye connection of a polyphase system, the center-tap of one portion of a delta, four-wire polyphase system, the center-tap of a three-wire single-phase system, or one conductor of a two-wire single-phase system."

Substantiation: The term neutral is used in numerous locations in the Code and there needs to be a definition so that it is clear which conductor is intended when the term is used. The problem arises in 250.26(2) and (5) where the instructions are to ground the neutral conductor with no indication which conductor is the neutral. It is rather obvious to a trained person which conductor is the neutral for a single-phase, 3-wire system, but not so obvious with respect to a 4-wire, delta, polyphase system. There are licensed electricians all across the country that do not understand this latter polyphase system. The code needs to be specific on this issue.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Proposal 5-36.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-27 Log #169 NEC-P05 **Final Action: Accept in Principle**

(100. Neutral Conductor)

NOTE: The following proposal consists of Comment 1-139 on Proposal 1-122 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 1-122 was:

Add a new definition as follows:

Neutral Conductor. A conductor that is connected to the neutral point of a system and is intended for carrying current during normal conditions.

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education

Recommendation: Accept but append "to ground".

Substantiation: "Zero voltage" needs a reference.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Proposal 5-36.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-28 Log #170 NEC-P05 **Final Action: Accept in Principle**

(100. Neutral Conductor)

NOTE: The following proposal consists of Comment 1-140 on Proposal 1-122 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 1-122 was:

Add a new definition as follows:

Neutral Conductor. A conductor that is connected to the neutral point of a system and is intended for carrying current during normal conditions.

Submitter: Charles M. Trout, Maron Electric Co. Inc.

Recommendation: Continue to "Accept in Principle" Proposal 1-122. Modify wording of proposal for definition of neutral conductor to read:

Neutral Conductor. The common conductor in a multi-wire, grounded or ungrounded, circuit or system that carries the current caused by an unbalance of the load on the phase conductors of a multi-wire circuit or system and by high harmonic neutral currents in a 3-phase, 4-wire, wye-connected power supply to nonlinear loads.

Substantiation: This definition will maintain the technical correctness that a two wire circuit cannot contain a neutral conductor. The panel may want to review the definition of a "Branch Circit Multiwire" and in the first sentence after the comma where it says "and a grounded conductor that has equal" etc. change the words "grounded conductor" to "common conductor". The present wording incorrectly implies that multiwire circuits can only be used in grounded systems.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Proposal 5-36.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-29 Log #171 NEC-P05 **Final Action: Accept in Principle**

(100. Neutral Conductor (New))

NOTE: The following proposal consists of Comment 1-141 on Proposal 1-122 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 1-122 was:

Add a new definition as follows:

Neutral Conductor. A conductor that is connected to the neutral point of a system and is intended for carrying current during normal conditions.

Submitter: Dorothy Kellogg, American Chemistry Council

Recommendation: The **Final Action** should be accept rather than accept in principle.

Substantiation: The definition as modified by the panel is too complex and is technically flawed. The "common point wye connection" as noted in the modified definition does not apply to all polyphase systems. Also, it is not clear what "zero voltage" is referenced to in the second condition of the definition. The "point of a symmetrical system which is normally at zero voltage" is likely not to be zero voltage under normal conditions unless it is grounded. The ACC believes that Mr. Dobrowsky's originally proposed definition provides more clarity to the term "neutral conductor" than the panel's proposed definition.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Proposal 5-36.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-30 Log #172 NEC-P05 **Final Action: Accept in Principle**

(100. Neutral Conductor)

NOTE: The following proposal consists of Comment 1-142 on Proposal 1-122 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 1-122 was:

Add a new definition as follows:

Neutral Conductor. A conductor that is connected to the neutral point of a system and is intended for carrying current during normal conditions.

Submitter: Noel Williams, Noel Williams Consulting

Recommendation: This proposal should continue to be accepted in principal as modified by panel action.

Substantiation: This definition is still imperfect, but it does recognize and address certain important points that are not in the original proposal. First, a definition is needed. The term "neutral" is used in many places in the code, in some places incorrectly. (For example, as noted by Minick in the comment on negative, a grounded conductor in a delta system is not a symmetrical system. However, Section 250.26(5) calls such a conductor a neutral.) Panel 1 has often referred to IEEE 100 in the past, but the edition mentioned in the panel statement is no longer available from IEEE, and the new edition of IEEE 100 now only applies to IEEE standards according to its introduction and the revised title: " The Authoritative Dictionary of IEEE Standards Terms."

Second, the original proposal refers to the neutral point of a system, and that term would require another definition. The revised definition covers this issue. The "zero voltage" is not clear, as noted by Barrios, but I cannot offer a solution to that problem. Third, the definition proposed may help to clear up some misconceptions and provide a term around which the rest of the NEC can become consistent in the future. For example, the comment that "all neutrals are grounded conductors" is incorrect. Obvious examples are given in 250.21 and 250.22, and ungrounded 480 volt wye systems are permitted in the NEC as long as the neutral is not used as a circuit conductor. Fourth, the proposed language "intended for carrying current during normal operations" will produce conflicts in other code language. For example, 250.21(4) refers to impedance grounded neutral systems, and according to 250.36, these systems have neutral conductors, but those neutral conductors are not permitted to be normal current-carrying conductors.

Panel Meeting Action: Accept in Principle

(100. Neutral Conductor (New))

NOTE: The following proposal consists of Comment 1-143 on Proposal 1-122 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 1-122 was:

Add a new definition as follows:

Neutral Conductor. A conductor that is connected to the neutral point of a system and is intended for carrying current during normal conditions.
Submitter: James M. Naughton, IBEW
Recommendation: Panel 1 should reconsider and reject the proposal.
Substantiation: This comment is the work of a Task Group from Panel 4 assigned to recommend an action, by direction of the Technical Correlating Committee.

The definition of neutral, as submitted, does not accurately reflect a neutral. The revised definition from Panel 1 does not deal with the neutral conductors from a 120/240v single phase system since these are not necessarily considered to be symmetrical systems of zero voltage.

A definition should provide an accurate method to define the word and neither the proposal nor the revised provides an accurate or clear definition of neutral.

Panel Meeting Action: Reject
Panel Statement: This panel concludes that the definition of Neutral Conductor will add clarity to the understanding and use of the NEC. See panel action and statement on Proposal 5-36.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-32 Log #174 NEC-P05 **Final Action: Accept in Principle**
(100. Neutral Conductor)

NOTE: The following proposal consists of Comment 1-144 on Proposal 1-122 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 1-122 was:

Add a new definition as follows:

Neutral Conductor. A conductor that is connected to the neutral point of a system and is intended for carrying current during normal conditions.
Submitter: D. Thomas Branson, Madison Gas & Electric
Recommendation: Panel proposed revised text:

Neutral Conductor. A conductor, other than a grounding conductor, that is connected to the common point of a wye connection in a polyphase system or the point of a symmetrical system which is normally at zero voltage.

We suggest that the word "normally" be replaced by the word "virtually", and adding the words "under ideal conditions" after the word "voltage".

Substantiation: Only under perfectly balanced conditions, will there be no voltage on the neutral. This condition is recognized in the NESC definition, which acknowledges the current flow in the neutral. We also support the negative comment made by Mr. Barrios in Log #2457.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 5-36.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-33 Log #2692 NEC-P05 **Final Action: Accept in Principle**
(100. Neutral Conductor (New))

Submitter: Charles M. Trout, Maron Electric Co. Inc.
Recommendation: Add a definition of Neutral conductor to read:

Neutral Conductor. The common conductor in a multiwire circuit that carries the unbalanced load between the phase conductors.

FPN: Refer to 220.61 for further information.

Substantiation: The term neutral is inaccurately used. As an example, the identified conductor in a 2-wire circuit is often called the neutral conductor. To be neutral something must not be aligned with any side. To be neutral a conductor must be a part of a multi-wire circuit.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 5-36.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-34 Log #176 NEC-P05 **Final Action: Accept in Principle**
(100. Neutral Conductor (New))

NOTE: The following proposal consists of Comment 1-147 on Proposal 1-122 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 1-122 was:

Add a new definition as follows:

Neutral Conductor. A conductor that is connected to the neutral point of a system and is intended for carrying current during normal conditions.
Submitter: Fred W. Brown, HI Electron
Recommendation: Revise the current text by adding "and carries the vectorial summation currents of the ungrounded to grounded conductor loads in multiwire branch circuit, feeder, and service entrance conductors."
Substantiation: I find the use of the terms "grounded conductor" and "neutral conductor" to be problematic in nature in the electrical industry. It is a concept used to distinguish between the two principles in order to properly apply the National Electrical Code (NEC).

Just by he nature of being grounded does not make a conductor neutral by the NEC. A neutral is a grounded conductor that carries the vectorial summation of line to neutral current loads.

310.15(B)(4) gives us some direction as to the use of the term, "neutral conductor." The basic application of this article is not to count the neutral conductor as a current-carrying conductor in 120/240 volt, single phase, 3 wire; 120/208 volt, 3 phase, 4 wire; 277/480 volt, 3 phase, 4 wire, and 120/240 volt 3 phase, 4 wire multiwire branch circuit, feeder, and service entrance conductor systems. The reason for this is that if the line to neutral loads are balanced per 210.11(B), the vectorial summation of the currents carried by the neutral will be zero. When contrasted with 115/230 volt, 2 phase, 3 wire and 5 wire systems, the neutral will carry a vectorial summation of the line to neutral loads at 140 percent of the ungrounded conductors. It is important to distinguish the true role of a neutral conductor in multiwire systems and circuits.

The term "neutral conductor" is only applicable in some multiwire circuits. Circuits consisting of two or more ungrounded conductors and have a voltage between them, a grounded conductor that has equal voltage between it and each ungrounded conductor, and the grounded conductor carries the vectorial summation of the ungrounded to grounded conductor loads, have neutral conductors. Systems like 240 volt, 3 phase, 3 wire Grounded B phase are multiwire but do not contain neutral conductors. A single two wire circuit that consists of an ungrounded and grounded conductor also does not have a neutral conductor.

I have watched code making committees clean up the use of neutral conductors for the past fifteen years. I would like to commend these efforts to finally put a clear definition in place which the electrical industry can use to apply the NEC correctly.

NOTE: The following proposal consists of Comment 1-146 on Proposal 1-122 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 1-122 was:

Add a new definition as follows:

Neutral Conductor. A conductor that is connected to the neutral point of a system and is intended for carrying current during normal conditions.
Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Reconsider and reject the proposal.
Substantiation: The addition of this definition will add unnecessary confusion to code users. The technical issues noted in the negative voting amplify the need to reject this proposal and should be considered carefully by the panel.
Panel Meeting Action: Reject
Panel Statement: This panel concludes that the definition of "Neutral Conductor" will add clarity to the understanding and use of the NEC. See panel action and statement on Proposal 5-36.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-36 Log #1554 NEC-P05 **Final Action: Accept in Principle**
(100.Neutral Conductor and Neutral Point)

TCC Action: The Technical Correlating Committee directs that the action on this proposal be sent to the Technical Correlating Committee Task Group on the definition of "Neutral Conductor" for review and comment.
Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Add the following definitions to Article 100:
Neutral conductor. A circuit conductor connected to the neutral point of a system.
Neutral point. The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.
Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).
The definition of ``neutral conductor'' and the associated definition for "neutral point" is needed in the NEC so that the appropriate conductor can be identified whenever this term is used in a requirement such as in 250.26 and 250.36. The proposed definition is derived from the IEC definition of "neutral conductor" and IEEE Std C57.12.80-2002 definition of "neutral point." The proposed definition was adapted into the NEC language and was expanded to cover the various cases relevant to the NEC.
The attached figures illustrate the meaning of the proposed definition. Note that according to the proposed definition "neutral conductor" exists even where it does not function as a neutral conductor (that is, where the conductor is not shared by two or more circuits in the system) as long as it is connected to the neutral point of the system.
Additional information is available in the Task Group report.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
Add the following (two) definitions to Article 100 as follows:
Neutral Conductor. The conductor connected to the neutral point of a system that is intended to carry current under normal conditions.
Neutral point. The common point on a wye-connection in a polyphase system or midpoint on a single-phase, 3-wire system, or midpoint of a single-phase portion of a 3-phase delta system, or a midpoint of a 3-wire, direct current system.
FPN: At the neutral point of the system, the vectorial sum of the nominal voltages from all other phases within the system that utilize the neutral, with respect to the neutral point, is zero potential.
Panel Statement: The revised wording removes the term "circuit" as was pointed out in the TCC ballot, there is no definition for a "circuit conductor" and the "neutral conductor" could be in a branch circuit, feeder or otherwise. The revised text also establishes a differentiation between the "neutral conductor" and the "equipment grounding conductor" which are in fact both ultimately connected to the neutral point of a system. The differentiation is that under some normal conditions, the "neutral conductor" is expected to be current carrying while under normal conditions the equipment-grounding conductor is never a current carrying conductor.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

10-1 Log #1294 NEC-P10 **Final Action: Reject**
(100.Overload)

Submitter: Jeffry Campbell, WM. Clinger Corp. / Rep. IBEW Local Union 654
Recommendation: Revise definition of overload to include within normal circuit path . Also create new definition for short circuit.
Substantiation: Definition of overload should include "within normal circuit path" to separate it from ground faults and short circuits which are "outside normal circuit path." Shorts and grounds clearly create more damaging overcurrents than overloads.
Panel Meeting Action: Reject
Panel Statement: No specific proposal is made for "Short Circuit". The existing definition clearly states that short circuits or ground faults are not overloads. The addition of "within normal circuit path" will not add to the clarity of either "Overload" or "Short Circuit" since both terms are common in the industry and are well understood.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-41 Log #3118 NEC-P01 **Final Action: Reject**
(100.Physical Damage, Severe)

Submitter: Jeremy Enders, East Lansing, MI
Recommendation: Add a new definition of severe physical damage. This term is used in various sections of the Code and it is subject to a wide range of interpretation. A suggested definition is as follows:
Physical Damage, Severe. Wiring, raceway, and equipment is located such that it can be contacted by equipment, animals, or human activity capable of inflicting a permanent change of shape.
Substantiation: There needs to be some definition of the meaning of severe physical damage to avoid conflicts in the field. Wiring materials and equipment may be exposed, but the probability of suffering damage may be very small, but because in some manner it can be reached, it is sometimes ruled as being exposed to severe physical danger.
Panel Meeting Action: Reject
Panel Statement: The evaluation of exposure to physical damage must be considered on the specific instance. Limiting the evaluation to "permanent change of shape" is overly restrictive. The use of the word "severe" is generally dependent on the requirements and intent of the Code sections where it appears.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-42 Log #1008 NEC-P01 **Final Action: Reject**
(100.Premises Wiring (System))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Add:
WIRING (permanent), (Permanently connected), (permanently installed), (fixed. Installations intended for an indefinite period of time, not covered by 527.3(A), and employing wiring methods permitted or required by this Code.
Substantiation: These phrases are used throughout the Code, e.g. 422.31(A), 501.11, 520.5(A), 525.20(A), 530.11, 530.31, and 553.13(2)(1). It may be inferred that they refer to wiring methods of Chapter 3 since there is no Code definition. However, flexible cords and cables covered by the proposed definition are permitted for indefinite periods, e.g., 410.30(B) and (C), 430.42(C), 501.4(A)(2) and (B)(2), 501.11, 502.4(A)(1)(e), 503.10, 550.10, 555.13(2)(1), 610.11(C), (D), and (E), 620.11(B), 620.21(A)(1), (C, and)(B)(3), 668.30(C)(1), 680.7, 680.21(A)(5), 680.22(B)(5), 680.23(B)(3), 680.42(A)(2), and 690.31(C).
Panel Meeting Action: Reject
Panel Statement: The proposal refers to a nonexistent Code section. In addition, it is not necessary to provide a unique definition of this term apart from its common usage. "Not covered by 527(A)" is considered a requirement, which is not permitted in a definition by 2.2.2 of the NEC Style Manual.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-43 Log #1315 NEC-P01 **Final Action: Accept in Principle**
(100.Premises Wiring (System))

Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Edit the definition of "Premises Wiring" as follows:
~~That~~ Interior and exterior wiring, including power, lighting, control, and signal circuit wiring together with all their associated hardware, fittings, and wiring devices, both permanently and temporarily installed, that extends from the service point or separately derived system, ~~source of power, such as a battery, a solar photovoltaic system, or a generator, transformer, or converter windings~~ to the outlet(s). Such wiring does not include wiring internal to appliances, luminaires (fixtures), motors, controllers, motor control centers, and similar equipment.
Substantiation: This proposed change brings the definition of "Premises Wiring" into alignment with the 2005 definition change of "Separately Derived System." In 2005, the list of example sources was taken out of the definition. This list of sources is the same list that appears in the definition of "Premises Wiring," lending further credence to the thought that the intent all along was "Service Point or Separately Derived System."

Panel Meeting Action: Accept in Principle
Revise the definition of "Premises Wiring" as follows:
Interior and exterior wiring, including power, lighting, control, and signal circuit wiring together with all their associated hardware, fittings, and wiring devices, both permanently and temporarily installed. This includes: (a) wiring from the service point or power source to the outlets; or (b) wiring from and including the power source to the outlets where there is no service point.
Such wiring does not include wiring internal to appliances, luminaires (fixtures), motors, controllers, motor control centers, and similar equipment.
Panel Statement: The panel concludes that this revision meets the submitter's intent since premises wiring can exist on the supply side of a separately derived system such as supply conductors originating from another system noted in the definition. If there is no service point, all wiring is premises wiring.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
BARRIOS, JR., L.: The panel action should have been "accept" rather than "accept in principle". The panel's revised definition does not add clarity to the original proposal and may introduce more confusion.
MCMAHILL, L.: This proposal should have been accept. The submitter's substantiation justified the change as proposed. The proposal was to simply eliminate the list of "source of power" examples and to use the definition of "separately derived system" in place of those examples. The proposed change

makes sense and is beneficial to code consistency and understandability. The panel action of revising the definition simply adds confusion. The panel statement notes that the reason for revising the submitter's proposal is that "premises wiring can exist on the supply side of a separately derived system." This is a true statement. However, "where there is no service point," premise wiring is usually supplied by a separately derived system or some other source of power. The definition of "separately derived system" states "A premises wiring system whose power is derived from a source of electric energy or equipment other than a service." In addition, the source of electric energy on the supply side of a separately derived system, such as a transformer, is typically from a feeder - see the definition of feeder. Again, the proposal as submitted makes sense!

Comment on Affirmative:

LABRAKE, JR., N.: Premises wiring can exist on the supply side of a separately derived system such as supply conductors originating from another system noted in the definition. If there is no service point, all wiring is premises wiring.

1-44 Log #675 NEC-P01 **Final Action: Reject**
(100.Qualified Person)

Submitter: Jamie McNamara, Hastings, MN
Recommendation: Revise as follows:

100 Qualified Person. One who has skills and knowledge related to the construction and operation of the electrical equipment and installations and has received safety training on the hazards involved. The name(s) of the qualified person(s) shall be kept in a record at the office of the place the Qualified Person performs work and made available to the Authority Having Jurisdiction upon request.

Substantiation: So the Authority Having Jurisdiction can verify there is a qualified person and who that person is.
Panel Meeting Action: Reject
Panel Statement: Section 2.2.2 of the NEC Style Manual states: "Definitions shall not contain requirements or recommendations."
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-45 Log #2589 NEC-P01 **Final Action: Accept**
(100.Qualified Person)

Submitter: Jebediah Novak, Cedar Rapids Electrical JATC
Recommendation: Revise text to read as follows:

Qualified Person. One who has skills and knowledge related to the construction and operation of the electrical equipment and installations and has received safety training ~~on~~ to recognize and avoid the hazards involved.

Substantiation: This revision to the definition for a qualified person corresponds with the text from NFPA 70E, Section 110.6(D)(1). It will help to better define what the focus of the safety training needs to be.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:

HITTINGER, D.: The submitter's reference to the text in NFPA 70E 110.6(D)(1) is not the same as the definition for "Qualified Person" as found in NFPA 70E. When it is possible, NFPA would prefer to have definitions correlate in each code.

1-46 Log #2646 NEC-P01 **Final Action: Reject**
(100.Qualified Person)

Submitter: Robert W. Jensen, dbi / Rep. BICSI, A Telecommunications Association
Recommendation: Revise text to read:

~~Qualified Person. One who has skills and knowledge related to the construction and operation of the electrical equipment and installations and has received safety training on the hazards involved.~~

~~FPN: Refer to NFPA 70E-2004, Standard for Electrical Safety in the Workplace, for electrical safety training requirements.~~

Qualified person. One who has verifiable training (including safety), skills and knowledge related to the construction, installation and operation of the electrical equipment and the potential hazards involved.

FPN: Refer to NFPA 70E-2004, Standard for Electrical Safety in the Workplace, for electrical safety training requirements.

Add definition:

Verifiable (as applies to training). Proven true by demonstration or evidence by certificate.

Substantiation: Safety not only stems from being trained on being safe, but also on ensuring that the person performing the work function will not cause the installation to be unsafe after it is completed. For example, an installer may fully understand how to install communications cabling from a protector in a building to a communications outlet. However, this same installer may not know to extend the continuity of the entrance cable shield across a splice to the protector, which could cause a hazard at a later time. Hence, the addition of "approved and verifiable training" to be a qualified person.

Providing this additional language will allow the AHJ to become informed of appropriate training opportunities that are acceptable within their jurisdiction and that will not cause harm to building occupants or other technicians in the future due to an unqualified person doing a job function they are not trained to do. By producing a completion of training certificate, the AHJ will understand the capability of the technician and thereby approve their competence for certain job functions.

Panel Meeting Action: Reject
Panel Statement: The substantiation addresses errors in work performed by an unqualified person. The proposed definition does not resolve this issue. The word verifiable as used in the proposed revision is a requirement and thus in violation of 2.2.2 and 2.2.2.1 of the NEC Style Manual. See panel action on proposal 1-45 relative to the suggested NFPA 70E reference.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:

HICKMAN, P.: While we agree with agree that CMP1 was justified in rejecting this proposal because it contained a requirement, we continue to support the concept that there should be a means for the AHJ to verify that a qualified person has received safety training.

8-1 Log #1173 NEC-P08 **Final Action: Reject**
(100.Raceway)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Add:

Cablebus and auxiliary gutter.

Substantiation: Edit. Although the definition is not limited to raceways listed, it would be more comprehensive if cablebus and auxiliary gutters are included, and remove any perception they are not raceways, and not covered by raceway rules that may apply, for example 230.7.
Panel Meeting Action: Reject
Panel Statement: While cablebus and auxiliary gutters are used in some ways like other raceways, their restriction of use prevents them from automatically being grouped with the others. Cablebus is ordinarily assembled at the point of installation from the components furnished or specified by the manufacturer, and auxiliary gutters shall be permitted to supplement wiring spaces at meter centers, distribution centers, switchboards, and similar points of wiring systems.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-2 Log #1913 NEC-P08 **Final Action: Reject**
(100. Rigid Nonmetallic Conduit (RNC))

Submitter: William Wagner, Certification Solutions
Recommendation: Add definition for Rigid Nonmetallic Conduit (RNC) as follows:

Rigid Nonmetallic Conduit (RNC). A non-flexible thermoplastic or thermosetting resin raceway of circular cross section, with integral or associated couplings, connectors, and fittings for the installation of electrical conductors and cables. Includes Rigid Polyvinyl chloride Conduit (Type PVC), High Density Polyethylene Conduit (Type HDPE), and Reinforced Thermosetting Resin Coundit (Type RTRC).

Substantiation: This is a companion proposal to the revised Article 352 for Type PC and the proposed new Article 355 for Type RTRC.

In the 2002 edition of the National Electrical Code, Article 352; Rigid Nonmetallic Conduit (RNC) included PVC, RTRC, and HDPE products. However, for the 2005 edition of the NEC, HDPE was separated from these other conduit types and located in new Article 353. This left two very dissimilar products grouped together as RNC under Article 352 and technically eliminated HDPE as an acceptable wiring method in all applications where rigid nonmetallic conduit was specified. The separation of the PVC and RTRC products, and the definition of RNC as including rigid PVC, HDPE, and RTRC will correct this situation.

Panel Meeting Action: Reject
Panel Statement: See panel action and statements on Proposals 8-53 and 8-78. The panel doesn't believe it is appropriate to put the definitions in Article 100. No other raceway has its definition included in Article 100. The panel took exception to including HDPE as RNC due to any potential references to use of RNC in Chapters 5, 6, and 7 without public review.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

KENDALL, D.: This proposal should be accepted. Panel Proposal 8-68a did not define a HDPE Conduit as a Rigid Nonmetallic Conduit. HDPE Conduit was under Artical 352 prior to the 2005 NEC. Article 352 scope included all rigid nonmetallic conduits.

1-47 Log #2590 NEC-P01 **Final Action: Reject**
(100.Secured)

Submitter: Jebediah Novak, Cedar Rapids Electrical JATC
Recommendation: Add text to read as follows:
Secured. Held rigidly in place by means of an identified strap, clamp, or other identified means.
Substantiation: In several of the Articles in Chapter 3, securing and supporting are referred to (.30) but no real definition is given as to what differentiates the two. Often times just passing the raceway through the building construction is allowed to satisfy this requirement. This will allow for better installations.
Panel Meeting Action: Reject
Panel Statement: Section 2.2.2 of the NEC Style Manual states: “Definitions shall not contain requirements or recommendations.”
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-1 Log #1703 NEC-P04 **Final Action: Reject**
(100.Service Conductors)

Submitter: Charles M. Trout, Maron Electric Company
Recommendation: Revise the definition of Service Conductors to read:
Service Conductors. The conductors from the ~~service point~~ last pole or other aerial support to the service disconnecting means.
Substantiation: The definition as written conflicts with the definition of service drop which includes the conductors from the last pole or other aerial support as service conductors.
Panel Meeting Action: Reject
Panel Statement: The crucial point for service conductors is the point where the utility company connects to the premises wiring, as defined in the phrase “service point” in Article 100. Any conductors on the utility company side are under the jurisdiction of the utility company (NESC), and any conductors from that point are considered premises wiring and under the jurisdiction of the NEC. The service point may be at the last pole and include any service drop conductors, but the service point for an overhead service drop often is at the weatherhead and does not include the drop conductors. This definition does not conflict with the definition of Service Drop. It is written to include both service drop and service lateral.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10
Comment on Affirmative:
BECK, C.: See my Affirmative Comment on Proposal 4-3.
ROGERS, J.: The submitter is not correct in his substantiation, service conductors could be either overhead or underground as defined in Article 100 Service Conductors are any conductors between the Service Point and the Service Disconnect Means.

10-2 Log #1743 NEC-P10 **Final Action: Accept in Principle**
(100.Short-Circuit Current Rating)

Submitter: David Sroka, Turner Falls, MA
Recommendation: Short-Circuit Current Rating.
The maximum short-circuit current that a piece of equipment or a component can safely withstand.
Substantiation: This definition is important and should be included.
Panel Meeting Action: Accept in Principle
Revise the proposed wording to read as follows:
“Short-Circuit Current Rating. The prospective symmetrical fault current at a nominal voltage to which an apparatus or system is able to be connected without sustaining damage exceeding defined acceptance criteria.”
Panel Statement: The panel has met the intent of the submitter with the definition, as modified.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-48 Log #3213 NEC-P01 **Final Action: Reject**
(100.Structure, FPN (New))

Submitter: Gus Bryan, Deputy ELectrical Inspector State of TN
Recommendation: Add text to read as follows:
FPN: Pole, columns, pedestals, and similar forms installed solely to support electrical equipment external to the main structure shall not be considered as structures themselves.
Substantiation: Literal meaning and enforcement of this section as written requires pedestals, poles etc. placed for mounting of service equipment disconnects, to be considered as structures, thus the premises served becomes a separate structure. Example: A mobile home with adjacent service equipment pedestal should not be considered a separate structure from the pedestal.
Panel Meeting Action: Reject
Panel Statement: The proposed FPN contains a requirement not permitted by Section 3.1.3 of the NEC Style Manual.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

5-37 Log #3542 NEC-P05 **Final Action: Reject**
(100.Supplemental Grounding Electode Conductor)

Submitter: Redwood Kardon, Code Check Institute
Recommendation: Revise as follows:
Supplemental Grounding Electrode Conductor. A conductor used to directly connect equipment ~~or the grounded circuit of a wiring system~~ to a signal reference grid grounding electrode or electrodes.
Substantiation: The term “grounding conductor” as currently defined does not distinguish itself from a grounding electrode conductor and is therefore redundant. Additionally, there are numerous places in the code that use the term “grounding conductor” that do not adhere to the current definition in Article 100.
Panel Meeting Action: Reject
Panel Statement: The proposed definition introduces terms that are not used in the NEC.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-3 Log #866 NEC-P03 **Final Action: Reject**
(100.Task Lighting)

Submitter: Grant Guymon, Comforce Technical Services
Recommendation: Add a new definition as follows:
Task Lighting (as applied to construction and maintenance). Listed task lights approved for use during temporary construction and maintenance activities that requires GFCI protection for personnel.
Substantiation: Please see related proposal for new definition for “Temporary String Lights.” Many inspectors and contractors do not have an understanding of the difference between Temporary String Lighting and Task Lighting definition or uses. This misunderstanding causes inspectors to require GFCI protection for temporary string lights in violation of the NEC and OSHA requirements.
Panel Meeting Action: Reject
Panel Statement: Adding a new definition for a commonly used phrase, such as “task lighting” is not necessary since, users of the NEC are very familiar with this phrase and this type of lighting. The submitter stated incorrectly that providing GFCI protection on task lighting is a violation of the NEC. Section 590.4(D) does not permit receptacles on a branch circuit that supplies temporary lighting on construction sites, nor does it permit receptacles to be connected to the same ungrounded conductor of multiwire branch circuits that supply temporary lighting.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-4 Log #867 NEC-P03 **Final Action: Reject**
(100.Temporary String Lighting)

Submitter: Grant Guymon, Comforce Technical Services
Recommendation: Add a new definition as follows:
Temporary String Lighting (as applied to construction and maintenance). Listed temporary string lighting approved for use during temporary construction and maintenance activities that is prohibited from connection to the load side of a ground-fault circuit interrupter.
Substantiation: Many inspectors and contractors do not have an understanding of the difference between Temporary String Lighting and Task Lighting definitions or uses. This misunderstanding causes inspectors to require GFCI protection for temporary string lights in violation of the NEC and OSHA requirements.
Panel Meeting Action: Reject
Panel Statement: Adding a new definition for a commonly used phrase, such as ”temporary string lighting” is not necessary since users of the NEC are very familiar with this phrase and this type of lighting. The submitter stated incorrectly that providing GFCI protection on a temporary string light is a violation of the NEC. Section 590.4(D) does not permit receptacles on a branch circuit that supplies temporary lighting on construction sites nor does it permit receptacles to be connected to the same ungrounded conductor of multiwire branch circuits that supply temporary lighting.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

5-38 Log #1518 NEC-P05 **Final Action: Accept**
(100.Ungrounded (new))

Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Add the following new term and definition in Article 100 as follows:
Ungrounded. Not connected to ground or a conductive body that extends the ground connection.

Substantiation: This is the result of the TCC Task Group on Grounding and Bonding in resolve of the 2005 NEC cycle actions related to Proposal 5-1 and Comment 5-1 as directed by the Technical Correlating Committee. This is a companion proposal to the proposed Article 100 revised definition "grounded (grounding)" and other proposals throughout the NEC relative to this Task Group's recommendations. The substantiation of this proposal is as follows.

It is proposed that a new definition for ungrounded be added to differentiate this term from the term grounded. An ungrounded system is a system that is not intentionally connected to ground solidly or through an impedance. Examples of ungrounded systems are covered by Sections 250.21 and 250.22. An ungrounded conductor is a circuit conductor that is not intentionally connected to ground. Examples of ungrounded conductors are line and phase circuit conductors that are not intentionally grounded. The phrase "… that extends the ground connection" is included to emphasize that the conductive body actually extends the ground connection such as the items in 250.118 for the purpose of "grounding" in premises wiring.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 13 Negative: 2

Explanation of Negative:

DOBROWSKY, P.: The proposal should be accepted in part as follows" Ungrounded. Not connected to ground. See my comment on 5-9.

TOOMER, R.: This definition is not needed and merely restates the common meaning of the word by taking the definition of grounding and adding the word "not". The prefix "un-" means 'not' or 'opposite of.'

Comment on Affirmative:

HARDING, G.: I agree with the proposed changes except that I think that the word "body" should be replaced with"object" to be consistent with the revised definition for Grounding Electrode on Proposal 5-14.

1-49 Log #3376 NEC-P01 **Final Action: Reject**
(100.Utility)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Recommendation: Add a new definition to read:

Utility. An organization, typically recognized by law as a common carrier and regulated by public service/utility commissions or other public authorities, that installs, operates, and maintains electric supply (such as generation, transmission, or distribution systems) or communication systems (such as telephone, CATV, Internet, satellite, or data services).

FPN: Entities designated as common carriers are bound to serve whoever will pay for their services, and are subject to comprehensive regulation by public authorities. As part of that process, they are subject to codes and standards covering those activities relevant to their industry. Refer to the appropriate governmental bodies, such as state regulatory commissions, for specific information applicable in a particular jurisdiction.

If this proposal is accepted, delete 90.2(B)(5) FPN.

Substantiation: This proposal places the concepts in the 2005 FPN into Article 100 where they belong, since the term is used in many NEC locations. It makes the following improvements in the content of the FPN:

1) Laws are only enacted by governments, and therefore the phrase "governmental law" is a redundancy and is not included in this proposal.

2) The definition includes the critical term "common carrier." Common carriers enjoy partial monopoly status in exchange for a greater level of regulation because competition is restricted, either due to government regulation, or in the case of power and communications utilities due to the existence of a natural monopoly, and they have the obligation to serve all who are willing to (in these cases) be connected. Until it somehow becomes feasible for competing utilities to run power and communications down the same street, electric and communications utilities will monopolize local distribution subject to regulation and the duty to serve. Their generation activities are becoming more competitive under deregulation, but not the local utility poles or telephone frame room. This concept is crucial to the understanding of how utilities operate.

3) The FPN captures the remaining concepts in the existing FPN, but much more simply worded. For emphasis this comment uses the phrasing "subject to comprehensive regulation by public authorities" to emphasize the regulatory constraints utilities operate under. The language mentioning FERC and the FCC, etc. was deleted because the concepts are universal and those agencies do not apply outside of the U.S. The NEC should be written from an international viewpoint where possible.

Panel Meeting Action: Reject

Panel Statement: The panel concludes that the determination of what constitutes a utility and what standards apply is solely within the purview of the regulatory authorities having jurisdiction over such entities under state or federal or other national laws. Such determination is beyond the scope of the NEC, and the Code itself cannot usurp such authority. Proper application of the Code depends upon what entities and activities are subject to the National Electrical Safety Code or its equivalent, and what entities and activities are subject to the National Electrical Code. This varies from jurisdiction to jurisdiction and the user of the Code should be referred to the proper regulatory authority for determination. The fine print note to 90.2(B)(4) and 90.2(B)(5) adequately explains this point. In addition, there is no applicable reference to the meaning of the term "common carrier" that would be recognized by the regulatory authorities.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

ANTHONY, M.: I see changes that friends of the NEC will either have to make themselves--or have made upon them. The appearance of this definition will clear the air for the next leg of growth of our industry. It also is justifiable because it meets the necessary conditions for inclusion in the NEC because of its appearance in the NEC 29 times.

Comment on Affirmative:

HICKMAN, P.: While we agree with the Panel Action, we do not necessarily agree with the entire Panel Statement.

13-3 Log #2580 NEC-P13 **Final Action: Accept in Principle**
(100.Utility-Interactive Inverter)

Submitter: Timothy M. Croushore, Allegheny Power

Recommendation: Please add new definition to Article 100 for Utility-Interactive Inverter. The definition is as follows:

Utility-Interactive Inverter. An inverter intended for use in parallel with an electric utility to supply common loads and sometimes deliver power to the utility.

Substantiation: The purpose of this change is to add a new definition of Utility-Interactive Inverter that will be used in Article 690, 692, and Article 705. Code Making Panel 13 should be given authority for this definition to appear in Article 100. The definition is the same as the definition in section 2.41 of Underwriter Laboratory Standard 1741 – Inverters, Converters and Controllers for Use in Independent Power Systems.

This new definition will be used in the definition of "Interactive System" used in Article 100, 690, 692 and Article 705. This change is being proposed as part of a re-write of Article 690, 692 and Article 705 with respect to the interconnection of systems and equipment for use with distributed energy resources.

UL 1741 is currently under revision with a title change from "Inverters, Converts, and Controllers for Use in Independent Power Systems" to "Inverters, Converters, Controllers and Interconnection Systems Equipment for Use with Distributed Energy Resources." However the definition of Utility-Interactive Inverter remains unchanged.

Panel Meeting Action: Accept in Principle

Accept the proposal with one revision:

change "sometimes" to "that may".

Panel Statement: The action clarifies the submitter's intent.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13

Ballot Not Returned: 1 Gustafson, R.

.

ARTICLE 110 — REQUIREMENTS FOR ELECTRICAL INSTALLATIONS

1-50 Log #2107 NEC-P01 **Final Action: Reject**
(110.3(A)(1))

Submitter: Herbert Moulton, Masters Technology Inc.

Recommendation: Revise the definition in FPN as follows:

~~FPN: Suitability of equipment use may be identified by a description marked on or provided with product to identify the suitability of the product for a specific purpose, environment, or application. Suitability of equipment may be evidenced by listing or labeling.~~

Revised Text: <u>FPN: Refer to Article 100 definitions listing or labeled.</u>

Substantiation: The deleted text is unnecessary as the reference made to Article 100 definitions clearly states the conditions required for Listing and Labeling. This is also referenced in 110.2, FPN as part of the approval process.

Panel Meeting Action: Reject

Panel Statement: The proposed change to the FPN would come unacceptably close to making "approval" contingent on listing or labeling. If that were the case, there would be no need for 110.3(A). CMP-1 disagrees that the fine print note is unnecessary, as it provides the Code user with explanatory information regarding the suitability of equipment for installation and use.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-51 Log #2324 NEC-P01 **Final Action: Reject**
(110.3(A)(6), FPN (New))

Submitter: Daleep C. Mohla, DCM Electrical Consulting Services, Inc.

Recommendation: Add a new FPN to read:

FPN: Listed Arc-resistant switchgear is designed and tested to withstand the effects of an internal arcing fault. See IEEE C37.20.7 for description and details of testing.

Substantiation: Arc flash hazard to the operating personnel requires mitigation to protect personnel from arc flash hazards such as thermal, shrapnel due to blast, and pressure wave caused by the internal arcing. Switchgear

designed and tested per IEEE C37.20.1 and 20.2 is tested under bolted fault conditions and not for effects of internal arcing faults. Switchgear designed and tested per IEEE C37.20.7 is tested to withstand effects of internal arcing faults in addition to the bolted fault conditions.
Panel Meeting Action: Reject
Panel Statement: Section 110.3(A)(6) is less about arc flash withstand of the equipment than it is about the effects of arcing. The fine print note as proposed is specific to arc-resistant switchgear only and provides no explanation of "arcing effects" as noted in item (6). Fine print notes are for explanatory information per the NEC Style Manual, Section 3.1.3.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
FLOYD, II, H.: The application of Arc Resistant Switchgear in US markets has grown over the past decade, to the point that all major manufacturers now offer this design. Experience in installations in the US and longer-term experience in other global regions demonstrates that arc resistant designs can reduce the frequency of personnel exposure to hazardous arcing faults. While I support the concept of recognizing this type of equipment in the NEC, I agree with the panel action for rejection.

1-52 Log #1395 NEC-P01 **Final Action: Reject**
(110.3(B) (New))

Submitter: George Stolz, II, Pierce, CO
Recommendation: Add new text to read:
(B) Installation and Use. When listed or labeled equipment is installed, it shall be installed and used in accordance with any instructions included in the listing or labeling.
Substantiation: As this section is currently written, it seems to require that listed or labeled equipment is required to be used. This would add clarity that unlisted equipment can be used, if it is approved by the authority having jurisdiction.
Panel Meeting Action: Reject
Panel Statement: The panel concludes that the proposed text does not add clarity to the NEC. The panel does not accept the premise that listed and labeled equipment is unilaterally required.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-53 Log #2108 NEC-P01 **Final Action: Reject**
(110.3(B))

Submitter: Herbert Moulton, Masters Technology Inc.
Recommendation: Revise text as follows:
(B) Installation and Use. ~~Listed or labeled~~ equipment shall be installed and used in accordance with any instructions included in the listing or labeling.
Revised Text: Equipment shall be installed and used in accordance with any instructions included in the listing and labeling.
Substantiation: The deleted text is unnecessary as the reference to listed and labeled is redundant.
Panel Meeting Action: Reject
Panel Statement: The existing language is intentional, designed to illuminate the difference between Sections 110.3(A) and 110.3(B). Section 110.3(A) contains criteria for authorities having jurisdiction to examine equipment. Listed equipment, covered by 110.3(B), is presumptively in satisfaction of 110.3(A)(1) through (8) by virtue of its conformity to product safety standards.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-54 Log #1768 NEC-P01 **Final Action: Reject**
(110.3(C))

Submitter: David Sroka, Turner Falls, MA
Recommendation: Add text to read as follows:
110.3(C) Nameplate Data. The short-circuit current rating shall be included on the nameplate for battery inverters, HVAC equipment, elevator and lighting controllers.
Substantiation: This data is hard to obtain after the original installation. It is important information. The nameplate is the best place for the equipment's rating.
Panel Meeting Action: Reject
Panel Statement: Article 110 contains general requirements for electrical installations. It would be more appropriate to place the marking requirements for specific types of equipment in the individual Code articles covering those types of equipment.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-55 Log #1767 NEC-P01 **Final Action: Reject**
(110.3(C) and FPN)

Submitter: David Sroka, Turner Falls, MA
Recommendation: New text to read:
110.3(C) Nameplate Data. Applicable labeled equipment shall include ambient temperature rating and terminal temperature rating on the nameplate.
FPN: Applicable equipment defined as: Switchboards, panelboards, motor control centers, busway, disconnect and transfer switches, control cabinets.
Substantiation: Granted, this data is also available in equipment manuals. However, temperature considerations are critical to a piece of equipment being installed and wired as intended.
Panel Meeting Action: Reject
Panel Statement: The term "Applicable labeled equipment" is vague and unenforceable. The proposed text is not clear as to the temperature rating to include on the nameplate and the fine print note contains a definition. Fine print notes are explanatory and informational only and are not enforceable. See the NEC Style Manual Sections 3.1.3 and 3.2.1, and NEC Section 90.5(C) Explanatory Material. CMP-1 refers the submitter to Section 110.14(C) temperature rating associated with the ampacity of a conductor for clarification.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-56 Log #3119 NEC-P01 **Final Action: Reject**
(110.6)

Submitter: Jonathan R. Althouse, Michigan State University
Recommendation: Add a new first paragraph as follows:
Add wire size in square millimeters to the section to read as follows:
110.6 Conductor Sizes. Conductor sizes are expressed in American Wire Gage (AWG), ~~or in~~ circular mils, or in square millimeters .
Substantiation: Wire sizes are included throughout the Code in square millimeters and this needs to be added to this section.
Panel Meeting Action: Reject
Panel Statement: Section 310.11 requires conductors and cables to be marked in AWG size or circular mil area. The requirements and applications contained in Chapters 1 through 8 generally do not use square millimeters as a requirement methodology. The panel recognizes that square millimeters are provided in Chapter 9 as reference material. The panel concludes that adding the submitter's suggested recommendation adds no clarity to the Code.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
ANTHONY, M.: The NEC should evolve into a standard that can be used internationally. Rejection of this proposal does nothing to hasten that evoluation.

1-57 Log #555 NEC-P01 **Final Action: Reject**
(110.7)

Submitter: R. K. Varma, State of PA, DCED
Recommendation: Add new text to read:
Completed wiring installations shall be tested by hi-pot ac or dc meters and shall be free from short circuits and from grounds other than as required or permitted in Article 250.
Substantiation: Completed installations have been seen to have been literally punctured by over driven staples causing shorts or even shocks to unaware personnel. (A Pastor of a church got a shock). We need to assure one and all that all installations are tested. We make them test with 1080 volts section in our housing program.
Panel Meeting Action: Reject
Panel Statement: The proposed testing method is not appropriate for all installations and could damage utilization equipment and controls. The substantiation is insufficient to support a requirement for hi-pot testing of all electrical installations.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-58 Log #617 NEC-P01 **Final Action: Accept in Principle in Part**
(110.7)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 5 for comment.
Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read as follows:
110.7 Insulation Integrity. Completed wiring installations shall be free from short circuits and from ground faults or any connections to ground ~~grounds~~ other than as required or permitted in Article 250 or elsewhere in the Code .
Substantiation: This proposal is for clarification purposes. The Code uses the term "ground fault" and various connections to ground or "grounding connections" are either permitted or required by Article 250 or even elsewhere in the NEC. The term ground fault is defined in 250.2, where as the word

"grounds" is not. The proposal is part of a larger effort to correct how the words and terms related to grounding are used in the NEC and promote uniform and consistent use of such defined words and terms. Article 250 is not the only article that requires or permits grounding connections so expanding the definition to apply to the rest of the Code is appropriate as well.

Panel Meeting Action: Accept in Principle in Part

Revise text to read as follows:

110.7 Insulation Integrity. Completed wiring installations shall be free from short circuits and from grounds other than as required or permitted ~~in Article 250 or~~ elsewhere in the Code .

Panel Statement: CMP-1 disagrees with the submitter that the revised and new text "from ground faults or any connections to ground" clarifies the provisions of this section. The additional text is redundant as Article 100 defines "ground" as "a conducting connection, whether intentional or accidental, between an electrical circuit or equipment and the earth or to some conducting body that serves in place of the earth." Use of the plural "grounds" is appropriate in the sentence and per the NEC Style Manual, Section 3.3.5, for parallel construction. Further, the term "ground fault" is specific to Article 250. CMP-1 accepts the proposed new text "elsewhere in the Code" and has removed the text "in Article 250 or" as it is redundant and unnecessary -- the use of "elsewhere" includes Article 250. CMP-1 believes the action on this proposal meets the intent and concerns of the submitter. CMP-1 requests that Panel 5 review and comment on the proposed action.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

BARRIOS, JR., L.: The panel action should have been "accept in principle" rather than "accept in principle in part". CMP1 should have accepted the submitter's intent to clarify the term "grounds". The following wording is proposed which should meet the submitter's intent. "110.7 Insulation Integrity. Completed wiring installations shall be free from short circuits and ~~from grounds~~ ground faults and from any connections to ground other than as required or permitted ~~in Article 250~~ elsewhere in the Code."

LABRAKE, JR., N.: This proposal should be accepted. The text "from ground faults or any connections to ground" is a proper description of this Code requirement. The term "grounds" indicates a safety application to purposely ground a deenergized circuit to perform work.

1-59 Log #568 NEC-P01 **Final Action: Reject**
(110.9)

Submitter: Jeffrey A. Fecteau, City of Peoria, Arizona

Recommendation: Revise as follows:

Equipment intended to interrupt current at fault levels shall have interrupting rating sufficient for the nominal circuit voltage and the current that is available at the line terminals of the equipment.

Equipment intended to interrupt current at other than fault levels shall have an interrupting rating at nominal circuit voltage sufficient for the current that must be interrupted.

Equipment that has an available fault current in excess of 10,000 amperes shall be field marked with the actual fault current available at the line terminals of the equipment. The marking shall be located so as to be clearly visible to qualified personnel before any overcurrent devices can be installed in the equipment.

Substantiation: This will ensure compliance with 110.9 with the ability to verify that the equipment is rated for the proper fault levels. It will also compliment the requirements of Section 110.16 for Flash Protection, 110.22 for the marking of equipment enclosure(s) applied with a series combination rating and 240.86(B) which requires end use equipment to be marked when the combination of the line-side overcurrent device and the load-side circuit breaker(s) is tested as a series combination.

There currently is no identification or marking requirements for Fully Rated installations. The problem is if we have 18K available at a panelboard with 22 K AIC rated breakers installed, the person performing work on the equipment would not know that a 10 K AIC rated breaker listed for use in the enclosure could not be installed. In fact, if the 10 K AIC rated breaker was installed, we would be in violation of 110.9, and have an unknown hazard due to the fact that most manufacturers have terminology on their equipment stating the withstand rating of the equipment, however it is limited to the lowest rated device installed within the enclosure.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The actual fault current at an installation is a variable and must be determined with knowledge of the system parameters (including those of the utility supply system) at any given time. Marking of the equipment with "actual" fault current would be misleading.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

HICKMAN, P.: We are voting negative to the panel action to reject proposal 1-59. Our explanation is as follows:

This proposal should have been accepted. Accepting this Proposal will, in our opinion, greatly enhance electrical safety. We feel that the submitter's proposal is a reasonable recommendation and we agree with the submitter that this will help ensure compliance with the present requirements of 110.9.

In addition, we strongly disagree with the Panel Statement. We submit that the statement "marking of the equipment with "actual" fault current would be misleading" is not accurate. Clearly, the actual fault current is not static. However, if the intent of this panel statement is to convey to those that who look to the written record for guidance of what a Code Panel meant when it wrote a rule, then this panel statement could be sending a message that evaluating series combination systems and determining motor contribution is not achievable. The industry simply cannot continue to hide behind this argument and not help protect inspectors, electricians, and others who install and maintain electrical equipment. It is reasonable to mark equipment with values that are present at the time of installation. As an alternative, we suggest the submitter's proposal be modified as follows: Equipment shall have an interrupting rating of not less than 65,000 amperes and be marked with the location, type, size or setting of the upstream overcurrent protective device.

MCMAHILL, L.: This proposal should have been accepted. The proposed requirement is reasonable and necessary for safety and code enforcement. This section requires that "Equipment intended to interrupt current at fault levels shall have an interrupting rating sufficient for the nominal circuit voltage and the current that is available at the line terminals of the equipment." If there is nothing on the equipment to indicate what is available at the line terminals, how does one comply with minimum code? For new installation, the available fault-current at the line terminals of the equipment is generally noted on the engineered plans; however, for existing installations such information is not readily available. Is it the intent that interrupting ratings are only important for new installations? CMP-1 should reconsider this proposal as the marking requirement is for in excess of 10,000 amperes. As noted, the proposed marking will compliment the marking requirements for flash protection and series combination rating. Such marking will also provide reasonable information to qualified persons when working on the equipment. The panel statement notes "The actual fault current at an installation is a variable and must be determined with knowledge of the system parameters (including those of the utility supply system) at any given time." Obviously, the actual fault current is a variable, but this is not a good reason for rejecting this proposal. Most electrical systems are designed with fixed and albeit conservative available fault current values that allow for any variable in the supply system. If not, it would be difficult to apply any electrical equipment within its rating. In addition, if CMP-1 believes the fault current value is a variable, then how does one attain compliance with the marking requirement for series combination systems and the motor contribution rule? CMP-1 should have accepted this proposal in principle to read, "Equipment intended to interrupt current in excess of 10,000 amperes shall be field marked with not less than the maximum current that is available at the line terminals of the equipment." This action meets the intent of the proposal, but most importantly provides the necessary language in meeting the intent of "Interrupting Rating." The proposal should have been referred to CMP-10 for consideration too.

1-60 Log #2846 NEC-P01 **Final Action: Reject**
(110.9)

Submitter: Doug Eckelkamp, Bell Electric

Recommendation: Add a new third paragraph to the existing two paragraphs as follows:

<u>An enclosure containing equipment intended to interrupt current at fault levels shall be field marked with the available short-circuit current.</u>

Substantiation: The problem is that it is next to impossible for inspectors to obtain the information on the available short-circuit current and then correlate that information at the job site with the specific overcurrent protective devices. This proposal will solve that problem by providing that necessary information right at the location where it is needed. This type of data must be field marked because the manufacturer will never know where their equipment will be installed.

Panel Meeting Action: Reject

Panel Statement: The actual fault current at an installation is a variable and must be determined with knowledge of the system parameters (including those of the utility supply system) at any given time. Marking of the equipment with "actual" fault current would be misleading.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

HICKMAN, P.: We are voting negative to the panel action to reject proposal 1-60. See our explanation of negative on Proposal 1-59.

MCMAHILL, L.: The submitter is correct in that field marking is important for the inspector and provides necessary information for selecting the appropriate interrupting devices for the equipment. In addition, see my comments to proposal 1-59 (Log 2846), as they are applicable here too.

1-61 Log #1981 NEC-P01 **Final Action: Accept**
(110.11)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 11 for comment.
Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Revise as follows:

110.11 Deteriorating Agents. Unless identified for use in the operating environment, no conductors or equipment shall be located in damp or wet locations; where exposed to gases, fumes, vapors, liquids, or other agents that have a deteriorating effect on the conductors or equipment; or where exposed to excessive temperatures.

FPN No. 1: See 300.6 for protection against corrosion.

FPN No. 2: Some cleaning and lubricating compounds can cause severe deterioration of many plastic materials used for insulating and structural applications in equipment.

Equipment not identified for outdoor use and equipment identified only for indoor use, such as "dry locations ", ~~"Type 1," or~~ "indoor use only" , "damp locations", or Enclosure Types 1, 2, 5, 12, 12K and/or 13, shall be protected against permanent damage from the weather during building construction.

FPN No. 3: See Table 110.20 for appropriate enclosure type designations.

Substantiation: The proposal is made as a part of a suggestion for dealing with Comments that were HELD during the 2005 cycle. Four Comments (1-229, 1-230, 1-231, and 1-233) on Proposal 1-157 were held, with the Panel Statement on the other three referring back to the Panel Action and Statement on 1-231. This proposal builds upon Proposals 1-152 and 1-157 of the 2005 cycle, and is essentially the same as Comment 1-231.

One difference from Comment 1-231 is the acknowledgment that moving the last paragraph of 110.11 into 110.20 would diminish its effectiveness for enclosures not marked with an enclosure Type number. Instead, the paragraph should remain here, with the clarifications suggested in Comment 1-231 incorporated and a FPN reference to 110.20 added.

A companion proposal proposed creating a new 110.20 from 430.91 and Table 430.91. If the should happen not to be enacted, the FPN reference here should be to 430.91, instead of 110.20.

Panel Meeting Action: Accept
Panel Statement: The panel recommends that the TCC forward this proposal to CMP-11 for comment.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-62 Log #435 NEC-P01 **Final Action: Reject**
(110.12)

Submitter: Clarence Young, Ludvick Electric
Recommendation: Revise text to read as follows:

110.12 Manual Execution of Work.

Electrical equipment shall be installed in a ~~neat and workmanlike~~ manner consistent with industry practices outlined in ANSI/NECA 1-2000, Standard Practices for Good Workmanship in Electrical Contracting, and other ANSI approved installation standards.

~~FPN: Accepted industry practices are described in ANSI/NECA 1-2000, Standard Practices for Good Workmanship in Electrical Contracting, and other ANSI approved installation standards.~~

Substantiation: Currently, 110.12 includes the FPN referring ANSI/NECA 1-2000 and other documents, but this only adds to the confusion of what is enforceable and what is not enforceable by "the authority having jurisdiction". By deleting "neat and workmanlike" and adding the additional documents to the Code, we can eliminate any confusion as to what is and what is not acceptable in terms of inspection for safety. I do realize that this adds even more for professionals in the electrical industry to read through and understand, however, the additional documents provided will add an element of safety as to the installation of electrical equipment.

Panel Meeting Action: Reject
Panel Statement: Section 4.2 of the NEC Style Manual states, "References to other standards shall not be in mandatory Code text... References to other standards shall be in the Fine Print Notes."
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

MCMAHILL, L.: This proposal should have been accept in principle in part. The submitter's intent was to eliminate the confusion of enforcing this section. "Neat and workmanlike" is an undefined performance requirement and, theoretically, a work practice issue that can vary throughout industry. For enforcement purpose, the critical attribute of neat and workmanlike is that the installation is mechanically safe, sound and code compliant. CMP-1 should have revised the text to read "Electrical equipment shall be installed in a manner consistent with the requirements of this code and accepted industry practices." This revised text eliminates vague and unenforceable terms as required by the NEC Style Manual Section 3.2.1. Further, the revised text allows industry, with the authority having jurisdiction's concurrence, to make the determination on what constitutes accepted industry practices. The existing fine print note provides information on one example of an industry practice.

1-63 Log #3369 NEC-P01 **Final Action: Reject**
(110.12)

Submitter: Mark Miller, Plumechtrics Consulting Engineering
Recommendation: Delete the FPN as shown:

~~FPN: Accepted industry practices are described in ANSI/NEC 1-2000, Standard Practices for Good Workmanship in Electrical Contracting and other ANSI approved installation standards.~~

Substantiation: The ANSI/NECA Standards are generic in nature and are not widely adopted stanards. There has been a movement within the NEC and other codes to keep the minutia out of the code. This is one more example of extra material that does not benefit the NEC or the user. As mentioned on the NECA website "these are the first quality and performance standards for electrical construction, and contain requirements over and above the minimum safety rules of the National Electrical Code (NEC). They are intended to be referenced by consulting engineers in plans and specifications for electrical construction projects". This purpose stated on the NECA website does not reflect the sole purpose of the National Electrical Code as a safety document. Design and quality issues should be included elsewhere. The NFPA organization should not place extra material within the document which may lead to more stringent requirements and higher costs. Individuals of companies who seek more stringent requirements may do so on their own.

For these reasons the FPN should be deleted.

Panel Meeting Action: Reject
Panel Statement: Fine print notes contain explanatory information and are not an enforceable part of the Code. The reference to ANSI/NECA 1-2000 provides additional information to illustrate what is meant by 110.12.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

HITTINGER, D.: This proposal should have been accepted. The fine print note reference to the ANSI/NECA 1-2000 standard contains information on the installation, handling and storage of certain products and hardware. This information is generic. It is misleading to direct users of the code to a single standard that may not be suitable, practical, or accepted in all industry practices. The fine print note should be deleted.

1-64 Log #2256 NEC-P01 **Final Action: Accept**
(110.12, FPN)

Submitter: H. Brooke Stauffer, National Electrical Contractors Assn. (NECA)
Recommendation: Update the publication date of the referenced standard as follows:

FPN: Accepted industry practices are described in ANSI/NECA 1-2006, Standard Practices for Good Workmanship in Electrical Contracting, and other ANSI-approved installation standards.

Substantiation: ANSI/NECA 1-2000 is currently being revised, and the 2008 NEC should reference the latest edition.

ANSI/NECA 1-2006 will be published prior to the Public Comment deadline.

Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:

BARRIOS, JR., L.: The panel action should have been "reject" rather than "accept". The 2006 revision of ANSI/NECA 1 was not an approved document at the time of the 2008 NEC ROP meeting. CMP1 should not consider modifying the FPN date reference to this standard until it is an approved document and the committee has an opportunity to review the final changes.

HITTINGER, D.: This proposal should be rejected. The revised ANSI/NECA 1-2006 standard was not available to Panel 1 members for consideration. Not knowing the content makes it difficult to make an informed decision on whether this document is truly an accepted industry standard that should be included in a fine print note.

1-65 Log #2886 NEC-P01 **Final Action: Reject**
(110.12, FPN)

Submitter: Ron Alley, ELECTRICO
Recommendation: Delete the following FPN:

~~FPN: Accepted industry practices are described in ANSI/NECA 1 2000, Standard Practices for Good Workmanship in Electrical Contracting and other ANSI approved installation standards.~~

Substantiation: Numerous consensus standards from organizations such as Underwriters Laboratories Inc. NEMA and IEC/ISO could be added as a Fine Print Note throughout the Code to assist the reader of the NEC as the existing FPN note does. There are just as many publications such as American Electricians Handbook, Electricians Pocket Manual, UGLY's Electricians Reference, Conduit Bending and Electricians Instant Answers to benefit the reader. Also, there are safety regulations, pertaining to installations such as OSHA 1910 and OSHA 1926 that could be added as a Fine Print Note to assist readers to make their companies and workers safer. However, adding a Fine Print Note for the purpose of informing the reader of all related standard and publications could be cumbersome. For that reason, I recommend, if a FPN is added it should include all documents providing information or none.

The particular standard mentioned in the FPN, (ANSI/NECA 1 2000 Standard Practices for Good Workmanship in Electrical Contracting) contains information on the installation of certain products and hardware. This information is generic. It should never be used instead of manufacturer's instructions.

Manufacturer's instructions are sometimes required to be included as a condition of listing or labeling and to be sent with the listed or labeled products. Manufacturers instructions are updated as needed to keep up with product improvements. The FPN in the 2005 Code most likely will not be as up to date as the manufacturer's instructions.

If the committee decides to keep the FPN, the following words should be added:

ANSI/NECA 1 2000 Standard Practices for Good Workmanship in Electrical Contracting is one source of many that can be used along with manufacturer's instructions.

Panel Meeting Action: Reject

Panel Statement: The Code contains numerous FPN references to ANSI-approved industry standards that provide explanatory information to Code users. Other documents mentioned in the submitter's substantiation, such as the American Electrician's Handbook, UGLY's Electrician's Reference and conduit bending guides, are not appropriate to include in FPNs because they are not industry consensus standards developed with broad participation by Code users. The scope of ANSI/NECA 1-2000 states: "Installers should always follow the NEC, applicable state and local codes, and manufacturers' instructions."

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

HITTINGER, D.: This proposal should have been accepted to delete the fine print note. See my explanation of negative vote on Proposal 1-63.

1-66 Log #177 NEC-P01 **Final Action: Accept in Principle**
(110.12(A))

NOTE: The following proposal consists of Comment 1-198 on Proposal 1-160 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 1-160 was:

Revise Section 110.12(A) as follows:

Insert additional language to include unused openings for circuit breakers and other overcurrent devices in addition to raceway and cable openings.

10.12 Mechanical Execution of Work.

Electrical equipment shall be installed in a neat and workmanlike manner.

(A) Unused Openings. Unused circuit breaker, cable or raceway, and other similar openings in boxes, raceways, auxiliary gutters, cabinets, cutout boxes, meter socket enclosures, equipment cases, or housings shall be effectively closed to afford protection substantially equivalent to the wall of the equipment. Where metallic plugs or plates are used with nonmetallic enclosures, they shall be recessed at least 6 mm (1/4 in.) from the outer surface of the enclosure.

The Technical Correlating Committee directs that this Comment be reported as "Hold". See Technical Correlating Committee action on Comment 1-202.

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education

Recommendation: Revise as follows:

"Unused ~~circuit breaker, cable or raceway, and other similar~~ openings in boxes, raceways, auxiliary gutters, cabinets, cutout boxes, meter socket enclosures, equipment cases, luminaires, or housings shall be effectively... enclosure.

Exception: Those openings intended by the manufacturer for purposes such as ventilation, mounting or drainage."

Substantiation: Per Mr. MacMahill's comment.

Panel Meeting Action: Accept in Principle

Panel Statement: The submitter's concerns, noted in Comment 1-198 which was reported as hold by the Technical Correlating Committee for the 2005 NEC cycle, have been addressed. The panel concludes that the defined term "equipment" covers the items in the original text. See CMP-1 action and statement on Proposal 1-71.

1-67 Log #178 NEC-P01 **Final Action: Accept in Principle**
(110.12(A))

NOTE: The following proposal consists of Comment 1-199 on Proposal 1-161 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 1-161 was:

Revise text as follows:

Unused ~~cable or raceway~~ openings in boxes, raceways, auxiliary gutters, cabinets, cutout boxes, meter socket enclosures, equipment cases, or housings shall be effectively closed to afford protection substantially equivalent to the wall of the equipment. Where metallic plugs or plates are used with nonmetallic enclosures, they shall be recessed at least 6 mm (1/4 in.) from the outer surface of the enclosure. Unused mounting holes with a maximum size of 6-mm (1/4 in) shall not be required to be closed.

Wording that is to be deleted has been struckthrough and new wording is underlined.

The Technical Correlating Committee directs that this Comment be reported as "Hold". See Technical Correlating Committee action on Comment 1-202.

Submitter: Donald A. Ganiere, Ottawa, IL

Recommendation: Panel should accept in principle, in part .

Unused ~~cable or raceway~~ openings in boxes, raceways, auxiliary gutters, cabinets, cutout boxes, meter socket enclosures, equipment cases, housings shall be effectively closed to afford protection substantially equivalent to the wall of the equipment. Where metallic plugs or plates are used with nonmetallic enclosures, they shall be recessed at least 6 mm (1/4 in.) from the outer surface of the enclosure. ~~Unused mounting holes with a maximum size of 6 mm (1/4 in.) shall not be required to be closed.~~

Substantiation: The words "cable or raceway" should be deleted from the section. All unused opening should be closed. The safety hazard is caused by the opening itself and not by the purpose of the opening.

Panel Meeting Action: Accept in Principle

Panel Statement: The submitter's concerns, noted in Comment 1-199 which was reported as hold by the Technical Correlating Committee for the 2005 NEC cycle, have been addressed. The panel concludes that the defined term "equipment" covers the items in the original text. See CMP-1 action and statement on Proposal 1-71.

(110.12(A))

NOTE: The following proposal consists of Comment 1-200 on Proposal 1-160 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 1-160 was:

Revise Section 110.12(A) as follows:

Insert additional language to include unused openings for circuit breakers and other overcurrent devices in addition to raceway and cable openings.

10.12 Mechanical Execution of Work.

Electrical equipment shall be installed in a neat and workmanlike manner.

(A) Unused Openings. Unused circuit breaker, cable or raceway, and other similar openings in boxes, raceways, auxiliary gutters, cabinets, cutout boxes, meter socket enclosures, equipment cases, or housings shall be effectively closed to afford protection substantially equivalent to the wall of the equipment. Where metallic plugs or plates are used with nonmetallic enclosures, they shall be recessed at least 6 mm (1/4 in.) from the outer surface of the enclosure.

The Technical Correlating Committee directs that this Comment be reported as "Hold". See Technical Correlating Committee action on Comment 1-202.

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Recommendation: The proposal should be rejected contingent on the new provisions being added to Article 408; if that does not happen, then it should continue to be accepted.

Substantiation: Circuit breaker knockouts, etc., involve considerations of panelboard dead fronts and other issues unique to Article 408. At the January ROP meetings, CMP 9 (Proposal 9-111) voted that this change should be made in 110.12(A), and Proposal 1-160 does exactly that. This comment is a companion to one submitted to create a new Section 408.7 as follows:

"408.7 Unused Openings. Unused openings for circuit breakers and switches shall be closed using listed closures, or other approved means that provide protection substantially equivalent to the wall of the enclosure."

In general, it is unwise to repeat code information in different articles because discrepancies can crop up in future cycles. That is why this comment suggests a conditional rejection based solely on jurisdiction and not on the technical merit of the originating proposal.

Responding to the comments in the voting, the reason this material has been recently restricted to cable and raceway openings is that before that modification CMP 9 had to deal with a series of Proposals similar to 1-161 from people who wanted reassurance that we weren't going to make them close bolt holes, weep holes, etc.

Panel Meeting Action: Accept in Principle

Panel Statement: The submitter's concerns, noted in Comment 1-200 which was reported as hold by the Technical Correlating Committee for the 2005

NEC cycle, have been addressed. The panel concludes that the defined term "equipment" covers the items in the original text. See CMP-1 action and statement on Proposal 1-71.

NOTE: The following proposal consists of Comment 1-201 on Proposal 1-160 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. [Refer to Proposal 1- (Log #179)]

The Technical Correlating Committee directs that this Comment be reported as "Hold". See Technical Correlating Committee action on Comment 1-202.

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Reject the proposal.
Substantiation: We agree with Mr. McMahill. There is no need to expand the list of unused openings that must be closed. The wording is clear that unused openings be effectively closed to provide substantially equivalent protection to that of the original enclosure. UL or equivalent standards development organizations develop the required product standards to ensure that the intent of the Code is met. This ensures that all new products meet the intent of the Code without having to continuously revise the Code for every new product that is introduced.
Panel Meeting Action: Accept in Principle
Panel Statement: The submitter's concerns noted in Comment 1-201 reported as hold by the Technical Correlating Committee for the 2005 NEC cycle have been addressed. NOTE: The following proposal consists of Comment 1-202 on Proposal 1-160 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. [Refer to Proposal 1- (Log #179)]

The Technical Correlating Committee directs that this Comment and Proposal 1-160 be reported as "Hold" in conformance with 4-4.6.2.2 and 4-4.6.2.3 of the Regulations Governing Committee Projects.

Submitter: Lanny G. McMahill, Phoenix, AZ
Recommendation: Reject this proposal and revise the section to read as follows: "(A) Unused Openings. Unused ~~cable or raceway~~ openings in boxes, raceways, auxiliary gutters, cabinets, cutout boxes, ~~meter socket~~ enclosures, and equipment ~~cases, or housings~~ shall be effectively closed...".
Substantiation: Reject this proposal based on the submitter's substantiation that states "By addressing only cable and raceway openings, other unused openings that also require closing appear to be left out of the 2002 edition." Adding the words "circuit breaker" does not change that concern. In theory, if the list continues to expand, only the specific openings listed are required to be closed. For example, if a voltmeter, switch or pilot light were removed from the front door of an enclosure, what code section requires the openings to be closed? A list is always limiting. Generally, there should be no unused openings in electrical enclosures, raceways and equipment except for those that are required for the normal operation or function of the equipment or installation. Instead of adding items to a list, delete the words "cable or raceway", "meter socket", and "case, or housings" from the existing definition. The remaining terms are clearly defined in Article 100. Using these terms eliminates the need to continue to expand the list of "unused openings" that must be closed and allows for a realistic enforcement practice.
Panel Meeting Action: Accept in Principle
Panel Statement: The submitter's concerns, noted in Comment 1-202 which was reported as hold by the Technical Correlating Committee for the 2005 NEC cycle, have been addressed. The Panel concludes that the defined term "equipment" covers the items in the original text. See CMP-1 action and statement on Proposal 1-71.

1-71 Log #2677 NEC-P01 **Final Action: Accept in Principle**
(110.12(A))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 9 for comment.
Submitter: Dorothy Kellogg, American Chemistry Council
Recommendation: Revise text to read:
110.12(A) Unused Openings
Unused ~~cable or raceway~~ openings other than opening intended for mounting, ventilation or drainage in boxes, raceways, auxiliary gutters, cabinets, cutout boxes, meter socket enclosures, equipment cases, control panels or housings shall be effectively closed to afford protection substantially equivalent to the wall of the equipment. Where metallic plugs or plates are used with nonmetallic enclosures, they shall be recessed at least 6 mm (1/4 in.) from the outer surface of the enclosure.
Substantiation: The current wording would allow unused openings other than those for cable or raceways to be left open. The revised wording would cover all openings and still allow for openings for mounting, ventilation and drainage.
Control panels are not included in the equipment list. Article 409 does not contain a requirement for closing openings. As an example, a device installed through the wall of a control panel could be removed and there would be no requirement in the NEC to require the opening to be closed.
Panel Meeting Action: Accept in Principle
Revise text to read:
"110.12(A) Unused Openings. Unused ~~cable or raceway~~ openings other than those for the operation of equipment or for mounting purposes shall be closed to afford protection substantially equivalent to the wall of the equipment ~~in boxes, raceways, auxiliary gutters, cabinets, cutout boxes, enclosures, and equipment shall be effectively closed to afford protection substantially equivalent to the wall of the equipment~~ . Where metallic plugs or plates are used with nonmetallic enclosures, they shall be recessed at least 6 mm (¼ in.) from the outer surface of the enclosure."

Panel Statement: The panel concludes that all unused openings should be closed except for those required for the functional operation of the equipment or enclosure or for the proper mounting of such equipment or enclosure. The defined term "equipment" covers the items in the original text. The revisions made meet the intent of the Submitters of Comments 1-198, 1-200, 1-201, 1-202, and 1-203, found in the 2004 Report on Comments, as well as Proposal 1-71.
Number Eligible to Vote: 12

Comment on Affirmative:
LABRAKE, JR., N.: This proposal should be forwarded by the TCC to CMP-9 for comment.

1-72 Log #2352 NEC-P01 **Final Action: Accept in Part**
(110.12(B))

Submitter: John S. Whitney, Newton Sq., PA
Recommendation: Delete requirements for subsurface enclosures and move requirements for racking cables into Article 110 V - Manholes and other Electric Enclosures Intended for Personnel Entry, All Voltages.
Substantiation: There is no NEC definition for "Subsurface Enclosures". The requirement for racking clearly applies to Article 110 V, "Manholes and other Electric Enclosures Intended for Personnel Entry, All Voltages". Hazards associated with manholes and other enclosures intended for personnel entry are directly related to the confined nature of the space within and limited access/egress. The hazards are independant of the location of the enclosure. Manholes and other enclosures intended for personnel entry are installed below grade, above grade, suspended below bridge decks, etc. Cable assemblies and conductors shall be racked to provid ready and safe access/egress. Cable assemblies and conductors shall not obstruct the standing area of the enclosure floor and shall be effectively secured to racks to safely withstand magnetic forces when subjected to short circuit current.
Panel Meeting Action: Accept in Part
Panel Statement: The panel accepts the deletion of 110.12(B) but does not accept relocation of the text in 110.12(B) to Article 110, Part V, since 110.74 presently contains the requirements for conductor racking. The panel concludes this action meets the intent of the submitter.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-73 Log #804 NEC-P01 **Final Action: Reject**
(110.12(D))

Submitter: Joe Tedesco, Boston, MA
Recommendation: 110.12(D)Access to Electrical Equipment Behind Panels Designed to Allow Access. Access to electrical equipment shall not be denied by an accumulation of wires and cables that prevents removal of panels, including suspended ceiling panels.
Substantiation: This requirement can be found in Chapters 6, 7, and 8 (search for denied) and should be added as a new rule in Article 110.
Panel Meeting Action: Reject
Panel Statement: The submitter describes a design and workmanship issue. Section 110.26 requires that access to electrical equipment be maintained. By 90.1(C), the NEC is not intended to be a design specification. Adding the proposed Section 110.12(D) would have an immediate impact on Code articles in Chapters 1, 2, 3, 4, and 5 without substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

Comment on Affirmative:

HICKMAN, P.: We agree that the submitter has identified a problem in the industry and appreciate his attempt to address it. We recognize that the problem of accumulation of wires and cables is widespread and does not only occur with Chapter 6, 7 and 8 wires and cables. While we agree that it may be easier to have one general requirement in Article 110 prohibiting the accumulation of wires and cables on ceiling tiles in Chapters 1-7, we agree with portion of the Panel Statement recognizing that this proposal would have an immediate impact on articles in Chapters of the NEC that CMP1 was not prepared to investigate. Since the proposal is to Article 110 and would therefore apply to Chapters 1-7, we encourage the submitter to further substantiate this concept in a Comment.

1-74 Log #426 NEC-P01 **Final Action: Reject**
(110.13(A))

Submitter: Kenneth Wilee, Wilee Electric Inc.
Recommendation: Add new text as follows:

In outdoor locations, equipment shall be mounted not less than (600 mm) 2 ft above grade level.

Substantiation: It is becoming practice to mount disconnecting means for a/c equipment and panelboards within inches of grade. This poses a hazard of damage, possible water entry from floods and unreasonable working space. This would apply to all electrical equipment.
Panel Meeting Action: Reject
Panel Statement: The requirement is too restrictive, as it would apply to all outdoor equipment including equipment designed to be mounted at or below grade. Equipment is a general term that includes materials, fittings, devices, luminaires, apparatus, etc. as part of an electrical installation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-75 Log #383 NEC-P01 **Final Action: Reject**
(110.14(A))

Submitter: Bryan P. Holland, Holland Electric
Recommendation: Add to the end of the first paragraph:

The tightening torque of terminations shall be made per the manufacturer's instructions. Delete the Fine Print Note following 110.14.

Substantiation: Fine Print Notes are not enforceable and the requirement of 110.3(B) is too general as torque specifications are often overlooked but are extremely important.
Panel Meeting Action: Reject
Panel Statement: Section 110.14 does not require that the manufacturer's instructions be followed when making up compression lugs or splicing wire connectors. There would seem to be no reason for the section to require torquing per manufacturer's instructions. In addition, the proposal does not contain a statement of the problem and substantiation for the change as required by Section 4.3.3(d) of the Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-76 Log #2059 NEC-P01 **Final Action: Reject**
(110.14(A))

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Recommendation: Add a third paragraph as follows:

Terminals, lugs, or connectors intended for use with flexible, fine-stranded cables shall be marked and listed for such use.

Substantiation: UL Standard 486 A and B requires that connectors, lugs, and terminals intended for use with flexible, fine-stranded cables be so marked for use with such cables. Very few connectors and terminals have been listed for such use and few are so marked. The vast majority of connectors and terminals are unsuitable for use with flexible, fine-stranded cables. However, the limited distribution and wording of the standard has resulted in these non-marked connectors being used improperly with flexible, fine-stranded cables. Connector/conductor failures in several widely different industries (e.g. uninterruptible power systems, motor drives, electric vehicles, photovoltaic power systems) have been reported. The existence of the UL Standard alone is not sufficient to prevent the misuse of these conductors and unmarked connectors, terminals, and lugs.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The term "fine-stranded cable" is not used or defined in the NEC. This proposal is adequately covered in 110.3(B).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-77 Log #3307 NEC-P01 **Final Action: Reject**
(110.14(A), FPN (New))

Submitter: Redwood Kardon, Code Check Institute
Recommendation: Add text to read as follows:

FPN: For additional requirements see 408.41.

Substantiation: Requirements for terminations contained in 408.41 have a direct relationship to the material covered by 110.14.
Panel Meeting Action: Reject
Panel Statement: Section 408.41 is specific to grounded conductor terminations in panelboards. Section 110.14(A) is a general requirement for all electrical installations. A fine print note referencing 408.41 for additional requirements does not improve clarity of the section. See the NEC Style Manual, Section 4.1.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-78 Log #2334 NEC-P01 **Final Action: Reject**
(110.14(B))

Submitter: Charles Carmical, Complete Services
Recommendation: Revise text to read:

Conductors shall be spliced or joined with splicing devices identified for the use or by brazing, welding, or soldering with a fusible metal or alloy. Soldered splices shall first be spliced or joined by twisting together, #10 gauge wire or smaller so as to be mechanically and electrically secure without solder and then be soldered.

Substantiation: I have soldered wire splices for forty-one years with 40/60 resin core solder with "0" failures, but have had an instructor teaching inspectors that a mechanical connector must be used when soldering.

In my opinion, twisting the free ends of up to #10 gauge wire together meets the definition of spliced or joined, mechanically and electrically secure until soldering with a fusible metal or alloy takes place as 110.14(B).

According to World Book Encyclopedia and Merriman/Websters Dictionary the definitions are:

Spliced or joined - to unite by interweaving the strands or wire.

Fusible metal or alloy - an element usually possessing hardness, malleability, fusibility, and conductivity of being fused.

Mechanically - of or relating to machinery or tools, of or relating to manual operations.

Electrically - relating to or operated by electricity.

I have found wire nuts burned from loose connections, crimp sleeves oxidized, split and become loose from heat, but have never had any soldered wire come apart, burned, oxidized, or cause any more resistance than other connectors.

In my opinion, I believe that this meets or exceeds the intent of this code section and after forty-one years of this practice with "0" failures, it has proven to be a superior and effective means of connecting splices to give the quality of workmanship that I strive to give my customers.

Nowhere in the NEC does a wire splice need more than one connector, and the interpretation of a mechanical connector before soldering is not mentioned or needed in 110.14(B) as I interpret this code.

I ask this board for consideration of this option if it meets code section 110.14(B) to give more effective options and choices of a good and lasting connection for years to come or render an interpretation of this code section.

Copper water lines were soldered for years with 40/60 solder before lead free was introduced, and it holds pressure so it will sure hold wire with no problem.

PC Boards are soldered with 40/60 resin core with no mechanical connectors or loss of conductivity in computers, automobiles, HVAC equipment, and many other items with no problems.

Audel Guide to the 2005 NEC makes reference to soldered splices with no mention of a mechanical connector, but a mechanical connection which is twisting as I understand this reference.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The submitter's substantiation does not explicate how the requirement would be clarified by adding the proposed language. In addition, the proposal would mandate twisting wires together, to the exclusion of all other methods of securing the conductors. The substantiation says that PC boards are soldered "with no mention of a mechanical connector" in computers, automobiles, and HVAC equipment. The fact is, standards for computers (ANSI/UL 60950) and HVAC equipment (ANSI/UL 1995) specifically require that the conductors be mechanically secured to their terminals before soldering.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-79 Log #3560 NEC-P01 **Final Action: Reject**
(110.14(C)(1))

Submitter: Robert Alexander, Laguna Hills, CA
Recommendation: Revise as follows:

110.14(C) Ampacity and Temperature Limitations of Electrical Connections. The ampacity of a conductor shall be selected and coordinated so as not to exceed the ampacity or temperature rating of any connecting device or equipment terminal to which it is connected.

(1) Provision for 0-600V Connecting Devices or Equipment Terminals. Temperature limitations of conductors, required by 0-600V rated connecting devices or equipment terminals, shall be based on 110.14(C)(1)(a), (b) or (c). Unless marked otherwise, the conductor ampacity at a connecting device or equipment terminal shall be based on Table 310.16 without further adjustment except as required by the appropriate ambient correction factor of the

conductor.

(a) Connecting devices or equipment terminals rated 100 amperes or less, or marked for conductors 14 AWG through 1 AWG, shall be used only for one of the following:

(1) Conductors with temperature ratings of 60°C (140°F).

(2) Conductors with higher temperature ratings, provided the ampacity of such conductors at the connecting device or equipment terminal is limited to the ampacity of a 60°C (140°F) temperature rated conductor of the same size.

(3) Conductors with higher temperature ratings if the connecting device or the equipment terminal and host equipment is identified for use with such conductors.

(B) Terminations rated over 100 amperes, or marked for conductors larger than 1 AWG, shall be used only for one of the following:

(1) Conductors with temperature ratings not more than 75°C (167°F)

(2) Conductors with higher temperature ratings, provided the ampacity of such conductors at the connecting device or equipment terminal is limited to the ampacity of a 75°C (167°F) temperature rated conductor of the same size

(3) Conductors with higher temperature ratings if the connecting device or the equipment terminal and host equipment is identified for use with such conductors.

(c) For motors marked with NEMA design letters B, C, or D, field terminated conductors shall have a temperature rating not more 75°C (167°F) or conductors with higher temperature ratings shall be permitted to be used provided the ampacity at the termination of such conductors is limited to the ampacity of a 75°C (167°F) temperature rated conductor of the same size.

Substantiation: This subsection is still widely misunderstood and needs clarification that these are ampacity and temperature limitations placed on conductors solely at the connections or terminations.

In the context of the primary (110.14) the purpose of this subsection is to define the appropriate temperature limitations of conductors at connections. The temperature limitations of the conductors in other conditions of use are appropriately defined in Section 310.10 and other parts of Article 310. It is important to note no additional adjustments are required by a connection itself unless marked otherwise, but ambient conditions are to be considered.

A coordinating proposal is being made to 310.15(A)(2) [Selection of Ampacity] to specifically recognize 110.14(C) and that the exception to 310.15(A)(2) does not apply to it.

The revised text also notifies the user that both the host equipment and its terminals must be identified for a higher temperature rating.

Termination devices in 110.14(C)(2) are both amp and temperature rated so ampacity restrictions are also recognized in the 110.14(C) general statement.

Nonlisted NEMA rated motors are identified as the basis for 110.14(C)(1)(c).

Panel Meeting Action: Reject

Panel Statement: The present text is clear. The proposal does not add clarity to the present requirements and suggests that equipment terminals or connecting devices have an "ampacity", a term limited to conductors. The substantiation does not indicate where the present text is unclear.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-80 Log #3658 NEC-P01 **Final Action: Reject**
(110.15)

Submitter: George Rohanna, Local Union #98 IBEW

Recommendation: New word (Purple).

Delete (Orange).

Substantiation: Orange is a "B" phase color for all 480 volt systems, wye or delta. The color purple should be used to identify a high leg on a 4-wire delta system.

Panel Meeting Action: Reject

Panel Statement: The submitter has provided no technical substantiation supporting a change of the high-leg color on a 4-wire delta connected system from orange to purple. See Section 4.3.3(d) of the Regulations Governing Committee Projects. CMP-1 notes to the submitter that orange has been the standard color code for high-leg systems for many years, and that there is no requirement in the NEC to identify the "B" phase of all 480 volt delta or wye systems as orange.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-81 Log #1316 NEC-P01 **Final Action: Reject**
(110.16)

Submitter: Mike Holt, Mike Holt Enterprises

Recommendation: Editing to clarify intent

Flash protection . Switchboards, panelboards, industrial control panels, meter socket enclosures and motor control centers that are in other than dwelling occupancies and are likely to ~~require examination, adjustment, servicing, or maintenance~~ be examined, adjusted, serviced, or maintained while energized shall be field marked to warn qualified persons of potential electric arc flash hazards. The marking shall be located so as to be clearly visible to qualified persons before examination, adjustment, servicing, or maintenance of the equipment.

Substantiation: As written, this provision is unenforceable. The phrase "likely to require," when taken literally, would mean to " ***command or insist on*** " working on energized equipment (see "require" in the American Century Dictionary). This would be in direct opposition to the standards put forth by OSHA. In fact, the existence of a remote means of disconnect could be used to argue that the equipment need not be worked on while energized. It is obvious that this is not the true intent of the ***Code*** .

110.16 is very important for maintaining the safety of electrical workers and must be written in enforceable language.

Panel Meeting Action: Reject

Panel Statement: CMP-1 disagrees with the submitter that the section is unenforceable and that the phrase "likely to require" implies "to command or insist on" in the context of the sentence. The word "require" also implies "having a compelling need for". In addition, the NEC Style Manual, Section 3.3.4, requires the use of clear and emphatic language and Section 3.3.5 requires parallel construction with other code sections. CMP-1 agrees with the submitter that Section 110.16 is important for maintaining safety of electrical workers. The panel has concluded that the section is written in enforceable language in accordance with the NEC Style Manual.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

ANTHONY, M.: The submitter's proposed language seems more enforceable because it uses the verb form of examination, adjustment, service and maintenance. This proposal could have been accepted in principle.

1-82 Log #1651 NEC-P01 **Final Action: Accept in Principle**
(110.16)

Submitter: Joe Tedesco, Boston, MA

Recommendation: Revise text to read as follows:

110.16 Flash Protection. Switchboards, panelboards, industrial control panels, meter socket enclosures, and motor control centers and are likely to require examination, adjustment, servicing, or maintenance while energized shall be field marked to warn qualified persons of potential electric arc flash hazards. The marking shall be located so as to be clearly visible to qualified persons before examination, adjustment, servicing, or maintenance of the equipment.

Substantiation: Removing the words: "that are in other than dwelling occupancies" makes sense because the hazards exist dwelling occupancies too.

Many dwellings have services that are 400 amperes or more, and some services are located within commercial occupancies where there are stores and dwelling units all served by the same electrical utility system. I believe that this change will be in the best interest of safety. With the warning sign present a qualified person who may be a Home Inspector or NACHI member will be aware of the need for some form of PPE, probably Catagory 2.

Panel Meeting Action: Accept in Principle

Revise text to read as follows:

110.16 Flash Protection. Switchboards, panelboards, industrial control panels, meter socket enclosures, and motor control centers that are in other than <u>one- and two-family</u> dwelling occupancies and are likely to require examination, adjustment, servicing, or maintenance while energized shall be field marked to warn qualified persons of potential electric arc flash hazards. The marking shall be located so as to be clearly visible to qualified persons before examination, adjustment, servicing, or maintenance of the equipment.

Panel Statement: The panel has revised the proposal to only include one- and two-family dwelling occupancies rather than all dwelling occupancies because one- and two-family dwellings provide a reasonable demarcation for occupancies where arc flash hazards may exist. The panel does not necessarily agree with all of the substantiation of the submitter.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 8 Negative: 3 Abstain: 1

Explanation of Negative:

LABRAKE, JR., N.: This proposal should be rejected. Qualified persons understand that equipment is to be placed in an electrically safe work condition before maintenance is performed. Generally, this can be readily accomplished in dwellings. Unlike some instances in commercial and industrial installations, it is not likely that electrical equipment in dwellings typically operated at less than 300 volts would have to be maintained while energized, and, therefore, do not need to be marked as to arc flash hazards.

MCMAHILL, L.: Although I agree that arc flash hazard exists in dwelling occupancies, I disagree that it exists at the same level as in other than dwelling occupancies. Panelboards and meter sockets in dwelling occupancies are not subject to the same scrutiny as commercial and industrial type occupancies, and the potential arc flash energy is generally less too. Expanding the marking requirement to include dwellings other than one- and two-family is excessive. The marking requirement will apply to all panelboards and meter sockets in multi-family dwellings. This is over restrictive and provides no useful purpose. Flash protection warnings are intended for "qualified persons" working on energized equipment, such as in commercial and industrial type facilities. Adding such marking on dwelling equipment appears to only encourage working on equipment while energized. Equipment in dwelling occupancies should always be deenergized before servicing!

MINICK: NEMA continues to support the position that personnel safety can best be assured when equipment is de-energized before performing any work.

Explanation of Abstention:

FISKE, W.: We are abstaining from voting on Proposals 1-82, 1-83, 1-84, and 1-85, as they relate to field marking of arc flash hazards. There is no role for conformity assessment bodies (i.e., nationally recognized testing laboratories) to play in fulfilling the existing or proposed requirements. As we are not an affected party, Intertek has elected not to take a formal position on the four proposals identified above.

1-83 Log #2220 NEC-P01 **Final Action: Reject**
(110.16)

Submitter: Donald A. Ganiere, Ottawa, IL
Recommendation: Revise as follows:

110.16 Flash Protection. Switchboards, panelboards, industrial control panels, meter socket enclosures, and motor control centers that are in other than dwelling occupancies and are likely to require examination, adjustment, servicing, or maintenance while energized shall be ~~field~~ marked to warn qualified persons of potential electric arc flash hazards. The marking shall be located so as to be clearly visible to qualified persons before examination, adjustment, servicing, or maintenance of the equipment.

Substantiation: The requirement that this be a field applied label is left over from the original proposal that called for the label to contain arc flash information that was specific to the installation. Now that only a "generic" warning tag is required there is no reason that it must be field applied. The warning label will have the same effectiveness whether applied in the field or applied by the equipment manufacturer.

Panel Meeting Action: Reject

Panel Statement: The panel concludes that marking of every item may weaken the safety aspects of the marking to warn qualified people where the instances of exposure to arc flash hazards are pronounced. Equipment manufacturers will not know if their equipment will need to be maintained while energized in a particular installation, therefore necessitating field marking. Also, the requirement in 110.16 applies when changes are made to existing equipment.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Abstain: 1

Explanation of Abstention:

FISKE, W.: We are abstaining from voting on Proposals 1-82, 1-83, 1-84, and 1-85, as they relate to field marking of arc flash hazards. There is no role for conformity assessment bodies (i.e., nationally recognized testing laboratories) to play in fulfilling the existing or proposed requirements. As we are not an affected party, Intertek has elected not to take a formal position on the four proposals identified above.

1-84 Log #2338 NEC-P01 **Final Action: Accept**
(110.16)

Submitter: Lanny G. McMahill, Phoenix, AZ
Recommendation: Revise text to read:

<u>Electrical equipment, such as s</u> ~~S~~ witchboards, panelboards, industrial control panels, meter socket enclosures, and motor control centers that are in other than dwelling occupancies and are likely to require examination, adjustment, servicing, or maintenance while energized shall be field marked...

Substantiation: Add the words "Electrical equipment, such as" to the sentence. This change eliminates the need to add equipment to the list and correlates with the requirements in 110.26. It also allows the AHJ flexibility in enforcement. As currently worded, there is no marking requirement for a 1600A fusible wall switch.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 1 Abstain: 1

Explanation of Negative:

MINICK: The proposed wording actually makes the section more ambiguous. The submitter proposes the new wording to all the AHJs to make determination as to where the labeling is required. However, there is absolutely no guidance given as to when it might make sense. For example, is a 30A general duty safety switch required to have an arc-flash marking? What about a fractional horsepower manual motor controller? Will AHJs end up extending this requiremnt to snap switches, wireways, etc.? This is a case where the laundry list of equipment might actually make sense.

Explanation of Abstention:

FISKE, W.: We are abstaining from voting on Proposals 1-82, 1-83, 1-84, and 1-85, as they relate to field marking of arc flash hazards. There is no role for conformity assessment bodies (i.e., nationally recognized testing laboratories) to play in fulfilling the existing or proposed requirements. As we are not an affected party, Intertek has elected not to take a formal position on the four proposals identified above.

1-85 Log #2672 NEC-P01 **Final Action: Reject**
(110.16)

Submitter: C. E. Gibson, III, Lawson Electric Company Inc.
Recommendation: Revise to read as follows:

Switchboards, panelboards, industrial control panels, meter socket enclosures, and motor control centers that are in other than dwelling occupancies and are likely to require examination, adjustment, servicing, or maintenance while energized shall be field marked to warn qualified persons of potential electric arc flash hazards. <u>The marking shall indicate the incident energy, the flash protection boundary, and the shock protection boundaries</u> . The marking shall be located so as to be clearly visible to qualified persons before examination, adjustment, servicing, or maintenance of the equipment.

Substantiation: I am the Safety Director for a large contractor and a proud member of the National Electrical Contractors Association. We, like all contractors, are committed to providing a safe workplace for the employees. Toward that end, we have found it imperative to have labels installed on electrical equpment indicating the incident energy, the flash protection boundary, and the shock protection boundaries. The simple fact that 110.16 exists assures me that the hazards of arc flash are well understood by the committee acting on this proposal.

While we are committed to having our employees place equipment in an electrically safe work condition before they work on or near it, we understand that even tasks such as voltage testing and placing equipment in an electrically safe work conditon is energized work. Therefore, there is no escaping the fact that workers are being exposed to the hazards of working on or near exposed energized parts. I offer Annex K of the 2004 edition of NFPA 70E as evidence and substantiation that recognized hazards exist when workers are working on or near exposed energized parts.

There is no better time than when the electrical equipment is installed to know key information necessary to determine incident energy, the flash protection boundary, and the shock protection boundaries.

The shock protection boundaries are fairly straightforward. These are based on voltage and a qualified peson should have no trouble determning that and determining the associated boundaries.

Both the incident energy and flash protection boundry require available fault current and clearing time. 110.9 and 110.10 of the NEC already require knowledge of the available fault current. Electrical inspectors are already requried to be sure these requirements are being complied with. This is certainly not new information or a new requirement. Clearing time is another piece of information that an overcurrent protective device manufacturer has readily available. This is not being applied retroactively, so we do not have to worry obtaining this information for Zinsco breakers.

While some may argue that using different calculation methods will give different results, there is no question that flash protection boundaries and incident energy calculations are beng done today. A few calculaton methods that come to mind are IEEE 1584, Easy Power, and SKM. All widely used and readily available. Major manufacturers of overcurrent protective devices such as Bussmann and Square D offer this service as part of the business. These are well respected members of the National Electrical Manufacturers Associaiton. If they are doing these calclations, then it is clear that it can be done. Even if the Tables of NFPA 70E were to be used to protect workers, the avalable fault current and clearing time needs to be known to use those tables.

The bottom line is that workers need to be protected. OSHA requires workers to be protected from recognized hazards. Even if it is to place equipment in an electrically safe work condition. An employer needs to know the incident energy, the flash protection boundary, and the shock protection boundaries to accomplish this. Is it better to have that informtion put on a label on equipment when it is installed and all the required information is readily avalaible on deenergized equpment so that is clearly visible to a qualified worker approaching the equpment before they work on it, or should we expect qualified persons to try to find wire size and length, type of conduit, and clearing time on energized equpment when that information is not necessarily readily available and workers are put at increased exposure to obtain that information?

Clearly labels would need to be updated when anyone makes changes to the system. That will ensure that the label reflects the latest information. If facilities or contractors do not want to, or are not able to, there are well respected companies such as Bussmann and Square D that are quite capable. That is part of their business.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: It may be misleading to mark equipment with the incident energy available at the time of installation. Electrical system configurations and parameters are subject to change on both the supply system and the premises wiring resulting in varying incident energy levels at a work location at a given time. Safety dictates that the determination of incident energy must be made prior to performing the work at the time the equipment is energized. The panel concludes that shock protection boundaries are outside the scope of this section. FPNs 1 and No. 2 provide information where to find these work practices.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 9 Negative: 1 Abstain: 2

Explanation of Negative:

HICKMAN, P.: We are voting negative to the panel action to reject proposal 1-85. Our explanation is as follows:

This proposal should have been accepted. Accepting this Proposal will, in our opinion, greatly enhance electrical safety. Knowledge of the available short-circuit current is absolutely necessary for proper compliance with 110.9 and 110.10. We feel that the submitter's proposal is a reasonable recommendation. We recognize that the actual fault current is not fixed. The industry simply cannot continue to hide behind this argument and not help protect inspectors, electricians, and others who install and maintain electrical equipment. It is reasonable to mark equipment with values that are present at the time of installation.

As an alternative, since key components to determining the incident energy are overcurrent device clearing time and available fault current, we suggest the submitter's proposal be modified to include the following:

Switchboards, panelboards, industrial control panels, meter socket enclosures, and motor control centers that are in other than dwelling occupancies and are likely to require examination, adjustment, servicing, or maintenance while energized shall be field marked to warn qualified persons of potential electric arc flash hazards. The marking shall indicate the incident energy, the flash protection boundary, the location, type, size or setting of the upstream overcurrent protective device, and the shock protection boundaries. The marking shall be located so as to be clearly visible to qualified persons before examination, adjustment, servicing, or maintenance of the equipment.

Explanation of Abstention:

ANTHONY, M.: Because arc-flash has been a controversial issue our interest group will abstain--as it did in the 2002 and 2005 code cycles--in order to keep the door open for more discussion. It is plain that good minds disagree on this. Nothing has changed since I last observed that our membership appears divided in its opinion about the practical effect of this proposal. Workgroups within the higher education facilities industry seem to divide along the same lines as the interest groups within CMP-1 itself.

In the 2005 cycle incident energy proposals were not adopted because of the abstention from our industry. The 2005 vote was 7 FOR, 4 AGAINST, with APPA's 1 ABSENTION resulting in failure to adopt the incident energy proposals. (8 votes are needed to change the NEC on CMP-1) Our abstention was based upon the belief that our industry needed more time to grasp the implications of the incident energy proposals.

Now the straw voting at the CMP-1 2008 ROP indicates substantially weakened support for an incident energy marking on arc flash labels. What has happened in the three years since? We look forward to comment from other industries and from the public.

FISKE, W.: We are abstaining from voting on Proposals 1-82, 1-83, 1-84, and 1-85, as they relate to field marking of arc flash hazards. There is no role for conformity assessment bodies (i.e., nationally recognized testing laboratories) to play in fulfilling the existing or proposed requirements. As we are not an affected party, Intertek has elected not to take a formal position on the four proposals identified above.

Comment on Affirmative:

FLOYD, II, H.: I am in support of the concept of providing more information to people who are at risk of exposure to arc flash hazards, however, there are other approaches that may be more useful in that they are less dependent on variations in available short circuit current. For example, if the label were to indicate the performance rating of personal protective equipment required, it could be specified to cover anticipated variations in the available short circuit current.

1-86 Log #2839 NEC-P01 **Final Action: Reject**
(110.16)

Submitter: Tracy Missey, Midlothian, VA

Recommendation: Revise 110.16 to read as follows:

110.16 Flash Protection. ~~Switch boards, panelboards, industrial control panels, meter socket enclosures, and motor control centers that are~~ Equipment , in other than dwelling occupancies ~~and are~~ that is likely to require examination, adjustment, servicing, or maintaining while energized shall be field marked to warn ~~qualified persons~~ of potential electric arc flash hazards. The marking shall be located so as to be clearly visible to qualified persons before examination, adjustment, servicing, or maintenance of the equipment. The marking shall include (1) the available short-circuit current in amperes and, (2) the available arc-flash energy in calories per centimeter squared (cal/cm 2).

The FPNs remain unchanged.

Substantiation: (1) The phrase "Switchboards, panelboards, industrial control panels, meter socket enclosures, and motor control centers" was replaced with "equipment" as suggested by Comment 1-224 in the ROC stage of the 2005 NEC in the comment by Lanny McMahill.

(2) The phrase "qualified persons" was deleted because it is not only qualified persons that need to be warned. Unqualified persons also need to be warned, even if they should not be in the energized equipment.

(3) The final sentence was added to be in agreement with Proposal 1-172a from the ROP for the 2005 NEC.

(4) The "available short-circuit current" was added to be in agreement with ROC 1-220 as submitted by Mark Miller. The available short-circuit current is a necessity, whether calculating the arc-flash energy or using the tables in 70E to determine the weight of PPE to wear.

(5) There is no need to tell the user how to calculate the arc-flash energy, just as there is no need to tell the user how to calculate the available short-circuit current.

Panel Meeting Action: Reject

Panel Statement: See panel actions on Proposals 1-84 and 1-85 and panel statement on 1-85.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

HICKMAN, P.: We are voting negative to the panel action to reject proposal 1-86. This proposal should have been accepted. See our Explanation of Negative on Proposal 1-85.

1-87 Log #2890 NEC-P01 **Final Action: Accept in Principle**
(110.16)

Submitter: B. Wiltse, Mandeville, LA

Recommendation: Revise the list in 110.16 by adding bus plugs, enclosed disconnect switches, enclosed circuit breakers, and transfer switches, as follows:

110.16 Flash Protection. Switchboards, panelboards, industrial control panels, meter socket enclosures, bus plugs, enclosed disconnect switches, enclosed circuit breakers, transfer switches , and motor control centers that are in other than dwelling occupancies and are likely to require examination, adjustment, servicing, or maintenance while energized shall be field marked to warn qualified persons of potential electric arc flash hazards.

The second sentence and the FPNs are to remain unchanged.

Substantiation: Additional equipment should be added to the list as pointed out by Mr. McMahill in the ROP stage for the 2005 NEC. (See proposal 1-172a from the 2005 NEC cycle).

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action on Proposal 1-84. The types of equipment recommended by the submitter are covered by the new wording on Proposal 1-84.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-88 Log #2325 NEC-P01 **Final Action: Reject**
(110.16, FPN (New))

Submitter: Daleep C. Mohla, DCM Electrical Consulting Services, Inc.

Recommendation: Add a new FPN to read:

FPN: Listed Arc-resistant switchgear is designed and tested to withstand the effects of an internal arcing fault. See IEEE C37.20.7 for description and details of testing.

Substantiation: Arc flash hazard to the operating personnel requires mitigation to protect personnel from arc flash hazards such as thermal, shrapnel due to blast, and pressure wave caused by the internal arcing. Switchgear designed and tested per IEEE C37.20.1 and 20.2 is tested under bolted fault conditions and not for effects of internal arcing faults. Switchgear designed and tested per IEEE C37.20.7 is tested to withstand effects of internal arcing faults in addition to the bolted fault conditions.

Panel Meeting Action: Reject

Panel Statement: The proposed FPN is not explanatory information to the marking requirement contained in 110.16.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

HICKMAN, P.: We are voting negative to the panel action to reject proposal 1-88. This proposal should have been accepted. We feel that the proposal is related to arc flash hazard. A FPN referring users of the NEC to IEEE C37.20.7 for description and details of testing of listed arc-resistant switchgear designed and tested to withstand the effects of an internal arcing faults is appropriate. It would improve awareness of this type of equipment and likely reduce damage to equipment and property and enhance worker safety.

Comment on Affirmative:

FLOYD, II, H.: The application of Arc Resistant Switchgear in US markets has grown over the past decade, to the point that all major manufacturers now offer this design. Experience in installations in the US and longer-term experience in other global regions demonstrate that arc resistant designs can reduce the frequency of personnel exposure to hazardous arcing faults. While I support the concept of recognizing this type of equipment in the NEC, I agree with the panel action for rejection.

1-89 Log #2137 NEC-P01 **Final Action: Reject**
(110.17)

Submitter: Russell LeBlanc, Peterson School of Engineering

Recommendation: Add new text to read:

The working space area described in 110.26(A) or 110.34(A) shall contain a warning sign mounted on or adjacent to the equipment requiring working space. The sign shall be clearly legible and contain the following:

WARNING! Working space is required for this electrical equipment. Clear space shall be maintained for a minimum of Depth Width Height

Substantiation: Obstructed working spaces place the lives of electrical workers in jeopardy. It can also hinder emergency personnel from quickly reaching disconnecting means when the power needs to be turned off or on in an emergency situation. This is much more than an enforcement issue. This is a serious safety concern when an emergency happens and equipment needs to be reached quickly. See photos which I have provided.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: Requiring a warning sign on or adjacent to the working space may not prevent infringement on such space. Such a requirement is overly restrictive, as the marking would apply to all items in the list. The proposed language is vague and unenforceable. See the NEC Style Manual, Section 3.2.1.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-90 Log #3664 NEC-P01 **Final Action: Reject**
(110.17)

Submitter: Wayne Clevenger, Durham City/ County Inspections
Recommendation: New 110.17
Marking of Meterbases and CI cabinets
All meterbase and/or CI cabinets shall be field marked after insulation to reflect voltage rating for application which applied. Marking shall be clearly and legible marked on face of enclosure.
Substantiation: Being utility company sub out much of the work in our area. After approving a job recently for a 120/208 application - utility company connected 277/180v and you can guess the rest. This could be avoided in the future with this section.
Panel Meeting Action: Reject
Panel Statement: This proposal addresses a local work method issue not related to the Code requirements according to 90.1(C).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
HICKMAN, P.: We are voting negative to the panel action to reject proposal 1-90. Our explanation is as follows:
This proposal should have been accepted. The submitter has reported a safety issue and offered a reasonable method to help prevent future incidents of this nature. We recognize that this recommendation to mark all meterbases would require marking of meterbases covered under the scope of the NEC, including those installed on the load side of service equipment.

1-91 Log #182 NEC-P01 **Final Action: Accept in Principle**
(110.20)

NOTE: The following proposal consists of Comment 1-229 on Proposal 1-157 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 1-157 was:
Move the existing text and table from Section 430.91 to a new Section 110.12 with editorial modifications as follows:
110.12 Enclosure Types.
Table 110.12 provides the basis for selecting enclosures for use in specific locations other than hazardous (classified) locations. The enclosures are not intended to protect against conditions such as condensation, icing, corrosion, or contamination that may occur within the enclosure or enter via the conduit or unsealed openings. These internal conditions shall require special consideration by the installer and user.
Equipment identified only as "dry locations," "Type 1," or "indoor use only" shall be protected against permanent damage from the weather during building construction.
Submitter: J. Philip Simmons, Simmons Electrical Services / Rep. National Armored Cable Manufacturers Association
Recommendation: Revise 110.20 from the 2005 NEC ROP Draft as follows:
110.20 Enclosure Types. Table 110.20 provides the basis for selecting enclosures for use in specific locations other than hazardous (classified) locations for the following equipment:
(1) Power distribution and control equipment enclosures such as cabinets and cutout boxes
(2) enclosed panelboards and switches
(3) meter sockets
(4) enclosed circuit breakers or switches
(5) industrial control equipment
(6) motor controllers.
The enclosures are not intended to protect against conditions, such as

---

[1]Enclosure type number shall be marked on the motor controller enclosure.
[2]Mechanism shall be operable when ice covered.

Renumber the existing Section 110.12 and following sections.

condensation, icing, corrosion, or contamination, that may occur within the enclosure or enter via the conduit or unsealed openings. These internal conditions shall require special consideration by the installer and user.

Equipment identified only as "dry locations," "Type 1," or "indoor use only" shall be protected against permanent damage from the weather during building construction.

Change footnote Number 1 below the table to read:

1 Enclosure type number shall be marked on the ~~motor controller~~ enclosure.

Substantiation: This Comment intends to clarify the application of Table 110.20 as contained in the substantiation for the Proposal that was accepted by CMP-1. Several previous editions of the NEC have located the Table as Table 430.91 where it applied to only motor controllers. UL has had similar requirements for many years for other types of equipment in the White or Green Directories in Electrical Equipment for Use in Ordinary Locations (AALZ). Other equipment categories in the UL directories contain similar requirements.

It makes sense to locate this Table in Article 110 so it clearly has application to all types of distribution and control equipment

Panel Meeting Action: Accept in Principle

Panel Statement: The panel concludes that the action taken on Proposal 1-95 addresses the submitter's concerns.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-92 Log #183 NEC-P01 **Final Action: Accept in Principle**
(110.20)

NOTE: The following proposal consists of Comment 1-230 on Proposal 1-152 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 1-152 was:

Move the last paragraph of 110.11 to new Section 110.12 as follows:

110.11 Deteriorating Agents.

Unless identified for use in the operating environment, no conductors or equipment shall be located in damp or wet locations; where exposed to gases, fumes, vapors, liquids, or other agents that have a deteriorating effect on the conductors or equipment; or where exposed to excessive temperatures.

FPN No. 1: See 300.6 for protection against corrosion.

FPN No. 2: Some cleaning and lubricating compounds can cause severe deterioration of many plastic materials used for insulating and structural applications in equipment.

~~**Equipment identified only as "dry locations," "Type 1," or "indoor use only" shall be protected against permanent damage from the weather during building construction.**~~

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Recommendation: Revise the proposed 110.20 to read as follows:

110.20 Enclosure Types. Enclosures (other than surrounding fences or walls) of all switchboards, panelboards, industrial control panels, meter sockets, motor control centers, enclosed switches, enclosed circuit breakers, transformers, and motor controllers, rated not over 600 volts nominal intended for such locations shall be marked with a Type number as shown in Table 110.20.

Table 110.20 provides the basis for selecting the above enclosures for use in specific locations other than hazardous (classified) locations. The enclosures are not intended to protect against conditions such as condensation, icing, corrosion, or contamination that may occur within the enclosure or enter via the conduit or unsealed openings. ~~These internal conditions shall require special consideration by the installer and user.~~

Equipment not identified for outdoor use and equipment identified only for indoor use, such as "dry locations" "Types 1 , 2, 5, 12, 12K, or 13 ," or "indoor use only" shall be protected against permanent damage from the weather during building construction.

Proposed Table 110.20 to be placed here

(Table 110.20 to be the same as existing 430.91, with the following modifications:

- Change title to "Enclosure Selection"
- Delete footnote 1
- Renumber footnote 2 as footnote 1)

Substantiation: Rationale for changes:

The proposal is a good start, but needs some additional modifications to make it acceptable as a general rule in the NEC. The following revisions are recommended:

1. The last sentence of the first paragraph is proposed to be deleted because it "requires" an action that is not specified or enforceable by the AHJ.
2. A new second paragraph is recommended that will limit the application of the table to specific equipment. Inserting the requirement into 110 without some limitation will result in it being applied to equipment that is not required to carry a Type number. There are many categories of equipment which use generic markings - Outdoor, Damp Locations, Rainproof, Raintight, Waterproof, etc. - instead of Types. All of the equipment included in this new paragraph is presently required by their respective product standards to be marked with Type numbers corresponding to the proposed table.
3. The words "other than surrounding fences and walls" are proposed because the NEC definition of enclosure includes the use of fences and walls, which are clearly not intended to be covered by the proposed table.
4. The third paragraph comes from Proposal 1-152. The revision is to make it more inclusive of other enclosures which need protection.
5. The table itself would need to be changed only in title and through deletion of footnote 1, which is now covered by the new second paragraph.

Panel Meeting Action: Accept in Principle

Panel Statement: The panel concludes that the action taken on Proposals 1-61 and 1-95 addresses the submitter's concerns.

Number Eligible to Vote: 12

1-93 Log #184 NEC-P01 **Final Action: Accept in Principle**
(110.20)

NOTE: The following proposal consists of Comment 1-231 on Proposal 1-157 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. [Refer to Proposal 1-92 (Log #182)]

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Recommendation: Revise the proposed 110.20 to read as follows:

110.20 Enclosure Types. Enclosures (other than surrounding fences or walls) of all switchboards, panelboards, industrial control panels, meter sockets, motor control centers, enclosed switches, enclosed circuit breakers, transformers, and motor controllers, rated not over 600 volts nominal intended for such locations shall be marked with a Type number as shown in Table 110.20.

Table 110.20 provides the basis for selecting the above enclosures for use in specific locations other than hazardous (classified) locations. The enclosures are not intended to protect against conditions such as condensation, icing, corrosion, or contamination that may occur within the enclosure or enter via the conduit or unsealed openings. ~~These internal conditions shall require special consideration by the installer and user.~~

Equipment not identified for outdoor use and equipment identified only for indoor use, such as "dry locations", "Types 1 , 2, 5, 12, 12K, or 13 ," or "indoor use only" shall be protected against permanent damage from the weather during building construction.

Proposed Table 110.20 to be placed here

(Table 110.20 to be the same as existing 430.91, with the following modifications:

- Change title to "Enclosure Selection"
- Delete footnote 1
- Renumber footnote 2 as footnote 1)

Substantiation: Rationale for changes:

The proposal is a good start, but needs some additional modifications to make it acceptable as a general rule in the NEC. The following revisions are recommended:

1. The last sentence of the first paragraph is proposed to be deleted because it "requires" an action that is not specified or enforceable by the AHJ.
2. A new second paragraph is recommended that will limit the application of the table to specific equipment. Inserting the requirement into 110 without some limitation will result in it being applied to equipment that is not required to carry a Type number. There are many categories of equipment which use generic markings - Outdoor, Damp Locations, Rainproof, Raintight, Waterproof, etc. - instead of Types. All of the equipment included in this new paragraph is presently required by their respective product standards to be marked with Type numbers corresponding to the proposed table.
3. The words "other than surrounding fences and walls" are proposed because the NEC definition of enclosure includes the use of fences and walls, which are clearly not intended to be covered by the proposed table.
4. The third paragraph comes from Proposal 1-152. The revision is to make it more inclusive of other enclosures which need protection.
5. The table itself would need to be changed only in title and through deletion of footnote 1, which is now covered by the new second paragraph.

Panel Meeting Action: Accept in Principle

Panel Statement: The panel concludes that the action taken on Proposal 1-95 addresses the submitter's concerns.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-94 Log #185 NEC-P01 **Final Action: Accept in Principle**
(110.20 (New))

NOTE: The following proposal consists of Comment 1-233 on Proposal 1-157 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. [Refer to Proposal 1-92 (Log #182)]

Submitter: Timothy M. Croushore, Allegheny Power

Recommendation: The proposal should be accepted in principle. Locate the table as a new Table 3, with the same title and footnotes, in Chapter 9. To accomplish this, perform the following additional actions:

1. Delete the phrase "motor controller" from Footnote 1. Locate the first paragraph of text accepted in the ROP as 110.20 below the table in Chapter 9, editorially revised as follows, and then include the fine print note accepted by CMP11 in the action on Proposal 11-61 immediately thereafter.

Table 3 ~~110.20~~ provides the basis for selecting enclosures for ~~use~~ certain equipment for which specific protection from various environmental conditions is required in other than hazardous (classified) locations. The enclosures are not intended to protect against conditions such as condensation, icing, corrosion, or contamination that may occur within the enclosure or enter via the conduit or unsealed openings. ~~These internal conditions shall require special consideration by the installer and user.~~

FPN: The term raintight is typically used in conjunction with Enclosure Types 3, 3S, 3SX, 3X, 4, 4X, 6, 6P. The term rainproof is typically used in conjunction with Enclosure Type 3R, 3RX. The term watertight is typically used in conjunction with Enclosure Types 4, 4X, 6, 6P. The term driptight is typically used in conjunction with Enclosure Types 2, 5, 12, 12K, and 13. The term dusttight is typically used in conjunction with Enclosure Types 3, 3S, 3SX, 3X, 5, 12, 12K, 13.

2. Do not create section 110.20 as proposed. Delete the second paragraph of 110.11, as indicated in Proposal 1-152. Create a new 110.28 worded as follows:

110.28 Enclosure Types, Not Over 600 Volts, Nominal. Enclosures of all switchboards, panelboards, industrial control panels, meter sockets, motor control centers, enclosed switches, enclosed circuit breakers, transformers, motor controllers, and other equipment enclosures required to be identified as being suitable for the specific environmental conditions that apply at their location, shall be marked with a type number marked on the enclosure by their manufacturer in accordance with Table 3 in Chapter 9.

Equipment not identified for outdoor use and equipment identified only for indoor use, such as "dry locations", "Types 1, 2, 5, 12, 12K, or 13," or "indoor use only" shall be protected against permanent damage from the weather during building construction.

3. Revise 430.91 to read as follows: "Motor controller enclosures shall be suitable for the specific environmental conditions that apply at their location, as evidenced by an enclosure type number marked on the controller."

FPN: See Table 3 in Chapter 9 for standard enclosure types.

4. Delete Table 430.91.

5. Revise the "Notes to Tables" located after Chapter 9, Table 1 to read: "Notes to Tables 1, 4, 5, and 5A".

Substantiation: This proposal was forwarded to CMP-9 for information and/or comment. The task group responding is comprised of Fred Hartwell, Tim Croushore, Robert Osborne, Jim Carroll, and Hector de Vega.

CMP-9 agrees that making this table available for reference by other code articles is wise, however, CMP-9 also agrees with the comments in the voting that enclosure type designations are not appropriate for many instances of installed equipment. For example, there is no need to require 4 in. sq. boxes on a cinder block interior wall of a store to be marked NEMA 1 or the equivalent. The solution is to place the table in Chapter 9, with the operational text modified to say, "for which specific protection from various environmental conditions is required". This wording allows the various code making panels to decide whether to implicitly (or explicitly) reference the new table in the future. The fifth action suggested in this comment corrects an error in the present Chapter 9 table notes that will only be exacerbated by the inclusion of the new Table 2 in this cycle (Proposal 8-24a).

The present enclosures required to have this designation then go into Article 110 as provided in this comment. Note that this list does not mention surrounding walls or fences because of the wording in this comment that clarifies that Type numbers are to be marked by their manufacturer. The location in Article 110 suggested in this comment differs from the initial CMP-1 action because these Type numbers only apply at 600 Volts and below, and therefore the requirement must be located in Part II of the article. The last sentence of the corresponding paragraph in the ROP is proposed to be deleted because it "requires" an action that is not specified or enforceable by the AHJ.

The principal reason to place this table in Chapter 9 is that it is immune from the Chapter 5 modification provisions of 90.3. This will then allow the inclusion of NEMA 7, 8, and 9 enclosures in a future code cycle, providing a single location for all the enclosure types, which would be very useful for code users. In fact, this location could also include IEC ingress protection tables as well.

CMP-9 understands that this comment crosses panel jurisdictional boundaries and for that reason will require action by the TCC. CMP-9 has made every effort to keep the subjects of this comment within the scope of material that has had public review, in the hope that this can be completed in this cycle. In terms of public review, CMP-9 notes that the exact wording of Proposal 1-157 is to "move" the text and table from 430.91, and not to "copy" it from that location. However, CMP-9 also understands that this comment may introduce sufficient complexity and need for review by other panels that the comment and underlying proposal may require a report as "hold" as allowed by 4-4.6.2.2(c) of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept in Principle

Panel Statement: The panel concludes that the action taken on Proposal 1-95 addresses the submitter's concerns.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-95 Log #1980 NEC-P01 **Final Action: Accept**
(110.20 (New))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 11 for comment.

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Recommendation: Add new section as follows:

110.20 Enclosure Types. Enclosures (other than surrounding fences or walls) of switchboards, panelboards, industrial control panels, motor control centers, meter sockets, and motor controllers, rated not over 600 volts nominal and intended for such locations, shall be marked with an Enclosure Type number as shown in Table 110.20.

(Table 110.20 is shown on the following page)

Table 110.20 provides the basis for selecting the above enclosures for use in specific locations other than hazardous (classified) locations. The enclosures are not intended to protect against conditions such as condensation, icing, corrosion, or contamination that may occur within the enclosure or enter via the conduit or unsealed openings.

Substantiation: This proposal is made as a part of a suggestion for dealing with Comments that were HELD during the 2005 cycle. Four Comments (1-229, 1-230, 1-231, and 1-233) on Proposal 1-157 were held, with the Panel Statement on the other three referring back to the Panel Action and Statement on 1-231. This proposal builds upon Proposals 1-152 and 1-157 of the 2005 cycle, and is essentially the same as Comment 1-231.

Due to lack of any other guidance within the Code, Table 430.91 has been applied to enclosures for numerous kinds of equipment, even though it is stated as applying only to motor controller enclosures. This has resulted in considerable confusion. Bringing the requirements of 430.91 into a general application area of the Code and specifically stating the kinds of equipment to which they apply will add clarity. The equipment types in the list all are required, by existing industry standards, to use a Type number marking.

Companion proposals proposed deleting 430.91 and Table 430.91 and modifying 110.10.

Panel Meeting Action: Accept

Panel Statement: The panel recommends to the TCC that the action taken on proposal 1-95 be forwarded to CMP-11.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

MCMAHILL, L.: I concur with the panel action on this proposal; however, I have a minor concern: Will the manufacturers be up to speed with the marking requirement for Type 1 enclosures for the 2008 NEC? If not, then I encourage the panel to review the code language as the list of items requiring marking includes control panels, panelboards and meter sockets. Requiring these items to be marked as Type 1 enclosures and the manufacturers are unable to provide such equipment places an unreasonable burden on designers, installers and code enforcement officials! At the minimum, CMP-1 should request assurance from the manufactures and testing labs that they can meet this requirement; if not, it would behoove CMP-1 to remove Type 1 enclosures from the Table.

Table 110.20 Enclosure Selection

For Outdoor Use

1-96 Log #137 NEC-P01 **Final Action: Reject**
(110.21(A) (New))

Submitter: Donald Weis, Weis Electric Inc.
Recommendation: Add new text to read:
(A) All disconnects, panelboards, load centers, control panels, meter mains, any electrical enclosure that may require any adjustment, service, reset will be marked:
[Warning minimum 3 ft clearance required per NEC Code]

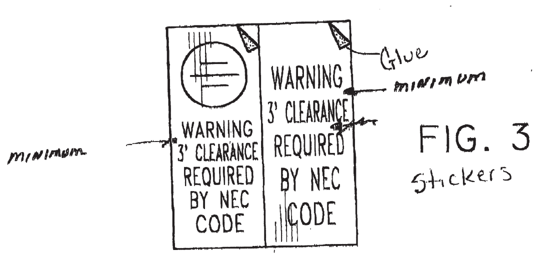

FIG. 3
Stickers

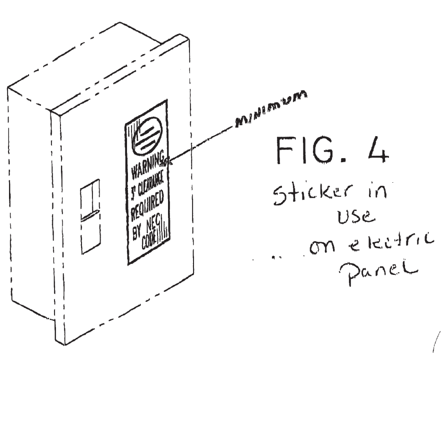

FIG. 4
sticker in use on electric panel

Substantiation: We have many problems, where homeowners or landscapers, will build a wall, fence, in front of a panel or control box or disconnect. I myself have been shocked, and had no where to jump back. When the person is informed of the 3 ft clearance code, they say, they wish they would have known this. This simple signage could prevent costly mistakes and even death.
Panel Meeting Action: Reject
Panel Statement: The panel concludes that such marking would be of little benefit or act as a deterrent to unqualified persons and that qualified persons should be aware of the required spaces about electrical equipment.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
HICKMAN, P.: We are voting negative to the panel action to reject proposal 1-96. Our explanation is as follows:
We do not necessarily agree with all of the panel statement. For example, we disagree that "…such marking would be of little benefit…." We feel the proposed marking would serve as a deterrent to unqualified persons and an important reminder to qualified persons. This point was further substantiated by Chairman Minnick during the deliberations on this issue. My notes indicate that he had personal experience as an inspector with having to require this type of marking in areas where there were repeated violations, and found these markings to be effective remedy.

1-97 Log #564 NEC-P01 **Final Action: Reject**
(110.22)

Submitter: Jeffrey A. Fecteau, City of Peoria, Arizona
Recommendation: Revise as follows:
Each disconnecting means shall be legibly marked to indicate its purpose unless located and arranged so the purpose is evident. The marking shall be of sufficient durability to withstand the environment involved.
Where circuit breakers or fuses are applied in compliance with the series combination ratings marked on the equipment by the manufacturer, the equipment enclosure(s) shall be legibly marked in the field to indicate the equipment has been applied with a series combination rating.
CAUTION – SERIES COMBINATION RATED SYSTEM ~~RATED~~ ——— AMPERES AVAILABLE
IDENTIFIED REPLACEMENT COMPONENTS REQUIRED.
SYSTEM RATED / K .
FPN No. 1: Amperes available is actual fault current at line side terminals (22,300) and System Rated is the series combination rating (10/65K)
FPN No. 2: See 240.86(B) for interrupting rating marking for end-use equipment.

When the series combination rated line side overcurrent device is remotely located from the load side circuit breaker(s), identification of the line side series combination rated device shall be legibly marked in the field to indicate the equipment has been applied with a series combination rating and shall indicate its series rating and replacement type.

CAUTION – SERIES COMBINATION RATED SYSTEM REPLACE WITH:

TYPE BREAKER

TYPE FUSE

Substantiation: By marking the actual fault current on the end use equipment, this would identify what the minimum AIC rating of the circuit breaker(s) that may be installed and considered fully rated.

By requiring the field marking at the line side device of a remotely located series rated combination, this will identify this device as part of a series rated combination. As currently allowed by the NEC, the series rated load side device may be compromised by replacement of the line side series rated device with a device not identified as compatible with the series rated combination.

This will also add clarity to 110.22 "...the equipment enclosure(s) shall be legibly marked in the field to indicate the equipment has been applied with a series combination rating." I would consider the term enclosure(s) with the (s) to mean where the line side overcurrent device is located remotely from the load side device; both enclosures shall be marked and readily visible. This clarity is needed to limit the confusion and promote consistency within the electrical inspection and installation communities.

Panel Meeting Action: Reject

Panel Statement: The actual fault current at an installation is a variable and must be determined with knowledge of the system parameters (including those of the utility supply system) at any given time. Marking of the equipment with "actual" fault current would be misleading.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

HICKMAN, P.: We are voting negative to the panel action to reject proposal 1-97. Our explanation is as follows:

This proposal should have been accepted. Accepting this Proposal will, in our opinion, greatly enhance electrical safety. We feel that the submitter's proposal is a reasonable recommendation. Knowledge of the available short circuit current at the equipment location is a key component of an installation for both fully rated and series rated systems alike. It makes good sense to have the marking indicate amperes available as the submitter suggests.

We strongly disagree with the Panel Statement. We feel that the statement "marking of the equipment with "actual" fault current would be misleading" is simply not true. Clearly, the actual fault current is not static. However, if the intent of this panel statement is to convey to those that who look to the written record for guidance of what a Code Panel meant when it wrote a rule, then this panel statement could be sending a message that evaluating series combination systems and determining motor contribution is not achievable. The industry simply cannot continue to hide behind this argument and not help protect inspectors, electricians, and others who count on this Code for the practical safeguarding of persons and property from hazards arising from the use of electricity.

We additionally offer the following as revised text to that of the submitter: Equipment shall be marked with the location, type, size or setting of the upstream overcurrent protective device.

MCMAHILL, L.: This proposal should have been accept in principle. For equipment with series combination ratings, I agree with the concept that marking the available short circuit current on the end use equipment will assist the NEC user in identifying the appropriate circuit-breaker(s) for installation and use. Whether the system is series or fully rated, knowing what the available short circuit current is at the equipment location is important in ensuring a safe and code compliant installation. Without this information, how does one meet the minimum code requirements of Sections 110.9 and 10? I disagree with the submitter's statement that Section 110.22 "As currently allowed by the NEC, the series rated load side device may be compromised by replacement of the line side series rated device with a device not identified as compatible with the series rated combination." Section 110.22 clearly requires that "... equipment enclosure(s) shall be legibly marked in the field to indicate the equipment has been applied with a series combination rating." Although I agree with the marking concept, I disagree with adding the rule to Section 110.22. Section 110.22 is specific to series combination ratings. A marking requirement for available short circuit current is appropriate for Section 110.9 – Interrupting Rating, and consideration should be given to Section 110.10 – Circuit Impedance and Other Characteristics. Both sections require this information to meet minimum code requirements. Most importantly, this information is necessary to determine that the circuit-protective devices will clear a fault without extensive damage to the electrical components of the circuit. I encourage CMP-1 to reconsider Proposal 1-59 to address the concerns of this proposal and this author. See my comments to Proposal 1-59 (Log 568), as they apply here too.

1-98 Log #1978 NEC-P01 **Final Action: Accept**
(110.22)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 10 for comment.

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Recommendation: In the following section, insert additional text as follows:

110.22 Identification of Disconnecting Means. Each disconnecting means shall be legibly marked to indicate its purpose unless located and arranged so the purpose is evident. The marking shall be of sufficient durability to withstand the environment involved.

Where circuit breakers or fuses are applied in compliance with series combination ratings selected under engineering supervision and marked on the equipment as directed by the engineer, the equipment enclosure(s) shall be legibly marked in the field to indicate the equipment has been applied with a series combination rating. The marking shall be readily visible and state the following:

CAUTION — ENGINEERED SERIES COMBINATION
SYSTEM RATED ________ AMPERES. IDENTIFIED
REPLACEMENT COMPONENTS REQUIRED.

FPN: See 240.86(A) for interrupting rating marking for end-use equipment.

Where circuit breakers or fuses are applied in compliance with the series combination ratings marked on the equipment by the manufacturer, the equipment enclosure(s) shall be legibly marked in the field to indicate the equipment has been applied with a series combination rating. The marking shall be readily visible and state the following:

CAUTION — SERIES COMBINATION SYSTEM
RATED ____ AMPERES. IDENTIFIED
REPLACEMENT COMPONENTS REQUIRED.

FPN: See 240.86(B) for interrupting rating marking for end-use equipment.

Substantiation: CMP 10 made a change in 240.86 in the 2005 NEC allowing Engineered Series Ratings. This change is to coordinate the requirements in 110.22 with that change. As currently worded, 110.22 does not require this cautionary marking if there is an engineered series rating.

Panel Meeting Action: Accept

Panel Statement: The panel recommends that the TCC forward this proposal to CMP-10 for comment.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-99 Log #691 NEC-P01 **Final Action: Reject**
(110.26)

Submitter: Timothy Schultheis, H.F.Lenz Company

Recommendation: Revise as follows:

110.26 Spaces About Electrical Equipment. Sufficient access and working space shall be provided and maintained about all electrical equipment to permit ready and safe operations and maintenance of such equipment. Enclosures housing electrical apparatus that are controlled by a lock(s) shall be considered accessible to qualified persons. Where the entrance has a personnel door(s), the door(s) shall open in the direction of egress, or while open, not interfering with working spaces .

Substantiation: Please see the diagrams that I have provided.

Note: Supporting Material is available for review at NFPA headquarters.

Panel Meeting Action: Reject

Panel Statement: Section 110.26 is a general statement regarding working spaces about electrical equipment. There is no mention in this section of an entrance, so the proposed language would be out of place in the paragraph. CMP-1 refers the submitter to NEC Section 110.26(C)(1) as it requires at least one entrance to working space. Additionally, the proposed language currently exists in Section 110.26(C)(2) for large equipment and repeating the text would cause confusion and conflict. CMP-1 appreciates the diagrams submitted and understands the concerns, but notes that the scenarios presented are work practice issues too. Adding specific requirements to all entrances to working spaces will not prevent poor work practices.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-100 Log #2934 NEC-P01 **Final Action: Reject**
(110.26)

Submitter: Philip Simmons, Simmons Electrical Services

Recommendation: Delete the last sentence of existing 110.26 as follows:

110.26 Spaces About Electrical Equipment. Sufficient access and working space shall be provided and maintained about all electric equipment to permit ready and safe operation and maintenance of such equipment. ~~Enclosures housing electrical apparatus that are controlled by lock and key shall be considered accessible to qualified persons.~~

Substantiation: This is a companion proposal to add the sentence proposed for deletion here to 230.92 and 240.24(B) where this rule should appropriately be located.

110.26 deals with access to working space about electrical equipment and does not apply to access to the equipment itself.

230.92 covers locked service overcurrent devices and requires additional overcurrent devices where the service disconnecting means is (are) locked. 240.24(B) requires that each occupant have ready access to all overcurrent devices protecting conductors supplying that occupancy. These sections need the sentence identified for deletion above to be added for improved organization of the Code.

Many locations come to mind where electrical equipment is locked to prevent unauthorized access. These include schools, colleges, health care facilities, airport terminals and office buildings that are open to the public. These buildings often have either panelboards with locking covers or electrical equipment located in locked rooms. Electrical inspectors recognize the security that is needed in these and other facilities. Locating this rule with the sections that cover locks on equipment will improve the usability of the Code.

Panel Meeting Action: Reject

Panel Statement: The panel concludes that it does no harm to retain the sentence in 110.26 whether similar language is added to Articles 230 and 240 or not.

Access to electrical equipment within enclosures as defined is of primary importance to the requirements in 110.26. The panel disagrees with the submitter's premise that the current requirements regarding enclosures housing electrical apparatus that are controlled by a lock(s) only apply to the equipment itself.

Proposals 1-45, 1-46, and 1-50, for the 1999 cycle to add a fine print note to the definition of accessible and readily accessible which would have basically addressed a locked door or room where a key in the possession of authorized personnel is still considered accessible or readily, led to public comment 1-253 that placed the current requirement in 110.26 in the 1999 NEC. The accepted added wording was made to clarify the fact that a locked electrical room door was not a Code violation.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

MCMAHILL, L.: The proposal should have been accepted as the submitter's substantiation justifies deletion of the text. I agree with the submitter that this sentence does not belong in this section and removing it will improve usability of the code. The panel statement notes that, "The submitter has not provided adequate technical substantiation that a problem exists." I believe the submitter has provided reasonable substantiation for the change. Section 110.26 addresses "Spaces About Electrical Equipment." A lock and key has nothing to do with these spaces. The sentence more appropriately belongs somewhere else in the code. At the minimum, CMP-1 should have accepted the proposed deletion of the sentence contingent on CMP-4 and 10's positive action on the submitter's companion proposals. CMP-1 should reconsider the action on this proposal.

1-101 Log #3082 NEC-P01 **Final Action: Reject**
(110.26)

Submitter: Michael A. Anthony, University of Michigan Business & Finance / Rep. Association of Higher Education Facilities Officers

Recommendation: Add text to read as follows:

110.26(D) (NEW) Emergency Illumination. The area around all service panels in non-dwelling unit occupancies 200 amperes and above shall be automatically illuminated upon loss of power. For a period of 90 minutes illumination levels shall be

(1) One footcandle (1-fc) along the floor to the established building emergency egress path.

(2) Two footcandles (2-fc) at all vertical surfaces where surface switchgear, permanent service directory, emergency transfer switches, or standby power switches are located.

Substantiation: During a forced outage this proposal will provide an illuminated egress path for the electrician who is working in the service equipment area without a flashlight. Electric service panels are not always installed along the 1-footcandle egress path required by the Life Safety Code for everyone else in the building. The 2 footcandle requirement matches the illumination levels required by the NESC for substations and will provide sufficient illumination of emergency and/or standby power apparatus that may be needed to be operated to start up the emergency and/or standby power systems. Emergency illumination for electricians should be intuitively understandable and should not be left to the building codes. Emergency illumination for electricians should be considered a general requirement for an electrical installation and not a special condition addressable in Article 700. While the per-service panel cost to provide such illumination is on the order of $1000 or less for both labor and materials in most parts of the US, the limitation of 200 amperes for non-dwelling unit occupancies has been selected to minimize the cost impact adoption of this proposal. The size or configuration may be modified by others in futhre code cycles. This proposal is a start in the right direction.

Panel Meeting Action: Reject

Panel Statement: The submitter has not provided adequate technical substantiation that a problem exists that would be solved by the proposal.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

ANTHONY, M.: That persons may need to enter, escape, or be rescued from an unlit service equipment location ought to be self-evident. I have no statistics that can be brought to bear upon this proposal but I know that the IBEW supported a similar proposal during the 2005 code cycle. That support was might have been at least partially based upon common sense recognition that electricians do not always carry flashlights and/or that building owners do not always provide illumination in service equipment areas that will work when the power goes out. Anecdotal evidence also suggests that non-electricians will go to service equipment areas during a power outage to diagnose a power problem. Common sense proposals based upon vast but un-compiled body anecdotes by industry professionals are not prohibited from being adopted into the NEC.

Emergency illumination requirements should not be a function of the many competing building codes any more than dedicated space above switchgear should be the function of a building code. Electrical industry professionals should require it for ourselves rather than depend upon other professionals in the building trades such as architects. Article 700 only tells you how to install an emergency lighting system once other codes make such lighting mandatory. Means of entry/escape/egress/rescue as articulated in the life safety and building codes do not contain provisions for emergency lighting for anything but general occupancies where larger numbers of people need to find their way out.

Electrical services are typically not on the escape/egress/rescue path. During an outage both the trained and the untrained would be fetching around in the dark unless the area was designed with lighting adequate for diagnosing; for example, transfer switch auto-manual mode, the odor of a fried solenoid or a loose wire on a starting battery. Arguably, lighting around service equipment during power outages is not emergency lighting at all but a concept closer to optional standby. A start would be the 1-2 foot requirement for a limited class of switchgear.

1-102 Log #3221 NEC-P01 **Final Action: Reject**
(110.26)

Submitter: Robert Carbone, Fischback & Moore Electric Inc.

Recommendation: Revise text to read:

110.26 Spaces About Electrical Equipment. Sufficient access and working space shall be provided and maintained about all electric equipment to permit ready and safe operation and maintenance of such equipment. Enclosures housing electrical apparatus that are controlled by a lock(s) shall be considered accessible to qualified persons. For the purpose of this section an enclosure is considered as an area enclosed by a fence or walls surrounding an installation to prevent personnel from accidentally contacting energized parts or to protect the equipment from physical damage.

(C ~~**) Entrance to Working Space**~~ **Access to Enclosures Containing Electrical Equipment.**

(1) Minimum Required. At least one entrance of sufficient area shall be provided to give access to working space about electrical equipment.

(2) Large Equipment. For equipment rated 1200 amperes or more that contains overcurrent devices, switching devices, or control devices, there shall be one entrance to the enclosure containing electrical equipment ~~required working space~~ not less than 610 mm (24 in.) wide and 2.0 m (6 1/2 ft) high at each end of the working space. Where the entrance has a personnel door(s), the door(s) shall open in the direction of egress and be equipped with panic bars, pressure plates, or other devices that are normally latched but open under simple pressure.

A single entrance to the required working space shall be permitted where either of the conditions in 110.26(C)(2)(a) or (C)(2)(b) is met.

(3) Service Equipment. Where service equipment is installed in an enclosure, personnel door(s) shall open in the direction of egress and be equipped with panic bars, pressure plates, or other devices that are normally latched but open under simple pressure.

Substantiation: As Safety Director for a large NECA contractor, I have had a number of inspectors express concern that the intent of the existing language is not necessarily clear even though the inspectors that I have spoken with agree that the present language in the 2005 NEC clearly requires panic hardware on doors of electrical rooms to allow workers to quickly exit the room by leaning against the panic hardware rather than fumbling for a door knob. There seems to be some question as to how far away the doors need to be from the equipment before the doors would not need panic hardware.

Discussions with inspectors and fellow safety professionals agreed that the distance where doors that open out and have panic hardware is definitely more that the working distance required by the code. How far away would the doors need to be before they would not need to open out and have panic hardware? Agreement was reached that it would not be reasonable to expect doors 1,000 feet away to have panic hardware. So the distance is somewhere between greater than code required working distance and 1,000 feet.

Presentations given at IAEI meetings and in articles in their magazine, articles by Square D in various trade publications, and at seminars that I have attended make it clear that the hazard workers face extends well beyond the code required working distance. As a matter of fact, testing done by IEEE shows a dark cloud containing massive amounts of toxic vapors that would make it unlikely that a worker could find a doorknob, let alone operate it. The arc ball and toxic cloud clearly extend well beyond code required working distance and would necessitate a door to have panic hardware wherever that door is located. In addition Dupont's Nomex safety wheel requires workers to wear a switching hood to do voltage testing in 480 volt equipment. It would be extremely difficult for a worker to find and operate a doorknob. It makes perfect sense why you wrote the code requiring panic hardware on doors and for them to open out.

Presenters at seminars I attended also indicated that reported electrical injury to workers has occurred well beyond 10 feet. I am sure that people writing these rules have seen this testing and work for companies that have done this testing and could support my position as I know their companies have been part of this testing and have written about and use this information in their training.

Although I have a great deal of experience and have attended a number of seminars and presentations on the electrical hazards workers are exposed to, I know you cannot take my word for it. I know you need proof. I have found Square D's website to be an extremely helpful resource for information associated with these hazards and am providing copies of some of that information as evidence of the hazard. Although I am submitting these publications in their entirety, I will try to point you to a number of quotes. All submitted information is submitted for consideration in its entirety as support of this change.

In the "Arc Flash Overview" paper, it is reported that "five to ten arc flash explosions occur in electrical equipment every day in the United States...". In the section "An Arc Flash Defined" in the provided June 2003 EC&M article by George Gregory of Square D (document number 0613NA0301) titled "Preventing Arc Flash Incidents in the Workplace", Mr. Gregory states that "... an enormous amount of concentrated radiant energy explodes outward from electrical equipment...that can damage their eyesight, and a superheated ball of gas that can severely burn a worker's body...". An example of an explosion and worker wearing protection including a flash hood is shown in Square D's publication "Engineering Services, Power Systems Engineering, Arc Flash Analysys" (order number 0180HO0302). In the publication "Arc Flash: Understanding The Need For Increased Electrical Safety" (order number 0613BR0301) it is reported that "arc flash incidents typically occur in applications above 120V...". Also note the "side view" of an equipment rack during an arc flash explosion" shown in this same publication. Under the "Potential Equipment Damage" heading, note that "...temperatures of the arcing event can typically range form 5,000 degrees Fahrenheit and up...vaporizing the copper and steel components." In the Data Bulletin (0100DB0402) provided, it is reported that "...an "arc flash"...can result in significant damage to equipment or worse, injury or death to workers exposed to the fault." Again, all submitted information is submitted for consideration in its entirety.

I do not necessarily consider myself a code expert. The changes I offer above are the result of discussions, help, and advice from a number of coworkers who were extremely helpful in trying to get the code wording right. I was advised that the concept for panic hardware in this section was based on the concept for doors for transformer vaults. That is the basis for the change of wording. At first it did not make sense to talk about the enclosure. I, perhaps like most, thought of a box when I thought of an enclosure. When I was reminded to look at the definitions it made sense. I also saw that all of the existing definition was not appropriate in this section. That is the reason for making a definition only for this section. Then, mirroring the words for the transformer vault doors to make them work in this section. I see that the rules for high voltage equipment also may not be clear so I submit that the same change be made in 110.33. In addition, rules for service equipment are added as that concept has not been addressed and the hazards are at least as great certainly at least as great as those for other types of equipment.

In summary, it is clear that the present language in the code requires doors to open out and have panic hardware. Because of that, it is clear that people involved in writing this rule already clearly understand the reasons why this rule is important to protect workers in electric rooms. Therefore, it is not my intent to change the rule to have electrical room doors open out and have panic hardware. It is important in my position as a safety professional for a large NECA contractor to support rules that will help improve worker safety. Having rules that are clear to inspectors, engineers, and contractors can only further that goal.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: No substantiation was presented by the submitter for defining an enclosure for the purpose of the subject section and it is unclear how this revision would clarify existing Code requirements. Electrical equipment is not always installed in a separate and specific enclosure or room. It is impractical and overly restrictive to require that all personnel doors, installed in entrances on the way to enclosures, as defined, containing electrical equipment that are subject to the space requirements of 110.26, to open in the direction of egress as a general requirement for all occupancies including dwellings; plus the need for panic hardware for all such installed personnel doors was not substantiated. The panel concludes that the subject matter of 110.26 best remains to be concerned with working space.

The additional text being proposed to Section 110.26 is redundant and unnecessary, as it is basically repeating the Article 100 definition of an "enclosure." Changing the title of 110.26(C) to "Access to Enclosures Containing Electrical Equipment" is unnecessary, as this section is addressing the working space. Working space is separate and distinct from any enclosures containing electrical equipment.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-103 Log #3273 NEC-P01 **Final Action: Reject**
(110.26)

Submitter: Leonard F. Devine, Jr., Palm Beach County Plan Review

Recommendation: Add text to read as follows:

110.26 Spaces about Electrical Equipment. Sufficient access and working space shall be provided and maintained about all electrical equipment, ***including metering devices*** to permit ready and safe operation and maintenance of such equipment. Enclosures housing electrical apparatus that are controlled by a lock(s) shall be considered accessible to qualified persons.

Substantiation: It is not unusual to find shrubbery, large and small in front of meter cans on the exterior of a single family residence, and other buildings which can pose a hazard to someone wanting to gain access to the meter can for inspection. Recently, here in Palm Beach County Florida, in the process of making an inspection of a meter can that was not supposed to be energized, an electrical inspector received a shock while lying in the shrubbery to open the meter can. This can be extremely dangerous, especially if the shrubbery is wet, which is the case in this part of the country.

Panel Meeting Action: Reject

Panel Statement: All electrical equipment requires sufficient access and working space per 110.26. This includes metering devices. This is an enforcement issue. CMP-1 refers the submitter to the NEC Style Manual, Section 3.3.4.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-104 Log #3274 NEC-P01 **Final Action: Reject**
(110.26(2))

Submitter: Leonard F. Devine, Jr., Palm Beach County Plan Review

Recommendation: Add text to read as follows:

110.26(2) Width of Working Space. The width of the working space about electrical equipment ***including metering devices*** , shall be the width of the equipment of 750 mm (30 in.), whichever is greater. In all cases, the work space shall permit at least a 90 degree opening of the equipment doors or hinged panels.

Substantiation: It is not unusual to find shrubbery, large and small in front of meter cans on the exterior of a single family residence, and other buildings which poses a hazard when someone wants to gain access to the meter can for inspection. Recently, here in Palm Beach County Florida, in the process of making an inspection of a meter can that was not supposed to be energized, an electrical inspector received a shock while lying in the shrubbery to open the meter can. This can be extremely dangerous, especially if the shrubbery is wet, which is the case in this part of the country much of the time.

Panel Meeting Action: Reject

Panel Statement: All electrical equipment requires sufficient access and working space per 110.26. This includes metering devices. This is an enforcement issue. CMP-1 refers the submitter to the NEC Style Manual, Section 3.3.4.

The panel concluded that 110.26(A)(2) is the section intended by the submitter.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-105 Log #384 NEC-P01 **Final Action: Reject**
(110.26(A))

Submitter: Bryan P. Holland, Holland Electric

Recommendation: Revise text to read as follows:

Working space for ~~equipment~~ <u>switchboards, panelboards, industrial control panels, meter socket enclosures, and motor control centers</u> operating at 600 volts, nominal, or less to ground ~~and likely to require examination, adjustments, servicing, or maintenance while energized~~ shall comply with the dimensions of 110.26(A)(1), (A)(2), and (A)(3) or as required or permitted elsewhere in this code.

Substantiation: It should be made clear exactly what equipment requires working space. This list mirrors the equipment identified in 110.16. The words "likely to require" should be removed. Per Table 3.2.1 of NEC style manual, "likely" is an unenforceable term. The words "while energized" should be removed. I believe the intent of this section is to provide adequate working space for the safety of the worker and anyone using the equipment whether or not the equipment is energized. One could argue equipment is never "required" to be energized.

Panel Meeting Action: Reject

Panel Statement: Creating a specific list of equipment that require working space is too limiting. As proposed, there is no requirement that working space be provided for equipment such as circuit breakers, fusible switches, control panels, control assemblies and industrial control assemblies, to name a few. Removing "likely to require examination, adjustment, servicing, or

maintenance while energized " is over-restrictive. CMP-1 understands the submitter's concerns about the use of vague or unenforceable language. The NEC Style Manual, however, recognizes and prefers the use of the term "likely" over the term "liable." As an example, "likely to become energized" means "failure of insulation on." Although the NEC Style Manual discourages the use of the term "likely", there are instances where the use is appropriate.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-106 Log #441 NEC-P01 **Final Action: Reject**
(110.26(A))

Submitter: W. Creighton Schwan, Hayward, CA
Recommendation: Add to (A), starting in line 6:
<u>The grade, floor or platform of the working space shall be horizontal, flat, and level, except where necessarily sloped to drain.</u>
Substantiation: In the 2004 ROP, included in the Panel Comment for similar proposals 1-201, 1-213, and 1-214 appeared this sentence: "If deemed necessary, the qualified person working on the equipment can create a flat and level workspace."
Is it still the opinion of the Panel that a factory worker attempting to operate a disconnect because his mate is caught in the machinery should be required to stop to construct a flat and level place for himself to stand in order to operate the disconnect?
For operation or maintenance, a flat level place to stand in front of the equipment is a basic safety requirement.
Panel Meeting Action: Reject
Panel Statement: The proposed language is too restrictive. For example, it could impact the installation of a disconnect means on the roof of a dwelling unit. The submitter has presented a scenario that is difficult to respond to without further information and detail. Generally, equipment that requires immediate disconnection (i.e., emergency) is specifically noted in the NEC, such as Articles 514 and 680. Additionally, Section 110.26(A) is applicable to the depth, width, and height of the working space.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-107 Log #3606 NEC-P01 **Final Action: Reject**
(110.26(A))

Submitter: Robert Alexander, Laguna Hills, CA
Recommendation: Revise as follows:
110.26 (A) Working Space. Working space for equipment operating at 600 volts, nominal, or less to ground and that requires examination, adjustment, servicing, operation or maintenance of exposed live parts shall comply with the dimensions of 110.26(A)(1), (2), and (3) or as required or permitted for specific installations elsewhere in this Code. Where work is for the operation or inspection of dead-front equipment only or access is required to work on de-energized equipment, a minimum horizontal depth in the direction of the work of 762 mm (30 in.) shall be provided.
Substantiation: The current wording is still too vague that an AHJ "judgment call" is required often well after a design is completed. The Proposed wording gives clear direction to the Design Professional.
Panel Meeting Action: Reject
Panel Statement: No "working space" relative to safety is required for equipment that will not be worked on while energized; insufficient technical substantiation is provided for this change.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-108 Log #1734 NEC-P01 **Final Action: Reject**
(Table 110.26(A)(1))

Submitter: Craig Schumann, Yorkville, IL
Recommendation: Table 110.26(A)(1) should be changed to reflect approach boundaries specified in NFPA 70E-2004, Table 130.2(c).
Substantiation: Table 110.26 (A)(1) is not consistent with NFPA 70E-2004, Table 130.2(c). For example, a limited approach boundary for 240 volts, exposed fixed circuit part is 3 ft 6 in. For condition of Table 110.26(A)(1), the minimum clear distance can be 3 ft, thereby, creating a condition where the requirements imposed by NFPA 70E-2004 could not be met.
Panel Meeting Action: Reject
Panel Statement: The submitter does not provide specific locations for the recommended changes or proposed text, as required by 4-3.3(b) and 4-3.3(c) of the Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-109 Log #2485 NEC-P01 **Final Action: Reject**
(110.26(A)(1))

Submitter: Michael J. Hittel, General Motors Corporation
Recommendation: Revise text to read as follows:
In 110.26(A)(1), there are three conditions considered. I would recommend the addition of language in Condition 1 that considers equipment designed with IP-2X (finger safe equipment). The specific language would be as follows added to the existing Condition 1 text as follows:
Condition 1 - Exposed live parts on one side of the working space and no live or grounded parts on the other side of the working space, ~~or~~ exposed live parts on both sides of the working space that are effectively guarded by insulating materials <u>, or effectively insulated parts on one side of the working space and effectively grounded parts on the other side of the working space.</u>
Substantiation: This specific type of installation is not considered in current language. In my opinion, an installation utilizing IP-2X components is a variation of Condition 1 as currently established in NEC 2005. This additional language would clarify the intent of Condition 1.
Panel Meeting Action: Reject
Panel Statement: The panel disagrees that providing finger safe equipment should be used as a basis to reduce the required working space. Ultimately the user is opening the panel to gain access to some level of adjustment or component that may expose himself or herself to an electrical hazard.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
FLOYD, II, H.: IP20 designs provide an inherently safer design that reduces the risk of inadvertent contact having the risk of electric shock or initiation of an arc flash. The NEC should acknowledge that the application of IP20 shrouded terminals provide a safer work environment for both qualified as well as unqualified personnel. These types of designs are addressed in Annexes of NFPA 79, and are widely used outside of the US to reduce the risk of inadvertent personnel contact in industrial control panels and other equipment. I feel the panel would better understand the condition addressed in this proposal if the submitter would provide comment on this action and include a diagram of the conditions currently addressed in this section, as well as the condition he has identified.
Comment on Affirmative:
BARRIOS, JR., L.: While I support the submitter's concept of including provisions for IP-20 "finger-safe" terminals into the NEC, the proposed change introduces additional confusion and an undefined and unenforceable term "effectively insulated" to Condition 1. I disagree with the panel statement that providing finger safe equipment should not be used as a basis for reducing the required working space. Finger safe terminals are inherently guarded against accidental contact and are restricted in size to only permit the entry of small tools and test leads to bare live parts.

1-110 Log #3074 NEC-P01 **Final Action: Accept**
(Table 110.26(A)(1))

Submitter: Sukanta Sengupta, North Brunswick, NJ
Recommendation: Revise as follows:

(Proposal 1-110 (Log #3074))

Table 110.26(A)(1) Working Spaces

Nominal Voltage to Ground	Minimum Clear Distance		
	Condition 1	Condition 2	Condition 2
0–150	~~900~~ <u>914</u> mm (3 ft)	~~900~~ <u>914</u> mm (3 ft)	~~900~~ <u>914</u> mm (3 ft)
151–600	~~900~~ <u>914</u> mm (3 ft)	~~1.1~~ 1.07 m (3 ft 6 in.)	~~1.2~~ 1.22 m (4 ft)

Substantiation: A true conversion is essential for applicationof the code in a global business environment where metric system is the only acceptable system.
Panel Meeting Action: Accept
Panel Statement: The panel concludes that the submitter's soft conversion is appropriate in accordance with 90.9(C)(4).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-111 Log #442 NEC-P01 **Final Action: Reject**
(110.26(A)(1)(a))

Submitter: W. Creighton Schwan, Hayward, CA
Recommendation: In the second sentence, replace "nonelectrical" with "de-energized" as in the 1999 Code so as to read:
Where rear access is required to work on ~~nonelectrical~~ de-energized parts on the back of enclosed equipment, a minimum horizontal working space of 762 mm (30 in.) shall be provided.
Substantiation: In the 2001 ROP, Proposal 1-252(a), CMP-1 made this change for "clarity". An exceedingly weak supporting comment for such a costly change, considering the cost per square foot for new construction.
From the 1965 when there was NO requirement for working space, to the 1996 NEC when 30 inches was introduced for de-energized parts, there were no reported injuries, no property damage. A good safety record.
Also, see 110.34(A) Exception, where for high voltage the 30 inch space is prescribed for de-energized parts. If it is safe for high voltage, it must be safe for low voltage.
Panel Meeting Action: Reject
Panel Statement: The submitter did not provide adequate substantiation to support this change from non electrical equipment to electrical equipment. In addition, the panel concludes that de-energized equipment is not as electrically safe as non electrical equipment.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
LABRAKE, JR., N.: This proposal should be accepted. "Deenergized" is the proper industry recognized term for use in this Code section which parallels the similar requirements for over 600 volts in 110.34(A).
MCMAHILL, L.: This proposal should have been accepted. As the submitter noted, the original change for clarity appears weak to say the least. Presently, use of the word "nonelectrical' is unclear and the section may be more restrictive depending on how the authority having jurisdiction enforces the requirement - the intent is unclear. As a note, the section is specific to dead-front assemblies. Dead front being "Without live parts exposed to a person on the operating side of the equipment." Although it may be assumed by the code reader, there is nothing in the section to indicate that dead-front assemblies are required to be enclosed – an assembly could be open frame equipment. This is important to note because as worded, the rear access requirement is specific to enclosed equipment. Therefore, changing the word "de-energized" to "non-electrical" changed the intent of the section without justification. In addition, de-energized is understood as the term "energized" is defined in the code; "non-electrical" is not defined in the code. Further, the panel statement indicates that the submitter's proposal is to change "non electrical equipment to electrical equipment" and "that de-energized equipment is not as electrically safe as non electrical equipment." These statements appear to be incorrect. Again, the text should revert to "de-energized."
Comment on Affirmative:
BARRIOS, JR., L.: In accordance with industry-accepted electrical safety practices, de-energized electrical equipment is assumed energized until verified with test equipment; thus, voltage verification of even de-energized parts may require the same depth of working space associated with Conditions 1, 2 or 3 in Table 110.26(A)(1).
The submitter is correct that there appears to be an unsubstantiated difference in working clearances required in the back of LV and MV equipment. 100.26(A)(1)(a) requires a minimum 30" horizontal clearance to work on non-electrical parts accessible from the back of enclosed LV equipment, while the Exception in 110.34(A) requires a minimum 30" horizontal clearance to work on de-energized parts accessible from the back of MV enclosed equipment. The ACC concludes that the corrective measure to illeminate the disparity is to change "de-energized parts" in the 110.34(A) Exception to "non-electrical parts" instead of what is being proposed by the submitter.

1-112 Log #3075 NEC-P01 **Final Action: Accept**
(110.26(A)(2))

Submitter: Sukanta Sengupta, North Brunswick, NJ
Recommendation: Revise as follows:
762 ~~750~~ mm (30 in.)
Substantiation: This conversion is consistent with the one shown in 110.26(A)(1)(a).
Panel Meeting Action: Accept
Panel Statement: The panel concludes that the submitter's soft conversion is appropriate in accordance with 90.9(C)(4).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-113 Log #1429 NEC-P01 **Final Action: Reject**
(110.26(A)(3))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise Section 110.26(A)(3) as follows:
(3) Height of Working Space. The work space shall be clear and extend from the grade, floor, or platform to the height required by 110.26(E). Stairs or stair treads shall not be permitted as the grade, floor, or platform as referred to in this section . Within the height requirements of this section, other equipment that is associated with the electrical installation and is located above or below the electrical equipment shall be permitted to extend not more than 150 mm (6 in.) beyond the front of the electrical equipment.
Substantiation: While I am mindful of the challenges that CMP-1 has faced in the past with adding stairs to this section, there still is an apparent need and obvious reasons for Code language that addresses the issue. Floors, platforms, and grade are all defined in the building code, and so is stairs. However, stairs are not mentioned in this section. Stairs in the standing area of the required working space create a hazard, and are not a good practice, yet are not currently restricted. Stairs in the standing area of the required working space create a hazard, and are not a good practice, yet are not currently restricted. Stairs in the standing area in front of the electrical equipment covered by this Code rule impacts not only installers, maintenance persons, and inspectors, but also occupants. Having to reset breakers or change fuses in the dark is challenging enough let alone putting stairs into the equation. Safety is a concern here, both during installation and after. Code enforcement jurisdictions have restricted these installations, but have never had a clear Code rule to back up the call. Another meaningful reason to revise this section as proposed is to promote more uniform and consistent application of the requirements in 240.24(A). 240.24(A) requires overcurrent devices to be readily accessible and be installed so that the center of the grip of the operating handle of the switch or circuit breaker, when in its highest position, is not more than 2.0 m (6 ft 7 in.) above the floor or working platform unless any of the provisions in 240.24(A)(1) through (4) apply. When stairs are the standing area in front of equipment, where do the measurements get taken from when applying the requirements of 240.24(A) to the installation? The conflict between these sections can lead to inconsistent enforcement of the height requirements for overcurrent devices. The proposed changes to this section are not intended to impact equipment requiring working space for equipment that is installed on roofs that include various slopes, or grade that is less than level, understanding very well the challenges that Code enforcement officials and industry would face with such a restriction. I have no deaths or injuries to include in this substantiation, but feel that the changes are necessary for those reasons and the other reasons provided in the statement of the problem and substantiation.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 1-115.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
HICKMAN, P.: We are voting negative to the panel action to reject proposal 1-113. This proposal should have been accepted. See our explanation of negative on Proposal 1-115.

1-114 Log #1639 NEC-P01 **Final Action: Reject**
(110.26(A)(3) (New))

Submitter: L. Keith Lofland, International Association of Electrical Inspectors
Recommendation: Add new text as follows:
(3) Height of Working Space. The work space shall be clear and extend from the grade, floor, or platform to the height required by 110.26(E). Within the height requirements of this section, other equipment that is associated with the electrical installation and is located above or below the electrical equipment shall be permitted to extend not more than 150 mm (6 in.) beyond the front of the electrical equipment. For the purpose of this section, interior stairways do not conform to the grade, floor, or platform .
Substantiation: Floors, platforms, and grade are all defined in the building code, and so is stairs. However, stairways are not mentioned in this section. Local Authorities Having Jurisdictions (AHJs) have prohibited panelboards from being installed in a stairway, but it seems that no clear Code language was present in 110.26 to support this stance. Stairways in the standing area of the required working space create a hazard, and are not a good practice, yet are not currently restricted.
240.24(A) requires overcurrent devices to be readily accessible and be installed so that the center of the grip of the operating handle of the switch or circuit breaker, when in its highest position, is not more than 2.0 m (6 ft 7 in.) above the floor or working platform unless any of the provisions in 240.24(A)(1) through (4) apply. When a panelboard is installed in a stairway, where does one take this required measurements from to meet the requirements of 240.24(A)? Which stairway tread do you measure from?
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 1-115.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

HICKMAN, P.: We are voting negative to the panel action to reject proposal 1-114. This proposal should have been accepted. See our explanation of negative on Proposal 1-115.

(110.26(A)(3))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise Section 110.26(A)(3) as follows:

(3) Height of Working Space. The work space shall be clear and extend from the grade, floor, or platform to the height required by 110.26(E). Stairs or stair treads shall not be permitted as the grade, floor, or platform as referred to in this section. Within the height requirements of this section, other equipment that is associated with the electrical installation and is located above or below the electrical equipment shall be permitted to extend not more than 150 mm (6 in.) beyond the front of the electrical equipment.

Substantiation: While I am mindful of the challenges that CMP-1 has faced in the past with adding stairs to this section, there still is an apparent need and obvious reasons for Code language that addresses the issue. Floors, platforms, and grade are all defined in the building code, and so is stairs. However, stairs are not mentioned in this section. Stairs in the standing area of the required working space create a hazard, and are not a good practice, yet are not currently restricted. Stairs in the standing area in front of the electrical equipment covered by this Code rule impacts not only installers, maintenance persons, and inspectors, but also occupants. Safety is a concern here, both during installation and after. Code enforcement jurisdictions have restricted these installations, but have never had a clear Code rule to back up the call. Another meaningful reason to revise this section as proposed is to promote more uniform and consistent application of the requirements in Section 240.24(A). Section 240.24(A) requires overcurrent devices to be readily accessible and be installed so that the center of the grip of the operating handle of the switch or circuit breaker, when in its highest position, is not more than 2.0 m (6 ft 7 in.) above the floor or working platform unless any of the provisions in 240.24(A)(1) through (4) apply. When stairs are the standing area in front of equipment, where do the measurements get taken from when applying the requirements of Section 240.24(A) to the installation? The conflict between these sections can lead to inconsistent enforcement of the height requirements for overcurrent devices. The proposed changes to this section are not intended to impact equipment requiring working space for equipment that is installed on roofs that include various slopes, or grade that is less than level, understanding very well the challenges that Code enforcement officials and industry would face with such a restriction. I have no deaths or injuries to include in this substantiation, but feel that the changes are necessary for those reasons and the other reasons provided in the statement of the problem and substantiation. Stairs used by unqualified persons while live parts are exposed during maintenance, troubleshooting increases the concern about exposure to a shock and arc flash hazards. It makes it more difficult to barricade the area as required by other standards. (See the graphic illustrations I have provided).

Note: Supporting Material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject
Panel Statement: The proposed requirement is restrictive and unnecessary. Qualified persons routinely work from various surface areas and conditions that may be within the workspace. If necessary, the qualified person working on the equipment can create a flat and level workspace. Generally, the height measurement would be from the lowest grade, floor, or platform surface. CMP-1 concludes that the proposal does not contain a clear statement of the problem or substantiation for the change. See the Regulations Governing Committee Projects, sections 4.3.3(b) and (d).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

HICKMAN, P.: We are voting negative to the panel action to reject proposal 1-115.
Our explanation is as follows:
This proposal should have been accepted. We disagree that the proposed recommendation is restrictive and unnecessary. A worker that is concentrating on the task at hand could easily be subject to an unnecessary fall or tripping hazard. We recognize that there may be cases where working from an uneven work surface may be necessary. It does not seem prudent to condone it or design it in to an installation.

1-116 Log #2358 NEC-P01 **Final Action: Reject**
(110.26(A)(3))

Submitter: Noel Williams, Herriman, UT
Recommendation: Revise the existing text to read:

"...to the height required by 110.26(E) or to the top of the equipment where a minimum height is not specified by 110.26(E)."

Substantiation: 110.26(E) specifies headroom only for "service equipment, switchboards, panelboards, and motor control centers." As currently worded, other equipment such as industrial control panels will have only the width and depth of the work space defined and no height so that no work space will actually be required. This is true regardless of the likelihood that the equipment will be serviced while energized. This proposal will also help to resolve questions about headroom for equipment such as disconnect switches installed in other spaces for environmental air.
Panel Meeting Action: Reject
Panel Statement: The submitter's intent is met by the reference to 110.26(E) height requirement in 110.26(A)(3).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-117 Log #3078 NEC-P01 **Final Action: Accept**
(110.26(A)(3))

TCC Action: The Technical Correlating Committee directs the panel to reconsider their action relative to the necessity of a soft conversion. This action will be considered by the panel as a public comment.
Submitter: Sukanta Sengupta, North Brunswick, NJ
Recommendation: Revise as follows:

152 ~~150~~ mm (6 in.)

Substantiation: This conversion is consistent with other NFPA standards.
Panel Meeting Action: Accept
Panel Statement: The panel concludes that the submitter's soft conversion is appropriate in accordance with 90.9(C)(4).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-118 Log #3530 NEC-P01 **Final Action: Reject**
(110.26(A)(4) (New))

Submitter: Bradley Butters, City of Reynoldsburg, Ohio IAEI / Rep. City of Reynoldsburg, Ohio IAEI
Recommendation: Add new (4) to read as follows:

(4) An adhesive sign not less than 3 in. x 5 in. shall be affixed to the front of all residential panels with nominal voltage to ground of 150 volts or less, that defines the depth, width, and height of working space. Sticker shall be OSHA yellow background with black letters and a thin black boarder.

Substantiation: It is my experience that most homeowners and many remodelers in our area have no awareness of the NEC rules regarding working space about the panel. We have a chronic problem of unsafe obstructions and flammable materials being placed within the limits of the panel clear work space. Electricians tend to be very tolerant of such customers misdeeds and go ahead and work a panel hot under severely compromised work space conditions, putting themselves at great risk of arc-flash and arc-blast exposure. A simple sticker on the front of residential panels that defines work space dimensions would greatly help this situation.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject
Panel Statement: Section 110.26(A) is applicable to the working space dimensions only. Requiring specific information related to signage is not necessary for this section. CMP-1 also discourages working on the equipment noted while energized and prefers not to endorse such practice based on signage being added to the equipment.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-119 Log #2169 NEC-P01 **Final Action: Accept in Part**
(110.26(C))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read as follows:

(C) Entrance to and Egress From Working Space.

(1) Minimum Required. At least one entrance of sufficient area shall be provided to give access to and egress from working space about electrical equipment.

(2) Large Equipment. For equipment rated 1200 amperes or more that contains overcurrent devices, switching devices, or control devices, there shall be one entrance to and egress from the required working space not less than 610 mm (24 in.) wide and 2.0 (6 1/2 ft) high at each end of the working space. ~~Where entrance has a personnel door(s), the doors(s) shall open in the direction of egress and be equipped with panic bars, pressure plates, or other devices that are normally latched but open under simple pressure.~~

A single entrance to and egress from the required working space shall be permitted where either of the conditions in 110.26(C)(2)(a) or (b) is met.

(a) Unobstructed Exit. Where the location permits a continuous and unobstructed way of exit travel, a single entrance to the working space shall be permitted.

(b) Extra Working Space. Where the depth of the working space is twice that required by 110.26(A)(1), a single entrance shall be permitted. It shall be located so that the distance from the equipment to the nearest edge of the entrance is not less than the minimum clear distance specified in Table 110.26(A)(1) for equipment operating at that voltage and in that condition.

Where the working space or room designated for electrical equipment has a personnel door(s), the door(s) shall open in the direction of egress and be equipped with panic hardware, pressure plates, or other devices that open under simple pressure.

Substantiation: CMP-1 has made several major improvements in this section in the past two cycles. This proposal is an effort to revise the existing requirements and attempt to improve the organization of the existing requirements and add clarity. This is a worker safety issue that must be addressed. It seems that more emphasis has been placed on entrance to the working space than the egress from the working space. It seems that it is equally important to be sure that electrical workers can escape the working space or room when an explosion occurs. The proposed revisions would help accomplish this. As the Code is currently worded in this section, the rules allow access but fall short of requiring adequate means to egress the area.

Panel Meeting Action: Accept in Part

The panel accepts only the submitter's recommendation to insert "and egress from" in three places.

Panel Statement: The panel concludes that it is not appropriate to move the requirement from 110.26(C)(2). In addition, the panel does not necessarily agree with all of the submitter's substantiation. The panel further concludes that the technical substantiation provided does not justify this part of the proposal.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-120 Log #2937 NEC-P01 **Final Action: Accept in Part**
(110.26(C))

Submitter: Philip Simmons, Simmons Electrical Services

Recommendation: Revise 110.26(C) as follows:

(C) Entrance to <u>and Egress From</u> Working Space.

(1) Minimum Required. At least one entrance of sufficient area shall be provided to give access to <u>and egress from the</u> working space about electrical equipment.

(2) Large Equipment. For equipment rated 1200 amperes or more that contains overcurrent devices, switching devices, or control devices, there shall be one entrance to the required working space not less than 610 mm (24 in.) wide and 2.0 m (6 1/2 ft) high at each end of the working space. ~~Where the entrance has a personnel door(s), the door(s) shall open in the direction of egress and be equipped with panic bars, pressure plates, or other devices that are normally latched but open under simple pressure.~~

A single entrance to <u>and egress from</u> the required working space shall be permitted where either of the conditions in 110.26(C)(2)(a) or (b) is met.

(a) Unobstructed Exit. Where the location permits a continuous and unobstructed way of exit travel, a single entrance to the working space shall be permitted.

(b) Extra Working Space. Where the depth of the working space is twice that required by 110.26(A)(1), a single entrance shall be permitted. It shall be located so that the distance from the equipment to the nearest edge of the entrance is not less than the minimum clear distance specified in Table 110.26(A)(1) for equipment operating at that voltage and in that condition.

<u>Where the room designated for electrical equipment has a personnel door(s) that provides access to the working space, the door(s) shall open in the direction of egress and be equipped with panic bars, pressure plates, or other devices that are normally latched but open under simple pressure.</u>

Substantiation: This proposal does not intend to introduce new requirements but to improve the organization of the existing requirements and add clarity.

The concept of providing egress from the working space in case of a blowup is contained in the existing language. Adding the language at appropriate locations seems appropriate.

It seems clear the Panel does not intend to require panic hardware for the working space itself but for the doors providing access to and egress from the room housing the large electrical equipment. The working space is a cube of specified width, depth and height. However, electrical equipment is most often located in rooms that are larger than the required working space. For example, a 1200-ampere, 480-volt switchboard that is 12-ft wide and 92 inches high requires a working space cube that is 12 ft by 92 in. by 3 ft for a Condition 1 installation. If this equipment is located in a room that is 20 ft by 40 ft, where are the doors with panic hardware required, at the working space or for the doors to and from the room? (And, we recognize this section does not require doors, a function of building codes, but requires panic hardware if doors are present.) Hopefully, adding the concept of electrical rooms designated for large electrical equipment (often shared with mechanical equipment) will add clarity to the requirement for panic hardware.

The requirement for panic hardware for doors for rooms that house large equipment must not be lost as the reasons for adding the rule – providing a way for electricians who may have burned hands and thus cannot grip and turn a door knob – is as valid as ever. It seems that locating the rule at the end of the section will add clarity.

It is not necessary for this section to specify the size of the personnel door to the room housing large electrical equipment as the number of doors and door sizes are a function of building codes.

Panel Meeting Action: Accept in Part

Panel Statement: See panel action and statement on Proposal 1-119.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-121 Log #3544 NEC-P01 **Final Action: Accept in Principle**
(110.26(C))

Submitter: Redwood Kardon, Code Check Institute

Recommendation: Add "Egress From" to the title of this article to read:

"Entrance to and <u>Egress From</u> Working Space."

Substantiation: The primary safety concern underlying subsection (C)(2) is to assure an unobstructed escape path for the qualified person should a catastrophic electrical fault occur. By including the word egress, the safety concern of this article would be better emphasized.

Panel Meeting Action: Accept in Principle

Add "and Egress from" in the title.

Panel Statement: See panel action and statement on Proposal 1-119. In addition, the panel does not necessarily agree with all of the submitter's substantiation.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-122 Log #120 NEC-P01 **Final Action: Reject**
(110.26(C)(2))

Submitter: Charlie Helmick, AVO Training Institute, Inc.

Recommendation: Revise as follows:

110.26(C)(2) Large Equipment. For equipment rated ~~1200 amperes or more~~ <u>Hazard/Risk Category 3 or higher</u> that contains overcurrent devices...

<u>FPN No. 1: See 110.16 for equipment requirements to be labeled by arc-flash hazard.</u>

<u>FPN No. 2: NFPA 70E-2004, Standard for Electrical Safety in the Workplace. Section 130.3(A) Flash Hazard Analysis shall be done in order to protect personnel.</u>

Substantiation: The hazard for the electrical worker in the room is not related or derived from the size of the equipment by ampacity. It is, however, directly related to the amount of incident energy available in the room. The incident energy values are derived from the amount of available fault current and clearing times on the equipment. The engineering studies that are accomplished based on the electrical one-line should make Hazard/Risk category information available to the planners for the building and the inspector that looks at the plans. If a worker attempts egress during an incident of some kind, the Flash-Hazard Boundary will be far more relevant than the ampacity size of the equipment.

Panel Meeting Action: Reject

Panel Statement: Hazard/Risk Category 3 is undefined in the NEC, and there is no definition proposed by the submitter. Proposed FPN No. 1 is not relevant to the application of the requirements to this section. Proposed FPN No. 2 contains mandatory language and is not in conformance with 3.1.3 of the NEC Style Manual.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

HICKMAN, P.: We are voting negative to the panel action to reject proposal 1-122. Our explanation is as follows:

This proposal should have been accepted in part. We agree with the submitter's recommendation to delete 1200 amps or more. Substantiation indicates that "the hazard for the electrical worker in the room is not related or derived from the size of the equipment by ampacity. It is, however, directly related to the amount of incident energy available in the room."

That substantiation is validated by substantiation submitted by Mr. Ray Jones, current chairman of the NFPA 70E Technical Committee. For example, the submitted IEEE paper entitled Staged Tests increase Awareness of Arc-Flash Hazards in Electrical Equipment (Paper number PCIC 97-34), which was published in the IEEE Transactions on Industry Applications in 1998, is substantiation for proposal 1-125. In Table I on page 3 of this paper, Test # 4 clearly indicates that Size 1 combination starter protected by a 640 amp power circuit breaker did not open when a load side phase to ground fault was created. Furthermore, the results indicated in Tables III and IV on page 5 clearly indicate that the resulting flash and blast from this test on a 640 amp device with a relatively modest 22,000 amps available was quite extensive. Clearly, equipment much smaller than 6 feet and 1200 amps can be extremely dangerous and would warrant the protection of 110.26 (C)(2). Therefore, we propose the following revised text: For equipment rated 600 amperes or more that contains overcurrent devices, switching devices, or control devices, there shall be one entrance to the required working space not less than 610 mm (24 in.) wide and 2.0 m (6 1/ 2 ft) high at each end of the working space. Where the entrance has a personnel door(s), the door(s) shall open in the direction of egress and be equipped with panic bars, pressure plates, or other devices that are normally latched but open under simple pressure.

1-123 Log #1198 NEC-P01 **Final Action: Accept**
(110.26(C)(2))

Submitter: Lanny G. McMahill, Phoenix, AZ
Recommendation: Revise second sentence:
Where the entrance has a personnel door(s) <u>that is less than 1.8 m (6 ft) from the working space,</u> the door(s) shall open in the direction of egress and be equipped with panic bars, pressure plates, or other devices that are normally latched but open under simple pressure.
Substantiation: The new language clarifies that the personnel door(s) requirement applies to the working space. The 1.8 m (6 ft) distance is reasonable and provides for safe egress from the area. Currently, some are applying the requirement where the doors are a considerable distance from the working space.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-124 Log #2001 NEC-P01 **Final Action: Reject**
(110.26(C)(2))

Submitter: David Sroka, Turner Falls, MA
Recommendation: Add a new paragraph to read:
"A suitable, listed, approved, portable fire extinguisher shall be located at each door to a large equipment working space."
Substantiation: Safety improvement. This idea comes from the National Electrical Safety Code and the IEEE Guide for Substation Fire Protection.
Panel Meeting Action: Reject
Panel Statement: The panel concludes that requirements for fire extinguishers are outside the scope of the NEC.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-125 Log #2291 NEC-P01 **Final Action: Reject**
(110.26(C)(2))

Submitter: Ray A. Jones, ESCS, Inc.
Recommendation: Revise text to read as follows:
~~(2) Large Equipment For equipment rated 1200 amperes or more that contains overcurrent devices, switching devices, or control devices, there shall be one entrance to the required working space not less than 610 mm (24 in.) wide and 2.0 m 6 1/2 ft) high at each end of the working space. Where the entrance has a personnel door(s) shall open in the direction of egress and be equipped with panic bars, pressure plates, or other devices that are normally latched but open under simple pressure.~~
<u>(2) Enclosed spaces containing electrical equipment having sufficient energy to cause blast and thermal injury.</u>
<u>Working spaces in enclosed rooms or fenced enclosures that contain electrical equipment with the energy capacity of at least 5000 ampere-seconds shall be provided with at least one door at each end of the equipment for emergency egress. The door shall be no less than 760 mm (30 in.) wide and 2.0 m (6 1/2 ft) high at each end of the working space. The door shall open out in the direction of egress and be equipped with panic bars, pressure plates, or other devices that normally are latched but open under simple pressure. The door(s) shall be clear and unobstructed. The minimum rating of 5000 ampere-seconds shall be determined as the product of the clearing time of the overcurrent device and the available short-circuit current.</u>
<u>FPN: Equipment with an energy capacity of 5000 ampere-seconds is equivalent to equipment with a flash protection boundary of 4 ft, as defined in NFPA 70E-2004, Article 130.3(A).</u>
Substantiation: The potential for injury from thermal energy and blast has been explored since the early 1960s, as illustrated by the current language in 110.26 (C)(2). An IEEE paper entitled Staged Tests increase Awareness of Arc-Flash Hazards in Electrical Equipment (Paper number PCIC 97-34), which was published in the IEEE Transactions on Industry Applications in 1998, illustrates the hazard (see Supplemental information). Tables III and IV of the referenced paper indicates that a significant amount of pressure and thermal energy is released in an arcing fault in equipment with limited available shout-circuit current. Table V in the referenced paper identifies the amount of let-through current and energy. All tests conducted in the series of staged tests were performed on equipment with current-carrying capacity much less than the 1200 ampere rating specified in the test recommended to be deleted. Code panel 1 is to be congratulated for its early efforts to provide an emergency escape path. However, tests and measurements published in the papers referenced by PCIC 97-34 indicate that current-carrying capacity has little, if any, bearing on the ability of a circuit to deliver injurious thermal or blast energy in event of an arcing fault.
NFPA 70E-2004 suggests a minimum protective boundary of 4 ft, based on the ability of the circuit/equipment to deliver injurious thermal energy to workers. Therefore, workers closer than 4 ft are exposed to injury should an arcing fault occur. An arcing fault will result in a very loud explosion and copious amounts of smoke and other products of combustion. Workers who might be present will have difficulty seeing and may be disoriented. Rapid egress is necessary to ensure that workers are afforded the best opportunity to escape from the area containing the potentially toxic smoke and products of combustion. The photographs included with this proposal illustrate a typical arcing fault and the resulting debris, smoke, and other products of combustion.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The panel rejects the concept of basing exiting requirements on incident energy levels. This section primarily deals with working space for large equipment rather than arc flash boundaries.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
FLOYD, II, H.: The physical size of equipment and parts should be used in determining the size of doors, but the magnitude of an arc flash event should be used for the basis of determining emergency egress requirements. The panel could have accepted this in principle and incorporate both methods. I would encourage the submitter to consider providing a comment incorporating these two methods to address both equipment and material handling access as well as emergency egress due to an arcing fault event.
HICKMAN, P.: We are voting negative to the panel action to reject proposal 1-125. Our explanation is as follows:
This proposal should have been accepted in principle. We agree with the submitter's recommendations to base the requirement on electrical equipment with the energy capacity of at least 5000 ampere-seconds and to delete "rated 1200 amps or more". Knowledge of the location, type, size or setting of the upstream overcurrent protective device is a crucial piece in determination of the application of this section. Mr. Ray Jones, submitter of this proposal and current chairman of the NFPA 70E Technical Committee submitted IEEE paper entitled Staged Tests increase Awareness of Arc-Flash Hazards in Electrical Equipment (Paper number PCIC 97-34), which was published in the IEEE Transactions on Industry Applications in 1998, as substantiation for this proposal. In Table I on page 3 of this paper, Test # 4 clearly indicates that Size 1 combination starter protected by a 640 amp power circuit breaker did not open when a load side phase to ground fault was created. Furthermore, the results indicated in Tables III and IV on page 5 clearly indicate that the resulting flash and blast from this test on a 640 amp device with a relatively modest 22,000 amps available was quite extensive. Clearly, equipment much smaller than 6 feet and 1200 amps can be extremely dangerous and would warrant the protection of 110.26 (C)(2).We propose two alternatives to comply with 110.26(C)(2). The balance of 110.26 is not included in the following alternatives:
110.26(C)(2) Equipment. For equipment rated 600 amperes or more that contains overcurrent devices, switching devices, or control devices, there shall be one entrance to the required working space not less than 610 mm (24 in.) wide and 2.0 m (6 1/ 2 ft) high at each end of the working space. Where the entrance has a personnel door(s), the door(s) shall open in the direction of egress and be equipped with panic bars, pressure plates, or other devices that are normally latched but open under simple pressure.
110.26(C)(2) Equipment. For equipment with the energy capacity of at least 5000 ampere-seconds that contains overcurrent devices, switching devices, or control devices, there shall be one entrance to the required working space not less than 610 mm (24 in.) wide and 2.0 m (6 1/ 2 ft) high at each end of the working space. Where the entrance has a personnel door(s), the door(s) shall open in the direction of egress and be equipped with panic bars, pressure plates, or other devices that are normally latched but open under simple pressure.
Comment on Affirmative:
BARRIOS, JR., L.: While I agree with the submitter that the number of entrances to a working space should not be based purely on a 1200A equipment rating (refer to my negative ballot comment on Comment 1-247 of the 2005 NEC ROC Report), the submitter's proposal has gaps that should be addressed. What "available short-circuit current" should be used in the energy calculation – three-phase, single-phase, symmetrical, asymmetrical? At what point should this "available short-circuit current" be calculated – line side of the main breaker or first disconnecting means, load side of the main breaker or first disconnecting means? Are the requirements less if arc-resistance switchgear or similar means to limit incident energy exposure are used?

1-126 Log #2881 NEC-P01 **Final Action: Reject**
(110.26(C)(2))

Submitter: James J. Rogers, Bay State Inspectional Agency
Recommendation: After the word "permitted" and prior to the word "where" insert the following:
"only in existing buildings when the addition of a second entrance is structurally impracticable and..."
Substantiation: I have examined several electrical rooms that have experienced catastrophic failures. Should one of these failures occur in a section of switchgear that is between the worker and the door there would no way of existing without suffering severe injury even if there was unobstructed travel or double working space.
Panel Meeting Action: Reject
Panel Statement: The proposed requirement is overly restrictive. The words "structurally impracticable" are vague and unenforceable. See the NEC Style Manual, Section 3.3.4.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
HICKMAN, P.: We are voting negative to the panel action. Our explanation is as follows:
This proposal should have been accepted in principle. We agree with the concept of the submitter whereby the relief offered by the alternatives for a single entrance should only be permitted for existing buildings when the addition of a second entrance is structurally impracticable.

1-127 Log #3487 NEC-P01 **Final Action: Accept**
(110.26(C)(2))

Submitter: Alan Manche, Square D Co.
Recommendation: Reinstate110.26(C)2 as found in the 2002 NEC. Revise NEC 110.26(C)2 with the additions (underlined) and deletions (strike through) as shown. The entire text of 110.26(C)2 is shown for clarity, but only those changes shown underlined or with a strike through are part of this proposal.
NEC 110.26(C) Entrance to Working Space.
(2) Large Equipment. For equipment rated 1200 amperes or more <u>and over 1.8 m (6 ft) wide</u> that contains overcurrent devices, switching devices, or control devices, there shall be one entrance to the required working space not less than 610 mm (24 in.) wide and 2.0 m (6 1/2 ft) high at each end of the working space.
Substantiation: The removal of the 6 ft limitation has a significant impact on equipment installation and the required working space. The panel accepted the substantiation from two comments supporting that the issue is related to arc-flash which in turn is driven from the size / rating of the equipment. The rating of the equipment is NOT the driving factor if the panel is using arc-flash to justify this change. NFPA 70E addresses arc-flash protection and no where in that document will you find that the rating of the equipment plays such a role. Mr. Barrios accurately provided an explanation in his negative vote in the 2005 ROC.
"BARRIOS: The panel action should have been to "reject" rather than "accept". During the proposal stage, CMP1 rejected Proposal 1-217 by an 11 to 1 vote, and yet reversed its decision during the comment stage based on no additional technical substantiation. Physical size of the equipment should continue to be criteria used to determine the amount of entrances needed for safe egress from an electrical equipment room or building. It is the physical size and placement of the equipment inside a room which creates barriers and obstructions for safe egress, not the equipments continuous current rating alone.
In his substantiation, the submitter indicated that the size of the arc blast is directly related to the electrical rating of the equipment. This is not necessarily true. The arc blast, or available incident energy at a location, is based on the voltage, available short circuit current, separation between the electrodes (phases), the distance a worker's body parts are from the arcing fault, and the duration of the fault. The continuous current rating of the equipment is not a direct factor in determining the available incident energy or level of the arc blast. Equipment and systems with 1200A or larger continuous current ratings can be designed to expose workers to less arc blast than lower-rated equipment. Likewise, equipment with smaller than 1200A continuous current ratings can pose a more severe arc blast hazard than equipment rated 1200A and above.
Therefore, this is not solely an arc blast issue. The issue is providing an unobstructed path for persons to exit the area not only under equipment fault conditions, but also including fire and other events requiring emergency egress. The 6-foot wide equipment criteria has been in the NEC since 1978 (increased from 4-foot prior to that). Providing unobstructed paths is based on the physical size and location of the equipment and the size of the area in which the equipment is installed. It should not be based solely on the continuous current rating of the equipment."
This area of the NEC addresses an egress issue and equipment width does plays a role but how wide is necessary? Did the committee intend to impose the additional provision on a 36 inch panelboard rated 1200A with a single 800A main? How about a 24 inch wide circuit breaker enclosure rated for a range of 600 to 1200A circuit breakers which has an 800A breaker? The present requirement does impose these additional working space restrictions unnecessarily on such an installation. When you consider disconnects, that are rate 1000A or more, they are required in NEC 230 and NEC 225 to be protected by GFPE which enhances the protection of the system from an arcing fault to ground.
I would encourage the panel to reconsider Mr. Barrios comments as I support the fact that egress from the working space is important and the width of the equipment does plays a role. A comment also shared a concerned that designers are going to avoid the requirements due to the 6ft limit. If the designer is driven by this requirement, he simply drops below the 1200A rating and places two enclosures on the wall making the travel distance further for the egress. Did the reduction in amperage compensate for the additional egress travel distance? Did the energy level for arc-flash change? I urge the committee to reinstate the 6ft width as found in the 2002 NEC as it has a long standing history and absolutely no documentation was presented during the 2005 NEC development process that the existence of the 6ft rule had a safety impact.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
HICKMAN, P.: We are voting negative to the panel action. Our explanation is as follows:
This proposal should have been rejected to maintain the direction the panel took on this issue last cycle. Not only should we not reinstate 6' back into the requirement, we feel that the 1200 amp value should be deleted as recommended in proposals 1-122 and 1-125. Substantiation submitted by Mr. Ray Jones, current chairman of the NFPA 70E Technical Committee clearly substantiates the continued elimination of 6' from this requirement. The submitted IEEE paper entitled Staged Tests increase Awareness of Arc-Flash Hazards in Electrical Equipment (Paper number PCIC 97-34), which was published in the IEEE Transactions on Industry Applications in 1998, is substantiation for proposal 1-125. Test # 4 of Table I on page 3 of this paper shows a Size 1 combination starter with a 30 amp fused switch and protected by a 640 amp power circuit breaker that did not open when a load side phase to ground fault was created. Clearly, a Size 1 starter is smaller than 6'. Furthermore, the results indicated in Tables III and IV on page 5 clearly indicate that the resulting flash and blast from this test on a 640 amp device with a relatively modest 22,000 amps available was quite extensive in spite of being smaller than 6'. Clearly, equipment much smaller than 6 feet can be extremely dangerous and would warrant the protection afforded by the requirements of 110.26 (C)(2).
MCMAHILL, L.: The removal of the 6-foot requirement was made for several reasons. Foremost, the concern for the work person and potential arc flash hazards. Providing sufficient working space for the work person is of utmost importance. Unfortunately, for enforcement purposes it is perhaps the most difficult to attain minimum code compliance. Another reason for the removal of the 6-foot rule is that the size of equipment has changed. Fifteen or twenty years ago, the 6-foot requirement made sense. Equipment enclosures were larger and typically required that a bigger working space area be provided to access and work on the equipment. The bigger space naturally made for a safer work environment. In addition, the hazards were not as great years ago. Available fault current values at the line terminals of the equipment were substantially less and the equipment interior was much larger. Today, available fault current values exceeding 100K are common at the equipment line terminals and interior space is much smaller. Additionally, more equipment and components are being packed into these interior spaces. Monitoring devices, sensors, filters and control devices are the norm today. Switchboard sections that contained only one or two switches several years ago now contain three, four or more. The physical size of the switching devices, such as fusible switches and circuit breakers, have been reduced substantially yet they contain more features and functions. Another consideration for the removal of the 6-foot requirement was how it is being interpreted and enforced. Does the rule apply to individual sections or to a complete assembly? It is easy to circumvent the rule by installing individual sections. Individual sections when placed end to end can easily exceed 6-foot. In addition, sections and assemblies that are less than 6-foot are installed on housekeeping pads with space provided for future sections to be added. Does the 6-foot rule apply to the future sections or only to what is installed? There are other reasons for removal of the 6-foot requirement, but foremost it was made for consideration and safety of the work person. Naturally, from a code enforcement standpoint the 6-foot rule is a difficult call to make - especially when the design of a project is complete and the size of the equipment is bigger than what was shown on the plans. Although it may be selfish on this author's part, removal of the 6-foot rule eliminates headaches for enforcement persons and provides for consistency and safety! I encourage the panel to reconsider the action on this proposal.

1-128 Log #398 NEC-P01 **Final Action: Reject**
(110.26(D))

Submitter: Charles Polson, Linwood, NC
Recommendation: Existing Text:
110.26 Spaces About Electrical Equipment
(D) Illumination. Illumination shall be provided for all working spaces about service equipment, switchboards, panelboards, or motor control centers installed indoors. Additional lighting outlets shall not be required where the work space is illuminated by an adjacent light source or permitted by 210.70(A)(1), Exception No. 1, for switched receptacles. In electrical equipment rooms, the illumination shall not be controlled by automatic means only.
210.70(A)(1)Exception No. 1: In other than kitchens and bathrooms, one or more receptacles controlled by a wall switch shall be permitted in lieu of lighting outlets.
(G) Disconnecting Means. In indoor locations, other than dwellings and associated accessory structures, fluorescent luminaires (fixtures) that utilize double-ended lamps and contain ballast(s) that can be serviced in place or ballasted luminaires that are supplied from multiwire branch circuits and contain ballast(s) that can be serviced in place shall have a disconnecting means either internal or external to each luminaire (fixture), to disconnect simultaneously from the source of supply all conductors of the ballast, including the grounded conductor if any. The line side terminals of the disconnecting means shall be guarded. The disconnecting means shall be located so as to be accessible to qualified persons before servicing or maintaining the ballast. This requirement shall become effective January 1, 2008.

Add text to read as follows:

110.26 Spaces About Electrical Equipment.

(D) Illumination. Illumination shall be provided for all working spaces about service equipment, switchboards, panelboards, or motor control centers installed indoors. Additional lighting outlets shall not be required where the work space is illuminated by an adjacent light source in other than kitchens and bathrooms, one or more receptacles controlled by a wall switch shall be permitted in lieu of lighting outlets. In electrical equipment rooms, the illumination shall not be controlled by automatic means only.

Substantiation: NEC Manual of Style states: 2.6 Exceptions, 2.6.1 Placement and Order. Exceptions shall immediately follow the main rule to which they apply. Where exceptions are made to items within a numbered list, the exception shall clearly indicate the items within the list to which it applies.

410.30 Cord-Connected Lampholders and Luminaires (Fixtures). (C) Electric-Discharge Luminaires (Fixtures). (1) A listed luminaire (fixture) or a listed assembly shall be permitted to be cord connected if the following conditions apply: (1) The luminaire (fixture) is located directly below the outlet or busway. (2) The flexible cord meets all the following: (a) Is visible for its entire length outside the luminare (fixture) (b) Is not subject to strain or physical damage (c) Is terminated in a grounding-type attachment lug cap or busway plug, or is a part of a listed assembly incorporating a manufactured wiring system connector in accordance with 604.6(C), or has a luminaire (fixture) assembly with a strain relief and canopy.

The NEC is clear in 410.30 that a fixture can be cord and plug connected. The problem arises when a cord and plug fixture is being switched at a panel. This seems to be noncompliant by 110.26 referring to the exception in 210.70(A)(1) for dwelling units.

Panel Meeting Action: Reject

Panel Statement: The substantiation does not support the reason for the proposal. There is no exception to the requirement for illumination in 110.26(D). There is also an inappropriate proposal to 410.30 included. Section 210.70(A)(1), Exception No., applies only to dwelling units. Disconnecting means for fluorescent luminaires are not related to the subject of illumination for working spaces about electrical equipment.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-129 Log #656 NEC-P01 **Final Action: Reject**
(110.26(D))

Submitter: Leon Przybyla, Southern Arizona Chapter IAEI

Recommendation: Revise text to read as follows:

Illuminations shall be provided for all working spaces about service equipment, switchboards, panelboards, or motor control centers installed ~~indoors.~~

Substantiation: On outdoor equipment being serviced at night sometimes the only light source is a flashlight.

Panel Meeting Action: Reject

Panel Statement: CMP-1 sees no technical substantiation to remove the word “indoors”, and as proposed the sentence appears to be incomplete. See the NFPA Regulations Governing Committee Projects, Section 4.3.3(d). The panel concludes that it is too restrictive to assume that all outdoor equipment needs to be serviced at night.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

HICKMAN, P.: While we agree that adequate technical substantiation has not been provided, we feel that the submitter has raised an issue that warrants attention and encourages the submitter to present substantiation in a Comment in the ROC. We join the submitter in wondering why equipment only requires illumination when installed indoors.

1-130 Log #694 NEC-P01 **Final Action: Reject**
(110.26(D))

Submitter: Rick Hollander, City of Tucson-Development Services

Recommendation: Revise as follows:

Illumination shall be provided for all working spaces about service equipment, switchboards, panelboards, or motor control centers installed ~~indoors~~ .

Substantiation: On outdoor equipment being serviced at night, sometimes the only light source is a flashlight.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 1-129.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

1-131 Log #3478 NEC-P01 **Final Action: Reject**
(110.26(D))

Submitter: Richard F. Van Wert, Middle Department Inspection Agency / Rep. Benjamin Franklin Chapter IAEI

Recommendation: Revise text to read:

110.26(D) Illumination. Illumination shall be provided for all working spaces about service equipment, switchboards, panelboards, HVAC equipment, or motor control centers installed indoors or outdoors on roofs .

Substantiation: This article needs rewording because lighting source is needed in these areas. Similar proposals were submitted for 210.70(C) and 110.34(D).

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 1-129. In addition, no substantiation has been provided to extend the coverage of 110.26(D) to HVAC equipment.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

HICKMAN, P.: While we agree that adequate technical substantiation has not been provided, we feel that the submitter has raised an issue that warrants attention and encourages the submitter to present substantiation in a Comment in the ROC. We join the submitter in wondering why equipment only requires illumination when installed indoors.

1-132 Log #2195 NEC-P01 **Final Action: Reject**
(110.26(D)(1) (New))

Submitter: David Williams, Lansing, MI

Recommendation: Add new text to read:

110.26(D)(1) Illumination Emergency Power. In the event of power supply failure, an emergency system shall automatically illuminate the electrical equipment room. The emergency power system shall provide power for a duration of not less than 90 minutes and shall consist of storage batteries, unit equipment or an onsite generator. This requirement is for buildings that are required to have emergency egress illumination by the building code.

Substantiation: The safety of the electrician has been overlooked in the past. Emergency lighting needs to be installed in the areas where electrical panels are located for egress of someone that may have been injured from an electrocution. The building code has not addressed this location and I think this is an area that needs to be addressed.

Panel Meeting Action: Reject

Panel Statement: See panel action and substantiation on Proposal 1-101.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-133 Log #393 NEC-P01 **Final Action: Reject**
(110.26(E))

Submitter: Eric Jason Ginn, Davidson County Community College

Recommendation: Revise text to read as follows:

110.26(E) Headroom. The minimum headroom of working spaces about service equipment, switchboards, panelboards, or motor control centers shall be 2.0 m (6 1/2 ft). Where the electrical equipment exceeds 2.0 m (6 1/2 ft) in height, the minimum headroom shall not be less than the height of the equipment.

Exception: In existing dwelling units, existing or replacement service equipment or panelboards that do not exceed 200 amperes shall be permitted in spaces where the headroom is less than 2.0 m (6 1/2 ft).

Substantiation: As written 110.26(E) exception could and has been thought to mean that any existing dwelling no matter how old or new could have a service change and the new panel not have to comply to the six foot six in. rule as outlined in 110.26(E).

As worded, a new house the day after receiving a Certificate of Occupancy could have the service panel moved to a place such as a crawl space or under a deck.

There needs to be a more concise meaning as to the intent of the exception.

Panel Meeting Action: Reject

Panel Statement: The submitter’s substantiation does not include evidence that non complying equipment has been or is likely to be installed in existing residences.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-134 Log #2140 NEC-P01 **Final Action: Reject**
(110.26(E) Exception)

Submitter: Tom Pernal, Tom Pernal Electrical Seminars LLC

Recommendation: Revise text to read:

Existing text from 70-2005:

Exception: In existing dwelling units, service equipment or panelboards that do not exceed 200 amperes shall be permitted in spaces where the headroom is less than 2.0 m (6 1/2 ft).

(X) Proposal of additional text:

Exception: In existing dwelling units, service equipment or panelboards that do not exceed 200 amperes shall be permitted in spaces where the headroom is less than 2.0 m (6 1/2 ft) <u>, but not less than 1.2 m (4 ft)</u> .

Substantiation: In many years of experience in the electrical field, I have been faced with the aforementioned situation a number of times. I have had to work on service equipment in locations that required a sitting position at best. Under arc-blast conditions it would be difficult, if not impossible, to get out of harms way. Personally, I would opt out of locating a service panel in such a location, but anything below 48 in. is not only difficult to work on, but extremely hazardous for service personnel. In addition, in the event of an emergency, service equipment in a location such as this would be inaccessible to many occupants, especially those with disabilities.

Note: Supporting Material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The substantiation suggests that it may be necessary to work on dwelling unit service equipment or panelboards while energized. No justification has been presented to further limit the headroom in existing installations. A dimension as suggested by the submitter was never used as a minimum benchmark for safety.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-135 Log #873 NEC-P01 **Final Action: Accept**

(110.26(F))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panels 9 and 19 for comment.

Submitter: Noel Williams, Noel Williams Consulting

Recommendation: Delete the term "distribution boards" to read as follows:

"All switchboards, panelboards, ~~distribution boards~~ , and motor control centers...".

Substantiation: Switchboards, panel boards, and motor control centers are defined terms. Distribution board is not. The NEMA publication titled "Panelboards and Distribution Boards" makes no distinction. A distribution board is simply a type of panelboard, so "distribution board" is redundant and possibly misleading.

Panel Meeting Action: Accept

Panel Statement: The panel recommends that the TCC forward this Proposal to CMP-9 and CMP-19 for comment.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-136 Log #2141 NEC-P01 **Final Action: Reject**

(110.26(F)(1)(c))

Submitter: David Sroka, Turner Falls, MA

Recommendation: Add a third sentence to this paragraph to read:

A floor drain sized for the sprinkler head(s) shall be installed.

Substantiation: Standing water is a safety hazard to personnel. Also, the chances of wiring being shorted out (floor mounted equipment and boxes) with standing water are greater.

Panel Meeting Action: Reject

Panel Statement: The proposal is outside the scope of the NEC.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-137 Log #657 NEC-P01 **Final Action: Reject**

(110.26(F)(2))

Submitter: Leon Przybyla, Southern Arizona Chapter IAEI

Recommendation: Add a new subsection 110.26(F)(2)(a).

110.26(F)(2)(a) Dedicated Electrical Space. The space equal to the width and depth of the equipment and extending from the floor to a height of 1.8 m (6 ft) above the equipment, shall be dedicated to the electrical installation. No piping, or other equipment foreign to the electrical installation shall be located in this zone.

Substantiation: Some of the same conditions that apply to an indoor installation in regard to piping and other equipment (Ex: Water piping, Gas Piping, Hose Bibs, Phone and Cable boxes) pose the same problems outdoors. Access may be impeded by these foreign objects in the area.

Note: Supporting Material is available for review at NFPA headquarters.

Panel Meeting Action: Reject

Panel Statement: The substantiation is inadequate to require the specified dedicated space for outdoor equipment installations. Access is required, and any impediment is not in conformance with Section 110.26(F).

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

HICKMAN, P.: While we agree that adequate technical substantiation has not been provided, we feel that the submitter has raised an issue that warrants attention and encourages the submitter to present substantiation in a Comment in the ROC. We join the submitter in wondering why equipment only requires dedicated space when installed indoors.

1-138 Log #663 NEC-P01 **Final Action: Reject**

1-139 Log #2678 NEC-P01 **Final Action: Reject**

(110.27)

Submitter: Dorothy Kellogg, American Chemistry Council

Recommendation: Revise text to read:

110.27 Guarding of Live Parts

(A) Live Parts Guarded Against Accidental Contact <u>by Unqualified Persons.</u> Except as elsewhere required or permitted by this Code, live parts of electrical equipment operating at 50 volts or more shall be guarded against accidental contact by approved enclosures or by any of the following means:

(1) By location in a room, vault, or similar enclosure that is accessible only to qualified persons.

(2) By suitable permanent, substantial partitions or screens arranged so that only qualified persons have access to the space within reach of the live parts. Any openings in such partitions or screens shall be sized and located so that persons are not likely to come into accidental contact with the live parts or to bring conducting objects into contact with them.

(3) By location on a suitable balcony, gallery, or platform elevated and arranged so as to exclude unqualified persons.

(4) By elevation of 2.5 m (8 ft) or more above the floor or other working surface.

<u>(B) Live Parts Guarded Against Accidental Contact by Qualified Persons. Electrical equipment and devices operating at 50 volts or more that are likely to require examination, adjustment, servicing, or maintenance by qualified persons while energized, shall be guarded to prevent accidental contact from live parts or constructed so that openings to live parts of the devices and equipment will not permit the entry of a 12.5 mm (0.5 in.) diameter rod.</u>

Substantiation: 110.27(A) covers protecting unqualified persons from accidental contact from live parts. It does not cover protecting qualified persons from accidental contact on equipment that requires adjustment, servicing, or maintenance while energized. The proposed additional wording requires this equipment to be suitably guarded against accidental contact or requires construction that limits the exposure size to exposed live parts. The 12.5 mm (0.5 in.) diameter dimension is based on IP 20 "touch safe terminals". Precedence on the use of the 12.5 mm diameter openings without using the term "touch safe terminals" was established in section 12.5.1.1 Exception No. 4, NFPA 79-2002.

Panel Meeting Action: Reject

Panel Statement: The current NEC language provides sufficient guarding of live parts from accidental contact regardless of the qualification status of the person. The panel does not accept the addition of the new item (B) because it would require that all electrical equipment be provided significant additional guarding inside of the equipment, which is both impractical and unreasonable. Given the type of work that occurs inside of a piece of equipment, the definition of what constitutes "accidental contact" is extremely broad and unclear. The panel notes that the only positive way to ensure that accidental contact with live parts does not occur is to deenergize the equipment prior to working on it.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

BARRIOS, JR., L.: The panel action should have been "accept" rather than "reject". The provisions in the current text of 110.27 do not address exposed live parts contained inside enclosures such as control cabinets, junction boxes, uninterruptible power supplies, and adjustable frequency drives.

Troubleshooting this equipment is often required to be carried out by qualified persons while the equipment is energized. The intent of the submitter's proposal is to provide suitable guarding to prevent accidental contact or to utilize finger-safe terminals as is common outside of the US to protect qualified persons when working in these enclosures.

FLOYD, II, H.: As submitted, the proposal was seen as too restrictive. For example, it wold require touch safe terminals on residential switch and receptacle outlet devices. Although the proposal is overly restrictive in requiring touch safe IP20 design on all equipment, the panel could have accepted this in principle in part by identifying this an acceptable option, rather than a mandatory requirement. IP20 designs provide an inherently safer design that reduces the risk of inadvertent contact having the risk of electric shock or initiation of an arc flash. The NEC should acknowledge that the application of touch safe IP20 shrouded terminals provide a safer work environment for both qualified as well as unqualified personnel. These types of designs are widely used outside of the US and significantly reduce the risk of inadvertent personnel contact in industrial control panels and other equipment. The requirement for touch safe IP20 designs has proven both acceptable and reasonable in installations outside the U.S. I would encourage the submitter to resubmit a proposal that is somewhat less restrictive, describes this as an optional method, and perhaps provide examples of how other standards development organizations have successfully implemented this concept.

1-140 Log #3589 NEC-P01 **Final Action: Reject**
(110.27)

Submitter: Sukanta Sengupta, North Brunswick, NJ
Recommendation: Revise as follows:

Entrance to rooms and other locations that contains live parts shall be marked with conspicuous signs ~~forbidding~~ restricting unqualified ~~person~~ persons ' movement i nside the limited approach boundary ~~to enter~~ .

FPN No. 1: NFPA 70E. Standard for Electrical Safety in the Work Place, provides assistance in determining Limited Approach Boundary .

Substantiation: NFPA 70E allows unqualified person to enter limited approach boundary under specific controls, supervision and instruction, from a qualified person.
Panel Meeting Action: Reject
Panel Statement: The proposal would permit unqualified persons access to locations having live parts without supervision, expecting them to know concepts such as "limited approach boundary".
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-141 Log #260 NEC-P01 **Final Action: Reject**
(110.27(B))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:

(B) Prevent ~~Physical~~ Damage. In locations where electric equipment is likely to be exposed to ~~physical~~ damage, enclosures or guards shall be so arranged and of such strength as to prevent such damage.

Substantiation: The word is superfluous. Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.

Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."

Panel Meeting Action: Reject
Panel Statement: "Physical damage" is a common term used in industry. Generally, it is damage caused to property from external events, such as accidents, vandalism, destruction, and other potential hazards. CMP-1 notes to the submitter that an enclosure does not protect equipment from internal events, such as caused by short-circuit and ground-fault conditions or computer and data errors. In addition, this proposal is in violation of 3.2.5.5 of the NEC Style Manual, as the term "physical damage" is a special term identified in that section.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-142 Log #406 NEC-P01 **Final Action: Accept**
(110.31(A))

Submitter: Sam Marcovici, NY City Buildings Dept.
Recommendation: Revise text to read as follows:

110.31 Enclosure for Electrical Installations.

(A) Fire ~~Resistivity~~ Resistance of Electrical Vaults. The walls, roof, floors, and doorways of vaults containing conductors and equipment over 600 volts, nominal, shall be constructed of materials that have adequate structural strength for the conditions, with a minimum fire rating of 3 hours. The floors of vaults in contact with the earth shall be of concrete that is not less than 4 in. (102 mm) thick, but where the vault is constructed with a vacant space or other stories below it, the floor shall have adequate structural strength for the load imposed on it and a minimum fire resistance of 3 hours. For the purpose of this section, studs and wallboards shall not be considered acceptable.

Substantiation: "Resistivity" is strictly an electrical term. The correct term to describe the fire ratings of materials is "Resistance", used by most building codes.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-143 Log #1436 NEC-P01 **Final Action: Reject**
(110.31(A))

Submitter: Wayne H. Robinson, Prince George County Government
Recommendation: Revise text to read as follows:

Where fire resistant vaults are required by 450.21(C), 450.26 and 460.2(A), the walls, roof, floors and doorways of vaults containing conductors and equipment over 600 volts, nominal, shall be constructed of materials that have adequate structural strength for conditions, with a minimum fire rating of 3 hours.

Substantiation: The present language leaves one to interpret that equipment rated over 600 volts; nominal should be installed in a vault. In determining whether a fire resistant vault is required depends on dry-type transformers rated over 35,000 volts, liquid filled transformers and capacitors, not if the equipment is rated over 600 volts.
Panel Meeting Action: Reject
Panel Statement: The requirements of 110.31(A) are general and do not supersede the requirements for the cited transformer and capacitor installations. There is no requirement that all equipment over 600 volts be installed in a vault. The panel concludes that all vaults in which over 600 volt equipment is installed shall have at least a 3 hour fire rating, not just required vaults.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-144 Log #2392 NEC-P01 **Final Action: Reject**
(110.31(A), FPN (New))

Submitter: James Troske, URS Corp.
Recommendation: Add a new FPN to read:

FPN: Vault as used here implies an enclosure of electrical equipment containing more than 1 US gallon of combustible fluid.

Substantiation: "Vault" is not defined in Article 100 and is used in 110.31 as an equal to room or closet. Without a definition of "vault" a strict reading of 110.31(A) requires a 3 hour fire rated enclosure around electrical equipment over 600V.
Panel Meeting Action: Reject
Panel Statement: The proposed FPN contains a requirement not permitted by Section 3.1.3 of the NEC Style Manual.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-145 Log #3181 NEC-P01 **Final Action: Accept**
(110.31(C)(1), FPN)

Submitter: Donald Cook, Shelby County Development Services
Recommendation: Delete this FPN completely.
Substantiation: A review of 90.2 (A) and (B), the Article 100 definition of service point, the complete NEC text and specifically the text in Articles 225, and 230 leads one to believe that electrical wiring and equipment located on the load side of the service point is under the scope of the NEC. This FPN, which based on the text in 90.5(C) is not enforceable, provides no value to the NEC user.

If industry believes information in the NESC is necessary for installations on the load side of the service point, that information should included as requirements of the NEC, not as a FPN. As an FPN, it only adds to the confusion of designers, installers, and AHJ's working on installations working on premises wiring.

The FPN also appears to include a requirement, which is not permitted to be located in a FPN.

Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
LABRAKE, JR., N.: This proposal should be rejected. The FPN provides the user of the Code an applicable resource that also is adopted by governmental bodies to cover industrial substations or multi-building complexes. Although the submitter recognizes these rules are not covered fully in the Code, ANSI C2 provides the specific information for those installations under engineering supervision.

1-146 Log #3076 NEC-P01 **Final Action: Accept**
(110.32)

TCC Action: The Technical Correlating Committee directs the panel to reconsider their action relative to the necessity of a soft conversion. This action will be considered by the panel as a public comment.
Submitter: Sukanta Sengupta, North Brunswick, NJ
Recommendation: Revise as follows:
914 ~~900~~ mm (3 ft)
Substantiation: This conversion is consistent with other NFPA standards.
Panel Meeting Action: Accept
Panel Statement: The panel concludes that the submitter's soft conversion is appropriate in accordance with 90.9(C)(4).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-147 Log #3223 NEC-P01 **Final Action: Accept in Principle**
(110.33, and 110.33(A) & (B))

Submitter: Robert Carbone, Fischback & Moore Electric Inc.
Recommendation: Revise text to read:
110.33 Entrance <u>to Enclosures Containing Electrical Equipment</u> and Access to Work <u>ing</u> Space.
(A) Entrance <u>to Enclosures</u> . At least one entrance not less than 610 mm (24 in.) wide and 2.0 m (6 1/2 ft) high shall be provided to give access to the <u>enclosures containing</u> ~~working space about~~ electric <u>al</u> equipment. Where the entrance <u>to the enclosure</u> has a personnel door(s), the door(s) shall open in the direction of egress and be equipped with panic bars, pressure plates, or other devices that are normally latched but open under simple pressure.
(B) Access <u>to Working Space</u> . Permanent ladders or stairways shall be provided to give safe access to the working space around electric equipment installed on platforms, balconies, or mezzanine floors or in attic or roof rooms or spaces.
Substantiation: This is essentially the same statement of problem and substantiation for the proposal I sent in for 110.26 & 110.26(C). Again, I have found Square D's website to be an extremely helpful resource for information associated with these hazards and am providing copies of some of that information as evidence of the hazard. This is the same information in my proposal for 110.26 and 110.26(C) and is submitted for consideration in its entirety as support of this change.
As Safety Director for a large NECA contractor, I have had a number of inspectors express concern that the intent of the existing language is not necessarily clear even though the inspectors that I have spoken with agree that the present language in the 2005 NEC clearly requires panic hardware on doors of electrical rooms to allow workers to quickly exit the room by leaning against the panic hardware rather than fumbling for a door knob. There seems to be some question as to how far away the doors need to be from the equipment before the doors would not need panic hardware.
Discussions with inspectors and fellow safety professionals agreed that the distance where doors that open out and have panic hardware is definitely more that the working distance required by the code. How far away would the doors need to be before they would not need to open out and have panic hardware? Agreement was reached that it would not be reasonable to expect doors 1,000 feet away to have panic hardware. So the distance is somewhere between greater than code required working distance and 1,000 feet.
Presentations given at IAEI meetings and in articles in their magazine, articles by Square D in various trade publications, and at seminars that I have attended make it clear that the hazard workers face extends well beyond the code required working distance. As a matter of fact, testing done by IEEE shows a dark cloud containing massive amounts of toxic vapors that would make it unlikely that a worker could find a doorknob, let alone operate it. The arc ball and toxic cloud clearly extend well beyond code required working distance and would necessitate a door to have panic hardware wherever that door is located. In addition Dupont's Nomex safety wheel requires workers to wear a switching hood to do voltage testing in 480 volt equipment. It would be extremely difficult for a worker to find and operate a doorknob. It makes perfect sense why you wrote the code requiring panic hardware on doors and for them to open out.
Presenters at seminars I attended also indicated that reported electrical injury to workers has occurred well beyond 10 feet. I am sure that people writing these rules have seen this testing and work for companies that have done this testing and could support my position as I know their companies have been part of this testing and have written about and use this information in their training.
Although I have a great deal of experience and have attended a number of seminars and presentations on the electrical hazards workers are exposed to, I know you cannot take my word for it. I know you need proof. I have found Square D's website to be an extremely helpful resource for information associated with these hazards and am providing copies of some of that information as evidence of the hazard. Although I am submitting these publications in their entirety, I will try to point you to a number of quotes. All submitted information is submitted for consideration in its entirety as support of this change.
In the "Arc Flash Overview" paper, it is reported that "five to ten arc flash explosions occur in electrical equipment every day in the United States...". In the section "An Arc Flash Defined" in the provided June 2003 EC&M article by George Gregory of Square D (document number 0613NA0301) titled "Preventing Arc Flash Incidents in the Workplace", Mr. Gregory states that "... an enormous amount of concentrated radiant energy explodes outward from electrical equipment...that can damage their eyesight, and a superheated ball of gas that can severely burn a worker's body...". An example of an explosion and worker wearing protection including a flash hood is shown in Square D's publication "Engineering Services, Power Systems Engineering, Arc Flash Analysys" (order number 0180HO0302). In the publication "Arc Flash: Understanding The Need For Increased Electrical Safety" (order number 0613BR0301) it is reported that "arc flash incidents typically occur in applications above 120V...". Also note the "side view" of an equipment rack during an arc flash explosion" shown in this same publication. Under the "Potential Equipment Damage" heading, note that "...temperatures of the arcing event can typically range form 5,000 degrees Fahrenheit and up...vaporizing the copper and steel components." In the Data Bulletin (0100DB0402) provided, it is reported that "...an "arc flash"...can result in significant damage to equipment or worse, injury or death to workers exposed to the fault." Again, all submitted information is submitted for consideration in its entirety.
I do not necessarily consider myself a code expert. The changes I offer above are the result of discussions, help, and advice from a number of coworkers who were extremely helpful in trying to get the code wording right. I was advised that the concept for panic hardware in this section was based on the concept for doors for transformer vaults. That is the basis for the change of wording. At first it did not make sense to talk about the enclosure. I, perhaps like most, thought of a box when I thought of an enclosure. When I was reminded to look at the definition of enclosure it made sense. Then, mirroring the words for the transformer vault doors to make them work in this section.
In summary, it is clear that the present language in the code requires doors to open out and have panic hardware. Because of that, it is clear that people involved in writing this rule already clearly understand the reasons why this rule is important to protect workers in electric rooms. Therefore, it is not my intent to change the rule to have electrical room doors open out and have panic hardware. It is important in my position as a safety professional for a large NECA contractor to support rules that will help improve worker safety. Having rules that are clear to inspectors, engineers, and contractors can only further that goal.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
Revise the title and first sentence of 110.33(A) as follows:
110.33 Entrance <u>to Enclosures</u> and Access to ~~Work~~ <u>Working</u> Space.
(A) Entrance. At least one entrance <u>to enclosures for electrical installations as described in 110.31</u> not less than 610 mm (24 in.) wide and 2.0 m (6½ ft) high shall be provided to give access to the working space about electric equipment.
Panel Statement: The panel does not necessarily agree with all of the submitter's substantiation. The panel concludes that the changes to 110.33 satisfy the concern of the submitter. The submitter's proposed changes to (B) have been incorporated into the panel action on the title of 110.33.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
MCMAHILL, L.: The additional text proposed to this section is unnecessary, overly restrictive and does nothing for safety. Section 110.31 addresses enclosure requirements and Section 110.33 is specific to access and entrance to the work space. Enclosure requirements are separate and distinct from work space requirements. The additional text will now unnecessarily require that an entrance be provided to the enclosure. The enclosure could be a wall, screen, or fence. Is the wall, screen, or fence is required to contain at least one entrance not less than 24 inches wide and 6-1/2 feet high? In addition, if the entrance has a personnel door(s), is it the intent that the door(s) must open in the direction of egress and be equipped with panic bars, pressure plates, or other devices that open under simple pressure? Keep in mind that the enclosure could be on a platform or in a vault too. A platform may have a ladder and hatch for access and a vault may have a larger roll up door for access. Are they required to have an additional entrance? As worded, this requirement will likely be an enforcement quagmire and do nothing for personnel safety. If anything, it will make it easier for unqualified persons to attain access to the enclosure. Is this the intent of the change? Generally, the enclosure should have as few openings as possible. It should also be noted that in most instances the enclosure is a considerable distance from the work space. Keep in mind that the purpose of the enclosure is to deter access by other than qualified persons. Again, Section 110.31 addresses the enclosure and Section 110.33 addresses the working space. The enclosure is separate and distinct from the working space! For public safety, it is correct to keep it that way! CMP-1 should reject this change.

1-148 Log #1197 NEC-P01 **Final Action: Accept**
(110.33(A))

Submitter: Lanny G. McMahill, Phoenix, AZ
Recommendation: Revise second sentence:
Where the entrance has a personnel door(s) that is less than 3.7 m (12 ft) from the working space, the door(s) shall open in the direction of egress and be equipped with panic bars, pressure plates, or other devices that are normally latched but open under simple pressure.
Substantiation: The new language clarifies that the personnel door(s) requirement applies to the working space. The 3.7 m (12 ft) distance is reasonable and provides for safe egress from the area. Currently, some are applying the requirement where the doors are a considerable distance from the working space.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
HICKMAN, P.: While we agree with the action of the panel, we do not necessarily agree with all of the substantiation of the submitter.

1-149 Log #2000 NEC-P01 **Final Action: Reject**
(110.33(C) (New))

Submitter: David Sroka, Turner Falls, MA
Recommendation: Add a new paragraph to read:
(C) Fire Extinguishers. A suitable listed, approved, portable fire extinguisher shall be located inside the work space near each entrance.
Substantiation: Safety improvement. This idea comes from the National Electrical Safety Code and the IEEE Guide for Substation Fire Protection.
Panel Meeting Action: Reject
Panel Statement: Requirements for fire extinguishers are outside the scope of the NEC.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-150 Log #186 NEC-P01 **Final Action: Reject**
(110.34(A))

NOTE: The following proposal consists of Comment 1-252 on Proposal 1-231 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 1-231 was:
Revise NEC 110.34 with the additions (underlined) and deletions (strike through) as shown. The entire text of 110.34(A) is shown for clarity, but only those changes shown underlined or strike through are part of this proposal.
110.34(A) Working Space. Except as elsewhere required or permitted in this Code, equipment likely to require examination, adjustment, servicing, or maintenance while energized shall have ~~the minimum~~ clear working space in the direction of access to live parts of the electrical equipment and shall not be less than specified in Table 110.34(A). Distances shall be measured from the live parts, if such are exposed, or from the enclosure front or opening if such are enclosed.
Submitter: Michael I. Callanan, IBEW
Recommendation: This proposal should be rejected.
Substantiation: The Submitter did not provide adequate technical substantiation to support the proposed recommendation. Section 110.26(A) is for equipment with 600 volts or less. Section 110.34(A) is for equipment with 601 volts or more. Section 110.32 states the minimum requirements for the height and width of working space. Section 110.32 also refers the user to 110.34(A) for the required depth of working space in the direction of access to live parts. Therefore, the Authority Having Jurisdiction (AHJ) would be correct in interpreting the provisions of Section 110.34(A). The present text is clear and addresses the concerns of the submitter. The term "likely" as per Section 3.2.1. and Table 3.2.1 of the NEC Style Manual is vague and unenforceable.
We agree with Mr. Hickman's negative vote that states that Section 110.34(A) is a stand-alone provision addressing clear working space in the direction to live parts. CMP-1 has strongly moved in the right direction over the past few Code cycles in regards to improvements about defining and maintaining working space. Acceptance of this proposal would be a step backwards.
This comment represents the official position of the International Brotherhood of Electrical Workers Codes & Standards Committee.
Panel Meeting Action: Reject
Panel Statement: The panel rejects Comment 1-252 and maintains the acceptance of the original Proposal 1-231 in the 2005 NEC Report on Proposals for the following reasons:
- That access to energized parts by qualified persons is common practice in over 600 volt applications;
- To provide for parallel text structure as in 110.26(A) for Code usability; and
- The term "likely to require" in Comment 1-252 in the 2005 NEC Report on Proposals is acceptable according to the NEC Style Manual.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
HICKMAN, P.: We are voting negative to the panel action to reject proposal 1-150. There still is no technical substantiation to warrant this change. It is not unusual to have unique or different rules for equipment operating at different voltages. We feel that this Panel Action is in violation of Section 3.3.5 of the Style Manual and cannot be considered an editorial change as suggested in the Panel Statement.

1-151 Log #3077 NEC-P01 **Final Action: Accept**
(110.34(A))

TCC Action: The Technical Correlating Committee directs the panel to reconsider their action relative to the necessity of a soft conversion. This action will be considered by the panel as a public comment.
Submitter: Sukanta Sengupta, North Brunswick, NJ
Recommendation: Revise as follows:
762 ~~750~~ min (30 in.)
Substantiation: This conversion is consistent with other NFPA standards.
Panel Meeting Action: Accept
Panel Statement: The panel concludes that the submitter's soft conversion is appropriate in accordance with 90.9(C)(4).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-152 Log #1097 NEC-P01 **Final Action: Reject**
(110.34(B) and (C))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: In (B) change "exposed wiring" to "exposed conductors."
Revise (C):
LOCKED ROOMS OR ENCLOSURES . The entrance to all building ~~s~~ areas , vaults, rooms, or similar enclosures containing live parts or exposed conductors operating at over 600 volts, nominal, shall be kept locked unless such entrances are under the observation of a qualified person or one empowered to forbid entry , at all times.
Substantiation: Edit. In (B), exposed wiring can be construed as including suitable raceways or cable assemblies which normally don't require separation. In (C) "exposed conductors" is used. Present literal wording of (C), appears to apply to the entrance of a high rise building which contains a dedicated area in the basement. A person doesn't have to be "qualified" (see definition) to forbid entry, security personnel for instance. Prevention of unauthorized entry is inferred but not specific. In comment 1-253 of the 2004 ROC, the panel states the presence of other than a qualified person cannot be guaranteed; that also applies to a qualified person. The word "similar" is proposed to exclude enclosures such as metal-enclosed switchgear for which 490.35(A) does not permit an alternate to locking.
Panel Meeting Action: Reject
Panel Statement: The panel concludes the proposed changes do not add clarity to the existing Code language. Wiring is not a specific term defined in the Code and is defined as a system of electrical distribution in the dictionary. The panel disagrees that parallel text structure of the term wiring relates to 110.34(C). A qualified person can forbid entry to unauthorized persons.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-153 Log #3081 NEC-P01 **Final Action: Reject**
(110.34(D))

Submitter: Michael A. Anthony, University of Michigan Business & Finance / Rep. Association of Higher Education Facilities Officers
Recommendation: Add text to read as follows:
110.34(D) (NEW) Emergency Illumination. All working spaces about electrical equipment shall be automatically illuminated upon loss of power. For a period of 90 minutes illumination levels shall be
(1) One footcandle (1-fc) along the floor to the established building emergency egress path.
(2) Two footcandles (2-fc) at all vertical surfaces where surface switchgear, permanent service directory, emergency transfer switches, or standby power switches are located.
Substantiation: During a forced outage this proposal will provide an illuminated egress path for the electrician who is working in the service equipment area without a flashlight. Electric service panels are not always installed along the 1-footcandle egress path required by the Life Safety Code

for everyone else in the building. The 2 footcandle requirement matches the illumination levels required by the NESC for substations and will provide sufficient illumination of emergency and/or standby power apparatus that may be needed to be operated to start up the emergency and/or standby power systems. Emergency illumination for electricians should be intuitively understandable and should not be left to the building codes. Emergency illumination for electricians should be considered a general requirement for an electrical installation and not a special condition addressable in Article 700. The per-unit cost to provide such illumination with surface mounted emergency lighting units is on the order of $1000 or less for both labor and materials in most parts of the US and is a relatively minor part of the capital cost to install switchgear over 600V.
Panel Meeting Action: Reject
Panel Statement: The panel concludes that emergency illumination requirements are a function of the building codes and NFPA Life Safety Code and presents a design issue where 90.1(C) intends that the NEC is not to be a design specification. There is no justification presented to require emergency illumination for all electrical equipment over 600 volts. Emergency illumination requirements are covered in 700.16 and are not under the purview of CMP-1.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Abstain: 1
Explanation of Abstention:
ANTHONY, M.: This proposal should have limited the application of emergency lighting to only <u>service</u> equipment over 600V. See comment on negative for proposal 1-101.

1-154 Log #3479 NEC-P01 **Final Action: Reject**
(110.34(D))

Submitter: Richard F. Van Wert, Middle Department Inspection Agency / Rep. Benjamin Franklin Chapter IAEI
Recommendation: Revise text to read:
110.34(D) Illumination. Illumination shall be provided for all working spaces about electrical equipment <u>indoors or outdoors on roofs</u> .
Substantiation: This article needs rewording because lighting source is needed in these areas. Similar proposals were submitted for 210.70(C) and 110.26(D).
Panel Meeting Action: Reject
Panel Statement: The panel concludes that illumination is required for all working spaces for equipment operating at over 600 volts.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-155 Log #1106 NEC-P01 **Final Action: Accept**
(110.51(B))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Delete last sentence.
Substantiation: Edit. This requirement is unenforceable, and doesn't conform to Style manual. Attention should be paid to all applicable articles.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-156 Log #259 NEC-P01 **Final Action: Reject**
(110.51(C))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
(C) Protection Against ~~Physical~~ Damage. Conductors and cables in tunnels shall be located above the tunnel floor and so placed or guarded to protect them from ~~physical~~ damage.
Substantiation: The word is superfluous. Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."
Panel Meeting Action: Reject
Panel Statement: "Physical damage" is a common term used in industry. Generally, it is damage caused to property from external events, such as accidents, vandalism, destruction, and other potential hazards. CMP-1 notes to the submitter that an enclosure does not protect equipment from internal events, such as caused by short-circuit and ground-fault conditions or computer and data errors. In addition, this proposal is in violation of 3.2.5.5 of the NEC Style Manual, as the term "physical damage" is a special term identified in that section.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-157 Log #1539 NEC-P01 **Final Action: Accept**
(110.54(A))

Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Delete the term "effectively" from the terms "effectively grounded" and "effectively bonded" from Articles 110 and revise text as shown for the affected NEC sections.
110.54(A): (A) Grounded and Bonded. All non-current-carrying metal parts of electric equipment and all metal raceways and cable sheaths shall be ~~effectively~~ <u>solidly</u> grounded and bonded to all metal pipes and rails at the portal and at intervals not exceeding 300 m (1000 ft) throughout the tunnel.
Substantiation: 110.54(A): The definition is ambiguous and very subjective without any defined values or parameters for one to judge as either "effective" or "ineffective."
This is the result of the TCC Task Group on Grounding and Bonding in resolve of the 2005 NEC cycle actions related to Proposal 5-1 and Comment 5-1 as directed by the Technical Correlating Committee. This is a companion proposal to delete the term "grounded, effectively" and its definition from Article 100 and other companion proposals throughout the NEC relative to this Task Group's recommendations. The substantiation of this proposal is as follows.
The term "Effectively Grounded" is used 29 times in the NEC. It appears as though in the majority of the locations where it is used, the word "grounded" or phrase "connected to an equipment grounding conductor" could be used. Other proposals are submitted to make those changes.
The 1996 NEC in Section 250.51 used the term "effective grounding path," and those concepts were incorporated in 250.2 (1999 NEC) and then expanded in 250.4(A) and (B) in the 2002 NEC. The performance criteria of grounding and bonding are currently provided in Section 250.4 and include the concepts contained in the vague definition of the term "effectively grounded."
The definition "Effectively Grounded" is very subjective and without any defined values or parameters for one to judge grounding as either "effective" or "ineffective." "Effective" is described in Section 250.4(A) and (B), but it relates to the effective ground-fault current path as a performance criteria. Deleting the term in the NEC and the definition is logical because there are no definitive parameters for Code users to make a determination on what constitutes "effectively grounded." Systems are solidly grounded, grounded through a resistor or impedance, or ungrounded. Equipment (normally noncurrent-carrying metal parts are grounded where connected to an equipment grounding conductor.
This proposal is to change the term "Effectively Bonded" to just "Bonded" in each of the section where it is used. The term "Effectively Bonded" is currently not defined in the NEC.
The term "effectively bonded" is also used a few times in the NEC and is undefined. The same situation exists. There are no defined parameters for Code users to judges what the difference between "Effectively Bonded" and "Bonded" really is. Where the term appears in the NEC, it is revised to just "bonded" and still has the same meaning in each rule.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-158 Log #1445 NEC-P01 **Final Action: Reject**
(110.75(D))

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise as follows:
(D) Covers. Covers shall be over 45 kg (100 lb) or otherwise designed to require the use of tools to open. They shall be designed or restrained so they cannot fall into the manhole or protrude sufficiently to contact electrical conductors or equipment within the manhole. <u>Metal covers and other exposed conductive surfaces shall be bonded in accordance with 250.96(A).</u>
Substantiation: The intent of this section is to provide an effective ground fault current path for manhole covers, as required by 250.4(A)(3) and 250.4(A)(5). This language already exists in 314.30(D) for handhole enclosures, and should also be present here. I urge Panel 1 to consider the safety ramifications of not accepting this proposal.
Panel Meeting Action: Reject
Panel Statement: The construction requirements of manholes, unlike handholes, virtually exclude the covers from contacting energized parts. There

is no technical justification presented to require bonding of manhole covers. By 90.1(C), the NEC is not intended to be a design specification.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-159 Log #2351 NEC-P01 **Final Action: Reject**
(110.80 (New))

Submitter: John S. Whitney, Newton Sq., PA
Recommendation: Add new section:
Racking Cables and Conductors. Cables and conductors installed within manholes and other electric enclosures intended for personnel entry shall be racked to maintain raedy and safe access/egress. Cables and conductors shall not obstruct the standing area of the enclosure floor or the enclosure entrance. Cables and conductors shall be effectively secured to racks to safely withstand magnetic forces when subjected to short circuit current. Clamps or cable ties securing cables and conductors to racks shall be suitable to withstand the environment in which they are installed.
Substantiation: Hazards associated with manholes and other electric enclosures intended for personnel entry are directly related to the confined nature of the space and the limited access/egress. Cables and conductors shall be racked to provide physical protection for the cables and to maintain safe access/egress and working space within the enclosure. Cables that are not secured to racks often end up on the floor of the enclosure where they present a hazard to entrants and may be damaged by ladders, pumps, personnel, and tools lowered into the enclosures from above. Cables and conductors that are not effectively secured to racks to withstand magnetic forces may sustain damage or damage adjacent cables or conductors as a result of movement due to magnetic forces from fault current. Materials applied within underground enclosures are subject to moisture, condensation, and repeated or continuous submersion and shall be suitable for the environment.
Panel Meeting Action: Reject
Panel Statement: The concerns of the submitter are addressed in 110.74. By 90.1(C), the NEC is not intended to be a design specification.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-160 Log #2353 NEC-P01 **Final Action: Reject**
(110.81 (New))

Submitter: John S. Whitney, Newton Sq., PA
Recommendation: Revise text:
Unused openings shall be effectively closed.
Substantiation: Unused conduit openings shall be effectively closed to minimize ingress of fluids, gasses, moisture, and wildlife. Subsurface utility failures and ground water often result in accumulations of fluids, gases, mud, etc. within enclosures located below grade and within enclosures with conduits entering form below grade. Effectively closing unused conduits will miinimize ingress. Additionally, rodent and other wildlife activity will be minimized.
Panel Meeting Action: Reject
Panel Statement: CMP-1 concludes that the proposal does not contain a clear statement of the problem or substantiation for the change. See the Regulations Governing Committee Projects sections 4.3.3(b) and (d).

(110.84 (New))

Submitter: John S. Whitney, Newton Sq., PA
Recommendation: Add new section:
Non Electrical Facilities. Non electric conduits, pipes, hoses, etc. transmitting or containing fluids or gases shall not be installed within or throuigh electric duct banks, manholes and other electric enclosures intended for personnel entry.
Substantiation: Duct systyems and manholes are valuable realestate for facility operators considering pathways for expansion or renovation of existing facilities. Existing spare duct space is a very attractive alternative when faced with the cost of underground construction. Comingling of systems introduces hazards outside the qualification of electrical workers. Prescriptive Code prohibiting comingling of facilities provides designers and installers with regulations to prevent such installation.
Panel Meeting Action: Reject
Panel Statement: The submitter's proposal is overly restrictive. For example, it could prohibit piping for a sump pump or the installation of optical fiber cables. Section 90.8(A) addresses wiring planning. CMP-1 concludes that the proposal does not contain a clear statement of the problem or substantiation for the change. See the Regulations Governing Committee Projects, sections 4.3.3(b) and (d).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
STAUFFER, H.: NECA supports accepting a new section 110.84. We believe the proposed new wording is similar to existing 300.8 and will contribute to safety for the same reasons. Fluids should not be deliberately introduced into electrical manholes and other electrical spaces intended for personnel entry. This is particularly true of gases, which may be flammable or pose an inhalation hazard for personnel working in such spaces.
We do not agree with the panel statement that Proposal 1-163 could prohibit the installation of optical fiber cables in these spaces. Optical fiber cables covered by Article 770 are a communications system within the scope of this Code. NECA intends to submit a public comment on this proposal, recommending the following language for new section 110.84:
110.84 Other Systems Not Permitted. Electric duct banks, manholes, and other electric enclosures intended for personnel entry shall not contain any pipe, tube, or equal for steam, water, air, gas, or any service other than electrical. This prohibition shall not preclude the installation of a sump pump with associated piping to drain a manhole or other electric enclosure intended for personnel entry.

1-164 Log #2357 NEC-P01 **Final Action: Reject**
(110.85)

Submitter: John S. Whitney, Newton Sq., PA
Recommendation: Add new section:
Identification of Cables and Conductors. Cables and conductors within enclosures intended for personnel entry shall be permanently and legibly tagged or labeled to indicate the owner, application, and the line or circuit number such as "METRO Electric Co. Circuit #123 15KV". Tags, labels and their attachments shall be durable and of materials suitable to withstand the environment in which they are installed.
Substantiation: Manholes and interconnecting duct systems are often shared by facility owners, serving utilities, and Municipal entities. Manholes may contain assortments of fiber optic and copper cables including communications, power, and data cables. Cables and conductors may be provided with physical protection such as inner duct or arc proofing. It is often difficult to determin the cable or conductor type or application through visual inspection of the jacket or insulation. To perform a hazard assessment of facilities installed within enclosures intended for personnel entry requires information regarding the facilities installed. When cables and conductiors are identified with legible tags or labels, the process of determining the application and owner is much simpler than searching through outdated records stored at a remote location. On site cable identification through field applied tags and labels expedites owner notification and the hazard assessment process when quick repair is a consideration.
Panel Meeting Action: Reject
Panel Statement: The proposal is too restrictive in that it requires identification of all cables and conductors in all enclosures intended for personnel entry. The subject matter of this proposal may be more appropriately addressed in Article 300.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

HICKMAN, P.: We are voting negative to the panel action to reject proposal 1-164. Our explanation is as follows:

This proposal should have been accepted. The submitter has identified a reasonable solution to a serious safety hazard. My notes indicate that there was a good deal of discussion surrounding this proposal with a number of organizations speaking in favor of it. We disagree that the proposal is too restrictive. While cutting an incorrect communication cable may not appear to have the same immediate consequences as cutting the wrong energized cable or conductor, these cables are often a vital link in both safety and commerce. This proposal is a reasonable and relatively cost effective way to improve safety. While Article 300 may be another place this proposal could have been submitted, as the Panel Statement suggests, we should not wait 3 years to consider this concept.

HITTINGER, D.: This proposal should be accepted. Identification of cables and conductors within enclosures would benefit personnel that must perform maintenance duties within the enclosure. In the process of determining cable application, conductor type and ownership, permanent marking should be done at the initial installation for future reference. Proper identification of cables would facilitate repairs and provide a level of safety to the worker engaged in the course of action.

1-165 Log #2994 NEC-P01 **Final Action: Reject**
(110, Part VI -(New))

Submitter: James J. Rogers, Bay State Inspectional Agency
Recommendation: Add new text as follows:

Insert in its entirety Part 1 of the 2002 National Electrical Safety Code pages 27 through 58 inclusive.

Substantiation: In submitting this proposal the submitter understands that it most likely will not be accepted in this fashion. However, due to changes in procedures by utility companies across the country many of the these installations are now privately owned and AHJs have nothing to enforce, this needs public review.
Panel Meeting Action: Reject
Panel Statement: No technical substantiation has been provided in accordance with the Regulations Governing Committee Projects, Sections 4.3.3(b) and (d). The referenced document part is not suitable for direct inclusion in the NEC without considerable modification.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

(Note: Sequence 1-166 was not used).

ARTICLE 200 — USE AND IDENTIFICATION OF GROUNDED CONDUCTORS

4-2 Log #2255a NEC-P04 **Final Action: Reject**
(Chapter 2)

Submitter: Bryan P. Holland, Holland Electric
Recommendation: Reorganize Chapter 2 as follows: 200 –, 210 – Branch-Circuits and Feeders, 215 –Outside Branch-Circuits and Feeders, 220 – Branch-Circuit, Feeder, and Service Calculations, 230 – Ovecurrent Protection, 240 – Use and Identification of Grounded Conductors 250 –Grounding, 260 – Bonding, 280 – Surge Arrestors, 285 – Transient Voltage Surge Suppressors.
Substantiation: This change provides a more linear arrangement for Chapter 2 and places alike articles next to each other. Branch circuits and feeders can be combined into the same article as they are when installed outdoors. The separation of grounding and bonding requirements will provide clarity that each is a separate fundamental and both serve a separate function.
Panel Meeting Action: Reject
Panel Statement: There are special rules and requirements for outside branch circuits and feeders in Article 225 and these special considerations should not be mixed into the general requirements for branch circuits and feeders since this would make the NEC more difficult to use. There has been a concentrated effort for the past three or four Code cycles to make the NEC more user friendly and combining general branch circuit and feeder requirements with these special applications for outside of a building or structure is not user friendly. This proposal is not in conformance with 4-3.3(c) of the NFPA Regualations Governing Committee Projects in that it does not contain recommended text.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

10-3 Log #2255b NEC-P10 **Final Action: Reject**
(Chapter 2)

TCC Action: The Technical Correlating Committee advises that Chapter layout and numbering are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.

The Technical Correlating Committee is forwarding this recommendation to the Usability Task Group for review.
Submitter: Bryan P. Holland, Holland Electric
Recommendation: Reorganize Chapter 2 as follows: 200 –, 210 – Branch-Circuits and Feeders, 215 –Outside Branch-Circuits and Feeders, 220 – Branch-Circuit, Feeder, and Service Calculations, 230 – Ovecurrent Protection, 240 – Use and Identification of Grounded Conductors 250 –Grounding, 260 – Bonding, 280 – Surge Arrestors, 285 – Transient Voltage Surge Suppressors.
Substantiation: This change provides a more linear arrangement for Chapter 2 and places alike articles next to each other. Branch circuits and feeders can be combined into the same article as they are when installed outdoors. The separation of grounding and bonding requirements will provide clarity that each is a separate fundamental and both serve a separate function.
Panel Meeting Action: Reject
Panel Statement: The organization and many of these articles of the NEC fall outside the scope of Code-Making Panel 10. This is a major change for which there is insufficient supporting substantiation. The panel requests that this proposal be reviewed by the Technical Correlating Committee for usability consideration.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

5-39 Log #2255 NEC-P05 **Final Action: Reject**
(Chapter 2)

Submitter: Bryan P. Holland, Holland Electric
Recommendation: Reorganize Chapter 2 as follows: 200 –, 210 – Branch-Circuits and Feeders, 215 –Outside Branch-Circuits and Feeders, 220 – Branch-Circuit, Feeder, and Service Calculations, 230 – Ovecurrent Protection, 240 – Use and Identification of Grounded Conductors 250 –Grounding, 260 – Bonding, 280 – Surge Arrestors, 285 – Transient Voltage Surge Suppressors.
Substantiation: This change provides a more linear arrangement for Chapter 2 and places alike articles next to each other. Branch circuits and feeders can be combined into the same article as they are when installed outdoors. The separation of grounding and bonding requirements will provide clarity that each is a separate fundamental and both serve a separate function.
Panel Meeting Action: Reject
Panel Statement: No specific text was proposed to revise Article 250. No specific text was proposed to add new Article 260. The proposal does not meet the requirements of Section 4.3.3 of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-40 Log #414 NEC-P05 **Final Action: Reject**
(200.2 Exception)

Submitter: Robert J. Walsh, City of Hayward
Recommendation: Exception: Circuits not requiring the use of a grounded conductor.
Substantiation: The section mandates the installation of the grounded conductor for all premise wiring systems. By definition, the premise wiring system is all of the circuitry between the service point and the furthest outlet. 210.10 and 215.7 permit ungrounded conductors to be tapped from ungrounded conductors of circuits that have a grounded conductor.

However, tapped circuits conductors do not reflect the connections of overcurrent devices to a panelboard supplying a feeder or branch circuit.

The addition of the exception would clarify the conventional practice of installing ungrounded and grounding circuit conductor without a grounded conductor.
Panel Meeting Action: Reject
Panel Statement: The panel concludes that the grounded conductor is not always required to be run with every circuit. The proposed text may lead to a conflict with other requirements in the Code. The exception does not add clarity to the code.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:

DOBROWSKY, P.: The concept of the proposal should be accepted. The existing language is not clear and including the panel statement material in the NEC is helpful.

5-41 Log #2063 NEC-P05 **Final Action: Accept in Principle**
(200.3)

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Recommendation: Add the following new Exception.

Exception: Listed and labeled utility-interactive inverters used in distributed resource generation systems such as photovoltaic and fuel cell power systems may be connected to premises wiring line-to-line without a grounded conductor when the connected premises wiring or utility system supplies the ground reference.

Substantiation: In utility-interactive PV systems, the utility grid and its grounded neutral, and the grounded neutral at the service entrance provide the ground reference and meet the requirement in 200.3 so that all premises wiring stays referenced to the same ground as the utility.

The 240-volt inverters used in photovoltaic power systems and fuel cell power systems do not have an output or internal signal point that would be referenced to the grounded ac neutral. They do, of course, have a grounded chassis (via the ac equipment-grounding conductor). Since most use an internal or external transformer, the dc side of the system is also ground referenced with the negative or positive output conductor of the source connected to ground. The output ac currents from these inverters are injected directly at 240 volts into the premises wiring and into the utility power system without reference to ground.

All of these inverters have been evaluated for safety against UL Standard 1741 and all are being installed in compliance with the instructions and labels provided with the product (NEC 110.3(B)) which include the instructions to connect many of them line to line without a grounded conductor reference. These devices have been operated for more than 20 years without any safety problems associated with the lack of a grounded conductor reference.

The exception is needed to clarify the situation where safe, listed devices without a ground reference may safely be connected to premises wiring under specific conditions.

Panel Meeting Action: Accept in Principle

Revise the proposed text to read as follows:

Exception: Listed ~~and labeled~~ utility-interactive inverters identified for use ~~d~~ in distributed resource generation systems such as photovoltaic and fuel cell power systems ~~may~~ shall be permitted to be connected to premises wiring ~~line-to-line~~ without a grounded conductor where the connected premises wiring or utility system includes a grounded conductor. ~~supplies the ground reference~~ .

Panel Statement: The panel accepts the concept proposed by the submitter. Changes made to the original recommendation bring the proposed text in line with the NEC Style Manual.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-42 Log #2146 NEC-P05 **Final Action: Reject**
(200.6)

TCC Action: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panel 6 for information.

Submitter: Roger Hewitt, Puget Sound Electrical Apprenticeship / Rep. IBEW LU #46

Recommendation: Delete existing text from 200.6 and replace with:

Insulated grounded conductors shall be identified in accordance with 310.12(A).

Substantiation: Multiple sections of the NEC must now be consulted to ensure proper conductor identification. Combining all conductor identification requirements in one section in Article 310 is logical.

Panel Meeting Action: Reject

Panel Statement: The scope of Article 200 states "Identification of grounded conductors" as to what is covered in Article 200. Section 200.6 is the appropriate location for this requirement. CMP-5 requests that this proposal be sent to CMP-6 for Information.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-43 Log #433 NEC-P05 **Final Action: Reject**
(200.6(A) & (E))

Submitter: Richard Angelin, McKee Foods Corporation

Recommendation: Strike all references to "three continuous white stripes".

Substantiation: Conductors are not finished like this, and rarely if ever have been used. This is not a common method of identification and causes confusion.

Panel Meeting Action: Reject

Panel Statement: The submitter has not provided any technical substantiation or practical reason to support such a change. Conductors are manufactured in accordance with what is permitted by this section as a means of identification for grounded conductors. Manufacturers utilize this method in equipment such as manufacturer's wiring systems, office furniture, Tele-power-poles etc. This method also allows installers and manufacturers a means by which to meet the branch circuit identification requirements of 210.5(C). The conductors mentioned in the recommendation are manufacturered and available.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-44 Log #1464 NEC-P05 **Final Action: Reject**
(200.6(A)(3))

Submitter: Ryan Jackson, West Valley City, UT

Recommendation: Revise as follows:

200.6 Means of identifying Grounded Conductors.

(A) Sizes 6 AWG or Smaller. An insulated grounded conductor of 6 AWG or smaller shall be identified by a continuous white or gray outer finish or by three continuous white stripes on other than green insulation along its entire length. Wires that have their outer covering finished to show a white or gray color but have colored tracer threads in the braid identifying the source of manufacture shall be considered as meeting the provisions of this section. Insulated grounded conductors shall also be permitted to be identified as follows:

(3) ~~Fixture~~ Luminaire wire shall comply with the requirements for grounded conductor identification as specified in 402.8.

Substantiation: With the changing of the term "fixture" to "luminaire", it only makes sense that the term "fixture wires" be changed to "luminaire wires".

For the purposes of correlation, this proposal is also being submitted to the following Articles/Sections/Tables/Annexes: 200.6; 210.19; 210.20; 210.24; 240.4; 240.5; 300.17; 310.1; 314.16; Article 402; 517.74; 660.9; Table 1; Table 5; Annex C.

Panel Meeting Action: Reject

Panel Statement: While the term "fixture" as relating to lighting fixtures has been changed to luminaires, the term for fixture wires applies to conductors that serve appliances or other devices and not just luminaires. The change in terminology will impose changes on the wire industry and those associated with no increase in safety or apparent benefit to users of the Code.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-45 Log #2545 NEC-P05 **Final Action: Accept**
(200.6(B))

Submitter: Timothy D. Curry, Curry Electric, Inc.

Recommendation: Add this language after the section:

Exception: Conductors larger than 6 AWG shall not be required to be marked or identified in conduit bodies that contain no splices or unused hubs.

Substantiation: The definition of "accessible" would include these conduit bodies. It is nearly impossible to install the markings, nor does it serve a purpose to require them in a conduit body where there is no realistic chance that anyone is going to try to splice or tap into the circuit. 250.119(A)(1) Exception uses same logic.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-46 Log #1699 NEC-P05 **Final Action: Reject**
(200.9 Exception)

Submitter: Charles M. Trout, Maron Electric Company

Recommendation: Delete the 200.9 Exception in its entirety.

Substantiation: The body of the text in 200.9 satisfactorily contains the necessary requirements of the safe termination of grounded conductors regarding means of identification of terminals. The exception permits a lesser degree of safety based on an undocumented qualified person hypothetically servicing the installation. No requirements are present to ensure that the conditions of maintenance and supervision to ensure that only qualified persons service the installation actually exist.

Panel Meeting Action: Reject

Panel Statement: The alternative in the exception to 200.9 continues to have occasional limited use within many electrical installations. CMP-5 addressed this issue in their actions to Proposals 5-31 and 5-32 (Log Nos. 3448 and 3449) in the 2005 NEC cycle. In addition, no safety incidents or evidence has been provided to the panel.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-47 Log #964 NEC-P05 **Final Action: Reject**
(200.11)

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Revise:

~~POLARITY OF~~ CONNECTIONS . No grounded conductor shall be attached to any terminal or lead intended for connection to an ungrounded conductor . ~~So as to reverse the designated polarity.~~

Substantiation: Edit. Polarity is associated with direct-current circuits. Alternating-current conductors are not assigned polarities.

Panel Meeting Action: Reject

Panel Statement: Polarity in general means the relationship between two opposite attributes. Looking at other places where this word is used in the NEC, that is the idea that applies. The submitter has provided no technical substantiation to support narrowing the view of this term to apply only to dc.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

ARTICLE 210 — BRANCH CIRCUITS

2-7 Log #1449 NEC-P02 **Final Action: Reject**
(Table 210.2)

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Add "Appliances" to the table, with a reference to Article 422. Delete "Central heating equipment other than fixed electric space-heating equipment" and its reference from the table.
Substantiation: Article 422 contains many instances that in theory permit deviation from Article 210. For example, storage type water heaters (422.13 and its fine print note). In this example, the fine print note clearly refers me to Article 422 for branch circuit requirements, not 210.19/210.20.
Panel Meeting Action: Reject
Panel Statement: The reference to 422.12 is to specifically provide information on the special purpose branch circuit required by Article 422. The more specific reference is more useful to the user.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-9 Log #1317 NEC-P02 **Final Action: Reject**
(210.4)

Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Revise as follows:
210.4 Multiwire Branch Circuits.
(A) General. Branch circuits recognized by this article shall be permitted as multiwire circuits. A multiwire circuit shall be permitted ~~to be considered as~~ to supply multiple circuits. All conductors shall originate from the same panelboard or similar distribution equipment.
Substantiation: Article 100 clearly indicates that a multiwire Branch Circuit is to be considered a single circuit. Even if this single circuit supplies multiple loads, as is the case with a 3 wire branch circuit supplying two lighting loads.
Panel Meeting Action: Reject
Panel Statement: The submitters recommendation creates an inaccurate sentence. A multiwire branch circuit cannot supply "multiple circuits". The purpose of the statement in the present code is to allow a multiwire branch circuit to be considered as multiple circuits when applying the rules of Article 210.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-10 Log #2679 NEC-P02 **Final Action: Accept in Principle**
(210.4)

Submitter: Dorothy Kellogg, American Chemistry Council
Recommendation: Revise text to read:
210.4 Multiwire Branch Circuits.
(A) General. Branch circuits recognized by this article shall be permitted as multiwire circuits. A multiwire circuit shall be permitted to be considered as multiple circuits. All conductors shall originate from the same panelboard and shall be provided with a means to disconnect simultaneously all ungrounded conductors.
FPN: A 3-phase, 4-wire, wye-connected power system used to supply power to nonlinear loads may necessitate that the power system design allow for the possibility of high harmonic neutral currents.
~~(B) Devices or Equipment. Where a multiwire branch circuit supplies more than one device or equipment on the same yoke, a means shall be provided to disconnect simultaneously all ungrounded conductors supplying those devices or equipment at the point where the branch circuit originates.~~
(B) Line-to-Neutral Loads. Multiwire branch circuits supply only line-to-neutral loads.
Exception No. 1: A multiwire branch circuit that supplies only one utilization equipment.
Exception No. 2: Where all ungrounded conductors of the multiwire branch circuit are opened simultaneously by the branch-circuit overcurrent device.
FPN: See 300.13(B) for continuity of grounded conductor on multiwire circuits.
Substantiation: Multiwire branch circuits employing shared neutrals can offer unexpected shock hazards to electricians unless all ungrounded conductors from the multiwire branch circuit are disconnected simultaneously. The safety concern associated with unintentional voltage being present on multiwire branch circuits during maintenance is not always fully appreciated. An electrician may not know that a circuit is a multiwire branch circuit when work begins. Even if aware of a multiwire branch circuit, there is presently no requirement to identify and disconnect all ungrounded conductors of that multiwire branch circuit. The present NEC correctly recognized this as a safety issue in 210.4(B) for the limited situation of "more than one device or component on the same yoke". While the use of multiwire branch circuits is a valid use, it should be permitted only where a means is provided to disconnect simultaneously all ungrounded conductors of that circuit.
Panel Meeting Action: Accept in Principle
Revise the last sentence of 210.4(A) in the present code to read: "All conductors of a multiwire branch circuit shall originate from the same panelboard or similar distribution equipment."
Revise 210.4(B) in the present code to read: "Disconnecting Means. Each multiwire branch circuit shall be provided with a means that will simultaneously disconnect all ungrounded conductors at the point where the branch circuit originates."
Panel Statement: The panel has accepted the submitter's recommendation, but has revised the text in 210.4(A) and (B) to accomplish the intent of the submitter.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
PURVIS, R.: The new requirement in 410.73(G) of the 2005 code requiring a disconnect for luminaries that are supplied from a multiwire branch circuit helps deal with the concerns of the submitter. Also, switches could be installed in "warehouse situations". For maintenance on the "circuit", at other locations a "qualified" person should be able to deal with the Multiwire issues in the circuit making it unnecessary to simultaneously disconnect all ungrounded conductors at the point where the branch circuit originates. By rejecting this proposal, the common practice of using SWD breakers on multiwire lighting circuits would be more practical rather than having to turn off all the lights with a 3 pole breaker.
Comment on Affirmative:
KING, D.: The revised text resulting from the panel meeting action on this proposal has significantly increased the level of safety for qualified persons working on multiwire branch circuits. I commend Panel 2 on their commitment to providing safer working conditions for persons working in the electrical industry.

2-11 Log #1555 NEC-P02 **Final Action: Accept**
(210.4(A), FPN)

Submitter: Technical Correlating Committee on National Electrical Code,
Recommendation: Make the following change in 210.4(A) FPN:
Change "neutral" to "neutral-conductor."
The revised text would appear as follows:
FPN: A 3-phase, 4-wire, wye-connected power system used to supply power to nonlinear loads may necessitate that the power system design allow for the possibility of high harmonic neutral- conductor currents.
Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).
The Task Group has proposed the following definitions to be added to Article 100:
● **Neutral conductor.** A circuit conductor connected to the neutral point of a system.
● **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.
This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals
● The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.
● The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.
Additional information is available in the Task Group report.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
KING, D.: This proposal should have been rejected. Supporting documentation from the Technical Correlating Committee that was included with this proposal indicates that there could be confusion with what constitutes a "neutral conductor" as it is defined in the Technical Correlating Committee Task Group recommended definition. While reading the proposed Technical Correlating Committee definition of "neutral conductor", it should be noted that this definition could also apply to the equipment grounding conductor of the circuit. This would only add confusion for the code user in determining which conductor is the neutral conductor of the circuit. This proposal should be referred back to the Technical Correlating Committee for further consideration.
Comment on Affirmative:
BROWN, L.: The text at the end of the FPN should be changed from "high harmonic neutral-conductor currents" to high harmonic currents on the neutral conductor" to reflect the correct use of terms related to this situation.

2-12 Log #3071 NEC-P02 **Final Action: Accept in Principle**
(210.4(B))

Submitter: Michael Kovacic, TMK and Associates, Inc.
Recommendation: Revise text to read as follows:
210.4(B) Devices or Equipment. Where a multiwire branch circuit supplies more than one device or equipment ~~on the same yoke~~ , a means shall be provided to disconnect simultaneously all ungrounded conductors supplying those devices or equipment at the point where the branch circuit originates.
Substantiation: Problem: Electrocution of qualified persons working on multiwire branch circuits.
There is a fatality case currently in litigation by OSHA where an experienced veteran electrician was wiring a lighting circuit and was electrocuted. Although the circuit the electrician was working on was shut off at the circuit breaker, the lighting was part of a multiwire branch circuit where the other phase was on. When the electrician opened the neutrals, backfeed through the energized leg energized the opened neutrals the electrician was electrocuted. There have been a number of similar cases in recent years with this same situation and which have resulted in an electrocution. The proposed change would result in both legs of the multiwire branch circuit being deenergized when either leg was shut off and being worked, eliminating possible backfeed and electrocution. As the case is currently in litigation, further details are not yet available but the continuing hazard is clear.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action on Proposal 2-10. The revisions in Proposal 2-10 accomplish the intent of the submitter.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
PURVIS, R.: See reason on Explanation of Negative for Proposal 2-10.

2-13 Log #3377 NEC-P02 **Final Action: Reject**
(210.4(B))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Delete this paragraph.
Substantiation: Effective with the 2005 NEC, this rule is completely subsumed by 210.7(B). The revised wording in 210.7(B) covers both multiwire and multiple two- (or three-) circuit applications. It is unwise code administration to place different versions of the same rule in two different locations, particularly when the wording isn't quite the same.
Panel Meeting Action: Reject
Panel Statement: The panel does not agree with the submitter's substantiation that the text is redundant with 210.7(B). Section 210.4 applies to all multi-wire branch circuits. 210.7(B) applies where two separate circuits may supply the equipment. See the panel action on Proposal 2-10.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-14 Log #3567 NEC-P02 **Final Action: Accept in Principle**
(210.4(B))

Submitter: John Grzywacz, U.S. Department of Labor Occupations Safety and Health Administration
Recommendation: Revise as follows:
210.4(B) Devices or Equipment. Where a multiwire branch circuit supplies more than one device or equipment ~~on the same yoke~~ , a means shall be provided to disconnect simultaneously all ungrounded conductors supplying those devices or equipment at the point where the branch circuit originates.
Substantiation: Problem: Electrocution of electricians working on multiwire branch circuits.
Substantiation: There is a current fatality case in litigation by OSHA where an experienced veteran electrician was wiring a lighting circuit and was electrocuted. Although the circuit the electrician was working on was shut off at the breaker, the circuit was part of a multiwire branch circuit where the other leg was on. When the electrician opened the neutrals, backfeed through the energized leg energized the neutrals which were opened and the electrician was electrocuted. There have been several similar cases in recent years where this same situation occurred and resulted in an electrocution. The proposed change requirements would result in both legs of the multiwire branch circuit being deenergized when either leg was shut off and being worked whereby eliminating possible backfeed and electrocution. Since the case is currently in litigation, the file is not yet available from OSHA, however, upon conclusion of the case the case file would be made available.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action on Proposal 2-10. The revisions in Proposal 2-10 accomplish the intent of the submitter.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
PURVIS, R.: See my Explanation of Negative for Proposal 2-10.

2-15 Log #3660 NEC-P02 **Final Action: Reject**
(210.4(B))

Submitter: James O'Driscoll, IBEW Local #98 / Rep. Eastern Code Advisory Group
Recommendation: Add to bottom of text - This means shall also disconnect all ungrounded conductors on an overcurrent condition.
Substantiation: If a fused safety disconnect switch is employed as the branch circuit overcurrent device, in the event of a ground fault, only one fuse could open, possibly leaving other energized ungrounded conductors present on this device. This would be a safety hazard. A circuit breaker sized with the proper number of poles would simultaneously open and de-energize all conductors upon a fault condition.
Panel Meeting Action: Reject
Panel Statement: The requirement only deals with disconnection requirements and not overcurrent requirements. Requirements for overcurrent protection are under the purview of CMP-10 in Article 240.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-16 Log #2251 NEC-P02 **Final Action: Accept in Principle in Part**
(210.4(D) (New))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 5 for information.
Submitter: Michael L. Last, Na'alehu, HI
Recommendation: Add new text to read as follows:
(D) Identification of Ungrounded and Associated Grounded Conductors. At each branch circuit panelboard where multiwire branch circuits originated, there shall be means to identify all multiwire branch circuit ungrounded (phase or line) conductors (two or more) and their associated grounded (neutral) conductor. Such identification shall be permanent, by approved means, and prominently displayed. Identification shall also indicate the lines (phases) to which the individual ungrounded conductors are attached. At all other locations where it is possible to interrupt the integrity of the grounded (neutral) conductor of a multiwire branch circuits, similar means shall be made to identify said grounded conductor with its associated ungrounded conductors. At all locations where more than one multiwire branch circuit is present, each separate multiwire branch circuit shall be uniquely identified whereby each grounded conductor is readily identified to the corresponding ungrounded conductors of that particular multiwire branch circuit.
Substantiation: Multiwire branch circuits are unique in that when the integrity of the grounded (neutral) conductor is compromised, a serious voltage imbalance can occur. The effect of such imbalance can place the safety of the individual(s) performing work on said multiwire branch circuit at risk. The possibility exists also for detrimental consequences to the equipment connected to the multiwire branch circuit. Similarly, when an ungrounded conductor of a multiwire branch circuit is disconnected and then reconnected to a different phase (line), there exists the potential for the grounded conductor of this multiwire branch circuit to operate at a current value that exceeds its ampacity. Where all the ungrounded and grounded conductors of a multiwire branch circuit are contained within a cable assembly, it could be readily indicated which are the associated conductors, however, when the conductors of a multiwire branch circuit(s) are not part of a cable assembly - such identification is not readily apparent. The concern for the integrity of the grounded conductor is apparent in 300.12(B). Similar concern should be addressed at all points of a multiwire branch circuit, not just where devices connections are present. To stipulate that only qualified personnel would perform work on multiwire branch circuits, and, therefore, be cognizant of the associated hazards (i.e., voltage imbalance and grounded conductor ampacity) is to rely on a false premise. When an electrical professional encounters a multitude of conductors of varying colors, along with the need to perform the task in a timely manner, safety is not always paramount. This proposal will increase the level of safety by making the worker immediately aware of the multiwire branch circuit characteristics.
Panel Meeting Action: Accept in Principle in Part
Add a new 210.4(E) to read:
(E) Identification. The grounded conductor of each multiwire branch circuit shall be clearly identified by marking tape, tagging or other approved means to indicate which ungrounded conductors it is associated with at the panelboard or other point of origination.
Panel Statement: This action in concert with the action on Proposal 2-17 will enable the grounded conductor of a multiwire branch circuits to be identified at their point of origin to enable service personnel to clearly associate all conductors of a multiwire branch circuit. The panel does not agree that the requirement to identify the grounded conductor should apply to the entire circuit length.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
KING, D.: See my Affirmative with Comment on Proposal 2-10.

2-17 Log #3378 NEC-P02 **Final Action: Accept in Principle**
(210.4(D) (New))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 5 for information.
Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Create a new 210.4(D) as follows:
(D) Conductors. The ungrounded and grounded conductors of each multiwire branch circuit shall be grouped using wire ties or similar means within the panelboard or other point of origination unless the circuit enters a cable or raceway unique to the circuit that makes the grouping obvious.
Substantiation: One of the problems of multiwire branch circuits is being assured that the neutral is really dead, and the only way to be sure of that is to be sure all the associated ungrounded conductors are disconnected. This comment works toward that end by forcing new installers to take care that they keep track of which white wire belongs with which colored wires and that they arrive at the same location. Although the requirement to originate in the same panelboard has been around for some time, it has been difficult to enforce, since everything connected will "work" if the rule is violated. It is true that occasionally one ungrounded leg of a multiwire circuit must be worked with the other legs still energized, however, it is still important to know which legs of the multiwire belong with which neutral, even if the not all the legs are disconnected.
Panel Meeting Action: Accept in Principle
Add a new 210.4(D) to read as follows:
(D) Grouping. The ungrounded and grounded conductors of each multiwire branch circuit shall be grouped by wire ties or similar means in at least one location within the panelboard or other point of origination.
Exception: The requirement for grouping shall not apply if the circuit enters from a cable or raceway unique to the circuit that makes the grouping obvious.
Panel Statement: The panel has accepted the concept but has added language to make it clear that the grouping is required at some point within the panelboard or other distribution equipment. This is necessary because not all arrangements of equipment would support grouping of the conductors along their entire length.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
PURVIS, R.: See my Explanation of Negative for Proposal 2-10.
Comment on Affirmative:
KING, D.: See my Affirmative with Comment on Proposal 2-10.

2-18 Log #2148 NEC-P02 **Final Action: Reject**
(210.5)

Submitter: Roger Hewitt, Puget Sound Electrical Apprenticeship / Rep. IBEW LU #46
Recommendation: Delete existing text from 210.5 and replace with:
<u>Branch circuit conductors shall be identified in accordance with 310.12 (ALL).</u>
Substantiation: Multiple sections of the NEC must now be consulted to ensure proper conductor identification. Combining all conductor identification requirements in one section in Article 310 is logical.
Panel Meeting Action: Reject
Panel Statement: The purpose of the requirement is to outline identification requirements for ungrounded conductors of branch circuits. The most logical place for those requirements is in the article dealing with branch circuits.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-19 Log #670 NEC-P02 **Final Action: Accept**
(210.5(C))

Submitter: Jamie McNamara, Hastings, MN
Recommendation: Revise as follows:
210.5 (C) Ungrounded Conductors. Where the premises wiring system has branch circuits supplied from more then one nominal voltage system, each ungrounded conductor of a branch circuit, where accessible, shall be identified by <u>phase and</u> system.
Substantiation: 210.4 in the 2002 NEC required identified by phase and system this identification helps installers and maintenance personnel identify what phase and system they will be services or working on and the hazards encountered.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
BROWN, L.: In all, see Panel Action on related Proposals: 2-19; 2-22; 2-24; 2-290; and 2-292.

2-20 Log #1119 NEC-P02 **Final Action: Reject**
(210.5(C))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise first sentence:
Where the premises wiring system has branch circuits supplied from ~~more than one nominal voltage~~ system <u>s with different characteristics such as voltages, frequencies, or phases, or derived from separate services or separately derived systems,</u> each ungrounded conductor of branch circuits, where accessible, shall be identified by system.
<u>Exception: Conductors for emergency systems.</u>
Substantiation: Different voltages should not be the only criterion for identification. Wiring systems may be supplied from different services, different transformer vaults, on site local transformers, batteries, rectifiers, generators, etc., with voltages no different than other systems, where the potential hazard of misconnection is no less simply because the voltages are the same. The exception is proposed since Article 700 requires identification for emergency systems.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided substantiation to expand the requirement for identification beyond different voltage system. The substantiation submitted to the panel on this issue dealt specifically with different voltages.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
BROWN, L.: In all, see Panel Action on related Proposals: 2-20; and 2-294.

2-21 Log #1444 NEC-P02 **Final Action: Reject**
(210.5(C))

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise as follows:
210.5 Identification for Branch Circuits.
(C) Ungounded Conductors. Where the premises wiring system has branch circuits supplied from more than one nominal voltage system, each ungrounded conductor of a branch circuit, where accessible, shall be identified by <u>voltage</u> system. The means of identification shall be permitted to be by separate color coding, marking tape, tagging, or other approved means and shall be permanently posted at each branch-circuit panelboard or similar branch-circuit distribution equipment.
Substantiation: I applaud panel 2 in acceptance of this change to the 2005 cycle. I do believe, however, that it does need to be relaxed a bit. A very common application for wiring commercial buildings is to "tack" electrical rooms vertically on each floor, with a 480Y/277 volt panel, a transformer and 208Y/120 volt panel in each room. Because of this, each floor creates at least one new "system". With a high rise building, this can mean literally hundreds of different systems. Unfortunately, there are not enough colors of the rainbow to create a color scheme for each system. I urge the panel to consider accepting this change to require identification by "voltage system" as opposed to "system" in an effort to make this code requirement a possibility.
A similar requirement is being made to 200.6(D) for the purposes of correlation.
Panel Meeting Action: Reject
Panel Statement: The current text already states what the submitter is requesting. The "system" required to be identified is the "nominal voltage system" as stated in the first sentence of the current text.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-22 Log #2221 NEC-P02 **Final Action: Accept**
(210.5(C))

Submitter: Donald A. Ganiere, Ottawa, IL
Recommendation: Revise as follows:
(C) Ungrounded Conductors. Where the premises wiring system has branch circuits supplied from more than one nominal voltage system, each ungrounded conductor of a branch circuit, where accessible, shall be identified <u>by phase and</u> system. The means of identification shall be permitted to be by separate color coding, marking tape, tagging, or other approved means and shall be permanently posted at each branch-circuit panelboard or similar branch-circuit distribution equipment.
Substantiation: In the 2002 code, identification was required by both phase and system for multiwire branch circuits. When the identification rule was expanded to cover other than multiwire branch circuits in the 2005 code, the requirement to identify by phase was deleted without substantiation. The identification by phase is required to help prevent overloading of grounded conductors when changes are made to the wiring system.
Panel Meeting Action: Accept

Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
BROWN, L.: In all, see Panel Action on related Proposals: 2-19; 2-22; 2-24; 2-290; and 2-292.

2-23 Log #2681 NEC-P02 **Final Action: Accept in Part**
(210.5(C))

TCC Action: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting related to the use of possibly unenforceable and vague terms.
This action will be considered by the Panel as a Public Comment.
Submitter: Dorothy Kellogg, American Chemistry Council
Recommendation: Revise text of section as follows:
210.5 Identifications for branch Circuits
(C) Ungrounded Conductors. Where the premises wiring system has branch circuits supplied from more than one nominal voltage system, each ungrounded conductor of a branch circuit ~~, where accessible,~~ shall be identified by system at all termination, connection and splice points . The means of identification shall be permitted to be by separate color coding, marking tape, tagging, or other approved means . The means of identification shall be documented in a manner that is readily available or ~~and~~ shall be permanently posted at each branch-circuit panelboard or similar branch-circuit distribution equipment. In industrial occupancies, where conditions of maintenance and supervision ensure that only qualified persons service the installation, a cable and conductor numbering system shall be permitted to meet this requirement.
Substantiation: The current wording would require marking of the conductors at every conduit fitting and pull box or any other location where the branch circuit is accessible. The locations where the branch circuit is terminated, connected or spliced are the critical locations where the marking is needed. The revised wording would account for branch circuits installed using cables and branch circuits installed using single conductors in raceways. Many industrial facilities already have rigorous comprehensive cable and conductor labeling/numbering systems. These systems meet already intent of the requirement and should be allowed. Posting of the numbering system on the equipment is impractical and would be confusing to the people in the field in these kinds of establishments. These labeling/numbering systems are documented on drawings. In these facilities, the drawings are used to gain understanding of the installations and how modifications can be made.
Panel Meeting Action: Accept in Part
1. Accept the submitters revision to the first sentence that deletes the words “where accessible” and adds the words “all termination, connection and splice points”.
2. Accept the submitters revision to the second sentence so that the text reads “The means of identification shall be permitted to be by separate color coding, marking tape, tagging, or other approved
means. The means of identification shall be documented in a manner that is readily available or shall be permanently posted at each branch-circuit panelboard or similar branch-circuit distribution equipment.”
3. Reject the new last sentence proposed by the submitter.
Panel Statement: The panel has accepted the revision to require the identification only at termination, connection and splice points and notes that the acceptance of 2-19, 2-22 and 2-24 will add the words “phase and” into the existing sentence.
The panel agrees that the identification should be permitted to be readily available and has accepted the revision as proposed by the submitter. The panel rejects the new last sentence because the identification proposed would already be permitted by the current text as an “approved means”. It is not the objective of the panel to detail every possible identification scenario.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
KING, D.: Panel 2 should have rejected the proposed text “The means of identification shall be documented in a manner that is readily available or.” This proposed text is vague and unenforceable and will greatly reduce the level of safety that now exists with the text as presently written in the code. Section 210.5(C) applies generally to all types of occupancies. There are no provisions in the proposed text to ensure that the documentation will be updated and available to electrical contractors, maintenance personnel or electrical inspectors after construction is completed. The present code text ensures that proper circuit identification is located at the point where the qualified person servicing the equipment performs the work.
WEBER, R.: I agree with the panel to accept the revision proposed, except for the change that adds the means to identify by allowing “documentation in a manner that is readily available or shall be permanently posted” created a problem. From the inspection community, when the identification of the ungrounded conductors is indicated by phase and system, it needs to be permanently posted at each panel board or distribution equipment. The proposed change could incorporate a file located somewhere to meet the intent of the language, which can be misplaced or lost at a critical time frame when it is most needed. It is our opinion the change to add “phase and” in Proposal 2-24, does make sense but allowing identification by some other manner that is readily available would cause future trouble for the enforcer.
Comment on Affirmative:
BROWN, L.: In all, see Panel Action on related Proposals: 2-23; and 2-291.

2-24 Log #2735 NEC-P02 **Final Action: Accept**
(210.5(C))

Submitter: Jim Pauley, Square D Company
Recommendation: Revise text to read as follows:
(C) Ungrounded Conductors. Where the premises wiring system has branch circuits supplied from more than one nominal voltage system, each ungrounded conductor of a branch circuit, where accessible, shall be identified by phase and system. The means of identification shall be permitted to be by separate color coding, marking tape, tagging, or other approved means and shall be permanently posted at each branch-circuit panelboard or similar branch-circuit distribution equipment.
Substantiation: The objective of this change is for CMP 2 to clarify whether or not the ungrounded conductors are expected to be identified for just the system or whether the expectation is to have the ID provide both phase and system identification. Under the present requirement, all of the ungrounded conductors of one system could carry the same identification provided it is distinguished from the ungrounded conductors of the other system.
If accepted, the new text will clarify that the expectation is to be able to not only distinguish between the different systems, but between the different phases of the system as well.
The previous requirement in 210.4(D) for identification of ungrounded conductors in multi-wire branch circuits applied to both phase and system.
A companion proposal has been made to Article 215 for feeders.
Panel Meeting Action: Accept

2-27 Log #938 NEC-P02 **Final Action: Reject**
(210.5(C) and Exception (New))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise as follows:
Where the premises wiring system has branch circuits supplied from ~~more than one nominal voltage~~ system s with different characteristics, such as voltage, frequencies or phases, or derived from separate services or separately derived systems, each ungrounded conductor of branch circuits, where accessible, shall be identified by system. (Remainder unchanged.)
Exception: Conductors for emergency systems shall not be required to be identified.
Substantiation: Different voltages should not be the only criterion for identification. Wiring systems may be supplied from different services, different transformer vaults, on site local transformers, batteries, rectifiers, generators, etc. with voltages no different from other systems, where the potential hazard of misconnection is no less simple because voltages are the same. The exception is proposed because Article 700 requires identification for emergency systems.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 2-20.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-28 Log #1076 NEC-P02 **Final Action: Reject**
(210.5(C) and Exceptions 1, 2, and 3 (New))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Where the premises wiring system has branch circuits supplied from ~~more than one nominal voltage~~ system s with different characteristics such as voltages, frequencies, phases, or supplied from different services or separately derived systems, each ungrounded conductor of a branch circuit, where accessible, shall be identified by system. Exception No. 1: Conductors for emergency systems.
Exception No. 2: Conductors in busways.
Exception No. 3: Where the Authority Having Jurisdiction determines that a system is sufficiently limited or separated from other systems identification shall not be required.
Substantiation: Different voltages should not be the only criterion for identification. Systems may be supplied from different services, different transformer vaults, local site transformers, batteries, rectifiers, generators, etc., with voltages no different than other systems, where the potential hazard of misconnection is no less. Exception No. 1 is proposed because Article 700 requires identification for emergency systems. It is impractical to identify busway conductors at every plug-in opening and connecting other system conductors to a busway is unlikely. Exception No. 3 provides some relief as, for example, a large industrial plant has multiple services or transformer vault, etc., and those systems supply limited or designated areas of the premises.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 2-20. It is unnecessary to add an exception for busways since the identification means is typically already in place. Exception No. 3 three is not needed since the authority having jurisdiction has the latitude to determine “other approved means”.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-29 Log #3390 NEC-P02 **Final Action: Reject**
(210.5(C), FPN)

Submitter: Randall Opperman, Jr., O.S.C.Inc.
Recommendation: Add new text to read:
FPN No. 1: 240 volt single phase systems shall be identified by red and black marking.
FPN No. 2: 240 volt 3-phase systems shall be identified by black, orange, and blue mark.
FPN No. 3: 480 volt 3-phase systems shall be identified by brown, orange, and yellow markings.
FPN No. 4: 208 volt 3-phase systems shall be identified by black, red, and blue markings.
Substantiation: 210.5 does not specify how a branch circuit shall be identified, yet it tells us to identify it. An industry standard for electricians who use the NEC should be adopted by adding a FPN to the article.
Panel Meeting Action: Reject
Panel Statement: The requirement is intended to be flexible and allow identification means other than color code. In addition, the submitter”s proposed FPN’s are inappropriate because they contain requirements.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
BROWN, L.: In all, see Panel Action on related Proposals: 2-29; and 2-289.

2-30 Log #2543 NEC-P02 **Final Action: Accept in Principle**
(210.5(C) Exception (New))

Submitter: Timothy D. Curry, Curry Electric, Inc.
Recommendation: Add this language after the section:
Exception: Conductors larger than 6 AWG shall not be required to be marked or identified in conduit bodies that contain no splices or unused hubs.
Substantiation: The definition of “accessible” would include these conduit bodies. It is nearly impossible to install the markings, nor does it serve a purpose to require them in a conduit body where there is no realistic chance that anyone is going to try to splice or tap into the circuit. 250.119(A)(1) Exception uses the same logic.
Panel Meeting Action: Accept in Principle
Panel Statement: The recommended action is accomplished through the panel action on Proposal 2-23.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
BROWN, L.: In all, see Panel Action on related Proposals: 2-30; and 2-293.

2-31 Log #2997 NEC-P02 **Final Action: Reject**
(210.6(D) Exception No. 3 (New))

Submitter: Robert H. Wills, Intergrid, LLC / Rep. Photovoltaic Industry Forum
Recommendation: Add the following exception at the end of 210.6(D) Branch-Circuit Voltage Limitations, 600 Volts Between Conductors:
Exception No. 3 to (D): For luminaries (fixtures) installed in direct current systems such as photovoltaic systems described in Article 690.
Substantiation: Fluorescent lighting in commercial and industrial buildings can be powered directly with DC power from photovoltaic (PV) systems. This is called Photovoltaic-Assisted Lighting (PAL) and was first demonstrated more than 20 years ago at a supermarket on Long Island, NY. Several test sites have been implemented since then without problem.
PAL systems can use standard electronic ballasts as these contain rectifiers and can work just as well on DC as AC Power.
The main advantages are efficiency and simplicity - no power conditioning is needed between the PV system and the luminaries.
Ballasts installed in these systems are listed for DC use.
AC ballasts operate best on DC if the DC voltage is near the rectified (peak) value of the normal AC supply.
For 277V AC ballasts, this peak voltage is 391V (with maximum of 430V at 110% of nominal AC voltage).
This also keeps currents low and reduces overall system costs.
210.6(D)(2) excludes luminaries for systems over 277V and thus making photovoltaic-assisted lighting systems using 277V AC ballasts impractical.
It is desirable to support this new technology of photovoltaic-assisted lighting in the NEC by making a provision for DC powered lighting systems with operating voltages up to 430V DC.
210.6(A)(1) limits the use of voltages greater than 120V to commercial and industrial sites.
Panel Meeting Action: Reject
Panel Statement: The recommendation proposed would allow a luminaire with up to 430V to be installed in a location where it could be easily accessed for changing lamps, etc. This defeats the intent of the requirement whichis to require luminaires with voltage supplies higher than 277V to be limited to very specific installations as described in 210.6(D)(1). There is no substantiation to allow luminaires supplied from PV systems to be treated any differently than luminaries power by AC line power.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-32 Log #2742 NEC-P02 **Final Action: Reject**
(210.6(D)(3))

Submitter: Wayne Gutschow, Nextek Power Systems, Inc. / Rep. Photovoltaic Industry Forum
Recommendation: Add the following to 210.6(D) Branch-Circuit Voltage Limitations, 600 Volts Between Conductors:
(3) the auxiliary equipment of electric-discharge lamps mounted in permanently installed luminaires (fixtures) when used in direct current systems.
Substantiation: Commercial fluorescent lighting systems can be powered directly with DC from photovoltaic (PV) systems. This is known as Photovoltaic-Assisted Lighting (PAL).
PAL was first demonstrated more than 20 years ago at a supermarket on Long Island, NY.
More recently, in 1992, the University of Massachusetts at Lowell installed a research system on the Bradlees Department Store in Medford, MA, that has been working flawlessly ever since.
The main advantages of PAL systems are:
- Standard electronic ballasts can be used as they contain rectifiers and work just as well on DC as AC power.

- The lamp terminals are provided with the same voltages as on AC systems - only the ballast input is changed.
- Efficiency: no power conversion equipment is needed between the photovoltaic system and the light ballasts. This can save 5% or more of a building's total lighting load.
- Battery backup can easily be added to provide lighting during power outages.
- The DC bus can also be powered directly from other sources of DC power such as fuel cells and micro-turbines.

Ballasts installed in these systems should, of course, be listed for DC use and 410.74 requires that luminaires be marked for dc operation. (For example, the Sylvania QHE/Universal series is UL listed for use on 380V DC).

A grid-powered AC rectifier is used in PAL systems to supply power at night and on cloudy days.

AC ballasts operate optimally on DC if the DC voltage is near the rectified (peak) value of the normal AC supply. For 277V AC ballasts, this peak voltage is 391V (with a maximum of 430V at 110% of nominal AC voltage). This also keeps currents low and reduces overall system costs.

210.6(D)(2) was changed in the 2005 code, excluding luminaires for systems over 277V and thus making photovoltaic-assisted lighting systems using 277V AC ballasts impractical.

It is desirable to support this new technology of photovoltaic-assisted lighting in the NEC by making a provision for DC powered lighting systems with operating voltages up to 430V DC.

The suggested wording limits the application specifically to light ballasts (the auxiliary equipment of electric-discharge lamps), and also to permanently installed luminaires. 210.6(A)(1) limits the use of voltages greater than 120V to commercial and industrial sites.

Panel Meeting Action: Reject

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-33 Log #668 NEC-P02 **Final Action: Accept in Principle**

(210.7)

Submitter: Jamie McNamara, Hastings, MN

Recommendation: Revise as follows:

210.7 Branch Circuit ~~Receptacle~~ Requirements.

Substantiation: Change the heading to read **Branch Circuit Requirements** . 210.7 cover more than receptacles (B) reads **"(B) Multiple Branch Circuits.** Where two or more branch circuits supply device or equipment on the same yoke, a means to simultaneously disconnect the ungrounded conductors supplying those devices shall be provided at the point the branch circuits originate."

Panel Meeting Action: Accept in Principle

Panel Statement: The recommended action is accomplished through the panel action on Proposal 2-35.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

(Note: Sequence 2-34 was not used)

2-35 Log #3666 NEC-P02 **Final Action: Accept**

(210.7)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Recommendation: Retitle this section "Branch Circuit Requirements for Device Connections and Locations."

Substantiation: This proposal eliminates the direct conflict between the section title, which only covers receptacles, and (B) which was broadened in the 2005 cycle to include all other equipment that might be fed by multiple circuits, whether multiple two- or three-wire, or multiwire.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-36 Log #87 NEC-P02 **Final Action: Reject**

(210.7(C) (New))

Submitter: Robert A. Kelly, Robert A. Kelly and Associates

Recommendation: Add a new paragraph (C) to Section 210:7:

(C) Receptacle outlets installed in a wet location shall be connected to circuits having ground-fault circuit-interrupter protection.

Substantiation: On two occasions in the past year, I have been called to make repairs to outside duplex receptacles destroyed by arcing.

In the first case, the duplex receptacle was in a flush mounted metal outlet box with a weatherproof cover in an outside wall sided with cedar shakes (a wet location). The outlet was not in use and the cover was shut. The weather was humid (late evening) but it had not been raining. The wiring method was nonmetallic sheathed cable. Moisture was able to enter the duplex receptacle and cause tracking internally, with the resulting arc creating a great deal of smoke. I was told the overcurrent device tripped, opening the circuit.

In the second case, the duplex receptacle was in a flush mounted metal outlet box with a weatherproof cover in an outside wall of brick veneer (a wet location). The outlet was not in use and the cover was shut. The weather was humid (early AM) but it had not been raining. The wiring method was armored cable. Moisture was able to enter the duplex receptacle and cause tracking internally, with the resulting arc creating smoke and fire, destroying the wooden sheathing in the vicinity of the outlet and a portion of the wooden stud to which the sheathing was nailed. I arrived after the firemen put the fire out and found the overcurrent device had tripped, opening the circuit. In addition to destroying the duplex receptacle, about four inches of the armored cable outside the outlet box and inside the wall was destroyed. The armored cable had been secured to the outlet box via a knockout and clamp.

To the best of my knowledge, the installations at both residences met all current Code requirements except for having ground-fault circuit-interrupter protection for personnel per 210.8(A)(3).

As you are aware, moisture and electricity do not mix. Given the materials from which receptacles are made (GFI and conventional), moisture makes them susceptible to tracking and arcing. While GFI receptacles provide protection to personnel, they, like conventional receptacles, with the presence of moisture (from condensation or seepage), can track from the live parts to other grounded parts, creating an arc and causing damage.

Use of a GFI receptacle in a wet location would not be a solution as it does not have the ability to disconnect power from its supply terminals. (I have had to replace GFI receptacles that were damaged by moisture.)

By requiring ground-fault circuit-interrupter protection upstream from a receptacle exposed to moisture, if racking does occur, as soon as the grounding conductor becomes involved, either from tracking or via combustion products and usually quickly, the circuit will be interrupted and damage will be significantly limited.

Use of ground-fault circuit-interrupter protection upstream from places where moisture is present will provide excellent protection to susceptible equipment and would have prevented the fire in the second case described above.

Panel Meeting Action: Reject

Panel Statement: The submitter notes that in both instances cited, GFCI protection was not provided as required by the current edition of the Code. The submitter has not provided sufficient substantiation to change the current requirement.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-37 Log #2663 NEC-P02 **Final Action: Reject**

(210.8)

Submitter: Anthony J. Denami, Nash Lipsey Burch, LLC

Recommendation: (A) Dwelling Units and (3) Other than Dwelling Units.

Add requirement for lighting installed in showers over bath tubs and within 6 feet of shower/tub to be protected by ground fault interrupter.

Substantiation: The receptacle located adjacent to the basin has GFI protection and most have feed through protected feature. It would not cost any more to connect this lighting to the GFI and the protection for personnel is achieved. This would also apply to hotels, motels and similar facilities.

Panel Meeting Action: Reject

Panel Statement: The proposal does not recommend specific code text as is required by Section 4.3.3(c) of the NFPA Regulations Governing Committee Projects.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-38 Log #2415 NEC-P02 **Final Action: Reject**

(210.8(7))

Submitter: Dan Frohberg, Northeast Community College

Recommendation: Add new text to read:

Exception No. 1 to (7): Receptacles that are not readily accessible.

Exception No. 2 to (7): A single receptacle or a duplex receptacle for two appliances located within the dedicated space for each appliance that, in normal use, is not easily moved from one place to another, that is cord and plug connected in accordance with 400.7(A)(6), (A)(7), or (A)(8).

Substantiation: The receptacles that would be affected are those within six feet of a laundry sink such as the washer or gas dryer, or a small refrigerator in a built in bar. We are given the same exceptions in other areas of the structure. This will make the exceptions standard throughout.

Panel Meeting Action: Reject

Panel Statement: The submitter has not substantiated the need for exceptions to the GFCI requirement. All of the equipment mentioned in the submitter's substantiation is compatible with GFCI protection.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-39 Log #558 NEC-P02 **Final Action: Reject**

(210.8(A))

Submitter: Tracy Barnett, Dickson, TN

Recommendation: Add additional wording to read:

The GFCI when in the tripped position shall not significantly impede the lighting in that area.

Substantiation: Lighting in these areas when lost due to a tripped GFCI can

introduce a hazard. As an electrical inspector, here are two examples I see: 1) lighting in stairs leading down to garage and garage lighting all on load side of GFCI for garage receptacles; and 2) lighting under floor will be on load side of GFCI service receptacle for HVAC.
Panel Meeting Action: Reject
Panel Statement: The submitter"s recommendation is a design issue. In addition, the words "significantly impede" are vague and unenforceable. The panel notes that there is no prohibition for any general lighting to be supplied by a GFCI and adding such a limitation would be design restrictive.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
BROWN, L.: From an emergency egress safety standpoint the submitter does address an issue of most
importance - That being the ability to see to safely egress a space. In most commercial
occupancies an emergency lighting is now installed in restrooms. In the case of a power failure the occupant has the ability to egress the restroom, as well as all other parts of the means of egress to the exit discharge. As a GFCI (or an AFCI for that matter) has the potential to disconnect the power to the lighting of an area (either through a fault or unintentional tripping) this could impede the egress from the space. This is of particular concern to those with disabilities. The installation of lighting on a GFCI protected circuit where there is no emergency lighting raises the potential for this problem and possible harm to the occupants. I would encourage the Submitter to submit a Public Comment on this change, using text that is written in enforceable code language. I also encourage the Panel to consider this concern, not from a design standpoint of receptacle protection, but the potential of physical harm to the occupants, especially those with disabilities when the lighting is connected to a GFCI protected circuit.

2-40 Log #3601 NEC-P02 **Final Action: Accept in Principle**
(210.8(A))

TCC Action: The Technical Correlating Committee understands that the Panel Action on this Proposal adds the additional new sentence after the existing sentence in 210.8(A)(5).
The Technical Correlating Committee understands that the Panel Action on Proposal 2-41 modifies the Panel Action on this Proposal and reidentifies the existing Exception No. 3 as Exception.
Submitter: Douglas Hansen, Code Check
Recommendation: Eliminate exception number 2 to (2) and eliminate exception number 2 to (5).
Substantiation: The change in 210.8(A)(7) in the 2005 edition has created a contradiction. If a laundry or utility sink is present in a garage or basement, and a clothes washer receptacle is within 6 feet of that sink, it now requires GFCI protection. The existing exceptions are no longer necessary. The present generation of GFCI devices do not have the problems of "nuisance tripping" that plagued the earlier devices.
Panel Meeting Action: Accept in Principle
In addition to deleting the exceptions the following text is to be deleted from 210.8(A)(2) and.
~~"Receptacles installed under the exceptions to 210.8(A)(2) shall not be considered as meeting the requirements of 210.52(G)."~~
Revise the current code text in the last paragraph of 210.8(A)(5) to read:
"Receptacles installed under the exception ~~s~~ to 210.8(A)(5) shall not be considered as meeting the requirements of 210.52(G)."
Panel Statement: The meeting action taken by the panel correlates with the accepted recommendation to delete the exceptions.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
BROWN, L.: I sincerely hope, from the discussion by the "experts" on the Panel, that the "problem" of "nuisance tripping" no longer exists. These two Exception were developed to address certain and clear needs. The Submitter's Substantiation related the need to delete these Exceptions to the installation of a utility sink and clothes washer. Using Exception #2, it is a refrigerator or freezer located on a GFCI protected circuit in a garage or basement loosing power and spoiling its consumable contents that is still of concern.
PURVIS, R.: The Submitter has not provided sufficient substantiation ("The existing exceptions are no longer necessary") to expand the requirements for GFCIs in dwellings.

2-41 Log #3602 NEC-P02 **Final Action: Accept**
(210.8(A))

Submitter: Douglas Hansen, Code Check
Recommendation: Eliminate exception #1 to (2) and exception #1 to (5).
Substantiation: Being "readily accessible" is too vague a standard. A garage door opener might not be readily accessible to a person who is 5 feet tall, and it could be accessible to a person who is 6 feet tall. There is no longer a need for these exceptions. The current generation of GFCI devices do not have the problems of nuisance tripping that were common with older GFCIs.
Panel Meeting Action: Accept
Panel Statement: See the panel action on Proposal 2-40.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
PURVIS, R.: See my Explanation of Negative for Proposal 2-40.

2-42 Log #3553 NEC-P02 **Final Action: Reject**
(210.8(A) & (B))

Submitter: Wayne Clevenger, Durham City/ County Inspections
Recommendation: Revise as follows:
210.8(A)(9) and 210.8(B)(6):
All 125 V receptacles located within 6 ft of sink, tub, or other body of water shall be GFCI protected.
Substantiation: Outlets in dwellings are often located within 6 ft of kitchen sink or utility sink not GFCI protection (most appliance cords 6 in. in length)
Outlets in commercial break rooms with sink not GFCI protected.
Isn't this what the code should require since GFIs are made for.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided substantiation to expand the GFCI requirement in such a general manner.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
KING, D.: I disagree with the panel action to reject this proposal. Panel 2 has accepted this proposal in part with the panel meeting action on proposal 2-81. The panel action on proposal 2-81 requires GFCI protection for all receptacles installed within 6 feet of a sink in other than dwelling units. In proposal 2-81, the submitter substantiated that the same electrical hazard exists in the area of a sink regardless of the type of occupancy where the sink is installed and that the same requirements for GFCI protection should be applied consistently to all receptacles installed in close proximity of a sink. Panel 2 has recognized the need for GFCI protection within 6 feet of sinks in dwelling units for many years. The present code text would allow for the installation of a receptacle within 6 feet of a kitchen sink without GFCI protection if the receptacle were to be installed more than 12 inches below the surface of the countertop. The submitters proposed text would require this receptacle to have GFCI protection and make
the requirements for GFCI protection within 6 feet of a sink in dwelling units the same as they are for installations in other than dwelling units.
Comment on Affirmative:
BROWN, L.: The term "other body of water" is too vague and would include water in a bucket or portable tub, and a puddle of water on the floor.

2-43 Log #1620 NEC-P02 **Final Action: Reject**
(210.8(A), Exception to (7))

Submitter: John Powell, Independence, OR
Recommendation: Add new text as follows:
<u>Exception to (7): A single receptacle or a duplex receptacle for two appliances located within dedicated space for each appliance that, in normal use, is not easily moved from one place to another and that is cord-and -plug connected in accordance with 400.7(A)(6), (A)(7), or (A)(8).</u>
Substantiation: Currently, 210.8(A)(7) would not allow a 125-volt washing machine to be located within 6 ft of a laundry sink unless the receptacle is GFCI protected. GFCI protection of washing machines are prone to nuisance tripping. This exception will mirror exceptions granted to 210.8(A)(2) for garages.
Panel Meeting Action: Reject
Panel Statement: The objective of the current requirement is to include the washing machine receptacle if it is installed within 6 feet of the sink. The panel disagrees with the submitter in the statement that "washing machines
are prone to nuisance tripping". A GFCI trips when the ground fault current exceeds 4-6mA. Washing machines are limited to leakage currents well below this threshold. If the washing machine has leakage current that exceeds the trip limits, the washing machine should be examined and repaired.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-44 Log #126 NEC-P02 **Final Action: Reject**
(210.8(A) Exception No. 3)

Submitter: Louis Roselle, Louis Roselle Electrical Cont. Inc.
Recommendation: Revise as follows:
Exception No. 3: A <u>single</u> receptacle supplying only a permanently installed fire alarm or burglar alarm system shall not be required to have ground fault circuit-interrupter protection.
Substantiation: Exception No. 2 states a single receptacle or a duplex receptacle for the twoappliances.
Life Safety Equipment, I feel, are not appliances as listed in Article 100. The word "single" would leave no doubt.
Panel Meeting Action: Reject
Panel Statement: Many power supply units for these systems have a retention screw that holds the power supply in place. Requiring a single receptacle

would defeat the ability to use the center of a duplex receptacle as a means to hold the supply in place. The panel notes that the use of the other receptacle can be limited by removing the tabs from the duplex receptacle. The panel understands that the recommendation is for Section 210.8(A)(5) Exception No. 3.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-45 Log #2152 NEC-P02 **Final Action: Reject**
(210.8(A)(1))

Submitter: Darwin Jones, IBEW
Recommendation: Revise text to read:
210.8 Ground-Fault Circuit-Interrupter Protection for Personnel.
(A) Dwelling Units. All 125-volt, single phase, 15- and 20-ampere receptacles installed in the locations specified in (1) through (8) shall have ground-fault circuit-interrupter protection for personnel.
(1) Bathrooms. <u>The ground fault circuit interrupter receptacle or device, protecting a bathroom shall be located in the bathroom being protected.</u>
Substantiation: 210.11(C)(3) requires an individual branch circuit to serve bathroom receptacle outlet(s). Such circuits shall have no other outlets. It states in the exception that if that branch circuit supplies a single bathroom that it may also serve other loads in that bathroom. This statement then obivously allows a single branch circuit to serve multiple bathrooms providing that it serves only the receptacle outlets.
As an Electrical Inspector for the State of South Dakota, I see many residences with multiple bathrooms on different levels being served by one individual branch circuit serving only the receptacle outlets. The electricians are placing the GFCI device in the bathroom located closest to the panel and protecting the other bathrooms which contain a standard duplex receptacle. When and if the GFCI device trips, it requires the homeowner to go to the location of the GFCI device to reset it. This trip could require going up or down two flights of stairs. The homeowner may have bare feet, slippers, loose fitting clothing or other encumbrances that are dangerous for climbing stairs. It is also very inconvenient for the homeowner. While the present code protects the individual from an electrical injury, it does in fact, invite the possibility of other injuries caused by the process of resetting the very device designed to protect them.
Panel Meeting Action: Reject
Panel Statement: This is a design issue and may be an inconvenience, but it is not an unsafe application.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
KING, D.: I agree with the panel action based on the substantiation that was provided. I disagree with the panel statement that this is a design issue and that it is not an unsafe application. The submitter of this proposal has raised a valid safety concern that should be considered further by panel 2.

2-46 Log #2349 NEC-P02 **Final Action: Reject**
(210.8(A)(1))

Submitter: Andre R. Cartal, Princeton Borough Building Dept.
Recommendation: Add Exceptions No. 1 and No. 2 that are in 210.8(A)(2).
Substantiation: This change will provide NEC and enforcement logic. There was a debate on the laundry in the bathroom a couple of Code cycles ago, the concern was that people could hop out of the shower and get clothes out of the laundry equipment. There is no relief from ground fault protection.
Presently, relief is granted for basements and garages even though basements and garages typically have concrete floors. In the summer, it is common for homeowners to be barefoot.
Panel Meeting Action: Reject
Panel Statement: The panel does not agree that equipment in bathrooms should be exempt from the GFCI protection requirements. The change recommended by the submitter reduces the protection provided without substantiation. See the panel action on Proposals 2-40 and 2-41.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-47 Log #1853 NEC-P02 **Final Action: Reject**
(210.8(A)(2))

Submitter: Rand Veerman, Town of Normal
Recommendation: Receptacles installed under the exceptions to 210.8(A)(2) shall not be considered as meeting the requirements of 210.52(G) <u>and shall be marked "Warning: No GFCI Protection."</u>
Substantiation: People who own newer homes assume that basement and garage receptacles are GFCI protected. When the original owner moves out taking his appliances, the second homeowner is left with unmarked and unprotected receptacles. This poses an obvious danger.
Panel Meeting Action: Reject
Panel Statement: The panel has deleted the exceptions. See panel action on Proposals 2-40 and 2-41.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-48 Log #3138 NEC-P02 **Final Action: Reject**
(210.8(A)(2))

Submitter: Dale Rooney, Municipality of Anchorage
Recommendation: Add new sentence after exception no. 2 (not part of ex. No. 2) to read:
Exceptions nos. 1 and 2 shall only be permitted after incompatible equipment has been identified and investigated for leakage current.
Substantiation: Despite improvements in the product standards for appliances and GFCI devices, there is a longstanding assumption that certain appliances should not be used on GFCI protected circuits. This new requirement will force electricians to test not only the equipment but their own assumptions as well.
Panel Meeting Action: Reject
Panel Statement: The panel has deleted the exceptions. See panel action on Proposals 2-40 and 2-41.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-49 Log #2118 NEC-P02 **Final Action: Reject**
(210.8(A)(2)(5), Exception No. 2)

Submitter: Jennifer Eigenberger, Lakeshore Technical College
Recommendation: Revise as follows:
A single receptacle <u>for one appliance</u> or a duplex receptacle for two appliances...
Substantiation: As an instructor, I often see difficulties interpreting this section. Many students believe the wording means that an installer has a choice of a single or a duplex receptacle. I believe the confusion would cease by adding three words, "for one appliance."
Panel Meeting Action: Reject
Panel Statement: The panel has deleted the exceptions. See panel action on Proposals 2-40 and 2-41.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-50 Log #3180 NEC-P02 **Final Action: Accept**
(210.8(A)(2) Exception No. 1 to (2))

Submitter: Donald Cook, Shelby County Development Services
Recommendation: Delete this exception completely.
Substantiation: The protection afforded by GFCI is not related to the location of the receptacle. If cord and plug connected utilization equipment is powered from this receptacle and has leakage current at a level that will trip the GFCI, protection should be provided. The permitted leakage current for typical cord and plug connected equipment is.5 ma. The trip range for GFCI protective devices is 4-6 ma. For this utilization equipment to trip the GFCI device, it would have 8 to 12 times the leakage current permitted by the product standard. The fact that the receptacle is not readily accessible will have no impact on the shock hazard to a person touching the utilization equipment.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
PURVIS, R.: See my Explanation of Negative for Proposal 2-40.

2-51 Log #3182 NEC-P02 **Final Action: Accept**
(210.8(A)(2) Exception No. 2)

Submitter: Donald Cook, Shelby County Development Services
Recommendation: Delete this exception completely.
Substantiation: The protection afforded by GFCI is not related to the location of the appliance or how easy the appliance is to move. If cord and plug connected utilization equipment is powered from this receptacle and has leakage current at a level that will trip the GFCI, protection should be provided. The permitted leakage current for typical cord and plug connected equipment is.5 ma. The trip range for GFCI protective devices is 4-6 ma. For this utilization equipment to trip the GFCI device, it would have 8 to 12 times the leakage current permitted by the product standard. The fact that the appliance is in a dedicated space and not easy to move will have no impact on the shock hazard to a person touching the utilization equipment.

BROWN, L.: Please see NAHB's Ballot Comment on Proposal 2-40 (Log #3601).
PURVIS, R.: See my Explanation of Negative for Proposal 2-40.

2-58 Log #561 NEC-P02 **Final Action: Reject**
(210.8(A)(5) Exception No. 3 to (5), FPN (New))

Submitter: Larry T. Smith, National Electrical Seminars
Recommendation: Add a new FPN to read:
Exception No. 3 to (5): A receptacle supplying only a permanently installed fire alarm or burglar alarm system shall not be required to have ground-fault circuit-interrupter protection.
<u>FPN: See 760.21 and 760.41. Power sources for fire alarms systems shall not be supplied through ground-fault circuit-interrupters.</u>
Substantiation: Both 760.21 and 760.41 make it clear that power sources for fire alarm circuits are not to be supplied through circuits protected by ground-fault circuit-interrupters or arc-fault circuit interrupters; this was a change in the 2005 NEC.
As presently written, 210.8(A)(5), Exception No. 3, simply states that fire alarm systems in unfinished basements are not required to have ground-fault circuit-interrupter protection; this Fine Print Note will alert installers that fire alarm systems are not permitted to be supplied by circuits that have ground-fault circuit-interrupter protection.
Panel Meeting Action: Reject
Panel Statement: The panel does not agree with adding the cross reference. If a fire alarm system is being installed, all applicable requirements of Article 760, including 760.21 and 760.41 have to be complied with.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
BROWN, L.: It may be advisable to include this cross-reference FPN in Chapter 2 as most electricians who wire one- and two-family dwellings and low-rise multifamily buildings very rarely use the provisions of Chapter 7. In addition, NAHB would like to make sure this important information is included in the electrical provisions of the ICC International Residential Code (IRC). These provision are extracts from NFPA 70.

2-59 Log #579 NEC-P02 **Final Action: Reject**
(210.8(A)(5) Exception No. 4 (New))

Submitter: Larry T. Smith, National Electrical Seminars
Recommendation: Add new Exception No. 4 to 210.8(A)(5):
<u>Exception No. 4 to (5): A single receptacle supplying a permanently installed sump pump.</u>
Substantiation: Permanently installed sump pumps were excluded from ground-fault circuit-interrupting protection in the 1990 and 1993 versions of the NEC as Exception No. 3.
The proposal to delete the sump pump exception was submitted by Robert H. Heis (Log #3398, Proposal 2-139, 1995 ROP). His intent was to include sump

pumps under, what was then, new Exception No.1: A single receptacle or a duplex receptacle for two appliances located within dedicated space for each appliance that, in normal use, is not easily moved from one place to another and that is cord-and-plug connected in accordance with 400.7(A)(6), (A)(7), or (A)(8).

Sump pumps do fit within the loose definition of appliances in Article 422, but are not specifically mentioned by name. I've had numerous reports from wireman and electrical contractors that many AHJs are requiring GFCI protection for sump pumps; the end result is occasional nuisance tripping and flooding. It was apparently not the intent of this Code-Making Panel, in accepting Robert H. Heis's proposal, to require GFCI protection for sump pumps. Restoration of this exception will eliminate, what appears to be, fairly common misinterpretation of this section.

Panel Meeting Action: Reject

Panel Statement: Sump pumps are not incompatible with GFCI protection. There is no technical basis to exempt them from GFCI protection.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

BROWN, L.: Though the discussion during the meeting set out that the old problems with GFIA nuisance tripping has been solved, I hope the new technology has solved all reasons for the nuisance tripping. The committee may want to reconsider this Proposal and all a sump pump to be non-GFCI protected.

As with fire pumps during an emergency fire situation (where the intent of not having overload
protection or GFCI protection is to ensure the pump motor can run until it burns up), there are
situations where the assurance of the availability of the sump pump needs to be maintained during flooding situations. The fire pump overload and GFCI provisions are located in Section 430.31 FPN, and Section 695.6 (D) and (H).

2-60 Log #1893 NEC-P02 **Final Action: Reject**
(210.8(A)(6))

Submitter: Norman Ellis, Stellar Inspections, Inc.

Recommendation: Revise as follows:

(6) Kitchens - Where the receptacles are installed to serve the counter top surfaces <u>or installed within 1.8 m (6 ft) of the outside edge of the sink.</u>

<u>Exception No. 1 to (6): Receptacles that are not readily accessible.</u>

<u>Exception No. 2 to (6): A single or a duplex receptacle for two appliances located...".</u>

Substantiation: Homes with kitchens where a knee wall or adjacent wall often have duplex receptacles where crockpots, decorations, phone charger, etc., rendering a safety hazard. Please provide provision for safety as this is often overlooked or argued over during construction inspection.

Panel Meeting Action: Reject

Panel Statement: If the receptacle is being used to supply the countertop, it must be provided with GFCI protection regardless of its location. The submitter has not presented any evidence that receptacles that do not serve the countertop are creating a specific hazard. In addition, the submitter has not provided any substantiation to add the exceptions to the kitchen requirements.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

KING, D.: This proposal should have been accepted in part. I agree with the panel that the submitter has not provided any substantiation to add exceptions to the required GFCI protection for receptacles serving countertops in residential kitchens, but disagree with the panel's position on GFCI protection of receptacles within 6 feet of a kitchen sink. See my explanation of negative for proposal 2-42.

Comment on Affirmative:

BROWN, L.: The 1990 NFPA 70 (NEC) (210-8(a)(5) (dwelling units) only required: "receptacles installed within 6 feet of a kitchen sink" to have GFCI protection.

This changed in the 1993 NEC (210-8(a)(5) (dwelling units) as the provision was changed to:
"receptacles to serve counter top surfaces, installed with 6 feet of a wet bar sink or kitchen sink."
In the 1996 NEC (210-8(a)(6) (dwelling units - kitchens) it was changed to apply only: "Where the receptacles are installed to serve the countertop surfaces." Any reference to the kitchen sink was removed from this provision. Though, provision (210-8(a)(7) (dwelling units - wet bar sinks) for GFCI protect for: "receptacles where installed to serve counter top surfaces and are located within 6 feet of the outside of the wet bar sink" was separated out into a new provision.
No change was made in the 1999 (210-8(a)(7) or 2002 (210.8(A)(7) editions of the NEC related to the GFCI locations for kitchens or wet bar sinks.

The 2005 NEC expanded Section (210-8(A)(7) to include "laundry, utility, and wet bar sinks", and the
GFCI locations changed to: "where the receptacles are installed within 6 feet of the outside of the sink." The relationship to serving a counter top was removed. The provisions for kitchen GFCI's (210-8(A)(6) did not change.

So the question is raised - does a receptacle on a wall in a kitchen, not serving the counter top surface, but within 6 feet of the sink, required to have GFCI protection? It would appear the NEC would not require GFCI protection for the wall outlet within 6 feet of a kitchen sink. Though, it would for any other type of sink. In addition, please refer to the Panel Statement on Proposal 2-64.

2-61 Log #3528 NEC-P02 **Final Action: Reject**
(210.8(A)(6) Exception No. 1 (New))

Submitter: Timothy McCord, Washington, PA

Recommendation: Add an exception to read as follows:

(6) Kitchens. Where the receptacles are installed to serve the countertop surfaces.

<u>Exception No. 1: A single receptacle or a duplex receptacle for two appliances located within dedicated space for each appliance that, in normal use, is not easily moved and that is cord-and-plug connected in accordance with 400.7(A)(6), 400.7(A)(7) or 400.7(A)(8).</u>

Substantiation: This will eliminate tripping of the GFCI due to motor loads.

Panel Meeting Action: Reject

Panel Statement: The submitter has not substantiated that "motor loads" are tripping the GFCI. Motor operated appliances are compatible with GFCI protection.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-62 Log #2348 NEC-P02 **Final Action: Reject**
(210.8(A)(7))

Submitter: Andre R. Cartal, Princeton Borough Building Dept.

Recommendation: Add new text to read:

210(8)(A) Exceptions No. 1 and No. 2 should be included with (7).

Substantiation: This will provide equal NEC provisions for equal installations. I can't see the logic of a washing machine being a hazard based on the installation of a laundry tub.

Panel Meeting Action: Reject

Panel Statement: The submitter has not substantiated adding new exceptions to the rule. Expansion of the exceptions to other areas is counter to increased safety, particularly since the equipment in question is compatible with a GFCI. See the panel action on Proposals 2-40 and 2-41.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-63 Log #2878 NEC-P02 **Final Action: Reject**
(210.8(A)(7))

Submitter: James J. Rogers, Bay State Inspectional Agency

Recommendation: Add a second paragraph to read as follows: This requirement for receptacles that are within this area and are solely for supplying power to permanently installed laundry appliances or sump pumps.

Substantiation: This requirement to provide additional protection to general purpose receptacles adjacent to laundry sinks is a good one. However, in reviewing the Panel Statement for 2-38 in the 05 code cycle it appears to me that the Panel was seeking to protect the general use receptacles in these areas not the appliance receptacle.

Panel Meeting Action: Reject

Panel Statement: It is the intent of the rule to cover all receptacles that are installed within 6 feet of the laundry sink, regardless of what they supply.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-64 Log #3120 NEC-P02 **Final Action: Reject**
(210.8(A)(7))

Submitter: Jonathan R. Althouse, Michigan State University

Recommendation: Revise the section as follows to allow for a receptacle in dedicated space to have GFCI protection omitted.

(7) Laundry, utility, and wet bar sinks - where the receptacles are installed <u>to serve a countertop or are readily accessible</u> , and are within 1.8 m (6 ft) of the outside edge of the sink.

Substantiation: The rule, as it is presently written, requires receptacles that are not readily accessible and are installed in dedicated space to serve not easily moved appliances to also be GFCI protected if located within 1.8 m of the edge of the sink. Sometimes this requires the receptacle to be located so it is not behind the appliance just to get it more than 1.8 m from the sink.

Panel Meeting Action: Reject

Panel Statement: It is the intent of the rule to cover all receptacles that are installed within 6 feet of the laundry sink, regardless of what they supply. The submitter has not provided any technical substantiation as to why all receptacles within 6 feet of the sink should not be included.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-65 Log #2009 NEC-P02 **Final Action: Reject**
(210.8(A)(7), Exceptions 1 & 2 (New))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reconsidered since the acceptance of two other proposals is not a technical reason for rejecting this proposal in accordance with the 4.3.5.1 of the NFPA Regulations Governing Committee Projects.

This action will be considered by the Panel as a Public Comment.

Submitter: Larry Logan, Township of Princeton, New Jersey
Recommendation: Insert after 210.8(A)(7)

Exception No. 1: Receptacles that are not readily accessible.

Exception No. 2: A single receptacle or a duplex receptacle for two appliances located within dedicated space for each appliance that, in normal use, is not easily moved from one place to another and is cord and plug connected in accordance with 400.7(A)(6), (A)(7), or (A)(8).

Substantiation: The present code fails to recognize the long standing practice of allowing fixed equipment with dedicated outlets to be exempt from the GFCI protection requirements. Other sections of this code that represent areas that would have as much greater chance of contact with grounded surfaces allow this practice, (i.e. Garages etc. 210.8(A)(2) and Unfinished basements, 210.8(A)(5)). It is unreasonable to expect that finished areas of a dwelling unit would be more hazardous than an unfinished area.
Panel Meeting Action: Reject
Panel Statement: See the panel action on Proposals 2-40, 2-41, and 2-62.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-66 Log #1431 NEC-P02 **Final Action: Reject**
(210.8(A)(7) Exception)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reconsidered since the acceptance of two other proposals is not a technical reason for rejecting this proposal in accordance with the 4.3.5.1 of the NFPA Regulations Governing Committee Projects.

This action will be considered by the Panel as a Public Comment.

Submitter: Greg Chontow, Hopatcong, NJ
Recommendation: Add new text as follows:

Exception: A single receptacle or a duplex receptacle for two appliances located within dedicated space for each appliance that, in normal use, is not easily moved from one place to another and that is cord connected in accordance with 400.7(A)(6), (A)(7), or (A)(8).

Substantiation: This new exception would be similar in installation to 210.8(A)(5) ex. no. 2 in that a washer/dryer would conform to a fixed appliance.
Panel Meeting Action: Reject
Panel Statement: See the panel action on Proposals 2-40, 2-41, and 2-62.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-67 Log #3121 NEC-P02 **Final Action: Reject**
(210.8(A)(7) Exception)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reconsidered since the acceptance of two other proposals is not a technical reason for rejecting this proposal in accordance with the 4.3.5.1 of the NFPA Regulations Governing Committee Projects.

This action will be considered by the Panel as a Public Comment.

Submitter: Truman C. Surbrook, Michigan State University
Recommendation: Add a new exception to this section with the same language as Exception 2 of 210.8(A)(5) to read as follows:

Exception: A single receptacle or a duplex receptacle for two appliances located within dedicated space for each appliance that, in normal use, is not easily moved from one place to another and that is cord-and-plug connected in accordance with 400.7(A), (A)(7), or (A)(8).

Substantiation: If laundry equipment is located in dwellings other than in the basement, the receptacle in this dedicated space is required to be GFCI protected if within 1.8 m (6 ft) of a sink. Generally, the washer is located next to a nonmetallic sink and the receptacle must be installed behind the dryer rather than the washer to keep it far enough away from the sink. Most of these sinks are nonmetallic. Even the plumbing supplying the sink is generally nonmetallic.
Panel Meeting Action: Reject
Panel Statement: See the panel action on Proposals 2-40, 2-41, and 2-62.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-68 Log #578 NEC-P02 **Final Action: Reject**
(210.8(A)(9) and 210.8(C))

Submitter: Larry T. Smith, National Electrical Seminars
Recommendation: Delete Section 210.8(C) and add new item (9) to Section 210.8(A)

~~210.8(C) Boat Hoists Ground-fault circuit-interrupter protection for personnel shall be provided for outlets that supply boat hoists installed in dwelling unit locations and supplied by 125-volt, 15- and 20-ampere branch circuits.~~

210.8(A)

(9) Boat Hoists - where 125 volt, 15 and 20-ampere receptacles are installed to serve boat hoists.

Substantiation: Traditionally 210.8(A) has contained the requirements for dwelling units; 210.8(B) has been reserved for other than dwelling units. The 2005 NEC broke with convention by adding 210.8(C) for boat hoists in dwelling unit locations. There seems to be little justification for this. While it is true that boat docks are not attached to the dwelling unit, neither are boat houses, accessory buildings, or for that matter detached garages.

It's much easier to explain to students of the Code that 210.8(A) is for dwelling units, and 210.8(B) is for other than dwelling units; for the sake of clarity and their understanding, we should try to keep it that way.
Panel Meeting Action: Reject
Panel Statement: The submitter has not substantiated changing the requirement to apply to only to cord- and plug-connected boat hoists. The requirement in the present code applies to "outlets" which could be receptacle or hard wired.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-69 Log #428 NEC-P02 **Final Action: Reject**
(210.8(B))

Submitter: Kenneth Wilee, Wilee Electric Inc.
Recommendation: Add new text as follows:

(6) Commercial Garages - see Article 511
(7) Temporary Wiring - see Article 590
(8) Elevator Rooms - see Article 620
(9) Fountains - see Article 680
And so on.

Substantiation: Incorporate ALL GFCI protection into 210.8 to avoid confusion or omission of requirements. One would clearly see what installations require GFCI protection and would know to go to that article for instructions.
Panel Meeting Action: Reject
Panel Statement: The requirements outlined by the submitter are application and occupancy specific and are not appropriate for the general article on branch circuits.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-70 Log #1443 NEC-P02 **Final Action: Accept in Principle in Part**
(210.8(B))

TCC Action: The Technical Correlating Committee understands that the Panel Action on this Proposal retained "(3) Rooftops"; revised (4) to read "(4) Outdoors", deleted the existing text in (4), changed the existing "Exception to (3) and (4)" to "Exception No. 1 to (3) and (4)", and added the proposed "Exception to (3)" as "Exception No. 2 to (4)"; and deleted (5).

The Technical Correlating Committee directs that the Action on this Proposal be rewritten to comply with 4.1.1 of the NEC Style Manual. This action will be considered by the Panel as a Public Comment.

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise as follows:

(B) Other Than Dwelling Units. All 125-volt, single-phase, 15- and 20-ampere receptacles installed in the locations specified in (1) through (5) shall have ground-fault circuit-interrupter protection for personnel:

(1) Bathrooms

(2) Commercial and institutional kitchens - for the purposes of this section, a kitchen is an area with a sink and permanent facilities for food preparation and cooking.

~~(3) Rooftops~~

~~(4) Outdoors in public spaces for the purpose of this section a public space is defined as any space that is for use by, or is accessible to, the public.~~

~~Exception to (3) and (4): Receptacles that are not readily accessible and are supplied from a dedicated branch circuit for electric snow-melting or deicing equipment shall be permitted to be installed in accordance with the applicable provisions of Article 426.~~

~~(5) Outdoors, where installed to comply with 210.63~~

(3) Outdoors

Exception to (3): Receptacles that are not readily accessible and are supplied from a dedicated branch circuit for electric snow-melting or deicing equipment shall be permitted to be installed in accordance with the applicable provisions of Article 426.

Substantiation: The existing code language in parenthetical four nearly requires all applicable outdoor receptacles to be protected, by the "accessible to the public" clause. The term "accessible" is defined in Article 100 in two areas: Accessible as it pertains to wiring methods, and Accessible as it pertains to equipment. The more accurate definition would be Accessible as it pertains to equipment. The definition is: "Accessible (as applied to equipment). Admitting close approach; not guarded by locked doors, elevation, or other effective means". Considering the broad scope of this definition, nearly all exterior 125V 15 or 20A receptacles all required to be GFCI protected. I could have a high rise building with a receptacle located 250 feet in the air and have it meet this definition. The argument then becomes "what is the intent?" The problem with that argument is, we are dealing with life safety equipment...my attorney isn't going to care what the intent is...he/she wants to know what the law is. Right now, the law is requiring such receptacles to be protected. It is time for the Code to stop beating around the bush on on this issue. Panel 2 did a great service to the public at large by accepting this in the 2005 cycle, it is time to take it a step further. If nothing else, this proposal should be accepted in an effort to create uniform interpretation.

Panel Meeting Action: Accept in Principle in Part

The panel accepts the recommendation to expand the requirement for outdoor GFCI protection. The panel rejects the recommendation to delete the requirement for GFCI protection of rooftop receptacles. Because the requirement for rooftop receptacles has been retained, the proposed revision to the exception and section renumbering is not accepted.

Add a new Exception No. 2 to read:

"In industrial establishments only, where the conditions of maintanance and supervision ensure that only qualified personnel are involved, GFCI protection shall not be required on receptacles that are limited to use with equipment qualified under an assured equipment grounding conductor program as specified in 590.6(B)(2)."

Panel Statement: The panel accepts the recommendation to expand the GFCI protection requirement to all outdoor 15- and 20-ampere, 125 volt receptacles. The panel rejects the proposed deletion of the term "rooftops" based on concerns that the outdoor GFCI requirement may not cover all rooftop applications. The addition of the new Exception No. 2 provides for a limited alternative to GFCI protection.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 9 Negative: 3

Explanation of Negative:

KING, D.: I agree with the panel action to accept in part the recommendation to expand the requirement for GFCI protection for all 125 volt, 15-and-20 ampere receptacles installed outdoors and to reject the recommendation to delete the requirement for GFCI protection for receptacles installed on rooftops. I disagree with the panel's addition of a new exception for industrial establishments that permits an assured equipment-grounding program in lieu of GFCI Protection. This proposed exception would greatly reduce the level of safety that would be provided if GFCI protection were to be required. Existing language in section 590.6(A) of the NEC limits the use of an assured equipment-grounding program to installations only where a greater hazard would exist if GFCI protection were to be used. Panel 2 was not provided with any technical data that would indicate that an assured equipment grounding program would provide the same level of safety as a GFCI protected receptacle and therefore should not have added this exception.

PURVIS, R.: No substantiation was provided to expand the GFCI protection requirement to all outdoor 15- and 20-ampere, 125 volt receptacles.

WEBER, R.: The enforcement community concurs with the expanded need and use of the GFCI protection for all outdoor receptacles as indicated in the section. We do no support the inclusion of the new Exception No. 2, which basically incorporates the concept found in 590.6(B)(2), for the assured equipment grounding conductor program. From actual in field observations and experience, when this system is evoked only lip service is given and little actual performance requirements are being done.

In previous additions of the code CMP-3, who has purview of Article 590 and former Article 305 - Temporary Installations, received comments indicating lack of meeting all of the requirements in what is now 590.6(B)(2). In its review of the value of the AEGCP (assured equipment grounding conductor program), the Panel was presented with data from OSHA as to the large number of noncompliance violation notices given out regarding that code section. In a number of cases, it was the lack of written documentation of identified responsible individuals and required test being recorded as well as records availability that were cited. We as an industry are approached many times to make special exceptions of the requirements for "In Industrial establishments only", given the theme that they have better trained, more experienced personnel with long term employment history and enhanced safety programs that are not present in commercial or other segments of the electrical industry. This may be true but given the fact that many tasks and projects are out sourced and contracted out, is that belief still viable? All workers should be afforded the best possible electrical safety scheme available with no exceptions to the code's required practice or procedure.

Comment on Affirmative:

PAULEY, J.: This comment is to provide some additional clarity to the panel action text of this proposal. The panel accepted revising the existing item (4) to say "Outdoors". The existing Exception in 210.8(B) should remain as "Exception to (3) and (4)....". The new exception added by the panel should say "Exception No. 2 to (4)...". This will make it clear that the new exception applies to 210.8(B)(4) only.

2-71 Log #2554 NEC-P02 **Final Action: Accept in Principle in Part (210.8(B))**

Submitter: Paul S. Hamer, Chevron Texaco Energy Research and Technology Company

Recommendation: Change the following in the introductory clause of this Section:

210.8(B) Other Than Dwelling Units. All 125-volt, single-phase, 15- and 20-ampere receptacles installed in the locations specified in (1) through (~~5~~ 6) shall have ground-fault circuit-interrupter protection for personnel:

The following item (6) is proposed to be added at the end of the existing wording in 210.8(B):

(6) Commercial, educational, institutional, or industrial laboratory facilities that have sinks or metallic countertops - where the receptacles are installed within 3 m (10 ft) of the outside edge of the sink or the metallic countertop.

Substantiation: An incident occurred recently in a new main industrial laboratory. This new lab has modern equipment, and had been built to the latest codes and provides more efficient ventilation, lighting, and work space for the employees.

The employee involved in this incident was following an ASTM standard that called for the use of a thin stainless steel tube about six feet long to clean a long glass tube. The employee was wearing Personal Protective Equipment (PPE), including a flame-resistant coat. Cleaning of these tubes can be done at a couple of different locations in the lab. This particular work station contains a sink and is under a ventilation hood with a sliding glass door that can be lowered to contain fugitive vapors. At the time of this incident, vapors were not a concern and the hood was raised.

Also located at this work station was a small electrical mixer. The cord for the mixer had been stretched behind the sink, around the side of the sink, and plugged into the outlet in front of the work station and outside of the hood. At some point the plug in the 120 volt receptacle for the mixer had been slightly jarred loose, leaving a gap of less than 1/4 in. between the rubber insulation of the plug and the receptacle on the wall. The receptacles in this work area were not protected by a GFCI (Ground Fault Circuit Interrupter). GFCIs are not presently required in this type of installation. GFCIs are required in residential installations for receptacles within 1.8 m (6 ft) of a laundry or utility sink.

After the cleaning of the tube was completed, the employee leaned into the hood to turn off the water at the back of the sink. During this movement, the stainless tubing coiled around and touched one of the electrical connectors on a nearby plug attachment. The employee was shocked and burned as the tubing contacted the stainless steel countertop.

This incident demonstrates that laboratory facilities that have sinks or grounded (e.g., through the sink's plumbing) metallic countertops represent a shock hazard if there are nearby receptacles. Requirements should be similar to those for a laundry or utility sink area, except that receptacles a farther distance from the sink or metallic countertop edge should be required to have GFCI protection to accommodate experiences such as described above. A distance of 3 m (10 ft) from the edge of a laboratory sink or metallic countertop is a reasonable distance to require installation of receptacles protected by GFCIs. This requirement will better protect personnel from the hazards of an electrical shock in a laboratory environment.

Panel Meeting Action: Accept in Principle in Part

The panel accepts the recommendation to provide GFCI protection in the proximity of sinks. The panel rejects the recommendation to require GFCI protection for receptacles in the proximity of metallic countertops.

Panel Statement: See the panel action on Proposal 2-81 for the GFCI requirements in the vicinity of all nonresidential sinks. The panel rejects the recommendation to require GFCI protection for receptacles in the proximity of all metallic countertops because there are instances where such countertops may not be grounded or in the vicinity of a wet or damp location.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 9 Negative: 3

Explanation of Negative:

KING, D.: I agree with the panel action on proposal 2-81 that extends GFCI protection for all 125-volt 15-and-20 ampere receptacles installed within 6 feet of any sink. I disagree with the panel action to reject the submitter's recommendation that receptacles installed to serve countertops that have a metal surface should not have GFCI protection. The submitter has illustrated in his substantiation that a hazard does exist where a grounded metal countertop is installed and accidental contact of live electrical components and the grounded metal surface of the countertop occur. The submitter has further demonstrated that this situation can result in serious injury to persons utilizing electrical appliances with these types of applications.

NENNINGER, B.: The panel should amend its action by rejecting the text "industrial laboratories." The reference to industrial lab facilities is of concern due to a potential loss of power to hood fans. Loss of power to such equipment either from a nuisance or intentional GFCI trip may result in a significant hazard depending on the characteristics of the gases requiring evacuation. These hazards include fire for those hood installations classified as division 2.

PURVIS, R.: Insufficient evidence to expand the use of GFCIs to commercial, educational, institutional or industrial laboratory facilities that have sinks.

2-72 Log #1318 NEC-P02 **Final Action: Accept**
(210.8(B)(2))

TCC Action: The Technical Correlating Committee directs that the Panel reconsider the proposal and correlate with the Panel Action on Proposal 1-36.

This action will be considered by the Panel as a Public Comment.

The Technical Correlating Committee understands that the Panel Action on Proposal 2-73 modifies the Panel Action on this Proposal.

Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Edit for clarification

Commercial and institutional kitchens—for the purposes of this ~~section~~ requirement , a kitchen is defined as an area with a sink and permanent facilities for food preparation and cooking.

Substantiation: According to the style manual, the use of the word "section," as written, makes this definition applicable to all of section 210.8, not just 210.8(B)(2). Furthermore, the existing *Code* language is written in a manner inconsistent with other provisions of the *Code* . If the intent of this rule is to create a defined term, it should be written as such.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-73 Log #1724 NEC-P02 **Final Action: Accept**
(210.8(B)(2))

TCC Action: The Technical Correlating Committee directs that the Panel reconsider the proposal and correlate with the Panel Action on Proposal 1-36.

This action will be considered by the Panel as a Public Comment.
Submitter: Richard P. Owen, City Of St. Paul Electrical Inspection
Recommendation: Revise as follows:

(2) Commercial, ~~and~~ institutional, and other nonresidential kitchens - for the purposes of this section, a kitchen is an area with a sink and permanent facilities for food preparation and cooking.

Substantiation: An office "break area" with a sink and permanent facilities for food preparation and cooking does not really qualify as either commercial or institutional, but the break area or room with a sink and permanent cooking facilities has the same shock hazard potential. This change should, hopefully, clarify that these break rooms or areas do fall under the requirements of this section for ground-fault protection.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

PURVIS, R.: Insufficient evidence to expand the use of GFCIs to other nonresidential kitchens just by reference to other similar kitchens.

2-74 Log #457 NEC-P02 **Final Action: Reject**
(210.8(B)(2) Exception (New))

Submitter: Amos D. Lowrance, Jr., City of Chattanooga, TN
Recommendation: Add a new exception to read as follows:

Exception: A single receptacle or a duplex receptacle for two appliances located within dedicated space for each appliance that, in normal use, is not easily moved from one place to another and that is cord-and-plug connected in accordance with 400.7(A)(6), (A)(7), or (A)(8).

Substantiation: This change would eliminate the nuisance tripping caused by commercial mixers, refrigerators and freezers that plug in a commercial kitchen. We have had several instances of these appliances causing the GFCI to trip due to motor loading at startup.
Panel Meeting Action: Reject
Panel Statement: The addition of the exception would lessen the requirements and would be counter to the substantiation submitted to the panel that added the requirement. The panel notes that the product standards for such equipment has leakage current limits that are compatible with GFCI protection. If the equipment was tripping the GFCI in question, it likely has leakage current that exceeds the permissible levels in the product standard.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

BROWN, L.: As I noted in my Ballot Comment Proposal 2-40: I sincerely hope, from the discussion by the
"experts" on the Panel, that the "problem" of "nuisance tripping" no longer exists. It appears from the Proposals submitted this cycle the problem still exists. If the Panel needs to have additional information on which to base a rational change, I suggest a Task Group be formed to research this problem prior to the next edition of the NEC.

2-75 Log #1430 NEC-P02 **Final Action: Reject**
(210.8(B)(2) Exception)

Submitter: Greg Chontow, Hopatcong, NJ
Recommendation: Add new text as follows:

Exception: A single receptacle or a duplex receptacle for two appliances located within dedicated space for each appliance that, in normal use, is not easily moved from one place to another and that is cord connected in accordance with 400.7(A)(6), (A)(7), or (A)(8).

Substantiation: This exception would allow non GFCI protected outlets for cord connected refrigeration equipment in commercial kitchens, therefore, reducing the possibility of lost food due to nuisance tripping.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Proposal 2-74.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

BROWN, L.: Please see my Ballot Comment on Proposals 2-40 and 2-74.

2-76 Log #122 NEC-P02 **Final Action: Reject**
(210.8(B)(2) Exception No. 2 (New))

Submitter: Arthur J. Carlson, Chubbuck, ID
Recommendation: Add a new exception to read as follows:

Exception to (2): A single receptacle or a duplex receptacle for two appliances located within a dedicated space for each appliance that, in normal use, is not easily moved from one place to another and that is cord-and-plug connected in accordance with 400.7(A)(6); (A)(7) or (A)(8).

Substantiation: Refrigeration equipment references something in the controls to ground when going into defrost, and will cause tripping of a Class A GFCI.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Proposal 2-74. The submitter has not substantiated the statement relative to the tripping of a Class A GFCI.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

BROWN, L.: Please see my Ballot Comment on Proposals 2-40 and 2-74.

2-77 Log #2017 NEC-P02 **Final Action: Accept in Principle**
(210.8(B)(3))

Submitter: Mark Smythe, Smythe Electric Inc.
Recommendation: Revise text to read as follows:

210.8(B) Other Than Dwelling Units. All 125-volt, single-phase, 15 and 20 amp receptacles installed in the locations specified in (1) through ~~(5)~~ (6) shall have ground fault circuit-interuupter protection for personnel:

(3) Food preparation/Serving areas - where the receptacles are installed within 1.8 m (6 ft) of the outside edge of the sink and serve the countertop surface ~~(3)~~ (4) ~~(5)~~ (6)

Substantiation: A. Statement of Problem

1. Food serving areas located in fast food, deli, and coffee house type establishments often have a serving/food preparation area consisting of a stainless steel counter top with one or more sinks along its length. Employee lunch rooms will also typically have a sink installed in the countertop surface, adjacent to where employees warm up and prepare their meals.

2. These countertop locations will often have various electric appliances, (toasters, microwaves, blenders, coffee makers, toaster ovens...) located adjacent to the sink.

3. The 2005 NEC only requires GFCI protection of these receptacles if the area includes permanent facilities for food preparation and cooking.

4. A shock hazard potential exists for the personnel when operating, and cleaning around these appliances.

B. Substantiation for proposal to change 210.8(B)(3)

1. The employees and personal of these type of establishments deserve the same degree of protection from shock as is provided for homeowners in 210.8(A)(6) and (7).

Panel Meeting Action: Accept in Principle
Panel Statement: The recommended action is accomplished through the panel action on Proposal 2-81.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

PURVIS, R.: See my Explanation of Negative for Proposal 2-81.

2-78 Log #2584 NEC-P02 **Final Action: Reject**
(210.8(B)(3), FPN (New))

Submitter: Jebediah Novak, Cedar Rapids Electrical JATC
Recommendation: Add text to read as follows:

FPN: Examples of permanent facilities are range-tops, stoves and ovens. Counter mounted microwaves, toasters, coffee-makers would not constitute permanent facilities.

Substantiation: The 2005 NEC made a good move in adopting the definition in the 2005 NEC, but it did not go far enough. By adding some clarification of what is intended in a FPN a lot of confusion will be alleviated in both installations and enforcement.
Panel Meeting Action: Reject
Panel Statement: The FPN is not appropriate because it contains a requirement. The term "permanent facilities" is sufficiently detailed.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-79 Log #3373 NEC-P02 **Final Action: Reject**
(210.8(B)(4))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reconsidered since the acceptance of two other proposals is not a technical reason for rejecting this proposal in accordance with the 4.3.5.1 of the NFPA Regulations Governing Committee Projects.
This action will be considered by the Panel as a Public Comment.
Submitter: Tom Braeutigam, Nuechterlein Electric
Recommendation: Revise text to read:
Outdoors in Public Spaces. For the purpose of this section a public space is defined as any space that is [lower than 3 meters (10 ft)], for use by, or is accessible to the public.
Substantiation: Receptacles located higher than 3 meters (10 ft), are not accessible to the general public. In municipalities, receptacles, located above this height, on light poles are generally used for decoration.
Panel Meeting Action: Reject
Panel Statement: The reference to "outdoors in public spaces" has been deleted by the panel action on Proposal 2-70.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-80 Log #3381 NEC-P02 **Final Action: Reject**
(210.8(B)(4))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reconsidered since the acceptance of two other proposals is not a technical reason for rejecting this proposal in accordance with the 4.3.5.1 of the NFPA Regulations Governing Committee Projects.
This action will be considered by the Panel as a Public Comment.
Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Revise as follows:
(4) Outdoors in spaces intended for use by the public or for which public access is expected to be routine.
Substantiation: The substantiation for the 2005 NEC wording did not support such a broad expansion of the requirements. With one exception, every electrocution involved a vending machine. This issue is now fully addressed in 422.51, which requires integral GFCI protection in new and remanufactured vending machines, (or double insulation) and protection for outlets for others. This means that for a single substantiated incident that would be otherwise unaddressed in the NEC, we are dealing with an extraordinary expansion of requirements.
Nevertheless, some expansion of coverage may be warranted. However, the applicability of such a requirement should be apparent to the user. Public access may be defined in some jurisdictions as every place not fenced, in others as any place not prohibited by a trespass sign, and still others as any place not within the lot lines of private as opposed to public property. Good code is in part code that will be consistently understood and applied in a uniform manner. Experience has already shown that this isl not, and the language needs to better signal the intent. This proposal addresses the spaces where the real loss exposure seems to lie, as covered in the substantiation for the 2005 change. It is also more simply worded.
Panel Meeting Action: Reject
Panel Statement: The reference to "outdoors in public spaces" has been deleted by the panel action on Proposal 2-70.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-81 Log #81 NEC-P02 **Final Action: Accept in Principle**
(210.8(B)(5) (New))

TCC Action: The Technical Correlating Committee understands that the Panel Action on Proposal 2-70 deleted the existing (5) and the Panel Action on this Proposal adds a new (5).
Submitter: Joe Riley, City of Arlington
Recommendation: Add:
(5) Laundry, utility, and wet bar sinks - where the receptacles are installed within 1.8 m (6 ft) of the outside edge of the sink.
Substantiation: GFCI protection for these areas should not be limited to just dwelling units. The hazard of electrical shock in and around water exists regardless of whether it is dwelling units or other than dwelling units.
Panel Meeting Action: Accept in Principle
(5) Sinks - where receptacles are installed within 1.8 m (6 ft) of the outside edge of the sink.
Panel Statement: The panel action is to provide GFCI protection at all sink locations in nonresidential occupancies.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
PURVIS, R.: Insufficient evidence to expand the use of GFCIs to all sink locations just by reference to use in sinks in dwelling units.

2-82 Log #2123 NEC-P02 **Final Action: Accept in Principle**
(210.8(B)(6))

Submitter: Bud Swathwood, Bud Swathwood Consulting
Recommendation: Add paragraph:
(6) Break rooms in commercial and industrial facilities. See No. 1 for definition of kitchens.
Substantiation: Many break room kitchens in commercial and industrial facilities have kitchens that meet the definition in 210.8(B)(2) and should be included in the requirements of 210.8(B).
Panel Meeting Action: Accept in Principle
Panel Statement: The recommended action is accomplished through the panel action on Proposal 2-73.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
PURVIS, R.: See my Explanation of Negative for Proposal 2-81.

2-83 Log #2743 NEC-P02 **Final Action: Reject**
(210.8(B)(6))

Submitter: Jeff Fitzloff, State of Idaho Division of Building Safety
Recommendation: Revise text to read:
(B) Other Than Dwelling Units. All 125-volt, single-phase, 15- and 20-ampere receptacles installed in the locations specified in (1) through (5) shall have ground-fault circuit-interrupter protection for personnel:
(1) Bathrooms
(2) Commercial and institutional kitchens – for the purposes of this section, a kitchen is an area with a sink and permanent facilities for food preparation and cooking
(3) Rooftops
(4) Outdoors in public spaces – for the purpose of this section a public space is defined as any space that is for use by, or is accessible to, the public
Exception to (3) and (4): Receptacles that are not readily accessible and are supplied from a dedicated branch circuit for electric snow-melting or deicing equipment shall be permitted to be installed in accordance with the applicable provisions of Article 426.
(5) Outdoors, where installed to comply with 210.63
<u>(6) Receptacles serving hair cutting and styling stations in barber shops and hair styling establishments</u>
Substantiation: During visits to such establishments I have noted that the cords for hair clippers, hair dryers, and styling blowers are two wire, cords and no equipment grounds and have exposed metal that is put in contact with people's heads. The chairs in these establishments put the customer in contact with grounded metal parts. These cords are normally twisted from the repeated wrapping of the cord around the clipper thus damaging the cord.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided sufficient substantiation to expand the requirements to hair styling establishments. The panel action on Proposal 2-81 has expanded GFCI protection requirements to all sink locations in nonresidential occupancies which provides protection in some of the most vulnerable locations in the type of occupancy covered by this proposal.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
KING, D.: The submitter of this proposal raises an important safety concern that warrants further consideration. Although the panel action on proposal 2-81 adds much needed protection in these types of occupancies in the area of a sink. Further protection is needed for persons who come in contact with electrical hair appliances while their hair is still wet and as the submitter has indicated in his Substantiation grounded through the chair in which he or she is seated. There is no requirement that these appliances be double insulated. Requiring GFCI protection for 125-volt 15-and 20-ampere receptacles in these types of occupancies would reduce the risk of electrical shock or electrocution.

2-84 Log #2919 NEC-P02 **Final Action: Reject**
(210.8(B)(6))

Submitter: Marcus Sampson, Lysistrata Electric
Recommendation: Revise as follows:
210.8 Ground-Fault Circuit-Interrupter Protection for Personnel.
(B) Other than Dwelling Units. All 125-volt, single-phase, 15- and 20-ampere receptacles installed in the locations specified in (1) through (5) (<u>6</u>) shall have ground-fault circuit-interrupter protection for personnel:
<u>(6) Bar countertops</u>

Substantiation: Stainless steel countertops, wet hands, melted ice and wet floors do not mix well with portable electric appliances such as blenders and juicers. The GFCI protection afforded individuals in kitchens should be extended to bartenders, since identical conditions exist.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided substantiation to expand the requirement. The term "bar countertops" is extremely broad and would apply the requirement is a wide variety of applications without substantiation. The panel action on Proposal 2-81 provides GFCI protection where a bar countertop contains a sink.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
KING, D.: This proposal should be given further consideration. The panel's reference to the panel action on proposal 2-81 does not fully address the submitter's concerns. The hazards associated with the use of electricity in locations that are damp or wet is well documented. The risk of electric shock or electrocution is present in the example given in the submitter's substantiation regardless of whether a sink is installed.

2-85 Log #3171 NEC-P02 **Final Action: Accept in Principle**
(210.8(B)(6))

Submitter: Wally Harris, Atlantic Inland Inspections
Recommendation: Add new Section as follows:
(6) Janitorial, Service and Utility Closets – for the purpose of this section a janitorial, service or utility closet is a closet which contains a floor level mop basin (slop sink), wall mounted mop basin or any other basin.
Substantiation: The same potential hazards exist at these locations that exist in bathrooms, kitchens, rooftops, and outdoor spaces. Electricity and ground faults do not follow, or take into consideration architectural definitions of building spaces.
Panel Meeting Action: Accept in Principle
Panel Statement: The recommended action is accomplished through the panel action on Proposal 2-81.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
PURVIS, R.: See my Explanation of Negative for Proposal 2-81.

2-86 Log #2187 NEC-P02 **Final Action: Accept in Principle**
(210.8(C))

Submitter: Dann Strube, Strube Consulting
Recommendation: Revise voltage:
"...supplied by ~~125~~ 120 volt...".
Substantiation: Use of 125 volts in the rule would imply that the requirement is for receptacle outlets only.
Panel Meeting Action: Accept in Principle
Panel Statement: The recommended action is accomplished through the panel action on Proposal 2-87.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-87 Log #3065 NEC-P02 **Final Action: Accept in Principle**
(210.8(C))

Submitter: Douglas A. Lee, U.S. Consumer Product Safety Commission
Recommendation: Revise 210.8(C) as follows:
(C) Boat Hoists
Ground -fault circuit-interrupter protection for personnel shall be provided for outlets that supply 120/240-volt boat hoists installed in dwelling unit ~~locations and supplied by 125 volt, 15- and 20-ampered~~ branch circuits.
Substantiation: The essential severe shock/electrocution protection provided by 210.8(C) for personnel in contact with a boat hoist or in the water near a boat hoist should not be limited to 120 V installatons.
CPSC In-depth Investigation (IDI) database describes four incidents resulting in five electrocution deaths from 1994 to 2003 from contact with a boat hoist.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
Revise 210.8(C) in the present Code to read:
(C) Boat Hoists. GFCI protection shall be provided for outlets not exceeding 240 volts that supply boat hoists installed in dwelling unit locations.
Panel Statement: The panel has revised the current language to apply to boat hoists not exceeding 240 volts. This will include 120V as well as 240V hoists. In addition, the panel has used the term "GFCI" in accordance with the NEC style manual.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-88 Log #1728 NEC-P02 **Final Action: Reject**
(210.8(D) (New))

Submitter: Paul S. Hamer, Chevron Texaco Energy Research and Technology Company
Recommendation: Add new text to read as follows:
(D) Three-Phase Ground-Fault Circuit-Interrupter System (GFCIS-3Ph) Protection for Personnel.
(1) Supplying Lighting Circuits. Lighting branch circuits with an operating voltage of more than 150 volts to ground shall be protected by a three-phase ground-fault circuit-interrupter system. Upon detection of a ground fault, the three-phase ground-fault circuit-interrupter system shall initiate disconnection of all three phases of the faulted branch circuit.
FPN: Segregation of the lighting power supply on a separately derived system facilitates application of the three-phase ground-fault circuit-interrupter system on all of the lighting branch circuits.
(2) Supplying Other Than Lighting Loads. Three-phase branch circuits that supply loads other than lighting shall be permitted to be protected by a three-phase ground-fault circuit-interrupter system. Upon detection of a ground fault, the three-phase ground-fault circuit-interrupter system shall initiate disconnection of all three phases of the faulted branch circuit.
Substantiation: There are many electrocutions that occur on three-phase 480 volts systems, particularly 277 volt lighting branch circuits. Ground-fault circuit-interrupters (GFCIs) have saved many lives on 120 volt and 120-240 volt single-phase systems since being introduced to the NEC in 1971. Application of GFCIs at voltages higher than 120 volts has not progressed due to fact that the higher voltages to ground result in higher capacitive charging current of branch circuits, which in turn leads to "nuisance trips." This proposal describes a Three-Phase Ground-Fault Circuit-Interrupter System (GFCIS-3Ph) that overcomes nuisance tripping by a novel approach to sensing and tripping logic. It is initially proposed as a requirement for lighting branch circuits due to the historical risk of these circuits, but the GFCIS-3Ph is also applicable to all 3-phase circuits and this proposal allows its application as an option for all three-phase branch circuits. Application of the proposed GFCIS-3Ph technology has the potential to almost eliminate electrocutions for persons who make direct contact between an energized phase conductor and ground on three-phase systems rated below 1000 volts, phase-to-phase.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The panel notes that there is no prohibition in the present code to the installation of the system described by the submitter. The panel disagrees with adding a requirement that all greater than 150V to ground lighting circuits be
supplied with a form of GFCI protection. The submitters substantiation notes that the hazard is when unqualified persons work on equipment without taking the appropriate precautions to deenergize the circuit and verify that circuit is disconnected. Adding such a system to compensate for what is improper and ineffective work practices is not appropriate.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
KING, D.: This proposal should be accepted. I disagree with the panel statement that states "The submitters substantiation notes that the hazard is when unqualified persons work on equipment without taking the appropriate precautions to de-energize the circuit and verify that circuit is disconnected" and the statement that "Adding such a system to compensate for what is improper and ineffective work practices is not appropriate." The panel falsely assumes that contact with energized parts of 480 volt 3 phase systems is limited to qualified persons working on these systems. There are many incidences in commercial buildings where construction and maintenance personnel can come in contact with exposed parts of energized circuits, especially with 277 volt lighting above suspended ceilings. Manufactured wiring systems for ceiling suspended luminaries can become partially or completely detached resulting in accidental contact by someone who is attempting to access equipment above the ceiling. In many cases the individual in this case is grounded through the surrounding structural steel or other mechanical piping and duct systems. This can result in a serious shock or electrocution. Qualified persons performing work are a constant victim of poor workmanship that may have been done prior to their working on equipment which may present a dangerous condition. The increased level of safety afforded by this new technology will save many lives and should not be disregarded by panel 2. Further consideration needs to be given to this proposal.
WEBER, R.: In the panel statement to support the reject action taken the statement is made, "there is no prohibition in the present code to the installation of the system" or in fact use of the component. But what are often times the case, if the requirement is not stated in the code or permissive language included in the code text, it falls into the great idea category but most users will not incorporate its use or protective scheme in normal installation. I am aware that all proposals submitted to the code-making panel must be acted upon and direction given to the submitter. If it were possible I would certainly recommend that this concept be "Held for Further Study" as can be done in the

review of comments stage. Given the comments made by the submitter and presentation of data to the panel as to the value and need of the enhanced protection scheme it would promote an additional electrical safety means and should be supported. The code process needs to incorporate some means of providing encouragement to new concepts and ideas that further the safety cause and have future potential life saving value. The electrical industry today has a tremendous amount of capital invested and must show reasonable expectations of use or inclusion of the new component or concept in the code before financial commitments are made beyond the research and development stage with a prototype model then being considered for marketing. I am a firm believer in Beta testing and the results of the product performance and fact-finding reports from National Recognized Testing Laboratories prior to it being included into the code. Thus, on the condition that data can be presented to be evaluated and considered by the panel for its true worth. We need that information before the theory is embraced. But if we stifle that concept, then are we meeting our mission's objectives? I look forward to comment by others in perhaps the IEC community or other code making bodies as to the need or value of the type of protection.

2-89 Log #1700 NEC-P02 **Final Action: Reject**
(210.9 Exception No. 2)

Submitter: Charles M. Trout, Maron Electric Company
Recommendation: Delete the 210.9 Exception No. 2 in its entiriety.
Substantiation: The body of the text in 200.9 satisfactorily contains the necessary requirements for branch circuits derived from autotransformers. The exception permits a lesser degree of safety based on an undocumented qualified person hypothetically servicing the installation. No requirements are present to ensure that the conditions of maintenance and supervision to ensure that only qualified persons service the installation actually exist.
Panel Meeting Action: Reject
Panel Statement: The authority having jurisdiction has the responsibility to evaluate whether persons responsible for the supervision and maintenance are qualified before permitting such installations.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
KING, D.: I agree with the submitter that this exception allows for an installation that is less safe. An exception that permits a reduction in safety to this extent should include clear prescriptive language for proper interpretation by both the electrician and the authority having jurisdiction. The present definition of "qualified person" in the NEC states that the qualified person must have safety training on the hazards involved. There is no requirement for documentation that would provide evidence for the authority having jurisdiction that a qualified person actually exists. This could lead to inconsistent and improper application of this section.

2-90 Log #2299 NEC-P02 **Final Action: Reject**
(210.11)

Submitter: James Shaw, Jim Shaw Electric Co.
Recommendation: Revise text to read as follows:
210.11(C)(4)(a) Smoke Detectors in New Dwelling Units. Dwelling units shall have smoke detectors installed in each bedroom, one on each floor level including basements but excluding stairway landings. All smoke detectors shall be installed as per manufacturer recommendations and shall be connected to an essential lighting circuit, be inter-wired and have battery back-up. The smoke detector circuit shall not be on dedicated branch circuit.
Smoke Detectors may be installed but shall not be required in attic spaces.
210.11(C)(4)(b) Heat Detectors in New Dwelling Units. Dwelling units shall have a heat detector installed in the garage. Heat detectors shall be installed as per manufacturer recommendations and shall be inter-wired with the smoke detector circuit inside the dwelling unit and have battery back-up. Heat Detectors may be used elsewhere including attic spaces inside the dwelling unit but are not required.
210.11(C)(4)(c) Carbon Monoxide Detectors in New Dwelling Units. Dwelling units shall have carbon monoxide detectors installed adjacent to or in all bedrooms. All carbon monoxide detectors shall be installed as per manufacturer recommendations and shall be inter-wired with the smoke detectors and have battery back-up. A combination smoke/carbon monoxide detector may be substituted for the smoke detectors required in 210.11(C)(4)(a).
Carbon Monoxide Detectors may be used elsewhere including attic spaces inside the dwelling unit but are not required.
210.11(C)(4)(d) Smoke, Heat and Carbon Monoxide Detectors installed in existing dwelling units shall not be required to be inter-wired.
Substantiation: I believe that smoke detectors in dwelling units should be addressed and have their own paragraph in the code.
I feel that smoke detectors, heat detectors, and carbon monoxide detectors should be a part of 210.11.
Panel Meeting Action: Reject
Panel Statement: This is a building/life safety code issue rather than an NEC issue. The section proposed for revision deals with branch circuits required rather than equipment to be installed. Proposals dealing with these topics should be submitted to the NFPA 101, Life Safety Code technical committees.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
BROWN, L.: In addition, the NFPA Technical Committee on Single- & Multiple-Station Alarms & Household Fire Alarm Systems (SIG-HOU) may have responsibility over some of the proposed criteria.

2-91 Log #2103 NEC-P02 **Final Action: Reject**
(210.11(A) and (C))

Submitter: Jon Farren, Farren Engineering, Inc.
Recommendation: Revise text to read as follows:
210.11(A) ~~Number~~ Quantity of Branch Circuits. The minimum ~~number~~ quantity of branch circuits shall be determined from the total calculated load and the size or rating of the circuits used. In all installations, the ~~number~~ quantity of circuits shall be sufficient to supply the load served. In no case shall the load on any circuit exceed the maximum specified by 220.18.
210.11(C)
(1) Small-Appliance Branch Circuits. In addition to the ~~number~~ quantity of branch circuits required by other parts of this section, two or more 20-ampere small-appliance branch circuits shall be provided for all receptacle outlets specified by 210.52(B).
(2) Laundry Branch Circuits. In addition to the ~~number~~ quantity of branch circuits required by other parts of this section, at least one additional 20-ampere branch circuit shall be provided to supply the laundry receptacle outlet(s) required by 210.52(F). This circuit shall have no other outlets.
(3) Bathroom Branch Circuits. In addition to the ~~number~~ quantity of branch circuits required by other parts of this section, at least one 20-ampere branch circuit shall be provided to supply bathroom receptacle outlet(s). Such circuits shall have no other outlets.
Substantiation: The term "quantity" refers to "total amount of", which is the intent of this code section.
Although the term "number" is sometimes used to indicate a quantity, it does not always specify the "total" quantity. The word "number" can also be used to designate a specific object, such as: "circuit number 3, in a 42 circuit panelboard", where 3 is the number and 42 is the quantity or "total amount of".
The word "number" has multiple meanings, the word "quantity" is more specifically related to "total amount of", which is the intent of this code section.
*Also refer to proposal for same word change in 220.42 and 230.2.
Panel Meeting Action: Reject
Panel Statement: The present term is clear and the recommended change would be more confusing. Webster's Dictionary has multiple definitions for the term "quantity" the first being "an indefinite number." The panel agrees that the proposed definition would not add any additional clarity to the intent of this section.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-92 Log #84 NEC-P02 **Final Action: Reject**
(210.11(B))

Submitter: Joe Riley, City of Arlington
Recommendation: Revise as follows:
This load shall be evenly proportioned among ~~multioutlet~~ multiwire branch circuits within the panelboard(s).
Substantiation: The word "multioutlet" refers to more than one outlet where in this article the word "multiwire" refers to a branch circuit.
Panel Meeting Action: Reject
Panel Statement: There is no technical substantiation for the change. The term "multi-outlet" is correct as used in this section.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-93 Log #1021 NEC-P02 **Final Action: Reject**
(210.11(B))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise as follows:
Where the load is calculated on a volt/ampere sq meter or sq ft basis, the wiring system up to and including the branch circuit ~~panelboard~~ overcurrent device(s) shall be provided to serve not less than the calculated load.
This load shall be evenly proportioned ~~among multioutlet branch circuit branch circuits in the panelboards~~ as much as practical between the ungrounded feeder conductors where the feeder consists of two or more ungrounded conductors . ~~Branch circuit overcurrent devices and circuit shall only be required to be installed to serve the connected load.~~
Substantiation: All branch circuits do not originate in panelboards e.g., a fused switch. It appears a 400 sq ft room in a dwelling unit or motel/hotel supplied by two multioutlet circuits requires each circuit to serve 200 sq ft since load is determined by area. This precludes one of the circuits from only supplying two or more outlets in close proximity at one location to serve grouped equipment such as an entertainment center. The provisions of 210.60(B) may preclude evenly proportioned load (sq ft area) for each circuit.

The last sentence is superfluous; it may be construed as utilization equipment but not receptacle outlets for general lighting.
Panel Meeting Action: Reject
Panel Statement: The term "panelboard" is correct because it is only required to install overcurrent devices to serve the connected load. This section refers to branch circuit conductors and the reference in the recommendation to ungrounded feeder conductors is inappropriate.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-94 Log #392 NEC-P02 **Final Action: Reject**
(210.11(C)(2))

Submitter: Anthony King, Linwood, NC
Recommendation: Revise text to read as follows:
210.11(C)(2) Laundry Branch Circuits. In addition to the number of branch circuits required by other parts of this section, at least one additional 20-ampere branch circuit shall be provided to supply the laundry <u>single</u> receptacle outlet required by 210.52(F). This circuit shall have no other outlets.
<u>Exception: A duplex may be installed for the igniters of a gas dryer if within six feet of receptacle.</u>
Substantiation: As written in 210.11(C)(2), there may be a duplex receptacle used in the laundry and only part of it being used for the washing machine. Leaving the second part of the duplex open may tempt a homeowner to use a drop cord across the washing machine for an iron. If there is a shelf above the washing machine, the homeowner may set the iron on the shelf and the homeowner might knock the iron off of the shelf and pull at the cord just as it enters the water.
Panel Meeting Action: Reject
Panel Statement: The laundry branch circuit is intended to supply one or more receptacle outlets for electrical appliances that are typically used for the purpose of laundering clothes. The submitter has not provided sufficient substantiation to support his recommendation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-95 Log #1839 NEC-P02 **Final Action: Reject**
(210.11(C)(2))

Submitter: Mark T. Rochon, Mark J. Rochon Master Electrician
Recommendation: Revise as follows:
Laundry Branch Circuits. In addition to the number of branch circuits required by other parts of this section, at least one additional <u>20 amp 120 volt circuit or 30 amp 120/240 volt circuit</u> shall be provided to supply the laundry receptacle outlet(s) required by 210.52(F).
Substantiation: Compact laundry units can require 30 amp 120/240 circuits without need of 20 amp 120V circuit. The code needs to follow appliance changes.
Panel Meeting Action: Reject
Panel Statement: The current text provides for minimum installation requirements. An additional circuit may be provided for compact or stacked laundry equipment.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-96 Log #2870 NEC-P02 **Final Action: Reject**
(210.11(C)(2))

Submitter: Andre R. Cartal, Princeton Borough Building Dept.
Recommendation: Add in the third line, at least one 20 ampere OR LARGER branch circuit shall be provided...
Substantiation: Laundry equipment now commonly requires 240V for the washing machine, which on a stacked washer/dryer is supplied by the 30 amp, 240V dryer circuit.
This change is part of the proposal submitted for 210.52(F) and concerns the installation of laundry equipment.
More substantiation provided in that proposal.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Proposal 2-95.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-97 Log #3259 NEC-P02 **Final Action: Reject**
(210.11(C)(2)(a))

Submitter: Ryan Schank, North Branch, MI
Recommendation: Add text to read as follows:
(a) Additional receptacles in the laundry room provided they are 20 amp rated can be served from adjacent circuits the specific laundry circuit is installed.
Substantiation: The reason for this is that it does not tell you if you can bring in more circuits into the laundry room.
Panel Meeting Action: Reject
Panel Statement: The intent of this section is to require at least one 20-ampere branch-circuit that is dedicated to the laundry area to ensure that the branch circuit is sufficiently sized to supply electrical equipment associated with doing laundry, such as an iron. Receptacles installed in a laundry area intended to serve laundry equipment must comply with 210.11(C)(2) as presently written. The requirements in section 210.11 do not preclude the addition of other branch circuits in the laundry area.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-98 Log #1408 NEC-P02 **Final Action: Reject**
(210.11(C)(2) and Exception (New))

Submitter: George Stolz, II, Pierce, CO
Recommendation: Change the term and add an Exception to read:
(2) Laundry <u>Equipment</u> Branch Circuits. In addition to the number of branch circuits required by other parts of this section, at least one additional 20-ampere branch circuit shall be provided to supply the laundry <u>equipment</u> receptacle(s) required by 210.52(F). This circuit shall have no other outlets.
<u>Exception: General purpose receptacles within the same laundry area shall be permitted on the laundry equipment circuit.</u>
Substantiation: As it is currently written in the 2005 NEC, laundry areas are to be treated in the same method as the areas defined in (C)(1) and (C)(3). It seems to unintentionally elevate the status of an entire laundry room as a special location. This presents conflicts, in that if a washing machine is to be located in a basement, the entire basement could be regarded as a laundry area, requiring all receptacles to be supplied by that circuit.
It is generally assumed that the laundry receptacle is to be used for the washing machine and gas-dryer ignitor receptacles. Changing the terminology to address the equipment to be served will clarify the purpose of the requirements of this section, and allow installers to install general-purpose receptacles from a general purpose branch circuit to serve wall spaces in laundry rooms.
Pertaining to the exception: Given that other cord-and-plug-connected laundry-related appliances such as irons have a high probability to be used in the laundry room, it is reasonable to allow this 20-ampere circuit to supply other receptacles in the same space for such potential uses. It is more desirable to extend the 20-ampere circuit required to encounter this potential load, than to require it to be supplied by a 15-ampere circuit for general lighting and receptacles.
Please note this is submitted with a coordinating proposal to similarly modify 210.52(F) accordingly:
(Change 210.52(F) to read: 210.52(F) Laundry Areas. In dwelling units, at least one receptacle outlet shall be installed for the laundry <u>equipment</u> .)
Panel Meeting Action: Reject
Panel Statement: The addition of term "equipment" as proposed by the submitter adds no further clarity to the present text. The proposed new exception is not necessary. The rule as written does not limit the number of receptacle outlets supplied by the laundry branch circuit. However, that circuit shall not supply outlets that are not covered in 210.52(F).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-99 Log #3358 NEC-P02 **Final Action: Reject**
(210.11(C)(2) Exception (New))

Submitter: Les Tanzer, City of Phoenix
Recommendation: Add new text to read:
<u>Exception: Where a laundry area consists of a closet sized to allow only accommodate a stackable type washer/dryer combination shall be permissible to install a single 30-ampere 240-volt branch circuit in lieu of the 20-ampere branch circuit.</u>
Substantiation: In smaller dwellings where the space/construction considerations will only allow the smallest of stackable washer/dryer combination units the installation of the 20-ampere branch circuit, as well as the needed 30-ampere branch circuit, appears to be redundant and useless. The wording of the original code text appears to have considered this possibility with the words "at least one additional 20-ampere branch circuit". This exception would tend to clarify if the use of a single 30-ampere branch circuit alone would be allowable in these situations.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Proposal 2-95.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-100 Log #150 NEC-P02 **Final Action: Reject**
(210.11(C)(3))

Submitter: Victor Timpanaro, Municipal Electrical Inspectors
Recommendation: Add to words "at least one 20 ampere branch circuit shall be provided to supply bathroom receptacle outlet(s) (<u>where not more than three bathrooms would be on the same 20 ampere circuit</u>).
Substantiation: More and more large dwelling units having more than three bathrooms pose a load greater than the one branch circuit can supply. NEC should then require additional branch circuits where more than 3 bathrooms.
Panel Meeting Action: Reject

Panel Statement: See the panel action and statement on Proposal 2-102. The submitter has not provided any data to support the limitation on the number of bathrooms permitted to be supplied by the bathroom branch circuit.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
KING, D.: See my explanation of negative on proposal 2-102.

2-101 Log #929 NEC-P02 **Final Action: Reject**
(210.11(C)(3))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Add:
"The ampere rating of the receptacle shall be 20-amperes."
Substantiation: The vast majority of these receptacles will be multiple type (duplex). Table 310.21(B)(2) indicates the maximum load as 12 amperes for a 15 ampere multiple receptacle I believe this section was adopted due to widespread use of hair blowdryers or portable electric space heaters. Most of these dryers are rated 1500 watts or higher which exceeds the maximum permitted load for a multiple 15 ampere rated receptacle.
Panel Meeting Action: Reject
Panel Statement: Section 210.23(A)(1) requires cord and plug connected utilization equipment to not exceed 80% of the branch circuit rating. Equipment with a 15 ampere rated cord cap should not exceed the load shown in Table 210.21(B)(2).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
BROWN, L.: The submitter may also want to refer to Section 210.24 for additional guidance.

2-102 Log #3149 NEC-P02 **Final Action: Reject**
(210.11(C)(3))

Submitter: Paul Kennedy, Jr., Inspectional Services
Recommendation: Revise the last sentence as follows:
Such circuits shall supply no more than two bathrooms and shall have no other outlets.
Substantiation: It is common to provide five or more bathrooms in today's higher priced residential market and it's unrealistic not to place a limit on the number of bathrooms that may be served by one circuit. Each of these bathrooms may contain three or more receptacles that could be serving appliances simultaneously.
Panel Meeting Action: Reject
Panel Statement: The submitter's recommendation is a design matter exceeding the minimum requirements prescribed by the Code.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
KING, D.: Panel 2 has been presented with several proposals regarding the overload conditions that exist with receptacles installed in bathrooms due to the use of readily available appliances that are typically used for hair care today. It has been substantiated that two or more of these appliances used simultaneously in most cases will create an overload condition for the branch-circuit wiring and outlet devices serving these cord and plug connected loads. The submitter's recommendation would limit the loading on these circuits to a safe level which is the intent of section 210.11(C)(3). Panel 2 should give further consideration to this proposal.
Comment on Affirmative:
BROWN, L.: If there is a problem in the field with the overcurrent device tripping due to the simultaneous use of the bathroom receptacles, especially with the larger homes, the home builders would address the situation as they want their customers to be happy with their new home. In addition, this is no different than all of the bedroom receptacles being used at the same time. There is no limit as to the number of receptacles on a residential general lighting branch circuit.

2-103 Log #685 NEC-P02 **Final Action: Reject**
(210.11(C)(3) Exception)

Submitter: Vincent Metallo, Sr., Baltimore County Government / Rep. Baltimore County Electrical Inspection
Recommendation: Delete the following:
~~Exception: Where the 20 ampere circuit supplies a single bathroom, outlets for other equipment within the same bathroom shall be permitted to be supplied in accordance with 210.23(A)(1) and (A)(2).~~
Substantiation: It has been an ongoing problem in which many bathroom luminaires and fans are listed to be protected at a 15 amp overcurrent protective device. Many times the equipment is provided by an owner and builder at the finish of the job because of custom type houses and change layouts. It has created a time consuming inspection process because of the disassembly required on each piece of equipment and has created a safety issue. The second problem created has been the loading of the circuit based on the unknown use on the receptacles ranging from hair curlers and 1500W hair dryers added to the load of bar type luminaires that can contain numerous light bulbs and other equipment. The problem is that these issues occur after the rough and final inspections are done. It is impossible to resolve this issue many times at this point and creates a burden on the homeowners and inspection authorities.
Panel Meeting Action: Reject
Panel Statement: Equipment must be installed in accordance with it's listing. Adequate substantiation has not been provided by the submitter to delete the exception.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
KING, D.: Panel 2 has been presented with several proposals regarding the overload conditions that exist with receptacles installed in bathrooms due to the use of readily available appliances that are typically used for hair care today. It has been substantiated that two or more of these appliances used simultaneously in most cases will create an overload condition for the branch-circuit wiring and outlet devices serving these cord and plug connected loads. The submitter's recommendation would eliminate additional loading on these circuits and allow for the connection of additional cord and plug connected loads which is the intent of 210.11(C)(3). Panel 2 should give further consideration to this proposal.

2-104 Log #3548 NEC-P02 **Final Action: Reject**
(210.11(C)(4))

Submitter: Ken Dunn, Corning Cable Systems
Recommendation: Add new te xt:
210.11(C)(4) Vital Communications Branch Circuit. In addition to the number of branch circuits required by other parts of this section, at least one 15 amp branch circuit shall be provided to supply non-network powered communications equipment for two way voice communications. The circuit shall have an outlet within 6 feet of the point of entrance of the communications cable and another outlet within 6 feet of communications equipment. The circuit shall have no other outlet(s). The outlet(s) shall be marked "VCO". The circuit shall not be required to have AFI or GFCI protection.
Substantiation: Reliable residential power for the support of two way voice communications during emergencies, such as fire, burglary, or medical emergency is a growing concern, because an increase amount of residential communications equipment is not network-powered. Services such as fiber to the home and IP technology rely on residential power circuits for continued operation.
Vital communications circuits must also be protected from nuisance trips. To this end, outlets on this circuit are limited to the communications point of entry and locations used for communications equipment (as defined in 800.2) In addition, mandatory GFCI and AFI are excluded because faults may not be readily identified and corrected by the elderly or infirm or those unfamiliar with such devices.
Panel Meeting Action: Reject
Panel Statement: The panel agrees there is a need for reliable power source for vital communications equipment when installed in dwelling units. However,the submitter has not provided sufficient substantiation to require this type of branch circuit for all dwelling units.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-105 Log #613 NEC-P02 **Final Action: Accept in Principle in Part**
(210.12)

TCC Action: The Technical Correlating Committee understands that the Panel Actions on Proposals 2-119, 2-137, 2-142, 2-143 and 2-147 modify the Panel Action on this Proposal.
The Technical Correlating Committee understands that the Panel Action on Proposal 2-143 will change the existing FPN to FPN No. 1.
The Technical Correlating Committee understands that the Panel Action did not change the existing "120-volt" to "125-volt".
Submitter: Eddie Phillips, Southern Regional Fire Code Development Committee
Recommendation: Revise NEC 210.12 to read as follows:
210.12 Arc-Fault Circuit-Interrupter Protection.
(A) Definition. An arc-fault circuit interrupter is a device ~~intended~~ designed to provide protection from the effects of arc-faults by recognizing characteristics unique to arcing and by functioning to de-energize the circuit when an arc-fault is detected.
(B) Dwelling Unit ~~Bedrooms~~ . All 125 volt, single phase, 15 and 20-ampere branch circuits supplying outlets installed in a d welling unit , as defined by the Life Safety Code (NFPA 101), bedrooms, recreational room, living room, dining room, kitchen and bathrooms shall be protected by a listed arc-fault circuit interrupter , ~~combination type~~ as listed in UL 1699, Standard for Arc-Fault Circuit Interrupters, installed to provide protection of the branch circuit.
~~Branch/Feeder AFCI's shall be permitted to be used to meet the requirements of 210.12(B) until January 1, 2008.~~

~~FPN: For information on types of arc-fault circuit interrupters, see UL 1699-1999, Standard for Arc-Fault Circuit Interrupters.~~

FPN: Closets off of bedrooms with outlets shall be considered part of the bedroom circuitry.

Exception: The location of the arc-fault circuit interrupter ~~combination type~~ shall be permitted to be at other than the origination of the branch circuit in compliance with (1) and (2):

(1) The arc-fault circuit interrupter installed within 1.8 m (6 ft) of the branch circuit overcurrent device as measured along the branch circuit conductors.

(2) The circuit conductors between the branch circuit overcurrent device and the arc-fault circuit interrupter shall be installed in a metal raceway or a cable with a metallic sheath.

Substantiation: During the last cycle of the NEC CMP 2 acknowledged the increased level of protection provided by branch/feeder AFCIs. This statement in itself affirms the AFCI as a beneficial safety device for saving lives, property and the environment from unwanted electrical arcing conditions that cause fires. The expansion of this proven safety protection device is justifiable. More than 15 million AFCIs are installed and working in new dwellings throughout the America.

The information submitted to the NEC CMP 2 during the last cycle still remains valid. The Consumer Product Safety Task Force, National Association of State Fire Marshals (NASFM), published a comprehensive report on August 1, 2002 on the efficacy and reliability of arc-fault circuit interrupters. Electrical engineering experts for the US CPSC, Underwriters Laboratories, Chair of NASFMÕs Science Advisory Committee, SP Swedish National Testing and Research Institute, and many fire safety professionals reviewed and commented on statistics and data provided by numerous sources which supports the reliability and effectiveness of arc-fault circuit interrupter technology. This has been confirmed by CMP 2 during the last cycle. Studies conducted by the NASFM and the CPSC indicate that expanding the requirement for AFCI protection to all living areas this code cycle would save many lives and save millions of dollars in property loss."

Panel Meeting Action: Accept in Principle in Part

The panel accepts in principle expansion of the AFCI protection requirements. The panel rejects the addition of the word "design," the reference to NFPA 101, the deletion of combination type devices, the reference to UL Standard 1699 in the mandatory text and the deletion of the fine print note. The panel accepts the deletion of the following text: "branch/feeder AFCI's shall be permitted to be used to meet the requirements of 210.12(B) until January 1, 2008."

Panel Statement: The term "intended" correlates with the terminology in the product standard. Dwelling units are defined in the NEC and the reference to the definition in NFPA 101 is not necessary. The reference to UL 1699 in mandatory code text does not comply with section 4.2 of the NEC Style Manual. The submitter has not provided adequate substantiation to delete the requirement for combination type devices. See the panel action on Proposal 2-142 regarding the expanded requirements for AFCI protection. It should be noted that the action on Proposal 2-142 addresses the concern regarding closets.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 8 Negative: 4

Explanation of Negative:

BECKER, R.: I agree with the comments expressed in Mr. Nenninger's explanation of negative vote.

BROWN, L.: Please see NAHB's Ballot Comment on Proposal 2-142, especially the use of dwelling unit fire data to support the expansion of AFCI protection.

NENNINGER, B.: The proposal should be rejected at this time, and the installation of AFCIs should be limited to bedrooms only. The use of combination type AFCIs will be a requirement in 2008. However, they will not be commercially available until summer of 2006. The requirement to expand an AFCI product beyond bedrooms to all dwelling unit locations in 2008 is premature as the market will not have sufficient experience with the newer combination type AFCI technology. It is more appropriate to leave the current code as written and gain experience with the combination type AFCIs in bedrooms only. Based on the outcome of this experience, further expansion can be considered for the 2011 code.

PURVIS, R.: See my Explanation of Negative for Proposal 2-115.

2-106 Log #614 NEC-P02 **Final Action: Accept in Part**
(210.12)

TCC Action: The Technical Correlating Committee understands that the Panel Action on Proposals 2-105 and 2-147 modify the Panel Action on this Proposal.

Submitter: Eddie Phillips, Southern Regional Fire Code Development Committee

Recommendation: Revise to read:

210.12 Arc-Fault Circuit-Interrupter Protection.

(A) Definition. An arc-fault circuit interrupter is a device ~~intended~~ designed to provide protection from the effects of arc-faults by recognizing characteristics unique to arcing and by functioning to de-energize the circuit when an arc-fault is detected.

(B) Dwelling Unit Bedrooms. All 125 volt, single phase, 15 and 20-ampere branch circuits supplying outlets installed in dwelling unit bedrooms shall be protected by a listed arc-fault circuit interrupter, combination type installed to provide protection of the branch circuit.

(C) Other Residential Occupancies. All 125 volt, single phase, 15 and 20-ampere branch circuits supplying outlets installed in lodging and rooming houses, dormitories, board and care facilities as defined by the Life Safety Code (NFPA 101) shall be protected by a listed arc-fault circuit interrupter as listed in UL 1699, Standard for Arc-Fault Circuit Interrupters, installed to provide protection of the branch circuit.

~~Branch/Feeder AFCI's shall be permitted to be used to meet the requirements of 210.12(B) until January 1, 2008.~~

~~FPN: For information on types of arc-fault circuit interrupters, see UL 1699-1999, Standard for Arc-Fault Circuit Interrupters.~~

Exception: The location of the arc-fault circuit interrupter shall be permitted to be at other than the origination of the branch circuit in compliance with (1) and (2):

(1) The arc-fault circuit interrupter installed within 1.8 m (6 ft) of the branch circuit overcurrent device as measured along the branch circuit conductors.

(2) The circuit conductors between the branch circuit overcurrent device and the arc-fault circuit interrupter shall be installed in a metal raceway or a cable with a metallic sheath.

Substantiation: The code proposal expands the use of arc-fault technology into other occupancies as defined by the Life Safety Code (NFPA 101). Previously CMP 2 rejected this proposal that it was too broad, therefore with the addition of the reference to the Life Safety Code the definition it is now better clarified.

Sufficient data has been submitted previously such as "Fire Loss in the United States During 2001" by Michael J. Karter, Jr., Fire Analysis and Research Division, September 2002 publication clearly indicates the tragic fire losses occurring in residential occupancies with an increase of 4.5 percent. The other occupancies identified in this proposal are used as a home environment must be protected to ensure the residents are provided protection from electrical arcing fires.

Panel Meeting Action: Accept in Part

The panel rejects the addition of the word "design," the reference to NFPA 101, the reference to UL Standard 1699 in the mandatory text and the deletion of the fine print note that references UL 1699. The panel accepts the deletion of the following text: "branch/feeder AFCI's shall be permitted to be used to meet the requirements of 210.12(B) until January 1, 2008."

Panel Statement: The term "intended" correlates with the terminology in the product standard. Dwelling units are defined in the NEC and the reference to the definition in NFPA 101 is not necessary. The reference to UL 1699 in mandatory code text does not comply with Section 4.2 of the NEC Style Manual. The fine print note provides useful information describing various types of AFCI's. The submitter has not provided adequate substantiation to support the expansion of AFCI devices to the locations described in the proposed new subdivision (C). CMP-2 action supporting the use and expansion of AFCI protection has been based on dwelling unit fire data.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

BROWN, L.: Please see NAHB's Ballot Comment on Proposal 2-142, especially the use of dwelling unit fire data to support the expansion of AFCI protection.

(Note to the TCC: It appears the Panel Meeting Action does not match the conclusion shown in the Panel Statement. The Panel Statement states, "The submitter has not provided adequate substantiation to support the expansion of ACFI devices to the locations described in the proposed new subdivision (C)." The Panel Meeting Action does not state that it does not accept the change shown in new subdivision (C). If it is the intent of the Panel to not accept new (C) this should be stated in the ROP. In fact, it actually looks as if the Panel Rejected the Proposal except for the one item (deletion of the sentence, "Branch/Feeder AFCI's....") already covered under Panel Meeting Action on Proposal 2-105.)

Comment on Affirmative:

KING, D.: I disagree with the panel action to not accept the expansion of AFCI protection to the occupancies listed in the submitter's recommendation. These occupancies serve as dwelling units for those who occupy them and are subject to the same hazards that arise with the use of electricity as that of a dwelling unit. The excessive use of extension cords in most dormitories is common place creating a greater risk of fire due to arcing faults. The panel should give further consideration to this proposal.

2-107 Log #615 NEC-P02 **Final Action: Reject**
(210.12)

Submitter: Eddie Phillips, Southern Regional Fire Code Development Committee

Recommendation: Revise to read: 210.12 Arc-Fault Circuit-Interrupter Protection.

(A) Definition. An arc-fault circuit interrupter is a device ~~intended~~ designed to provide protection from the effects of arc-faults by recognizing characteristics unique to arcing and by functioning to de-energize the circuit when an arc-fault is detected.

(B) Dwelling Unit Bedrooms. All 125 volt, single phase, 15 and 20-ampere branch circuits supplying outlets installed in dwelling unit bedrooms shall be protected by a listed arc-fault circuit interrupter, combination type installed to provide protection of the branch circuit.

Branch/Feeder AFCI's shall be permitted to be used to meet the requirements of 210.12(B) until January 1, 2008.

FPN: For information on types of arc-fault circuit interrupters, see UL 1699-1999, Standard for Arc-Fault Circuit Interrupters.

Exception: The location of the arc-fault circuit interrupter shall be permitted to be at other than the origination of the branch circuit in compliance with (1) and (2):

(1) The arc-fault circuit interrupter installed within 1.8 m (6 ft) of the branch circuit overcurrent device as measured along the branch circuit conductors.

(2) The circuit conductors between the branch circuit overcurrent device and the arc-fault circuit interrupter shall be installed in a metal raceway or a cable with a metallic sheath.

<u>(C) Educational and Day Care Occupancies. All 125-volt single phase, 15-and 20Ðampere branch circuits supplying outlets installed in educational occupancies K-12 and day care centers for preschool age as defined by the Life Safety Code (NFPA 101) shall be protected by a listed arc-fault circuit interrupter, as listed in UL 1699, Standard for Arc-Fault Circuit Interrupters, installed to provide protection of the branch circuits.</u>

<u>Exception: The location of the arc-fault circuit interrupter combination type shall be permitted to be at other than the origination of the branch circuit in compliance with (1) and (2):</u>

<u>(1) The arc-fault circuit interrupter installed within 1.8 m (6 ft) of the branch Circuit overcurrent device as measured along the branch circuit conductors.</u>

<u>(2) The circuit conductors between the branch circuit overcurrent device and the arc-fault circuit interrupter shall be installed in a metal raceway or a cable with a metallic sheath.</u>

Substantiation: The need to expand the use of AFCI technology is necessary to afford greater safety within these occupancies from the hazards arising from the use of electricity. Educational occupancies as defined by the Life Safety Code include grades K through 12. These facilities are supported by tax dollars as well as private funding and protecting this investment is vital to the educational programs. A school fire disrupts the educational process and disrupts the academia programs. Schools also contain many different hazards such as laboratories, shops etc. These hazardous areas in use by students present an even greater hazard and the installation of AFCI's would reduce one of those hazards. To prevent electrical fires in the educational occupancies is justifiable and vital to the safety of the students. It is not a matter of staffing but practical safeguarding from the hazards arising from the use of electricity.

Day care centers fall into the same category as educational occupancies substantiation except today many are private facilities.

Panel Meeting Action: Reject

Panel Statement: The submitter has not provided adequate substantiation to support the expansion of AFCI devices to the locations described in the proposed new subdivision (C). CMP-2 action supporting the use and expansion of AFCI protection has been based on dwelling unit fire data.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

KING, D.: I agree with the submitter that this proven safety technology should be expanded to educational facilities. The use of AFCI devices does reduce the incidence of fires due to arcing faults. The panel action on proposal 2-142 speaks to the confidence that panel 2 has with the reliability of these devices. The National Association of State Fire Marshals has documented that of the majority of the 5,500 fires in educational facilities that are reported on average annually, most occur during the hours when school is in session and the buildings are occupied thus increasing the risk of injury or death to persons occupying these facilities. The orientation of some of these documented fires is electrical in nature. Requiring AFCI protection for branch circuits supplying 125-volt 15-and 20-ampere receptacle outlets would reduce the number if not eliminate the number of fires resulting from electrical arcing on these branch circuits.

Comment on Affirmative:

BROWN, L.: Please see NAHB's Ballot Comment on Proposal 2-142, especially the use of dwelling unit fire data to support the expansion of AFCI protection.

2-108 Log #616 NEC-P02 **Final Action: Reject**
(210.12)

Submitter: Eddie Phillips, Southern Regional Fire Code Development Committee

Recommendation: Add a new Subsection of 210.12 to read as follows:

<u>( ) Existing Occupancies: When the panelboard that contains the overcurrent protection devices for branch circuits is replaced in existing dwellings, apartments, lodging and rooming houses, residential board and care homes and dormitories as defined by the Life Safety Code, (NFPA 101), a listed arc-fault circuit interrupter as listed in UL 1699, Standard for Arc-Fault Circuit Interrupters, shall protect each branch circuit that serves 125-volt, single-phase, 15 and 20-ampere outlets.</u>

<u>E xception: The location of the arc-fault circuit interrupter shall be permitted to be at other than the origination of the branch circuit in compliance with (1) and (2):</u>

<u>(1) The arc-fault circuit interrupter installed within 1.8 m (6 ft) of the branch circuit overcurrent device as measured along the branch circuit conductors.</u>

<u>(2) The circuit conductors between the branch circuit overcurrent device and the arc-fault circuit interrupter shall be installed in a metal raceway or a cable with a metallic sheath.</u>

Substantiation: Data provided CMP 2 from NFPA regarding lodging and rooming houses, existing dwellings, dormitories, apartments and residential board and care homes provide equivalent environments settings to dwellings (our homes). Previously CMP 2 indicated that apartments are considered dwellings; however, there is no definition of dwelling in the NEC. Therefore, utilizing the Life Safety Code definition provides consistency with NFPA documents. Apartments added to this section may be redundant but necessary to clearly provide intent of the code.

Existing occupancies as identified in this proposal house the largest number of citizens for living in an environment that has the greatest fire losses, human and property that must be provided the latest technology for electrical safety. Data clearly indicates that dwelling fires from electrical arcing conditions cause approximately 400 deaths, 1700 injuries and over a billion dollars in losses. These unnecessary and needless losses can be prevented by the use of arc-fault technology. Providing for the installation of AFCIs during electrical upgrades will greatly enhance the electrical safety in the proposed occupancies.

Wiring in older homes is a problem. Over the years circuits, receptacles and other accessories have been added, in most cases by inexperienced people, to the existing circuits and panel boards. The addition of AFCI's during change out would ensure an increased level of safety in these aging systems.

Panel Meeting Action: Reject

Panel Statement: The submitter has not provided sufficient substantiation to expand the requirement for AFCI protection beyond dwellings. CMP-2 action supporting the use and expansion of AFCI protection has been based on dwelling unit fire data. See panel action and statement on Proposal 2-138 regarding the use of AFCI protection in existing dwelling units.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

KING, D.: This proposal should have been accepted in principal with the panel rejecting the reference to the Life Safety Code, NFPA 101 and the addition of the reference to UL Standard 1699 in the main text. With regard to the part of the submitter's recommendation that AFCI protection be required for each 125-volt 15-and 20-ampere circuits installed in dwelling units, CMP-2 has accepted this for new installations with the panel meeting action on proposal 2-142. Panel 2 has been presented with data both in the past and present code cycle that shows evidence that there is an increased risk of fire in homes that are older than 20 years old, with even a more significant increase in fires in homes that are 40 years or older. The installation of these devices in older dwelling units will identify many wiring problems that will need to be corrected by the electrician installing these devices. This will help to mitigate the number of fires due to the improper installation of branch circuit wiring while ensuring that protection in the future from fires associated with arcing faults is afforded to these homeowners. Panel-2 should give further consideration to the submitter's recommendation to expand this requirement to other occupancies that are similar to dwelling units. See my explanation of negative for proposal 2-106.

WEBER, R.: The value and enhanced safety for occupants as well as the general public by the use and incorporation of AFCI protection techniques in not only dwelling unit type occupancies will provide a safer environment. Given the age and lack of good maintenance to the electrical systems in older type structures this proposal has merit and advantages. See my comment and explanation for the negative vote on Proposal 2-138.

Comment on Affirmative:

BROWN, L.: Please see NAHB's Ballot Comment on Proposal 2-142, especially the use of dwelling unit fire data to support the expansion of AFCI protection.

2-109 Log #2300 NEC-P02 **Final Action: Reject**
(210.12)

Submitter: James Shaw, Jim Shaw Electric Co.

Recommendation: Subject 210.12

I am told that I am amongst the fifty percent of the country that oppose smoke detectors on arc-fault circuits. I feel that 210.12(B) should be rewritten once again.

210.12(B) Dwelling unit bedrooms. All 120 volt, single phase 15 and 20 ampere branch circuits supplying <u>receptacle</u> outlets installed in dwelling unit bedrooms shall be protected by a listed arc-fault circuit interrupter, combination type installed to provide protection for the branch circuits.

I also believe that the exceptions in this section should be eliminated entirely, and allow AFCI receptacle outlets (similar to GFCI receptacle outlets) to be installed at the first outlet of each bedroom.

Substantiation: In the 1999 code, Arc-fault Circuit interrupters, were introduced. I do not have a copy of the 1999 code book, but as I remember it, it stated that in 2002 all receptacle outlets installed in dwelling unit bedrooms shall be protected by a listed arc fault circuit interrupter.

In the 2002 code book, the wording was changed slightly to include ALL 125 single phase 15 and 20 ampere outlets installed in dwelling unit bedrooms shall be protected by an arc fault circuit interrupter listed to provide protection of the entire branch circuit. The way this was written meant that now smoke detectors installed in bedrooms now had to be installed on the arc-fault protected circuit. This should never have happened? Placing a smoke detector circuit on a sensitive arc-fault circuit is like placing a sump pump on a GFCI circuit or a fire pump on breaker. These items should be on at all times and should be the last to trip or to fail.

Panel Meeting Action: Reject

Panel Statement: The submitter has not provided any technical substantiation that would indicate that AFCI devices are not compatible with smoke alarms nor has there been any data presented that warrants limiting AFCI protection to only receptacle circuits in dwelling unit bedrooms. The exception provides reasonable alternatives for dwelling unit owners that do not have service panels compatible with currently available AFCI procucts.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

BROWN, L.: Please see NAHB's Ballot Comment on Proposal 2-142, especially the use of dwelling unit fire data to support the expansion of AFCI protection.

2-110 Log #2605 NEC-P02 **Final Action: Reject**
(210.12)

Submitter: Thomas Domitrovich, Eaton Electrical

Recommendation: Revise text to read:

210.12 Branch Circuit Arc-Fault Circuit-Interrupter Protection.

(A) Definition. Arc-Fault Circuit-Interrupter. An arc-fault circuit interrupter is a device intended to provide protection from the effects of arc faults by recognizing characteristics unique to arcing . ~~and by functioning~~ It functions to de-energize the circuit when an arc fault is detected ~~.~~ and in response to ground faults that exceed a setting of no more than 100 mA.

(B) No change.

Substantiation: Article 210 is concerned with Branch Circuits. It is, therefore, appropriate to add the words "Branch Circuit" to the 210.12 heading. With this heading, the definition, 210.12(A), and the requirement, 210.12(B), relate to branch circuit protection. This change is needed because the AFCI standard, UL 1699, covers six different types of AFCI, and many of these types, for example, portable AFCIs, are not suitable for branch circuit protection.

The 210.12(A) definition change reflects the fact that all commercially available AFCIs, designed for branch circuit protection, incorporate ground fault protection that is set to operate at no more than 100 mA. Thus, ground faults that exceed this setting will de-energize the circuit. In addition to exceeding the UL 1699 requirement for responding to arcs down to 5A in typical installation-cable, Type NM-B plus ground, this ground fault protection has important fire protection advantages. First, the AFCI will respond to arcs to ground at any point in the installed wiring and in the branch circuit extension wiring. This response will occur for currents down to 100 mA, or less depending upon the design. Second, there is significant protection against "glowing connections" (1) Thus, loose connections at receptacles can lead to local overheating. The resulting "glowing connections" can create ground currents that can cause the AFCI to operate prior to fire initiation. Third, wiring errors (for example, grounded or shared neutrals) are immediately detected during initial circuit installation and power use.

The value of ground fault was recognized in the 1995 UL landmark study (2) prepared by UL for CPSC entitled "Technology for Detecting and Monitoring Conditions that Could Cause Electrical Wiring System Fires". That report includes in its Summary of Findings the statement: "Ground-fault interruption technology, due to the low-trip current levels that are possible, coupled with a fast response was shown to be very effective in interrupting arcing-fault currents to ground. This suggests that it should be combined with AFD technology, since AFD technology does not require current to ground to operate. As a fire prevention device, as opposed to a device intended to provide protection from electric shock, there is greater flexibility with respect to trip-current levels. The effectiveness of ground-fault technology is enhanced by increasing the probability that a fault will involve ground."

Further, in the 1995 study Recommendations, UL states: "Arc fault detection appears to be a very promising technology [for protecting against electrical fires] especially when added to residential branch circuit breakers and combined with other proven technologies such as ground fault protection."

The proposed definition change will not impact the design of commercially available AFCIs. It will, however, ensure that the additional fire protection benefits of ground fault detection continue to be incorporated in the AFCIs that are applied to branch circuits.

BROWN, L.: Please see NAHB's Ballot Comment on Proposal 2-142, especially the use of dwelling unit fire data to support the expansion of AFCI protection.

2-111 Log #2606 NEC-P02 **Final Action: Accept in Principle in Part**
(210.12)

Submitter: Thomas Domitrovich, Eaton Electrical

Recommendation: Revise text to read:

210.12 Arc-Fault Circuit-Interrupter Protection.

(A) Definition. Arc-Fault Circuit Interrupter. (No change)

(B) Dwelling Unit ~~Bedrooms~~ Living Areas . All 120-volt, single phase, 15- and 20-ampere branch circuits supplying outlets installed in dwelling unit ~~bedrooms~~ living areas shall be protected by a listed arc-fault circuit interrupter ~~, combination type~~ installed to provide protection of the branch circuit.

~~Branch/feeder AFCIs shall be permitted to be used to meet the requirements of 210.12(B) until January 1, 2008.~~

~~FPN: For information on types of AFCI, see UL 1699-1999, Standard for Arc Fault Circuit Interrupters.~~

Exception: (No change)

Substantiation: The change dealing with the type of AFCI would permit the continued use of listed Branch/feeder AFCIs beyond January 1, 2008. Further, since the proposed code language would not specify any particular type of AFCI for branch circuit protection, the wording would also permit the use of listed Combination Type AFCIs when available. Essentially the code language is similar to the language used in the 2002 code, which did not specify a Type designation. This change is necessary because, as of November 2005, Combination AFCIs have not become commercially available. As a consequence, there is no practical field experience to form a basis for judging whether these devices offer superior fire protection and satisfactory resistance to unwanted tripping. This practical field experience is absolutely essential as pointed out in the recent Eaton Electrical articles that appeared in IAEI News (ref. 1) and the NEC Digest (ref. 2).

What is know is that Branch/feeder AFCIs have proven safety features. They mitigate the effects of high current arcs at any point in the branch circuit wiring, Type NM-B plus ground, and in the two-wire branch circuit extension wiring. They protect against low current arcs in the branch circuit wiring and, since the commercially available devices contain low-level ground fault protection (30-50 mA), they additionally mitigate the effects of arcs to ground and of glowing connections (ref. 3). Branch/feeder AFCIs are practical devices that have been readily available from at least four major manufacturers since 1999. Since that time more than 15 million devices have been installed. Electrical fires have been prevented, wiring errors during initial electrical installation have been corrected, and unwanted tripping has been minimal. In particular, the AFCI support of many organizations including UL, CSA, the National Association of State Fire Marshals, the Consumer Products Safety Commission, and the Electrical Safety Foundation International is based on the experience gained with Branch/feeder AFCIs.

The change dealing with AFCI protection for all living areas represents an increase in AFCI application and fire safety. At the present time, AFCI protection is only required for bedroom circuits. These circuits represent a limited fraction of dwelling unit circuits. Consequently, AFCIs can presently mitigate less than 20 percent (ref. 4) of the electrical fires that could occur in dwellings that are wired according to the 210.12(B) code requirements. The value of expanded AFCI fire protection was certainly appreciated by the National Association of State Fire Marshals who, during the 2005 code cycle, proposed (proposal 2-140) the expansion of AFCI to all branch circuits that supply living areas. The NASFM proposal was subsequently discussed during the comment period, (comment 2-91) where is was defeated. The associated panel statement reads, "The panel appreciates the level of protection provided by branch/feeder AFCIs. However, the panel wants to see the combination protection implemented before expansion beyond the bedrooms. The submitter has provided comprehensive fire data; however, Panel 2 seeks to gain further information on the experience with the devices already in the field". The dissenting statement, supporting expansion, by Ms. Porter of UL reads, "The panel has been provided with data that shows that fires in kitchens, living rooms and other dwelling unit areas may be reduced by the use of AFCI devices. The existing branch/feeder AFCIs have demonstrated their performance in the field. Since these devices will continue to be permitted until January 1, 2008, there is no need to postpone the expansion of AFCI into other circuits." The dissenting statement, supporting expansion, by Jim Pauley of NEMA deals with the fire statistics issue.

The panel is faced with a quandary. (1) With two years left before Branch/feeder AFCIs exclusion, which is the intent of the 2005 Code language, their presumed successor, Combination AFCIs, are not commercially available and their viability has not been proven. (2) Even if Combination AFCIs became available in January 2006, there would be very limited field experience prior to the code-comment-period decisions in December 2006. (3) Following from (1) and (2), if expansion of AFCI application is dependent on Combination AFCI implementation and experience, then expansion is likely to be delayed to the 2012 code cycle. And, during this time period there are likely to be thousands of preventable electrical system fires in dwelling units, with associated deaths, injuries and property loss.

The present proposal offers a solution to the quandary. (1) The installation of Branch/feeder AFCIs, with a level of protection, per the panel statement, that is appreciated, would be permitted beyond January 1, 2008. (2) No type of AFCI is specified in the proposed code language. This means that Combination AFCIs could be introduced to the market place at any time. This should result in a gradual increase in practical experience rather than a possible rush for experience in 2006. (3) Fire statistics show an evident need for electrical-system fire-protection on additional circuits. As expressed by Ms. Porter, "The existing Branch/feeder AFCIs have demonstrated their performance in the field. Since these devices will continue to be permitted until January 1, 2008, there is no need to postpone the expansion of AFCI into other circuits." The proposed code language achieves circuit expansion, and the protection requirement, at least initially, can be expected to be met by Branch/feeder AFCIs. However, the public could choose, alternatively, to fill the requirement using Combination AFCIs, when available. Ultimately, the panel may be in a position to compare the technologies and experiences. But for the moment, the best interests of fire safety are served by a lack of AFCI type specification, and an increase in the number of protected circuits.

(210.12)

TCC Action: The Technical Correlating Committee understands that the Panel Action on this Proposal is modified by the Panel Action on Proposal 2-142.

Submitter: Thomas Domitrovich, Eaton Electrical

Recommendation: Revise text to read:

210.12 Arc-Fault Circuit-Interrupter Protection.

(A) Definition. Arc-Fault Circuit Interrupter. (No change)

(B) Dwelling Unit Bedrooms. All 120-volt, single phase, 15- and 20-ampere branch circuits supplying outlets installed in dwelling unit bedrooms shall be protected by a listed arc-fault circuit interrupter ~~, combination type~~ installed to provide protection of the branch circuit.

~~Branch/feeder AFCIs shall be permitted to be used to meet the requirements of 210.12(B) until January 1, 2008.~~

~~FPN: For information on types of arc fault circuit interrupters, see UL 1699-1999, Standard for Arc Fault Circuit Interrupters.~~

Exception: (No change)

Substantiation: This change would permit the continued use of listed Branch/ feeder AFCIs beyond January 1, 2008. Further, since the proposed code language would not specify any particular type of AFCI for branch circuit protection, the wording would also permit the use of listed Combination Type AFCIs when available. Essentially, the code language is similar to the language used in the 2002 code, which did not specify a Type designation.

In the November/December 2003 IAEI News article "AFCIs-A Critical NEC 2005 Issue" (1), Eaton Electrical had suggested that the 2005 code language should not be changed to reference a specific type of AFCI. We stated that the code panel could certainly revisit this subject in future code cycles should Combination AFCIs become commercially available, and if subsequent practical field experience indicated superior fire protection capabilities and satisfactory resistance to unwanted tripping. But, as of November 2005, Combination AFCIs have not become commercially available. As a consequence, there is no practical field experience to form the basis for judging superior fire protection and satisfactory resistance to unwanted tripping. Eaton Electrical has also provided an in-depth discussion of Branch/feeder AFCIs and Combination AFCIs in the June 2005 edition of NEC Digest (2), This article again stresses that, although UL has provided listings for Combination AFCIs, these devices are not readily available in the marketplace.

Further, the article points out that Combination AFCIs could eventually be installed in millions of homes where they would be subjected to all manner of circuit conditions and all manner of appliance types and configurations. But, so far extensive commercial experience with the devices is lacking and their resistance to unwanted tripping under practical field conditions is unknown.

In urging the panel to accept this proposal, Eaton Electrical again references the proven safety features of Branch/feeder AFCIs. They mitigate the effects of high current arcs at any point in the branch circuit wiring, Type NM-B plus ground, and in the branch circuit extension wiring. They protect against low current arcs in the branch circuit wiring and, since the commercially available devices contain low-level ground fault protection (30-50 mA), they additionally mitigate the effects of arcs to ground and of glowing connections (3), Branch/ feeder AFCIs are practical devices that have been readily available from at least four major manufacturers since 1999. Since that time more than 15 million devices have been installed. Electrical fires have been prevented, wiring errors during initial electrical installation have been corrected, and unwanted tripping has been minimal. In particular, their fire-protection value has been recognized by many organizations including UL, CSA, the National Association of State Fire Marshals, the Consumer Products Safety Commission, and the Electrical Safety Foundation International. It must again be emphasized that the proposed language does not exclude Combination AFCIs. Rather, it removes the exclusion of the proven technology, Branch/ feeder AFCIs, and also permits the immediate introduction of Combination AFCIs when available. Eventually the panel should expect to have comparative data from millions of field installations for the two types of devices. But, at this time, there is absolutely no commercial field experience with Combination AFCIs that could justify the exclusion of Branch Feeder AFCIs. The panel should accept this proposal in the interests of continued fire safety.

Panel Meeting Action: Accept in Part

The panel accepts the deletion of "Branch/feeder AFCIs shall be permitted to be used to meet the requirements of 210.12(B) until January 1, 2008."

The panel rejects the remainder of the recomendation.

Panel Statement: See the Panel action and statement on Proposal 2-111 regarding the rejected portion of the recommendation.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 9 Negative: 3

Explanation of Negative:

BECKER, R.: The combination type AFCI should be dropped as proposed by the submitter. In presentation to CMP 2 the submitter raised serious questions regarding the viability of the combination type AFCI, while at the same time also promoted extending the use of the non combination type. The submitter's concerns regarding combination type AFCI availability, the viability of the UL tests, and the existence of a proven track record are valid.

The CPSC 2005 Performance and Accountability Report states that its goal for 2005 was to evaluate field installed AFCIs to make future NEC proposals, but that the devices were not available. Why not wait for results from CPSC? Mandating use of a product that is still in a testing environment unnecessarily risks the financial resources of the public. NASFM fact finding endeavors reveal that series type arc faults are low energy and less likely to cause fires. There is no documentation to support the substantial existence of fires attributable to events that the combination type will sense, and that would not be sensed by the branch/feeder AFCI. It is prudent to wait until the product has a more substantial record and is field proven.

The panel statement asks the submitter to provide substantiation that the combination type is not viable, but clearly this is unreasonable for a product that is not widely, commercially available. CPSC's unfulfilled intent should be enough substantiation. IEEE encourages CPSC and UL to develop testing procedures that reveal significant benefits of the combination type AFCI.

CMP 2 should approach the combination type AFCI as it did with its response to Proposal 2-88, nothing in the code prevents its installation, and if it offers beneficial results they will be proven in the field.

BROWN, L.: Please see NAHB's Ballot Comment on Proposal 2-142, especially the use of dwelling unit fire data to support the expansion of AFCI protection.

NENNINGER, B.: See my explanation of negative vote on Proposal 2-105.

2-113 Log #3620 NEC-P02 **Final Action: Reject**
(210.12)

Submitter: Richard W. Becker, Engineered Electrical Systems, Inc. / Rep. IEEE
Recommendation: Delete this section.
Substantiation: Electrically caused ignition is the result of joule heating when an energized conductor comes in contact with a grounded surface. The heat that is produced can result in the conductor melting and vaporizing which then emits "sparks" and can support "arcing" however ignition results before this phenomenon becomes detectable by the Arc Fault detection circuit. Producing ignition in combustible material using conductors protected by an AFCI device can be accomplished repeatedly without tripping the device. Under these conditions it becomes apparent that this technology is not effective in preventing electrically caused ignition.

The estimated cost of this requirement has been stated in other documentation as an estimated average cost of $ 100 per dwelling. The benefit has not been demonstrated, and the consumer is being given a false sense of security. Substantiation that has been presented previously by Fire Investigators is not specific as to the actual electrical conditions at the time of ignition. Research must continue to accurately define the conditions that result in "electrically caused" fires so that positive measures can be defined that will reduce or eliminate this problem.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any data that would indicate that AFCI devices would not respond to an arcing fault in time to prevent ignition of combustible materials. Contrary to the submitters substantiation, there is documentation at NFPA headquarters that supports the panel's position that AFCI devices do mitigate the effects arcing faults prior to ignition of surrounding combustible materials.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

BROWN, L.: Please see NAHB's Ballot Comment on Proposal 2-142, especially the use of dwelling unit fire data to support the expansion of AFCI protection.

(Note: Sequence 2-114 was not used)

2-115 Log #3646 NEC-P02 **Final Action: Reject**
(210.12)

Submitter: Lawrence Brown, National Association of Home Builders (NAHB)
Recommendation: Delete Section 210.12.
Substantiation: Data on fire loss has yet to prove that the use of AFCI devices is a cost-effective approach to lessen fires associated with the wiring between the electric distribution panel and the electrical outlet. Also of concern is that these devices are not capable of identifying all of the possible electrical fires that may be related to this same wiring. If, on a national basis, the cost to install these devices greatly exceeds the loss there is no cost-benefit and this provision in the NEC should be removed. Please see the article on House Fire Deaths which I have provided.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The submitters substantiation includes one report on the declining number of residential fires both in the United States and Europe. The report fails to include any data on the contribution of AFCI technology to the decline of electrically oriented fires. Since first discussed during the 1999 NEC cycle, data has been presented that supports the panel's position that AFCI devices do mitigate the number of fires resulting from electrical arcing. The panel is aware that there have been other measures taken to reduce the number of fires in dwelling units and views the use of AFCI protected devices as being one that will play a role in the reduction of these fires.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:

BROWN, L.: Please see NAHB's Ballot Comment on Proposal 2-142, especially the use of dwelling unit fire data to support the expansion of AFCI protection.

PURVIS, R.: Proposal 2-115 (AFCIs) should be accepted. EEI EL&P agrees with the substantiation of the proposal. AFCI requirements should be removed from the NEC for dwelling unit branch circuits and not be expanded to any other location. Problems in the field, manufacturer recalls, nuisance trips, and the numerous jurisdictions that have removed this requirement from local adoption are an indication of the lack of support of AFCIs in electrical systems in residential occupancies. AFCI requirements throughout the dwelling increases housing costs when not justified for new wiring systems. The AFCI does not address all of the problems with the incidents of fire that were submitted in the substantiation of the Consumer Product Safety Commission. The majority of known problems submitted have occurred on old wiring systems in older dwellings and not with the latest wiring requirements found in the NEC. Hazards have occurred when there is a lack of receptacles in an existing dwelling and extension cords are used to supply utilization equipment. These cords have been placed under furniture, under floor coverings or had physical damage. It appears that the intent of the AFCI requirement in the NEC is to create a market for a product where the benefit of the device does not protect against all arcing problems.

2-116 Log #2918 NEC-P02 **Final Action: Reject**
(210.12 Exception No. 1 (New))

Submitter: Marcus Sampson, Lysistrata Electric
Recommendation: Revise as follows:

210.12 Arc-Fault Circuit-Interrupter Protection.

<u>Exception 1: A single receptacle located within a bedroom closet used exclusively for a lift pump shall not require arc-fault circuit interrupter protection. This receptacle shall be identified as NOT arc-fault protected.</u>

Renumber existing exception as Exception <u>2</u> .
Substantiation: As an essential piece of equipment, lift pumps located within bedroom spaces should not be required to be installed on a circuit that, if tripped, could cause unnecessary damage.
Panel Meeting Action: Reject
Panel Statement: The submitter of this proposal has not provided any technical data to support his position that listed AFCI devices are not compatible with lift pumps.
Number Eligible to Vote: 12

Comment on Affirmative:

BROWN, L.: Please see NAHB's Ballot Comment on Proposal 2-142, especially the use of dwelling unit fire data to support the expansion of AFCI protection.

2-117 Log #2920 NEC-P02 **Final Action: Reject**
(210.12 Exception No. 1 (New))

Submitter: Marcus Sampson, Lysistrata Electric
Recommendation: Add an exception to read as follows:

<u>Exception No. 1: A single receptacle used exclusively for the connection of an essential medical device shall not require arc-fault circuit interrupter protection. This receptacle shall be identified as NOT arc-fault protected.</u>

Renumber existing exception as Exception No. 2.
Substantiation: Specialty home medical devices have electronic components that are incompatible with ground-fault and arc-fault devices.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any technical data to support his substantiation that electronic components contained in medical devices are incompatible with arc-fault devices.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:

BROWN, L.: Please see NAHB's Ballot Comment on Proposal 2-142, especially the use of dwelling unit fire data to support the expansion of AFCI protection.

2-118 Log #2850 NEC-P02 **Final Action: Reject**
(210.12 Exception No. 2 (New))

Submitter: Lorenzo Adam, City of Mason-Building Department
Recommendation: Add new text as follows:

Exception <u>No. 1</u> : The location...".

<u>Exception No. 2: In dwelling units 120 volt, single phase, 15- and 20-ampere branch circuits supplying smoke alarms shall conform to NFPA 72.</u>
Substantiation: Article 760 covers Fire Alarm Systems. Smoke alarms covered under this article are part of a system and not individually (single and multiple stations) as in the Building Code. The International Building Code and International Residential Code cover single- and multiple-station smoke alarms. Both codes reference NFPA 72. In NFPA 72, Chapter 11 covers single- and multiple-station alarms.

This is a case where NFPA 72 and 70 are in conflict with each other.

(1) NFPA 72 states no smoke detectors under AFCI protection (see ROP already submitted for NFPA 72, 2006 (to be specific 72-530 Log #179 SIG-HOU/11.36.3(5)/72-528 Log #390/72-529 Log #630) which has been accepted to modify and to add "arc fault circuit interrupter" to this paragraph) and;

(2) NFPA 70 states that any "outlets" in the bedrooms must be AFCI protected. The word "outlets" is what makes smoke alarms part of the AFCI protection. Therefore, it would be the discretion of the Authority Having Jurisdiction to interpret which code is more appropriate for the application of the proper code language. In this case, is it the building code that has the jurisdiction over the smoke alarms in residential applications.

Panel Meeting Action: Reject
Panel Statement: See the panel action on Proposal 2-118a (Log# CP 200) which is consistent with the action of the NFPA 72 Technical Correlating Committee to resolve the potential conflict.
Number Eligible to Vote: 12

Comment on Affirmative:
BROWN, L.: Please see NAHB's Ballot Comment on Proposal 2-142, especially the use of dwelling unit fire data to support the expansion of AFCI protection.

2-119 Log #3061 NEC-P02 **Final Action: Accept**
(210.12(A).Arc-Fault Circuit Interrupter (AFCI))

TCC Action: The Technical Correlating Committee understands that the Panel Action on this Proposal modifies the Panel Action on Proposal 2-105.
The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal to revise the definition to comply with 2.2.2 of the NEC Style Manual by deleting the term within the definition.
This action will be considered by the Panel as a Public Comment.
Submitter: Douglas A. Lee, U.S. Consumer Product Safety Commission
Recommendation: Revise section 210.12(A) to read as follows:
(A) Definition: Arc-Fault Circuit Interrupter (<u>AFCI</u>). An arc-fault circuit interrupter is a device intended to provide protection from the effects of arc faults by recognizing characteristics unique to arcing and by functioning to de-energize the circuit when an arc fault is detected.
Substantiation: The acronym "AFCI" is used in 210.12(B) but is not previously defined. Appropriately the acronym "GFCI" is in the definition of Ground-Fault Circuit Interrupter (GFCI) in Article 100.
Some people are still confused by arc-fault circuit interrupters, which are used to protect against arcing faults to prevent fires, and ground-fault circuit interrupters which are used for personnel protection against electrical shock. This addition will help users to relate arc-fault circuit interrupter to AFCI.
Panel Meeting Action: Accept
Number Eligible to Vote: 12

Explanation of Negative:
BROWN, L.: Please see NAHB's Ballot Comment on Proposal 2-142, especially the use of dwelling unit fire data to support the expansion of AFCI protection.

2-118a Log #CP200 NEC-P02 **Final Action: Accept**
(210.12(B))

Submitter: Code-Making Panel 2,
Recommendation: Add a new FPN after the main paragraphs of 210.12(B) to state:
FPN No.2: See 11.6.3(5) of NFPA 72-2007, National Fire Alarm Code® for information related to secondary power supply requirements for smoke alarms installed in dwelling units.
Substantiation: At the request of the NFPA 72 Technical Correlating Committee, the panel has added a new FPN to reference the specific requirement in NFPA 72 for a secondary power source for smoke alarms that are installed on AFCI protected circuits. The panel notes that the provision for a secondary power source is required for all new installations of smoke alarms under the provisions of NFPA 72 and the addition of the FPN correlates with the revision by the NFPA 72 Technical Correlating Committee to require that all AC powered smoke alarms (whether new installation or retrofit) that are supplied by an AFCI protected circuit must have a secondary power source.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-120 Log #96 NEC-P02 **Final Action: Reject**
(210.12(B))

Submitter: Kenneth Stevens, Corunna, MI
Recommendation: Add a new sentence at the end of the paragraph as follows:
"Fire alarm circuits shall not be supplied through arc-fault circuit-interrupters."
Substantiation: This statement is in 760.21 and 760.41, but it probably will not be seen by too many persons in the field. This statement needs to be made clear.
Panel Meeting Action: Reject
Panel Statement: Fire alarm circuits are covered in Article 760 which modifies the general requirements of 210.12(B). See panel action and statement on Proposal 2-150.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
BROWN, L.: Please see NAHB's Ballot Comment on Proposal 2-142, especially the use of dwelling unit fire data to support the expansion of AFCI protection.

2-121 Log #107 NEC-P02 **Final Action: Accept in Principle**
(210.12(B))

Submitter: Virgil Alexander, Saginaw, MI
Recommendation: Add a new second paragraph as follows:
"Closets and other rooms accessible only from a bedroom shall have all outlets supplied by 125 volt, 15- or 20-ampere circuit protected by a listed arc-fault circuit interrupter, combination type installed to provide protection of the branch circuit.
Substantiation: The first sentence of paragraph (B) states only 125 volt 15- and 20-ampere outlets in bedrooms shall be arc-fault circuit-interrupter protected. The question has been raised as to whether closets and dressing rooms off a bedroom are also included. Some inspectors say yes and others say no. This issue needs to be clarified. As I am proposing, all rooms accessible only from a bedroom are to have the 125 volt, 15- and 20-ampere outlets arc-fault circuit-interrupter protected. This would include bathrooms as well as closets, storage areas, and dressing rooms. I do not have any strong feelings as to which rooms should be included, I just want the issue clarified so as an electrician I can wire a dwelling correctly the first time and not have to go back and fix a Code violation.
Panel Meeting Action: Accept in Principle
Panel Statement: The recommended action is accomplished through the panel action on Proposal 2-142.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
BROWN, L.: Please see NAHB's Ballot Comment on Proposal 2-142, especially the use of dwelling unit fire data to support the expansion of AFCI protection.

2-122 Log #391 NEC-P02 **Final Action: Reject**
(210.12(B))

Submitter: Stephen Schaefer, DCCC
Recommendation: Revise text as follows:
All 120-volt single phase, ~~15- and 20-ampere~~ branch circuits supplying outlets installed in dwelling unit bedrooms shall be protected by a listed arc-fault interrupter, combination type installed to provide protection of the branch circuit. Branch/feeder AFCIs shall be permitted to be used to meet the requirements of 210.12(B) until January 1, 2008.
Substantiation: It seems as if there would be a way around putting arc-fault protection in dwelling unit bedrooms if the branch circuits covered by the Code only listed 15- and 20-ampere branch circuits. One could get around installing arc-fault protection simply by installing either a 10- or 30-ampere breaker. A 10-amp breaker could be installed to serve the smoke detectors in dwelling unit bedrooms. This could lead some to believe that this would also be all right for the bedroom branch circuit. One could also try installing #10 wire with a thirty amp breaker. This would not be acceptable because there could be box fill problems. In not so many words, it would provide more clarity for this article by saying that ALL 120-volt single phase branch circuits, and not just 15- and 20-ampere branch circuits.
Panel Meeting Action: Reject
Panel Statement: The submitter of this proposal has not provided any technical substantiation to support his recommendation. Section 210.3 does not permit 10 ampere rated multi-outlet branch circuits. The panel notes that the use of a 30 ampere overcurrent protective device on a receptacle and general lighting circuit would not be compliant with other provisions of the NEC.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
BROWN, L.: Please see NAHB's Ballot Comment on Proposal 2-142, especially the use of dwelling unit fire data to support the expansion of AFCI protection.

2-123 Log #395 NEC-P02 **Final Action: Reject**
(210.12(B))

Submitter: Goddson Blair, Thomasville, NC
Recommendation: Revise text to read as follows:
All 120-volt, single phase, ~~15- and 20-ampere~~ branch circuits supplying outlets installed in dwelling unit bedrooms shall be protected by a listed arc-fault circuit interrupter, combination type installed to provide protection of the branch circuit.
Substantiation: I propose that all 120-volt, single phase, branch circuits shall have arc-fault circuit interrupters protecting the circuits supplying outlets that are installed in dwelling unit bedrooms, so 10- and 30-ampere branch circuits cannot be used to bypass the arc-fault circuit interrupter.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Proposal 2-122.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
BROWN, L.: Please see NAHB's Ballot Comment on Proposal 2-142, especially the use of dwelling unit fire data to support the expansion of AFCI protection.

2-124 Log #401 NEC-P02 **Final Action: Reject**
(210.12(B))

Submitter: David Miklos, Miklos Electric Inc.
Recommendation: Add text to read as follows:
210.12(B) Dwelling Unit Bedrooms. All 120-volt, single phase, 15- and 20-ampere branch circuits supplying outlets installed in dwelling unit bedrooms <u>and all 120-volt, single phase, 15- and 20-ampere outlets supplying equipment installed in dwelling unit bedrooms</u> shall be protected by an arc-fault circuit interrupter listed to provide protection of the entire branch circuit.
Substantiation: 2005 NEC 210.12(B) Does not require AFCI protection for electric fireplaces that are installed in bedrooms because the outlets are not located in the bedrooms. The outlets are located outside of the finished bedroom walls, accessible only after removing the fireplace. The outlets are located in unfinished areas of the dwelling unit. This "Dead Space" is not within the bedrooms. Therefore, the outlet is NOT required to be AFCI protected even though the equipment it supplies is located in the bedroom.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The panel intends that the current requirement applies only to branch circuits supplying outlets in bedrooms. The use of the term "equipment" is too broad in the context of the submitter's recommendation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
BROWN, L.: Please see NAHB's Ballot Comment on Proposal 2-142, especially the use of dwelling unit fire data to support the expansion of AFCI protection.
KING, D.: The panel action on proposal 2-142 satisfies the submitter's intent.

2-125 Log #471 NEC-P02 **Final Action: Accept in Principle in Part**
(210.12(B))

Submitter: Richard Lockhart, Lexington, NC
Recommendation: Revise text to read as follows:
All 120-volt, single phase, ~~15- and 20-ampere~~ branch circuits supplying outlets installed in dwelling unit <u>s</u> ~~bedrooms~~ <u>whether new construction or remodeling,</u> shall be protected by a listed arc fault circuit interrupter, combination type installed to provide protection of the branch circuit.
Substantiation: NFPA statistics for the period 1999-2002 show an annual average of 32,000 fires caused by electrical distribution equipment, with an average of 240 civilian deaths, 1000 injuries and property damage in the billions of dollars. Seventeen percent of the fires, resulting in 28 percent of the fatalities, were attributed to damaged or defective cords and plugs. Seventeen percent of the fatalities were children aged five and under. Fires were most frequent during the winter months, due to the increased use of heating equipment, but also due to short circuits caused by overloading outlets and cords during the Christmas holiday season. The use of arc-fault circuit interrupters on all receptacle outlet branch circuits will greatly decrease the number of fires caused by defective or overheated drop cords, plugs, or receptacle outlets.
Panel Meeting Action: Accept in Principle in Part
The panel rejects the deletion of text: "15- and 20-ampere.The panel rejects the addition of the wording "whether new construction or remodeling" to this section. The panel accepts the deletion of the term "bedrooms" through their action on Proposal 2-142.
Panel Statement: The submitter has not given any substantiation to extend the requirement of AFCI devices beyond "15- and 20-ampere branch circuits. The word "remodeling" is too general of a term and does not specifically reference electrical renovations. See the panel action on Proposal 2-142 regarding the expanded use of AFCI protection.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 8 Negative: 4
Explanation of Negative:
BROWN, L.: Please see NAHB's Ballot Comment on Proposal 2-142, especially the use of dwelling unit fire data to support the expansion of AFCI protection.

KING, D.: This proposal should have been accepted. The submitter has provided adequate substantiation on the number of fires that occur in dwelling units that are electrical in nature. Not all of the electrical fires documented originate in 15-and-20 ampere branch circuits. Extending the requirement for AFCI protection to all 125 volt single phase circuits will further reduce the number of fires in dwelling units. Panel 2 has been presented with data both in the past and present code cycle that shows evidence that there is an increased risk of fire in homes that are older than 20 years old, with even a more significant increase in fires in homes that are 40 years or older. The installation of these devices in older dwelling units when remodeling will identify many wiring problems which will be corrected by the electrician after installing these devices. This will help to mitigate the number of fires due to the improper installation of branch circuit wiring while ensuring that protection in the future from fires associated with arcing faults is afforded to these homeowners.
NENNINGER, B.: See my explanation of negative vote on Proposal 2-105.
PURVIS, R.: See my Explanation of Negative for Proposal 2-115.

2-126 Log #596 NEC-P02 **Final Action: Accept in Part**
(210.12(B))

Submitter: Michael P. O'Quinn, MOGO Enterprises, Inc.
Recommendation: Revise text to read as follows:
(B) Dwelling Unit Bedrooms. All 120-volt, single phase, 15- and 20-ampere branch circuits supplying outlets installed in dwelling unit bedrooms shall be protected by a listed arc-fault circuit interrupter <u>in accordance with 210.12(B)(1), (B)(2), or (B)(3)</u> , ~~combination type installed to provide protection of the branch circuit~~ .
~~Branch/feeder AFCIs shall be permitted to be used to meet the requirements of 210.12(B) until January 1, 2008.~~
FPN: For information on types of arc-fault circuit interrupters, see UL 1699-1999, Standard for Arc-Fault Circuit Interrupters.
<u>(1) For outlets installed using non-combustible construction methods and employing metallic raceways or metal-sheathed cables, arc-fault protection shall only be required to protect appliances or equipment connected to the outlet.</u>
<u>FPN: For a listing of construction type, see Annex E.</u>
<u>(2) For outlets not covered in 210.12(B)(1), arc-fault protection shall be of the combination type provided to protect the entire circuit.</u>
Exception: The location of the arc-fault circuit interrupter shall be permitted to be at other than the origination of the branch circuit in compliance with (a) and (b):
(a) The arc-fault circuit interrupter installed within 1.8 m (6 ft) of the branch circuit overcurrent device as measured along the branch circuit conductors.
(b) The circuit conductors between the branch circuit overcurrent device and the arc-fault circuit interrupter shall be installed in a metal raceway or a cable with a metallic sheath.
<u>(3) For outlets supplying only a permanently installed fire alarm or burglar alarm shall not be required to have arc-fault circuit-interrupter protection.</u>
Substantiation: Arc-fault protection, as outlined in the UL White Book, is intended to provide protection for branch circuit wiring to the outlet (Branch/Feeder type), protection for cord-connected devices connected to the outlet (outlet type), or both (combination type). This means arc-fault protection is either circuit wiring protection to the outlet, or protection of device/equipment cords.
The dangers associated with arc-fault in the circuit wiring are centered in the use of non-metallic jacketed conductors or conductors not in metal raceways, installed in combustible walls in dwellings that could be subjected to construction-related damage. The NEC2005 210.12(B) Exception provides that conductors installed in metallic conduit or metal-sheathed cables are not a circuit arc-fault danger, or least not for 6 feet in combustible walls.
In this Proposal, 210.12(B)(1) requires no arc-fault protection for wiring to the outlet using metal-enclosed or metal-jacketed conductors in non-combustible walls, but does require arc-fault protection for devices or equipment cords downstream. This could be type UL-designated AWBZ, AFCI Outlet Branch Circuit Type, or UL-designated AWCG, Outlet Circuit Type as an example.
In this Proposal, 210.12(B)(2) would require arc-fault protection for the entire circuit for wiring not covered in 210.12(B)(1) – wiring not installed in metal conduit or metal-sheath cable in combustible walls. This follows the requirements of the 2005NEC version of 210.12(B).
Also note that 210.18 requires AFCI protection for bedroom outlets in Guest Rooms or Guest Suites provided with provisions for cooking as this is one of the "rules" for dwelling units implied in the 2005NEC® change. As a majority of these Guest Rooms or Guest Suites are constructed using non-combustible walls and wired in metal raceways or metal-sheathed cables, the installation of arc-fault circuit-interrupter protection for wiring to the outlet is unnecessary as the metallic covering over the conductors would provide substantial protection against construction-related damage. Likewise some jurisdictions have required the use of metal conduit or metal-sheath wiring methods in residential structures, and the installation of AFCI protection is likewise not necessary for the same reason.
210.12(B)(3) eliminates the requirement for arc-fault protection for permanently installed outlets serving fire alarm or burglar alarms, for the same reason 210.8(A)(5) Exception No. 3 eliminates ground-fault circuit-interrupter protection for these same outlets.
Panel Meeting Action: Accept in Part
CMP-2 accepts the deletion of "Branch / feeder AFCI's shall be permitted to be used to meet the requirements of 210.12(B) until January 1, 2008." The panel rejects the remaining recomendations.
Panel Statement: The submitter has not provided any technical data to support his position that an electrical arcing is not a factor where metal sheathed cables are installed. Arc-fault circuit interrupters are not evaluated for

protection of appliances or equipment. The submitter has not provided any technical data that would indicate that AFCI devices are not compatible with listed burglar alarm systems. Fire alarm circuits are covered in article 760 which modifies the general requirements of Section 210.12(B). See panel action and statement on Proposal 2-143.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

BECKER, R.: If premises wiring to outlets is in raceway, or is installed in noncombustible construction, an outlet AFCI should be accepted. There has been no substantiation of risk of combustion under these conditions. The substantiation presented to the CMP of risk in the premises wiring system does not differentiate between conditions that could be detected by AFCI circuitry. The AFCI detection circuit does not detect short circuits, high resistance "glowing" connections, or severed conductors in series with the load. There has been no substantiation of "arcing" risk in the premises wiring homerun.

BROWN, L.: Please see NAHB's Ballot Comment on Proposal 2-142, especially the use of dwelling unit fire data to support the expansion of AFCI protection.

2-127 Log #601 NEC-P02 **Final Action: Reject**
(210.12(B))

Submitter: Vincent Metallo, Sr., Baltimore County, MD / Rep. Baltimore County Electrical Inspections

Recommendation: Revise text to read:

(B) ~~(Dwelling)~~ Unit Bedrooms.

Substantiation: Delete the word dwelling in the heading. Many independent living and assisted living facilities are dwelling units with the exception that they do not contain cooking and have main dining areas. As now written in the code, the safety issue for arc faults in bedrooms is determined by the definition of a dwelling unit and its cooking conditions. This would allow the local jurisdictions to have the authority to define a bedroom by its use rather then by its cooking facilities. The purpose of arc fault protection was required by documentation submitted to the committee because of the amount of fires in bedrooms. This would allow an added level of safety especially for these type of facilities that consist of elderly residents.

Panel Meeting Action: Reject

Panel Statement: Deleting the word "dwelling" makes it unclear as to where the requirement applies.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 9 Negative: 3

Explanation of Negative:

BROWN, L.: Please see NAHB's Ballot Comment on Proposal 2-142, especially the use of dwelling unit fire data to support the expansion of AFCI protection.

KING, D.: I agree with the submitter's substantiation that the requirement for AFCI protection should not be dependent on the type of cooking facilities that are available in a residence. The submitter's concern that AFCI protection should be extended to occupancies that are similar to dwelling units is valid. See my explanation of negative on proposal 2-106.

WEBER, R.: The submitter in his substantiation has raised many valid points when addressing the need for AFCI protection in the "independent living and assisted living and assisted living facilities" that do not meet the defined meaning of a dwelling type unit. Many of these structures have all of the similarities of a dwelling unit but lack the requirement for in unit or room area having permanent cooking facilities by virtue of the fact the building described does contain central cooking nad dining areas. We in the enforcement community take the position by expanding the AFCI protection availability, life threatening electrical incidents or fires will be decreased and public safety increased.

2-128 Log #949 NEC-P02 **Final Action: Reject**
(210.12(B))

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Revise as follows:

Guest rooms and guest suites in <u>motels, hotels and dormitories</u> ~~provided with permanent provisions for cooking~~ shall have branch circuit outlets installed to meet the requirements for dwelling units.

Substantiation: The perceived intent is to protect cords susceptible to arcing. There is no need to include circuits supplying only fixed equipment such as lighting outlets or smoke/fire detectors. An arc-fault could deenergize such circuits just when needed. Many agencies such as fire departments report dead or removed batteries which make backup unreliable. It is not clear if guest rooms or suites apply to a dormitory. What relevance does permanent cooking facilities have re: this requirement? 210.8(A) and (B) have exceptions for GFCI requirements.

Panel Meeting Action: Reject

Panel Statement: The submitter's recommendation is unclear as it relates to the current text of 210.12(B) and the substantiation does not support his recommended action.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-129 Log #1293 NEC-P02 **Final Action: Accept in Principle**
(210.12(B))

Submitter: Ray C. Mullin, Ray C. Mullin Books

Recommendation: Revise wording as follows:

(B) Dwelling Unit Bedrooms and Closets Directly Associated with Bedrooms. All 120-volt, single phase, 15- and 20-ampere branch circuits supplying outlets installed in dwelling unit bedrooms <u>and closets directly associated with bedrooms</u> shall be protected by a listed arc-fault circuit interrupter, combination type installed to provide protection of the branch circuit.

Substantiation: As presently worded, 210.12(B) requires AFCI protection for the branch circuits supplying outlets in bedrooms. The NEC does not have a definition of a bedroom.

Electricians are confused.

Is the intent of 210.12(B) to include closets associated with a bedroom? Circuit design for bedrooms and associated closets probably will include the closet lighting on the same branch circuit as the outlets in the bedroom.

Expanding the mandatory requirement of including closets in 210.12 will enhance electrical safety relative to arc faults, and will reduce the confusion as to the intent of 210.12.

Statistics of fires of all types are quite convincing.

Eighty three percent of residential fires originate in bedrooms (41 percent), living rooms (27 percent), or kitchen areas (15 percent).

Eighty percent of fire related deaths and 70 percent of fire related injuries occur in these rooms.

Webster defines a bedroom as: a room furnished with a bed and intended primarily for sleeping.

Webster defines a closet as: a cabinet or recess for especially china, household utensils, or clothing.

Panel Meeting Action: Accept in Principle

Panel Statement: The recommended action is accomplished through the panel action on Proposal 2-142.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

BROWN, L.: Please see NAHB's Ballot Comment on Proposal 2-142, especially the use of dwelling unit fire data to support the expansion of AFCI protection.

2-130 Log #1657 NEC-P02 **Final Action: Reject**
(210.12(B))

Submitter: John Steinke, Reno, NV

Recommendation: Replace entire section with:

All 120 volt single phase 15 and 20 amp circuits serving outlets in dwelling unit bedrooms shall be protected by an arc fault circuit interrupting device. The device may be located at the panel, or at any point in the circuit before the first outlet on the circuit in the bedroom itself.

New installations, and additions to existing installations, shall only be required to have the new outlets so protected.

A closet, dressing room, or other area associated with the bedroom shall be considered separate from the bedroom only if separated from the bedroom by a door.

FPN 1: It is not the intent of this code to require the use of equipment that does not exist, or is not available, at the time of construction.

FPN 2: Pleas note that this section applies only to 15 and 20 amp circuits. An alarm outlet on a smaller circuit that serves the bedroom need not be AFCI protected.

FPN 3: Where energy codes mandate the use of fluorescent lighting, or the use of surge protection equipment causes nuisance tripping problems, the AHJ may exempt specific outlets from this requirement.

Substantiation: There is a need for AFCI devices, especially in the case of remodels and extensions of existing circuits. Many older homes have service equipment for which AFCI breakers are not available. Others were wired in a manner that does not separate bedroom circuits from other circuits.

The manufacturers have repeatedly failed to deliver as promised. By broadening the use of AFCI devices, it is hoped that application will be broader, and that there will be more parties at work to improve things. As George Patton said, "Don't let "perfect" become the enemy of "good".

Finally, many electronic items can cause nuisance tripping of the AFCI. These include electronic light ballasts and computer surge suppressors. If we do not allow for exceptions, there will be disconnections. I submit that half a loaf is better than none.

Panel Meeting Action: Reject

Panel Statement: The panel reaffirms its position that AFCI devices are to protect the entire length of all 120 volt, 15- and 20-ampere branch circuits supplying outlets in dwelling unit bedrooms and that the AFCI devices that are used be installed at the origin of the circuit. The submitter has not provided any technical data that would support his position that AFCI devices are not compatible with listed equipment.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

BROWN, L.: Please see NAHB's Ballot Comment on Proposal 2-142, especially the use of dwelling unit fire data to support the expansion of AFCI protection.

2-132 Log #2144 NEC-P02 **Final Action: Accept in Principle**
(210.12(B))

Submitter: John Fiorello, Fiorello Electric Inc.
Recommendation: Revise text to read:
(B) ~~(Dwelling Unit Bedrooms.)~~ (Dwelling Unit Rooms.) All 120-volt, single phase, 15- and 20-ampere branch circuits supplying outlets installed in dwelling ~~(unit bedrooms)~~ (unit rooms) shall be protected by a listed arc-fault circuit interrupter, combination type installed to provide protection of the branch circuit.
Substantiation: The intent of this code proposal is to bring into alignment the discrepancies created during the expansion of Article 210 during the 2005 code cycle. Simultaneously, to fortify continuity, individuality, and proper application of the existing definitions found in the code.
210.18 requires in Guest Rooms and Suites that, "branch circuits and outlets installed to meet the rules for dwelling units." 210.12(B) is presently titled Dwelling Unit Bedrooms, which does not qualify compliance with 210.18 as no current rule regarding AFCI protection exists for Dwelling Units as a whole.
Attachment to this, and substantiation in favor of this proposal is that even if a code proposal would be made to correct the rules of 210.18 stating, "branch circuits and outlets installed to meet the rules for dwelling ~~(units)~~ (unit bedrooms) " the current requirement afforded to Guest Rooms and Suites specific to portions of Suites which are combination rooms for living, sleeping, and food preparation additionally support the requirement that Dwelling Unit Rooms be protected by AFCIs. Fact seems to be that these two types of premises cannot be viewed as different, regardless of term of occupancy.
210.18 expands the definition of a Guest Room/Suite to include permanent provision for cooking. Inherently what is being communicated is that AFCI protection is required in premises meeting the requirements of a Guest Room/Suite/Dwelling Unit, as all aspects of a Dwelling Unit as defined in Article 100 can found in 210.18 within its expanded definition of a Guest Room and Suite. This substantiates that Dwelling Unit Rooms be afforded the same AFCI protection as a Guest Rooms or Suites.
True benefits of AFCI protection can only be made through uniformity of minimum code standard in premises occupied for living whether they are temporary or permanent. In requiring Dwelling Unit Rooms to be protected by AFCIs such uniform protection will be accomplished. Likewise, the code will need not address construction design specifications needed in substitution of AFCI protection, as it seems design specifications of electrical installation would be the only other way to fundamentally eliminate the hazard of arc fault without use of AFCI. Need it be said, that the code is not intended for such purpose.
Multiple authorities having jurisdiction to effectively write out current requirements of AFCI have used the arguments noted above. As the general public has been made aware that these devices are available and that enforcement authorities due to code discrepancy are not mandating use, it is believed that in the interest of fire prevention and electrical safety that the CMP respond in the most progressive manner.
Panel Meeting Action: Accept in Principle
Panel Statement: The recommended action is accomplished through the panel action on Proposal 2-142.
Number Eligible to Vote: 12

BROWN, L.: Please see NAHB's Ballot Comment on Proposal 2-142, especially the use of dwelling unit fire data to support the expansion of AFCI protection.

2-133 Log #2161 NEC-P02 **Final Action: Reject**
(210.12(B))

Submitter: Charles Hayes, Takoma Park, MD
Recommendation: Suggested solution:
If the breaker were installed at the outlet, this would solve the problem. A second solution would be to start using #12 wire at bedroom outlets.
When jurisdictions start using ARC FAULT on the smoke detector circuits, this problem will be worse since this is #14 wire and has much longer runs. This is dangerous.
I am a home inspector with 17 years experience. I am concerned about this problem.
Substantiation: I am bringing your attention to a potentially dangerous situation involving ARC FAULT CIRCUIT INTERRUPTERS. The problem involves high impedance in the wiring interfering with the normal operation of an ARC FAULT CIRCUIT INTERRUPTER.
Problem:
The ARC FAULT CIRCUIT INTERRUPTER is not tripping when there is a resistance (impedance) in the circuit that is over 7 ohms. However, long runs of #14 wire in big houses frequently have such resistance levels. Even though the code recommended maximum impedance is 1 ohm. This is not an enforceable provision but, only a recommendation. When testing at the use end of the circuit with an Ideal SureTest tester, we send a surge of 140 amps in 8 half cycles (according to the UL 1436 specifications) but, the breaker normally doesn't trip. Under dynamic conditions, this breaker wouldn't trip and there could be injury.
Panel Meeting Action: Reject

2-136 Log #3062 NEC-P02 **Final Action: Reject**
(210.12(B))

Submitter: Douglas A. Lee, U.S. Consumer Product Safety Commission
Recommendation: Add text in 210.12(B) to read as follows:

(B) Dwelling Unit Bedrooms. All 120-volt, single phase, 15- and 20-ampere branch circuits supplying outlets installed in dwelling unit bedrooms shall be protected by a listed arc-fault circuit interrupter, combination type installed to provide protection of the branch circuit. <u>An outlet on each AFCI-protected branch circuit that supplies a smoke alarm shall include a luminaire.</u>

Branch/feeder AFCIs shall be permitted to be used to meet the requirements of 201.12(B) until January 1, 2008.

FPN: For information on types of arc-fault circuit interrupters, see UL1699-1999, *Standard for Arc-Fault Circuit Interrupters* .

Exception: The location of the arc fault circuit interrupters shall be permitted to be at other than the origination of the branch circuit in compliance with (a) and (b):

(a) The arc-fault circuit interrupter installed within 1.8m (6 ft) of the branch circuit overcurrent device as measured along the branch circuit conductors.

(b) The circuit conductors between the branch circuit overcurrent device and the arc-fault circuit interrupters shall be installed in a metal raceway or a cable with a metallic sheath.

Substantiation: The AFCI requirements for bedroom outlets, as detailed in 210.12, include smoke alarms that are installed in bedrooms. There has been much debate over speculation that a smoke alarm (even with battery backup) may not be operable because of a tripped AFCI that supplies power to the branch circuit from which the smoke alarm is supplied. A luminaire on a circuit supplied by an AFCI could serve as an indicator that the device has tripped. See CPSC report, Considerations for Installation of Smoke Alarms on Residential Branch Circuits, CPSC-ES-0504, Lee and Lee, October 2005 (http://www.cpsc/gov/LIBRARY/FOIA/F01A06/os/acfismoke.pdf).
Panel Meeting Action: Reject
Panel Statement: The panel agrees that any overcurrent protective device that protects a branch circuit that supplies a smoke alarm outlet could go undetected if it trips or is inadvertently turned off by the occupant(s) of the dwelling. The indication that a smoke alarm has lost power should be required as part of the product requirements for listing. The panel reaffirms its position that AFCI devices are compatible with listed smoke alarm equipment and that AFCI protection shall be provided for all branch circuits that supply dwelling unit bedrooms.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

(210.12(B))

Submitter: Douglas A. Lee, U.S. Consumer Product Safety Commission
Recommendation: Add text as follows:

210.12(B) Dwelling Unit Bedrooms. All 120-volt, single phase, 15- and 20-ampere branch circuits supplying outlets installed in dwelling unit bedrooms shall be protected by a listed arc-fault circuit interrupter, combination type installed to provide protection of the branch circuit.

Branch/feeder AFCIs shall be permitted to be used to meet the requirements of 210.12(B) until January 1, 2008. <u>These requirements shall also apply to existing installations whenever the circuit protection device is replaced as part of a service capacity upgrade or renovation.</u>

FPN: For information on types of arc-fault circuit interrupters, see UL 1699-1999, *Standard for Arc-Fault Circuit Interrupters* .

Exception: The location of the arc-fault circuit interrupters shall be permitted to be at other than the origination of the branch circuit in compliance with (a) and (b):

(a) The arc-fault circuit interrupter installed within 1.8 m (6ft) of the branch circuit overcurrent device as measured along the branch circuit conductors.

(b) The circuit conductors between the branch circuit overcurrent device and the arc-fault circuit interrupters shall be installed in a metal raceway or a cable with a metallic sheath.

Substantiation: According to CPSC staff estimates, an average of 41,500 residential fires annually are associated with the electrical distribution system, having remained relatively constant over the 10-year period from 1989 through 1998 (*Residential Fire Loss Estimates, 1998 (and prior), National estimates of Fires, Deaths, Injuries, and Property losses from Non-Incendiary, Non-Suspicious Fires* , CPSC Directorate for Epidemiology, 2002, see <u>http://www.cpsc.gov/LIBRARY/fire98.pdf</u>). A staff report issued by the U.S. Consumer Product Safety Commission in 1987 ("Residential Electrical Distribution System Fires"), Smith & McCoskrie, see <u>http://www.cpsc.gov/library/foia/foia04/os/reselecfire.pdf</u>) provided evidence that fires originating in branch circuit wiring predominately occurred in dwellings over 20 years old, with the highest rates of fires occurring in dwellings over 40 years old.

AFCI technology offers the greatest potential for mitigation of electrical fires propagating from failures in the electrical distribution system and the subsequent reduction in fire-related deaths, injuries, and property loss by its implementation into older homes. Because the *NEC* is an installation document, the only way to address this risk of electrical fires in older homes is when the overcurrent protection devices are replaced when the electrical service capacity is upgraded. When a panelboard is replaced, the existing wiring is rarely changed because it is cost prohibitive. Over the past 20 years the increased utilization of electrical appliances has stressed the branch circuit of homes that were designed to operate in previous decades with a lower demand of current on the branch circuit wiring.

While AFCIs can be added to all general purpose branch circuits to increase protection at the discretion of the installer, dwelling unit bedrooms especially need this protection. The bedroom circuits are typically the longest run from the panel and are often exposed to attics where environmental conditions increase the aging and stress placed on branch circuit wiring. Additionally, based on the highest rate of fire incidents and deaths, the bedroom is one of the higher risk areas in a home (seeTable, National Estimates based on NFIRS and NFPA survey, Marty Ahrens, NFPA, March 2001 that I have provided). Consumers may be sleeping during the start of an electrical fire incident and not be aware of the fire until it is out of control.

A CPSC staff economic analysis indicates that adding Arc-Fault Circuit Interrupters (AFCIs) to older homes outweighs the cost of installation. See CPCS staff memorandum on *Economic Considerations--AFCI Replacements* that I have provided . By adding this requirement, consumers of older homes will benefit by the more advanced circuit breaker technology. Otherwise, consumers will install conventional circuit breakers that are less effective in preventing electrical wiring fires in older homes.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: There is a wide variety of existing wiring configurations and the panel needs additional input on the compatiblity of these wiring systems with AFCI protection.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 3
Explanation of Negative:

KING, D.: The submitter has provided adequate substantiation to support this change. The installation of these devices in older dwelling units will identify many wiring problems that will need to be corrected by the electrician installing these devices. This will help to mitigate the number of fires due to the improper installation of branch circuit wiring while ensuring that protection from fires associated with arcing faults is afforded to these homeowners. Panel-2 should give further consideration to this proposal.

LAROCCA, R.: Older dwellings are the ones most likely to have wiring systems that are compromised due to age, damage, or poor installation techniques. They are the dwellings that could benefit the most from the retrofitting of AFCIs during the replacement of circuit protection devices during a service upgrade or renovation. The panel's action to reject this proposal will make the extension of AFCI protection to these dwellings difficult.

Also, even though there are a wide variety of existing wiring configurations, all should be compatible with AFCIs if they are not damaged or otherwise compromised. Adding AFCIs to these systems will help identify potential dangers in existing wiring.

WEBER, R.: This proposal should have been accepted in Principle or in Part or a combination of both to recognize the submitter's concerns of bringing older type structures into code compliance with the use of combination AFCI equipment when changes to the system are being done. If we use the present recognition by many of the model building codes relative to smoke alarms installation and use which are to be installed in the older structure stock when changes are being made to them, it would seem logical that increased protection offered by the installation of AFCI protection is reasonable and prudent as well. Given the fire history in older type structures and years that normally go by before any of the electrical systems are changed or up-graded that addition of AFCI protection is warranted.

Comment on Affirmative:

BROWN, L.: Please see NAHB's Ballot Comment on Proposal 2-142, especially the use of dwelling unit fire data to support the expansion of AFCI protection.

2-139 Log #3147 NEC-P02 **Final Action: Reject**
(210.12(B))

Submitter: Joseph A. Ross, Ross Seminars
Recommendation: Revise as follows:

(B) Dwelling unit Bedrooms. All 120-volt, ~~single phase,~~ 15- and 20-ampere branch circuits supplying <u>receptacle</u> outlets installed dwelling unit bedrooms shall be...

Add a new second paragraph (present second paragraph becomes a third paragraph, if needed).

It shall be permitted to provide AFCI protection for branch circuits that supply other outlets in a dwelling unit.

Substantiation: In the last 50 years, there has never been an NEC requirement that has been so controversial and that has split the thinking and the enforcement into two sides. We are all aware that many states and hundreds of municipalities have amended their Codes to prohibit a life-saving smoke detector from being connected to a sensitive AFCI protected branch circuit. National organizations have developed disclaimers, many States have enacted disclaimer statements, and many AHJs (without the benefit of a disclaimer) are reluctant to enforce the CMP 2 intended mandate. It's time to end the Chaos!

This proposal is a win-win solution.

1) It will please the concerns of Contractor members of CMP 2 who wanted bedroom lights, fans, etc. to be permitted.

2) It will please representatives of the Nat'l. Assn. of State Fire Marshals and CPSC who proposed an expansion of "receptacles only" to other areas of a dwelling unit (See Comment 2-91, ROC).

3) It will please the Fire and Smoke Detection Alarm System experts of CMP 3 and the NFPA 72 Committees who have voted to support the concept that a smoke detector's ability to function should not be compromised in the event of a dwelling unit fire.

4) It will please the hearing impaired who depend on strobe-light type smoke detectors; and strobe lights do not function on batteries.

5) It will please the elderly and the underprivileged who must budget their funds to buy food, medicine, fuel, rent, insurance and utilities; there will be little left to pay a fee to have their batteries replaced.

6) It will please the smoke detector manufacturers who have witnessed AFCI nuisance tripping upon the operation of a smoke detector in laboratory tests.

7) It will please our Canadian neighbors, as the Country of Canada has expanded the application of AFCI protection, but prohibits a smoke detector system from being connected to an AFCI protected circuit. It will be a giant step toward international harmonization.

Most agree that placing a smoke detector on an AFCI protected circuit runs the risk of disabling that smoke detector when it is most needed. The technology is not sufficiently mature to assure reliability at this time. Battery backup is at best "better than nothing" as most batteries are dead, missing, or improperly installed.

Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its position that all branch circuits that supply dwelling unit bedrooms shall be protected by an AFCI device and that the device shall protect the branch circuit. The submitter has not provided any technical substantiation that supports his position that listed AFCI devices are not compatible with listed smoke alarm equipment.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

Comment on Affirmative:

BROWN, L.: Please see NAHB's Ballot Comment on Proposal 2-142, especially the use of dwelling unit fire data to support the expansion of AFCI protection.

2-140 Log #3209 NEC-P02 **Final Action: Reject**
(210.12(B))

Submitter: H. Dean Schumacher, H. Dean Schumacher Electrical Inspections
Recommendation: Revise text to read as follows:

210.12(B)...All 120 volt, single phase 15- and 20- ampere branch circuits supplying ~~outlets~~ <u>receptacles</u> installed in dwelling...

Substantiation: Arc fault protection has limited value in other than receptacle/cord applications. If Panel can substantiate need, then why is it required in bedrooms only?
Panel Meeting Action: Reject
Panel Statement: The panel disagrees with the submitter's statement that AFCIs have limited value in other than receptacle/cord applications. The protection is required for the branch circuit.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

BROWN, L.: Please see NAHB's Ballot Comment on Proposal 2-142, especially the use of dwelling unit fire data to support the expansion of AFCI protection.

2-141 Log #3222 NEC-P02 **Final Action: Reject**
(210.12(B))

Submitter: Dennis Anderson, Electrical Inspector
Recommendation: Revise text to read as follows:

Dwelling Unit Bedrooms. All 120-volt, single phase, 15 and 20 ampere branch circuits supplying <u>receptacle</u> outlets installed in dwelling unit bedrooms shall be protected by a listed arc-fault circuit interrupter.

Substantiation: I believe the purpose of arc-fault circuit interrupters is to protect cord connected devices. Fixtures and smoke detectors don't need that protection room lighting should stay on even if there is a fault.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Proposal 2-140.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1

BROWN, L.: Please see NAHB's Ballot Comment on Proposal 2-142, especially the use of dwelling unit fire data to support the expansion of AFCI protection.

2-142 Log #3488 NEC-P02 **Final Action: Accept**
(210.12(B))

Submitter: Alan Manche, Square D Co.
Recommendation: Revise 210.12(B) as shown below:

(B) Dwelling Units. All 120-volt, single phase, 15- and 20-ampere branch circuits ~~supplying outlets~~ installed in dwelling unit <u>s</u> ~~bedrooms~~ shall be protected by a listed arc-fault circuit interrupter, combination type installed to provide protection of the branch circuit. ~~Branch/feeder AFCIs shall be permitted to be used to meet the requirements of 210.12(B) until January 1, 2008.~~

Substantiation: For the past three NEC cycles, CMP 2 has reviewed extensive amounts of data and information pertaining to the benefit of AFCIs for the protection of dwelling unit branch circuits. After careful consideration the panel decided to required AFCIs on branch circuits that supplied bedrooms as a means to gain experience and to put the application in an easily defined area.

AFCIs have had an excellent track record in the field and their installation/use have found numerous wiring errors and in addition they have found wiring damage and equipment damage that could have been potential sources of fire. With the experience gained, it is an appropriate time to expand AFCIs to all 15 and 20 ampere branch circuits in the dwelling. There is no basis for limiting the protection to circuits that supply only bedrooms and the increased protection is needed for other circuits. This expansion will continue the effort to address fires of electrical origin in dwellings.

The text has been modified to apply to all 120V 15 and 20 ampere branch circuits that supply outlets in all locations. The second paragraph is proposed to be deleted since it is no longer applicable.

Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 8 Negative: 4

Explanation of Negative:

BECKER, R.: AFCIs should not be expanded to the entire dwelling unit. In reply to item 2-140, Log #1623, of the 2004 ROP, CMP 2 noted that there was not enough data to demonstrate the reliability and effectiveness of AFCIs to justify their expansion. Since 2004, there has been no substantiation presented regarding the effectiveness of AFCIs. The historic data cited justifying AFCIs largely relates to home fires and not the field performance of the device.

Substantiation must provide a demonstrable link between the AFCIs installed in bedrooms and a reduction in dwelling unit fires prior to expanding these to the entire dwelling unit. AFCIs add significant cost to homes without field data demonstrating that they prevent fires beyond the standard circuit breaker. Expanding the AFCI requirement as proposed will add as many as ten or twenty AFCI circuits (appliance, laundry, disposer, insta-hot, bath, basement, garage, HVAC maintenance, attic, storage, outside holiday lighting). The added cost is easily in the range of $250 to $500 per dwelling unit, plus the cost of dedicated neutrals and whatever the installer allows for “installation problems and call-backs.” There is no information provided on installing GFCIs on AFCI branch circuits.

BROWN, L.: Let’s get to the bottom line on this matter - There is absolutely no fire data that can be used to
support the expansion of AFCI’s to all receptacles, let alone the mandatory installation of AFCI’s in bedrooms.

Looking at the latest data from NFPA in the report “The U.S. Home Product Report (Appliances and Equipment Involved in Fires)”, by John R. Hall, Jr. of the Fire Analysis and Research Division of NFPA dated November 2005, the report shows that the annual average of number of home fires is 372,900, with direct property damage of $443,000,000. Of this number 32,000 (or 9% = $39,870,000) of these fires are caused by “electrical distribution equipment.” Of that 9%, only 14,500 (or 4% = $17,720,000) of those fires are attributed to “fixed wiring, switches, outlets, and receptacles.” And, there is no data or study to support that of these 14,500 fires an the installation of an AFCI device would have prevent the fire.

Using the U.S. Census Bureau data on building permits for 2004 (Table (S-3) Final) shows
1,656,413 one- & two-family dwelling units and 413,664 multifamily units for that year.

There are typically 20 (twenty) 20-volt, single phase, 15- and 20-ampere branch circuits in each one- & two-family dwelling unit, and 10 in each multifamily dwelling unit. Using these numbers, there will be 33,128,260 AFCI’s in OTFD’s and 4, 136,640 for multifamily units, for a total of 37,264,900 AFCI’s.

Using a wholesale cost of $34.00 per breaker, marked-up the industry standard percentage of 66%, produces a cost per breaker of $56.44 to the home owner.

In all, the average annual total cost to the public for the mandatory installation of AFCI’s will be
$2,103,230.956 ($1,267,006,600 wholesale). That is 2 BILLION, 130 MILLION, 230 THOUSAND, and 956 DOLLARS.

Using current fire loss data society will be spending $2,103,230.956 per year to cover losses of only $39,870,000. That means spending 52 times the amount of money that would be loss if the devices were not installed, and that is if the devices work 100% of the time. If you use the lossesrelating only to “fixed wiring, switches, outlets, and receptacles” (the part of the wiring that is claimed to be protected by AFCI breakers) the ratio to money spent relative to monetary loss ($17,720,000) is 119 times, again, if they work 100& of the time.

In addition to the Submitter’s Substantiation, there is no data to support the contention of a neither “excellent track record”, nor information that these “installations have found numerous wiring errors” or “they have found wiring damage and equipment damage that could have been a potential sources of fire”. That statement alone provides no correlation between the purported problems and the use of AFCI’s.

The Panel needs to reconsider the mandatory installation of AFCI’s, let alone the expansion of
requiring these devices for all 120-volt, single phase, 15- and 20-ampere branch circuits in dwelling units. Until true field test data on the efficacy of AFCI’s can be directly related to saving society monetary loss there is no cost-benefit in this provision.

NENNINGER, B.: See my explanation of negative vote on Proposal 2-105.

PURVIS, R.: See my Explanation of Negative for Proposal 2-115.

Comment on Affirmative:

KING, D.: I commend Panel 2 for accepting this proposal. The panel action on this proposal will save many lives and countless dollars due to the higher level of protection to persons and property where these devices are installed.

WEBER, R.: We in the inspection community want to applaud and thank the panel for its action on the proposal and by its recognition of the value and merits that are applied to electrical safety when AFCI protective means are present. It is a bold, and in my opinion, a logical step forward. The electrical industry has the means and technology available today and even though the requirement will not become mandatory until the acceptance of the 2008 NEC, it sends a clear message to the public that you and your family’s protection is our goal in making code changes to provide a higher level of protection throughout the house for the occupants.

2-143 Log #97 NEC-P02 **Final Action: Accept in Principle**
(210.12(B), FPN (New))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 3 for information.

Submitter: Brandon Whitman, Owosso, MI

Recommendation: Add a new fine print note at the end of this section to read as follows:

FPN: See 760.21 and 760.41 for circuits supplying fire detection and warning equipment.

Substantiation: Sections 760.21 and 760.41 specifically state that the supply for fire alarm circuits shall not be protected by a GFCI or an AFCI.

Panel Meeting Action: Accept in Principle

Revise the recommended text of the fine print note to read:

FPN No. 3: See 760.21 and 760.41 for power supply requirements for fire alarm systems.

Panel Statement: The submitter’s intent is satisfied with the panel’s action on this proposal.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

BROWN, L.: Please see NAHB’s Ballot Comment on Proposal 2-142, especially the use of dwelling unit fire data to support the expansion of AFCI protection.

In addition, please refer to the NFPA Technical Committee (TC) on Single- & Multiple-Station Alarms & Household Fire Alarm Systems (SIG-HOU) actions on this same matter as shown in the 2006

Annual Revision Cycle Report on Comment, Comment 72-479 (Page 72-123).

2-144 Log #2733 NEC-P02 **Final Action: Accept in Part**
(210.12(B) Exception)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reported as “Accept in Part” to correlate with the Panel Action on Proposal 2-147.

The Technical Correlating Committee understands that the Panel Action on this Proposal is to accept the deletion of (b) in the Exception and to not accept the remainder of the Proposal in accordance with the Panel Statement.

Submitter: Jim Pauley, Square D Company

Recommendation: Delete the exception.

~~*Exception: The location of the arc-fault circuit interrupter shall be permitted to be at other than the origination of the branch circuit in compliance with (a) and (b):*~~

~~*(a) The arc-fault circuit interrupter installed within 1.8 m (6 ft) of the branch circuit overcurrent device as measured along the branch circuit conductors.*~~

~~*(b) The circuit conductors between the branch circuit overcurrent device and the arc-fault circuit interrupter shall be installed in a metal raceway or a cable with a metallic sheath.*~~

Substantiation: CMP 2 added the exception in the 2005 NEC to be able to handle situations where an existing panelboard may be obsolete and there are no AFCIs available. The exception allowed a limited length of the branch to be installed without AFCI protection. In addition that portion of the branch circuit was required to be in a metal raceway or metal sheathed cable. It was anticipated that the limited length along with the restriction on the wiring method would be a reasonable accommodation to the unique situation. However, as the 2005 NEC was being introduced a number of individuals and reputable companies have stated that there is no basis for the 6’ allowance. Some have even taken out ads to indicate that the 6’ is not justified. Given that there is a feeling that the 6’ allowance cannot be justified, the panel should delete the exception and stick to the main rule that the branch circuit must be protected.

Within the last year we have investigated a number of fires and at least two of them were determined to have started in the home run of electrical wiring between the panel and the first outlet. Had proper AFCI protection been provided at the origin of the branch circuit, these fires would likely have been prevented.

Given that protection of the home run is important and since the 6’ limitation is thought to not be justified, the panel should simply delete the exception.

The panel should resist any attempts to eliminate the home run from the protection of AFCIs. These are misguided efforts and ignore the basic premise that CMP 2 started with in 1996 which was to provide protection for the branch circuit wiring. One cannot distinguish the need for protection after the first outlet from the need to protection of the home run. The exception attempted to provide some stringent tradeoffs to allow a limited length. The tradeoffs should not be reduced. If they are not acceptable, then the exception should be deleted.

Panel Meeting Action: Reject

Panel Statement: The exception provides reasonable alternatives for dwelling unit owners that do not have service panels compatible with currently available AFCI products.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
BROWN, L.: Please see NAHB's Ballot Comment on Proposal 2-142, especially the use of dwelling unit fire data to support the expansion of AFCI protection.
Comment on Affirmative:
KING, D.: I agree with the submitter that the intent of section 210.12 is to provide AFCI protection for the entire length of the branch circuit. The 6 foot limitation was implemented to provide an alternative to the combination type devices where an existing panel board was not compatible with the AFCI devices that are available today. The 6 foot limitation is intended to allow for enough branch circuit wiring for termination at the panelboard and the AFCI device while ensuring that the device is located adjacent to the panel board where the branch circuit originated. Additional physical protection of the unprotected portion of the branch circuit wiring is also required when applying the exception due to the hazard that exists with leaving that part of the branch circuit wiring unprotected by the AFCI device.

2-145 Log #2964 NEC-P02 **Final Action: Reject**
(210.12(B) Exception (New))

Submitter: Ron Alley, ELECTRICO
Recommendation: Exception: Outlets serving smoke detectors and fire detection devices.
Substantiation: Power to smoke and fire detectors should NEVER be cleared, especially if a fire danger could be present.
Panel Meeting Action: Reject
Panel Statement: Smoke detectors and fire detectors are components of fire alarm systems that are covered in Article 760. See panel action on Proposal 2-143.
For smoke alarm applications see panel action on Proposal 2-118a (Log #CP-200.)
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
BROWN, L.: Please see NAHB's Ballot Comment on Proposal 2-142, especially the use of dwelling unit fire data to support the expansion of AFCI protection.
In addition, please refer to the NFPA Technical Committee (TC) on Single- & Multiple-Station Alarms & Household Fire Alarm Systems (SIG-HOU) actions on this same matter as shown in the 2006 Annual Revision Cycle Report on Comment, Comment 72-479 (Page 72-123).

2-146 Log #3650 NEC-P02 **Final Action: Reject**
(210.12(B) Exception (New))

Submitter: Lawrence Brown, National Association of Home Builders (NAHB)
Recommendation: Add New Exception as follows:
Exception No. 1: *Circuits serving smoke alarms shall not contain AFCI protection.*
(Renumber current Exception as No. 2)
Substantiation: There is an inherent problem with having the smoke alarm system for a dwelling unit powered by an AFCI protected circuit. NEC Section 210.12 requires all electrical outlets in a bedroom, including the box in the ceiling that contains only the wiring for the bedroom smoke alarm, to be supplied by a circuit that is protected by an AFCI. As this is the requirement, the practice is to supply the power to the smoke alarm system for the entire house from a bedroom circuit. One needs to understand that the wiring to the smoke alarms in the bedrooms also serves the smoke alarms in all other areas of a dwelling. Except of the wiring to the first smoke alarm on a system, the wiring serving the other smoke alarms does not serve any other electrical outlet.
One main concern is situations where the smoke alarms do not contain a secondary power source such as a battery. This arises where the secondary power source is not required, such as allowed by the NFPA Life Safety Code, and in installations in older dwellings where the smoke alarms were installed prior to provisions requiring a secondary power source.
As the provisions of the NEC will require the installation of AFCI protection for bedroom circuits when the existing electrical distribution panel is replaced relates to this concern. In those installations where no secondary power source is provided there lays the distinct probability that the entire smoke alarm system for the dwelling would be incapacitated when the AFCI breaker protecting the bedroom circuit trips.
A belief that the occupants will know that the bedroom circuit has no power because the lights will not work may be an inaccurate assumption. The circuit supplying the smoke alarms could easily be from a circuit in a bedroom that is not often used, such as a guest bedroom.
This matter was discussed at the NFPA 72 TC on Single- and Multiple-Station Alarms and Household Fire Alarm Systems (SIG-HOU) ROC meeting that was held in October 2005. The intent of NFPA 72, Section 11.6.3 is to provide a minimum level of assurance that the integrity of the primary power supply to the smoke alarms is maintained. Subsections (3) and (5) addresses situations that may inadvertently disconnect the smoke alarms from its power source, thus rendering the alarm system useless to provide notification of a fire situation.
The first life-safety device used to protect the occupants of a dwelling during a fire occurrence is the smoke alarm system. Thus, to be effective in the saving of lives a reliable source of power needs to be provided and maintained.
There are Exceptions throughout the NEC, such as with GFCI protection, to address practical applications of the provision. Exempting the smoke alarm from being on AFCI protected circuits will not affect the NEC's intent to provide AFCI protection to the branch circuit serving the receptacle and lighting outlets within a bedroom.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any technical substantiation that supports his position that listed AFCI devices are not compatible with listed smoke alarms. See the panel action on Proposal 2-118a (Log #CP-200) for correlation with NFPA 72.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
BROWN, L.: Please see NAHB's Ballot Comment on Proposal 2-142, especially the use of dwelling unit fire data to support the expansion of AFCI protection.
In addition, please refer to the NFPA Technical Committee (TC) on Single- & Multiple-Station Alarms & Household Fire Alarm Systems (SIG-HOU) actions on this same matter as shown in the 2006 Annual Revision Cycle Report on Comment, Comment 72-479 (Page 72-123).

2-147 Log #3360 NEC-P02 **Final Action: Accept in Principle**
(210.12(B) Exception (b))

TCC Action: The Technical Correlating Committee understands that the Panel Action on this Proposal modifies the Panel Actions on Proposals 2-105 and 2-137.
Submitter: Aaron B. Chase, Leviton Mfg. Co. Inc.
Recommendation: Revise text to read:
Exception: The location of the arc-fault interrupter shall be permitted to be at other than the origination of the branch circuit in compliance with (a) ~~and (b):~~
(a) The arc-fault circuit interrupter installed within 1.8 m (6 ft) of the branch circuit overcurrent device as measured along the branch circuit conductors.
~~(b) The circuit conductors between the branch circuit overcurrent device and the arc fault circuit interrupter shall be installed in a metal raceway or a cable with a metallic sheath.~~
Substantiation: During the ROC for the 2002, NEC CMP-2 voted unanimously to accept the current revision to 210.12 under Comment 2-105. I too concur with CMP-2's actions recognizing the importance of detecting low level arcing. CMP-2 has always sought to develop Code language that not only protects the branch circuit wiring but also the extended wiring. There is a significant amount of data already presented to this Panel that confirms many electrical fires are caused by damaged supply cords from products plugged into the outlets. Fire statistics have already led to one Code Making Panel to adopt dedicated AFCI/LCDI protection on room air conditioning supply cords. The Code Making Panel is reviewing these alarming statistics to look at protecting against dangerous arcing scenarios caused by damaged extension cords and appliance cords. The combination AFCI will provide this valuable protection especially in two-wire cords. Unfortunately this technology has not been made commercially available. This can be rectified by deleting Exception (b).
There has been combination AFCI technology listed and there are at least two other promising combination type AFCI technologies that can be made available if the 6 ft restriction was eliminated. The submitter of this proposal recalls CMP-2 members asking the device manufacturers about commercial availability during the 2003 ROC meetings in San Diego. Combination outlet box manufacturers cited they either have the technology or would release it (tool up the product) if Exception (b) was eliminated. Exception (b) was viewed by those manufacturers as a commercial restriction and not specifically an installation mandated restriction. Absence of supporting data to require this 6 ft section of conductor to be protected, the NEC should eliminate this text in the spirit of supporting technological advances that will lead to commercial availability for products designed to protect against the hazards associated with electricity.
In essence, Exception (b) has stifled technology yet there is no data to support Exception (b). The 6 ft between the service entrance and the specified location of the AFCI has never been identified through research as a location of fire origin.
At a recent UL/CPSC meeting, UL acknowledged that they did not identify in their review of fire data this one specific location as problematic and they did not foresee this location as being one.
In a preemptive response to an anticipated comment or question as to why the device manufacturers did not make a combination type AFCI available when it became evident that the break type was still not in the marketplace consideration should be given to the following:
The device manufacturers were not aware that there would not be commercially available combination AFCI breakers and still are not sure if this will hold true. Should these products become available (combination AFCI breakers) the commercial restriction (due to labor costs alone) would eliminate

any demand for their products. Device manufacturers would in essence make a significant capital investment in a product that would not be economically feasible to be used by the builder. Further, the required use is still over 2 years away with no assurances that this combination breaker-type would not be commercially available there is no motivation for the device manufacturers to take a huge risk.

If this proposal is accepted, based on UL's reported analysis of fire data, there would be no compromise in safety. Conversely, on the upside, the acceptance of this proposal would help foster new technological advances to help achieve the NFPA safety mission.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle

Revise the recommended text to read:

Exception: The location of the arc-fault interrupter shall be permitted to be at other than the origination of the branch circuit where the arc-fault circuit interrupter is installed within 1.8 m (6 ft) of the branch circuit overcurrent device as measured along the branch circuit conductors.

Panel Statement: The revision to the recommendation has been made to comply with the NFPA Manual of Style.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 9 Negative: 3

Explanation of Negative:

BROWN, L.: Please see NAHB's Ballot Comment on Proposal 2-142, especially the use of dwelling unit fire data to support the expansion of AFCI protection.

KING, D.: This proposal should have been accepted in principal in part. I agree with the panel that the recommended text should be revised to comply with the NEC manual of style. I disagree with the submitter's recommendation to delete subdivision (B) of the exception. The submitter of this proposal has not substantiated that the present requirement in subdivision (B) of the exception has stifled technology as is stated in his substantiation or that the requirement is cost prohibitive from an installation standpoint. The requirement for the additional physical protection provided in exception is necessary to reduce the risk of physical damage to this portion of the branch circuit wiring that is not protected by the AFCI device. It is the intent of this section that AFCI protection is provided for the entire length of the branch circuit. An exception to allow even a small portion of this circuit to be unprotected must be supplemented with some other means of physical protection.

PURVIS, R.: See my Explanation of Negative for Proposal 2-115.

2-148 Log #2851 NEC-P02 **Final Action: Reject**
(210.12(B) Exception No. 2 (New))

Submitter: Wendy B. Gifford, Invensys Climate Controls America

Recommendation: 210.12(B) Arc-Fault Circuit-Interrupter Protection

Add:

<u>Exception No. 2: Smoke alarms and carbon monoxide alarms shall not be installed on a circuit which can lose primary (main) power by operation of an arc fault circuit interrupter.</u>

Substantiation: A bedrock of fire protection is uninterrupted power to smoke alarms, with battery backup as insurance in case of loss of commercial power. Yet the current NEC would allow disruption of the main power circuit by an AFCI. Although the argument is made that the backup battery will power the alarms if the circuit trips, this argument does not apply once the battery needs replacement. Invensys continues to receive field complaints of problems in installation of smoke alarms on AFCI protected circuits. Most common are chirping, nuisance alarms, and tripping of the AFCI breakers. In addition to the problem of power loss, we are also concerned about the possibility that either an installer or a consumer, unable to complete installation without nuisance alarming, may somehow circumvent proper procedures in order to solve the problem, thereby compromising consumer safety.

Panel Meeting Action: Reject

Panel Statement: See the panel statement on Proposal 2-146. The submitter has not provided any technical data to support the position that listed AFCI devices are not compatible with listed carbon monoxide alarms.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

BROWN, L.: Please see NAHB's Ballot Comment on Proposal 2-142, especially the use of dwelling unit fire data to support the expansion of AFCI protection.

In addition, please refer to the NFPA Technical Committee (TC) on Single- & Multiple-Station Alarms & Household Fire Alarm Systems (SIG-HOU) actions on this same matter as shown in the 2006 Annual Revision Cycle Report on Comment, Comment 72-479 (Page 72-123).

2-149 Log #3148 NEC-P02 **Final Action: Reject**
(210.12(B) Exception No. 2 (New))

Submitter: Joseph A. Ross, Ross Seminars

Recommendation: Number the present *Exception* as *Exception No. 1* and add a new *Exception No. 2* as follows:

Exception No. 2: Arc-fault circuit-interrupter protection shall not be required for branch circuits within the scope of this article supplying permanently-installed equipment used to detect one or more of a through c. No circuit wired under the terms of this Exception shall supply other outlets for which arc-fault circuit-interrupter protection is required by this Code:

a. Fire;
b. Intrusion; or
c. carbon monoxide

Substantiation: In this world of lawyers, liabilities, disclaimers, and the protection of lives and property; this is another of several proposals that has been submitted to assure that a smoke detectors' ability to function will not be compromised in the event of a dwelling unit Fire.

There are many states and hundreds of municipalities that prohibit the connection of a life-saving smoke detector to a sensitive AFCI protected circuit. In the last 50 years, there has never been an NEC requirement that has divided the country as this one has. CMP 2 mandates that a smoke detector, because of its location in a bedroom, *(It is to be noted that nothing gets plugged into it and its location is certainly free from physical injury)* must be connected to an AFCI protected circuit. CMP 3 (760.21) exempts a smoke detector from being connected to an AFCI protected circuit (and both CMP's are addressing 120-volt smoke detectors). It's time to get this issue on a level playing field, reunite the country with an emphasis on fire protection, and put aside any interests other than the never ending quest toward saving lives and property.

Panel Meeting Action: Reject

Panel Statement: Smoke detectors and fire detectors are components of fire alarm systems that are covered in Article 760. See panel action and statement on Proposal 2-143. The submitter has not provided any technical data to support his position that listed AFCI devices are not compatible with listed carbon monoxide and intrusion alarms. For smoke alarm applications see the panel action on Proposal 2-118a (Log #CP-200.)

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

BROWN, L.: Please see NAHB's Ballot Comment on Proposal 2-142, especially the use of dwelling unit fire data to support the expansion of AFCI protection.

In addition, please refer to the NFPA Technical Committee (TC) on Single- & Multiple-Station Alarms & Household Fire Alarm Systems (SIG-HOU) actions on this same matter as shown in the 2006 Annual Revision Cycle Report on Comment, Comment 72-479 (Page 72-123).

2-150 Log #3417 NEC-P02 **Final Action: Reject**
(210.12(B) Exception No. 2 (New))

Submitter: Edward Johnson, Flint, MI

Recommendation: Add and Exception to read:

Exception No. 2: AFCI protection shall not be required for smoke detectors in dwelling unit bedrooms.

Substantiation: A smoke detector on an AFCI circuit could be disabled when an arc fault occurs and this is a time when it is most needed.

Panel Meeting Action: Reject

Panel Statement: Smoke detectors and fire detectors are components of fire alarm systems that are covered in Article 760. See panel action and statement on Proposal 2-143. For smoke alarm applications see Proposal 2-118a (Log #CP-200). The panel notes that single and multiple station smoke alarms are devices that are powered by branch circuits under the purview of CMP-2. Smoke detectors powered through a fire alarm system are covered under the requirements of NFPA 72 and Article 760.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

BROWN, L.: Please see NAHB's Ballot Comment on Proposal 2-142, especially the use of dwelling unit fire data to support the expansion of AFCI protection.

In addition, please refer to the NFPA Technical Committee (TC) on Single- & Multiple-Station Alarms & Household Fire Alarm Systems (SIG-HOU) actions on this same matter as shown in the 2006 Annual Revision Cycle Report on Comment, Comment 72-479 (Page 72-123).

2-151 Log #3549 NEC-P02 **Final Action: Reject**
(210.12(B) Exception No. 2 (New))

Submitter: Michael L. Savage, Sr., Middle Department Inspection Agency Inc.

Recommendation: Change exception to Exception <u>No. 1</u> .

Add new exception to read as follows:

<u>Exception No. 2: Smoke Alarms installed in dwelling unit bedrooms shall not be required to be installed on a branch circuit protected by an arc-fault circuit interrupter.</u>

Substantiation: Many times a smoke alarm receives its primary source of power from other than a bedroom area. NFPA 72 allows smoke alarms to be fed from a dedicated circuit, if the alarm is fed from a guest bedroom circuit and this circuit trips without the knowledge of the occupants the entire dwelling is left without smoke alarm protection.

There have been many cases of nuisance tripping, and in some cases recalls of defective AFCI circuit breakers. There have also been fire reports of smoke alarms being found without batteries installed. With a non-afci dedicated circuit or an exception allowing smoke alarms to not need AFCI protection, the smoke alarm will continue to serve the occupants. The State of Delaware and Queen Anne's County, Maryland currently allows this.

Panel Meeting Action: Reject

Panel Statement: See the panel action and statement on Proposal 2-146.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

BROWN, L.: Please see NAHB's Ballot Comment on Proposal 2-142, especially the use of dwelling unit fire data to support the expansion of AFCI protection.

In addition, please refer to the NFPA Technical Committee (TC) on Single- & Multiple-Station Alarms & Household Fire Alarm Systems (SIG-HOU) actions on this same matter as shown in the 2006 Annual Revision Cycle Report on Comment, Comment 72-479 (Page 72-123).

2-152 Log #1835 NEC-P02 **Final Action: Reject**
(210.12(C))

Submitter: Mark T. Rochon, Mark J. Rochon Master Electrician

Recommendation: Revise as follows:

(C) Institutional Bedrooms. All 120-volt, single phase, 15- and 20-ampere branch circuits supply outlets installed in institutional bedrooms shall be protected by a listed arc-fault circuit interrupter combination type installed to provide protection of the branch circuit.

Substantiation: There is no requirement for (word unreadable) protection in children's sleeping quarters at schools, dorms, and the like.

Panel Meeting Action: Reject

Panel Statement: The submitter has not provided any technical substantiation to support his recommendation. CMP-2 action supporting the use and expansion of AFCI protection has been based on dwelling unit fire data.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

BROWN, L.: Please see NAHB's Ballot Comment on Proposal 2-142, especially the use of dwelling unit fire data to support the expansion of AFCI protection.

2-153 Log #2796 NEC-P02 **Final Action: Reject**
(210.12(C))

Submitter: Bradley Butters, City of Reynoldsburg, Ohio / Rep. IAEI

Recommendation: Add new section (C) to 210.12.

<u>(C) Required luminaires for stairway and equipment illumination shall not have arc-fault protection.</u>

Substantiation: It is common practice for our area for the residential stairway lighting to be added to the bedroom arc-fault protected circuit. I feel that on the occasion of the arc-fault tripping at night is precisely the worst time to lose the stairway illumination. Before and after dark, a loss of power event can be diagnosed, stairway illumination is critical for a safe path to the basement. In a true emergency the stairway illumination is critical to safe evacuation.

Panel Meeting Action: Reject

Panel Statement: The submitter of this proposal has not provided any technical substantiation to support his position that listed AFCI devices are not compatible with listed luminaires. The submitter describes a situation that can occur as a result of any overcurrent device tripping.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

BROWN, L.: Please see NAHB's Ballot Comment on Proposal 2-142, especially the use of dwelling unit fire data to support the expansion of AFCI protection.

2-154 Log #1721 NEC-P02 **Final Action: Reject**
(210.13 (New))

Submitter: Michael McQuade, E.I. Dupont de Nemours and Company Inc.

Recommendation: Add new text to read:

"All 125-volt single phase receptacles shall have Overload Fault Interrupter Protection for Personnel."

For greater fire safety, newly constructed residential dwellings should include variable-threshold circuit disconnect relays in all electrical outlets, referred to by some companies as Overload Fault Interrupters. The trip threshold of this variable-threshold resettable switch should automatically match the electrical current or power rating of the appliance, lamp, extension cord or other device plugged into the receptacle. It should communicate with the electrical device to download this trip level. Additionally, the trip threshold should not allow more current than the electrical outlet rating to flow through the outlet. Upon sensing an overload condition it should disconnect electricity to the device before the device wires can overheat and ignite fires.

For greater shock protection, newly constructed residential dwellings should also include a normally-open relay in series with the line blade connection socket. When the outlet receptacle(s) are open and exposed (nothing plugged in) the technology would block electricity (keeps the relay open) from the receptacles drastically reducing the shock hazard. The relay should close only upon the detection of a valid electrical plug, not upon insertion of any other foreign objects.

Substantiation: Fire Risk

According to data from "The U.S. Home Product Report: appliances and equipment, 1 actual and potential fires caused by electrical overload faults produce up to 93% (57,900) of all the 62,400 reported fires triggered by electrical distribution equipment (excluding transformers, meters and meter boxes), appliances and tools (text illegible) even more concerning is the Consumer Product Safety Commission's estimated 890,000 unreported home electrical distribution equipment fires per year in the USA 2 .

Furthermore, overload caused fires from appliances, tools and distribution equipment, compared to all electrical causes, make up 95% (391) of the total 412 civilian deaths, 90% (1,901) of the 2,121 civilian injuries and 93% ($741 million) of the $800 million dollars in direct property loss.

Circuit breakers and fuse panels provide excellent protection for the permanent in-wall wiring, but cannot offer the protection necessary for the smaller gauge wires in extension cords, small appliances, lamps, and electronics. These electrical devices and extension cords can overload at less than 15 Amps of current and cause serious fires.

Furthermore, electrical devices experience wear, abuse and misuse through their product life. Wear can cause internal breakage and fraying of strands of copper wires resulting in shorts inside power cords. Wear can cause binding or motor bearings causing an increase in current during normal usage. Abuse and misuses can place larger loads on an electrical device than its design can safely support. Another form of misuse is replacement of circuit breakers with a higher current rated unit (20A breaker or fuses installed on a 15A circuit), thus negating adequate protection on that branch circuit.

Examples of fires caused by misuses, abuse and failure resulting in electrical device current overloads include the following:

"Four children were killed yesterday when a lightning-quick blaze ripped through their New Jersey home - just hours after their mother had firefighters check the house for smoke." 3 The dead children were three boys, ages 4, 6 and 15, and a 5-year old girl." A preliminary investigation by the Teaneck Fire Department found an overloaded 20-amp circuit caused the motor in a basement freezer to burn out and start the fire, Kadison, Dan et al. "Family of Young N.J. Fire Victims Holding Fire Officials Responsible", NY Times, March 24, 2005.

"The chief said about a dozen firefighters spent half an hour checking the home's appliances and furnace but found no signs of impending danger. He said they even checked a basement freezer, refrigerator, washer and dryer plugged into the overload circuit but did not detect an obvious threat." Samules, Tany et al., "N.J. blaze kills 4", NY daily news, March 23, 2005.

"A 71 year-old man died after trying to extinguish a small fire, reported by his 71 year old wife, in the living room of his single family home. He was able to leave the house, but he collapsed outside from smoke inhalation. Investigators determined that the fire began because the motor bearings of a fan had worn down, causing the fan to freeze and its wiring to overheat, igniting the insulation." NFPA Journal September/October 2005, Vol. 99 No. 5 Firewatch Page 24-29.

"Terrah Campbell [6 years old] was asphyxiated by smoke from the June 10 fire that broke out in the rental unit. Her body was found in her bed where she slept. The fire began in an extension cord connected to a "burned out electrical outlet" in a bedroom..." Whitehead, Sheely. "Probe: Girl could have escaped fire," The Kentucky Post, August 3, 2005.

"North Charleston officials say an overloaded surge protector caused an apartment fire that killed a mother and her teenage daughter last month." The Associated press, "Officials Blame Surge Protector For Fatal North Charleston Fire." September 16,2005,

"A fire early this morning killed a mother and child at a Baton Rouge apartment complex. Fire officials say 36-year-old Amie Williams, and her four-year old son Donnie Thomas Junior were pronounced dead at the scene. Fire officials said they believe that an overloaded electrical outlet sparked the fire, which quickly spread throughout the apartment. the victims were believed to have been overcome by smoke. Two other children were treated and released at a hospital for burns to their arms and face." WAFB-TC, Baton Rouge, "Fire in Baton rouge Apartment Kills Mother, 4-year old http://www.katc.com/Global/story.asp?S-366631>

"Three generations of a Queens family - including a 2-year old girl - were killed early yesterday when an air conditioner's overload extension cord sparked a fast moving fire inside their home." Belenkaya, Veronika, "Three Generations Perish". Daily News, July 20, 2005.

"An overloaded circuit on a fish tank filter is suspected as the cause of a fire at 421 Sixth Ave., S.E. on Saturday, Decatur Fire and Rescue reported." The Decatur Daily, Sunday, Sept. 25, 2005. http://www.decaturdaily.com/decaturdaily/news/050925/areabriefs.shtml>

"Terrah Campbell was asphyxiated by smoke from the June 10 fire that broke out in the rental unit. Her body was found in her bed where she slept. The fire began in an extension cord connected to a burned out electrical outlet" in the bedroom overlooking 10th Street," Shelly Whitehead, "Probe: Girl could have escaped fire." The Kentucky Post, Wednesday, August 3, 2005.

"The thought of a daycare fire strikes fear in every parent's heart. And when those words crackled over emergency radios in Williams County on Wednesday, the worst was feared. A faulty electrical outlet in a bedroom is blamed for the fire." Bundgaard, Chris. "Daycare Safely Evacuated During Fire." News 2 WKRN-TV, September 21, 2005.

"Three men were killed and three other people were critically injured yesterday morning after a fire broke out in a cellar apartment in Queens and surged through the building, a two-story attached home, forcing neighbors to run down the street to escape the heat and smoke...Fire officials said last night that an overloaded power strip in the cellar had caused the fire." O'Gilfoil, Patrick. "Apartment Fire Kills 3 people in Queens," January 31, 2005.

"An Oakland Street house fire on Oct. 26 is now believed to have been caused by an electrical problem, the fire chief said. We believe it was an electrical fire caused by the lamp cord. "Fire Chief Wayne Vinton said," Guha, Audit. "Electrical Fire Likely Cause of Medway Fire," November 5, 2004.

www.townonline.com>

"A 30-amp fuse in a 20-amp hole is being blamed for a fire that gutted a four-unit apartment house Thursday morning, displacing six people. Hainstock said a short circuit at the bedroom socket probably heated the wires like the elements in a toaster. The short circuit would have blown a smaller fuse, but the 30-amp fuse allowed the wires to continue heating and to start a fire, Hainstock said." Schwartz, Sid. "Wrong Sized Fuse Blamed for Blaze" Janesville Gazette, September 9, 2005.

"Quick response to reports of a fire in Charlestown saved a two bedroom dwelling place from total destruction...It is believed that the fire was caused by an electrical fan that was left running and which short circuited. McCall, Terresa "Fire Unit Contains House Fire in Nevis <http://sunstkitts.com> September 9, 2005.

"Nineteen firefighters were called to the six story retirement home at 59 Cedar St. N. The fire started in the living room of a third-floor apartment which was empty at the time...Once inside, firefighters found the unit filled with thick, black smoke...An upholstered chair near the lamp was burning, Taves said the lamp's electrical cord caught fire and then ignited the chair and rug." Record Staff: "Faulty Lamp Sparks Apartment Fire." The Kitchener Record, December 30, 2005.

Overload Fault Interrupter protection for personnel has the potential to significantly reduce the hundreds of thousands of electical overload fires in U. S. Homes that result in hundreds of deaths and thousands of serious burn injuries yearly.

Shock Risk. In fact, "3,900 injuries associated with electrical receptacle outlets are treated in hospital emergency rooms each year," 4 One third of them are young children inserting the metal objects. Existing solutions include plastic receptacle covers and tamper resistant covers, many of which do not provide adequate protection. Depending on the type, plastic receptacle covers can be removed by up to 100% of 2-4 year olds. 6

Thousand of serious shock injuries resulting in hospital visits from receptacles can be avoided every year. Furthermore, of the hundreds of electrocutions occurring in the United States each year (411 deaths in 2001), a substantial number are associated with electrical outlets and can also be avoided.

Panel Meeting Action: Reject

Panel Statement: There is insufficient information provided to determine if the proposed protective device would have prevented the incidents described in the substantiation. The proposed device should be independently evaluated to determine that it will perform the intended function and that there will be no unintended consequences such as false tripping of the device.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-155 Log #2278 NEC-P02 **Final Action: Reject**

(210.13 (New))

Submitter: Bob Boutin, BE Safe Consultants, Inc.

Recommendation: Add text to read:

Electrical outlets in residential and commercial environments should not provide electrical current without the insertion of a valid electrical plug.

Substantiation: Due to their design, all electrical outlets pose a potential electrocution hazard. Thousands of injuries and deaths could be prevented by utilizing technology that blocks electrical current from the outlet until a valid plug is inserted. Stopping the flow of electricity to improperly insert plugs, metal objects and other foreign material provides adequate protection from electrical currents.

Existing products designed to cover outlet openings fall short of full protection as they are not fail-safe. These devices only offer protection when they are properly inserted into the outlet, cannot be secured to prevent removal by the persons they are most intended to protect and, by the nature of their design eliminates the usefulness of the outlet which, often times prevents consumers from purchasing in the first place.

Panel Meeting Action: Reject

Panel Statement: There is insufficient information provided to determine if the proposed protective device would have prevented the incidents sited in the substantiation. The proposed device should be independently evaluated to determine that it will perform the intended function and that there will be no unintended consequences such as false tripping of the device. The submitter's use of the term "should not" could be interpreted as not being mandatory language and may not satisfy the submitter's original intent.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

(Note: Sequence 2-156 was not used)

2-157 Log #429 NEC-P02 **Final Action: Reject**

(210.15)

Submitter: Mark Magee, Journeyman, Idaho J22653

Recommendation: Add new text as follows:

<u>Line voltage smoke detectors and fire detection equipment shall be supplied by an isolated circuit, and clearly marked as such. The said circuit will have identification by means of a red tag with the writing "FIRE DETECTION ONLY" written upon the tag in the circuit panel from which it is supplied.</u>

Substantiation: Use of household smoke detectors on arc fault circuit interrupter lighting circuits creates a hazard in that the smoke detector may be switched off by de-energizing the circuit, or improperly wiring signaling circuits.

Note: Supporting Material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The submitter has not substantiated that a problem exists where smoke alarms are installed on AFCI protected branch circuits.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

BROWN, L.: This should be under the purview of CMP 3 or the TC's of NFPA 72.

2-158 Log #1005 NEC-P02 **Final Action: Reject**

(210.18)

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Revise text to read as follows:

Guest rooms in motels, hotels, <u>and dormitories,</u> ~~provided with permanent provisions for cooking~~ shall have branch circuits installed to meet the requirements for dwelling units.

Substantiation: The perceived intent is to protect cords susceptible to arcing. There is no need to include circuits supplying only fixed equipment such as lighting outlets or smoke/fire detectors. An arc-fault could deenergize such circuits just when needed. Many agencies such as fire departments report dead or removed batteries in smoke detectors which make such backup unreliable. It is not clear what relevance permanent cooking facilities have on this requirement. 210.8 has exceptions for GFCI requirements.

Panel Meeting Action: Reject

Panel Statement: The submitter's substantiation is not clear and lacks the necessary technical data to support his recommendation.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-159 Log #2160 NEC-P02 **Final Action: Reject**

(210.18)

Submitter: Richard E. Loyd, Sun Lakes, AZ

Recommendation: Delete Section 210.18 in its entirety.

Substantiation: The addition of this section has caused confusion in the industry. Many "guest suites" are nothing more than a single room with furniture arrangement and cooking provisions to make them suitable for extended stay, while others may clearly be a dwelling with multiple bedrooms within a hotel or motel. The countertop may be one 3 ft cabinet top adjacent to a combination sink - cooktop unit with a micro-oven exhaust fan hung above the unit.

NEC section requiring AFCI, GFCI, laundry, outside receptacle requirements, and other specific safety requirements should be dealt with in each individual section as applicable to extended stay suites.

Panel Meeting Action: Reject

Panel Statement: CMP 2 maintains that guest rooms and guest suites that have permanent provisions for cooking are required to have branch circuits installed to meet the rules for dwelling units.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-160 Log #2734 NEC-P02 **Final Action: Accept**
(210.18)

Submitter: Jim Pauley, Square D Company
Recommendation: Revise 210.18 as shown below:
210.18 Guest Rooms and Guest Suites.
Guest rooms and guest suites that are provided with permanent provisions for cooking shall have branch circuits ~~and outlets~~ installed to meet the rules for dwelling units.
Substantiation: The outlet provisions for guest rooms and suites are outlined in 210.60 and 210.70. 210.18 is a necessary section, but is only needed to indicate that the branch circuits for a guest room/suite with permanent cooking provisions need to have branch circuits installed in a similar manner to a dwelling unit. This would include the small appliance branch circuits and the bathroom branch circuit. The laundry branch circuit is included, but an Exception #2 to 210.52(F) would allow the omission of the laundry receptacle if no laundry facilities are contemplated.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-161 Log #3469 NEC-P02 **Final Action: Reject**
(210.19)

Submitter: Richard F. Van Wert, Middle Department Inspection Agency / Rep. Benjamin Franklin Chapter IAEI
Recommendation: Revise text to read:
210.19 Conductors - Minimum Ampacity and Size.
(A) Branch Circuits Not More Than 600 Volts.
(3) ~~Household~~ Dwelling Unit Ranges and Cooking Appliances. Branch circuit conductors supplying ~~household~~ dwelling unit ranges, wall-mounted ovens, counter-mounted cooking units, and other ~~household~~ dwelling unit cooking appliances etc.
Exception No. 2: The neutral conductor of a 3-wire branch circuit supplying a ~~household~~ dwelling unit electric range, etc.
Substantiation: We need to stay consistent with our wording in the NEC so as to not mislead or confuse the reader with an unorthodox term.
Panel Meeting Action: Reject
Panel Statement: The present text is clear. The submitter's recommended text does not add any clarity when describing types of cooking appliances.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-162 Log #2008 NEC-P02 **Final Action: Reject**
(210.19(3))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 17 for action within Article 422.
This action will be considered by Code-Making Panel 17 as a public comment.
Submitter: Robert Caggiano, General Electric Company
Recommendation: Revise as follows:
(3) Household Ranges and Cooking Appliances. Branch-circuit conductors supplying household ranges, wall-mounted ovens, counter-mounted cooking units, and other household cooking appliances shall be protected by a listed ground fault circuit interrupter for personnel and shall have an ampacity not less than the rating of the branch circuit and not less than the maximum load to be served. For ranges of 8 3/4 kW or more rating, the minimum branch-circuit rating shall be 40 amperes.
Substantiation: Electric ranges make use of sheathed resistance heaters as heating elements. These heaters are susceptible to failures due to wear or corrosion. These failures result in an intense arcing similar to an arc welding operation. The arc can propagate and can be self-sustained for an extended period of time. The writer has witnessed such an event.
The arcing is caused by a fault from the electrical supply to ground. The leakage current during one of these events has been measured to be in the range of 3 to 5 amperes. A standard thermal/magnetic circuit breaker or fuse will not detect enough current to recognize this extraordinary event. A common ground fault circuit interrupter with 5mA trip setting would easily detect and interrupt this event. Ground Fault protection is also recommended for any appliance with a heating element (i.e., refrigerators, dish washers and cloths dryers).
Panel Meeting Action: Reject
Panel Statement: The panel recognizes that the event described in the submitter's substantiation is possible at end of life for sheathed heating elements. Because this proposal addresses a specific applicance, the panel recommends to the Technical Correlating Committee that this proposal be forwarded to CMP-17 for action.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-163 Log #3471 NEC-P02 **Final Action: Accept in Part**
(210.19(3) Exception No. 1)

Submitter: Richard F. Van Wert, Middle Department Inspection Agency / Rep. Benjamin Franklin Chapter IAEI
Recommendation: Revise text to read:
210.19(3) Exception No. 1: Conductors tapped from a 40- or 50-ampere branch circuit supplying electric ranges, wall-mounted electric ovens and counter-mounted electric cooking units shall have an ampacity of not less than 20 amperes and shall be sufficient for the load to be served. These taps, etc.
Substantiation: The article needs a rewording in order to clarify the whole intent of what is intended here and the rule will now match the graphic used in the IAEI Power Point presentation.
Panel Meeting Action: Accept in Part
The panel accepts the rewording of the exception but rejects the addition of the 40 ampere branch circuit.
Panel Statement: The submitter has not substantiated the addition of the 40 ampere branch circuit
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-164 Log #1465 NEC-P02 **Final Action: Reject**
(210.19(A), 210.20, Table 210.24)

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Rename the term “fixture wires” to “luminaire wires” in 210.19(A)(4)(b); 210.19(A)(4), Exception No. 2; 210.20(B) and Table 210.24.
Substantiation: With the changing of the term “fixture” to “luminaire” it only makes sense that the term “fixture wires” be changed to “luminaire wires”.
For the purposes of correlation, this proposal is also being submitted to the following Articles/Sections/Tables/Annexes: 200.6; 210.19; 210.20; 210.24; 240.4; 240.5; 300.17; 310.1; 314.16; Article 402; 517.74; 660.9; Table 1; Table 5; Annex C.
Panel Meeting Action: Reject
Panel Statement: While the term “fixture” as relating to lighting fixtures has been changed to luminaries, the term for fixture wires applies to conductors that serve appliances or other devices and not just luminaries. The change in terminology will impose changes on the wire industry and those associated with no increase in safety or apparent benefit to users of the code.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-165 Log #2836 NEC-P02 **Final Action: Reject**
(210.19(A), FPN 4)

Submitter: Robert P. McGann, City of Cambridge
Recommendation: Make this Fine Print Note into mandatory text.
Substantiation: This is necessary to properly facilitate the operation of overcurrent protection. We are all looking at ways to reduce the number of electrical fires. This will aid us in achieving that goal.
Panel Meeting Action: Reject
Panel Statement: The fine print note deals with efficiency of operation and it is not clear from the substantiation that making the fine print note mandatory will reduce electrical fires.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
BROWN, L.: In all, see Panel Action on related Proposals: 2-165; and 2-268.

2-166 Log #1319 NEC-P02 **Final Action: Accept in Principle**
(210.19(A)(1))

TCC Action: The Technical Correlating Committee understands that the Panel Action on this Proposal is to identify the existing Exception as “Exception No. 1” and the Exception being added as “Exception No. 2” to be located immediately following the existing Exception.
Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Revise as follows:
210.19 Conductors – Minimum Ampacity and Size.
(A) Branch Circuits Not More Than 600 Volts.
(1) General. Branch-circuit conductors shall have an ampacity not less than the maximum load to be served. ~~Where a branch circuit supplies continuous loads or any combination of continuous and noncontinuous loads, the minimum branch-circuit conductor size,~~ Branch-circuit conductors that are connected to an overcurrent device assembly shall have a minimum allowable ampacity, before the application of any adjustment or correction factors, ~~shall have an allowable ampacity~~ not less than the noncontinuous load plus 125 percent of the continuous load.
Substantiation: “Minimum Rating and Size”: The identical wording should be used for 210.19, 215.2, and 230.42.

Confusion reigns as to under what conditions grounded conductors are subject to the same 125 percent of continuous load sizing requirements as are ungrounded conductors. During the 2005 *Code* cycle this issue was addressed for feeders, but action was deferred. ROC No. 2-145 included a lucid, sound "substantiation" that unfortunately was rejected by CMP 2 at that time. Now is an excellent time to re-evaluate that "substantiation" and adopt its intent.

The basis for the 125 percent requirement stems from the manner in which listed overcurrent devices are tested. During continuous load tests of enclosed overcurrent devices, in order to prevent nuisance tripping, it has been found that it is necessary to limit the current to 80 percent of the device's rating. Conductors are sized, then, (1) at 125 percent of the continuous current in accordance with the allowable ampacity determined from Table 310.16, and (2) per the terminal temperature limitations of 110.14(C).

The reality is that the enclosed overcurrent devices rely on the mass of the conductors to act as heat sinks that dissipate excess thermal energy and thereby avoid unacceptable nuisance tripping. Of course, since overcurrent devices cannot distinguish between ungrounded and grounded conductors, in both cases the conductor sizes must be based on calculations that include an additional 25 percent factor when the load is continuous. On the other hand, there is no reason to add 25 percent to the load of a conductor that is not connected to a device that is not subject to nuisance tripping, such as in the case of a grounded conductor connected a neutral terminal bus.

The end result of this proposal is twofold:

1. The additional 25 percent continuous load requirement applies only to conductors, both ungrounded and grounded, that connect to an overcurrent device (unless, of course, the assembly is listed for operation at 100 percent of its rating).

2. Grounded conductors that carry continuous loads and that connect only to neutral buses, or to devices not subject to nuisance tripping, are not required to have their loads increased by 25 percent.

This proposal accomplishes that goal and, in hand with similar proposals made in two other Articles, brings into conformity the requirements for branch circuits (210.19), feeders (215.2), and services (230.42).

Panel Meeting Action: Accept in Principle

Add a new exception to 210.19(A)(1) to read:

Exception: Grounded conductors that are not connected to an overcurrent device shall be permitted to be sized at 100% of the continuous and non-continuous load.

Panel Statement: The panel has accepted the submitter's concept, but has added the provision as an exception to the main rule. The concern with the submitter's proposed language is that it may be interpreted that the conductors have to terminate directly to an overcurrent device.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-167 Log #1647 NEC-P02 **Final Action: Reject**

(210.19(A)(1))

Submitter: Larry T. Smith, National Electrical Seminars

Recommendation: Revise text to read as follows:

(1) General. Branch-circuit conductors shall have an ampacity not less than the maximum load to be served. Where a branch circuit supplies continuous loads or any combination of continuous and noncontinuous loads, the minimum branch-circuit conductor size, before the application of any adjustment or correction factors, shall have an allowable ampacity not less than the noncontinuous load plus 125 percent of the continuous load <u>in accordance with the temperature limitations of 110.114(C)</u> .

Substantiation: Ignoring the temperature rating of equipment is the most common mistake being made in conductor sizing today. Entirely too many wiremen take no notice of the temperature limitations of 110.14(C) when sizing conductors. They disregard the temperature rating of equipment, and use the 90°C column of Table 310.16 when 90°C rated conductors, such as THHN, are being used. The equipment rating will either be 60° or 75°C, not 90°C.

Observing the temperature rating of the equipment is an integral part of sizing branch circuit conductors; it should be included as a requirement of 210.19(A)(1).

Panel Meeting Action: Reject

Panel Statement: The panel agrees that 110.14(C) is an important section, but its application in conductor selection is a much broader application than 210.19. Adding another reference to this section would not improve the usability because 110.14(C) is a general requirement.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-168 Log #1723 NEC-P02 **Final Action: Reject**

(210.19(A)(1), FPN 4)

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education

Recommendation: Revise as follows:

"... and where the maximum total voltage drop on service equipment, feeders, and branch circuits (including outlet devices) to the farthest...".

Substantiation: The present wording is based on nominal voltage minus 5 percent reliably being high enough for reasonable efficiency of operation. If voltage predictable runs lower than that, there may be problems. I have encountered service equipment that added 1 percent or more impedance. Standard VD testers, after all, indicate total drop, not merely drop through feeders and branch circuits.

Panel Meeting Action: Reject

Panel Statement: The fine print note is advisory with respect to total voltage drop not exceeding 5% and does not cover all possible causes for the voltage drop.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-169 Log #915 NEC-P02 **Final Action: Reject**

(210.19(A)(2))

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Delete or substitute:

Conductors of branch circuits supplying two or more receptacles or outlets shall comply with the requirements in Table 210.24.

Substantiation: Edit. This is already covered in Table 210.24. Present wording does not apply where one receptacle and other type outlets are supplied.

Panel Meeting Action: Reject

Panel Statement: Section 210.19 provides the requirements for branch circuit ratings and Table 210.24 provides a summary of the requirements. Deleting 210.19(A)(2) does not improve the usability or clarity of the code.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-170 Log #2124 NEC-P02 **Final Action: Reject**

(210.19(A)(3))

Submitter: Charles Swathwood, Electrical Contracting Inc.

Recommendation: Add paragraph No. 3 to read:

(3) Microwave ovens shall not be considered meeting the requirements of 210.8(A)(3).

Substantiation: Microwave ovens are a cord and plug appliance and have their own name plate specifications for installation.

Panel Meeting Action: Reject

Panel Statement: The recommendation is not clear as to the section referenced which does not apply to microwave ovens.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

BROWN, L.: Perhaps the Recommendation should read: "Add Exception No. 3", not "paragraph No. 3".

2-171 Log #541 NEC-P02 **Final Action: Accept in Part**

(210.19(A)(4) Exception No. 1 (b.))

Submitter: Edward G. Kroth, Academy Electric, Inc.

Recommendation: Revise text to read:

(b) A <u>luminaire (lighting fixture)</u> ~~fixture~~ having tap conductors as provided in 410.67.

Substantiation: Article 410 is titled Luminaires (Lighting Fixtures), Lampholders and Lamps. The proposed change is suggested to provide consistency with this title.

Panel Meeting Action: Accept in Part

Revise the present Code text to read:

(b) A <u>luminaire (fixture)</u> having tap conductors as provided in 410.67.

Panel Statement: The panel has deleted the word "lighting" to be consistent with the use of only the term "fixture" in 410.67.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-172 Log #1698 NEC-P02 **Final Action: Reject**

(210.19(B)(2))

Submitter: Charles M. Trout, Maron Electric Company

Recommendation: Add a new last sentence to 210.19(B)(2)(2) to read:

Evidence of documentation of qualified person shall be kept in a permanent file at the office of the establishment where the installation is made.

Substantiation: No requirements are present to ensure the conditions of maintenance and supervision to ensure that only qualified persons service the installation actually exist.

Panel Meeting Action: Reject

Panel Statement: The portion of the recommendation calling for documentation is already covered by the existing requirement of 210.19(B)(2)(2). In addition the proposed text is overly restrictive by requiring documentation to be maintained at the place where the installation is made.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

KING, D.: The submitter's recommendation to add a new last sentence requiring that the documentation be located in a permanent file on site where the work is performed is necessary to ensure that the documentation is available for the authority having jurisdiction at the time of inspection. I disagree with the panel statement that the proposed language is to restrictive. Facilities seeking to perform electrical installations under the provisions of this section should have a set location on site, preferably in the office of the supervising engineer employed by the facility, where the documentation is accessible to whoever may require it. It is difficult for the authority having jurisdiction to enforce the provisions of this section without clear prescriptive language as to what determines the presence of a qualified person at a facility. The additional language recommended by the submitter would aid the authority having jurisdiction in determining if the application of this section should be permitted.

2-173 Log #1411 NEC-P02 **Final Action: Reject**
(210.20)

Submitter: George Stolz, II, Pierce, CO
Recommendation: Delete 210.20, 210.20(B) through (D). Move 210.20(A) with Exception to new section Article 240.4(H) and change the words relating to branch circuits to apply to all conductors.

~~210.20(A)~~ 240.4(H) Continuous and Noncontinuous Loads. Where ~~a branch circuit supplies~~ conductors supply continuous loads or any combination of continuous and noncontinuous loads, the rating of the overcurrent device shall not be less than the noncontinuous load plus 125 percent of the continuous load.

Exception: Where the assembly, including the overcurrent devices protecting the ~~branch circuit~~ conductor(s), is listed for operation at 100 percent of its rating, the ampere rating of the overcurrent device shall be permitted to be not less than the sum of the continuous load plus the noncontinuous load.

Substantiation: In general, this will reduce redundant text in the NEC. General overcurrent rules are more appropriate (and are already present) in Article 240, Overcurrent Protection. What follows are substantiations for each deletion.

210.20: With (A) through (D) relocated or deleted, this text becomes obsolete.

(A): This is a uniform requirement for all conductors: a similar rule in 215.3 requires the same for feeders. It would be clearer for users of the NEC if the requirements were merged into an all-encompassing requirement for all conductors, located in an appropriate article.

(B): Redundant 240.4 and 240.5 are enforceable over branch circuit conductors without 210.20 referencing them.

(C): Redundant 240.3 is enforceable over branch circuit conductors without 210.20 referencing it.

(D): 210.21 is enforceable over branch circuit conductors without 210.20 referencing it.

The deletions would require revisions to the following: Sections 210.24; 225.9; 368.13; Index: “Appliances, Overcurrent Protection, Single”, “Branch Circuits, Individual, Overcurrent Protection”, “Branch Circuits, Overcurrent Protection”, “Continuous Load, Application”, “Overcurrent Protection, Branch Circuits”, and “Overcurrent Protection, Single Appliance”.

Panel Meeting Action: Reject
Panel Statement: The current wording provides clarity in the use of the code as applied to branch circuits.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-8 Log #822 NEC-P02 **Final Action: Reject**
(210.21(B)(1))

Submitter: Jeffrey A. Fecteau, City of Peoria, Arizona
Recommendation: Revise text to read as follows:

Single Receptacle on an Individual Branch Circuit. A single receptacle installed on an individual branch circuit shall have an ampere rating ~~not less than~~ equal to that of the branch circuit.

Substantiation: As currently written, it is currently being interpreted to allow a 20 ampere single receptacle to be installed on a 15 ampere individual branch circuit. 20 ampere single receptacle is not less than that of the branch circuit. This would allow a 20 ampere rated piece of equipment to be connected to a 15 ampere circuit.

See supporting material for response to a question posed to Code Question of the day, hosted by NEIS, and answered by Ed Holt (Electrical Inspector - Architect of the Capitol - Instructor - The College of Southern Maryland)

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject
Panel Statement: The recommendation would be overly restrictive in the case of some larger receptacle applications that do not directly correspond to the standard ratings of overcurrent protective devices. The panel notes that a 20-ampere receptacle installed on a 15-ampere branch cirrcuit is protected within it’s rating.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-174 Log #3133 NEC-P02 **Final Action: Reject**
(210.21(B)(2))

Submitter: Eric Stromberg, Stromberg Engineering, Inc.
Recommendation: Delete Section 210.21B(2) and associated table.
Substantiation: As written, this section is unenforceable, because it applies to all cord-and-plug devices; not just those fastened in place at the time of installation. According to this section, every time I use my circular saw, I violate the *Code* . If this section is for the purpose of after-the-fact application, as would be the case for a fire investigation, it seems that 210.23 could be cited instead.
Panel Meeting Action: Reject
Panel Statement: The panel continues to maintain that the cord and plug connected load must not exceed the maximum load specified in Table 210.21(B)(2).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

(210.21(B)(2) and Table 210.2(B)(2))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: This section has nothing to do with safety and is virtually unenforceable when the load is portable or transient, or connected after inspection. In Proposal 1-64 of the 1994 ROP, the panel rejected the proposal to define an individual circuit as one supplying a single receptacle inferring that a circuit supplying a duplex receptacle with only one equipment plugged in is an individual circuit. If this is the intent, the receptacle can supply any load for which it is rated. Receptacles are evaluated for their full ratings. There are listed appliances with rated current over 12 amperes with factory equipped 15 ampere plugs with no instructions to utilize an individual circuit, such as hair dryers, central vacuums, pressure water sprayers, etc. implying the testing agency found no hazard with a multiple receptacle circuit.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Proposal 2-174.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-176 Log #1394 NEC-P02 **Final Action: Reject**
(210.21(B)(2), Table 210.21(B)(2))

Submitter: George Stolz, II, Pierce, CO
Recommendation: Delete the text and chart.
Substantiation: Item (1) and (3) in 210.21(B) address receptacle ratings, whereas Item (2) addresses connected loads, which are more appropriately and already addressed in 210.23(A)(1). 210.21(B)(2) is redundant.

The following sections reference this section and would need to be amended to either reference 210.21 in general, or 210.23:

210.21, the FPN to 406.2(B), 406.3(A), 520.9, 530.21(A). Index “Heavy Duty Lampholders”, and “Maximum Connected Load to Receptacles”.

No coordinating proposal will be submitted to request these amendments.

Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Proposal 2-174.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-177 Log #1849 NEC-P02 **Final Action: Reject**
(210.21(B)(5) (New))

Submitter: David Williams, Lansing, MI
Recommendation: Add new text to read as follows:

(5) Bathroom Receptacle Rating. The rating of dwelling unit bathroom receptacles shall be rated 20 amperes.

Substantiation: The code section requires a maximum cord and plug connected load to a 15 ampere receptacle to be 12 amperes. Most personal hair dryers draw in excess of that amount and should be using a 20 ampere receptacle.
Panel Meeting Action: Reject
Panel Statement: Section 210.23(A)(1) requires cord and plug connected utilization equipment to not exceed 80% of the branch circuit rating. Equipment with a 15 ampere rated plug should not exceed the load shown in Table 210.21(B)(2).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:

BROWN, L.: The submitter may also want to refer to Section 210.24 for additional guidance.

2-178 Log #3132 NEC-P02 **Final Action: Reject**
(210.23(A)(1))

Submitter: Eric Stromberg, Stromberg Engineering, Inc.
Recommendation: Delete section 210.23(1) and renumber (2) to (1).
Substantiation: As written, this section is unenforceable, because it applies to cord-and-plug devices not fastened in place at the time of installation. According to this section, every time I use my circular saw, I violate the *Code* (if I use it on a 15 amp branch circuit). If this section is for the purpose of after-the-fact application, as would be the case for a fire investigation, it seems that 210.23 could be cited instead.
Panel Meeting Action: Reject
Panel Statement: The panel continues to maintain that the cord and plug connected load must not exceed the maximum load specified in Table 210.21(B)(2)
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
BROWN, L.: It should be noted this Section could apply to equipment in commercial kitchens where the equipment is cord-and-plugged-connected for ease of cleaning.

2-179 Log #71 NEC-P02 **Final Action: Reject**
(210.23(A)(1) Exception (New))

Submitter: Wesley Gerrans, Northwest Kansas Technical College
Recommendation: Add an exception to read as follows:
Exception No. 1: A single cord and plug connected load connected to a single receptacle on an individual branch circuit shall not exceed the rating of the branch circuit.
This could also be worded:
210.23(A)(1) The rating of any one cord and plug connected utilization equipment <u>not on an individual branch circuit</u> shall not exceed 80 percent of the branch circuit rating.
Substantiation: Without this Exception 210.23(A)(1) appears to defeat the reasoning behind 210.21(B)(1) requiring the single receptacle on an individual branch circuit a rating not less than that of the branch circuit, and that of 210.23 that says an individual branch circuit shall be permitted to supply any load for which it is rated.
Panel Meeting Action: Reject
Panel Statement: This requirement is already covered by 210.23.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
BROWN, L.: In all, see Panel Action on related Proposals: 2-179; and 2-181.

2-180 Log #3485 NEC-P02 **Final Action: Reject**
(210.23(A)(2))

Submitter: Richard F. Van Wert, Middle Department Inspection Agency / Rep. Benjamin Franklin Chapter IAEI
Recommendation: Revise text to read:
210.23(A)(2) Utilization Equipment Fastened in Place. The total rating of a <u>single</u> utilization equipment fastened in place etc.
Substantiation: This article needs clarification because as it stands now it is allowable to connect a dishwasher, garbage disposal, dish warmer and trash compactor all on one 20 ampere branch circuit.
Panel Meeting Action: Reject
Panel Statement: The present language is clear in it's intent. The section refers to the "total rating of utilization equipment fastened in place" which permits more than one utilization equipment as long as the total rating does not exceed 50% of the branch-circuit rating.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-181 Log #72 NEC-P02 **Final Action: Reject**
(210.23(B))

Submitter: Wesley Gerrans, Northwest Kansas Technical College
Recommendation: Revise as follows:
<u>The</u> ~~A~~ rating of any one cord and plug connected utilization equipment <u>not on an individual branch circuit</u> shall not exceed 80 percent of the branch circuit ampere rating.
Substantiation: Clarification of Section "B" based on 210.23, "an individual branch circuit shall be permitted to supply any load for which it is rated."
Panel Meeting Action: Reject
Panel Statement: This requirement is already covered by 210.23.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
BROWN, L.: In all, see Panel Action on related Proposals: 2-179; and 2-181.

2-182 Log #1320 NEC-P02 **Final Action: Reject**
(210.24)

Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Delete the following:
~~210.24 Branch-Circuit Requirements — Summary. The requirements for circuits that have two or more outlets or receptacles, other than the receptacle circuits of 210.11(C)(1) and (C)(2), are summarized in Table 210.24. This table provides only a summary of minimum requirements. See 210.19, 210.20, and 210.21 for the specific requirements applying to branch circuits.~~
~~Table 210.24 Summary of Branch-Circuit Requirements~~
Substantiation: 210.24 is not enforceable code, as is clearly indicated in the last two sentences of the section. A "summary of requirements" should be in a document such as the National Electrical Code Handbook, not the *Code* itself.
Panel Meeting Action: Reject
Panel Statement: The table provides a useful summary of the branch circuit requirements which are enforceable by the authority having jurisdiction.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-183 Log #612 NEC-P02 **Final Action: Reject**
(210.25)

Submitter: Robert Bourke, Northeastern Regional Fire Code Dev.
Recommendation: Revise to read:
210.25 Common Area Branch Circuits. Branch circuits in dwelling units shall supply only loads within that dwelling unit or loads associated only with that dwelling unit. Branch circuits required for the purpose of lighting, central alarm, signal, communications, or other needs for public or common areas of a ~~two-family or~~ multifamily dwelling shall not be supplied from equipment that supplies an individual dwelling unit. <u>Branch circuits required for the purpose of lighting, central alarm, signal, communications, or other needs for public or common areas of a two-family dwelling shall be allowed to be supplied from equipment that supplies an individual dwelling unit provided that the disconnecting means of the branch circuit is accessible to the occupants of both dwelling units.</u>
Substantiation: The model building codes do not distinguish between one and two family homes. The common area branch circuit requirements serve no safety purpose if all occupants of the building have access to the disconnecting means. The requirement for a separate branch circuit for common areas in a two family dwelling results in a separate meter socket, breaker panel and wiring at a great expense to the owner. Many power companies charge commercial rates for power when there is more than one meter on a property while some other power companies charge a fixed minimum per month for each meter that is much greater than the usage for alarm and lighting for the common area.
Panel Meeting Action: Reject
Panel Statement: The common area branch circuit requirements for two family dwellings had this provision added by the panel in lieu of the potential that an occupant could have the service meter disconnected by the utility company for a variety of reasons such as vacancy or non payment, or by having the branch circuit internally disconnected.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
BROWN, L.: The Submitter's Substantiation is incorrect as there are differences in the application of provisions for one- and two-family dwellings constructed using the ICC International Residential Code (IRC) and multifamily buildings constructed using the ICC International Building Code (IBC). There are also differences in the types of two-family dwellings such as side-by-side or above-and-below configurations in which the common area may or may not be present, and may not require a separate house meter and circuit(s)

2-184 Log #823 NEC-P02 **Final Action: Accept in Principle in Part**
(210.25)

Submitter: Jeffrey A. Fecteau, City of Peoria, Arizona
Recommendation: Revise text to read as follows:
Common Area Branch Circuits. Branch circuits in ~~dwelling~~ <u>individual</u> units shall supply only loads within that ~~dwelling~~ <u>individual</u> unit or loads associated only with that ~~dwelling~~ <u>individual</u> unit. Branch circuits required for the purpose of lighting, central alarm, signal, communications, or other needs for public or common areas of a ~~two-family or multifamily dwelling~~ <u>multi-occupant building</u> shall not be supplied from equipment that supplies an individual ~~dwelling~~ unit.
Substantiation: Current code language allows multi-tenant retail buildings to have life safety and security systems connected to a tenant meter. When this design is utilized, there is the possibility that the Fire Alarm Control Panel (FACP), Monitor System, Sprinkler Tamper-Flow Switch, Site Lighting, etc., may have the power source disconnected if space becomes vacant and the utility meter is removed leaving the building in an unsafe condition.

Installation of an FACP, Monitoring System, Sprinkler Tamper-Flow Switch, Site Lighting, etc., using a tenant meter would not allow ready access to the overcurrent devices as required by 240.24 when the tenant space is not occupied for business. Therefore, making the OCPD for common area systems not readily accessible during non-business hours.

2003 IFC Section 907.5 requires the power supply for Fire Protection Systems to comply with NFPA 72. 1999 NFPA 72 Section 1-5.2.5.2 requires that the circuit shall be accessible only to authorized personnel. Allowing a tenant meter as the power supply for a common area Fire Protection System would allow access to non-authorized personnel.

Panel Meeting Action: Accept in Principle in Part

Revise the 210.25 text to read:

210.25 Branch Circuits in Buildings With More Than One Occupancy.

<u>(A) Dwelling Unit Branch Circuits.</u> Branch circuits in each dwelling unit shall supply only loads within that dwelling unit or loads associated only with that dwelling unit.

<u>(B) Common Area Branch Circuits.</u> Branch circuits required for the purpose of lighting, central alarm, signal, communications, or other needs for public or common areas of a two-family, ~~or~~ multifamily dwelling <u>, or a multi-occupancy building</u> shall not be supplied from equipment that supplies an individual dwelling unit <u>or tenant space</u> .

Panel Statement: The panel has revised this section into two subdivisions for compliance with the NEC style manual. The revisions made in new (B) accomplish the intent of the submitter. The panel added the word "each" in (A) for clarity. The panel did not accept the recommedation for the first sentence of 210.25 because the revision would be overly restrictive in many commercial applications.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

BROWN, L.: It should also be noted that a two-family dwelling is not classified as a multifamily building in the International Building Code (IBC) or the International Residential Code (IRC). In addition, the Submitter should consult the NFPA 17 (NEC) definitions of Dwelling Unit; Dwelling, One-Family; Dwelling, Two-Family; and Dwelling, Multifamily.

2-185 Log #3139 NEC-P02 **Final Action: Reject**
(210.25 Exception (New))

Submitter: Dale Rooney, Municipality of Anchorage

Recommendation: Add exception to read:

Exception: For common area lighting it shall be permitted to provide lighting from each unit such that all the lighting and switching requirements are met. Switching shall be accessible to all occupants unless the branch circuit overcurrent devices are accessible to all occupants.

Substantiation: A recent building design includes an interior stairway common to two dwelling units. This exception will eliminate the need for a separate service for just one circuit.

Panel Meeting Action: Reject

Panel Statement: See the panel action statement on proposal 2-183.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

BROWN, L.: Depending on the configuration, there may not be a need for a separate panel for a two-family dwelling common area as both dwelling units may have their own lighting for their portion of the common areas. In addition, the "equipment" required by this Section to control shared lighting, etc., would not necessarily require a "separate service."

2-186 Log #3168 NEC-P02 **Final Action: Accept**
(210.50(C))

Submitter: Wally Harris, Atlantic Inland Inspections

Recommendation: Change title of section to "Appliance Receptacle Outlets" instead of "Appliance Outlets".

Substantiation: Section does in fact address "Appliance Receptacle Outlets" as indicated in the first three words of the Section.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-187 Log #118 NEC-P02 **Final Action: Reject**
(210.52)

Submitter: Bill Elder, B.E. Electric

Recommendation: None.

Substantiation: Every residential electrician agrees, get rid of requiring breakfast room and dining room plugs to be on a 20 amp circuit. No one even uses those plugs much, accept in rare cases. We should be able to use a general lighting 15 amp circuit to feed those plugs. It's overkill to be required to put them on a 20 amp circuit!! Every electrician agrees.

Panel Meeting Action: Reject

Panel Statement: The proposal does not recommend specific code text as is required by Section 4.3.3(c) of the NFPA Regulations Governing Committee Projects.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-188 Log #1321 NEC-P02 **Final Action: Reject**
(210.52)

Submitter: Mike Holt, Mike Holt Enterprises

Recommendation: Revise as follows:

210.52 Dwelling Unit Receptacle Outlets.

(1) **Receptacle Outlets Served** . In the kitchen, pantry, breakfast room, dining room, or similar area of a dwelling unit, the two or more 20-ampere <u>2-wire</u> small-appliance branch circuits <u>or the one or more 20-ampere 3-wire multiwire branch circuits</u> required by 210.11(C)(1) shall serve all wall and floor receptacle outlets covered by 210.52(A), all countertop outlets covered by 210.52(C), and receptacle outlets for refrigeration equipment.

(2) **No Other Outlets** . The two or more 20-ampere <u>2-wire</u> small-appliance branch circuits <u>or the one or more 20-ampere 3-wire multiwire branch circuits</u> specified in 210.52(B)(1) shall have no other outlets.

Substantiation: The key here is that there must be a minimum of two 20-ampere small-appliance branch circuits. These circuits may either be fed individually from the panel, or they may be fed from a single 3-wire branch circuit.

Panel Meeting Action: Reject

Panel Statement: The additional text in not necessary. Section 210.4(A) already permits this application.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

BROWN, L.: Section 210.11(C)(1) does not require a "3-wire multiwire" branch circuit. It only requires two or more 20-ampere small-appliance circuits to serve the kitchen/dining areas, however they may be provided.

2-189 Log #1409 NEC-P02 **Final Action: Accept in Principle**
(210.52)

Submitter: George Stolz, II, Pierce, CO

Recommendation: Add the following to 210.52:

<u>Receptacles in the areas defined in this section shall be permitted to be switched, provided uninterrupted receptacles are installed at the spacings required by this section.</u>

Substantiation: As this section is currently written, there is no prohibition from allowing the required receptacles to be switched. A requirement that constant power is required at the intervals specified in 210.52(A)(1), and (C)(1) would add clarity to the existing text. It is generally perceived that this section is to reduce the use of extension cords in residences. The prohibition of switching required receptacles would further assure this reduction.

Panel Meeting Action: Accept in Principle

Panel Statement: The recommended action is accomplished through the panel action on Proposal 2-190.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

BROWN, L.: Please see NAHB's Ballot Comment on Proposal 2-190.

2-190 Log #3324 NEC-P02 **Final Action: Accept in Principle**
(210.52)

TCC Action: It was the action of the Technical Correlating Committee that consideration be given to using a list format as recommended in 2.1.5.1, 3.3.1.2, and 3.3.2 of the NEC Style Manual.

This action will be considered by the Panel as a Public Comment.

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc. / Rep. Massachusetts Electrical Code Advisory Committee

Recommendation: Revise the second sentence to read as follows:

The receptacles required by this section shall be in addition to any receptacle that is part of a luminaire (lighting fixture) or appliance, <u>or that is controlled by a wall switch in accordance with 210.70(A)(1) Exception No. 1, or that is</u> located within cabinets or cupboards, or <u>that is</u> located over 1.7 m (5½ feet) above the floor.

Substantiation: When both halves of a duplex receptacle are switched together, the common result is to simply leave the switch permanently in the closed position. Note that the word "outlets" was removed from the NEC text in order to clarify that a split receptacle, with two receptacles in one outlet (See Article 100 definition of a receptacle, etc.), can be used.

If the room is laid out such that a load that should remain energized, such as an alarm clock, happens to be near a receptacle outlet that is entirely under the control of a snap switch, then the switch will either be left in the "ON" position [defeating the purpose of 210.70(A)(1)], or (perhaps more likely) an extension cord will be run across a traveled area from a receptacle not controlled by the switch, defeating the purpose of 210.52(A). Surely when the result of current wording routinely results in the effective cancellation of provisions within the same article, it is time to reexamine the language.

Panel Meeting Action: Accept in Principle

Revise the second sentence in 210.52 to read:

The r eceptacle s ~~outlets~~ required by this section shall be in addition to any receptacle that is part of a luminaire (lighting fixture) or appliance, or is controlled by a wall switch in accordance with 210.70(A)(1) Exception No. 1, or is located within cabinets or cupboards, or is located more than 1.7 m (5½ ft) above the floor.

Panel Statement: The changes made by the panel provide additional clarity and address the submitter's concerns.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

BROWN, L.: The proposed change, developed by the Panel, referring to Section 210.70(A)(1) Exception #1, should not be accepted. The other modifications to this Section of deleting the word "outlets" is correct in the application of the NEC and should be accepted. The intent of Section 210.70 (A)(1) is to provide "switch-controlled lighting" for habitable rooms. The Exception to this rule is to allow a design feature of a switched receptacle to be used in lieu of a switched lighting outlet in the ceiling or wall. It is a matter of design. There is no basis, nor was any supporting documentation presented, the support the Submitter's belief that it is a "common" practice to "leave the switch" controlling a duplex outlet "permanently in the closed position." Nor is there any substantiation to support the "switch will either be left in the "ON" position [defeating the purpose of Section 210.70(A)(1), or (perhaps more likely) an extension cord will be run across a traveled area from a receptacle not controlled by the switch." The receptacle required by Section 210.70(A)(1) is a receptacle that could be easily be used for a lighting fixture for the room whether or not the receptacle is switched. This design feature of convenience should not be penalized as a basis to require additional general lighting wall receptacles.

2-191 Log #3371 NEC-P02 **Final Action: Reject**
(210.52, FPN (New))

Submitter: Jared DeWitte, MSU

Recommendation: Add new FPN to read:

FPN: All measurements required by Article 210.52 are to be made to the center of the device.

Substantiation: Numerous measurements are required in this Article, but no where in the article does it tell measure to what.

Panel Meeting Action: Reject

Panel Statement: The panel does not agree that the addition of the new FPN improves clarity, as other uniform points of measurement will also meet the requirements.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-192 Log #1399 NEC-P02 **Final Action: Reject**
(Figure 210.52)

Submitter: George Stolz, II, Pierce, CO

Recommendation: Delete the text from the upper left corner representing the area requiring outlets behind a sink or range in a corner from Figure 210.52: Outlets not required ~~if X < 450 mm (18 in.)~~ .

Substantiation: This figure is a good addition to the 2005. However, in practice, when a kitchen sink is placed in the corner of a kitchen, it is frequently flanked by windows. Just as frequently, the corner of the space lies just outside of 18 in. from the sink. This places an undue burden on the installer to not compromise the structure by cutting a receptacle outlet into load bearing corners or bearing studs surrounding windows.

In addition, the receptacle required is usually not readily accessible to most medium-height adults; a typical countertop is around 36 in. tall, and 24 in. deep. In the corners, this distance can increase dramatically, precluding the likelihood that such a receptacle outlet would ever be used for small appliances with 2 ft cords, behind a sink. I am 6 ft 1 in., and I nearly have to get on the counter to touch kitchen corners that barely fall under this requirement.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The panel disagrees with the submitter and notes that a corner mounted sink that has countertop exceeding the 450mm (18") dimension does create a usable counter space.

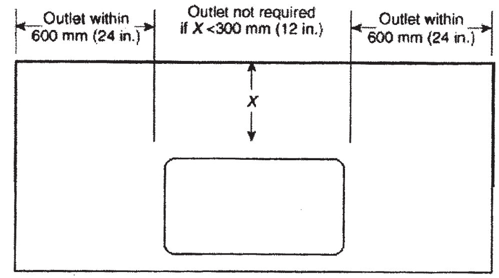
Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

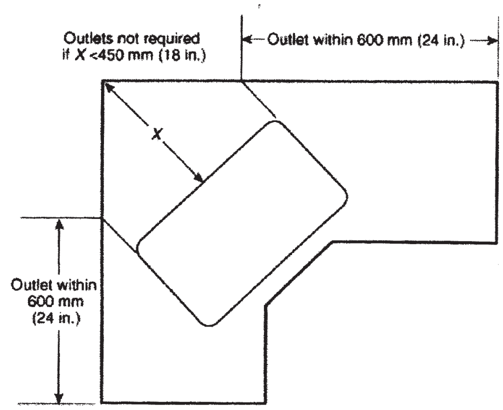
2-193 Log #1463 NEC-P02 **Final Action: Reject**
(Figure 210.52)

Submitter: Ryan Jackson, West Valley City, UT

Recommendation: Revise Figure 210.52 as shown:



Sink or range mounted in counter



Sink or range mounted in corner

Substantiation: Having this apply only when the sink or range extends beyond the front of the countertop is not substantiated. When does it apply? When the sink extends 12 in. from the face of the counter? When it extends 1/2 in. from the face of the counter? Accepting this proposal will assist in the uniform interpretation of the code.

Panel Meeting Action: Reject

Panel Statement: Figure 210.52 is applicable to sinks or ranges mounted in wall counter spaces. The submitter's concern is already addressed in 210.52(C)(1). The part of Figure 210.52 referenced applies to a sink or range extending from the counter face.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-195 Log #397 NEC-P02 **Final Action: Reject**
(210.52(A))

Submitter: Bradly Shoaf, Davidson County Community College

Recommendation: Revise text to read as follows:

General Provisions states that, in every kitchen, family room, dining room, living room, parlor, library, den and foyers and unoccupied wall space of laundry room, or similar room or areas of dwelling units, receptacles outlets shall be installed according to 210.52(A).

Substantiation: Convenience receptacles will be required for these areas of dwelling units. With the addition of these areas 210.52(A) will reduce the possibilities of a homeowner running a extension cord under a rug and through the foyer room. All receptacles should be placed in as easily accessible location.

Panel Meeting Action: Reject

Panel Statement: The submitter's concern about the receptacle outlet requirements in foyer areas is already addressed in 210.52(H). The submitter has not substantiated the requirement to add additional receptacles in the laundry space.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

KING, D.: This proposal should have been accepted in part. The submitter's recommendation to require receptacles to be installed in foyers in accordance with section 210.52(A) is warranted. I disagree with the panel statement where it states that the submitter's concerns are addressed in 210.52(H). There are many foyers that are comprised of separate wall spaces that are divided by doors and open entryways to adjacent rooms. These separate wall spaces in many cases are 2 or more feet in width. The dimensions of these foyers in any one direction may not be 10 or more feet in length, thus making the provisions of 210.52(H) not applicable. With this scenario it is possible to have separate wall spaces that are large enough in width to require a receptacle(s) to be installed under the provisions of section 210.52(A). The absence of a requirement for receptacle outlets in these locations would require the use of extension cords to supply power to lamps or other utilization equipment that may be used at these wall spaces as is indicated in the submitter's substantiation. This would greatly increase the risk of fire due to arcing faults from damaged cords placed across doorways end entryways to provide power to these wall spaces. Requiring foyers to comply with 210.52(A) is warranted and should be given further consideration by Panel 2.

2-196 Log #390 NEC-P02 **Final Action: Reject**
(210.52(A)(1))

Submitter: Antonio Rubin, DCCC student
Recommendation: Add sentence to the end of 210.52(1).

210.52 Dwelling Unit Receptacle Outlets.

(A) General Provisions. In every kitchen, family room, dining room, living room, parlor, library, den, sunroom, bedroom, recreation room, or similar room or area of dwelling units, receptacle outlets shall be installed in accordance with the general provision specified in 210.52(A)(1) through (A)(3).

(1) Spacing. Receptacles shall be installed so that no point measured horizontally along the floor line in any wall space is more than 1.8 m (6 ft) from a receptacle outlet. Layout of receptacle outlets shall be readily accessible after placement of furniture.

Substantiation: It is my belief that it would be of great convenience to have an outlet readily accessible for the odds and in. Having outlet receptacles accessible after furniture layout is necessary to keep from running an extension cord under a rug, throw rug, and/or maybe daybed etc. Any rubbing of the cord could lead to rupturing which will cause a spark, next comes fire. This causes you to use the cord to do everyday activities such as vacuum cleaner, ironing clothes, and curling irons for women, electrical shaver for men. I live in a house that was built in the 1950's which causes me to have my bed to be positioned on one side of the room and use an extension cord under my bed and behind a chest for the TV, DVD, Play Station 2, and also a lamp. On service calls electrician(s) can always find the outlet behind a bed, nightstand, china cabinet or another piece of furniture. This is why I recommend putting one opposite of the door hinge or straight down from the light switch within 24 in. of the door.

210.60(B) Receptacle Placement. In applying the provision of 210.52(A), the total number of receptacle outlets shall not be less than the minimum number of that section. "These receptacle outlets shall be permitted to be located conveniently for permanent furniture layout. At least two receptacle outlets shall be readily accessible." Where receptacles are installed behind the bed, the receptacle shall be located to prevent the bed from contacting any attachment plug that may be installed or the receptacle shall be provided with a suitable guard.

Panel Meeting Action: Reject
Panel Statement: The spacing requirements in 210.52(A)(1) provide for the placement of an adequate number of receptacles in lieu of the use of extension cords. Layout of receptacles to coordinate with furniture locations is impractical and could lessen the present requirements.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-197 Log #1977 NEC-P02 **Final Action: Reject**
(210.52(A)(1))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Add new text to read as shown:

210.52(A)(1) Spacing. Receptacles shall be installed so that no point measured horizontally along the floor line in any wall space is more than ~~1.8 m (6 ft)~~ 0.9 m (3 ft) from a receptacle outlet.

Substantiation: Electrical cord fires are one of the leading causes of residential fires in the United States. According to the 1998 Residential Fire Loss Estimates published by the United States Consumer Product Safety Commission (CPSC), during the five-year period between 1994-1998 there were 27,400 fires associated with electrical cords that required response by the fire service. These fires resulted in 350 deaths and 1,680 injuries. Extension cords were responsible for over half of these incidents. CPSC estimates that about 3,300 residential fires originate in extension cords each year, killing 50 people and injuring 270 others.

Recent CPSC statistics indicate that there are over 4,000 injuries associated with electrical extension cords that result in treatment in hospital emergency rooms annually. Half the injuries involve fractures, lacerations, contusions or sprains from people tripping over extension cords. Thirteen percent of the injuries involve children under the age of 5.

Although there has been a significant increase in the number of cord connected household electrical products used in dwellings, there has been no corresponding change in the NEC that addresses the need for the additional receptacle outlets that are necessary to accommodate the use of these products by the homeowner. Since 1956, the receptacle spacing requirements in 210.52(A)(1), and the resultant number of receptacles installed, has remained unchanged.

The lack of a sufficient number of available receptacle outlets leads the homeowner to use extension cords. The NEC has long recognized the hazards presented by the use of extension cords, especially where extension cords are used in place of permanent wiring. With the proliferation of cord connected home use electrical products such as room air conditioners, dehumidifiers, humidifiers, air purifiers, cordless phones, home entertainment systems, computer equipment, electronic games, multiple TVs, appliances, etc., it is evident that the number of receptacles required 50 years ago is no longer adequate for today's home. Reducing the spacing between receptacles as recommended in this proposal will help ensure that there are an adequate number of receptacles available for connection of the large number of cord connected appliances now being used in the typical dwelling.

Previous editions of the NEC Handbook (e.g., 1981) stated, "Receptacles are to be located so that no point in any wall space is more than 6 ft from a receptacle. This rule intends that an appliance or lamp with a flexible cord attached may be placed anywhere in the room and be within 6 ft of a receptacle, thus eliminating the need for extension cords." Since most cord connected equipment will have 6 ft cords, based on the UL standards requirements for these products, it is still true that the receptacle spacing requirements now in the NEC will allow the cord on any single product to reach a receptacle from any point along the wall without the use of extension cords. However, this requirement did not anticipate the extraordinary increase in the availability and use of cord connected electrical equipment in the home. Due to the large number of cord connected products that may be used in any room of a home, all available receptacles within reach of a cord can easily be in use. This results in the homeowner using extension cords to reach other unused, available receptacles. The increased use of cord connected equipment results in the same condition that the 6 ft spacing rule was intended to prevent. Reducing the required spacing will have the effect of making more receptacles available for the increased number of cord connected products now used in homes.

Panel Meeting Action: Reject
Panel Statement: The spacing requirements of 210.52(A)(1), as noted by the submitter, allow for appliances or lamps with standard lengths of flexible cord to be within 6' of a receptacle outlet. Decreasing the spacing requirements for receptacle outlets is not practical when addressing the unknown application of cord connected equipment and should be a design consideration. The panel is looking for specific documentation from the field that the current spacing requirement is inadequate.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:

KING, D.: The submitter of this proposal has provided adequate substantiation to support this change. There is a significant increase in the number of electrical appliances used in dwelling units today resulting in an increased use in extension cords to accommodate the homeowner's needs. There are also many listed appliances available today that have cord lengths that are less than 6 feet. The purpose of this section is to eliminate the use of extension cords in dwelling units, thus reducing the risk of fires. Further consideration should be given to this proposal.

PAULEY, J.: NEMA recognizes that the panel was not in support of reducing the receptacle spacing to 3 ft coverage of wall space. However, the discussions of the panel did reveal that since the inception of the 6 ft rule, the product standards have changed to allow a minimum cord length of 5 ft of many appliances (e.g. table lamps). Given this reduction, it is prudent for the panel to consider reducing wall space coverage for a single receptacle from six feet down to four or five feet. This issue should be revisited in the comment stage so that the code requirements are consistent with the requirements on cord length.

2-198 Log #1976 NEC-P02 **Final Action: Reject**
(210.52(A)(4) (New))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Add new text to read as shown:

(4) Large Area Rooms. A floor receptacle outlet shall be installed at least 450 mm (18 in.) from the wall in rooms other than basements, kitchens, bathrooms, hallways, and swimming pool rooms that are 60 m^2 (625 ft^2) in area or greater. A floor receptacle outlet shall be installed for each 60 m^2 (625 ft^2) in area in a room.

Substantiation: The purpose of this new section is to eliminate the use of extension cords in large family rooms, great rooms, bedrooms and living rooms. Damaged extension cords are a cause for shock and fire. Furniture and lights are placed in the middle of these rooms away from any wall receptacles. Requiring provision for receptacles to be installed in listed floor boxes will eliminate the need for extension cords. The proposed language is written so that there is flexibility in where to locate the floor receptacle(s).

Electrical cord fires are one of the leading causes of residential fires in the United States. According to the 1998 Residential Fire Loss Estimates published by the United States Consumer Product Safety Commission (CPSC), during the five-year period between 1994-1998 there were 27,400 fires associated with electrical cords that required response by the fire service. These fires resulted in 350 deaths and 1,680 injuries. Extension cords were responsible for over half of these incidents. CPSC estimates that about 3,300 residential fires originate in extension cords each year, killing 50 people and injuring 270 others.

Recent CPSC statistics indicate that there are over 4,000 injuries associated with electrical extension cords that result in treatment in hospital emergency rooms annually. Half the injuries involve fractures, lacerations, contusions or sprains from people tripping over extension cords. Thirteen percent of the injuries involve children under the age of 5.

Although there has been a significant increase in the number of cord connected household electrical products used in dwellings, there has been no corresponding change in the NEC that addresses the need for the additional receptacle outlets that are necessary to accommodate the use of these products by the homeowner. Since 1956, the receptacle spacing requirements in 210.52(A)(1), and the resultant number of receptacles installed, has remained unchanged.

The lack of a sufficient number of available receptacle outlets leads the homeowner to use extension cords. The NEC has long recognized the hazards presented by the use of extension cords, especially where extension cords are used in place of permanent wiring. With the proliferation of cord connected home use electrical products such as room air conditioners, dehumidifiers, humidifiers, air purifiers, cordless phones, home entertainment systems, computer equipment, electronic games, multiple TVs, appliances, etc., it is evident that the number of receptacles required 50 years ago is no longer adequate for today's home. The addition of floor receptacles as recommended in this proposal will help ensure that there are an adequate number of receptacles available for connection of the large number of cord connected appliances now being used in the typical dwelling.

Previous editions of the NEC Handbook (e.g., 1981) stated, "Receptacles are to be located so that no point in any wall space is more than 6 ft from a receptacle. This rule intends that an appliance or lamp with a flexible cord attached may be placed anywhere in the room and be within 6 ft of a receptacle, thus eliminating the need for extension cords." Since most cord connected equipment will have 6 ft cords, based on the UL standards requirements for these products, it is still true that the receptacle spacing requirements now in the NEC will allow the cord on any single product to reach a receptacle from any point along the wall without the use of extension cords. However, this requirement did not anticipate the use of cord connected electrical equipment used in large rooms where the furniture is placed in the middle. The addition of floor receptacles will allow lamps and other electrical appliances to be used in the center of large rooms without the use of extension cords.

The use of additional listed floor boxes would require an increase in labor and cost, but these costs would be offset by the increased degree of safety and the reduction in the probability of a fire.

Panel Meeting Action: Reject

Panel Statement: The addition of a floor receptacle at least 450mm (18") from a wall for each 625 sq. ft. of room area in large area rooms would not be practical considering that they would be in close proximity to already required wall receptacle outlets and would promote the use of extension cords in these areas.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

KING, D.: I concur with Mr. Weber's explanation of negative vote for this proposal. The absence of a requirement for receptacle outlets in large area rooms would promote the use of extension cords which would greatly increase the hazard of fire or electrical shock. The submitter of this proposal has provided the panel with adequate substantiation on the hazards associated with the use of cords in dwelling units. Panel 2 should give further consideration to this proposal.

WEBER, R.: I believe that the panel should have accepted this proposal in Principle and addressed the need for electrical receptacles in large open room areas. Since a floor receptacle installed within 450 mm (18 in.) of a wall per 210.52(A)(3) is considered as acceptable as a required wall outlet, the submitter in his proposal should have identified a greater dimension from the walls for his indicated location for a receptacle. The fact remains that when large rooms are encountered there is presently no additional receptacle requirement other than those along the wall space. The concept of requiring a floor receptacle for each 625 sq. ft. of room area or a second receptacle for that space beyond that size is valid. If they are not made available the use of extension cords will be provided to meet the occupants need. Many of these large rooms will have furniture locations away from the walls and will have lamps, electrical appliances or other electrical needs that are presently being met by the use of cord. Cords run under carpet or placed under rugs become damaged without the occupants knowledge, thus creating a potential fire or shock hazard. With the requirement for other than wall receptacles in large rooms, a mandatory floor receptacle would help alleviate some of the potential problems.

2-199 Log #1708 NEC-P02 **Final Action: Reject**
(210.52(B)(1) Exception No. 2)

Submitter: Danny Thomas, Henderson, NC

Recommendation: Add text to read as follows:

Exception No. 2: Receptacle outlet(s) installed to serve refrigeration equipment or any equipment that is installed within kitchen cabinets shall be permitted to be supplied from an individual branch circuit rated 15 amps or greater.

Substantiation: This would allow microwaves, disposal motors, trash compactors, and perhaps even some dishwashers to be supplied from a 15 amp circuit rather than having to install a 20 amp circuit for them which increases the cost of a new home, just because it is located in the rooms specified in 210.52(B)(1).

Panel Meeting Action: Reject

Panel Statement: The current requirement for kitchens is that receptacles that serve refrigeration equipment and serve the countertop must be on the 20 ampere small appliance branch circuits. The small appliance branch circuits are not permitted to supply dishwashers, trash compactors or disposals because these outlets do not serve the countertop.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

BROWN, L.: It should be noted that Section 210.52(B)(1) Exception #3 already allows the receptacle outlet for refrigeration equipment to be on an individual branch circuit of 15 amperes or greater. I see no reason to limit individual circuits for these types of permanently installed appliances, such as the disposer and dishwasher, that would not require a circuit rated greater than 15 amperes. I believe the Panel Statement is somewhat misleading in its assertion that Section 210.52(B)(1) and the proposed text relate only to the countertop receptacles that are covered in Section 210.52(B)(3) and 210.52(C). In other words, I do not believe the Panel Statement is a good response to the Submitter's Substantiation. If the Panel believes these appliances are already allowed to be on a circuit(s) that do not supply the receptacles as outlined in Section 210.52(B)(1) it should be acknowledged.

2-200 Log #1404 NEC-P02 **Final Action: Reject**
(210.52(B)(1))

Submitter: George Stolz, II, Pierce, CO

Recommendation: Revise text to read:

210.52(B)(1) Receptacle Outlets Served. In the kitchen, pantry, breakfast room, dining room, or similar area of a dwelling unit, the two or more branch circuits required by 210.11(C)(1) shall serve all wall, ~~and~~ floor, ~~receptacle outlets covered by 210.52(A), all~~ and countertop outlets, ~~covered by 210.52(C),~~ and receptacle outlets for refrigeration equipment.

Exception No. 1: In addition to the required receptacles specified by 210.52, switched receptacles supplied from ~~a general purpose branch circuit as defined in 210.70(A)(1), Exception No. 1,~~ another circuit for lighting purposes shall be permitted.

Substantiation: The numerous references to other sections do not contribute to the effectiveness of this section, so omitting them will add clarity while not changing the substance of this section.

210.70(A)(1), Exception No. 1 states that "in other than kitchens and bathrooms one or more receptacles controlled by a wall switch shall be permitted in lieu of lighting outlets." There is no evident reason why small appliance branch circuits cannot perform this function, as most cord-and-plug connected lamps do not constitute a large enough load to compromise the primary function of these circuits. As a minimum standard, permitting the small appliance circuit to perform this function would be preferable to installing a 15-ampere receptacle beside a 20-ampere receptacle, inviting a small appliance load to be connected to the 15-ampere circuit.

In addition, the last statement in 210.52(B)(1), Exception No. 1, is not literally correct, as no general purpose branch circuit is defined in 210.70(A)(1), Exception No. 1.

Panel Meeting Action: Reject

Panel Statement: The panel does not agree that deletion of the references will add more clarity. Exception No. 1 allowing for the switched receptacles is permitted but not required.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-201 Log #2222 NEC-P02 **Final Action: Reject**
(210.52(B)(1))

Submitter: Donald A. Ganiere, Ottawa, IL
Recommendation: Revise as follows:
(B) Small Appliances.
(1) Receptacle outlets served in the kitchen, pantry, breakfast room, dining room, or similar area of a dwelling unit, the two or more 20-ampere small-appliance branch circuits required by 210.11(C)(1) shall serve all wall and floor receptacle outlets ~~covered by 210.52(A)~~ , all countertop outlets ~~covered by 210.52(C)~~ , and receptacle outlets for refrigeration equipment.
Substantiation: Under the 2005 code wording, if receptacles in addition to those that are required by 210.52(A) or (C), these additional receptacles are not required to be supplied by the two or more 20 ampere small appliance branch circuits. This proposed change will require all installed receptacles in these areas to be supplied by the small appliance branch circuits.
Panel Meeting Action: Reject
Panel Statement: The panel added the references to make it clear as to what receptacles had to be on the small appliance branch circuit. The use of the term "covered" in the text was very specifically chosen instead of "required" to avoid the exact issue raised by the submitter.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-202 Log #1300 NEC-P02 **Final Action: Reject**
(210.52(B)(2))

Submitter: Joseph Whitt, JW Electric
Recommendation: Revise text to read:
No Other Outlets. The two or more small-appliance branch circuits specified in 210.52(B)(1) shall ~~have no other outlets~~ <u>supply only the required receptacle outlets specified in 210.52(B)(1) and supply no other receptacle outlet, appliance outlet or luminaries (lighting fixtures) outlined in 410.1</u> .
Substantiation: As worded, a duplex receptacle above a countertop for the small appliances could be used to supply a permanently installed cord and plug connected under cabinet area luminary leaving one receptacle to fulfill the small appliance receptacle requirement.
Refer to the definition of lighting outlet, "Lighting Outlet. An outlet intended for the (direct connection) of a lamp holder...".
The words "direct connection" in the definition of alighting outlet lends to the belief that a cord and plug connected luminary would not constitute a lighting outlet, therefore, an under cabinet luminary plugged into the small appliance receptacle would not violate 210.52(B).
This will lead to the use of outlet multipliers, plug strips and extension cords that could have sixteen gauge conductors.
As an instructor of inspector classes in the state of North Carolina, I see those inspectors coming through my classes are split about fifty/fifty on this issue. This issue needs clarity.
Panel Meeting Action: Reject
Panel Statement: The definition of "outlet" in Article 100 is a point on the wiring system where current is taken to supply utilization equipment and includes all of the equipment types noted in the recommendation. A luminaire that can be plugged into a countertop outlet is not prohibited on the small appliance branch circuit.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-203 Log #1391 NEC-P02 **Final Action: Reject**
(210.52(B)(2) Exception No. 3 (New))

Submitter: George Stolz, II, Pierce, CO
Recommendation: Add an Exception to (B)(2) to read:
Exception No. 3: Receptacles installed on an island or peninsula to serve other areas in compliance with the requirements of 210.52(A)(1) and (2) shall be permitted on the same small appliance branch circuit(s) installed to comply with 210.52(C)(2) or (3).
Substantiation: Islands and peninsulas that are adjacent to living areas not covered under the provisions of 210.52(B) sometimes require an installation of a 15 or 20 amp receptacle to conform with 210.52(A)(2)(3). There is the risk of a "living room" outlet that is not required to be GFCI protected being installed in a location where GFI protection is required on the 20 amp circuit installed per 210.52(C)(2) or (3).
In addition, given that the use of said receptacles is remote, it should be acceptable to allow a receptacle that is on an island to serve an adjacent "living room." It doesn't seem to constitute a high potential for load, and is generally installed for code's sake, not because a true need is perceived by the installer or AHJ.
Panel Meeting Action: Reject
Panel Statement: The receptacles in the adjacent room should not be permitted on the small appliance branch circuit. Some of the arrangements encountered would fit well into the submitter's concept, but others may indeed place a burden on the small appliance branch circuit. Given the wide and varying types of construction, it is prudent to keep the receptacles delineated between the two rooms.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-204 Log #594 NEC-P02 **Final Action: Reject**
(210.52(C))

Submitter: Michael P. O'Quinn, MOGO Enterprises, Inc.
Recommendation: Revise text to read as follows:
(C) Countertops. In kitchens and dining rooms of dwelling units, receptacle outlets for counter spaces shall be installed in accordance with 210.52(C)(1) through (C)(5).
(1) Wall Counter Spaces. A receptacle outlet shall be installed at each wall counter space that is 300 mm (12 in.) or wider. Receptacle outlets shall be installed so that no point along the wall line is more than 600 mm (24 in.) measured horizontally from a receptacle outlet in that space.
<u>Where a rangetop or sink is installed in the countertop, the rangetop or sink is considered to divide the countertop into separate countertop spaces as defined in 210.52(C)(4).</u>
~~Exception: Receptacle outlets shall not be required on a wall directly behind a range or sink in the installation described in Figure 210.52.~~
~~Figure 210.52 Determination of Area Behind Sink or Range.~~
(2) Island Counter Spaces. At least one receptacle shall be installed at each island counter space with a long dimension of 600 mm (24 in.) or greater and a short dimension of 300 mm (12 in.) or greater. Where a rangetop or sink is installed in an island ~~counter and the width of the counter behind the rangetop or sink is less than 300 mm (12 in.)~~ , the rangetop or sink is considered to divide the island into two separate countertop spaces as defined in 210.52(C)(4).
(3) Peninsular Counter Spaces. At least one receptacle outlet shall be installed at each peninsular counter space with a long dimension of 600 mm (24 in.) or greater and a short dimension of 300 mm (12 in.) or greater. A peninsular countertop is measured from the connecting edge.
(4) Separate Spaces. Countertop spaces separated by rangetops, refrigerators, or sinks shall be considered as separate countertop spaces in applying the requirements of 210.52(C)(1), (C)(2), and (C)(3).
(5) Receptacle Outlet Location. Receptacle outlets shall be located above, but not more than 500 mm (20 in.) above, the countertop. Receptacle outlets rendered not readily accessible by appliances fastened in place, appliance garages, sinks, ~~or~~ rangetops ~~as covered in 210.52(C)(1), Exception~~ , or appliances occupying dedicated space shall not be considered as these required outlets.
Exception to (5): To comply with the conditions specified in (1) or (2), receptacle outlets shall be permitted to be mounted not more than 300 mm (12 in.) below the countertop. Receptacles mounted below a countertop in accordance with this exception shall not be located where the countertop extends more than 150 mm (6 in.) beyond its support base.
(1) Construction for the physically impaired
(2) On island and peninsular countertops where the countertop is flat across its entire surface (no backsplashes, dividers, etc.) and there are no means to mount a receptacle within 500 mm (20 in.) above the countertop, such as an overhead cabinet.
Substantiation: While the change in 210.52(C) in the NEC2005 appears to cover some new kitchen designs, the requirement of receptacles on the wall behind a sink or rangetop with a distance at or greater than 12" or 18" would allow cords installed in these receptacles to run across the sink or rangetop, causing a possible dangerous situation.
By eliminating references to 210.52(C) Exception, the mandating of the receptacle behind the sink or rangetop is eliminated. 210.52(C)(5) would allow the installation of receptacles behind sinks and countertops, but would require proof to the AHJ that any installed appliance cord would not cause a shock or fire hazard.
Panel Meeting Action: Reject
Panel Statement: The panel disagrees with the submitter and notes that the current rule requires that the space be included in the measurements, since if it exceeds the dimensions shown, it becomes usable space. The panel notes that the text doesn't "mandate" that a receptacle be installed in that space, but it does require that the space be used as part of the wall measurement.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-205 Log #835 NEC-P02 **Final Action: Reject**
(210.52(C))

Submitter: Eugene Swisher, City of Tampa / Rep. IBEW Local 915, IAEI Southcoast Division
Recommendation: Revise text to read as follows:
Countertops. In kitchens ~~and~~ , dining rooms <u>, breakfast rooms, pantry or similar areas,</u> of dwelling units, receptacle outlets for counter spaces shall be installed in accordance with 210.52(C)(1) through (5).
Substantiation: 210.52(B)(1) requires the 20 amp small appliance branch circuits to serve in the receptacles in these areas. The new text would recognize the fact that counter spaces in pantry and breakfast rooms also need properly spaced receptacles to eliminate the use of extension cords in these areas, just as in the kitchen and dining room.
Panel Meeting Action: Reject

Panel Statement: The panel does not agree that it is necessary to separately identify the additional proposed areas in the code. The panel notes that if a receptacle is installed for these counter tops they must be supplied from the small appliance branch circuits.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
KING, D.: This proposal should have been accepted. Countertop spaces installed in areas described in the submitter's substantiation are intended for the use of small appliances and should meet the requirements of 210.52(C)(1) through (5). The panel statement indicates that if receptacles were to be installed that they would be required to be supplied from the small appliance branch circuits. The additional language recommended by the submitter would ensure that the proper number of receptacles is installed to serve these countertop spaces.
WEBER, R.: The submitter has identified a problem area and it could be clarified by the acceptance of the proposed language or accepted in part. As is indicated in the Panel statement for the reject action proposed to be taken on the proposal is that presently it is implied that if a receptacle is installed for these countertop spaces, they must be supplied from the small appliance branch circuits. But is that understood by all of the code users? Does the proposed added language clear the issue up? Breakfast room countertops should be treated similarly to those in the kitchen area. Many times appliances are in service or are temporarily placed on breakfast room countertops that are not provided with receptacles and then cores are being utilized to provide an outlet for the needed use.

2-206 Log #2331 NEC-P02 **Final Action: Reject**
(210.52(C))

Submitter: Haddi Horri, U.S. Army Corps. of Engineers
Recommendation: My proposal and recommendation is to revise the wording in this statement to read as:
Outlet shall not be installed if X< 300 mm (12 in.) behind the countertop sink.
Substantiation: My name is Hadi Horri, an Electrical Engineer working for the US Army Corps of Engineers in Jacksonville District.
Recently, during one of my inspections at the project site, I observed a receptacle installed behind a sink faucet in the kitchen countertop.
I thought that it would be a Code violation but when I look into the Code 210.52(C), it states that "Outlet is not required if X< 300 mm (12 in.)". The wording in this statement is not enforceable and I couldn't direct the contractor to remove the receptacle based on the Code requirements to a new location.
At this time we decided to install a plan cover plate. To have a receptacle behind the countertops sink is not practical and it is dangerous because of water splashing on it.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The panel does not intend that a receptacle outlet be prohibited from being located in space behind a sink. The installation of a receptacle in this space is a convenience issue when Figure 210.52 is applicable. Figure 210.52 is intended to identify when the space behind a sink or range is not required to be included in determining the receptacle spacing.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
BROWN, L.: Locating a receptacle behind a sink or countertop cooking unit may be a design consideration for the convenience of the end user. It may be possible the receptacle is for some type of kitchen equipment to be used in the sink (glass scrubber) or on the stove. If a window is located behind the sink or stove the receptacle could be used for decorative lighting. There is no more the possibility of water splashing on this receptacle that a receptacle located directly adjacent to the sink. Section 210.5(C)(1) requires a receptacle within the first 24 inches from a sink. There is no provision that the receptacle be located exactly 24 inches from the sink. In addition, these receptacles are required to have ground-fault protection.

2-206a Log #CP201 NEC-P02 **Final Action: Accept**
(Figure 210.52)

Submitter: Code-Making Panel 2,
Recommendation: Revise Figure 210.52 as follows:
In both diagrams, change the words "Outlet(s) not required" to "Space exempt from wall line measurement"
In both diagrams, change the caption on both diagrams from "Sink or Range" to "Sink, Range, or Counter-Mounted Cooking Unit".
Substantiation: The panel has revised the diagram to make it clear that the space in question is exempt from the wall line measurements if the dimension between the sink and wall are as shown in the drawings. The figure caption has been revised to "Determination of Area Behind a Sink, Range, or Counter-Mounted Cooking unit" to be consistent with the terms defined in Article 100.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-207 Log #3382 NEC-P02 **Final Action: Accept in Principle**
(210.52(C))

TCC Action: The Technical Correlating Committee directs that the Panel Action on this Proposal be correlated with Figure 210.52 by changing the title of the Figure to "Figure 210.52(C)(1)" to comply with 2.3.1 of the NEC Style Manual, and change the Table titles from "Sink or range…" to "Range, counter-mounted cooking unit or sink…" to correlate with Panel Actions on this Proposal and Proposals 2-211 and 2-218.
The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal as to the placement of the proposed text within 210.52(C).
This action will be considered by the Panel as a Public Comment.
Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Delete the last sentence of 210.52(C)(2); add the following sentences to the parent language in 210.52(C);
Where a rangetop or sink is installed in an island or peninsular countertop and the width of the counter behind the rangetop or sink is less than 300 mm (12 in.), the rangetop or sink is considered to divide the countertop space into two separate countertop spaces as defined in 210.52(C)(4). Each separate countertop space shall comply with the applicable requirements in 210.52(C).
Substantiation: This proposal corrects an oversight. If a sink divides an island countertop, the result is two islands. If the same sink divides a peninsular countertop identical in size to the island, the result is still a peninsula with the resulting "island" not covered by any receptacle placement rule unless it is large enough to invoke 210.52(A), and even here there is no requirement to require a receptacle to serve the countertop. The wording in the proposal moves the requirement so it covers both peninsulas and islands on an even basis.
Panel Meeting Action: Accept in Principle
In the three occurrences in the recommendation, change "rangetop or" to "range, counter-mounted cooking unit or".
Panel Statement: The panel accepts the submitter's recommendation, but has replaced "rangetop" with "range, counter-mounted cooking unit " to be consistent with the terms defined in Article 100.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-208 Log #2824 NEC-P02 **Final Action: Reject**
(210.52(C)(1))

Submitter: Gary Boughton, Town of Bethel Building Deparment
Recommendation: 210.52(C)(1) Wall Counter Spaces. Second sentence insert after the word no to read:
Receptacle outlets shall be installed so that no horizontal counter space length is located more than 24 in. from a receptacle .
Substantiation: As now written you are penalized for having a wall or cabinet at the end of a counter top space. A 24 in. by 24 in. with a wall or cabinet at two adjacent sides will require 2 receptacles where a wall or cabinet is on only one wall only one would be required. Why is this extra receptacle outlet required, where is the extra hazard. These receptacles are to serve the counter not the wall space.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The submitters language would eliminate the measuring of the space for receptacles around the corner of a countertop as is required in a standard kitchen layout.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-209 Log #3225 NEC-P02 **Final Action: Reject**
(210.52(C)(1))

Submitter: Erik Goulish, Burton, MI
Recommendation: Delete the following text:
~~Exception: Receptacle outlet shall not be required on a wall directly behind a range or sink in the installation description in Figure 210.52~~
Substantiation: The distance behind sinks and ranges are too great of a distance to safely use the outlet with out risk of personal injury. To reach over a hot stove or a sink that should be grounded and contain water is a personal hazard.
Panel Meeting Action: Reject
Panel Statement: Under certain conditions this is usable counter space. See panel statement on Proposal 2-206 for how the space is utilized.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
BROWN, L.: Please see NAHB's Ballot Comment on Proposal 2-206.

2-210 Log #2635 NEC-P02 **Final Action: Reject**
(210.52(C)(1) and 210.52(C)(4))

Submitter: David Hansen, Simi Valley, CA
Recommendation: Add an Exception to read:
Exception:
(c) Receptacle outlets adjacent to kitchen sinks shall not be installed closer than (600 mm) 24 in., and no further than (900 mm) 36 in. measured horizontally along a wall counter space. Additional receptacle outlets shall be installed in accordance with 210.52(C)(1) and 210.52(C)(4).
Substantiation: 1) With small appliance attachment plugs and flexible cords measuring approximately 24 in. in length, the installation of a receptacle outlet closer than 24 in. to a sink allows for the possibility of accidental submersion of the appliance. Physical damage to the attachment plug and flexible cord, as well as the receptacle outlet could also occur if the appliance were to fall from the counter top into the sink. By allowing proposed "210.52(C), Exception (c)", the installation of the receptacle outlets no closer than (600 mm) 24 in. and no further than (900 mm) 36 in. from the sink, the possibility of submersion would be greatly reduced and would still allow the close proximity to the sink.
2) With the more advanced architectural design of today, windows adjacent to kitchen sinks are becoming larger, without vertical surfaces adjacent to, and behind sinks to place receptacle outlets, and the increased structural support required to accommodate the larger openings makes compliance in accordance with 210.52(C)(1) and 210.52(C)(4) more difficult. By allowing proposed "210.52(C), Exception (c)", the required receptacle outlets adjacent to the sink may be placed no closer than (600 mm) 24 in. and no further than (900 mm) 36 in. measured horizontally along the wall counter space. This will allow the receptacle outlets to be placed and/or located more easily, conveniently, and safely in accordance with 210.52(C)(1) and 210.52(C)(4).
In summary, by allowing proposed "210.52(C), Exception (c)" to be adopted, the risk of harm to person and property would be reduced, and it would give greater latitude in design, both architecturally and structurally.
Panel Meeting Action: Reject
Panel Statement: The submitter has not substantiated the claims that receptacles located closer than 24" to a sink are being misused and pose a hazard. The panel notes that the submitters wording also creates a conflict with the basic rule, by allowing the receptacle to be up to 36" away, when the basic rules require a receptacle be within 24" of the counter space.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
BROWN, L.: Please see NAHB's Ballot Comment on Proposal 2-206.

2-211 Log #2151 NEC-P02 **Final Action: Accept in Principle**
(210.52(C)(1) Exception)

Submitter: Lawrence Seekon, Coon Rapids, MN
Recommendation: Revise text to read:
210.52(C)(1) Exception: Receptacle outlets shall not be required on a wall directly behind a range, cooktop or sink in the installation described in Figure 210.52.
Substantiation: The exception should also apply to a cooktop. My dictionary defines a range as having burners on the top surface and one or two ovens. Therefore the current wording would not apply to a cooktop.
Panel Meeting Action: Accept in Principle
Revise the recommended text to read:
Exception: Receptacle outlets shall not be required on a wall directly behind a range, counter-mounted cooking unit, or sink in the installation described in Figure 210.52.
Panel Statement: The panel revised the recommended text to be consistent with Article 100.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
BECKER, R.: I agree with the comments expressed in Mr. Nenninger's explanation of negative vote.

2-212 Log #3046 NEC-P02 **Final Action: Reject**
(210.52(C)(1) Exception)

Submitter: Randy Anderson, Nebraska State Electrical Division
Recommendation: Revise text to read as follows:
Exception: Receptacle outlets shall not be required on a wall directly behind a range or sink, however, they shall be allowed where the distance is greater than that listed in the installation described in Figure 210.52
Substantiation: The current code as it is written, requires a receptacle behind a range or sink if the distance is greater than that listed in Figure 210.52. This requirement creates a great safety hazard, as cords could come in contact with hot surfaces. I feel it should be allowed, to serve equipment in the area, but not required.
Panel Meeting Action: Reject
Panel Statement: The panel does not agree with the submitter's substantiation and notes that this space is usable counter space where it is equal to or greater than the "X" dimension shown in Figure 210.52.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-213 Log #1701 NEC-P02 **Final Action: Reject**
(210.52(C)(1) Exception and Figure 210.52)

Submitter: Charles M. Trout, Maron Electric Company
Recommendation: Delete Figure 210.52 in its entirety and revise the exception to read:
Exception: Receptacle outlets serving countertops shall not be installed directly behind a sink or counter mounted cooking top.
Substantiation: In the drawing shown in Figure 210.52 the shape of the countertops has been enhanced or enlarged. I have never seen standard countertops shaped in this manner. Most kitchen sinks (33 in. x 22 in.) are placed in 24 in. countertops with barely 1 in. behind the sink but with a back splash or wall where a receptacle could be placed since it is not prohibited. What is being called a range would be more accurately described as a cooking unit (see Article 100) and again would probably be installed in a standard 24 in. countertop. If installed in a corner, there would be less than 12 in. behind the cooking unit but with a back splash or wall where a receptacle outlet could be placed since it is not prohibited.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 2-206.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-214 Log #1640 NEC-P02 **Final Action: Reject**
(210.52(C)(1) Exception & Figure 210.52)

Submitter: L. Keith Lofland, International Association of Electrical Inspectors
Recommendation: Revise text to read as follows:
210.52(C) Countertops In kitchens and dining rooms of dwelling units, receptacle outlets for counter spaces shall be installed in accordance with 210.52(C)(1) through (C)(5).
(1) Wall Counter Spaces. A receptacle outlet shall be installed at each wall counter space that is 300 mm (12 in.) or wider. Receptacle outlets shall be installed so that no point along the wall line is more than 600 mm (24 in.) measured horizontally from a receptacle outlet in that space.
Exception: Receptacle outlets shall not be ~~required~~ permitted on a wall directly behind a range or sink ~~in~~ unless the installation meets the requirements described in Figure 210.52.
Change wording in Figure 210.52 to read: Outlets ~~not~~ required if X ~~<~~ ≥ 300mm (12 in.) and Outlets ~~not~~ required if X ~~<~~ ≥ 450mm (18 in.)
Substantiation: The diagram in Figure 210.52 pertaining to a straight countertop seems to represent a very small percentage of the dwelling unit kitchen countertops encountered by installers and inspectors. On the vast majority of countertops, there is typically only an inch or two behind the rangetop or sink. Permitting a receptacle outlet to be located directly behind the typical range or sink would subject any flexible cord from a small appliance to physical damage. Currently, inspectors are prohibiting a receptacle outlet behind a rangetop or sink by referencing 400.8(7) for uses not permitted for flexible cords and cables. This proposal would put language directly in 210.52 to prohibit such receptacle outlets from being installed directly behind ranges or sinks with very limited countertop space behind the range or sink.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 2-206.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-215 Log #2728 NEC-P02 **Final Action: Reject**
(210.52(C)(1) Exception No. 2 (New))

Submitter: David Zinck, Newburyport Wiring Inspector
Recommendation: Change existing Exception to Exception No. 1: and add Exception No. 2.
Exception No. 2: Counter space where the access to the wall is prevented by cabinets or accessories shall not be counted as counter spaces.
Substantiation: It is becoming increasingly popular to have accessories such as fixed wine racks, drawer units, or custom cabinets fill in the nominal 18 in. between the counter top and the upper cabinets. These typically have a depth of about 12 in. so there is still a 13 in. deep counter top in front of them. There is no way to provide an outlet for these spaces. I have seen the width of these units 4 ft or greater although 2 ft -3 ft units are more common. This rule will make it unnecessary for an electrician to be looking to the wiring inspector for an exception.

Panel Meeting Action: Reject
Panel Statement: The panel disagrees with simply exempting the space because of an accessory being installed. Either the accessory can be moved, or the receptacles may have to be spaced in a manner to avoid the accessory, but still comply with the 24" requirement.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-194 Log #1748 NEC-P02 **Final Action: Reject**
(210.52(C)(2))

Submitter: Ronald Martin, Martha Martin, Citizens Input
Recommendation: Revise as follows:
In private residences the homeowner may elect not to install receptacles in the center island if the following conditions are met.
● A minimum of 12 linier feet of countertop that is not part of the center island (need not be continuous).
● The above countertop shall be within 4 ft of the island.
● Homeowner makes provisions for future installation of receptacles in center island by installing a junction box within the island cabinet for that purpose.
Substantiation: Receptacles installed on center islands pose a safety hazard whereas appliances have been knocked down due to the cord being snagged by people passing close by in crowded conditions. In addition, a toddler just learning to walk could grab hold of the cord, lose their balance, and pull the appliance down on top of them. This in fact did happen in our old home.
Receptacles installed on center islands where the sink divides the center island and there is 12 in. or more counter top between the sink and the edge of counter top also poses a safety hazard as small slow cookers fit nicely in that space and could be knocked into the sink or on the floor.
If adequate adjacent counter space and receptacles are provided, there is no reason to place receptacles in the island.
Furthermore, fine cabinetry with drawers and raised panel doors make installation and aesthetics less than satisfactory.
<u>Summary</u>
I believe the function of the NEC should be to protect people from hazards that they may not be aware of. Having receptacles in a center island may produce more hazards than they eliminate. There needs to be room for choices. Our personal freedoms are continuously being eroded. Government regulations are making attempts to idiot proof our lives. Citizens need to be responsible for their own actions concerning safety in their homes. I believe that common sense should prevail over bureaucracy mandates.
We spent a lot of money designing our kitchen and made provisions for plenty of receptacles and do not want them in our center island. Please consider this change for future requests so that others don't have to go through what we are going through. Thank you for considering these changes.
Panel Meeting Action: Reject
Panel Statement: The panel has debated the issue of where to mount receptacles on islands over numerous code cycles. The current wording of the NEC provides a reasonable set of rules to address practical mounting based on the construction of the countertop and cabinets.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-216 Log #413 NEC-P02 **Final Action: Accept in Principle in Part**
(210.52(C)(2))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 2-207.
This action will be considered by the Panel as a Public Comment.
Submitter: Alan Chech, Trenton, NJ
Recommendation: 2nd sentence. Change "width" to DEPTH.
Revised:
Where a rangetop or sink is installed in an island counter and the DEPTH of the counter behind the rangetop or sink is...
Also: This article denotes "rangetop" where as 210.52 (C)(1) Exception denotes "range" - stay consistent.
Substantiation: These changes will clarify new sections.
Maybe...rangetop / sink meeting dimensions of fiqure 210.52 should just divide counter into 2 separate counter spaces...end of problem.
Panel Meeting Action: Accept in Principle in Part
The panel accepts changing the term "rangetop". The panel does not accept changing "width" to "depth".
Panel Statement: The term "depth" is no more or less accurate than "width" and is dependent upon where one is in relationship to the island. The current text is well understood.
For the revision on "rangetop", see the panel action on Proposal 2-207.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-217 Log #2164 NEC-P02 **Final Action: Reject**
(210.52(C)(2).)

Submitter: James Shaw, Jim Shaw Electric Co.
Recommendation: I believe the section should be rewritten as follows:
210.52(C)(2)(a) Island Counter Spaces With A Backsplash. (All other wording in this paragraph remains the same).
210.52(C)(2)(b) Island Counter Spaces Without A Backsplash. Receptacle outlets are allowed but not required in islands that do not have a back plash. If receptacle outlets are installed, they shall comply with 210.52(C)(5).
Substantiation: I can see no safety reason why an outlet is required in ALL islands. In fact, I can see several safety issues as to why outlets should NOT be installed in islands. To be more specific, I am talking about islands which do not have a backsplash. Looking at it from a safety stand point, the cord hanging down over the edge of the counter is a magnet for being caught by just about anyone or anything. Once the cord has become caught, the appliance could now be hanging from its cord, and creating an unsafe condition. (Yes, it is most likely connected to GFCI circuit. Not everyone checks these outlets for proper operation, and they are known to fail and not trip.) From a logical standpoint, who is going to place an appliance on an island with no backsplash? Would you want to look at the back side of your microwave or toaster oven? I think not.
I have several customers that have told me that they do not want an outlet in their island for the very same reason that I stated above and for other reasons. I have had several inspectors that have agreed and not forced me to install an outlet there.
Panel Meeting Action: Reject
Panel Statement: The text is clear as written and conveys the panel intent. The panel does not agree that the receptacle should be eliminated from the island simply because there is no backsplash.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-218 Log #153 NEC-P02 **Final Action: Accept in Principle**
(210.52(C)(3))

TCC Action: The Technical Correlating Committee understands that the Panel Action changed the term in three places and correlates with the Panel Action on Proposal 2-207.
Submitter: Don A. Hursey, Durham County Inspections Department
Recommendation: Revise as follows:
Peninsular Counter Spaces. At least one receptacle outlet shall be installed at each peninsular counter space with a long dimension of 600 mm (24 in.) or greater and a short dimension of 300 mm (12 in.) or greater. A peninsular countertop is measured from the connecting edge. <u>Where a rangetop or sink is installed in a peninsular counter and the width of the counter behind the rangetop or sink is less than 300 mm (12 in.) the rangetop or sink is considered to divide the peninsular into two separate countertop spaces as defined in 210.52(C)(4).</u>
Substantiation: Many peninsulas have range tops and sinks installed as island countertops as well. Requirements for peninsulas should be the same as for islands.
Panel Meeting Action: Accept in Principle
Change the term "rangetop" to "range, counter-mounted cooking unit or..."
Panel Statement: The panel revised the recommended text to be consistent with Article 100. See also the panel action on Proposal 2-207.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-219 Log #2165 NEC-P02 **Final Action: Reject**
(210.52(C)(3))

Submitter: James Shaw, Jim Shaw Electric Co.
Recommendation: I believe the section should be rewritten as follows:
210.52(C)(3)(a) Pennisular Counter Spaces With A Backsplash. (All other wording in this paragraph remains the same.
210.52(C)(3)(b) Pennisular Counter Spaces Without A Backsplash. Receptacle outlets are allowed but not required in pennisulars that do not have a backsplash. If receptacle outlets are installed, they shall comply with 210.52(C)(5).
Substantiation: I can see no safety reason why an outlet is required in all peninsulars. In Fact I can see several safety issues as to why outlets should not be installed in peninsulas. To be more specific, I am talking about peninsulars which do not have a back splash. Looking at it from a safety stand point, the cord hanging down over the edge of the peninsular is a magnet for being caught by just about anyone or anything. Once the cord has become caught, the appliance could now be hanging from its cord, creating an unsafe condition. (Yes it is most likely connected to a GFCI circuit. Not everyone checks these outlets for proper operation, and they are known to fail and not trip.) From a logical stand point, who is going to place an appliance on a peninsular with no back splash? Peninsulars many times have overhangs in which one can place

stools underneath and use the space for eating. Would you want to look at the back side of your microwave or toaster oven? Would you want to read the label plate of your toaster oven or coffee pot? I think not.

I have had several customers that have told me that the do not want an outlet in their peninsular for the very same reasons that I stated above and for other reasons. I have had several inspectors that have agreed and not forced me to install an outlet there.

Panel Meeting Action: Reject

Panel Statement: See panel statement on Proposal 2-217

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-220 Log #443 NEC-P02 **Final Action: Reject**

(210.52(C)(4))

Submitter: W. Creighton Schwan, Hayward, CA

Recommendation: After "refrigerators," add " <u>appliance garages</u> " so as to read:

(4) Separate Spaces. Countertop spaces separated by rangetops, refrigerators, <u>appliance garages,</u> or sinks shall be considered as separate countertop spaces in applying the requirements of 210.52(C)(1), (C)(2), and (C)(3).

Substantiation: An appliance garage separates the counter space to the same degree that a range top, refrigerator, or sink does. This change will require that a countertop receptacle be placed not more than 24 inches on each side of an appliance garage.

Panel Meeting Action: Reject

Panel Statement: The panel does not agree that appliance garages generally split the countertops into separate spaces. The face of the appliance garage does not typically extend to the outer edge of the countertop; a work surface is available directly in front of the appliance garage that is contiguous with the counters on either side of the appliance garage.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-221 Log #2536 NEC-P02 **Final Action: Reject**

(210.52(C)(5))

Submitter: Timothy D. Curry, Curry Electric, Inc.

Recommendation: I would propose that after the last sentence in part (5), to add two new sentences to read:

<u>Receptacles shall be permitted to be mounted not more than 300 mm (12 in.) below the countertop. Receptacles mounted below the countertop, in accordance with this rule, shall not be located where the countertop extends more than 150 mm (6 in.) beyond its support base.</u>

I would further propose to completely delete the entire ~~Exception to (5)~~ .

Substantiation: This location (below countertops) is allowed for several other areas. Obviously, if you feel it is safe enough for bathrooms, peninsulas, and islands, and even regular countertops for the physically impaired, then I would think it should be plenty safe for regular countertop spaces, if that is the owner's desire.

Panel Meeting Action: Reject

Panel Statement: The current language was developed after reviewing a large number of proposals and comments and from extensive discussion of the panel. The language is a balance in accordance with the basic approach of the panel which recognizes that the receptacles in the kitchen should be above the countertop. The exception takes into consideration some of the design difficulties and provides for a limited means to mount the receptacle below the countertop.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

BROWN, L.: Please see NAHB's Ballot Comment on Proposal 2-224.

2-222 Log #1847 NEC-P02 **Final Action: Reject**

(210.52(C)(5) Exception)

Submitter: Mark T. Rochon, Peabody, MA

Recommendation: Revise as follows:

Receptacles mounted below a countertop in accordance with this exception shall not be located where the countertop extends more than 150 mm (6 in.) beyond its support based <u>on one side only.</u>

Substantiation: Countertops are being built with 6 in. overhangs to avoid receptacle installation on peninsulars and islands.

Panel Meeting Action: Reject

Panel Statement: If the countertop extends more than 6" beyond the support based on all sides, the receptacle would have to be mounted above the countertop.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-223 Log #2166 NEC-P02 **Final Action: Reject**

(210.52(C)(5) Exception)

Submitter: James Shaw, Jim Shaw Electric Co.

Recommendation: I think that the first sentence should be rewritten to read as follows:

Exception to (5): To comply with the conditions specified in (1) or (2) or (3), receptacle outlets shall be permitted to be mounted not more than 300 mm (12 in.) below the countertop.

Substantiation: I believe that the exception is missing a number.

Panel Meeting Action: Reject

Panel Statement: The exception only contains items (1) and (2). There is no item (3) in the exception.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-224 Log #840 NEC-P02 **Final Action: Reject**

(210.52(D))

Submitter: Stephen W. Drayton, Eastern Idaho Electrical JATC

Recommendation: Revise text to read as follows:

The receptacle outlet shall be located on a wall or partition that is adjacent to the basin or basin countertop, <u>or installed on the side or face of the basin cabinet not more than 300 mm (12 in.) below the counter top.</u> ~~EXCEPTION: The receptacle shall not be required to be mounted in the wall...countertop~~

Substantiation: We think this is an exception that could be deleted by including it in the general rule. We were led to believe that deleting exceptions is one of the goals of the NEC CMPs.

Panel Meeting Action: Reject

Panel Statement: The exception is clear as currently stated. Deleting exceptions is not a "goal" where the exception can best communicate what is intended.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

BROWN, L.: Contrary to the Committee Statement, the current Exception is actually a rule. Reading both the Section text and the Exception text, the requires receptacle can be located either in a wall or partition, or on the side or face of the basin. What is the Exception? This would also apply to Section 210.5(C)(5). In this day and age of providing greater accessibility to those who are disabled, of limited ability, and the 50+ population, the Panel should not consider accessibility to electrical receptacle outlets an exception to the rule.

2-225 Log #2910 NEC-P02 **Final Action: Reject**

(210.52(D))

Submitter: Raymond C. Paulson, City of Lincoln, NE

Recommendation: Revise as follows:

In dwelling units, at least once receptacle shall be installed in bathrooms ~~within 900 mm (3 ft) of the outside edge of each basin~~ . The receptacle outlet shall be located on a wall or partition that is adjacent to the basin or basin countertop.

Substantiation: Bathroom appliances (hairdryers, curlers, shaving machines, etc.) do not need a basin to operate. The 900 millimeter requirement does not add any degree of safety. There are many extra long vanities that do not lend themselves to conformance with this requirement. Delete the reference to 900 millimeters.

Panel Meeting Action: Reject

Panel Statement: Most bathroom appliances are used near the basin. If the receptacle is located further away, the user may need an extension cord to use the appliance near the basin. The 900mm requirement was specifically mandated to address this concern.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

BROWN, L.: In actual practice, it is really the mirror that is relative to the use of a hair dryer, not the sink. Though, for the use of oral care equipment, the receptacle location relative to the sink is the main consideration.

2-226 Log #2963 NEC-P02 **Final Action: Reject**

(210.52(D))

Submitter: Timothy D. Curry, Curry Electric, Inc.

Recommendation: Last sentence by modified thusly:...basin, countertop, <u>or installed on the face or side of the basin cabinet not more than 300 mm (12 in.) below the countertop.</u>

I would further propose to completely delete the entire: ~~(D) Exception~~

Substantiation: Changing the exception to positive langage.

Panel Meeting Action: Reject

Panel Statement: The exception as stated, clearly conveys the intent and objective of the rule.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
BROWN, L.: Please see NAHB's Ballot Comment on Proposal 2-224.

2-227 Log #2976 NEC-P02 **Final Action: Reject**
(210.52(D))

Submitter: Raymond C. Paulson, City of Lincoln, NE / Rep. Building & Safety, City of Lincoln, NE
Recommendation: In dwelling units, at least one receptacle shall be installed in bathrooms ~~within 900 mm (3 ft) of the outside edge~~ of adjacent to each basin. The receptacle outlet shall be located on a wall or partition that is adjacent to the basin or basin countertop.
Substantiation: Many bathroom vanities are too long to meet this 900 mm requirement. No advantage is offered by having the outlet this close. Bathroom appliances are not for use "in the basin", hair dryers, shavers, etc. are well served by an outlet "adjacent to each basin" without the distance requirement.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 2-225. The 900 mm dimension defines the extent of adjacency.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-228 Log #394 NEC-P02 **Final Action: Accept in Principle**
(210.52(E))

Submitter: Frank Foster, Thomasville, NC
Recommendation: Add a new sentence to the end of the following section:
For a one-family dwelling and each unit of a two-family dwelling that is at grade level, at least one receptacle outlet accessible at grade level and not more than 2.0 m (6 1/2 ft) above grade shall be installed at the front and back of the dwelling. For each dwelling unit of a multifamily dwelling where the dwelling unit is located at grade level and provided with individual exterior/egress, at least one receptacle outlet accessible from grade level and not more than 2.0 m (6 1/2 ft) above grade shall be installed. See 210.8(A)(3).
(1) A receptacle outlet shall be installed within the footprint of every porch, deck, patio, and similar structure.
Substantiation: Electrical fire and trip hazard. By requiring that a receptacle outlet be installed within the footprint of every porch, deck, patio, and similar structure, the chance that someone will run an extension cord through a window or doorway to an indoor receptacle outlet (not GFCI-protected) for lights, radios, electric weed-eaters, etc., is greatly reduced. This requirement will lessen the possibility of an electrical fire and eliminate any unnecessary trip hazards around doorways.
Panel Meeting Action: Accept in Principle
Panel Statement: The recommended action is accomplished through the panel action on Proposal 2-229.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
BROWN, L.: In all, see Panel Action on related Proposals: 2-228 and 2-299. Please see NAHB's Ballot Comment on Proposal 2-229.

2-229 Log #637 NEC-P02 **Final Action: Accept in Principle**
(210.52(E))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Revise text to read as follows:
(E) Outdoor Outlets.
(1) One-family and Two-family Dwellings. For a one-family dwelling and each unit of a two-family dwelling that is at grade level, at least one receptacle outlet accessible at grade level and not more than 2.0 m (6 1/2 ft) above grade shall be installed at the front and back of the dwelling.
(2) Multi-family Dwellings. For each dwelling unit of a multifamily dwelling where the dwelling unit is located at grade level and provided with individual exterior entrance/egress, at least one receptacle outlet accessible from grade level and not more than 2.0 m (6 1/2 ft) above grade shall be installed.
(3) Balconies. Dwelling unit balconies with exterior entrance/egress shall have at least one receptacle outlet installed accessible from the balcony.
Substantiation: The revised text takes into consideration those units that are above the first floor level that may have balconies. It is common for holiday lighting and other electrical appliances to be used on the balconies of these units. Without receptacles, extension cords are run from inside the unit and pinched between sliding doors or windows.
The section was numbered for ease of use.
Panel Meeting Action: Accept in Principle
Revise the recommended text to read:
(E) Outdoor Outlets. Outdoor receptacle outlets shall be installed in accordance with (E)(1) through (E)(3).
(1) One-Family and Two-Family Dwellings. For a one-family dwelling and each unit of a two-family dwelling that is at grade level, at least one receptacle outlet accessible at grade level and not more than 2.0 m (6 1/2 ft) above grade shall be installed at the front and back of the dwelling.
(2) Multifamily Dwellings. For each dwelling unit of a multifamily dwelling where the dwelling unit is located at grade level and provided with individual exterior entrance/egress, at least one receptacle outlet accessible from grade level and not more than 2.0 m (6 1/2 ft) above grade shall be installed.
(3) Balconies, Decks and Porches. Balconies, decks and porches that are attached to the dwelling unit and are accessible from inside the dwelling shall have at least one receptacle outlet installed accessible from the balcony, deck or porch.
Panel Statement: The revised text meets the intent of the submitter.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
BROWN, L.: In all, see Panel Action on related Proposals: 2-228 and 2-299. Concerning new 210.52(E)(3): It would be more appropriate for there to be a minimum size balcony, deck, or porch for the application of this new provision. As was discussed at the ROP meeting, some members would consider exterior area in front of a door used for solely ventilation a "balcony", just because there is the installation of a protective guard (railing) to prevent falls. In reality there is no actual floor space. Also, may designs of high-rise multifamily buildings include a very small standing area, perhaps 3 feet by 6 feet, to allow for fresh air and a place to have a smoke and not contaminate the interior environment. There is barely room for a single chair. The Panel should consider the use of the deck area relative to the need for a receptacle. For a floor space large enough to allow outdoor cook (electric grill) or sunbathing (radio) the installation of a receptacle may be appropriate. For a floor space that is a result of a designed ventilation opening a receptacle would be of no practical use.
It should also be noted that for all multifamily construction the guards are required to be a minimum of 42 inches in height above the deck surface. For the small deck areas the guard usually is attached to the building directly adjacent to the door frame. This provides no wall surface with the guard to install a receptacle. If the receptacle was to be install it would be located approximately 46 inches above the deck surface, and due to structural framing around the door would be located 12 or more inches outside the deck area.
The installation of a receptacle for usable deck areas would seem appropriate, and is usually already included in the design of the unit as a convenience for using outdoor appliances. The contention that that outlet is needed in the event holiday lighting is installed is not the basis for requiring a receptacle. If you require a receptacle for holiday lighting on the deck, why not one for all of the gutters and rake boards? As with any use of holiday or other decorative lighting, this is a use and design consideration of the user. Not one of minimum electric safety regulations. The use of holiday lighting cords and fixtures are already covered in the NEC and the product's listing.
Comment on Affirmative:
KING, D.: This is a much needed revision to section 210.52. The additional requirement for the installation of receptacles on balconies, decks and porches will eliminate the use of extension cords and the hazards that exists from these cords being passed through doorways in order to supply power to these locations. The additional requirement that these outdoor receptacles be provided with GFCI protection will potentially save many lives.
PAULEY, J.: The new item (3) added by the panel may need some additional clarification. The discussions of the panel indicated that the intent of the requirement is to require a receptacle be installed on any porch, deck or balcony. This receptacle was intended to be in addition to those that are installed to meet (1) or (2). It may be clearer if the new item (3) were written as "(3) Balconies, Decks and Porches. Balconies, decks and porches that are attached to the dwelling unit and are accessible from inside the dwelling shall have at least one receptacle outlet installed accessible ~~from~~ on the balcony, deck or porch." This will prevent the argument that a receptacle installed elsewhere on grade can meet the requirement of (3) because you can walk down the steps of the porch or deck. The panel's language in item (1) makes it clear that a receptacle on a deck could only serve as the receptacle meeting item(1) if it is accessible AT grade level.
It should also be noted that the panel is intentional in its use of differing language (AT grade level versus FROM grade level) in items (1) and (2) because of the configurations of multifamily dwellings.

2-230 Log #862 NEC-P02 **Final Action: Reject**
(210.52(E))

Submitter: Ray C. Mullin, Ray C. Mullin Books
Recommendation: Revise as follows:
(E) Outdoor Outlets. For a one-family dwelling and each unit of a two-family dwelling that is at grade level, at least one receptacle outlet accessible ~~at~~ when standing on grade level, ~~and~~ not more than 2.0 m (6 1/2 ft) above grade nor less than 600 mm (24 in.) above grade shall be installed at the front and back of the dwelling.
For each dwelling unit of a multifamily dwelling where the dwelling unit is located at grade level and provided with individual exterior entrance/egress, at least one receptacle outlet accessible from grade level and not more than 2.0 m (6 1/2 ft) above grade shall be installed. See 210.8(A)(3).

Substantiation: As a past member of CMP 4, I readily understand that after much discussion around the table at the CMP meetings discussing precisely how the wording of a Code section should be, the intent is finally understood by the CMP members. They hear all of the discussion. They know what the intent is. They decide on the wording. But, electricians are not privy to these actual CMP meeting discussions. They merely read the NEC. As an author of electrical text books, I know how difficult it is to select the right wording to get the point across with no confusion to the reader. The simpler the wording, the easier to understand.

Regarding the 210.52(E), the word "at" results in a lot of confusion in the field. It is the intent that the receptacle be accessible when a person is standing on grade. So I suggest that we say so. I have deleted the word "at" and replaced it with the simple and understandable phrase "when standing on grade level."

This wording leaves no doubt as to the intent.

The second part of my proposal addresses the minimum height of the receptacle.

The current maximum height restriction addresses the requirement that the receptacle be accessible for the average person. No problem with that.

Stipulating a minimum height above grade will improve safety by reducing the possibility of the receptacle being buried in snow...or being flooded out for whatever reason.

I ask the Code Making Panel to accept this proposal.

Panel Meeting Action: Reject

Panel Statement: See the panel action and statement on Proposal 2-231. The panel does not agree with adding the "24" dimesion because it is overly restrictive. The panel reaffirms its position that the present code text requires that the receptacle be accessible "at" grade level. A receptacle that cannot be reached while standing on grade and be within the 6 feet, 6 inches height requirement would not meet the requirement of 210.52(E).

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

WEBER, R.: See my comments and explanation for Negative vote on Proposal 2-231.

Comment on Affirmative:

BROWN, L.: It should be noted that the lower reach-range dimension for wheelchair accessible equipment is 15 inches. With respect to snow or flooding conditions, snow ground cover could easily be well over 24 inches in many areas of the country. In the case of flooding, as we have witnessed over the past several years, a future flooding condition is not easily predicted. In addition, some equipment may be less than 24 inches in height. Would this equipment not be subject to the same snow or water conditions as a receptacle?

2-231 Log #1624 NEC-P02 **Final Action: Reject**
(210.52(E))

Submitter: James Tente, City of Naperville

Recommendation: Revise text to read as follows:

For a one-family dwelling and each unit of a two-family dwelling that is at grade level, at least one receptacle outlet accessible <u>while standing</u> at grade level and not more than 2.0 m (6 1/2 ft) above grade shall be installed at the front and back of the dwelling where the dwelling unit is located at grade level and provided with individual exterior entrance/egress, at least one receptacle outlet accessible. <u>While standing</u> from on grade level and not more than 2.0 m (6 1/2 ft) above grade shall be installed. See 210.8(A)(3).

Substantiation: Present language is vague. The interpretation of "accessible" can vary greatly and is commonly misinterpreted. The panel statement for 2005 ROP 2-236 (Log #3197) clarifies the meaning of "accessible" and should be included in code text for clarity.

Panel Meeting Action: Reject

Panel Statement: The panel reaffirms it's previous position that "at grade" means "while standing on grade". See the panel action and statement on Proposal 2-230.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

WEBER, R.: The panel should have accepted this proposal as submitted, when we consider the full range of the persons using the code simplified language as recommended will solve a lot of confusion of the requirement being encountered out in the field. The addition of the term "while standing" at grade will make it clear that a receptacle installed on an elevated porch, that is accessible by stairs from grade, would not meet the requirements of section 210.52(E).

2-232 Log #2223 NEC-P02 **Final Action: Reject**
(210.52(E))

Submitter: Donald A. Ganiere, Ottawa, IL

Recommendation: Revise as follows:

(E) Outdoor Outlets. For a one-family dwelling and each unit of a two-family dwelling that is at grade level, at least one receptacle outlet accessible ~~at~~ <u>from</u> grade level and not more than 2.0 m (6 1/2 ft) above grade shall be installed at the front and back of the dwelling.

Substantiation: There is no safety hazard in having the required outdoor receptacles located above an open porch or deck. The intent is to have the receptacles located in a location that is easily accessible from the outside. In many dwelling units it is not possible to comply with the existing code rule as there are open porches or decks installed across the front and back of the building.

Panel Meeting Action: Reject

Panel Statement: See the panel action and statement on Proposal 2-230.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-233 Log #3326 NEC-P02 **Final Action: Reject**
(210.52(E))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc. / Rep. Massachusetts Electrical Code Advisory Committee

Recommendation: Add the following sentence at the end:

For the purposes of this section, the phrase "accessible at grade level" and the phrase "accessible from grade level" shall mean readily accessible from grade, and no more than 2.0 m (6½ ft) above grade level.

Substantiation: Major jurisdictions are applying the current wording to disqualify a receptacle on a low open deck as the required outdoor receptacle on one side of a dwelling unit. Unlike the receptacle behind the doorway issue, where there is an excellent reason to count that space, there has never been a good reason to disallow a receptacle on an open porch or deck as counting as the exterior receptacle, especially under the terms of this proposal. It would still need to be readily accessible, which means not obstructed from someone approaching from grade, and not up more than a few steps. It would not be more likely to require an extension cord, and in fact, it might be less likely since it would be placed nearest the likely location for electrical appliance usage. It might even be in a damp, as opposed to a wet location, resulting in a less hazardous condition. This proposal also removes a distinction between a one- and two-family dwelling (still subject to the potential deck disqualification), and a multifamily dwelling (certainly not so restricted, in fact, their decks don't even require stairs to grade.)

Panel Meeting Action: Reject

Panel Statement: See the panel action and statement on Proposal 2-230.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-234 Log #3484 NEC-P02 **Final Action: Reject**
(210.52(E))

Submitter: Richard F. Van Wert, Middle Department Inspection Agency / Rep. Benjamin Franklin Chapter IAEI

Recommendation: Revise text to read:

210.52(E) Outdoor Outlets....at least one receptacle outlet <u>125 V, 15- or 20-ampere</u> accessible at grade level etc.

Substantiation: This article needs clarification because as it stands now it is allowable to install a different voltage or current level than what is intended.

Panel Meeting Action: Reject

Panel Statement: This provision is already covered in the main paragraph of 210.52.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-235 Log #1407 NEC-P02 **Final Action: Reject**
(210.52(F))

Submitter: George Stolz, II, Pierce, CO

Recommendation: Change 210.52(F) to read:

210.52(F) Laundry Areas. In dwelling units, at least one receptacle outlet shall be installed for the laundry <u>equipment</u> .

Substantiation: This will clarify that the receptacle is required to supply the laundry equipment, not the entire room as a whole.

Please note: This proposal is submitted in coordination with a similar proposal to revise 210.11(C)(2).

Panel Meeting Action: Reject

Panel Statement: The panel rejected the companion proposal to this proposal. See the panel statement on Proposal 2-98.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-236 Log #2871 NEC-P02 **Final Action: Reject**
(210.52(F) Exception No. 3 (New))

Submitter: Andre R. Cartal, Princeton Borough Building Dept.

Recommendation: Add exception No.3.

Where the laundry equipment consists of a stacked washer/dryer combination. The required receptacle shall be permitted to be a 30 ampere, 240V dryer type.

Substantiation: The existing requirements are for 125V receptacles and do not reflect current practice.

We see the LAUNDRY AREA consisting of a recess in a hall wall just the width of the washer/dryer appliances. To require a 125V receptacle within 6 feet of the intended location of the laundry equipment makes no sense unless we have to allow for ironing - but in the hallway?

Panel Meeting Action: Reject

Panel Statement: See the panel statement on Proposal 2-95.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-237 Log #3140 NEC-P02 **Final Action: Reject**

(210.52(F) Exception No. 3 (New))

Submitter: Dale Rooney, Municipality of Anchorage

Recommendation: Add new exception No. 3 to read:

Exception No. 3: Where a laundry space only permits a stackable washer/dryer with no provision for a ga s dryer a 240 volt receptacle only shall be permitted.

Substantiation: The first sentence of 210.52 specifies that the section applies to 120 volt 15 and 20 volt receptacles. The two exceptions in sub-part (F) do not specifically address this situation. The 120 volt receptacle is redundant since a stackable combo without a gas dryer will almost always require a 240 volt receptacle. The few combos available for 120 volts require two separate circuits and the 240 volt circuit can be relatively easily converted to such use.

Panel Meeting Action: Reject

Panel Statement: See the panel statement on Proposal 2-95.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-238 Log #125 NEC-P02 **Final Action: Reject**

(210.52(G))

Submitter: Ryan Price, Benfield Electric Contractors, Co.

Recommendation: Revise as follows:

For a one-family dwelling, at least one receptacle outlet, in addition to any provided for laundry equipment, shall be installed in each basement and in each attached garage, <u>with a minimum mounting height above finished floor of 18 in.</u> and in each detached garage with electric power.

Substantiation: Receptacles in basements that may be effected by water/flooding.

Sparks from outlets in garages where chemical fumes are present.

Panel Meeting Action: Reject

Panel Statement: The 450mm (18") dimension in the basement is arbitrary and may or may not be adequate relative to flooding. Residential garages are not classified as hazardous locations.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

BROWN, L.: See NAHB's Ballot Comment on Proposal…

2-239 Log #419 NEC-P02 **Final Action: Reject**

(210.52(G))

Submitter: Ryan Price, Benfield Electric Contractors, Co.

Recommendation: Revise to read as follows:

For a one-family dwelling at least one receptacle outlet, <u>mounted at a minimum height of 18 in. above grade level,</u> in addition to any provided for laundry equipment, shall be installed in each basement and in each attached garage, and in each detached garage with electric power. See 210.8(A)(2) and (A)(5). Where a portion of the basement is finished into one or more habitable rooms, each separate unfinished portion shall have a receptacle outlet installed in accordance with this section.

Substantiation: Most basements, attached garages, and detached garages with electric power store or have the presence of flammable or ignitable vapors that could build up and ignite. Most harmful vapors pertaining to the NEC, hover about 8 in. to 12 in. above grade level. Placing all receptacles at a minimum height of 18 in. above grade level would insure that electrical sparks from the receptacles will not ignite the vapors.

Panel Meeting Action: Reject

Panel Statement: The submitter's claim that most basements and garages "have the presence of flammable or ignitable vapors" is unsubstantiated. Neither of these areas are classified as hazardous locations.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-240 Log #1265 NEC-P02 **Final Action: Accept**

(210.52(G))

TCC Action: It was the action of the Technical Correlating Committee that the panel reconsider the proposal relative to the grammar and the use of complete sentences. This action will be considered by the panel as a public comment.

Submitter: Mark Shapiro, Farmington Hills, MI

Recommendation: Revise the rule to require "general-use" receptacles in basements and garages.

"For a one-family dwelling, at least one <u>general-use</u> receptacle outlet ~~, in addition to any provided for the laundry equipment,~~ shall be installed in each basement and in each attached garage, and in each detached garage with electric power. See 210.8(A)(2) and (A)(5). Where a portion of basement is finished into one or more habitable rooms, each separate unfinished portion shall have a <u>general-use</u> receptacle outlet installed in accordance with this section."

Substantiation: As presently written, a single receptacle installed for a basement sump pump would satisfy this sections requirement for a basement receptacle that is in addition to the laundry receptacle. The same could hold true for a receptacle, mounted on the side of a furnace, for a humidifier.

Why is a "general-use receptacle" proposed here rather than the more familiar sounding phrase "general-purpose receptacle"? "General-use" is proposed to avoid confusion with the term "general-purpose branch circuits".

"Branch circuits, general-purpose" are defined in Article 100. They are defined as having 2 or more outlets. Unfortunately, I fear that the use of the term "general-purpose receptacle" here, would result in some people arguing that this basement or garage receptacle was required to be on a general-purpose branch circuit and could not be on a separate circuit.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

BROWN, L.: This is nonsense. The addition of the term "general-use" to describe a typical receptacle adds absolutely no additional clarification to these provisions. Looking at the 2005 NEC this term is only used in Article 220 (Branch-Circuit, Feeder, and Service Calculations); Section 440.62(C) (Air-Conditioning and refrigerating Equipment - Provisions for Room Air-Conditioners); and Section 552.46(B)(3) (Park Trailers - Branch Circuits - General Appliances). But, what is a "general-use" receptacle? There is no definition, as there is for "General-Use Switch", in the NEC. Regarding the Submitter's Substantiation, adding this term will provide no more enforcement of having a useable receptacle in these locations than the current language already provides. What would ever make someone think a single receptacle is not a "general-use" receptacle? If you really want to address the Submitters purported problem, make these receptacles in addition to any other receptacle used for equipment installed in those areas.

2-241 Log #3627 NEC-P02 **Final Action: Reject**

(210.52(I))

Submitter: Raymond C. Paulson, City of Lincoln, Nebraska

Recommendation: Add a new section 210.52(I) Walkways.

In dwelling units where an area is defined by change of architecture or a permanent differentiation of floor covering as a walkway, a receptacle shall be placed on the occupiable side of the walkway in addition to any receptacle(s) that are required by 210.52(A) & (H). This receptacle or receptacles may be installed in lieu to any receptacle that would otherwise be installed as a floor receptacle by a railing in the walkway.

Substantiation: As the Code evolves, so does the space in which we dwell. Just as we achieve safe usage of electricity by the requirement of receptacle outlets each 2,6 & 12 feet(More is better), this change can alleviate a hazard that we are inadvertantly introducing. It is a VERY common design that is used to create a "walkway" by the use of a hard floor covering such as tile or hardwood directing foot traffic around a seating area in a living room or great room. By Code we must enforce an outlet in the floor next to the open railings for the stairways. Sometimes waging turf wars with the homeowner and interior designer for ownership of space in the Italian marble tile, we forget the reason for the outlet and just fall back on "because the Code says so". We should step back and see what is happening here and allow the receptacle by the furniture grouping and get rid of the trip hazard and cord damage hazard by allowing a reasonable alternative to "always requiring a receptacle in the walkway" by the railing. This allowance will provide a convenient receptacle by the chair or table for the floor lamp and eliminate the hazard of stretching a cord to the outlet by the railing on the other side of the "walkway".

Panel Meeting Action: Reject

Panel Statement: The situation described by the submitter is too vague to attempt a specific code rule. The specified text of "change of architecture or a permanent differentiation of floor covering" is too subjective.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-242 Log #1184 NEC-P02 **Final Action: Accept in Part**

(210.60(A))

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Revise as follows:

Guest rooms in hotels, motels, <u>dormitories</u> , and similar occupancies shall have receptacle outlets installed in accordance with <u>310.11(C),</u> 210.52(A), and 210.52(D).

Substantiation: Rooms in hotels, motels, and dormitories meeting the definition of dwelling unit are required to comply with 210.11(C)(3), but if without permanent provisions for cooking are exempt. It is difficult to see how a cooking appliance affects the need for application of 210.11(C)(3). It is my impression this section was adopted due to widespread use of high wattage hair blow dryers or portable electric space heaters. Occupants of guest rooms or dorms with or without provisions for cooking are just as prone to use these appliances.

Panel Meeting Action: Accept in Part

The panel accepts the recommendation to add "dormitories".

Panel Statement: The panel agrees that receptacle requirements for domitories are not currently covered and need to be treated similarly to hotel and motel guest rooms. The panel does not accept the reference to 210.11(C) because those requirments would not be applciable to all dormitory configurations.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

PURVIS, R.: Proposal 2-242 (Dormitories) should have been rejected. The submitter did not provide any technical substantiation that electrical requirements in a dormitory room are like the electrical requirements of hotel or motel rooms. Dormitories are a much different occupancy than a hotel or motel room. For example, colleges and universities often set rules for dormitories and dormitory occupants that limit the use of equipment in the room. Colleges and universities also have been attentive in the design of dormitory room electrical systems to accommodate the typical loads and the needs for receptacles for these occupancies and uses. Unlike hotel or motel rooms, dormitories are likely to have coincident loads lacking the diversity of hotel and motel loading.

Typically, dormitory occupancies are different because student housing at colleges and universities are much different than the occupancy at a hotel or motel room with transient occupancy.

The submitter has not provided any examples or cases of fire or problems that would show there is a problem with the current Code and its application to dormitories.

Comment on Affirmative:

BROWN, L.: The occupancy "Dormitory", as used and defined in other NFPA documents, would not include individual cooking facilities. But, there may be other problems with including dormitories along with guest rooms and guest suites. The dormitory would consist of sleeping rooms for the occupants, and all other areas would be classified as public or general use areas. It may be better to break this out into a separate subsection. A guest room and a guest suite are defined to differentiate these types of spaces from the other parts of the lodging building, But, with a dormitory you need to relate these provisions only to the sleeping accommodations. Not the entire dormitory building.

PAULEY, J.: With this change, the panel should consider revising the title of 210.60 to "210.60 Guest Rooms, Guest Suites and Dormitories" to make it clear that dormitories are now included.

2-243 Log #3383 NEC-P02 **Final Action: Reject**
(210.60(B))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Recommendation: Revise the second sentence of 210.60(B) to read as follows:

These receptacle outlets shall comply with the spacing requirements in 210.52(A), but adjustments to the extent necessary to accommodate a permanent furniture layout shall be permitted.

Substantiation: On numerous occasions, this submitter has been asked for advice with respect receptacle placements and this section. In several cases, the size of the room would require a given number of receptacle outlets, and the architect had specified one or two fewer than this number. The electrical contractor proposed placing an additional receptacle outlet one foot (and in the same stud bay) from one of the existing receptacle outlets. In support of this, he said he was accommodating a permanent furniture layout. The room, indeed, had a permanent furniture layout, but this section was never intended to allow, for example, all the receptacles to be located on one wall just because some of furniture somewhere had a permanent location. This proposal (using slightly stronger language than is prior version in the previous cycle) provides an opportunity to clarify that installers must follow 210.52(A), with only those adjustments "to the extent necessary" to meet the permanent layout.

Panel Meeting Action: Reject

Panel Statement: The submitter's use of the phrase "to the extent necessary to accommodate" is vague and unenforceable.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-244 Log #1895 NEC-P02 **Final Action: Accept**
(210.62)

Submitter: James W. Carpenter, International Association of Electrical Inspectors

Recommendation: Revise text to read as follows:

210.62 Show Windows. At least one receptacle outlet shall be installed ~~directly~~ <u>within 450 mm (18 in.) of the top of</u> ~~above~~ a show window for each 3.7 linear m (12 ft) or major fraction thereof of show window area measured horizontally at its maximum width.

Substantiation: As the Authority Having Jurisdiction, we see many instances that involve ceiling heights that in some cases are as much as 16 to 18 ft above the top of show windows. The Code currently does not address the location of height above the window, only that it be above the show window. The required show window outlets then are placed on the ceilings 16 to 18 ft above the top of the show windows and are in compliance with the letter of the code. The object of this section is to eliminate or lessen the use of extension cords used for display items or advertising placed in the show window. Placing limits on the height of these receptacles above show windows would place these receptacles at a distance above a show window to make them usable to perform their intended use.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-245 Log #2290 NEC-P02 **Final Action: Reject**
(210.62)

Submitter: Gary Boughton, Town of Bethel Building Deparment

Recommendation: Rename 210.62 Show Windows. <u>To "210.62 Other Than Dwelling Units."</u> and add/change present 210.62 to <u>(A) Show Windows,</u> and keep present wording. Add <u>(B) Kitchens Where a kitchen is installed, countertop receptacles shall be installed according to 210.52 (B) and (C).</u> Add <u>(C) Bathrooms. Where a basin and toilet are installed with one of more of the following: A tub or shower, Receptacles shall be installed according to 210.52(D).</u>

Substantiation: There was a time when having a kitchen in a workplace was unheard-of now almost every business has a kitchen area for the warming and preparation of food, coffee etc. There is much competition for these receptacles during lunch and other busy times. We have had several kitchens in business and industrial occupancies, two of which have over 25 feet of counter space, with only 3 receptacles. The code as now written does not require any receptacles for nondwelling unit kitchens. The dangers and hazards are the same as dwelling units and the counter top appliances are the same, limited cord lengths etc. This is not meant for diners or restaurant kitchens that are specifically designed for their use. 210.8(B) already requires these receptacles <u>when</u> installed to be GFCI protected.

Bathrooms are similar in that a private bathroom that includes a shower or tub in business occupancies is not required to provide a receptacle outlet but provides the same danger and hazard. This also arises in health spas, firehouse trucking and towing businesses to name just a few all at some time being remedied with the use of long extension cords through walls of doors to provide the needed receptacle.

Panel Meeting Action: Reject

Panel Statement: The submitter has not substantiated the requirement for additional receptacles in kitchens and bathrooms of non-dwelling locations. Because of the intended use of some of these spaces, it may be desirable to have no receptacles installed to limit the use of the space.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

KING, D.: The submitter has adequately substantiated the need for consistent application of the requirements of 210.52(A),(B) and (C). The same hazards exist with the use of electricity in kitchens and bathrooms regardless of the type of occupancy where they are located. Accepting this proposal would provide the same level of safety that is now required in the same locations in dwelling units.

2-246 Log #2414 NEC-P02 **Final Action: Reject**
(210.62)

Submitter: Dan Frohberg, Northeast Community College

Recommendation: Revise text to read:

~~At least one receptacle outlet shall be installed directly above a show window for each 3.7 linear m (12 linear ft) or major fraction thereof of show window area measured horizontally at its maximum width.~~

No point along the show window shall be more than nine feet from a receptacle.

Substantiation: We calculate spacing of receptacles to fixed distances between or accessibility to receptacles. This would be easier to understand and provide the needed receptacles for show windows.

Panel Meeting Action: Reject

Panel Statement: The submitter has not substantiated changing the requirement in order to place a receptacle within nine feet of every point of the show window. The revision in Proposal 2-244 makes it clear as to where the receptacle can be placed.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-247 Log #1229 NEC-P02 **Final Action: Reject**
(210.63)

Submitter: Michael Dempsey, Municipal Code Inspections
Recommendation: Revise text to read as follows:
The receptacle shall be located on the same level and within 25 ft <u>and when the heating, airconditioning and refrigeration equipment is located outdoors, the receptacle shall be located outside, GFI protected and within 25 ft.</u>
Substantiation: This would prevent a situation when HVAC equipment is located on a deck or near a grade level door, that the receptacle on the same level and within 25 ft could be inside and not GFI protected.
Panel Meeting Action: Reject
Panel Statement: The panel does not agree that the present rule would allow a receptacle located inside, to meet the requirement of 210.63 for equipment located outdoors. NEC 400.8 prohibits the use of flexible cord through doors, windows or similar openings.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-248 Log #1266 NEC-P02 **Final Action: Reject**
(210.63)

Submitter: Mark Shapiro, Farmington Hills, MI
Recommendation: Delete “heating” from the section so that it reads:
“A 125-volt, single phase, 15- or 20-ampere-rated receptacle outlet shall be installed at an accessible location for the servicing of ~~heating~~ , air-conditioning, and refrigeration equipment. The receptacle shall be located on the same level and within 7.5 m (25 ft) of the ~~heating~~ , air-conditioning, and refrigeration equipment. The receptacle shall not be connected to the load side of the equipment disconnecting means.”
Substantiation: Is there a need for receptacles for the servicing of furnaces? Is there a need for receptacles adjacent to unit heaters in the ceilings of industrial shops? Apparently not. And other people seem to agree, because I have yet to see one that has been provided for that purpose. Nonetheless, the present language puts countless unit heater installations in violation of the code.
The requirement is justifiable at cooling and refrigeration equipment. Even though most equipment these days, is battery powered, it assures a safe source of 120 volt power for the use of vacuum pumps to evacuate the system before refrigerant is installed.
Panel Meeting Action: Reject
Panel Statement: The current code language is consistent with the model mechanical codes which include heating equipment.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-249 Log #3388 NEC-P02 **Final Action: Reject**
(210.63)

Submitter: Steve Moore, Romulus, MI
Recommendation: Add a definition for Evaporative Cooler to read:
Evaporative Cooler. Cooling system that cools by evaporation.
Substantiation: There is no definition in the current edition of the NEC that explains what an evaporative cooler is.
Panel Meeting Action: Reject
Panel Statement: The term “evaporative cooler” is well understood in the construction industry and does not need a specific definition in the NEC. The model mechanical codes define these units.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-250 Log #1442 NEC-P02 **Final Action: Reject**
(210.63 Exception)

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise as follows:
210.63 Heating, Air-Conditioning, and Refrigeration Equipment Outlet. A 125-volt, single-phase, 15- or 20-ampere-rated receptacle outlet shall be installed at an accessible location for the servicing of heating, air-conditioning, and refrigeration equipment. The receptacle shall be located on the same level and within 7.5 m (25 ft) of the heating, air-conditioning, and refrigeration equipment. The receptacle outlet shall not be connected to the load side of the equipment disconnecting means.
~~Exception: A receptacle outlet shall not be required at one- and two-family dwellings for the service of evaporative coolers.~~
FPN: See 210.8 for ground-fault circuit-interrupter requirements.
Substantiation: This exception does not belong, as it has nothing to do with “Heating, Air-Conditioning and Refrigeration” equipment. Evaporative coolers are listed as “evaporative fans” per the UL 507. Furthermore, because of the language existing, it falsely gives the impression that a receptacle outlet is required at other than dwelling units, which is incorrect. Once again, evaporative coolers are not HACR equipment.
Panel Meeting Action: Reject
Panel Statement: The submitter is incorrect in that an evaporative cooler is a form of air-conditioning. A receptacle is required for these units if they are installed at other than one or two family dwellings.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
KING, D.: I agree with the panel statement that an evaporative cooler is a form of air conditioning and that a receptacle is required for these units if they are installed at other than one and two family dwellings. I disagree with the panel action to not delete the exception as recommended by the submitter. The requirements of section 210.63 should apply to evaporative coolers given the fact that they are a form of air conditioning equipment. Panel 2 added this exception in the 2005 code cycle based on a substantiation that was anecdotal in nature and lacked any technical data that would warrant the need for this exception. Deleting this exception would ensure that a receptacle outlet would be installed for the purposes of servicing this equipment and that the receptacle would be provided with GFCI protection. Persons servicing this type of equipment are at a greater risk of electric shock or electrocution as a result of this panel action.

2-251 Log #575 NEC-P02 **Final Action: Reject**
(210.70)

Submitter: Alan H. Nadon, City of Elkhart, IN
Recommendation: Revise as follows:
210.70 Lighting Outlets Required. Lighting outlets, <u>that provide illumination,</u> shall be installed where specified in 210.70(A), (B), (C).
Substantiation: As currently worded, only 210.70(A)(2)(b) requires a lighting outlet to actually illuminate anything. The definition of a lighting outlet, in Article 100 does not require anything more than a junction box with switched conductors intended to be connected to a lampholder, light fixture, or pendent light. A proposal has also been submitted to change or amend the definition of lighting outlet. Proper illumination ensures safe movement for persons thus preventing many accidents.
Panel Meeting Action: Reject
Panel Statement: The objective of the NEC is to provide the requirement for the lighting outlet. The requirements specific to illumination are in the building code.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-252 Log #3164 NEC-P02 **Final Action: Reject**
(210.70)

Submitter: Wally Harris, Atlantic Inland Inspections
Recommendation: Add text as indicated in underlined font, and delete text as indicated in strikethrough text as shown:
210.70 Lighting Outlets Required. Lighting outlets shall be installed where specified in 210.70(A), (B), and (C).
(A) Dwelling Units. In dwelling units, lighting outlets shall be installed in accordance with 210.70(A)(1), (2), and (3).
(1)Habitable Rooms. At least one wall switch-controlled lighting outlet shall be installed in every habitable room and bathroom <u>, with switch control provided at each entrance to these rooms.</u>
(2) Additional Locations. Additional lighting outlets shall be installed in accordance with (A)2(a), (A)(2)(b), and (A)(2)(c).
(a) At least one wall switch-controlled lighting outlet shall be installed in hallways, stairways, attached garages, and detached garages with electric power.
(b) For dwelling units, attached garages, and detached garages with electric power, at least one wall switch–controlled lighting outlet shall be installed to provide illumination on the exterior side of outdoor entrances or exits with grade level access. A vehicle door in a garage shall not be considered as an outdoor entrance or exit.
(c) Where one or more lighting outlet(s) are installed for interior stairways, there shall be a wall switch at each floor level, and landing level that includes an entry way, to control the lighting outlet(s) where the stairway between floor levels has six risers or more.
<u>(d) Where lighting outlets are installed as specified in 210.70(A)(2)(a), (b), and (c) above switch control shall be provided at each entrance to these locations.</u>
Substantiation: Consider the case of a basement with an exterior entrance, and the building users choose to enter the basement from an exterior door. All too often the only switch to control a basement luminaire is at the top of the stairs entering the basement from the interior. In a scenario where entry is made from the exterior there is no mechanism to turn on the luminaire, thus creating a possible trip or fall hazard to the occupant. Switched control of lighting at each entrance to a basement or a room as proposed would greatly contribute to safety of persons.

Panel Meeting Action: Reject

Panel Statement: The location and number of switches is a design requirement that is determined by the designer, user or installer. The panel disagrees with the submitter's example in the substantiation relative to the switch at the top of the basement stairs. If there are six risers or more, a switch is required at the top and bottom of the stairs.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

KING, D.: This proposal should have been accepted. Minimum requirements for the location of control of required lighting outlets is not a design consideration but rather a safety issue. Location and accessibility of switches is addressed in other sections of the NEC. Section 210.70(A)(3) Requires at least one point of control for illumination of equipment and storage spaces to be at the usual entry point to these spaces. This is intended to provide control of illumination at a location that will allow for safe access to these spaces. The reference to the requirement in section 210.70(C) in the panel statement does not address the submitter's concerns. The submitter is illustrating in his substantiation the need for the control of illumination at every point of entry to a basement regardless of whether or not stairs are needed to access this space. There have been several proposals submitted that alert panel 2 to the risk of injury to persons that can occur as a result of not including minimum requirements for the location of switches that control the required lighting outlets in 210.70. Adding these requirements will ensure that the control of illumination that is required in 210.70 is located to allow safe access to these areas. Panel 2 should give this proposal further consideration.

2-253 Log #3480 NEC-P02 **Final Action: Reject**
(210.70(3))

Submitter: Richard F. Van Wert, Middle Department Inspection Agency / Rep. Benjamin Franklin Chapter IAEI

Recommendation: Revise text to read:

210.70(3) Storage or Equipment Spaces. For attics, underfloor spaces, utility rooms , closets and basements, at least etc...

Substantiation: This article needs rewording because the contractor feels that every closet space is exempt from the rule because it is not mentioned in the requirement list.

Panel Meeting Action: Reject

Panel Statement: Closets are not intended to be covered in the present rule. The submitter has not substantiated a requirement for a lighting outlet in every closet.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

BROWN, L.: It would seem this Proposal would apply to Section 210.70(A)(3), not 210.70(3). A closet is used for storage and is not a habitable room or space, and vary greatly in size.

2-254 Log #1664 NEC-P02 **Final Action: Reject**
(210.70(A))

Submitter: David Nemchik, Median County Building Deparment

Recommendation: Change to 210.70(A)

210.70 Lighting Outlets Required. Lighting outlets shall be installed where specified in 210.70(A), (B), and (C).

(A) Dwelling Units. In dwelling units, lighting outlets shall be installed in accordance with 210.70(A)(1), (A)(2), and (A)(3).

(1) ~~Habitable Rooms.~~ General Provisions. Lighting outlets shall be installed in accordance with 210.70(A)(1)(a) and (A)(1)(b).

(a) At least one wall switch-controlled lighting outlet shall be installed in every habitable room and bathroom.

(b) For dwelling units, attached garages, and detached garages with electric power, at least one wall switch-controlled lighting outlet shall be installed to provide illumination on the interior side of outdoor entrances or exits with grade level access. One wall switch shall be located on the interior no more than 1.8 m (6 ft) from the exterior entrance door. A vehicle door in a garage shall not be considered as an outdoor entrance or exit.

Exception No. 1 to (A)(1)(a) and (A)(1)(b) : In other than kitchens and bathrooms, one or more receptacles controlled by a wall switch shall be permitted in lieu of lighting outlets.

Exception No. 2 to (A)(1)(a) and (A)(1)(b) : Lighting outlets shall be permitted to be controlled by occupancy sensors that are (1) in addition to wall switches or (2) located at a customary wall switch location and equipped with a manual override that will allow the sensor to function as a wall switch.

(2) Additional Locations. Additional lighting outlets shall be installed in accordance with (A)(2)(a), (A)(2)(b), and (A)(2)(c).

(a) At least one wall switch-controlled lighting outlet shall be installed in hallways, stairways, attached garages, and detached garages with electric power. In hallways of 3.0 m (10 ft) or more in length, there shall be a wall switch at no less than two locations, to control the lighting outlet(s).

As used in this subsection, the hall length shall be considered the length along the centerline of the hall without passing through a doorway.

(b) For dwelling units, attached garages, and detached garages with electric power, at least one wall switch-controlled lighting outlet shall be installed to provide illumination on the exterior side of outdoor entrances or exits with grade level access. One wall switch shall be located on the interior and no more than 1.8 m (6 ft) from the exterior entrance door. A vehicle door in a garage shall not be considered as an outdoor entrance or exit.

(c) Where one or more lighting outlet(s) are installed for interior stairways, there shall be a wall switch at each floor level, and landing level that includes an entryway, to control the lighting outlet(s) where the stairway between floor levels has six risers or more.

Exception to (A)(2)(a), (A)(2)(b), and (A)(2)(c): In hallways, stairways, and at outdoor entrances, remote, central, or automatic control of lighting shall be permitted.

(3) Storage or Equipment Spaces. For attics, underfloor spaces, utility rooms, and basements, at least one lighting outlet containing a switch or controlled by a wall switch shall be installed where these spaces are used for storage or contain equipment requiring servicing. At least one point of control shall be at the usual point of entry to these spaces. The lighting outlet shall be provided at or near the equipment requiring servicing.

Substantiation: Several factors are contributing to a market place shift that is increasing the focus on minimal lighting for the housing market.

First, there is an increased interest in legislation that decreases or eliminates the ability of the local jurisdiction from setting additional requirements for electrical installations. As example, the state of Ohio has a new law that would restrict the local jurisdictions from adding requirements beyond the NEC to insure a uniform business field across the state for construction contractors.

Secondly, the United States has an aging population that has more specific needs. Supporting material show the large increase in the over 65 year old segment of the population and the addresses their need for "light levels in transitional spaces such as hallways and entrance foyers". It also addresses studies that show fall injury in the elderly is caused by environment and rarely by illness. Two environmental factors that are highlighted as Home Hazards Conductive to Falls are: Inadequate illumination and No light switches at room entry.

The 2005 NEC does not allow inspectors to require control for inside lighting at the entrances to the home. It also does not support the inspector if he or she would like to require hallway lighting controls at more than one location in long hallways.

The above proposed changes in 210.70(A) would allow the inspector to require a minimal amount of protection to anyone living in the home and be particularly helpful for older adults. As an added bonus, these changes would prove to be very small to the electrical contractor and, in fact, are already being done by many. This change would level the playing field between contractors that build to minimum and those that consider the welfare of the consumer during installation of the home electrical system.

The language used in this proposed change duplicates sentences already in use in other parts of the code. It also uses the same types of trigger conditions, such as, applying a multiple switching requirement to the same "3.0 m (10 ft) or more" hallway category as the existing receptacle requirement.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The location and number of switches for the general areas described is a design issue and consideration.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

KING, D.: See my explanation of negative for proposal 2-252.

2-255 Log #148 NEC-P02 **Final Action: Reject**
(210.70(A)(1))

Submitter: Victor Timpanaro, Municipal Electrical Inspectors

Recommendation: Revise as follows:

At least one wall switch-controlled lighting outlet shall be installed in every habitable room and bathroom (nearest the point of entry) (and at each point of entry).

Substantiation: The Code has never addressed how close to point of entry a switch shall be installed and where multiple entries exist if more than one switch is required. This language will prevent entry into a dark room looking for switch.

This would also coincide with argument on rule presented at Section 210.70(A)(2)(c).

Panel Meeting Action: Reject

Panel Statement: The location and number of switches for the general areas described is a design issue and consideration.

Number Eligible to Vote: 12

2-256 Log #603 NEC-P02 **Final Action: Reject**
(210.70(A)(1))

Submitter: Vincent Metallo, Sr., Baltimore County, MD / Rep. Baltimore County Electrical Inspections
Recommendation: Revise text to read:
(1) Habitable Rooms. At least one wall switch-controlled lighting outlet shall be installed in every habitable room and bathroom. (At least one point of control shall be at the usual point of entry to these rooms.)
Substantiation: Switches can be located in these rooms at any location in the room. This would add a level of safety to entering a room by being able to switch a light on at the entrance. A switch location is mandated in 210.70(3) for spaces that are not used as nearly as much as a habitable room.
Panel Meeting Action: Reject
Panel Statement: The location and number of switches for the general areas described is a design issue and consideration.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
KING, D.: See my explanation of negative for proposal 2-252.

2-257 Log #1432 NEC-P02 **Final Action: Reject**
(210.70(A)(1))

Submitter: Greg Chontow, Hopatcong, NJ
Recommendation: Revise text to read as follows:
~~At least~~ one wall switch ~~controlled lighting outlet~~ shall be installed at every entrance to every habitable room and bathroom controlling at least one wall switch controlled lighting outlet.
Substantiation: This new wording will allow occupants to enter any room at any location and operate a lighting outlet, therefore, preventing an occupant from entering in the dark.
Panel Meeting Action: Reject
Panel Statement: The location and number of switches for the general areas described is a design issue and consideration.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
KING, D.: See my explanation of negative for proposal 2-252.

2-258 Log #1766 NEC-P02 **Final Action: Reject**
(210.70(A)(1))

Submitter: Paul Kennedy, Town of Andover, MA
Recommendation: Revise as follows:
(1) Habitable rooms. At least one wall switch-controlled lighting outlet shall be installed in every habitable room and bathroom. A wall switch is required at each entry of a habitable room or bathroom.
Substantiation: It is common for kitchens, dining rooms, living rooms, bedrooms, bathrooms, garages, basements to have more than one entry/exit. The literal wording of the code permits any of these rooms with two or more entries/exits to be served by a single pole switch located at one of the entries/exits. Most installers opted to design 3- and 4 way switching systems at these locations, however, some spec-built houses have followed the literal text of the code and provided but one wall switch at one location forcing the future homeowner to traverse a dark room fumbling or tripping to locate a wall switch.
Panel Meeting Action: Reject
Panel Statement: The location and number of switches for the general areas described is a design issue and consideration.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
KING, D.: See my explanation of negative for proposal 2-252.

2-259 Log #2693 NEC-P02 **Final Action: Reject**
(210.70(A)(1))

Submitter: Bradley Butters, City of Reynoldsburg, Ohio
Recommendation: Add sentence at end to read: "Bathroom lighting outlets shall not be GFCI protected."
Substantiation: Much bathroom use occurs with the door closed. If the lights are on a GFCI circuit and that GFCI trips, the person is left in the dark. Personal injury can easily occur if the lights go out while showering, shaving, etc. Most bathroom luminaires are not required to be GFCI protected. There is more safety to be lost from bathroom luminaires being GFCI protected than there is to be gained.
Panel Meeting Action: Reject
Panel Statement: The panel does not agree that a bathroom light should be prohibited from being GFCI protected. GFCIs provide additional protection that can be installed if desired.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-260 Log #2548 NEC-P02 **Final Action: Reject**
(210.70(A)(2)(b))

Submitter: Robert P. McGann, City of Cambridge
Recommendation: Revise text to read as follows:
With grade level access at least one wall switch controlled outlet shall be installed to provide illumination on the interior side of the principal entrances.
Substantiation: Documentation of seniors tripping and breaking hips upon entering.
Panel Meeting Action: Reject
Panel Statement: This is a design issue that is impacted by the arrangement and use of the space in the dwelling.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
KING, D.: See my explanation of negative for proposal 2-252.

2-261 Log #3327 NEC-P02 **Final Action: Reject**
(210.70(A)(2) Exception No. 2)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc. / Rep. Massachusetts Electrical Code Advisory Committee
Recommendation: Designate the existing exception as Exception No. 1 and add a second exception as follows:
Exception No. 2 to (c): Where a stairway connects to an unfinished area with no other entryway, the switch at the unfinished floor level shall be permitted to be omitted. For the purposes of this exception, the term "entryway" does not include a means of egress from an unfinished area.
Substantiation: A three-way switch at the end of a stairway into an unfinished area without an exit has no basis in safety, only design, and as such is beyond the scope of the Code. Previous examples cited by the panel in rejecting this over the years, such as darkrooms or work areas, probably would constitute a connection to finished areas if they were extensive. Transient occupants of such spaces would not be turning the light off and leaving themselves in darkness. It is worthy of note that there is no three-way switch rule for hallways of whatever length, or rooms of whatever size and numbers of entries.
This text avoids the terminology "second exit" and instead uses the term "entryway" which is now used in (c) and which excludes basement bulkheads and other locations that are not defined as full entry locations under the model building codes.
Panel Meeting Action: Reject
Panel Statement: The panel disagrees with the submitter that the rule should be limited to only finished spaces. The space has a wide variety of uses even when it is unfinished, and the three-way switch requirement should apply in all those instances.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-262 Log #834 NEC-P02 **Final Action: Reject**
(210.70(A)(2)c.)

Submitter: Eugene Swisher, City of Tampa / Rep. IBEW Local 915, IAEI Southcoast Division
Recommendation: Revise text to read as follows:
Where one or more lighting outlet(s) are installed for interior or exterior stairways, there shall be a wall switch at each floor level, ground or grade level and landing level that includes an entry way to contact the lighting outlets where the stairway between floor levels or floor and ground or grade levels has six risers or more.
Substantiation: This will close a loophole that appears to allow the required lighting outlet at outdoor entrances of multi-level dwelling units, to not have control of the lighting outlet from each level or grade.
Panel Meeting Action: Reject
Panel Statement: The submitter's revision would literally require a switch at a set of exterior steps from a driveway leading up to a porch. In addition, on multi-family applications, designers typically avoid installing switches and use other control means for this type of application.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-263 Log #1636 NEC-P02 **Final Action: Reject**
(270.70(A)(2)(c.))

Submitter: L. Keith Lofland, International Association of Electrical Inspectors
Recommendation: Add new text as follows:
(c) Where one or more lighting outlet(s) are installed for interior stairways, there shall be a wall switch at each floor level, and landing level that includes an exterior entryway, to control the lighting outlet(s) where the stairway between floor levels has six risers or more.
Substantiation: The current language in the 2005 NEC would require a wall switch at a stairway landing to control the stairway lighting where the stairway landing simply has a half-door leading into an attic area (attic entryway) from the stairway landing. This switch is not needed at the landing in the above described scenario.

Panel Meeting Action: Reject
Panel Statement: Exterior can be interpreted to mean outside entrance only.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-264 Log #400 NEC-P02 **Final Action: Reject**
(210.70(B))

Submitter: J. Carlos Gonzalez, Greiner Electric
Recommendation: Revise text to read as follows:
Guest Rooms. At least one wall switch-controlled lighting outlet ~~or wall switch controlled receptacle~~ shall be installed <u>within 18 in. of each bed or adjacent nightstand</u> in guest rooms in hotels, motels, or similar occupancies.
Substantiation: I have spent the last several months living in a hotel on a work assignment. The problem that I have found is that the wall switches are positioned on the far ends of the room, not anywhere near the beds. When I get up to turn the light on or off in t he middle of the night, I have to walk across the room in the dark. Being in unfamiliar surroundings, it is very easy to trip or run into a piece of furniture. I feel that this presents a hazard to the guests. Therefore, I believe that there should be a wall switch within reach of the guest beds.
Panel Meeting Action: Reject
Panel Statement: This is a design issue that is impacted by the many configurations and arrangements of the space. The panel notes that the submitter's language would only require that the lighting outlet be installed within 450mm (18 in.) of the bed.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
BROWN, L.: In addition to the Committee Statement, there is no way to ascertain where a bed will be located during the life of the guest room. The location of the bed may change year-to-year, from one side of the room to another, especially when the hotel comes under new ownership.

2-265 Log #569 NEC-P02 **Final Action: Reject**
(210.70(C))

Submitter: Jeffrey A. Fecteau, City of Peoria, Arizona
Recommendation: Revise as follows:
Other than Dwelling Units: For attics and ~~underfloor~~ <u>under floor</u> spaces containing equipment requiring servicing, ~~such as heating, air conditioning, and refrigeration equipment,~~ at least one lighting outlet containing a switch or controlled by a wall switch shall be installed in such spaces. At least one point of control shall be at the usual point of entry to these spaces. The lighting outlet shall be provided at or near the equipment requiring servicing.
FPN: Examples of equipment requiring servicing may include but are not limited to heating, air-conditioning, refrigeration, power supplies and transformers used for signage.

Substantiation: This would eliminate any confusion that this code provision is applicable to all concealed installations of equipment requiring servicing and maintenance and not just heating, air-conditioning, and refrigeration equipment.
Note: Supporting Material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The current language is applicable to equipment that requires servicing. Heating, air conditioning and refrigeration equipment are provided as a partial list of examples, but is not an all-inclusive list of utilization equipment.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-266 Log #658 NEC-P02 **Final Action: Reject**
(210.70(C))

Submitter: Leon Przybyla, Southern Arizona Chapter IAEI
Recommendation: Revise Section 210.70(C) as follows:
(C) Other Than Dwelling Units. For attics, <u>soffits</u> and underfloor spaces containing equipment requiring servicing, such as heating, air-conditioning, ~~and~~ refrigeration equipment, <u>ballasts, transformers, and electronic power supplies,</u> at least one lighting outlet containing a switch or controlled by a wall switch shall be installed in such spaces.
Substantiation: To facilitate servicing as necessary for 600.21.
Panel Meeting Action: Reject
Panel Statement: "Soffit" is too broad of a term and would require lighting outlets in areas where they were not practical. The submitter has not substantiated applying the requirement to parts of the electrical distribution system outlined in the recommendation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-267 Log #664 NEC-P02 **Final Action: Reject**
(210.70(C))

Submitter: Rick Hollander, City of Tucson-Development Services
Recommendation: Revise Section 210.70(C) as follows:
(C) Other Than Dwelling Units. For attics, <u>soffits</u> and underfloor spaces containing equipment requiring servicing, such as heating, air-conditioning, ~~and~~ refrigeration equipment, <u>ballasts, transformers, and electronic power supplies,</u> at least one lighting outlet containing a switch or controlled by a wall switch shall be installed in such spaces.
Substantiation: To facilitate servicing as necessary for 600.21.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 2-266.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-268 Log #2671 NEC-P02 **Final Action: Reject**
(210.70(C))

Submitter: Bradley Butters, City of Reynoldsburg, Ohio
Recommendation: Add text to extend the last sentence.
... the equipment requiring sevicing <u>in such a manner as to allow one to read the stickers on the equipment without needing an additional light source.</u>
Substantiation: This proposal offers more specific criteria to the term "at or near". Being able to "read the stickers on the equipment" is clear, concise, and addresses the underlying intent that adequate illumination be provided for service and repair of the equipment.
Panel Meeting Action: Reject
Panel Statement: The submitter's recommendation is subjective and would be impractical given the differing locations of the labeling. The panel notes that a flashlight may be a simple solution to the submitter's issue.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-269 Log #2771 NEC-P02 **Final Action: Reject**
(210.70(C))

Submitter: Bradley Butters, City of Reynoldsburg, Ohio / Rep. City of Reynoldsburg, OH - IAEI
Recommendation: Add new sentence at end of paragraph:
<u>These lighting outlets shall not be GFCI or arc-fault protected.</u>
Substantiation: I feel strongly that an underlying principle of the code should be that a person be able to see to get to the location of various devices in order to investigate and attempt to reset the device, especially in an emergency. This can lead to injury due to trips and falls and running into obstacles along with a time delay in true emergencies due to loss of illumination.
Panel Meeting Action: Reject
Panel Statement: The panel disagrees with a prohibition of GFCI or AFCI protection for these outlets. If desired by the design, GFCIs or AFCIs can be utilized and provide an increased level of protection.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-270 Log #2772 NEC-P02 **Final Action: Reject**
(210.70(C))

Submitter: Bradley Butters, City of Reynoldsburg, Ohio / Rep. City of Reynoldsburg, OH - IAEI
Recommendation: Insert additional text:
"... at least one lighting outlet <u>consisting of a permanent luminaire</u> containing a switch or controlled by a wall switch...".
Substantiation: This paragraph could be interpreted loosely as allowing a switched receptacle in this application instead of a permanent luminaire. This proposal would remove any ambiguity.
Panel Meeting Action: Reject
Panel Statement: The panel disagrees with the submitter. The definition of "lighting outlet" in Article 100 is specific as pertains to the requirement for a direct connection of a lampholder or luminaire.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-271 Log #3467 NEC-P02 **Final Action: Reject**
(210.70(C))

Submitter: Richard F. Van Wert, Middle Department Inspection Agency / Rep. Benjamin Franklin Chapter IAEI
Recommendation: Revise text to read:
210.70(C) Other Than Dwelling Units. For <u>rooftops,</u> attics and underfloor spaces, etc.
Substantiation: Lighting of the work area around rooftop units is being specified by architects and engineers. The NEC should also address this safety issue.

Panel Meeting Action: Reject
Panel Statement: The panel disagrees that lighting on a rooftop should be mandated. In the majority of cases, daylight would provide the needed lighting.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
KING, D.: This proposal should be accepted. I disagree with the panel statement that most service work is performed at times when daylight would provide the needed lighting. Most service work is performed at night when buildings are not occupied, therefore creating an unsafe condition due to inadequate lighting. Persons working on rooftop equipment should be afforded the same level of safety that is provided with the requirements in section 210.70(C).

2-272 Log #3482 NEC-P02 **Final Action: Reject**
(210.70(C))

Submitter: Richard F. Van Wert, Middle Department Inspection Agency / Rep. Benjamin Franklin Chapter IAEI
Recommendation: Revise text to read:
210.70(C) Other Than Dwelling Units. For attics <u>, rooftops</u> and underfloor spaces etc.
Substantiation: This article needs rewording because the Architects and Engineers are most often requiring that a luminaire be installed at the HVAC Units located on the roof. The NEC should contain this requirement also since off-hours service calls are often needed during the dark hours and the servicemen need light here just as much as in an attic or other spaces that contain equipment.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 2-271.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
KING, D.: See my explanation of negative for proposal 2-271.

2-273 Log #3328 NEC-P02 **Final Action: Reject**
(210.70(D) (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc. / Rep. Massachusetts Electrical Code Advisory Committee
Recommendation: Insert an additional lettered subsection (D) to 210.70 as follows:
(D) GFCI Protection of Lighting Outlets in All Occupancies. The operation of a single GFCI device shall not deenergize all lighting outlets in a given area.
Substantiation: The issue addressed in this proposal is surprisingly common, probably due to the prevalence of the use of 210.11(C)(3) Exception in today's built environment. Using this exception means that only one branch circuit typically enters dwelling unit bathrooms. Although there is no loading issue, if the GFCI trips at night, or if there is no window in the room, the room will be completely dark unless at least one light is wired ahead of the GFCI. This is a safety issue. In addition, commercial occupancies unencumbered by 210.11(C) also use the same wiring pattern because of the diminished expenses associated with it. Since a GFCI protected light typically only occurs in a shower stall, this should not generally result in additional lighting outlets. It simply requires mindfulness on the part of the installer as to what loads are on the load side of the GFCI.
Panel Meeting Action: Reject
Panel Statement: The submitter has not substantiated the recommendation for excluding GFCI protection for lighting outlets in all occupancies. This application, however, is not prohibited and would be a design consideration.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 215 — FEEDERS

2-274 Log #1096 NEC-P02 **Final Action: Reject**
(215.2(A)(1))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Delete second paragraph.
Substantiation: The proposal in the 2004 ROP resulting in this rule did not provide substantiating data re: occurrences of burned open feeder grounded conductors. A 208/120 volt 3 phase 4-wire feeder supplying a large pump motor, one receptacle, and one lighting outlet in a pump room could utilize a No. 12 or 14 AWG grounded (neutral) conductor prior to this rule. Such a pump motor rated 100 HP 3-phase 208 volts (273 amperes) could have the feeder protected by nontime-delay fuses with a rating 300 percent of the motor FLA plus the lighting and receptacle load of 360 voltamps which is 273 x 300 percent plus 3 amperes, or 822 amperes. If 800 ampere fuses are used for feeder protection, the grounded conductor for a 3 ampere load is required to be 1/0 copper or 3/0 aluminum. However, if a separate 2-wire 120 volt circuit with No. 12 or 14 conductors are installed in the same raceway or enclosure, the present requirement is not applicable. The present requirement does not protect grounded conductors of other circuits which may be installed in the same raceway or enclosure and have overcurrent protection rated less than the overcurrent protection of other conductors. This section is only effective where feeder conductors are in a dedicated raceway or enclosure or all other conductors have the same overcurrent protection rating. If the feeder conductors terminate in an auxiliary gutter and taps are installed to supply fused switches or circuit breakers for the example above is the grounded conductor tap required to be 1/0 or 3/0? It is still a feeder conductor up to the line side of the switch or breaker. A 30 ampere switch or 15 or 20 ampere circuit breaker for the lighting and receptacle is not suitable for such conductors. It is not clear if the tap rules are intended to apply. For Proposals 5-63 (250.24) in the 2004 ROP, the panel stated: "There is no technical substantiation to demonstrate that the grounded conductor sized per 250.24 (2002 NEC) is inadequate". Similar statements were made for Proposal 5-70 and 5-71 for service conductors. Although service conductors may not be installed in raceway with non-service conductors they apparently may be installed with other service conductors (230.7) with grounded conductors (neutrals) sized by requirements different than this section (230.31and 230.42) even though "unprotected." 351.72 doesn't have such a requirement for site feeder grounded (neutral) conductors.
Panel Meeting Action: Reject
Panel Statement: The panel disagrees with the submitter and notes that the grounded conductor will be a fault return path. The panel also notes that Proposal 5-63 from the 2005 cycle substantiated keeping the rule since 250.24 requires that these conductors not be smaller than a 250.66 conductor.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-275 Log #1322 NEC-P02 **Final Action: Accept in Principle**
(215.2(A)(1))

TCC Action: The Technical Correlating Committee understands that the Panel Action located the new Exception between the last two paragraphs in 215.2(A)(1).
Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Revise as follows:
215.2 Minimum Rating and Size.
(A) Feeders Not More Than 600 Volts.
(1)General. Feeder conductors shall have an ampacity not less than required to supply the load as calculated in Parts III, IV, and V of Article 220. ~~The minimum feeder-circuit conductor size,~~ <u>Feeder-circuit conductors that are connected to an overcurrent device assembly shall have a minimum allowable ampacity,</u> before the application of any adjustment or correction factors, ~~shall have an allowable ampacity~~ not less than the noncontinuous load plus 125 percent of the continuous load.
Substantiation: Confusion reigns as to under what conditions grounded conductors are subject to the same 125 percent of continuous load sizing requirements as are ungrounded conductors. During the 2005 *Code* cycle this issue was addressed for feeders, but action was deferred. ROC No. 2-145 included a lucid, sound "substantiation" that unfortunately was rejected by CMP 2 at that time. Now is an excellent time to re-evaluate that "substantiation" and adopt its intent.
The basis for the 125 percent requirement stems from the manner in which listed overcurrent devices are tested. During continuous load tests of enclosed overcurrent devices, in order to prevent nuisance tripping, it has been found that it is necessary to limit the current to 80 percent of the device's rating. Conductors are sized, then, (1) at 125 percent of the continuous current in accordance with the allowable ampacity determined from Table 310.16, and (2) per the terminal temperature limitations of 110.14(C).
The reality is that the enclosed overcurrent devices rely on the mass of the conductors to act as heat sinks that dissipate excess thermal energy and thereby avoid unacceptable nuisance tripping. Of course, since overcurrent devices cannot distinguish between ungrounded and grounded conductors, in both cases the conductor sizes must be based on calculations that include an additional 25 percent factor when the load is continuous. On the other hand, there is no reason to add 25 percent to the load of a conductor that is not connected to a device that is not subject to nuisance tripping, such as in the case of a grounded conductor connected a neutral terminal bus.
The end result of this proposal is twofold:
1. The additional 25 percent continuous load requirement applies only to conductors, both ungrounded and grounded, that connect to an overcurrent device (unless, of course, the assembly is listed for operation at 100 percent of its rating).
2. Grounded conductors that carry continuous loads and that connect only to neutral buses, or to devices not subject to nuisance tripping, are not required to have their loads increased by 25 percent.

This proposal accomplishes that goal and, in hand with similar proposals made in two other Articles, brings into conformity the requirements for branch circuits (210.19), feeders (215.2), and services (230.42).

Panel Meeting Action: Accept in Principle

Add a new exception to 215.2(A):

Exception: Grounded conductors that are not connected to an overcurrent device shall be permitted to be sized at 100% of the continuous and noncontinuous load.

Panel Statement: The panel has accepted the submitters concept but has added the provision as an exception to the main rule. the concern with the submitters proposed language is that it may be interpreted that the conductors have to terminate directly to an overcurrent device.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-276 Log #1493 NEC-P02 **Final Action: Reject**

(215.2(A)(1))

Submitter: Larry T. Smith, National Electrical Seminars

Recommendation: Revise text to read as follows:

(1) General. Feeder conductors shall have an ampacity not less than required to supply the load as calculated in Parts III, IV, and V of Article 220. The minimum feeder-circuit conductor size, before the application of any adjustment or correction factors, shall have an allowable ampacity not less than the noncontinuous load plus 125 percent of the continuous load <u>in accordance with the temperature limitations of 110.14(C)</u> .

Substantiation: Ignoring the temperature rating of equipment is the most common mistake being made in conductor sizing today. Entirely too many wiremen take no notice of the temperature limitations of 110.14(C) when sizing conductors. They disregard the temperature rating of equipment, and use the 90°C column of Table 310.16 when 90°C rated conductors, such as THHN, are being used. The equipment rating will either be 60° or 75°C, not 90°C.

Observing the temperature rating of the equipment is an integral part of sizing feeder conductors; it should be included as a requirement of 215.2(A)(1).

Panel Meeting Action: Reject

Panel Statement: Section 110.14 (C) applies generally to all installations. Adding a direct reference in this section would only confuse users because a reference is not added in every other section of the NEC impacted by 110.14(C).

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-277 Log #2837 NEC-P02 **Final Action: Reject**

(215.2(A)(3), FPN 2)

Submitter: Robert P. McGann, City of Cambridge

Recommendation: Make this Fine Print Note into mandatory text.

Substantiation: This is necessary to properly facilitate the operation of overcurrent protection. We are all looking at ways to reduce the number of electrical fires. This will aid us in achieving that goal.

Panel Meeting Action: Reject

Panel Statement: Acceptable voltage drop is a system design issue that may vary with the application and equipment involved.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-278 Log #1722 NEC-P02 **Final Action: Reject**

(215.3(A)(3), FPN 2)

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education

Recommendation: Revise as follows:

"... and where the maximum total voltage drop on service equipment, feeders, and branch circuits (including outlet devices) to the farthest...".

Substantiation: The present wording is based on nominal voltage minus 5 percent reliably being high enough for reasonable efficiency of operation. If voltage predictable runs lower than that, there may be problems. I have encountered service equipment that added 1 percent or more impedance. Standard VD testers, after all, indicate total drop, not merely drop through feeders and branch circuits.

Panel Meeting Action: Reject

Panel Statement: It is not necessary to define possible combinations of equipment to convey the intent of the FPN.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-279 Log #1556 NEC-P02 **Final Action: Accept**

(215.4)

Submitter: Technical Correlating Committee on National Electrical Code®,

Recommendation: Make the following change in 215.4:

Change "neutral" to "neutral conductor."

The revised text would appear as follows:

215.4 Feeders with Common Neutral <u>Conductor</u> .

Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).

The Task Group has proposed the following definitions to be added to Article 100:

- **Neutral conductor.** A circuit conductor connected to the neutral point of a system.
- **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.

This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals

- The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.
- The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.

Additional information is available in the Task Group report.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

KING, D.: See my explanation of negative for proposal 2-11.

2-280 Log #2224 NEC-P02 **Final Action: Reject**

(215.4)

Submitter: Donald A. Ganiere, Ottawa, IL

Recommendation: Revise as follows:

215.4 Feeders with Common Neutral.

~~(A) Feeders with common Neutral Two or three sets of 3-wire feeders or two sets of 4-wire or 5-wire feeders shall be permitted to utilize a common neutral.~~

~~(B) In Metal Raceway or Enclosure.~~ Where installed in a metal raceway or other metal enclosure, all conductors of all feeders using a common neutral shall be enclosed within the same raceway or other enclosure as required in 300.20.

Substantiation: There is no code violation in using a common neutral so the specific provision to use one is not required.

Panel Meeting Action: Reject

Panel Statement: The panel disagrees with the submitter's substantiation. Section 215.4 (A) is the requirement which limits the number of feeders that may share a common neutral.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-281 Log #1557 NEC-P02 **Final Action: Accept**

(215.4(A))

Submitter: Technical Correlating Committee on National Electrical Code®,

Recommendation: Make the following change in 215.4(A):

Change "neutral" to "neutral conductor."

The revised text would appear as follows:

(A) Feeders with Common Neutral <u>Conductor</u> . Two or three sets of 3-wire feeders or two sets of 4-wire or 5-wire feeders shall be permitted to utilize a common neutral <u>conductor</u> .

Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).

The Task Group has proposed the following definitions to be added to Article 100:

● **Neutral conductor.** A circuit conductor connected to the neutral point of a system.

● **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.

This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals

● The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.

● The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.

2-282 Log #1558 NEC-P02 **Final Action: Accept**

(215.4(B))

Submitter: Technical Correlating Committee on National Electrical Code

Recommendation: Make the following change in 215.4(B):

Change "neutral" to "neutral conductor."

The revised text would appear as follows:

(B) In Metal Raceway or Enclosure. Where installed in a metal raceway or other metal enclosure, all conductors of all feeders using a common neutral conductor shall be enclosed within the same raceway or other enclosure as required in 300.20.

Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).

The Task Group has proposed the following definitions to be added to Article 100:

● **Neutral conductor.** A circuit conductor connected to the neutral point of a system.

● **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.

This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals

● The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.

● The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.

Additional information is available in the Task Group report.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

KING, D.: See my explanation of negative for proposal 2-11.

2-283 Log #524 NEC-P02 **Final Action: Accept**

(215.6)

TCC Action: It was the action of the Technical Correlating Committee that the panel reconsider this Proposal and correlate with the action taken on Proposal 5-119. This action will be considered by the panel as a Public Comment.

Submitter: Michael J. Johnston, Plano, TX

Recommendation: Revise text to read:

215.6 Feeder ~~Conductor~~ Equipment Grounding Conductor ~~Means~~ . Where a feeder supplies branch circuits in which equipment grounding conductors are required, the feeder shall include or provide an equipment grounding conductor ~~a grounding means~~ , in accordance with the provisions of 250.134, to which the equipment grounding conductors of the branch circuits shall be connected.

Exception: Where the feeder to a separate building or structure is installed in accordance with 250.32(B)(2), an equipment grounding conductor shall not be installed.

Substantiation: This proposal is an editorial revision to the section and a new mandatory exception is proposed that will correlate with 250.32(B)(2) which includes provisions for feeders installed to supply separate buildings or structures that are not required or permitted to include an equipment grounding conductor where the grounded conductor is used for grounding purposes.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

KING, D.: I agree with the panel action to accept the addition of the exception to 215.6. I disagree with the panel action to accept the deletion of the existing term "grounding means." The submitter of this proposal has not provided any substantiation to revise the term in the present text in 215.6. See my explanation of negative for proposal 2-284.

2-284 Log #1531 NEC-P02 **Final Action: Accept**

(215.6)

Submitter: Technical Correlating Committee on National Electrical Code®,

Recommendation: Revise the title of 215.6 as follows:

215.6 Feeder Equipment Grounding Conductor ~~Grounding Means~~

Substantiation: This is the result of the TCC Task Group on Grounding and Bonding in resolve of the 2005 NEC cycle actions related to Proposal 5-1 and Comment 5-1 as directed by the Technical Correlating Committee. This is a companion proposal to the proposed revision to the terms "bonded", "grounded", and "equipment grounding conductor" in Article 100 relative to this Task Group's recommendations. This change clarifies the present requirement in more prescriptive language. The title is changed to more accurately describe the subject of the text.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

KING, D.: I disagree with the panel action to accept this proposal. Documentation included with this proposal indicates that there is not a clear consensus with all the members of the Task Group on the clarity of the recommended revised text by the Technical Correlating Committee. This proposal should be referred back to the Technical Correlating Committee for further consideration.

2-285 Log #1729 NEC-P02 **Final Action: Reject**

(215.9(A) and (B))

Submitter: Paul S. Hamer, Chevron Texaco Energy Research and Technology Company

Recommendation: Renumber the existing wording of 215.9 and include as (A):

(A) Ground-Fault Circuit-Interrupter Protection for 125-volts, Single-Phase Feeders. Feeders supplying 15- and 20-ampere receptacle branch circuits shall be permitted to be protected by a ground-fault circuit interrupter in lieu of the provisions for such interrupters as specified in 210.8 and 590.6(A).

Add a new section (B):

(B) Ground-Fault Circuit-Interrupter System (GFCIS-3Ph) Protection for Three-Phase Feeders.

(1) Supplying Lighting Circuits. Three-phase feeders that supply lighting branch circuits with an operating voltage of more than 150 volts to ground shall be permitted to be protected by three-phase ground-fault circuit-interrupter systems in lieu of the provisions for such systems as specified in 210.8.

(2) Supplying Other Than Lighting Loads. Three-phase feeders that supply loads other than lighting shall be permitted to be protected by three-phase ground-fault circuit-interrupter systems in lieu of the provisions for such systems as specified in 210.8.

Substantiation: See my companion proposal for 210.8(D). If the proposal for 210.8(D) is accepted, this proposal would allow the alternative of using the three-phase ground-fault circuit-interrupter systems for feeders.

This proposal subdivides the existing 215.9 to accommodate single-phase and three-phase ground-fault protection. The proposed title of "A" is added to differentiate the existing "Ground-Fault Circuit-Interrupter Protection for 125-volts, Single-Phase Feeders" from the newly proposed provisions in "B" for "Ground-Fault Circuit-Interrupter System (GFCIS-3Ph) Protection for Three-Phase Feeders."

Provision (B)(1) is proposed to correspond with the proposal submitted for the proposed new section 210.8(D)(1). Provision (B)(2) is added to indicate an allowed option of fusing the three-phase ground-fault circuit-interrupter systems for loads other than lighting, corresponding to the proposed new 210.8(D)(2).

Panel Meeting Action: Reject

Panel Statement: The panel notes that the system recommended by the proposal is currently not prohibited. See the panel action and statement on Proposal 2-88.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

KING, D.: See my explanation of negative for proposal 2-88.

Comment on Affirmative:

BROWN, L.: In all, see Panel Action on related Proposals: 2-6; 2-88; and 2-285.

2-286 Log #3499 NEC-P02 **Final Action: Accept**
(215.10 Exception No. 2)

Submitter: Jim Pauley, Square D Company

Recommendation: Delete Exception No. 2 of 215.10

~~*Exception No. 2: The provisions of this section shall not apply to fire pumps.*~~

Renumber the remaining exceptions

Substantiation: During the 2005 NEC Cycle, CMP 13 added the provision to prohibit GFPE on fire pumps in 695.6(H). The section reads as follows:

(H) Ground Fault Protection of Equipment. Ground fault protection of equipment shall not be permitted for fire pumps.

Since Chapter 6 can supplement or modify requirements in Chapter 2, there is no need for the exception in 215.10. In fact, the exception adds confusion because code users misinterpret that an exception needs to be in Chapter 2 for Chapter 6 to exempt it.

The deletion is consistent with 90.3 and consistent with the TCC direction to not create redundant rules.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-287 Log #3498 NEC-P02 **Final Action: Accept**
(215.10 Exception No. 3)

Submitter: Jim Pauley, Square D Company

Recommendation: Revise Exception No. 3 as shown below:

Exception No. 3: The provisions of this section shall not apply if ground-fault protection of equipment is provided on the supply side of the feeder <u>and on the load side of any transformer supplying the feeder</u> .

Substantiation: This proposal is intended to clear up some misunderstandings of code users relative to this exception. The intent of the exception is to not require GFPE on a feeder disconnect if that feeder has GFPE protection provided upstream. However, some are misinterpreting that GFPE could be provided on the primary of a transformer to meet this exception. Of course, GFPE on the primary side of a transformer provides no equipment protection to equipment connected to the secondary since the ground-fault on the secondary only returns current to the secondary of the transformer.

The revision would serve to make it clear that any GFPE on the supply side used to exempt the feeder disconnect from GFPE must be on the load side of the transformer supplying the feeder.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-288 Log #2149 NEC-P02 **Final Action: Reject**
(215.12)

Submitter: Roger Hewitt, Puget Sound Electrical Apprenticeship / Rep. IBEW LU #46

Recommendation: Delete existing text from 215.12 and replace with:

<u>Feeder conductors shall be identified in accordance with 310.12 (ALL).</u>

Substantiation: Multiple sections of the NEC must now be consulted to ensure proper conductor identification. Combining all conductor identification requirements in one section in Article 310 is logical.

Panel Meeting Action: Reject

Panel Statement: The purpose of Article 215.12 is to outline the requirements for identifying feeders. The appropriate place for listing these requirements is in the section on feeders.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

BROWN, L.: In all, see Panel Action on related Proposals: 2-18; and 2-288.

2-289 Log #3226 NEC-P02 **Final Action: Reject**
(215.12, FPN)

Submitter: Randall Opperman, Jr., O.S.C.Inc.

Recommendation: Add text to read as follows:

FPN: 1) 240 volt single phase systems shall be identified by red and black marking

2) 240 volt 3 phase systems shall be identified by black, orange, and blue mark

3) 480 volt 3 phase systems shall be identified by brown, orange, and yellow markings

4) 208 volt 3 phase systems shall be identified by black, red and blue markings.

Substantiation: 215.12 does not specify how a branch circuit shall be identified, yet it tells us to identify it. An industry standard for electricians who use the NEC should be adopted by adding a FPN to the article.

Panel Meeting Action: Reject

Panel Statement: The submitter's recommended fine print note contains branch circuit identification requirements which are not appropriate in a fine print note. Further the panel notes that the detail of how to identify a circuit is intentionally not specified to allow flexibility for identifying circuits by methods other than color.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

BROWN, L.: In all, see Panel Action on related Proposals: 2-29; and 2-289.

2-290 Log #671 NEC-P02 **Final Action: Accept**
(215.12(C))

Submitter: Jamie McNamara, Hastings, MN

Recommendation: Revise as follows:

215.12 (C) Ungrounded Conductors . Where the premises wiring system has feeders supplied from more than one nominal voltage system, each ungrounded conductor of a feeder, where accessible, shall be identified by <u>phase and</u> system.

Substantiation: To Harmonize with 210.5 (C) and helps installers and maintenance personnel identify what phase and system they will be services or working on and the hazards encountered.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

BROWN, L.: In all, see Panel Action on related Proposals: 2-19; 2-22; 2-24; 2-290; and 2-292.

2-291 Log #2682 NEC-P02 **Final Action: Accept in Part**
(215.12(C))

Submitter: Dorothy Kellogg, American Chemistry Council

Recommendation: Revise text of section as follows:

215.12 Identification for Feeders.

(C) Ungrounded Conductors. Where the premises wiring system has feeders supplied from more than one nominal voltage system, each ungrounded conductor of a feeder, ~~where accessible~~ , shall be identified by system <u>at all termination, connection and splice points</u> . The means of identification shall be permitted to be by separate color coding, marking tape, tagging, or other approved means. <u>The means of identification shall be documented in a manner that is readily available or</u> ~~and~~ shall be permanently posted at each feeder panelboard or similar feeder distribution equipment. <u>In industrial occupancies, where conditions of maintenance and supervision ensure that only qualified persons service the installation, a cable and conductor numbering system shall be permitted to meet this requirement.</u>

Substantiation: The current wording would require marking of the conductors at every conduit fitting and pull box or any other location where the branch circuit is accessible. The locations where the branch circuit is terminated, connected or spliced are the critical locations where the marking is needed. The revised wording would account for branch circuits installed using cables and branch circuits installed using single conductors in raceways. Many industrial facilities already have rigorous comprehensive cable and conductor labeling/

numbering systems. These systems meet already intent of the requirement and should be allowed. Posting of the numbering system on the equipment is impractical and would be confusing to the people in the field in these kinds of establishments. These labeling/numbering systems are documented on drawings. In these facilities the drawings are used to gain understanding of the installations and how modifications can be made.

Panel Meeting Action: Accept in Part

1. Accept the submitters revision to the first sentence that deletes the words "where accessible" and adds the words "at all termination, connection and splice points".

2. Accept the submitters revision to the second sentence so that the text reads "The means of identification shall be permitted to be by separate color coding, marking tape, tagging, or other approved
means. The means of identification shall be documented in a manner that is readily available or shall be permanently posted at each feeder panelboard or similar feeder distribution equipment."

3. Reject the new last sentence proposed by the submitter.

Panel Statement: The panel has accepted the revision to require the identification only at termination, connection and splice points and notes that the acceptance of 2-290 and 2-292, will add the words "phase and" into the existing sentence.

The panel agrees that the identification should be permitted to be readily available and has accepted the revision as proposed by the submitter. The panel rejects the new last sentence because the identification proposed would already be permitted by the current text as an "approved means". It is not the objective of the panel to detail every possible identification scenario.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

KING, D.: See my explanation of negative vote for Proposal 2-23.

WEBER, R.: I support the action of the panel to accept in part as indicated but do not agree with the acceptance of an alternate method for feeder identification as panels or distribution equipment. By incorporating the text thus allowing **"** documentation in a manner that is readily available <u>or</u> shall be permanently posted" creates a problem. From the inspection community, when the identification of the feeder conductors is indicated by system, it needs to be permanently posted at each panel board or distribution equipment. The proposed change could incorporate a file located somewhere to meet the intent of the language, which can be misplaced or lost and not available at a critical time frame when it is most needed. To be consistent with the proposed change in Proposal 2-24, the term "phase and" by system should be added to the end of the first sentence of the section.

Comment on Affirmative:

BROWN, L.: In all, see Panel Action on related Proposals: 2-23; and 2-291.

2-292 Log #2736 NEC-P02 **Final Action: Accept**
(215.12(C))

Submitter: Jim Pauley, Square D Company

Recommendation: Revise text to read as follows:

(C) Ungrounded Conductors. Where the premises wiring system has feeders supplied from more than one nominal voltage system, each ungrounded conductor of a feeder, where accessible, shall be identified by <u>phase and</u> system. The means of identification shall be permitted to be by separate color coding, marking tape, tagging, or other approved means and shall be permanently posted at each feeder panelboard or similar feeder distribution equipment.

Substantiation: The objective of this change is for CMP 2 to clarify whether or not the ungrounded conductors are expected to be identified for just the system or whether the expectation is to have the ID provide both phase and system identification. Under the present requirement, all of the ungrounded conductors of one system could carry the same identification provided it is distinguished from the ungrounded conductors of the other system.

If accepted, the new text will clarify that the expectation is to be able to not only distinguish between the different systems, but between the different phases of the system as well.

A companion proposal has been made to Article 210 for branch circuits.

Panel Meeting Action: Accept

Panel Statement: The panel accepts only the addition of the words "phase and".

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

BROWN, L.: In all, see Panel Action on related Proposals: 2-19; 2-22; 2-24; 2-290; and 2-292.

2-293 Log #2544 NEC-P02 **Final Action: Accept in Principle**
(215.12(C) Exception (New))

Submitter: Timothy D. Curry, Curry Electric, Inc.

Recommendation: Add this language after the section:

<u>Exception: Conductors larger than 6 AWG shall not be required to be marked or identified in conduit bodies that contain no splices or unused hubs.</u>

Substantiation: The definition of "accessible" would include these conduit bodies. It is nearly impossible to install the markings, nor does it serve a purpose to require them in a conduit body where there is no realistic chance that anyone is going to try to splice or tap into the circuit. 250.119(A)(1) Exception uses same logic.

Panel Meeting Action: Accept in Principle

Panel Statement: The recommended action is accomplished through the panel action on Proposal 2-291.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

BROWN, L.: In all, see Panel Action on related Proposals: 2-30; and 2-293.

2-294 Log #924 NEC-P02 **Final Action: Reject**
(215.12(C), Exceptions Nos. 1, 2, & 3 (New))

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Revise first sentence:

Where the premises wiring system has feeders supplied ~~from more than one nominal voltage~~ system <u>s with different characteristics such as voltages, frequencies, phases, or supplied from different services or separately derived systems,</u> each ungrounded conductor of a feeder, where accessible, shall be identified by system.

<u>Exception No. 1: Conductors for emergency systems.</u>

<u>Exception No. 2: Conductors in busways.</u>

<u>Exception No. 3: Where the Authority Having Jurisdiction determines that a system is sufficiently limited or separated from other systems identification shall not be required.</u>

Substantiation: Different voltages should not be the only criterion for identification. Systems may be supplied from different services, different transformer vaults, local site transformers, batteries, rectifiers, generators, etc. with voltages no different than other systems, where the potential hazard of misconnection is no less. Exception No. 1 is proposed because Article 700 requires identification for emergency systems. It is impractical to identify busway conductors at every plug-in opening and connecting other system conductors to a busway is unlikely. Exception No. 3 provides some relief as for example a large industrial plant has multiple services or transformer vault, etc. and those systems supply limited or designated areas of the premises.

Panel Meeting Action: Reject

Panel Statement: The submitter has not provided substantiation to require identification of feeders other than for system and voltage.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

BROWN, L.: In all, see Panel Action on related Proposals: 2-20; and 2-294

ARTICLE 220 — BRANCH-CIRCUIT, FEEDER, SERVICE CALCULATIONS

2-295 Log #1323 NEC-P02 **Final Action: Reject**
(220.3)

Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Revise as follows

Calculation	Article	Section (or Part)
Storage-Type Water Heaters	422	422.11(E) , 422.13

Substantiation: The 2005 *Code* accepted a change to 422.13 that requires a fixed storage-type water heater with a capacity of 450 L (120 gal) or less to be considered a continuous load. The change impacts load calculations for branch circuits, feeders, and services. This proposal adds an additional load calculation reference to Table 220.3 to alert *Code* users to that fact.
Panel Meeting Action: Reject
Panel Statement: Loads that are continuous impact the sizing of feeder and service conductors and overcurrent protective devices in accordance with Articles 215 and 230.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-296 Log #477 NEC-P02 **Final Action: Reject**
(220.3(10)(1) and (2))

Submitter: Joseph Rossi, Township of Clinton
Recommendation: Revise text to read:
All receptacles shall be calculated at 180 volt-amperes.
Substantiation: On one of my inspections for a final of a new house, I noticed there were six outlets outside, so I tripped one receptacle and started counting how many did not work, there were a total of 15 outlets that did not work, so I gave the contractor a red sticker and wrote down 15 × 120 = 1800, divide that by 180VA gives you a total of 10 receptacles. When I got back to the office my C.O. said, “You can’t do that, you don’t calculate dwelling units with 180VA, you use 3VA per square foot.” I responded with “Since when is the outside of a house and a garage considered living space?” We then started our debate about calculations. I wrote to the DCA of New Jersey and talked to many of my fellow inspectors about this issue, all tell me to use 3VA/square foot. After a long battle, I finally ceded when my instructor Ben Shedlock said to follow the Code. Mostly everyone I talk to agrees that it would be a poor design to have more than 10 receptacles on a 15-amp breaker, but you cannot do your calculations like that. This is a passion issue for me so please give it some attention.
Panel Meeting Action: Reject
Panel Statement: CMP-2 has addressed this issue many times. The load calculation of 3VA/sqft for dwelling units adequately covers the load calculations for receptacles. Since the Code requires that the receptacles be installed in specific locations and specific spacings in dwellings, it is not intended to limit the number of receptacles on a branch circuit. The panel also notes that 220.14(J) is clear that the receptacle outlets for outdoors and garages are included in calculations.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-297 Log #1149 NEC-P02 **Final Action: Reject**
(220.5)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise heading:
~~SIZE~~ AMPACITY of CONDUCTORS 600 VOLTS, NOMINAL or LESS
Substantiation: Edit. The text relates to AMPACITY; SIZE DOESN’T NECESSARILY RELATE TO AMPACITY COVERING, CONDUCTOR MATERIAL, NUMBER OF CONDUCTORS CAN AFFECT AMPACITY.
Panel Meeting Action: Reject
Panel Statement: Section 220.5 is titled “Calculations” and not “Size of Conductors.”
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-298 Log #3261 NEC-P02 **Final Action: Reject**
(220.5(B))

Submitter: Derek Burk, Frankenmuth, MI
Recommendation: Add text to read as follows:
...permitted to be dropped. All other fractions shall be rounded up to the nearest whole integer.
Substantiation: The code gives instructions for what is to be done with fractions less than.5, but lacks explanation of what to do with other fractions.
Panel Meeting Action: Reject
Panel Statement: The submitter’s substantiation does not provide evidence of a safety concern using the current calculation method. In addition, the calculation method proposed is not prohibited by the code.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-299 Log #3622 NEC-P02 **Final Action: Reject**
(220.5(B))

Submitter: Richard W. Becker, Engineered Electrical Systems, Inc. / Rep. IEEE
Recommendation: Revise to read:
“Where calculations result in a fraction of an ampere, the result shall be permitted to be rounded to the nearest whole number.”
Substantiation: The present wording permits a fractional amp less than 0.5 to be dropped but fractions 0.5 through 0.9 must be kept. “Rounding” the smaller fraction but not the larger results in an understatement of the actual amperage.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Proposal 2-298.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
BECKER, R.: This proposal should be accepted. The purpose of the proposal is to correct the error in mathematical/engineering terminology.

2-300 Log #3613 NEC-P02 **Final Action: Reject**
(220.10)

Submitter: Joseph A. Hertel, State of Wisconsin
Recommendation: Substitute the following wording for NEC 220.10:
Branch-circuit loads shall be calculated as shown in NEC 220.12, 220.14 and 220.16 or under the supervision of a professional engineer, architect or designer of electrical systems, circuit load calculations may use a lower unit load than identified in Table 220.12 when energy codes restrict lighting loads to an amount lower than the table values.
Substantiation: Jurisdictions are mandated to adopt energy codes than have unit loads significantly lower than the Table 220.12 values. The increasing energy efficiency of illumination products has not been reflected in the values used for sizing branch circuit loads. While this creates a factor of safety an engineering professional should be able to provide an appropriate size and thereby reduce the installed cost.
Panel Meeting Action: Reject
Panel Statement: The current requirements given in 220.10 are not in conflict with the local energy codes. The calculation methods provided in this article provide a means to determine adequate service and feeder capacities but do not require that this entire capacity be connected.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-301 Log #3117 NEC-P02 **Final Action: Reject**
(Table 220.12)

Submitter: James M. Imlah, City of Hillsboro Building Department
Recommendation: Revise text as follows:
220.12 Lighting Load for Specified Occupancies
A unit load of not less than that specified in Table 220.12 for occupancies specified therein shall constitute the minimum lighting load. The floor area for each floor shall be calculated from the outside dimensions of the building, dwelling unit, or other area involved. For dwelling units, the calculated floor area shall not include open porches, garages, or unused or unfinished spaces not adaptable for future use.

Table 220.12 General Lighting Loads by Occupancy

Type of Occupancy	Unit Load	
	Volt-Amperes per Square Meter	Volt-Amperes per Square Foot
Armories and auditoriums	11	1
Banks	39 [b]	3 1/2 [b]
Barber shops and beauty parlors	33	3
Churches	11	1
Clubs	22	2
Court rooms	22	2
Dwelling units [a]	33	3
Garages-commercial (storage)	6	1/2
~~Hospitals~~ (Patient Care Area)	22	2
Hotels and motels, including apartment houses without provision for cooking by tenants [a]	22	2
Industrial commercial (loft) buildings	22	2
Lodge rooms	17	1 1/2
Office buildings	39 [b]	3 1/2 [b]
Restaurants	22	2
Schools	33	3
Stores	33	3
Warehouses (storage)	3	1/4
In any of the preceding occupancies except one-family dwellings and individual dwelling units of two-family and multifamily dwellings:		
Assembly halls and auditoriums	11	1
Halls, corridors, closets, stairways	6	1/2
Storage spaces	3	1/4

[a] See 220.14(J).
[b] See 220.14(K).

FPN: The unit values herein are based on minimum load conditions and 100 percent power factor and may not provide sufficient capacity for the installation contemplated. General lighting loads determined by 220.12 are in fact minimum lighting loads, and there are no exceptions to these requirements. Therefore, energy saving-type calculations are not permitted to be used to determine the minimum calculated lighting load if they produce loads less than the load calculated according to 220.12. On the other hand, energy saving-type calculations can be a useful tool to reduce the connected lighting load and actual power consumption.

Substantiation: "Hospital" is a portion of a building for the care of 4 or more inpatients. More medical facilities and procedures are being performed outside of the "hospital" environment. There is outpatient care being provided in Oregon by nurse practitioners performing medical exams in local pharmacies. It is imperative this change has to clarify an exam area as a "Patient Care Area" whereever this care is being provided. The reference to hospital does not provide clarity as to the rooms or areas under consideration for minimum lighting and could be overly restrictive due to the expansion of health care facilities outside of the hospital only location. A majority of individuals seeking medical attention are finding the inpatient/outpatient facilities located within their work location or the mall/shopping center down the street. Minimum lighting is a necessity when a person is seeking care in a patient exam room or procedure area. The definition of "Patient Care Area" will provide a clearer understanding of what specific areas shall have a minimum lighting for the care of patients using the definition located in 517.2. The use of "patient care area" provides a clear reference to what rooms would be required to meet the minimum code lighting loads by occupancy, Table 220.12.

Acceptance of this proposal will request the relocation of the definition "patient care area" to article 100 general definitions because of the usage of "patient care area" use in more than one article as per the NFPA style manual.

Panel Meeting Action: Reject

Panel Statement: A patient care area is a portion of a larger occupancy that is currently covered. The quality of lighting in patient care areas is not addressed by the NEC, rather it is a design issue. The FPN proposed by the submitter is not appropriate because it contains requirements. In addition, the panel notes the text in 220.12 already states that the minimum lighting load requirements are designated in Table 220.12.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

BROWN, L.: It should be noted that the calculations required by the NEC for determining branch circuit load calculations are not directly related to illumination levels (foot candles / Lux) of the room or space, or the minimum lighting necessary to perform certain tasks.

2-302 Log #105 NEC-P02 **Final Action: Reject**
(220.12(B))

Submitter: Patrick Boughan, Clifford, MI

Recommendation: Change the track lighting load requirement from 150 volt-amperes per 600 mm to 250 volt-amperes per meter. The section will then read as follows:

"... an additional load of ~~150~~ 250 volt-amperes shall be included for every meter ~~600 mm~~ (~~2~~ 3 ft) of lighting track or major fraction thereof."

Substantiation: It's about time we start getting serious about conversion to SI units. State this load requirement based upon a standard SI unit and not just a conversion from the previously used customary unit of 2 ft. The actual calculation will change slightly in some cases, but the change will not be significant.

Panel Meeting Action: Reject

Panel Statement: The submitter's substantiation for changing the load value simply because of the SI units, is not sufficient to justify the change.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-303 Log #1324 NEC-P02 **Final Action: Accept**
(220.14(K))

TCC Action: The Technical Correlating Committee understands that the Panel Action was to accept the term "calculated" only, and the remainder of 220.14(K) is unchanged.

Submitter: Mike Holt, Mike Holt Enterprises

Recommendation: Revise as follows:

Banks and office buildings. In banks or office buildings, the receptacle loads shall be calculated to be the higher of (1) or (2):

(1) The ~~computed~~ calculated load from 220.14

11 volt-amperes/m 2 or 1 volt-ampere/ft 2 .

Substantiation: This change is proposed to create uniformity with the rest of article 220, after the 2005 NEC decision to replace the word "computed" with "calculated."

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-304 Log #874 NEC-P02 **Final Action: Accept**
(220.14(K)(1))

Submitter: Noel Williams, Noel Williams Consulting

Recommendation: Change the term "computed" to "calculated" in (1) to read as follows: "The ~~computed~~ calculated load from 220.14(I)."

Substantiation: This was an apparent oversight in the 2005 rewrite of this section.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-305 Log #1896 NEC-P02 **Final Action: Accept**
(220.14(K)(1))

Submitter: James W. Carpenter, International Association of Electrical Inspectors

Recommendation: In 220.14(K)(1), change "computed" to "calculated" to read as follows:

(K) Banks and Office Buildings. In banks or office buildings, the receptacle loads shall be calculated to be the larger of (1) or (2):

(1) The ~~computed~~ calculated load from 220.14

(2) 11 volt-amperes/m 2 or 1 volt-ampere/ft 2 .

Substantiation: There was a global change accomplished for the 2005 NEC where all of the terms "computed" were changed to the term "calculated." Since the remainder of 220.14 refers to calculations, this subsection should also use the term "calculated" for consistency.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-306 Log #146 NEC-P02 **Final Action: Reject**
(220.22)

Submitter: Ernest Harju, MJ Electric

Recommendation: There's no minimum neutral size for feeders thus a 400 amp load with a 50 amp neutral load only requires a neutral to carry load required. Should be a minimum neutral size.

Substantiation: If you had a 400 amp feeder 3-500 mcm and a 60 amp neutral load the neutral would only be required to be sized for 60 amp not any future loads. In other words 3 - 500s and A # 4 would be ok?

Panel Meeting Action: Reject

Panel Statement: This proposal does not comply with section 4.3.3(C) of the NFPA Regulations Governing Committee Projects, because the wording to be added, revised (and how revised), or deleted is not specified in the recommendation. The submitter is directed to 215.2(A)(1) which specifies the minimum size of a feeder grounded conductor.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-307 Log #3614 NEC-P02 **Final Action: Reject**
(220.40)

Submitter: Joseph A. Hertel, State of Wisconsin

Recommendation: Add an Exception in addition to the requirements of NEC 220.40.

Exception: Under the supervision of a professional engineer, architect or designer of electrical systems, the feeder or service size may be computed using diversity factors or historical data of a similar type of building, other than one- and two-family dwellings.

Substantiation: The calculated service size for a building does not reflect the energy efficient electrical lighting that is being utilized. Traditionally the service or feeder for a building has provided a safty factor that is immense. A professional should be capable of providing by calculation, a service or feeder size that will adequately meet the building as well as the energy code needs. The NEC has not changed to reflect the restrictions placed by energy codes.

Panel Meeting Action: Reject

Panel Statement: The panel disagrees with reducing the minimum load calculations required for feeders and services using energy codes as a basis. The current requirements given in 220.40 are not in conflict with the energy codes. The calculation methods provided in this article provide a means to determine adequate service and feeder capacities but do not require that this entire capacity be connected. In addition, although the energy codes specify loading for general lighting, it is supplemented with task lighting as necessary to accommodate the occupancy. The VA/sqft calculations already accommodate task lighting.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-308 Log #2101 NEC-P02 **Final Action: Reject**
(220.42)

Submitter: Jon Farren, Farren Engineering, Inc.
Recommendation: Revise text to read as follows:
220.42 General Lighting. The demand factors specified in Table 220.42 shall apply to that portion of the total branch-circuit load calculated for general illumination. They shall not be applied in determining the ~~number~~ quantity of branch circuits for general illumination.
Substantiation: The term "quantity" refers to "total amount of", which is the intent of this code section.
Although the term "number" is sometimes used to indicate a quantity, it does not always specify the "total" quantity. The word "number" can also be used to designate a specific object, such as: "circuit number 3, in a 42 circuit panelboard", where 3 is the number and 42 is the quantity or "total amount of".
The word "number" has multiple meanings, the word "quantity" is more specifically related to "total amount of", which is the intent of this code section.
*Also refer to proposal for same word change in 220.11 and 230.2.
Panel Meeting Action: Reject
Panel Statement: The use and meaning of the term "number" is clear in the context used to cover this requirement. Changing "number" to "quantity" does not add any clarity.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-309 Log #1671 NEC-P02 **Final Action: Reject**
(220.43(B))

Submitter: Aleah Thompson, Lightolier
Recommendation: Revise text to read as follows:
220.43(B)
For track lighting in other than dwelling units or guest rooms of hotels or motels, an additional load of 150 volt-amperes shall be included for every 2 ft (600 mm) of lighting track or fraction thereof. Where multi-circuit track is installed, the load shall be considered to be divided equally between the track circuits. The 150 VA rating per 2 ft of track is for load calculations of feeders and services only. It is not intended to limit the number of feet of track on a single branch circuit nor is it intended to limit the number of fixtures on an individual track.
Substantiation: This is a companion proposal to one made to 410.101(B).
During the 1996 NEC code writing cycle, Code Making Panel 18 found it appropriate to add a FPN to clarify that the track lighting load value of 150VA for every 2 ft was intended solely for purposes of load calculation.
During the 1999 code cycle, the track lighting load value was moved from 410-102 to 220.43(B) in an effort to further clarify that the electrical load per length value applied during load calculation and did not limit the length of track that can be run or the number of fixtures allowed. At that time, the FPN specifically stating this was removed.
Unfortunately, the relocation of the track lighting load value 220.43(B) has not prevented continued misinterpretation of the code. Many code users, including Authorities Having Jurisdiction as well as lighting professionals, continue to misinterpret the language in 220.43(B) as limiting the length of track that can be run or the number of fixtures allowed.
The addition of the proposed language to 410.101(B) and 220.43(B) would prevent any further misinterpretation thereby greatly improving the usability of the code.
Note: Supporting Material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The placement of this requirement in Part III "Feeders and Service Load Calculations" makes it clear that the rule is not intended to specify branch circuit requirements for track lighting. The panel does not agree with adding statements about what is not intended by a rule when the rule itself is clear.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-310 Log #2873 NEC-P02 **Final Action: Reject**
(220.43(B))

Submitter: Steve Botos, M Retail Engineering Inc.
Recommendation: Add text to read as follows:
...an additional load of 150 VA shall be included for every 600 mm (2 ft) of lighting track or fraction thereof , minus lighting track load (i.e. track heads) connected on branch circuits.
Substantiation: The additional wording will help clear up confusion encountered when dealing with various building departments who sometimes interpret the code to mean 150W/2 ft PLUS whatever track load you have connected on panels branch circuits.
Panel Meeting Action: Reject
Panel Statement: The present wording is clear that the track lighting contribution to a feeder and service Load is determined by the length of the track only.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-311 Log #3175 NEC-P02 **Final Action: Reject**
(220.43(B))

Submitter: Michael S. O'Boyle, Lightolier Division of Genlyte Thomas Group
Recommendation: Revise text to read:
(B) Track Lighting. For track lighting in other than dwelling units or guest rooms or guest suites of hotels or motels, an additional load of 150 volt-amperes shall be included for every 600 mm (2 ft) of lighting track or fraction thereof. Where multicircuit track is installed, the load shall be considered to be divided equally between the track circuits. Where the lighting track is provided with an integral current limiting device, the load shall be calculated based on the maximum volt-ampere rating of the equipment.
Substantiation: Energy codes often require that lighting track be provided with an integral current limiting device. There are Listed track lighting devices, containing supplemental protection, that are used to meet these requirements. When such equipment is provided, the electrical load is controlled by the device and is independent of the linear length of track provided. It is appropriate to use this known value to calculate feeder and service load.
Panel Meeting Action: Reject
Panel Statement: All track lighting is connected to a device that limits current whether supplemental or via the branch circuit protective device. The panel is open to substantiation that provides an alternative to the 150 VA calculation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-312 Log #98 NEC-P02 **Final Action: Reject**
(220.50)

Submitter: Jacob Zervan, Chesaning, MI
Recommendation: Add a new last sentence to the section as follows:
The nameplate ampere or kVA rating shall be used for dwelling load calculations.
Substantiation: For the optional calculation, it is permitted to take the nameplate rating of motors at 100 percent and it is not required to take the largest motor at 125 percent. This same rule should apply to the demand load calculaton of Part III. Inspectors and contractors alike are in question on this issue.
Panel Meeting Action: Reject
Panel Statement: The optional calculations address specific occupancies and installations including dwelling units. The submitter has not provided substantiation that calculating the motor contribution to feeder and service loads at 100% of nameplate is adequate in all instances.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-313 Log #3122 NEC-P02 **Final Action: Reject**
(220.50)

Submitter: Jeremy Enders, East Lansing, MI
Recommendation: Revise the section to clarify the procedure for including motor load in a service calculation to read as follows:
220.50 Motors. Motor loads shall be calculated using the current as determined in accordance with 430.24, 430.25, and 430.26 and with 440.6 for hermetic refrigerant motor compressors. Where the calculated load is to be in volt-amperes, the motor current shall be multiplied by the nominal circuit voltage for single-phase and direct current motors, and by the nominal circuit voltage and 1.73 for three-phase motors.
Substantiation: Personnel trying to learn how to include motor load into a service calculation get confused by this section which leads to Article 430 or Article 440 for the sizing of conductors. Those references simply tell how to determine the motor load current. That needs to be made clear in 220.50 and an additional sentence needs to be added to explain what is to be done with that motor current with respect to determining the load in volt-amperes on a feeder or set of service conductors.
Panel Meeting Action: Reject
Panel Statement: The current 220.50 text is clear in its reference to the calculation methods of Article 430 and 440. The submitter's last sentence is basic electrical theory and better suited to textbooks.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-314 Log #1042 NEC-P02 **Final Action: Reject**
(220.51)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Change 100 percent to 125 percent in the text and exception.
Substantiation: 424.3(B) states electric space heating loads are continuous, and requires conductor ampacity not less than 125 percent of the load. 215.2(A)(1) requires feeder ampacity not less than 125 percent of continuous load. Since load may determine minimum ampacity of conductors, a calculated 100 percent can result in conductor ampacity less than 125 percent.

Panel Meeting Action: Reject
Panel Statement: Section 220.51 is written for the purposes of determining a load contribution from electric space heaters used in determining the overall feeder and service load. It is not intended to specify the conductor size of the branch circuit feeding an electric space heater. The submitter has not substantiated that these loads be added into the feeder and service calculations at 125%.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-315 Log #1123 NEC-P02 **Final Action: Reject**
(220.51)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Change "100 percent" to percent "125" in the text and exception.
Substantiation: Electric space heating loads are continuous loads. Calculations for sizing equipment, conductors, and overcurrent devices are commonly done by calculating continuous loads at 125 percent. If calculated at 100 percent that is the value for the feeder and service per 220.40, and overcurrent devices. Feeders are required to have an ampacity not less than 125 percent of continuous load per 215.2(A), which also applies to service conductors per 230.42. The minimum ampacity of branch circuit conductors calculated at 100 percent as indicated by this section differs from 210.19(A)(1) for continuous loads. 424.3(B) requires conductor ampacity not less than 125 percent. Different requirements may confuse Code users.
Panel Meeting Action: Reject
Panel Statement: The panel does not agree that heating loads should be added into the load calculations at 125%. The 125% sizing applies to the conductors and overcurrent devices. See panel action and statement on Proposal 2-314.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-316 Log #1297 NEC-P02 **Final Action: Reject**
(220.51)

Submitter: Mark Smythe, Smythe Electric Inc./Minnesota State Contract Electrical Inspector
Recommendation: Revise text to read:
Article 220.51 Fixed Electric Space Heating loads shall be calculated at ~~(100)~~ (125) percent of the total connected load. ~~(However in no case shall a feeder or service load current rating be less than the rating of the largest branch circuit supplied.)~~
~~(Exception:)~~ (Exception No. 1)
(Exception No. 2: Where the Service Disconnect Overcurrent Device is listed for operation of 100 percent of its rating, the ampere rating of the overcurrent device shall not be less than the load served.)
Substantiation: A. Statement of Problem,
1. Electric Heating Panels Service Calculations in Northern Minnesota,
a. A large percentage of dwelling units have Dual Fuel and/or Off-Peak systems installed, with fixed electrical space heating installed as the primary heat source.
b. 220.51 allows Fixed Electric Space Heating to be calculated at 100 percent for feeders and services. This would seem to allow 200 amps of actual load on a 200 amp main breaker panel.
c. The UL General Information Directory, (The White Book), under the listing of "Circuit Breakers, Molded-Case and Circuit Breaker Enclosures" states; "Unless otherwise marked, circuit breakers should not be loaded to exceed 80 percent of their current rating, where in normal operation the load will continue for three hours or more." Typically, electric space heating equipment in this cold climate would operate uninterrupted, for more than 3 hours.
d. Referring to 424.3(B), Branch Circuit Sizing; Fixed Electric Space Heating shall be considered a continuous load. Many references in the NEC state that continuous loads (operating 3 hours or more), shall be calculated at 125 percent.
e. There are numerous Electrical Thermal Storage Units being installed in my inspection area with total ampere ratings of, 162 amps, 167 amps, and 197 amps, respectively. Sizing the service entrance conductors and service equipment at 100 percent, as permitted by 220.51, would allow these models to be fed from a standard 200 amp main breaker panel. Many installers would also feed a water heater or dryer from this panel, as the calculated load would still remain under 200 amps, depending on the load of the fixed electric heater.
f. The second sentence of 220.51 states that in no case shall the feeder or service load current rating be less than the largest branch circuit supplied. Sizing the branch circuit feeding the heaters at 125 percent, as required by 424.3(B), would require a larger service for all three of these popular heaters, regardless of whether any additional loads were fed from this 200 amp, main breaker panel.
B. Substantiation for Proposal to change 220.51.
1. Eliminate the confusion in the field by homeowners and contractors when doing service calculations for panels feeding fixed electric space heating. They would not have to refer to 424.3(B) when doing the service calculation for these systems.
2. The last sentence of 220.51 would be redundant and could be eliminated. If the feeders and service calculations were clearly defined to be calculated at 125 percent of the entire electric space heating load, the service and feeders would always be larger than the largest branch circuit fed from the panel. This would clarify what seems to have become a confusing article in the current NEC.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Proposal 2-315.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-317 Log #499 NEC-P02 **Final Action: Reject**
(220.52)

Submitter: Bryan P. Holland, Holland Electric
Recommendation: Delete "dwelling units" from Table 220.42; Delete 220.52(A) and (B). Delete 220.53; Delete 220.54; Delete 220.55; Relocate 220.82 to 220.52 and rewrite as follows:
220.52 Dwelling Units.
(A) Feeder and Service Load. The calculated load shall be the result of adding the loads from 220.52(B) and (C). The neutral load shall be determined by 220.61.
(B) General Loads. The general calculated load shall be not less than 100 percent of the first 10 kVA plus 40 percent of the remainder of the following loads:
(1) A general lighting load as calculated by Table 220.12 and specified in Section 220.14(J).
(2) 1500 volt-amperes for each 2-wire, 20-ampere small appliance branch circuit and each laundry circuit as specified in 210.11(C)(1) and (2).
(3) The nameplate rating of all appliances that are fastened in place, permanently connected, or located to be on a specific circuit, ranges, wall-mounted ovens, counter-mounted cooking units, clothes dryers, and water heaters.
(4) The nameplate ampere or kVA rating of all motors and all low-power-factor loads.
(C) Keep the same.
Substantiation: The purpose of the NEC is to provide the minimum standards for a safe installation. 90.1(C) states that the code is not a design specification. The codes allowance for two different methods for calculating a dwelling service does not meet the purpose or intent of the code. Submitted data has indicated that the standard method for calculating a dwelling service is too conservative for today's high efficiency appliances and equipment used in typical homes. Applying a separate demand factor for general lighting, appliances, and cooking equipment is excessively complicated and unnecessary considering the optional method has been proven to be as effective and adequate with one overall demand applied to all loads added together. This change in no way presents a hazard or decreases any requirements already existing in the NEC. This change will add to the code's consistency and clarity when making service and feeder calculations for dwellings.
Panel Meeting Action: Reject
Panel Statement: The panel disagrees with replacing the standard calculation. Either method is permitted provided the parameters outlined in 220.82(A) can be met.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-318 Log #472 NEC-P02 **Final Action: Reject**
(220.52(A))

Submitter: Brian Magilley, Current Electric
Recommendation: Add new text to read:
In each dwelling unit, the load shall be calculated at 1500 volt-amperes for each 2-wire small-appliance branch circuit required by 210.11(C)(1). If more than two small appliance branch circuits are provided then no additional load shall be required.
Substantiation: Adding this sentence will prevent the error people make by adding 1500 volt-amperes for each small appliance branch circuit provided. An example is if you provide three small appliance branch circuits then you calculate the load at 3000 VA and not 4500 VA.
Panel Meeting Action: Reject
Panel Statement: The submitter's substantiation is incorrect in that the 1500VA must be added for each small appliance branch circuit that is installed.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-319 Log #606 NEC-P02 **Final Action: Accept in Principle**
(220.52(A))

Submitter: Joseph Michael Whitt, JW Electric
Recommendation: Revise text to read:
Small Appliance Circuit Load. In each dwelling unit, the load shall be calculated at 1500 volt-amperes for each 2-wire small-appliance branch circuit ~~required~~ installed by 210.11(C)(1).
Substantiation: As worded, it could be misunderstood that only two circuits are to be used in the service or feeder calculation due to the fact that 210.11(C)(1) could lead one to believe that only two circuits are required by

the wording “two or more”. By changing the word “required” to “installed”, it would make it clear that any and all circuits being installed as outlined by 210.11(C)(1) would be required to be included in the service or feeder calculation.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle

Revise the words in the first sentence of 220.52(A) “required by 210.11(C)(1)” to “as covered by 210.11(C)(1)”.

Panel Statement: The panel has revised the text to remove the words “required” and simply reference the coverage of the provision in 210.11(C)(1).

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-320 Log #605 NEC-P02 **Final Action: Accept in Principle**

(220.52(B))

Submitter: Joseph Michael Whitt, JW Electric

Recommendation: Revise text to read:

Laundry Circuit Load. A load of not less than 1500 volt-amperes shall be included for each 2-wire laundry branch circuit installed as ~~required~~ <u>installed</u> by 210.11(C)(2).

Substantiation: As worded, it could be misunderstood that only one circuit is to be used in the service or feeder calculation due to the fact that 210.11(C)(2) could lead one to believe that only one circuit is required by the wording “at least one additional”. By changing the word “required”to “installed”, it would make it clear that any and all circuits being installed as outlined by 210.11(C)(2) would be required to be included in the service or feeder calculation.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle

Revise the words in the first sentence of 220.52(B) “required by 210.11(C)(2)” to “as covered by 210.11(C)(2)”.

Panel Statement: The panel has revised the text to remove the words “required” and simply reference the coverage of the provision in 210.11(C)(2).

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-321 Log #111 NEC-P02 **Final Action: Reject**

(220.52(C))

Submitter: Mark Wolschleger, Harbor Beach, MI

Recommendation: Include 1500 VA in a dwelling service or feeder calculation for the loads in the bathroom. The new paragraph (C) will read as follows:

(C) Bathroom Loads: A load of not less than 1500 VA shall be included for one bathroom circuit. This load shall be permitted to be included with the general lighting load and subjected to the demand factors provided in Table 220.42.

See companion proposals for 220.82(B)(2); 220.83(A)(2); 220.83(B)(2); and 220.84(C)(2).

Substantiation: The number and rating of portable electrically operated appliances in the home has increased rapidly over the past few years yet the method used to calculate the minimum demand load for dwellings has not changed. A 100 ampere rated service is permitted for some dwelling units where a higher rated service should be installed. Including 1500 VA in the calculation for one bathroom receptacle circuit at this time is appropriate and will help to reduce the number of undersized services in dwellings.

Panel Meeting Action: Reject

Panel Statement: The submitter has not substantiated that the loading for the bathroom receptacle circuit is not sufficiently covered by the current VA/sqft calculations.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

BROWN, L.: In all, see Panel Action on related Proposals: 2-321; 2-339; 2-345; 2-347; and 2-350.

2-322 Log #2286 NEC-P02 **Final Action: Reject**

(220.52(C) (New))

Submitter: Andre Michalik, AMI Electric Co. / Rep. ABCD Academy-Instructor

Recommendation: Add a new 220.52(C) to read:

(C) Fastened in Place Kitchen and Bathroom Appliances. A nameplate rating load of kitchen appliances and bathroom appliances, fastened in place, used sporadically for short time as garbage disposal, garbage compactor, hot water dispenser, dishwasher, microwave oven, hydromassage tub, etc. shall be permitted to be included with the general lighting load and subjected to the demand factor provided in Table 220.42.

Substantiation: The appliances stated in proposal are used for a very short time and some of them really add for service or feeder far smaller load than 75 percent allowed in 220.53.

It is obvious, that laundry load, permitted to be included with general lighting load, add more to the service (or feeder) than dishwasher, as well as coffee maker, toaster or mixer connected to the kitchen circuit and also subjected to the “lighting demand factor” add more load to the service than garbage disposal, compactor or hot water dispenser at sink, which are used for shorter time. It is unlikely to use simultaneously most of the mentioned above appliances.

Now, as in NEC 2005, the above-mentioned appliances fallen under “75 percent demand” tremendously and unrealistically increases minimum service (or feeder) ampacity, especially for multifamily dwelling, causing waste of electrical equipment and materials (as copper wires). Proposed demand factor (35 percent or 25 percent) shall be good enough to secure power for some of nameplate rating of the mentioned above appliances.

Panel Meeting Action: Reject

Panel Statement: The panel does not agree with the addition of “kitchen and bathroom appliances fastened in place” being included in the current VA/sq ft calculations. There is no additional loading for a bathroom required in the current text.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-323 Log #123 NEC-P02 **Final Action: Accept in Principle**

(Table 220.54)

Submitter: Joseph Penachio, Joe Penachio Electrician

Recommendation: Revise as follows:

~~12-22 % = 47 - (number of dryer - 11)~~

<u>12-23 47% - 1% for each dryer exceeding 11</u>

~~23 35%~~

~~24 - 42 % = 35% - [0.5 x (number of dryers - 23)]~~

24 - 42 <u>35% - 0.5% for each dryer exceeding 23</u>

Table 220.54 Demand Factor for Household Electric Clothes Dryers

Number of Dryers	Demand Factor (Percent)
1-4	100%
5	85%
6	75%
7	65%
8	60%
9	55%
10	50%
11	47%
~~12 – 22~~	~~% = 47 – (number of dryer – 11)~~
<u>12-23</u>	<u>47% - 1% for each dryer exceeding 11</u>
~~23~~	~~35%~~
~~24 - 42~~	~~% - 35% [0.5 x (number of dryers – 23)]~~
<u>24 – 42</u>	<u>35% - 0.5% for each dryer exceeding 23</u>
43 and over	25%

Substantiation: As an electrical instructor who teaches the masters program, I have experienced that most students are confused and have difficulty understanding how to calculate 12 to 42 dryers as it is written in the code. Expressing 47% minus 1% for each dryer exceeding 11 and expressing 35% minus a half percent of each dryer exceeding 23 is much easier to understand. Also, it conforms to the new user friendly format.

Panel Meeting Action: Accept in Principle

Revise the recommended text to read:

<u>12-23 47% minus 1% for each dryer exceeding 11</u>

24 - 42 <u>35% minus 0.5% for each dryer exceeding 23</u>

Panel Statement: The panel has revised the recommended text for clarity.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

BROWN, L.: (Note to TCC: Change “-” (minus sign) to the word “minus” in all tables, etc.)

2-324 Log #1168 NEC-P02 **Final Action: Reject**

(220.54)

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Revise as follows:

ELECTRIC CLOTHES DRYERS ~~DWELLING UNITS~~ . The load for ~~household~~ <u>208-volt and 240-volt</u> electric clothes dryers ~~in a dwelling unit~~ shall be either 5000 watts (volt-amperes) or the nameplate rating, whichever is larger, for each dryer served. The use of the demand factors in Table 220.54 shall be permitted <u>for such household electric clothes dryers</u> . (remainder unchanged).

Substantiation: Edit. The present wording does not cover ratings for commercial facilities or common laundry areas in a multifamily dwelling. The dryers should be specified as 208 or 240-volt connected.

Panel Meeting Action: Reject

Panel Statement: Electric Clothes Dryers in other than dwelling units would be calculated at nameplate value. The submitter has not substantiated applying the demand table to dryers in other than dwelling unit installations.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-325 Log #1332 NEC-P02 **Final Action: Accept**
(220.54)

Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Add clarification sentence
220.54 Electric Clothes Dryers — Dwelling Unit(s).
The load for household electric clothes dryers in a dwelling unit(s) shall be either 5000 watts (volt-amperes) or the nameplate rating, whichever is larger, for each dryer served. The use of the demand factors in Table 220.54 shall be permitted. Where two or more single-phase dryers are supplied by a 3-phase, 4-wire feeder or service, the total load shall be calculated on the basis of twice the maximum number connected between any two phases. Kilovolt-amperes (kVA) shall be considered equivalent to kilowatts (kW) for loads calculated under this section.
Substantiation: This proposal is intended to provide similar Code language between 220.54 and 220.55. Because both of these types of equipment are commonly rated in kVA, they should both have similar language.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-326 Log #2153 NEC-P02 **Final Action: Accept**
(Table 220.55)

Submitter: Brian Dolan, IBEW/NECA Technical Institute
Recommendation: Revise text to read:
(3 1/2 ~~to~~ through 8 3/4 kW rating)
Substantiation: This change would clarify the intent that 8 3/4 kW is included in the wording. The new wording would be consistent with the wording in Note 3 to Table 220.55.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
BROWN, L.: (Note to TCC: This should be done to all tables in the NEC.)

2-327 Log #831 NEC-P02 **Final Action: Reject**
(Table 220.55(C))

Submitter: James Weimer, Eastern Idaho Electrical JATC
Recommendation: Revise text to read as follows:
Maximum Demand (KW) (See Notes)
~~(Not over 12 kW Rating)~~
(8 3/4 Kw through 12 Kw Rating)
Substantiation: When calculating range demands, there is confusion if a 8 3/4 range belongs in Column B or C. We maintain that a 8 3/4 range should be included in Column C.
Panel Meeting Action: Reject
Panel Statement: The panel confirms that 8 3/4 kW ranges are included in Column B. See panel action on Proposal 2-326. The panel notes that Column C applies to all ranges not over 12 kW.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-328 Log #3356 NEC-P02 **Final Action: Reject**
(220.56)

Submitter: Les Tanzer, City of Phoenix
Recommendation: Revise text to read:
220.56 Kitchen Equipment - Other Than Dwelling Unit(s). It shall be permissible to calculate the load for commercial electric cooking equipment, dishwasher booster heaters, water heaters and other kitchen equipment in accordance with Table 220.56. These demand factors shall be applied to all equipment , with resistive loads, that has either thermostatic control or intermittent use as kitchen equipment. These demand factors shall not apply to motor loads, such as refrigerators, freezers, ice-making equipment, or mixers, as well as space heating, ventilating or air conditioning equipment.
Substantiation: There appears some uncertainty as to the kitchen equipment meant to be allowed to be calculated in Table 220.56. If this is misapplied, this can cause a panel or possibly a service to become overloaded. This is intended to clarify that the Table only applies to cooking equipment and not to any and every piece of equipment used in a kitchen. In the past, this has been applied to walk-in refrigerators freezers as well as beverage dispensers and coffee makers. This many items taken at 100 percent rather than 65 percent may adversely effect final load totals for equipment.
Panel Meeting Action: Reject
Panel Statement: This provision is intended to apply to the types of equipment the submitter is trying to limit.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-329 Log #1325 NEC-P02 **Final Action: Reject**
(220.59 (New))

Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Create new section, 220.59
220.59 Air Conditioning Equipment
Air conditioning loads shall be calculated at 100 percent of the total connected load. However, in no case shall a feeder or service load current rating be less than the rating of the largest branch circuit supplied.
As an alternative to creating a new section, 220.51 could be modified as follows:
220.51 Fixed Electric Space Heating and Air Conditioning Equipment .
Fixed electric space heating and air conditioning loads shall be calculated at 100 percent of the total connected load. However, in no case shall a feeder or service load current rating be less than the rating of the largest branch circuit supplied.
Substantiation: This section is intended to clarify whether the A/C is to be calculated at 100% or 125%. The proposed language is similar to that found in Section 220.51 of the existing *Code* .
Panel Meeting Action: Reject
Panel Statement: Section 220.50 for motor loads already covers the air conditioning requirements by its reference to Article 440.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-330 Log #971 NEC-P02 **Final Action: Reject**
(220.60)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Add “branch circuit” between “a” and “feeder.”
Substantiation: Edit. Branch circuits may supply loads where a selector switch prevents simultaneous operation. 422.12 Exception No. 2 permits air conditioning equipment and central heating equipment on the same branch circuit.
Panel Meeting Action: Reject
Panel Statement: Section 220.60 is applicable to feeders and services, not branch circuits. As such, the revision is not appropriate.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-331 Log #1163 NEC-P02 **Final Action: Reject**
(220.60)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Change “at one time” to “at the same time”.
Substantiation: “One time” is not really the same as “same time”.
Panel Meeting Action: Reject
Panel Statement: The existing text in 220.60 is clear as written. The submitter’s proposal does not add any additional clarity.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
BROWN, L.: Changing the wording as suggested by the Submitter would completely change the application of this provision.

2-332 Log #1559 NEC-P02 **Final Action: Accept**
(220.61(A))

Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Make the following change in 220.61(A):
Change “neutral” to “neutral conductor.”
The revised text would appear as follows:
(A) Basic Calculation. The feeder or service neutral load shall be the maximum unbalance of the load determined by this article. The maximum unbalanced load shall be the maximum net calculated load between the neutral conductor and any one ungrounded conductor.
Substantiation: This proposal was developed by the TCC Task Group on the definition of “Neutral Conductor.” Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).
The Task Group has proposed the following definitions to be added to Article 100:
● **Neutral conductor.** A circuit conductor connected to the neutral point of a system.
● **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.
This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals

● The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.

● The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.

Additional information is available in the Task Group report.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

KING, D.: See my explanation of negative for proposal 2-11.

2-333 Log #3306 NEC-P02 **Final Action: Reject**
(220.61(A))

Submitter: Redwood Kardon, Code Check Institute
Recommendation: Add text to read as follows:

220.61 Feeder or Service Neutral Load.

(A) Basic Calculation. The feeder or service neutral load shall be the maximum unbalance of the load determined by this article. The maximum unbalanced load shall be the maximum net calculated load between the neutral and any one ungrounded conductor <u>of multiwire branch circuit(s) utilizing the neutral. Circuits not utilizing a neutral (line-line) shall not be required to be included in these calculations.</u>

Substantiation: As worded, 220.61 does not exclude line-line loads from the calculation of neutrals. The word "neutral" is not defined in the National Electrical Code contributing to the lack of clarity in this article. Numerous AHJs take from this article that the neutral must be sized to match the physical size of the largest ungrounded conductor at a service or in a feeder.

Panel Meeting Action: Reject
Panel Statement: The existing text is clear relative to the calculations for feeders. The panel notes that "neutral conductor" is being defined through the work of an NEC TCC task group. Finally, 215.2 (A)(1) defines the minimum size requirements for the ungrounded conductor associated with a feeder or service.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-334 Log #1560 NEC-P02 **Final Action: Accept**
(220.61(A) Exception)

Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Make the following change in 220.61(A) Exception:

Change "neutral" to "neutral conductor."

The revised text would appear as follows:

Exception: For 3-wire, 2-phase or 5-wire, 2-phase systems, the maximum unbalanced load shall be the maximum net calculated load between the neutral <u>conductor</u> and any one ungrounded conductor multiplied by 140 percent.

Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).

The Task Group has proposed the following definitions to be added to Article 100:

● **Neutral conductor.** A circuit conductor connected to the neutral point of a system.

● **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.

This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals

● The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.

● The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.

Additional information is available in the Task Group report.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

KING, D.: See my explanation of negative for proposal 2-11.

2-335 Log #1435 NEC-P02 **Final Action: Reject**
(220.61(C), FPN 3)

Submitter: Wayne H. Robinson, Prince George County Government
Recommendation: Add new text as follows:

<u>FPN No. 3: When determining the neutral load from the basic calculation, continuous rated loads shall be calculated at 125 percent of the noncontinuous net computed load.</u>

Substantiation: To clarify calculating a single phase 3 wire 120/240 volt neutral conductor size or demand load.

It's not clear whether 125 percent should be applied to the neutral load for continuous single phase 3 wire 120/240 loads. 220.61(A) Basic Calculation, second sentence references "The maximum unbalanced load shall be the net calculated load between the neutral and any one ungrounded conductor". Text materials from Code experts calculate the neutral demand in both fashions, either at 125 or 100 percent. I am from the school that single phase 3 wire loads are not required to be calculated at 125 percent because the neutral only carries the unbalanced current as stated in 310.15(B)(4). Hopefully, you can see the dilemma. To resolve the issue, the fine print note would clarify that all continuous neutral loads shall be calculated at 125 percent ending any misconceptions.

Two rules of thought: A store has 120/240 volt single phase service with 10000 VA of continuous lighting load and 6000 VA of receptacle load. What is the total calcualted neutral load?

(Table shown below)

In conclusion it plays havoc with testing. UL White Book (KDER) recommends that "If there is a need for such a conductor a grouning bushing should be used."

NOTE: KDER "covers bonding devices, ground clamps, grounding and boning bushings and locknuts, ground rods, armor grounding wire, protector grounding wire, grounding wedges, ground clips for securing the ground wire to an outlet box, water meter shunts, and similar equipment". Applying all the stanards and knowledge one can teach and apply these applications, it would be helpful and added safety for boning the electrode to enclosures.

Panel Meeting Action: Reject
Panel Statement: Article 220 addresses the calculation and considerations for determining loads. Neutral conductor sizing is addressed in Articles 210 and 215. In addition, the submitter's proposed fine print note is inappropriate because it contains a specific requirement.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-336 Log #1561 NEC-P02 **Final Action: Accept**
(220.61(C)(1))

Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Make the following change in 220.61(C)(1):

Change "neutral" to "neutral conductor." Also, change "wires" to "conductors."

The revised text would appear as follows:

(1) Any portion of a 3-wire circuit consisting of 2-phase <u>conductors</u> ~~wires~~ and the neutral <u>conductor</u> of a 4-wire, 3-phase, wye-connected system.

Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).

(Proposal 2-335 (Log #1435))

General Load	Neutral Load #1	Neutral Load #2
10000 VA x 1.25 = 12500 VA	10000 x 1.25 = 12500	10000 x 100% = 10000
6000 VA x 1.00 = <u>6000 VA</u>	6000 x 1.25 = <u>6000</u>	6000 x 100% = <u>6000</u>
18500 VA	18500 VA	16000 VA

The Task Group has proposed the following definitions to be added to Article 100:

● **Neutral conductor.** A circuit conductor connected to the neutral point of a system.

● **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.

This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals

● The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.

● The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.

Also, the word "wire" should be replaced by "conductor" for consistency.

Additional information is available in the Task Group report.

Note: Supporting material is available for review at NFPA Headquarters.

KING, D.: See my explanation of negative for proposal 2-11.

2-337 Log #1562 NEC-P02 **Final Action: Accept**

(220.61(C)(2), FPN 2)

Submitter: Technical Correlating Committee on National Electrical Code®,

Recommendation: Make the following change in 220.61(C)(2) FPN No. 2:

Change "neutral" to "neutral-conductor."

The revised text would appear as follows:

FPN No. 2: A 3-phase, 4-wire, wye-connected power system used to supply power to nonlinear loads may necessitate that the power system design allow for the possibility of high harmonic neutral- conductor currents.

Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).

The Task Group has proposed the following definitions to be added to Article 100:

● **Neutral conductor.** A circuit conductor connected to the neutral point of a system.

● **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.

This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals

● The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.

● The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.

Additional information is available in the Task Group report.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

KING, D.: See my explanation of negative for proposal 2-11.

2-338 Log #1165 NEC-P02 **Final Action: Accept in Principle in Part**

(220.82(B) and (C))

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Revise as follows:

(B)(2): ~~1500~~ 3000 volt-amperes for ~~each 2-wire~~ the small appliance branch circuit and 1500 volt-amperes for each laundry branch circuit specified in 210.11(C) ~~220.52~~ .

Delete present (B)(3) and (4) and substitute:

(B)(3) The nameplate rating of electric ranges, exhaust hoods, wall-mounted ovens, counter-mounted cooking units, 208-volt and 240-volt clothes dryers, dishwashers, food waste disposers, and storage water heaters. If water heater elements are interlocked so that all elements cannot be energized at the same time, it shall be permitted to calculate only the highest rated element.

(B)(4) The nameplate rating of electrical utilization equipment with or without an integral motor, not covered by (B)(2)(3) and (C), that is permanently connected, fastened in place, or connected to a dedicated circuit.

(B)(5) The current rating required by 430.6(B) for separate motors.

Revise (C)(1): ~~100 percent of the nameplate ratings of the air-conditioning and cooling.~~ The rated load current or the branch circuit selection current, whichever is greater for hermetic refrigerant motor compressors .

Delete (C)(2)

(C)(3) ~~100~~ 125 percent of the nameplate ratings of electric thermal storage...(remainder unchanged).

(C)(4) ~~100 percent of the nameplate ratings of the heat pump compressor and~~ 65 percent of the susupplemental electric heating...(remainder unchanged).

Substantiation: The requirement for 1500 volt-amperes for each small appliance branch circuit tends to discourage installation of more than two circuits. Added circuits provide diversity and reliability without actually increasing load. Apparent intent is not to require additional load for the circuit permitted by 210.52(B)(1) Ex. No. 2. Where more than the minimum required number of circuits is installed for a va/sq ft load no additional load calculation is required. The requirement to provide small appliance and laundry branch circuits is in 210.11(C), not 220.52, and two wire circuits are not required; a multiwire circuit may be used. Appliances of (B) should be specified as electric since gas types may utilize a small appliance branch circuit per 210.52(B)(2) Exception No. 2. Clothes dryers should be designated as 208 or 240-volt, as some operate on 120-volt and are covered by the laundry circuit load. In (B)4.) "all" motors literally includes those integral to appliances such as clothes washers and dryers which are already accounted for. Low-power factor is not defined; what value is "low"? Present wording does not exempt a redundant calculation already covered by (B)(2) and (3). In (C), hermetic type equipment should be specified as gas type and evaporative coolers are covered by the proposed (B)(4). 220.18(A) indicates Articles 430 and 440 apply where motors or air conditioning equipment are the only circuit load. Conductors, overcurrent devices and services are determined by the 125 percent requirement for temporary motor overload conditions and continuous heating load, and the present 100 percent may be misleading, as this articles does not modify Articles 424, 430 and 440.

Panel Meeting Action: Accept in Principle in Part

Revise 220.82(B)(2) of the existing code to read:

(2) 1500 volt-amperes for each 2-wire, 20 ampere small-appliance branch circuit and each laundry branch circuit covered in 210.11(C)(1) and (2).

Revise 220.82(B)(4) to read:

(4) The nameplate ampere or kVA rating of all permanently connected motors not included in (3).

Reject the remaining changes and concepts of the submitter's recommendation.

Panel Statement: The panel does not accept eliminating 1500VA for each small appliance branch circuit. The requirement is to calculate 1500VA for each small appliance branch circuit. The submitter has not substantiated adding on 3000VA.

2) The panel does not accept deleting "2-wire" since multi-wire branch circuits are considered individual circuits in accordance with 210.4.

3) The panel has accepted revising the reference from 220.52 to 210.11(C).

4) The panel does not accept the revisions to (B)(3) because it is not necessary to attempt to list all of the additional equipment. The water heater rating is taken into account by its nameplate rating.

5) The panel has accepted in principle the revision to (B)(4) and has deleted the reference to "low power factor loads" and added wording to make it clear that motors already covered in item (3) are not included.

6) The panel does not accept the revision to (C)(1) since the current wording properly conveys that the nameplate of the AC or cooling system is the reference. Changing the text to "hermetic refrigerant motor compressors" is more confusing to the user.

7) The panel does not accept the revision to 125% for thermal storage. Load calculation and the requirement for overcurrent device and conductor sizing are separate issues.

8) The panel does not accept the revision to (C)(4) because the submitter provided no substantiation to make the change.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-339 Log #112 NEC-P02 **Final Action: Reject**

(220.82(B)(2))

Submitter: Mark Wolschleger, Harbor Beach, MI

Recommendation: Include 1500 VA in a dwelling service or feeder calculation for the loads in the bathroom. The new paragraph (B)(2) will read as follows:

"(2) 1500 volt-amperes for each 2-wire, 20-ampere small-appliance branch circuit, ~~and~~ each laundry branch circuit, and one bathroom receptacle branch circuit specified in 220.52."

See companion proposals for 220.52(C); 220.83(A)(2); 220.83(B)(2); and 220.84(C)(2).

Substantiation: The number and rating of portable electrically operated appliances in the home has increased rapidly over the past few years yet the method used to calculate the minimum demand load for dwellings has not changed. A 100 ampere rated service is permitted for some dwelling units where a higher rated service should be installed. Including 1500 VA in the calculation for one bathroom receptacle circuit at this time is appropriate and will help to reduce the number of undersized services in dwellings.

Panel Meeting Action: Reject
Panel Statement: There is no additional load calculation for the bathroom circuit. The load for the bathroom is included in the VA/sqft requirements for the general load calculation. The panel disagrees that not including 1500VA for the bathroom load leads to "undersized services in dwellings".
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
BROWN, L.: In all, see Panel Action on related Proposals: 2-321; 2-339; 2-345; 2-347; and 2-350.

2-340 Log #3249 NEC-P02 **Final Action: Accept in Principle**
(220.82(B)(3))

Submitter: David Filipiak, Sky Electric, Inc.
Recommendation: Revise text to read as follows:
~~...located to be on a specific circuit, ranges, wall mounted ovens...~~
...Located to be on a specific circuit, <u>including ranges,</u> wall-mounted ovens...
Substantiation: The text, as currently written, does not follow standard grammatical format and is confusing to the reader.
Panel Meeting Action: Accept in Principle
Revise 220.82(B)(3) of the existing code to read:
(3) The nameplate rating of:
a. All appliances that are fastened in place, permanently connected, or located to be on a specific circuit.
b. Ranges, wall-mounted ovens, counter-mounted cooking units.
c. Clothes dryers that are not connected to the laundry branch circuit specified in (2).
d. Water heaters
Panel Statement: The panel has revised the language to break up the sentence into a list that will make it clear to the user what is included. The reference to "clothes dryers" was expanded to make it clear that a gas dryer connected to the laundry branch circuit requires no additional calculation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
BROWN, L.: In all, see Panel Action on related Proposals: 2-340; 2-344; 2-349; and 2-351.

2-341 Log #3372 NEC-P02 **Final Action: Accept in Principle**
(220.82(B)(3))

Submitter: Rob Hogan, E. Lansing, MI
Recommendation: Revise text to read:
The nameplate rating of all appliances that are fastened in place, permanently connected, or located to be on a specific circuit <u>including</u> ranges, wall, mounted ovens, counter mounted cooking units, clothes dryers, and water heaters.
Substantiation: Run-on sentence, revise for clarity.
Panel Meeting Action: Accept in Principle
Panel Statement: The recommended action is accomplished through the panel action on Proposal 2-340.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-342 Log #3123 NEC-P02 **Final Action: Reject**
(220.82(B)(4))

Submitter: Jeremy Enders, East Lansing, MI
Recommendation: Specify how motor load is to be determined and converted from amperes to kVA by revising paragraph (4) as follows:
(4) The nameplate ampere or kVA rating of all motors and of all low-power factors loads <u>in accordance with 220.50</u> .
Substantiation: Typical motors are not rated in kVA and the value must be calculated based on the motor full-load current. The method of determining the motor full-load current is not specified, leaving the decision to a difference of interpretation.
Panel Meeting Action: Reject
Panel Statement: A reference to 220.50 is not needed. The current text is clear that the nameplate rating of the motor is used. The full load current would come from the nameplate.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-343 Log #1897 NEC-P02 **Final Action: Accept in Principle**
(220.82(C)(2))

TCC Action: The Technical Correlating Committee understands that the Panel Action accepts the submitter's recommendation as well as renumbering the items in the existing text.
Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: In 220.82(C)(2), delete the word "heating" and replace it with the words "heat pump" and change the word "a" to "the" to read as follows:
220.82 Dwelling Unit.
(C) Heating and Air-Conditioning Load. The largest of the following six selections (load in kVA) shall be included:
(2) 100 percent of the nameplate rating(s) of the ~~heating~~ <u>heat pump</u> when ~~a~~ <u>the</u> heat pump is used without any supplemental electric heating.
Substantiation: Since the heat pump compressor and related accessories are being used to generate the heat without the use of supplemental electric heating strips, the nameplate rating of the heat pump would be used for the general load. The text as used in the 2005 NEC indicates the use of the heating load on the nameplate when, in fact, there would be no specific heating load for this air conditioner. Changing the existing text to the proposed new text, as suggested in the proposal, will provide the user of this optional calculation method with the proper location of the data necessary for the calculation.
Panel Meeting Action: Accept in Principle
Move existing (3) to become (6) and renumber existing (4), (5), (6) to become (3), (4), (5).
Panel Statement: The panel has reordered the items to place the heat pump requirements sequentially.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-344 Log #1166 NEC-P02 **Final Action: Accept in Principle in Part**
(220.83(A) and (B))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise (A)(2):
~~1500~~ <u>3000</u> volt-amperes for ~~each 2-wire~~ <u>the</u> small appliance branch circuits specified in <u>210.11(C)</u> ~~220.52.~~
Delete present (A)(3) and (A)(4) and substitute:
(A)(3) The nameplate rating of electric ranges, exhaust hoods, wall-mounted ovens, counter-mounted cooking units, 208-volt and 240-volt clothes dryers, dishwashers, food waste disposers, and storage water heaters. If water heaters are interlocked so that all elements cannot be energized at the same time it shall be permitted to calculate only the highest rated element.
(A)(4) The nameplate rating of electrical utilization equipment with or without an integral motor, not covered by (A)(2), (A)(3) or (B).
(A)(5) The current rating required by 430.6 for separate motors.
Delete the last sentence of (B) and substitute:
The smaller of the air conditioning or fixed electric space heating load shall be permitted to be excluded from the calculations
Revise formula chart:

LOAD	PERCENT OF LOAD
<u>Hermetic type air</u> conditioning equipment	125 percent of either the rated load Current or branch circuit selection Current whichever is greater
Central electric space heating	~~100~~ <u>125</u>
Less than four-separately controlled Electric space heating units	~~100~~ <u>125</u>

Delete (B)(1,)(2), (3), an (4) and substitute: The loads specified in 220.83(A).
Substantiation: The requirement for 1500 voltamperes for each small appliance branch circuit tends to discourage installation of more than two circuits. Additional circuits provide reliability and diversity without actually increasing load. Apparent intent is not to require additional load for the circuit permitted by 210.52(B)(1) Exception No. 2. If more than the minimum number of circuits is installed for a va/sq ft load no additional load calculation is required. The requirement to provide small appliance and laundry branch circuits is in 210.11(C) not 220.52, and 2-wire circuits are not specified. A multiwire circuit may be used. Appliances of (A)(3) should be specified as electric since gas types may utilize a small appliance branch circuit per 210.52(B)(2), Exception No. 2.
Panel Meeting Action: Accept in Principle in Part
Revise 220.83(A)(2) and 220.83(B)(2) of the present code using the following text in both locations:
(2) 1500 volt-amperes for each 2-wire, 20 ampere small-appliance branch circuit and each laundry branch circuit covered in 210.11(C)(1) and (2).
Replace 220.83(A)(3) and (4) and 220.83(B)(3) and (4) of the current code using the following text in both locations:
(3) The nameplate rating of:
a. All appliances that are fastened in place, permanently connected, or located to be on a specific circuit.
b. Ranges, wall-mounted ovens, counter-mounted cooking units.
c. Clothes dryers that are not connected to the laundry branch circuit specified in (2).
d. Water heaters.
Reject the remaining submitter revisions.

Panel Statement: 1) The panel does not accept eliminating the 1500VA requirement. The submitter has not substantiated adding only 3000VA.
2) The panel does not accept deleting "2-wire" since multi-wire branch circuits are considered individual circuits in accordance with 210.4.
3) The panel does not accept the revision to (A)(3) because it is not necessary to attempt to list all of the additional equipment. The water heater rating is taken into account by its nameplate rating.
4) The panel has accepted revising the reference from 220.52 to 210.11(C).
5) The panel has revised 220.83(A)(3) and (4) and 220.83 (B)(3) and (4) to be consistent and use the same language as 220.82 in the panel action on Proposal 2-340. The panel has accepted the submitter's concept of specifying that clothes dryers not included on the laundry circuit are to be added in the other appliance loads.
6) The panel does not accept the revisions to the table in 220.83(B) because the electric space heating load is intended to be calculated at 100%. Conductor and overcurrent device sizing are handled in Articles 210 and 215. The addition of "hermetic type air" to the table does not add any clarity.
7) The panel does not accept the revision to 125% for thermal storage. Load calculation and the requirement for overcurrent device and conductor sizing are separate issues.
8) The panel does not accept the revision to (C)(4) because the submitter provided no substantiation to make the change.

" <u>It shall be permitted to calculate only</u> the larger ~~connected~~ load of air-conditioning or <u>fixed</u> space heating ~~but not both shall be used.~~
~~Revise chart:~~
LOAD PERCENT OF LOAD
Air-conditioning equipment ~~100~~ Not less than the ampacity values specified in 440.32
and 440.33
Central electric space heating ~~100~~ <u>125</u>
less than four separately controlled fixed ~~100~~ <u>125</u>
Electric space heating units
Substantiation: The text of (B) requires omission of the smaller load which should be permitted but not required. The requirements of Article 440 require ampacities greater than 100 percent of actual load. Electric space heating is continuous load. Ampacities of conductors are based on 125 percent of continuous loads.
Panel Meeting Action: Reject
Panel Statement: The current language is clear and the submitter's revision does not add any clarity. Electric space heating is added at 100% for load calculation purposes. Continuous loads do not increase the amount of load on the circuit.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-347 Log #114 NEC-P02 **Final Action: Reject**
(220.83(B)(2))

Submitter: Mark Wolschleger, Harbor Beach, MI
Recommendation: Include 1500 VA in a dwelling service or feeder calculation for the loads in the bathroom. The new paragraph (B)(2) will read as follows:
"(2) 1500 volt-amperes for each 2-wire, 20-ampere small-appliance branch circuit, ~~and~~ each laundry branch circuit, <u>and one bathroom receptacle branch circuit</u> specified in 220.52."
See companion proposals for 220.52(C); 220.82(B)(2); 220.83(A)(2); and 220.84(C)(2).
Substantiation: The number and rating of portable electrically operated appliances in the home has increased rapidly over the past few years yet the method used to calculate the minimum demand load for dwellings has not changed. A 100 ampere rated service is permitted for some dwelling units where a higher rated service should be installed. Including 1500 VA in the calculation for one bathroom receptacle circuit at this time is appropriate and will help to reduce the number of undersized services in dwellings.
Panel Meeting Action: Reject
Panel Statement: There is no additional load calculation for the bathroom circuit. The load for the bathroom is included in the VA/sqft requirements for the general load calculation. The panel disagrees that not including 1500VA for the bathroom load leads to "undersized services in dwellings".
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
BROWN, L.: In all, see Panel Action on related Proposals: 2-321; 2-339; 2-345; 2-347; and 2-350.

2-348 Log #3156 NEC-P02 **Final Action: Accept in Principle**
(Table 220.84)

Submitter: Wally Harris, Atlantic Inland Inspections
Recommendation: Insert lines into table as shown below:

Table 220.84 Optional Calculations — Demand Factors for Three or More Multifamily Dwelling Units

Number of Dwelling Units	Demand Factor (Percent)
3–5	45
6–7	44
8–10	43
11	
12–13	41
14–15	40
16–17	39
18–20	38
21	37
22–23	36
24–25	35
26–27	34
28–30	33
31	32
32–33	31
34–36	30
37–38	29
39–42	28
43–45	27
46–50	26
51–55	25
56–61	24
62 and over	23

Substantiation: Inserting these lines will make the Table easier to use, more "user friendly", and perhaps reduce the possibility of user error.
Panel Meeting Action: Accept in Principle
Panel Statement: The submitter omitted the demand factor for 11 dwellings in his proposal. The panel accepts the concept of adding the lines.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-349 Log #947 NEC-P02 **Final Action: Accept in Principle in Part**
(220.84(C))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise as follows:
(2) ~~1500~~ <u>3000</u> volt-amperes for ~~each~~ <u>the</u> 2- ~~wire~~ small appliance branch circuits and <u>1500 volt amperes for</u> the laundry circuit specified in <u>210.11(C)</u> ~~220.52~~ .
Delete present (2), (3), and (4) and substitute:

The nameplate rating of electric ranges, exhaust hoods, wall mounted ovens, counter-mounted cooking units, 208-volt and 240-volt clothes dryers, dishwashers, food waste disposers, and storage water heaters. If water heaters are interlocked so that all elements cannot be energized at the same time it shall be permitted to calculate only the highest rated element. (4) The nameplate rating of electrical utilization equipment with or without an integral motor, not covered by (C)(2), (C)(3), (C)(4), or (C)(5). The current rating required by 430.6 for separate motors.
Revise (5): The larger of the air-conditioning load or the fixed electric space heating load.
Substantiation: The requirement for 1500 volt-amperes for each small appliance circuit tends to discourage installation of more than two circuits. Additional circuits provide diversity and reliability without actually increasing load. Apparent intent is not to require additional load calculation for the circuit permitted by 210.52(B)(1) Exception No. 2. Where more than the minimum number of circuits is installed for a va/sq ft calculated load, no additional load calculation is required. The requirement to provide small appliance and laundry circuits is in 210.11(C) not 220.52, and 2-wire circuits are not specified; a multiwire circuit may be installed. Appliances of (C) should be specified as electric, since gas types may utilize a small appliance circuit per 210.52(B)(2) Exception No. 2. Low power factor is not defined, what values are to be considered low?
Panel Meeting Action: Accept in Principle in Part
Revise 220.84(C)(2) of the present code to read as follows:
(2) 1500 volt-amperes for each 2 wire, 20 ampere small-appliance branch circuit and each laundry branch circuit covered in 210.11(C)(1) and (2).
Replace 220.84(C)(3) of the current code with the following text:
(3) The nameplate rating of:
a. All appliances that are fastened in place, permanently connected, or located to be on a specific circuit.
b. Ranges, wall-mounted ovens, counter-mounted cooking units.
c. Clothes dryers that are not connected to the laundry branch circuit specified in (2).
d. Water heaters.
Replace 220.84(C)(4) of the current code with the following text:
(4) The nameplate ampere or kVA rating of all permanently connected motors not included in (3).
Accept the submitters revision to (C)(5).
Reject the submitters recommendation to delete (2), (3) and (4) and the new language proposed.
Panel Statement: The panel has accepted the revisions to item (2) to be consistent with the revisions taken in 220.82 and 220.83.
The panel has revised item (3) to be consistent with the revisions made in Proposals 2-340 and 2-344. The panel has deleted the reference in the current code to "space heaters", because these items would either be fixed electric space heating that are already covered in (5) or they would be appliances as already covered in new item (3)a. The panel has also deleted the sentence in item (3) regarding water heater elements because the requirement is to add the nameplate rating and the deleted sentence also required adding the nameplate rating.
The panel has revised item (4) to be consistent with the revisions in Proposals 2-338 and 2-344.
The panel did not accept the submitter's revisions to items (3) and (4) because it is not necessary to attempt to list all of the additional equipment. The water heater rating is taken into account by its nameplate rating.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

(220.84(C)(3) & Table 220.84)

Submitter: Ted Smith, Ludvik Electric Co. / Rep. International Electrical Instructors & Students Assoc.
Recommendation: Revise as follows:
220.84 Multifamily Dwelling.
(A) Feeder or Service Load. It shall be permissible to calculate the load of a feeder or service that supplies three or more dwelling units of a multifamily dwelling in accordance with Table 220.84 instead of Part III of this article if all the following conditions are met:
(1) No dwelling unit is supplied by more than one feeder.
(2) Each dwelling unit is equipped with electric cooking equipment.
Exception: When the calculated load for multifamily dwellings without electric cooking in Part III of this article exceeds that calculated under Part IV for the identical load plus electric cooking (based on 8 kW per unit), the lesser of the two loads shall be permitted to be used.
(3) Each dwelling unit is equipped with either electric space heating or air conditioning, or both. Feeders and service conductors whose calculated load is determined by this optional calculation shall be permitted to have the neutral load determined by 220.61.
(B) House Loads. House loads shall be calculated in accordance with Part III of this article and shall be in addition to the dwelling unit loads calculated in accordance with Table 220.84.

Table 220.84 Optional Calculations — Demand Factors for Three or More Multifamily Dwelling Units

Number of Dwelling Units	Demand Factor (Percent)
3 – 5	45
6 – 7	44
8 – 10	43
11	42
12 – 13	41
14 – 15	40
16 – 17	39
18 – 20	38
21	37
22 – 23	36
24 – 25	35

28 – 30	33
31	32
32 – 33	31
34 – 36	30
37 – 38	29
39 – 42	28
43 – 45	27
46 – 50	26
51 – 55	25
56 – 61	24
62 and over	23

(C) Connected Loads. The calculated load to which the demand factors of Table 220.84 apply shall include the following:
(1) 33 volt-amperes/m^2 or 3 volt-amperes/ft^2 for general lighting and general-use receptacles.
(2) 1500 volt-amperes for each 2-wire, 20-ampere small-appliance branch circuit and each laundry branch circuit specified in 220.52 .
(3) The nameplate rating of all appliances that are fastened in place, permanently connected or located to be on a specific circuit, ranges, wall-mounted ovens, counter-mounted cooking units, clothes dryers and water heaters , and space heaters . If water heater elements are interlocked so that all elements cannot be used at the same time the maximum possible load shall be considered the nameplate load.
(4) The nameplate ampere or kilovolt-ampere rating of all motors and of all low-power-factor loads.
(5) The larger of the air conditioning load or the space-heating load.
Substantiation: Space heaters are listed in subsection (3) and in subsection (5). This requires that the space heating load be calculated twice when determining the demand. The space heating load only needs to be calculated once. This is effectively done in subsection (5).
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Proposal 2-349.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-353 Log #1124 NEC-P02 **Final Action: Accept in Principle**
(Table 220.86)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise heading:
OPTIONAL METHOD - DEMAND FACTORS for FEEDERS AND SERVICE - ~~ENTRANCE~~ CONDUCTORS
Substantiation: Edit. There may be no service-entrance conductors per the FPN to definition of Service-Entrance Conductors, Underground System.
Panel Meeting Action: Accept in Principle
In addition to the submitter's recommendation revise the second paragraph to read: "Feeders and service ~~-entrance~~ conductors..."
Panel Statement: The panel has made the same revision within the body of the requirement as was recommended for the table title.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-354 Log #1164 NEC-P02 **Final Action: Accept**
(Table 220.86)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise heading:
OPTIONAL METHOD - DEMAND FACTORS for FEEDERS and SERVICE ~~ENTRANCE~~ CONDUCTORS
Substantiation: Edit. There may be no service-entrance conductors per the FPN to definition of Service-Entrance Conductors, Underground System.
Panel Meeting Action: Accept
Panel Statement: See the panel action and statement on Proposal 2-353.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-355 Log #3159 NEC-P02 **Final Action: Reject**
(Table 220.86)

Submitter: Wally Harris, Atlantic Inland Inspections
Recommendation: Reformat Table as presented below:

Table 220.86 Optional Method — Demand Factors for Feeders and Service-Entrance Conductors for Schools

Connected Load		Demand Factor (Percent)
First 33 VA/m2	(3 VA/ft2) at	100
Plus overage from 34 to 220 VA/m2	(3 to 20 VA/ft2) at	75
Plus overage from 221 VA/m2 and up	(20 VA/ft2) at	25

Substantiation: Use of the terminology in this Table is often times confusing to some users of the Code. Present use of the term "Over 33 to 220…" actually means from 34 to 220. Present use of the term "Remainder over 220…" actually means from 221 and up. It would seem that this proposal would help make the Code more user friendly, eliminate mental blocks for some users, and eliminate some confusion as to interpretation when this Table is used.
Panel Meeting Action: Reject
Panel Statement: The panel does not agree that the current table is unclear. The submitter's revisions do not improve clarity.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-356 Log #2683 NEC-P02 **Final Action: Reject**
(220.89)

Submitter: Dorothy Kellogg, American Chemistry Council
Recommendation: Revise text to read:
220.89 Optional Calculations - Supervised Industrial Installations
(A) Supervised Industrial Installations - For the purposes of this article, Supervised Industrial Installations shall be defined as installations that meet the following criteria:
(1) Conditions of maintenance and engineering supervision ensure that only qualified persons design, control, monitor and service the system.
(2) The premises has at least one service or feeder that is more than 150 volts to ground and more than 300 volts phase-to-phase.
This definition excludes installations in buildings used by the industrial facility for offices, warehouses, garages, machine shops, and recreational facilities that are not an integral part of the industrial plant, substation, or control center.
(B) Demand Factor - For services and feeders in Supervised Industrial Installations, calculation of load shall be permitted to be the product of the total connected load and a demand factor. The demand factor shall be calculated and applied under engineering supervision and meet the following requirements:
(1) The application of a determined demand factor must yield a sufficient ampacity capable of serving the actual operating load.
(2) The allowable demand factor applied shall not be less than 50%
(FPN): Demand factors determined in the design of new facilities can often be validated against actual historical experience from similar installations. Refer to ANSI/IEEE Std. 141, IEEE Recommended Practice for Electric Power Distribution for Industrial Plants and ANSI/IEEE Std. 241 for information on the calculation of loads and demand factor.
Substantiation: The NEC does not specifically recognize the use of demand factors in the determination of loads in Supervised Industrial Installations. As a result, the NEC determined loads for supervised industrial installations are overly conservative and require distribution systems with higher than needed ratings at a significant cost to owners and misuse of finite natural resources. This approach is inconsistent with the historical experience found in both utilities and industry. Utilities have been successfully sizing and operating supplies using a demand-based approach for many years. Industry has also had success applying a demand-based approach in calculating loads when allowed by the authority having jurisdiction. The NEC recognizes this as an issue and partially addresses it in Article 220 by allowing sixteen optional methods that make use of demand factors for determining particular types of loads. However, none of these optional methods address Supervised Industrial Installations. This proposal makes use of concepts the NEC already recognizes such as demand factor, Supervised Industrial Installations (240.21(C)(3)), and engineering supervision to allow an optional demand-based approach in determining loads for Supervised Industrial Installations. The proposed FPN is also currently recognized by the NEC in 430.26. Finally, the NEC was established to safeguard persons and property. Allowing a demand-based approach for sizing feeders in Supervised Industrial Installations does not compromise safety to persons or property. This is due to the overcurrent protection requirements already given in Article 240. Even if misapplied due to calculation errors, the required overcurrent protection will de-energize overloaded equipment ensuring safety of persons and property.
Panel Meeting Action: Reject
Panel Statement: The panel requests that the submitter provide more data to support the new optional calculation for supervised industrial installations. The panel is not sure that the proposed approach will be applicable for all industrial installations.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
NENNINGER, B.: Recognizing the panel's concerns regarding applicability and need for data, a more restrictive text is offered below as an alternate proposal. Using this revised text addresses the applicability concerns of broadly applying the optional calculation to all Supervised Industrial Installations and narrows the scope to only new petroleum and chemical processing plants. Additionally, the requirement that the petroleum or chemical plant qualify as being within a Supervised Industrial Installation per section 240.2 was left to ensure only qualified persons monitor and service the system and that the plant was part of an overall system load that exceeded 2500 kVA. Finally, requiring the use of measured maximum demand data per section 220.87 for two comparable plants in operation was added in establishing a minimum demand factor. In this case, it is difficult to gather comparable load data as was done for the restaurant calculations. In order to achieve a similar approach, one would need to gather extensive data sets around a long list of specific process technologies such as Polyethylene, Chlor-alkali, Polycarbonate, Ethylene, etc. Even then, the process technology used within these processes evolves impacting demand. By employing the conditions in the proposed text, comparable and relevant demand data would be gathered on a case by case basis. Please keep in mind allowing this approach will not compromise safety even if misapplied due to overcurrent protection requirements already required in Article 240.

220.89 Optional Calculations - New Petroleum and Chemical Processing Plants.

(A) Applicability. New petroleum and chemical processing plants must comply with the following criteria in order to apply the optional calculations permitted in 220.89 in lieu of Part III of this article.

(1) Exist for the primary purpose of manufacturing, refining and/or processing petroleum and chemical products.

(2) Qualify as a plant within a Supervised Industrial Installation as defined in Section 240.2.

(3) Have measured demand data obtained in accordance with Section 220.87(1) from at least two existing petroleum or chemical processing plants using similar process technology in the manufacture of the same product(s).

(B) Demand Factor. For services and feeders in Petroleum and Chemical Processing Plants, calculation of load shall be permitted to be the product of the total connected load and a demand factor. The applied demand factor shall meet the following requirements:

(1) Be calculated and applied under engineering supervision.

(2) Yield a sufficient ampacity capable of serving the actual operating load.

(3) Not be less than 50 percent of the connected load.

(4) Not be less than 125 percent times the highest maximum demand determined for two similar plants as measured per Section 220.87(1).

PURVIS, R.: This proposal should have been accepted in Principle with a reference to EEI Statement on Proposal 2-357.

2-357 Log #3191 NEC-P02 **Final Action: Reject**
(220.90 (New))

Submitter: Timothy M. Croushore, Allegheny Power
Recommendation: Please add new section in Part IV Optional Feeder and Service Load Calculations in Article 220 for Engineering Supervision for feeder and service load calculations. The new section is as follows:

220.90 Engineering Supervision. Feeder and service load calculations for new or existing loads shall be permitted by a qualified Registered Professional Engineer. Feeder conductors shall not be required to be of greater ampacity than the service conductors. Service or feeder conductors shall be permitted to have neutral load determined by 220.61.

Substantiation: The purpose of this change is to add the provision for a qualified Registered Professional Engineer to perform load calculations by using either the real and reactive components of load or to use appropriate demand/diversity factors for occupancies of similar loads to calculate the feeder or service load.

The requirement for a qualified Registered Professional Engineer is similar to the requirement in 505.7(A) for the supervision of area classification for hazardous locations. The requirement for a qualified Registered Professional Engineer is the most stringent requirement for the capabilities of the individual calculating load. This Code accepted term is more limiting to the requirements and capabilities of the engineer than does the Code accepted term "engineering supervision." Using this term in this new section will assure that calculations done by the requirements of this section will be done carefully and accurately.

This provision would provide the capabilities of a qualified registered professional engineer to calculate loads using the exact method of adding all of the real (kW) loads together and adding all of the reactive (rkVA) loads together to get a total real (kW) and reactive (rkVA) load. Once the actual real and reactive load is determined, the actual kVA load and power factor can be determined more accurately than just adding the amps of various power factor loads together as is done in the remainder of Article 220.

This provision would also provide the capabilities of a qualified registered professional engineer to calculate loads for similar occupancies in a manner similar to the way 220.87 does for existing loads. The qualified registered professional engineer will have the ability to apply demand or diversity factors to the loads of feeders or services. These demand or diversity factors are for similar uses and similar occupancies and are either published or are available from sources of data that meter such loads. For example, this new section may be used by an electrical engineer with a Professional Engineering registration calculating the service or feeder size for commercial occupancies such as a Lowes, Home Depot, Wal-Mart, Target, K-Mart, Eckerd Pharmacy, Walgreens, Rite-Aid, Krogers, Wynn-Dixie, Supervalue, PetSmart, Petco, etc. and other occupancies based on previously installed and monitored electrical metering. This section could also be used for industrial occupancies under the supervision of a qualified registered professional engineer where demand/diversity factors are accepted by industry for process loads and manufacturing loads.

The last two sentences of this new section are the same as the last two sentences of 220.88 for New Restaurants.

Panel Meeting Action: Reject
Panel Statement: The proposal provides an open ended approach to load calculations and does not establish a minimum level of safety. The current NEC rules adequately provide a minimum load calculation and take into account demand factors for areas that have been shown to be substantiated (e.g. lighting demand in 220.42). See the panel action and statement on Proposal 2-356.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

PURVIS, R.: Proposal 2-357 (Load Calculations) should have been accepted in principal.

The submitter makes two technical points with load calculations:
1. The current load calculations in Article 220 do not differentiate between loads with different power factors or non-coincidental demand. For example, 1 ampere plus 1 ampere plus 1 ampere does not necessarily equal 3 amperes of load current that will be flowing in the circuit.
2. There are diversities and demand factors published in IEEE documents that are applicable to commercial and industiral occupancies that a qualified Registered Professional Engineer could use.

The panel should have accepted the following text for 220.90.

220.90 Engineering Supervision. Feeder and service entrance load calculations for new or existing loads, except for one- and two family dwelling units, shall be permitted by a qualified Registered Professional Engineer. Feeder conductors shall not be required to be of greater ampacity than the service conductors. Service entrance or feeder conductors shall be permitted to have neutral load determined by 220.61.

An exception for one- and two-family dwellings has been added to the original proposed language. There are existing optional service and feeder size calculation methods for one- and two-family dwellings in the current NEC.

2-358 Log #104 NEC-P02 **Final Action: Reject**
(220.100)

Submitter: Matt Knieper, Chesaning, MI
Recommendation: Add the following to the end of the sentence:

"Farm loads shall be calculated in accordance with Part V and applicable sections of Part II and Part III.

Substantiation: Agricultural buildings are being constructed for mixed applications such as a horse barn, riding arena, and living quarters. Some agricultural buildings have a kitchen and lounging area. There are other mixed combinations. Some agricultural buildings for livestock confinement have locker rooms and laundry facilities. It needs to be made clear that applicable sections of Article 220 also apply. It needs to be made clear that 220.50 applies to motor loads. It is not clear to many in the field whether to include the largest motor at 125 percent of full-load current or whether it is included at 100 percent.
Panel Meeting Action: Reject
Panel Statement: The submitter has not substantiated revising the calculations for farm loads. The method of calculation in 220.102(B) would require that all loads be known. If they are not known, then Parts II and III would have to be used.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-359 Log #102 NEC-P02 **Final Action: Reject**
(Table 220.102)

Submitter: Ian Papp, Burton, MI
Recommendation: From the table, delete the phrase "not less than 125 percent full-load current of the largest motor" so the entry reads as follows:

"Loads expected to operate simultaneously, but ~~not less than 125 percent full-load current of the largest motor and~~ not less than the first 60 amperes of load."

Substantiation: This statement is confusing. It is understood that the full-load current of the largest motor is required to be included in the calculation at 125 percent, therefore, if it is already in the calculation, this statement is redundant. See companion proposal dealing with agricultural building load calculations.
Panel Meeting Action: Reject
Panel Statement: The submitter is confusing the general calculation for motor loads with the optional calculation for farms. The statement in the table is correct and requires that the largest motor be added at 125% along with 60 amperes of other load. No demand factor can be applied to this portion of the calculation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-360 Log #103 NEC-P02 **Final Action: Reject**
(220.103)

Submitter: Russell Dones, Saginaw, MI
Recommendation: Revise the first sentence as follows:

"Where there is a common supply for buildings and structures, ~~supplied by a common service,~~ the total load ~~of the farm~~ for ~~service~~ distribution point conductors and ~~service~~ equipment shall be calculated in accordance with ~~the farm~~ any dwelling unit load and demand factors specified in Table 220.103."

Substantiation: The distribution point is not necessarily a service as permitted by 547.9 and needs to be referred to as the distribution point conductors and equipment to avoid confusion. The term "farm"is being removed because the term is too restrictive. Article 547 makes reference to agricultural buildings and not to farm buildings. In some parts of the country, the term "ranch" is used in place of "farm" and the same rules should apply to a ranch as well as a farm. The word "any" was added before dwelling unit because there may be more than one dwelling unit supplied from a central distribution point. As used in the present section, the implication is that only one dwelling unit is included at 100% of the dwelling demand load. Keep in mind, the term "dwelling unit" can be a broad term that can include a multi-family dwelling unit in some cases.

Panel Meeting Action: Reject
Panel Statement: Per Article 100, "service" includes the service drops, service laterals and service entrance conductors. Together these contain the distribution point.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-3 Log #912 NEC-P04 **Final Action: Reject**
(220.203 (New))

TCC Action: Although the Technical Correlating Committee does not oppose the panel action to reject this proposal, it does express significant concern and disagreement with the panel statement. The Technical Correlating Committee notes that service laterals and service drops are not, by current definitions and code requirements, limited to the "utility company side of the service point". The service point can be established at many locations, including at the secondary of a utility owned transformer or at a utility owned pole. The conductors from that location to the building can be a service lateral or service drop that is covered by the NEC.

Changing the definitions and related code rules to redefine what customer owned conductors are called would require significant work that is beyond the scope of what can be accomplished in this code cycle and allow for adequate public review.

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Add:

230.203 Service Lateral Conductors. Service lateral conductors shall be installed in accordance with the applicable requirements of this Code covering the type of wiring method used and shall be limited to the following methods:

1. Rigid metal conduit
2. Intermediate metal conduit
3. Type NUCC conduit
4. Type HDPE conduit
5. Rigid nonmetallic conduit
6. Direct-burial conductors in accordance with 300.50.

Substantiation: Edit. Service incorporating service-lateral conductors do not appear to be covered.
Panel Meeting Action: Reject
Panel Statement: The panel disagrees that this is an "editorial change." Service lateral conductors are on the utility company side of the service point and, based on 90.2(B)(5)(a), are under the exclusive control of an electric utility and not covered by the NEC.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

Comment on Affirmative:

BECK, C.: The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-a-vis the NEC Section 90.2(B)(5) over the last several cycles and it has been finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth is via the definitions of "service drops" and "service laterals". Those too are utility installed extensions of the services. What comes after the "point of delivery" or "the point of connection" are "service entrance conductors" either underground or overhead.

This panel action adds clarity to the above concept, and Panel 4's support and application of those concepts that have previously been put forth (e.g.by CMP1). It is recognized, however, that the definitions of "service entrance conductors" (either overhead and/or underground) need to have the concept of "service Point" added to ensure further clarity of the issue. Also, in NEC Section 230.30, I would recommend that the title be changed from "service lateral" to "service entrance conductor, underground" to insure clarity and support CMP-4's panel statement. Finally, elsewhere in the code, all sections that use the terms "service lateral" or "service drop" need to be reviewed to insure the correctness of the use of those terms or whether actually "service entrance conductor, overhead" or "service entrance conductor, underground" are more appropriate.

The panel has stated its position, but I recommend that the Technical Correlating Committee review the following three definitions in Article 100 and the underlined recommended revisions. I believe they need to be revised as recommended to assure that all the other related definitions are clarified within the NEC. These have not previously been updated to correlate with the other existing definitions related to services and service entrances and capture the above stated intent and understanding in the NEC.

They are as follows:

Service -Entrance Cable. Service -entrance conductors made up in the form of a cable.

Service -Entrance Conductor. The conductors from the service point to the service disconnecting means.

Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuses(s) and their accessories, connected to the load end of service -entrance conductors to a building or other structure, or an otherwise designated area, and intended to constitute the main control and cutoff of the supply.

Additionally, it is recommended that the Correlating Committee form a Task Group or take other appropriate action with the following sections, as they need to be reviewed and revised as appropriate to assure the concept of services are suppled by utilities and provide clarity of the demarcation between the utility and premises systems. They are:

And, in Annex D:
Example D1(a)
Example D3
Example D4(a)

ROGERS, J.: I agree with the Panel action on this proposal. I do not agree with the Panel statement that service lateral conductors are always on the utility side of the service point. If that were the case there would be no need to define the installation of service lateral conductors in the NEC as 90.2(b)(5) would apply to all installations of service lateral conductors. In reality that is not the case and thus the language in 90.2(b)(5) that states "installations under the exclusive control of an electric utility", in many cases these conductors are installed on private property by private contractors and thus are not under the exclusive control of the electric utility. The definition of service lateral defines these conductors as all conductors between the connection at the street and some type of enclosure at the building served, this definition does not limit these conductors to being utility owned or controlled conductors. The definition of "Service Point" first appeared in the 1993 NEC, there was only one proposal, in the substantiation for that proposal the submitter stated that he was seeking clarity that the "Service Point" could be at locations other than at the building served and that the installation of service lateral conductors could be done by other than the serving utility. CMP 1 accepted that portion of the proposal. Since that time there has been much more clarity on this issue throughout the country and some utility companies define the service point as being at the pole or handhole at the property edge and thus the service lateral is not under their exclusive control and some define the service point at the building meter enclosure or tap box and thus they are responsible for the service lateral conductors. To go backward at this time and state that service lateral conductors are always under the exclusive control of the electric utility would only lead to another round of confusion in an area that has not displayed real confusion since the 1993 NEC. In addition if this interpretation was to be used any requirements for either listing or sizing of these cables installed on private property would be lost. If CMP 4 is truly of the opinion that these conductors are exclusively utility conductors then Part III of Article 230 should be removed. I have provided two drawings, one from the Nstar Electric Installations Requirements book and the other from the National Grid Electric Installations Requirements book. Both of these drawings indicate that the service lateral is installed by private contractors. I am sure that to many this statement seems lengthy for such a minute item, however, it would create enormous problems for installers, inspectors and utility companies if the belief that all service laterals are exclusively under the control of electric utilities was to come about due to this panel statement.

Note: Supporting material is available for review at NFPA Headquarters.

ARTICLE 225 — OUTSIDE BRANCH CIRCUITS AND FEEDERS

4-4 Log #1533 NEC-P04 **Final Action: Accept in Principle in Part (225 and 230)**

TCC Action: The Technical Correlating Committee directs that the action on this proposal be sent to the Technical Correlating Committee Grounding and Bonding Task Group for review and comment.

Submitter: Technical Correlating Committee on National Electrical Code®,

Recommendation: Revise Articles 225 and 230 as described in the following, relative to the terms bonding and grounding.

225.18 Revise the title of this section as follows:

225.18 Clearance from Grade ~~Ground~~

230.7 Exception No. 1 Revise Exception No. 1 as follows:

Exception No. 1: Conductors or jumpers used for grounding or bonding. ~~Grounding conductors and bonding jumpers.~~

230.24(B) Revise the title of this section as follows:

(B) Vertical Clearance from Grade ~~Ground~~

230.50 : Revise the title and section as follows:

230.50 Protection of Open Conductors and Cables Against Damage — Above Grade ~~Ground~~

Service-entrance conductors installed above grade ~~ground~~ shall be protected against physical damage as specified in 230.50(A) or (B). …

230.82(2) and (3) Revise these sections as follows:

(2) Meters and meter sockets nominally rated not in excess of 600 volts, provided all metal housings and service enclosures are grounded and bonded in accordance with Part V and VII of Article 250.

(3) Meter disconnect switches nominally rated not in excess of 600 volts that have a short-circuit current rating equal to or greater than the available short circuit current, provided all metal housings and service enclosures are grounded and bonded in accordance with Part V and VII of Article 250.

230.95: Revise this section as follows:

230.95 Ground-Fault Protection of Equipment. Ground-fault protection of equipment shall be provided for solidly grounded wye electrical services of more than 150 volts to ground but not exceeding 600 volts phase-to-phase for each service disconnect rated 1000 amperes or more. The grounded conductor for the solidly grounded wye system shall be connected directly to ground through a grounding electrode as specified in 250.50 without inserting any resistor or impedance device.

230.204: Revise the title and section as follows:

(D) Grounding Electrode Connection Isolating switches shall be provided with a means for readily connecting the load side conductors to a grounding electrode when disconnected from the source of supply.

A means for grounding the load side conductors to a grounding electrode shall not be required for any duplicate isolating switch installed and maintained by the electric supply company.

Substantiation: 225.18: This section refers to clearances from grade levels, sidewalks, streets, parking areas, etc or any platform or projection. Although the word "grade" can sometimes mean the "ground" it does not always in this section. The proposed revision is intended to correlate with the revision to the definition of the word "ground" and replace it with a more appropriate word.

230.87 Exception No. 1: The exception is proposed to be revised to have more general coverage of any conductors that would be performing grounding or bonding functions. Grounding conductor is defined in Article 100.

230.24(B): This section refers to clearances from grade levels, sidewalks, streets, parking areas, etc or any platform or projection. Although the word "grade" can sometimes mean the "ground" it does not always in this section. The proposed revision is intended to correlate with the revision to the definition of the word "ground" and replace it with a more appropriate word.

230.50: The proposed revision is to include the function of bonding in this section in addition to grounding since both functions are apparent in these installations.

230.82(2) and (3): The proposed revision is to include the function of bonding in this section in addition to grounding since both functions are apparent in these installations.

230.95: This proposed revision is proposed to be more prescriptive and specific with respect to the connection to ground. This connection is required to be a solid connection to a grounding electrode.

230.204: This proposed revision is proposed to be more prescriptive and specific with respect to the connection to ground. This connection is required to be a solid connection to a grounding electrode.

This is the result of the TCC Task Group on Grounding and Bonding in resolve of the 2005 NEC cycle actions related to Proposal 5-1 and Comment 5-1 as directed by the Technical Correlating Committee. This is a companion proposal to the proposed revision to the terms "bonded", "grounded", and "equipment grounding conductor" in Article 100 relative to this Task Group's recommendations. These changes clarify the present requirement in more prescriptive language.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle in Part

Item (1). Accept in principle the proposed change of "ground" to "grade" in the titles to 225.18, 230.24(B), and 230.50. Accept in principle the change of "ground" to "grade" to the text in 230.50. See the panel action in Proposals 4-12 and 4-40 and (log #CP400.)

Item (2). Reject the change of "Grounding conductors and bonding jumpers" to "Conductors or jumpers used for grounding and bonding" in 230.7, Exception No. 1.

Item (3). Reject the text changes to Section 230.204(D).

Item (4). Change the proposed text in 230.82(2) and (3) to "…grounded in accordance with Part VII and bonded in accordance with Part V of Article 250," to read as follows:

230.82 Equipment Connected to the Supply Side of Service Disconnect

(1). [remains unchanged from the NEC 2005 text]

(2). Meters and meter sockets nominally rated not in excess of 600 volts, provided all metal housings and service enclosures are grounded in accordance with VII and bonded in accordance with Part V of Article 250.

(3). Meter disconnect switches nominally rated not in excess of 600 volts that have a short-circuit current rating equal to or greater than the available short circuit current, provided all metal housings and service enclosures are grounded and bonded in accordance with Part V and VII of Article 250.

[the remainder of this section is not changed by this proposal]

Item (5). Change the proposed text in 230.95 by adding the word "system" after the word "electrode" and before the word "as" to read as follows:

230.95 Ground-Fault Protection of Equipment. Ground-fault protection of equipment shall be provided for solidly grounded wye electrical services of more than 150 volts to ground but not exceeding 600 volts phase-to-phase for each service disconnect rated 1000 amperes or more. The grounded conductor for the solidly grounded wye system shall be connected directly to ground through a grounding electrode system as specified in 250.50 without inserting any resistor or impedance device.

Panel Statement: Item (1). See the panel action in Proposals 4-12 and 4-40 and (log #CP400.) The proposed changes from "ground" to "grade" in 225.18, 230.24(B), and 230.50 were really outside the scope of the Task Group dealing with grounding and bonding issues. However, the text within the sections used the term "grade." The task group seemed to feel this change was necessary due to a new definition proposed for the term "ground" in Article 100, but this definition has existed for many Code cycles, as has the term "ground" for measurement purposes in Article 225 and 230.

Item (2). The proposed change to 230.7, Exception No. 1, was rejected, since the existing text more adequately and specifically describes grounding conductors and bonding jumpers that are permitted in the same raceways with service conductors. The proposed text can cause confusion, since "grounding jumpers" is not a phrase normally used in conjunction with service conductors in a raceway, but "bonding jumpers" certainly is a phrase commonly used. The proposed text applies "conductors and jumpers" to both "grounding and bonding" at the end of the sentence.

Item (3). The proposed text to Section 230.204 has been rejected, since the purpose of this requirement in the existing text is to provide a grounding point for connection of a grounding or bonding jumper during servicing of the system in conjunction with a lock-off, tag-off procedure. This point of connection provides an accessible point of connection from the isolating switch to a grounding point in close proximity to the switch. Connection to a grounding electrode is not necessary in this case, since the grounding point may be a ground mat installed as part of the substation. Ground mats are not one of the recognized grounding electrodes as described in 250.50 and 250.52 but can be used to ground the system on a temporary basis as required in OSHA 1910.269M.

Item (4). The changes made to the proposed text in 230.82(2) and (3) more accurately describe the specific parts for both grounding and bonding with each specific part immediately following the term as applied.

Item (5). Adding "system" to the proposed text in 230.95 requires compliance with installing a grounding electrode system as required by 250.50 and not connection just to a single electrode as the proposed text would imply.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-5 Log #3186 NEC-P04 **Final Action: Reject**

(225.1, FPN)

Submitter: Donald Cook, Shelby County Development Services

Recommendation: Delete this FPN completely.

Substantiation: A review of 90.2 (A) and (B), the Article 100 definition of service point, the complete NEC text and specifically the text in Articles 225, and 230 leads one to believe that electrical wiring and equipment located on the load side of the service point is under the scope of the NEC. This FPN, which based on the text in 90.5(C) is not enforceable, provides no value to the NEC user.

If industry believes information in the NESC is necessary for installations on the load side of the service point, that information should included as requirements of the NEC, not as a FPN. As an FPN, it only adds to the confusion of designers, installers, and AHJ's working on installations working on premises wiring.

Panel Meeting Action: Reject

Panel Statement: As mentioned in the proposal substantiation, this is a fine print note and, as stated in Section 90.5(C), it is for added information. The purpose is to point out that more information on high voltage installations is available by accessing the National Electrical Safety Code (the utility company standard from IEEE). A similar fine print note referencing the National Electrical Safety Code can be found in 110.71 for additional information on the loading that can be expected to bear on underground manholes. This added information should not be confusing to anyone dealing with premises wiring for high voltage systems.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 9 Negative: 1

Explanation of Negative:

NAUGHTON, J.: I agree with the submitter, removing this FPN from the Scope would eliminate any conflicting confusion.

Comment on Affirmative:

ROGERS, J.: I agree with the Panel action on this proposal. I do not totally agree with the Panel statement. The term confusion may not be the correct term, perhaps the term conflicting requirements would be better as NEC requirements are not in harmony with NESC requirements for electrical installations over 600 volts that are installed on the customer side of the service point. As an AHJ, there are many times problems in convincing local jurisdictions to adopt the most recent edition of the NEC, to add the NESC to this creates even more of a dilemma. The NEC is silent on many of these requirements and this has become very problematic in recent years as throughout the country installations that were formerly installed and maintained by electric utilities are now being installed or maintained by private contractors as premises wiring beyond the service point.

4-6 Log #2428 NEC-P04 **Final Action: Reject**

(225.4 Exception)

Submitter: Donald W. Zipse, Zipse Electrical Engineering, Inc.

Recommendation: Delete the following words from Section 225.4, Exception, "and grounded circuit conductors".

Substantiation: It is unnecessary to remind you, the panel members but for the reader of the ROC it is important to re-state the **PURPOSE OF THE NEC: It is the safeguarding of persons from hazards arising from the use of electricity.**

By continuing to allow the "grounded circuit conductors", commonly referred to as the neutral to be installed bare allows the neutral current to flow uncontrolled over the earth. This uncontrolled flow of "stray current" results in the potential to harm not only humans but to cows and pigs.

When a person reports to me that, they are getting an electric shock from their swimming pool, hot tub, shower or a dairy farmer with cows, the first thing I determine is if the neutral conductors within the structure is free from neutral conductor-to-earth faults. This eliminates the owner of the property from contributing to the problem. The NEC by continuing to allow the installation of bare grounded circuit conductors, the neutral, contributes to the flow of uncontrolled dangerous and hazardous neutral currents over the earth.

There are three (3) sources of these dangerous and hazardous stray currents. One is from stray bare grounded circuit conductors (NEC) originating from the utility's secondary power, the service entrance source. Another source 2) is the bastardized transformer's high voltage primary neutral to secondary neutral connection.

The third source is multigrounded neutral electrical distribution system neutral connection to earth four (4) times per mile. The stray current either enter the bare neutral conductor and travel back to the substation or conversely the stray current flows into the bare grounded conductor and enters the earth on its way back to the substation. In either case, the dangerous and hazardous stray current is flowing one way or the other and the NEC allowed bare neutral conductor is in the circuit.

EPRI: "Created by the nation's electric utilities in 1973, EPRI is one of America's oldest and largest research consortia, with some 700 members and an annual budget of about $ 500 million. Linked to a global network of technical specialists, EPRI scientists and engineers develop innovative solutions to the world's toughest energy problems while expanding opportunities for a dynamic industry."

An EPRI document states that 40 to 60 percent of the neutral return current in a multigrounded neutral electrical distribution system returns over the earth. We have measured 88 percent of the neutral current returning over the earth. This dangerous and hazardous stray current will use the bare grounded circuit conductor that is presently allowed by the NEC to either flow from the multigrounded neutral electrical distribution system into the earth on its way back to the substation or will flow onto the bare neutral conductor, the neutral, and onto the multigrounded neutral electrical distribution system in order to get back to the substation.

I suggest that for your own edification you obtain the proposal to eliminate the equipotential planes in 547.2 and 547.10. In addition, if you are interested in more information on multigrounded neutral electrical distribution system see the technical paper titled, "The Hazardous Multigrounded Neutral Distribution System and Dangerous Stray Currents", Copyright Material IEEE Paper No. PCIC-03-03.

Zipse's Law states "In order to have and maintain an electrical installation safe from electrical shocks and to prevent electrocution from stray current: All continuously, flowing current shall be contained within a conductor, insulated from earth, except at one place within the system and only one place can the neutral be connected to earth."

This is accomplished within industrial facilities since they do not make the bastardized electrical transformer connection between the primary neutral and the secondary neutral, which allows the continuous flow of dangerous and hazardous high voltage neutral current over the earth and ground conductors. The industrial facilities keep the neutral insulated and carry the ground conductor with the phase conductors.. (See IEEE Standard 141, "Electrical Power Distribution", The Red Book.

Panel Meeting Action: Reject

Panel Statement: This exception is necessary, since it recognizes that an uninsulated grounded conductor is permitted to be bare or covered in other articles of the NEC. For example, Article 396 permits messenger-supported wiring to have an uninsulated or covered messenger wire to support insulated conductors. Another example of a wiring method permitting an uninsulated grounded conductor is found in 338.10(B)(2), Exception, covering service entrance cable (Type SE cable).

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-7 Log #1563 NEC-P04 **Final Action: Accept**

(225.7(B))

TCC Action: The Technical Correlating Committee directs that this proposal be referred to the Technical Correlating Committee Neutral Conductor Task Group for information.

Submitter: Technical Correlating Committee on National Electrical Code®,

Recommendation: Make the following change in 225.7(B):

Change second appearance of "neutral" to "neutral conductor"

The revised text would appear as follows:

(B) Common Neutral. The ampacity of the neutral conductor shall not be less than the maximum net computed load current between the neutral <u>conductor</u> and all ungrounded conductors connected to any one phase of the circuit.

Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).

The Task Group has proposed the following definitions to be added to Article 100:

● **Neutral conductor.** A circuit conductor connected to the neutral point of a system.

● **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.

This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals

- The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.
- The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept

Panel Statement: The use of the term "neutral conductor" as provided by the two definitions in the substantiation by the task group does not seem to fit within the proposed neutral point since the neutral is required to be sized to not less than the maximum net computed load current between the neutral and all ungrounded conductors connected to any one phase of the circuit. The definition proposed by the task group does not recognize a neutral, as a common point to a single-phase conductor as covered in Section 225.7(B) so the substantiation does not fit the proposed text. However, the existing text on this type of neutral has been in the NEC for many Code cycles.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

Comment on Affirmative:

BECK, C.: The Panel action to Accept is correct. However, the Panel Statement does not clearly indicate that while the Panel agrees with the proposed change, it does not agree with the proposed definitions for the reasons stated in the Panel Statement. The Technical Correlating Committee should refer the Panel Action and Statement to other CMPs affected by this definition.

4-8 Log #2128 NEC-P04 **Final Action: Reject**
(225.10)

Submitter: Russell LeBlanc, Peterson School of Engineering

Recommendation: Change heading to:

Wiring on Buildings <u>and Other Structures.</u>

Insert: <u>and other structures</u> after the word "buildings" in the first sentence.

Substantiation: The same action needs to be taken in several sections of this article. See 225.11, 225.15, 225.16(A) and (B), 225.19 heading, 225.21.

Panel Meeting Action: Reject

Panel Statement: The proposal does not meet the requirements of Section 4-3.3 of the Regulations Governing Committee Projects. The submitter has not included a statement of the problem in his substantiation, and the recommendation to take similar action on the other sections referenced must be done in individual proposals for those sections. The submitter did not provide the location where the text is to be inserted in the other sections noted in the substantiation.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-9 Log #2204 NEC-P04 **Final Action: Reject**
(225.10)

Submitter: Kyle Cope, Prysmian Cables and Systems

Recommendation: Revise as follows:

"... as open wiring on insulators, as multiconductor cable, <u>as Type PA cable</u> , as Type MC cable...".

Substantiation: Statement on Problem: Material technology advancements now allow for cable designs that provide improved mechanical damage protection, i.e., crush and impact, over standard Type MC cable without sacrificing flame performance properties. The characteristics achieved using traditional metallic components can now be realized using polymeric materials. The use of polymeric materials also provides the opportunity for lighter and smaller diameter cables.

Substantiation for Proposal: Type PA cable offers enhanced mechanical protection over Type MC cable for this application. See test data provided. A UL Fact-Finding Study comparing the subject cable to Type MC is ongoing at the time of proposal submittal. This data will be forwarded once the study is complete.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: This cable and the acceptance of a special article covering this type of cable is under the jurisdiction of Panel 7 and must first be accepted by Panel 7 before it is included in the NEC. In addition, the UL fact-finding report should be submitted as part of the substantiation for acceptance of the cable to help determine the acceptability and the installation criteria for the cable.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-10 Log #3472 NEC-P04 **Final Action: Accept**
(225.10)

Submitter: Richard F. Van Wert, Middle Department Inspection Agency / Rep. Benjamin Franklin Chapter IAEI

Recommendation: Revise text to read:

225.10 Wiring on Buildings. The installation off outside wiring on surfaces of buildings shall be permitted for circuits of not over 600 volts, nominal, as open wiring on insulators, as multiconductor cable, as Type MC cable, <u>as Type UF cable,</u> as Type MI cable, etc.

Substantiation: This article needs rewording in order to clarify that UF cable is allowed to be installed outdoors on the building surface.

Panel Meeting Action: Accept

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

Comment on Affirmative:

ODE, M.: Adding "Type UF" cable to the acceptable wiring methods in 225.10 for wiring on buildings not does not absolve the user from complying with the requirements in Article 340.

4-11 Log #570 NEC-P04 **Final Action: Reject**
(225.12)

Submitter: Jeffrey A. Fecteau, City of Peoria, Arizona

Recommendation: Revise as follows:

~~Open~~ Conductor Supports. ~~Open conductors shall be supported on glass or porcelain knobs, racks, brackets, or strain insulators~~ . Cables or individual open-conductors shall be installed as specified in 230.51(A), (B), (C), Article 396, and Article 398.

Substantiation: As currently written, it does not address the support of cable assemblies used as outside branch circuits and feeders.

Panel Meeting Action: Reject

Panel Statement: This section specifically covers open conductors; the other wiring methods defined by the submitter are covered elsewhere.

The purpose of Section 225.12 is to specifically provide methods of support for open conductors by requiring these open conductors to be supported on glass or porcelain knobs, racks, brackets, or strain insulators, and not to deal with messenger-supported wiring as covered in Article 396 or open wiring on insulators as covered by Article 398. Open wiring on insulators is a wiring method with a very narrow application since it is only permitted for industrial or agricultural establishments. The NEC Style Manual does not permit a reference to an entire article within a section.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-12 Log #620 NEC-P04 **Final Action: Accept in Principle**
(225.18)

Submitter: Michael J. Johnston, Plano, TX

Recommendation: Revise text to read as follows:

225.18 Clearance from <u>Grade</u> ~~Ground~~ .

Overhead spans of open conductors and open multiconductor cables of not over 600 volts, nominal, shall have a clearance of not less than the following:

(1) 3.0 m (10 ft) - above finished grade, sidewalks, or from any platform or projection from which they might be reached where the voltage does not exceed 150 volts to ground and accessible to pedestrians only

(2) 3.7 m (12 ft) - over residential property and driveways, and those commercial areas not subject to truck traffic where the voltage does not exceed 300 volts to ground

(3) 4.5 m (15 ft) - for those areas listed in the 3.7-m (12 ft) classification where the voltage exceeds 300 volts to ground

(4) 5.5 m (18 ft) - over public streets, alleys, roads, parking areas subject to truck traffic, driveways on other than residential property, and other land traversed by vehicles, such as cultivated, grazing forest, and orchard

Substantiation: This proposal is for clarification purposes. The term "from grade" is currently used approximately 23 times in the Code. Ground is a defined term in Article 100 and relates to the concepts of grounding and bonding. The words used in this section are "finished Grade" "sidewalks" and "platform or projection". The word "ground" is used in this section in the term "voltage to ground". This proposal is part of a larger effort being placed on the correct use of the word "ground" or any derivatives of the word. No technical changes are being proposed to revise this section.

Panel Meeting Action: Accept in Principle

Change the title to "Clearance for Overhead Conductors and Cables."

Panel Statement: The term "grade" was too subjective since there is initial grade at time of construction, there is intermediate grade during construction, and then final grade at the end of construction. "Grade" could ultimately be changed at any future time. The title change uses the actual text within the section itself.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-13 Log #1462 NEC-P04 **Final Action: Reject**

(225.22)

Submitter: Ryan Jackson, West Valley City, UT

Recommendation: Revise as follows:

225.22 Raceways on Exterior Surfaces of Buildings or Other Structures. Raceways on exteriors of buildings or other structures shall be arranged to drain and shall be raintight in wet locations.

Exception (1): Flexible metal conduit, where permitted in 348.12(1), shall not be required to be raintight.

Exception (2): Raceways shall not be required to be raintight as permitted in 312.2.

Substantiation: The language new to the 2005 NEC in 312.2 is moot without this exception, as the two requirements contradict.

Panel Meeting Action: Reject

Panel Statement: Section 312.2, last sentence, deals with raceway entries into an enclosure in a wet location whereas Section 225.22 deals with a raceway on the exterior of a building or other structure. There is no contradiction, as alluded to in the substantiation, between the two sections, since one deals specifically with a raceway entry into an enclosure and the other deals with a raceway installed on a building. Raceways are only required to be raintight in wet locations.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-14 Log #2608 NEC-P04 **Final Action: Reject**

(225.22)

Submitter: David H. Kendall, Carlon

Recommendation: Revise as follows:

225.22 Raceways on Exterior Surfaces of Buildings or Other Structures. Raceways on exteriors of buildings or other structures shall be arranged to drain and shall be raintight in wet locations.

~~Exception: Flexible meal conduit, where permitted in 348.12(1), shall not be required to be raintight.~~

Substantiation: The exception should be deleted since installations found in Chapter 3 of the code apply generally per 90.3.

Panel Meeting Action: Reject

Panel Statement: Section 90.3 states that Chapters 1 through 4 apply generally except as amended or supplemented by Chapters 5, 6, or 7, but an application in Chapter 3 does not amend or supplement the information in Chapter 2. The exception in 225.22 recognizes that flexible metal conduit installed on a building or other structure is not required to be raintight where installed in accordance with 348.12. This exception helps clarify an application commonly used in the field and therefore must be retained,

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-15 Log #1280 NEC-P04 **Final Action: Reject**

(225 Part II)

Submitter: Mark R. Hilbert, State of New Hampshire

Recommendation: Change the title of Part II of Article 225 as follows:

II. ~~More Than One Building or Other Structure~~ Buildings or Structures Supplied by Feeder(s) or Branch Circuit(s)

Substantiation: Please consider changing the title of Part II to reference buildings or structures supplied by feeder(s) or branch circuit(s) as opposed to the current title that references more than one building or other structure. The language referencing two or more buildings supplied by a common service no longer exists in the title or text of 250.32 which addresses grounding of buildings or other structures that have been supplied by a feeder(s) or a branch circuit(s). Accepting the recommended text will correlate the title of Part II of Article 225 with the change in the title and text of 250.32 accepted by Panel 5 in the 2005 cycle. It will also identify that the requirements of the section pertain to a building or other structure that is being supplied by a feeder or branch circuit that may or may not be from a common service.

Panel Meeting Action: Reject

Panel Statement: Most buildings have electrical systems and equipment supplied by feeders and branch circuits. By changing the title, as suggested in the proposal, Part II would apply to all buildings and structures where the branch circuit or feeder was routed outside the building or structure and not just more than one building or structure supplied by outside branch circuits and feeders, as is intended in the present NEC.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-16 Log #1281 NEC-P04 **Final Action: Reject**

(225.30)

Submitter: Mark R. Hilbert, State of New Hampshire

Recommendation: Revise the text in the main paragraph of 225.30 as follows:

~~Where more than one building or other structure is on the same property and under single management, each additional building or other structure that is served by a branch circuit or feeder on the load side of the service disconnecting means shall be supplied by only one feeder or branch circuit.~~ A building or other structure shall be permitted to be supplied by one set of feeder conductors or by one set of branch circuit conductors unless otherwise permitted in 225.30(A) through (E). For the purpose of this section, a multiwire branch circuit shall be considered a single circuit. Feeders or branch circuits shall be permitted to run from one building or other structure to another building or other structure where the buildings or other structures are on the same property and under single management.

Substantiation: Please consider changing the text in this section that references buildings or other structures that are served by a feeder(s) or branch circuit(s) to ones that are supplied by a feeder(s) or branch circuit(s). The revised wording will still identify that a building or other structure can only be supplied by one feeder or branch circuit unless otherwise permitted by the section and that feeders or branch circuits can be run between buildings or other structures on the same property with single management. Additionally, the rewording will help clarify that a single building supplied by one set of conductors from a remote metering pedestal is not "multiple buildings or buildings and other structures."

Panel Meeting Action: Reject

Panel Statement: The proposed new first sentence references a single building or structure supplied by one set of feeders or branch circuits. This proposed change would provide language without the restrictive language in the present NEC text stating that this section only applies to each additional building or structure served by a feeder or branch circuit on the load side of the service disconnecting means from the first building. This limitation must remain in this section to retain the original intent to apply to additional buildings or structures on the premises.

The proposed last sentence implies that multiple feeders and branch circuits can be installed between buildings but permission for multiple feeders or branch circuits is only permitted in 225.30(B) through (D) so the proposed new text would be in conflict with the restrictive text in the existing first sentence.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-17 Log #1486 NEC-P04 **Final Action: Reject**

(225.30(A)(6))

Submitter: Ryan Jackson, West Valley City, UT

Recommendation: Revise as follows:

225.30 Number of Supplies.

(A) Special Conditions. Additional feeders or branch circuits shall be permitted to supply the following:

(6) ~~Systems~~ designed for connection to multiple sources of supply for the purpose of enhanced reliability.

(6) Equipment designed for connection to multiple sources of supply for the purpose of enhanced reliability.

Substantiation: Permitting an additional feeder or branch circuit for "systems" designed for enhanced reliability is too vague. The code user can easily argue that it is up to the registered design professional of the building to design a system for enhanced reliability. If the intent of this allowance is to permit multiple services to provide enhanced reliability for a piece (or pieces of) equipment, it should be written as such.

I urge the members of Panel 4 to revisit Mr. Pauley's statements at the comment stage of the 2005 cycle (4-19 Log #1579) which was accepted in principle. In the comment, the point was made that "enhanced reliability" should be considered. While the panel did, in fact, judge wisely, it also left out one of the key parts of Mr. Pauley's comment, which is the word "equipment".

A similar proposal will be made to 230.2 for the purposes of correlation.

Panel Meeting Action: Reject

Panel Statement: The allowance for redundant supplies is intended for engineered systems, not just engineered equipment. The panel stated in the 2004 Report on Comments in Comment Number 4-19, Log #1579 in response to its action to accept in principle as follows: "The submitter is correct in pointing out that the term 'redundant system' may be confusing. The type of equipment used to facilitate such a system is not defined, since different types of equipment may be used depending on the application."

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-18 Log #3329 NEC-P04 **Final Action: Reject**
(225.30(E))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc. / Rep. Massachusetts Electrical Code Advisory Committee
Recommendation: Revise to read as follows:
(E) Documented Switching Procedures. Additional feeders or branch circuits shall be permitted to supply large capacity multibuilding industrial or institutional installations under single management where documented safe switching procedures are established and maintained for disconnection.
Substantiation: The 2005 NEC is far too broad given the multiplicity of jurisdictions subject to the NEC. It potentially reaches a single-family house with a detached garage, which is rather far afield from the limitation to “large capacity multibuilding industrial,” a limitation that had been in the Code since it first appeared in the 1984 edition. Other occupancies are unlikely to maintain the documentation in a form that would be practical for Authorities Having Jurisdiction to be able to rely on.
Panel Meeting Action: Reject
Panel Statement: The submitter’s substantiation implies that the limitation for large capacity, multi-building industrial and institutional installations was deleted in the 2005 NEC process, when in fact, this limitation has not been in the Code since the 1996 NEC. There was no technical substantiation provided in the proposal to require documented switching procedures to be limited to industrial and institutional installations. The key to the use of this provision is for the installation to be under single management with documented safe switching procedures. This provision could apply to large multi-building office complexes, schools, apartments, and other similar facilities where provisions have been made to safely and effectively shut the system down where necessary.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-19 Log #3332 NEC-P04 **Final Action: Reject**
(225.32 Exception No. 1)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc. / Rep. Massachusetts Electrical Code Advisory Committee
Recommendation: Revise to read as follows:
Exception No. 1: For large capacity multibuilding industrial or institutional installations under single management where documented safe switching procedures are established and maintained for disconnection, and where the disconnection is monitored by qualified individuals, the disconnecting means shall be permitted to be located elsewhere on the premises.
Substantiation: This is a companion proposal to one for 225.30(E), submitted for consistency. The substantiation for the other proposal (governing the allowance for multiple feeder supplies) applies equally to an allowance for remote disconnecting means.
Panel Meeting Action: Reject
Panel Statement: There was no technical substantiation provided in the proposal to require documented switching procedures to be limited to industrial and institutional installations. The key to the use of this provision is for the installation to be under single management with documented safe switching procedures, with the additional requirement that qualified individuals must monitor the installation This provision could apply to large multi-building office complexes, schools, apartments, and other similar facilities where provisions have been made to safely and effectively shut the system down where necessary.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-20 Log #1333 NEC-P04 **Final Action: Accept**
(225.33)

TCC Action: The Technical Correlating Committee understands that the Panel Action on this proposal is Accept.
Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Revise as follows:
225.33 Maximum Number of Disconnects.
(B) Single-Pole Units. Two or three single-pole switches or breakers capable of individual operation shall be permitted on multiwire circuits, one pole for each ungrounded conductor, as one multipole disconnect, provided they are equipped with identified handle ties or a master handle to disconnect all ungrounded conductors with no more than six operations of the hand.
Substantiation: This change is meant to provide correlation with the 2005 change to 240.20.
Panel Meeting Action: Accept in Part
The panel does not accept the deletion of 225.33(A) and the exception.
Panel Statement: The panel accepts the addition of the word “identified” because it correlates with 240.20(B).
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-21 Log #1103 NEC-P04 **Final Action: Reject**
(225.34(B))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise (B):
ADDITIONAL DISCONNECTING MEANS . The one or more additional disconnecting means covered in 225.32 for each additional supply circui t for fire pumps, or for emergency, or for legally required or optional standby systems permitted by 225.3(A) shall be installed sufficiently remote from the one to six disconnecting means for ~~normal~~ all other supply systems to minimize the possibility of simultaneous interruption of supply.
Substantiation: The present wording does not require the disconnecting means for fire pumps and emergency systems to be remote from each other. There could be a total of twelve disconnects at one location which could be confusing to personnel. Safety should require the disconnecting means for fire pumps, emergency and legally required standby systems to be remote from all other disconnecting means. There is no guarantee that an “occurrence” in these systems is less likely than on “normal” systems. Conductors, wiring methods, voltages, could be essentially the same as normal systems. 695.4(B)(2)(3) requires remote location from other (all) disconnecting means. 700.12(D) requires separation of service drops and laterals which infers the disconnecting means where they terminate should be separated. This section is not consistent with that section.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided the panel with enough information. The existing NEC text requires the disconnecting means for fire pumps, emergency, legally required standby, and optional standby systems to be located sufficiently remote from the normal supply to the building to minimize the possibility of simultaneously disconnecting these loads. Any disconnects for these loads, no matter how many, must be located sufficiently remote from any other disconnects, so confusion should not be an issue as implied by the substantiation. The proposed new text “all other supply systems” could apply to pneumatic, steam, natural gas, or any other supply to the building and could very easily be misapplied since the original application was intended to apply to the normal electrical supply to the building.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-22 Log #968 NEC-P04 **Final Action: Accept in Part**
(225.39)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise as follows:
The feeder and branch circuit disconnecting means shall have a rating not less than the calculated load to be carried, determined in accordance with Part I, II, III, and IV of Article 220, as applicable . In no case shall the ampere rating be less than specified in 225.39(A), (B), or (C).
(A) ONE CIRCUIT INSTALLATION . For installations to supply only ~~limited~~ loads of a single branch circuit, the feeder and branch circuit disconnecting means shall have a rating of not less than 15 amperes.
(B) TWO CIRCUIT INSTALLATION . For installations consisting of ~~not more than~~ two 2-wire branch circuits ~~the~~ a 2-wire feeder ~~or branch circuit~~ disconnecting means shall have a rating of not less than 30 amperes. For installations consisting of two multiwire branch circuits or two 3-phase branch circuits, the feeder disconnecting means shall have a rating of not less than 30 amperes.
Substantiation: Edit. “Calculated” load should be specified; some motor loads and continuous loads are calculated at 125 percent of ampere ratings. References should not be made to entire articles. In (A) “limited” is not defined; load is limited by circuit ratings and other requirements. A branch circuit breaker in the building supplied may be supplied by a 15 ampere feeder breaker. In (B) “not more than” literally includes one circuit; 225.30 basically requires one circuit, therefore, the two branch circuits of this sections are presumed to be supplied by a feeder. Without the proposed requirement for two multiwire and 3-phase circuits, the disconnect rating is required to be 60 amperes for two such circuits, which is excessive.
Panel Meeting Action: Accept in Part
Accept only the addition of the word “calculated” in the first sentence of the section, and reject the remainder of the proposed changes.

Panel Statement: This proposal is not editorial. The word “calculated” was accepted to be consistent with the changes in the text in Article 220 and other parts of the NEC in the 2005 NEC.
The addition of the words “as applicable” is not necessary since the changes in the 2005 NEC have accomplished the goal of referencing the various parts of Article 220 that apply.
Deleting the word “limited” in (A) would make this section inconsistent with the text in 230.23(B), Exception, that refers specifically to limited loads of a single branch circuit being required to be not smaller than 12 AWG in size for small overhead service drops on limited loads. Adding the phrase “the feeder and” would apply this section to feeders supplying a single branch circuit. There is no reason to apply feeder requirements to a single branch circuit since it is the final overcurrent protective device before the load.

There is no technical substantiation for the suggested changes to (B). If there is only a single branch circuit, then (A) covers the application of a single branch circuit, not (B). In the substantiation, an incorrect statement is made that 225.30 requires one circuit. An additional building or structure on the same property as another building is not required to have power at all but can have a feeder or a branch circuit from the first building or structure. This has been clarified in the text changes to 225.30 for the 2005 NEC. There also was no substantiation provided to change from two 2-wire branch circuits to two multiwire branch circuits or two three-phase branch circuits.
In addition, the panel does not accept the deletion of (C) and (D).
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-23 Log #1334 NEC-P04 **Final Action: Reject**
(225.39)

Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Revise as follows:
225.39 Rating of Disconnect.
The feeder or branch-circuit disconnecting means shall have a rating of not less than the load to be supplied, determined in accordance with Parts I and II of Article 220 for branch circuits, Parts III or IV of Article 220 for feeders, or Part V of Article 220 for farm loads. In no case shall the rating be lower than specified in 225.39(A), (B), (C), or (D).
(A) One-Circuit Installation. For installations that supply only limited loads of a single 2-wire or multiwire branch circuit, the branch circuit disconnecting means shall have a rating of not less than 15 amperes.
(B) Two-Circuit Installations. For installations consisting of not more than two 2-wire or multiwire branch circuits, the feeder or branch-circuit disconnecting means shall have a rating of not less than 30 amperes.
Substantiation: Whether the circuit is a 2 wire or multiwire circuit, the load requirements shouldn't change.
Panel Meeting Action: Reject
Panel Statement: There was no technical substantiation provided with the proposal to expand this requirement from not more than two 2-wire branch circuits to apply to multiwire branch circuits.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-24 Log #1400 NEC-P04 **Final Action: Reject**
(225.39)

Submitter: George Stolz, II, Pierce, CO
Recommendation: Delete this section and its subsections.
Substantiation: Currently, this section is unclear as to what the "rating" requirement is referring to. Some view it as an addition of the ratings of the breakers installed at the separate structure in the panel(s). Some view it as a rating requirement for the enclosure itself. Some even view it as the rating for the OCPD that is installed at the supply side at the originating building, protecting feeder conductors. In any case, it appears evident that the size of conductors feeding the disconnecting means are truly what constitute the capacity of the system, and those conductors are sized and installed independent of the requirements laid out in this section.
Given the requirement given in 225.36, it appears that the purpose of this area of Article 225 is geared towards the ease of future expansion: should a separate structure at some point be supplied by a separate service, such an improvement would be made easier if the existing equipment were already suitable for such use. The requirements of this area are a reflection of nearly identical requirements of Article 230.
However, section 90.1(B) states that compliance with the NEC "...will result in an installation that is essentially free from hazard but not necessarily efficient, convenient, or adequate for good service or future expansion of electrical use." There is no hazard that is prevented by this section, it appears to exist solely for future expansion, which is explicitly outside the desired scope of the NEC per 90.1.
Further, if such an improvement is made to a structure at a later date, it is probable that most if not all equipment supplying that structure will be removed due to age or fundamental changes in the use of the building requiring greater capacity. Given the rampant misunderstanding of the nature of this section, if it is retained, the language should be clarified to reflect what exact component of the system is to bear the ratings listed in (A) through (D).
Panel Meeting Action: Reject
Panel Statement: The title of the section clearly states the "Rating of Disconnect". Simply stated, this is the minimum ampacity rating of the disconnecting means regardless of type. The fact that it is service rated does not establish an ampacity rating. Future expansion has nothing to do with this requirement.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-25 Log #2156 NEC-P04 **Final Action: Accept in Principle**
(225.39)

TCC Action: The Technical Correlating Committee understands that the panel action on Proposal 4-22 adds the word "calculated" to the wording in this panel action.
Submitter: James Grant, Rochester, NH
Recommendation: Revise text to read:
225.39 Rating of Disconnect. The feeder or branch-circuit disconnecting means shall have a rating of not less than the load to be supplied, determined in accordance with Parts I and II of Article 220 for branch circuits, Parts III or IV of Article 220 for feeders, or Part V of Article 220 for farm loads. Where the branch circuit or feeder disconnecting means consists of more than one switch or circuit breaker, as permitted by 225.33, the combined ratings of all the switches or circuit breakers used shall be permitted. In no case shall the rating be lower than specified in 225.39(A), (B), (C), or (D).
Substantiation: When using up to six disconnects, as permitted by 225.33, the present wording requires all the disconnects to be rated at the value as determined by 225.39. This revised article would directly parallel with 230.80. For the same reason that 230 has it for calculating the service, it would allow the value of some of the breakers to be used as the rating of the disconnect for the feeder or branch circuit.
The panel's statement to 4-36 Log #609 NEC-P04 in the 2005 report of proposals made the following comment:
"Since a disconnect is a device or group of devices, permission is already inherent to add each device to reach a total rating in compliance with this section." The new revised text will eliminate any confusion that there is inherent permission for breakers to be additive in calculating the rating of a disconnect.
Panel Meeting Action: Accept in Principle
Accept the added sentence with the exception of the word "used" and revise the proposed text by changing "combined ratings of" to "combining the ratings of" and add the phrase "for determining the rating of the disconnecting means" to the text before "shall be permitted" in the NEC to read as follows: "The feeder or branch-circuit disconnecting means shall have a rating of not less than the load to be supplied, determined in accordance with Parts I and II of Article 220 for branch circuits, Parts III or IV of Article 220 for feeders, or Part V of Article 220 for farm loads. Where the branch circuit or feeder disconnecting means consists of more than one switch or circuit breaker, as permitted by 225.33, combining the ratings of all the switches or circuit breakers for determining the rating of the disconnecting means shall be permitted. In no case shall the rating be lower than specified in 225.39(A), (B), (C), or (D)"
Do not revise any other text within this section.
Panel Statement: The word "used" was deleted and text was added to the proposed new sentence to provide clarity and to be more specific in what constitutes the combined ratings of the disconnecting means for feeder or branch circuit disconnecting means for separate buildings or structures.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-26 Log #2194 NEC-P04 **Final Action: Reject**
(225.39, FPN)

Submitter: David Williams, Lansing, MI
Recommendation: Revise as follows:
The rating feeder or branch-circuit disconnecting means shall have a rating of not less than the load to be supplied, determined in accordance with Parts I and II of Article 220 for branch circuits. Parts III or IV of Article 220 for feeders, or Part V of Article 220 for farm loads. In no case shall the rating be lower than specified in 225.39(A), (B), (C), or (D).
FPN: The rating of the overcurrent device protecting the feeder does not need to be rated to the minimum rating in this section.
Substantiation: The code section specifies the minimum rating of the disconnect and is not clear that the feeder or branch circuit needs to be rated for this minimum rating. As an inspector, I am not positive if this section only applies to the rating of the disconnect or does this mean that the minimum size of a feeder to a building should be 60 amperes.
Just trying to clear up a concern.
Panel Meeting Action: Reject
Panel Statement: An additional FPN is not necessary. The title of 225.39 defines the requirement as solely being the rating of the disconnect.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-27 Log #2959 NEC-P04 **Final Action: Reject**
(225, Part IV)

Submitter: James J. Rogers, Bay State Inspectional Agency
Recommendation: Add new text as follows:
Insert in it entirety Part 2 of the 2002 National Electrical Safety Code pages 59 through 190 inclusive.
Substantiation: In submitting this proposal the submitter understands that it most likely will not be accepted in this fashion. However, due to changes in procedures by utility companies across the country many of these installations are now privately owned and AHJs have nothing to enforce, this needs a public review.
Panel Meeting Action: Reject
Panel Statement: This proposal is not in compliance with Section 4-3.3(C) of the NFPA Regulations Governing Committee Projects, since the recommended text has not been submitted as part of the proposal. In addition, the submitter proposes adding text that was developed and under copywrite protection by IEEE. In rejecting this proposal, the panel recognizes the issue and recommends that he submit a letter to the TCC requesting a Task Group be assigned from the various code panels with high voltage installation requirements to insert additional text to cover high voltage installations.

ARTICLE 230 — SERVICES

4-29 Log #2102 NEC-P04 **Final Action: Reject**
(230.2)

Submitter: Jon Farren, Farren Engineering, Inc.
Recommendation: Revise text to read as follows:
230.2 ~~Number~~ Quantity of Services.
Substantiation: The term "quantity" refers to "total amount of", which is the intent of this code section.
Although the term "number" is sometimes used to indicate a quantity, it does not always specify the "total" quantity. The word "number" can also be used to designate a specific object, such as: "circuit number 3, in a 42 circuit panelboard", where 3 is the number and 42 is the quantity or "total amount of".
The word "number" has multiple meanings, the word "quantity" is more specifically related to "total amount of", which is the intent of this code section.
*Also refer to proposal for same word change in 220.11 and 220.42.
Panel Meeting Action: Reject
Panel Statement: The existing word "number" is used in the title to establish an actual number of services that are permitted to be supplied to a building or structure. The basic number of services to a single building or structure is one but the remainder of 230.2 gives permission for additional services to be added under specific conditions. The word "number" adequately provides the necessary information and provides clarity on the application of the Code rule.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-30 Log #3227 NEC-P04 **Final Action: Reject**
(230.2 (New))

Submitter: Michael A. Anthony, University of Michigan Business & Finance / Rep. Association of Higher Education Facilities Officers
Recommendation: Add new text to read:
230.2 Location. Service conductors from the electrical utility source shall be located the closest distance to the service disconnecting means required in 230.7(A)(1) unless they can be located outside the building according to 230.6.
Substantiation: Essentially this re-states the requirements of 230.6 and 230.70(A)(1) but at an earlier position in Article 230. Making this linkage may clarify the requirement for utility service planners. A clear straightforward statement like this early in Article 230 may help electrical system designers build their case for adequate, dedicated space for electric service equipment when architects and building owners are planning a new facility.
Panel Meeting Action: Reject
Panel Statement: Article 230 provides requirements for service conductors and equipment, as explained in the Scope statement in Section 230.1, and should be used in its entirety. Adding this proposed text at the beginning of the Article does not add clarity and, in fact, provides questionable text, such as "Service conductors from the electric utility source shall be located the closest distance to the service disconnecting means required in 230.70(A)(1) [the proposed text reads 230.7(A)(1) but should be 230.70(A)(1)]." Requiring the distance to be closest to the utility company source would be an undetermined distance and would be almost unenforceable.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-31 Log #1155 NEC-P04 **Final Action: Reject**
(230.2(A))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Delete: Optional Standby Systems.
Substantiation: 702.2 states optional standby systems are intended to supply onsite generator power. Does "intended" connote an option or a requirement? 90.3 indicates Chapter 7 modifies Chapter 3.
Panel Meeting Action: Reject
Panel Statement: The submitter has not presented adequate substantiation for this change. Article 702 does not indicate that optional standby systems should be allowed as an additional service. The allowance in 230.2(A) clearly identifies optional standby systems as an additional service.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-32 Log #1092 NEC-P04 **Final Action: Reject**
(230.2(A)(4))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Delete: (4) Optional Standby Systems.
Substantiation: 702.2 states: "optional standby systems are intended to supply onsite generated power." While the "intent" seems to exclude power from a serving utility, it doesn't seem to be a mandatory type of statement. To avoid confusion (4) should be deleted or modified. Chapter 7 may modify Chapter 2.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 4-31.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-33 Log #1487 NEC-P04 **Final Action: Reject**
(230.2(A)(6))

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise as follows:
230.2 Number of Services.
(A) Special Conditions. Additional services shall be permitted to supply the following:
(6) ~~Systems~~ designed for connection to multiple sources of supply for the purpose of enhanced reliability.
(6) Equipment designed for connection to multiple sources of supply for the purpose of enhanced reliability.
Substantiation: Permitting an additional service for "systems" designed for enhanced reliability is too vague. The code user can easily argue that it is up to the registered design professional of the building to design a system for enhanced reliability. If the intent of this allowance is to permit multiple services to provide enhanced reliability for a piece (or pieces of) equipment, it should be written as such.
I urge the members of Panel 4 to revisit Mr. Pauley's statements at the comment stage of the 2005 cycle (4-33 Log #1580), which was accepted in principle. In the comment, the point was made that "enhanced reliability" should be considered. While the panel did, in fact, judge wisely, it also left out one of the key parts of Mr. Pauley's comment, which is the word "equipment".
A similar proposal will be made to 225.30 for the purposes of correlation.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 4-17.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-34 Log #566 NEC-P04 **Final Action: Reject**
(230.2(C))

Submitter: Jeffrey A. Fecteau, City of Peoria, Arizona
Recommendation: Revise as follows:
(C) Capacity Requirements. Additional services shall be permitted under any of the following:
(1) Where the capacity requirements are in excess of ~~2000 amperes~~ local serving utilities capacity at a supply voltage of 600 volts or less.
(2) Where the load requirements of a single-phase installation are greater than the serving agency normally supplies through one service.
(3) By special permission.

Substantiation: This will eliminate problems and confusion between the local AHJ, designers, and the local serving utility. The NEC identifies in excess of 2000 amps and the local serving utilities have serving capacities larger than this amount. Designers will design multiple services to a single building based on the 2000 amp capacity; the AHJ will approve the plans and design based on the NEC and then the serving utility company requests the local AHJ in writing to the serving utility, approve the installation of multiple services.

This written approval constitutes special permission, and based on current code language there is no need for special permission. However, the serving utility sates that 2000 amps is less than their serving capacity and will not allow or energize without this written approval by the AHJ.

In the metro Phoenix area, we have two electrical utility companies, SRP (Salt River Project) and APS (Arizona Public Service).

SRP has a maximum service size of 2000 amps 3-phase 277/480 volt overhead, 3600 amps 3-phase 277/480 volt underground, 2500 amps 3-phase 120/208 volt overhead and 4000 amps 3-phase 120/208 volt underground.

APS has a maximum service size of 6000 amps in the Phoenix network area, 3000 amps 3-phase 120/208 volt and 277/480 volt underground outside the Phoenix network area, 1600 amps, 3-phase 120/208 volt overhead and 600 amps 3-phase 277/480 volt overhead.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: A single service exceeding 2000 amps does not require special permission. More than one service "shall be permitted" according to 230.2(C). Where the capacity requirements are in excess of 2000 amps, the NEC does not require special permission in accordance with 230.2(C)(1). The restriction to require written approval by the AHJ, as noted by the submitter, may be a local serving utility requirement not found in the NEC.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-35 Log #3308 NEC-P04 **Final Action: Reject**

(230.7)

Submitter: Redwood Kardon, Code Check Institute

Recommendation: Revise text to read as follows:

230.7 Other Conductors in <u>Cable Tray</u> , Raceway or Cable.

<u>FPN: For service conductors in cable trays see 230.44.</u>

Substantiation: The safety concerns that require separation for service conductors from "other conductors" applies equally to cable tray as it does raceways or cable assemblies.

Panel Meeting Action: Reject

Panel Statement: Section 230.7 covers raceways and cables generally for all service conductors, service entrance, service drop, and service laterals, not cable trays. Cable trays are more likely to be used for service entrance conductors than for service drop or service lateral applications, and thus belong not in the general requirements in 230.7 for raceways or cables that are used for service drop or service laterals but should stay exclusively in 230.44.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-36 Log #3481 NEC-P04 **Final Action: Reject**

(230.7 Exception No. 1)

Submitter: Richard F. Van Wert, Middle Department Inspection Agency / Rep. Benjamin Franklin Chapter IAEI

Recommendation: Revise text to read:

230.7 Other Conductors in Raceway or Cable.

Exception No. 1: Grounding conductors, <u>grounding electrode conductors</u> and bonding jumpers.

Substantiation: This article needs rewording because the installer sometimes feels the need to drill a second hole through 24 in. thick walls because the Code is not clear that the GEC can pass through in the same hole that the service cable enters into the building.

Panel Meeting Action: Reject

Panel Statement: Section 230.7 addresses conductors within raceways or cable assemblies. The submitter is describing conductors adjacent to service entrance cables, not within. The installation as described is not prohibited by 230.7.

Grounding conductors include grounding electrode conductors, so permission is already present in 230.7, Exception No. 1, to allow grounding electrode conductors to be in the same raceway with service conductors. Adding the proposed new wording may cause confusion in applying this section since it clearly is permitted.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-37 Log #2822 NEC-P04 **Final Action: Reject**

(230.24 Exception No. 4)

Submitter: Lanny G. McMahill, Phoenix, AZ

Recommendation: Add new Exception Number 4:

<u>Exception No. 4: Where the voltage between conductors does not exceed 300, and the roof is not readily accessible, reduction in clearance to not less than 900 mm (3 ft) shall be permitted.</u>

Substantiation: This proposed change is intended to coordinate with requirements in the National Electrical Safety Code (NESC). The NESC allows the reduction of the conductor clearance to 3 ft above a roof surface where not readily accessible. Although this change is less restrictive, it is the position of at least one utility company representative that it does not create an unsafe condition. In addition, coordinating the requirements will help to eliminate any differences in standards. These differences can cause problems from a code enforcement standpoint.

Panel Meeting Action: Reject

Panel Statement: Many building roofs are not readily accessible, based on the definition for Readily Accessible in Article 100. Roof access ladders and stairs onto the roof of a building make that roof readily accessible and thus this proposed exception would not apply to those buildings but reducing the clearance from the roof to service drop conductors to 3 feet would affect installations where a ladder is used to access the roof, meaning the roof is not readily accessible.

A person walking across the roof is still subject to the danger of the service drop. Utility company ungrounded service drop cables may be covered, not insulated, and may have some leakage current through the covering, even where well maintained. In addition, the bare grounded conductor is also the messenger cable. Based on this proposed new exception, the bare grounded conductor of the service drop cable would be permitted to be within 3 feet of the surface of the roof and any metal in close proximity to the roof surface creating a potential danger to anyone on the roof.

CMP-4 notes that there are significant differences in terms and definitions used in the NEC and the NESC. This can create differences in the installation practices.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

Comment on Affirmative:

ROGERS, J.: I voted with the Panel on this proposal, however, the submitter is correct in his concern relative to these conflicting requirements. The fact is that most electric utilities define the service point for overhead services as the connection of the service drop conductors to the service entrance conductors at the premises served. This being the case, as stated in 90.2(b)(5), these conductors are not covered by the NEC.

4-38 Log #1832 NEC-P04 **Final Action: Accept**

(230.24(A) Exception No. 4 (New))

Submitter: Mark T. Rochon, Mark J. Rochon Master Electrician

Recommendation: Add an exception to read as follows:

Exception No. 4: The requirement for maintaining the vertical clearance 900 mm (3 ft) from the edge of the roof shall not apply to the final conductor span where the service drop is attached to the side of the building.

Substantiation: The number 4 is missing from the last exception.

Panel Meeting Action: Accept

Panel Statement: The missing number 4 is an erratum that was picked up by NFPA staff and added to the errata sheets sent out with the NEC or corrected in the later printing of the Code.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-39 Log #2872 NEC-P04 **Final Action: Reject**

(230.24(A) Exception No. 4 (New))

Submitter: Michael L. Dyer, Salt River Project

Recommendation: Add new Exception Number 4:

<u>Exception No.4: Where the service drop cable is insulated, supported on an effectively grounded bare messenger or neutral, the voltage between conductors does not exceed 750V, and the roof is not readily accessible, the clearance may be not less than 900 mm (3 ft).</u>

Substantiation: This proposed change will harmonize 230.24(A) with the National Electrical Safety Code rule 234C3d1 exception 1, eliminating the differences in these standards. These differences have caused problems with respect to code enforcement.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 4-37.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-40 Log #619 NEC-P04 **Final Action: Accept in Principle**

(230.24(B))

Submitter: Michael J. Johnston, Plano, TX

Recommendation: Revise text to read as follows:

(B) Vertical Clearance from <u>Grade</u> ~~Ground~~ . Service-drop conductors, where not in excess of 600 volts, nominal, shall have the following minimum clearance from final grade:

(1) 3.0 m (10 ft) - at the electric service entrance to buildings, also at the lowest point of the drip loop of the building electric entrance, and above areas or sidewalks accessible only to pedestrians, measured from final grade or other accessible surface only for service-drop cables supported on and cabled together with a grounded bare messenger where the voltage does not exceed 150 volts to ground

(2) 3.7 m (12 ft) - over residential property and driveways, and those commercial areas not subject to truck traffic where the voltage does not exceed 300 volts to ground

(3) 4.5 m (15 ft) - for those areas listed in the 3.7-m (12 ft) classification where the voltage exceeds 300 volts to ground

(4) 5.5 m (18 ft) - over public streets, alleys, roads, parking areas subject to truck traffic, driveways on other than residential property, and other land such as cultivated, grazing, forest, and orchard

Substantiation: This proposal is for clarification purposes. The term "from grade" is currently used approximately 23 times in the Code. Ground is a defined term in Article 100 and relates to the concepts of grounding and bonding. The words used in this section are "finished grade" "sidewalks" and "platform or projection". The word "ground" is used in this section in the term "voltage to ground". This proposal is part of a larger effort being placed on the correct use of the word "ground" or any derivatives of the word. No technical changes are being proposed to revise this section.

Panel Meeting Action: Accept in Principle

Change the title to (B) to "Vertical Clearance for Service-drop Conductors."

Panel Statement: The term "grade" was not specific enough, since there is initial grade at time of construction, there is intermediate grade during construction, and then final grade at the end of construction. "Grade" could ultimately be changed at any future time. The title change uses the actual text within the section itself.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-41 Log #1066 NEC-P04 **Final Action: Reject**

(230.34 (New))

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Add: 230.34 WIRING METHODS for 600 VOLTS, NOMINAL, or LESS. Underground service - lateral conductors shall be installed in accordance with the requirements of the Code covering the type of wiring method used and shall be limited to the following methods:

1. Type IGS cable
2. Rigid metal conduit
3. Intermediate metal conduit
4. Type MI cable
5. Type USE cable

Substantiation: Provision should be made for underground service lateral wiring methods, especially when the FPN for service conductor, underground systems indicate there may be no service-entrance conductors. These conductors are not included in the definition of Service-Entrance Conductors, Underground Systems in Article 100.

Panel Meeting Action: Reject

Panel Statement: Wiring methods are not provided in Article 230 for either overhead service drops or underground service laterals. These service conductors <u>in some instances</u> are under the exclusive control of the utility company in accordance with 90.2(B)(5) and are not governed by the NEC. Service entrance conductors are under the jurisdiction of the NEC and are covered by the wiring methods in 230.43.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 8 Negative: 2

Explanation of Negative:

NAUGHTON, J.: I disagree with the panel statement and panel action. If these conductors are truly service entrance conductors, they belong under the jurisdiction of the NEC and not the utility sector.

ROGERS, J.: As described in my comment on proposal 4-3, there are many time when service laterals are installed by private contractors on private property. The submitter is correct that these installations are not adequately covered in the NEC. The Panel should have accepted this proposal in principle and reviewed the requirements for the installation of service laterals.

Comment on Affirmative:

BECK, C.: See my Affirmative Comment on Proposal 4-3.

4-42 Log #2188 NEC-P04 **Final Action: Accept in Principle**

(230.40 Exception No. 1)

Submitter: Dann Strube, Strube Consulting

Recommendation: Revise text to read as follows:

"A building <u>with more than one occupancy</u> should be permitted...".

Substantiation: 230.2 and 230.40 main rules are clear that a building with one occupancy can have more than one service. It is also clear that a set of entrance conductors is allowed for each service to a one occupant building. The only application for Exception No. 1 is when a multi-occupant situation is involved. To reduce confusion, that condition should be clearly stated.

Panel Meeting Action: Accept in Principle

Change the word "should" to "shall" in the recommendation to read as follows: "A building with more than one occupancy shall be permitted…."

Panel Statement: The word "should" in the proposal was replaced with the word "shall" to comply with 90.5(B) for permissive language.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-43 Log #3384 NEC-P04 **Final Action: Reject**

(230.40 Exception No. 1)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Recommendation: Revise text to read:

If the number of service disconnect locations for any given classification of service is not more than six, the requirements of 230.2(E) shall apply at each location. If the number of service disconnect locations is more than six for any given supply classification, all service disconnect locations for all supply characteristics shall be clearly described using suitable graphics or text or both on one or more plaque(s) located in an approved, readily accessible location(s) on the building or structure served and as near as practicable to the point(s) of attachment or entry(ies) for each service drop or lateral.

Substantiation: Some control over the potential proliferation of service disconnects at widely dispersed locations is needed by the inspection community, preferably without resort to 90.4. In the comment period for the 2005 NEC the panel seemed to be moving in this direction, having accepted part of this concept. However, that action was set aside by the TCC, giving CMP 4 a fresh opportunity to consider these questions. This proposal responds to concerns in the voting on 2005 NEC Proposal 4-71 that when the exception is applied to allow a large number of remote service entrance conductor sets and their disconnects, it may become unwieldy to provide full reciprocal labeling at each location.

The proposal suggests a limit of six disconnecting means, considered for each classification of supply characteristics. Suppose, for example, there were one 480Y/277V service for large power loads using a single disconnect at the owner's mechanical room and one 208Y/120V service with service entrance conductors run to each of ten occupancies with service disconnects in each. Assuming each occupancy does not qualify as a separate building, this wording would result in either one or two plaques (instead of eleven) depending on whether the two service drops or laterals arrive at the same or at different locations. The proposed text includes the word "approved" in order to allow the AHJ to review the proposed locations for suitability.

Panel Meeting Action: Reject

Panel Statement: The permission to use 230.40, Exception No. 1 has been in the NEC for the past 60 years in one form or another without a requirement for location plaques to be installed at each disconnect location. Where there are more than six disconnect locations, the proposal would require all supply characteristics to be clearly described using graphics or text or both on a plaque. Locating this graphic/text plaque on the building in a readily accessible location that is acceptable to the authority having jurisdiction, usable for any location identification, and that is as near as practicable to the point of attachment or service entrance entry into the building would be extremely difficult on all but the smallest buildings.

A large building or a high-rise building in a city is often on the exact footprint of the city lot with underground service laterals supplying a utility company vault. Even smaller buildings are often supplied with underground service laterals so the entrance into the building is not obvious so a plaque installed at the point of entrance of the service conductors into the building would only be of use where someone searched for the plaque. In an emergency situation, another power disconnection point would most often be used rather than a search made for the plaque first and then an attempt made to disconnect power at multiple locations.

The submitter has not provided any substantiation that there is a problem with not marking these locations for the last 60 years. There does not seem to be a large number of people submitting proposals to require these plaques for installations where multiple occupancies exist with multiple disconnect locations. The suggested recommendation has too many unenforceable requirements.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-44 Log #3262 NEC-P04 **Final Action: Reject**

(230.40 Exception No. 1 and 230.71(A))

Submitter: Eugene E. Morgan, Clakamas County, Building Codes Divison

Recommendation: Revise text to read as follows:

230.40 Number of service-Entrance Conductor Sets. Each service drop or lateral shall supply only one set of service-entrance conductors.

~~*Exception No.1: A building shall be permitted to have one set of service entrance conductors for each service, as defined in 230.2, run to each occupancy or group of occupancies.*~~

(Delete Exception No.1 and re-number Exceptions 2, 3, 4 and 5 to Exceptions 1, 2, 3, and 4.)

230.71 Maximum Number of Disconnects.

(A) General. The service disconnecting means for each service permitted by 230.2, or for each set of service-entrance conductors permitted by 230.40, Exception No. ~~1, 3, 4 or~~ 5 <u>2, 3 or 4,</u> shall consist of not more than six switches or sets of circuit breakers...

(Revise the Exception Nos. to match the deletion of Exception No.1, and renumber the other exceptions to Section 230.40.)

Substantiation: Exception No.1 to 230.40 is the source of considerable misunderstanding for installers as well as inspectors. It is in apparent conflict with 230.70(A)(1) **Readily Accessible Location,** and with **230.72(A) Grouping of Disconnects.** It is also in apparent conflict with the basic safety premise of 230.71(A) **Maximum Number of Disconnects.**

When taken literally, 230.40 Exception No. 1 would seem to allow an unlimited number of disconnects in an unspecified number of tenant spaces, as long as there were no more than six at any one location. There is no mention of area separation requirements that are essential to prevent the spread of fire and provide for the safety of fire fighters or rescue personnel. In the event of a fire, earthquake or other disaster, rescue personnel would be severely hampered by working against energized service, feeder, and branch circuit conductors that could not be readily disconnected at a common location in such an emergency.

The term “occupancy” is not defined in the National Electrical Code or in the generally adopted building codes. The building codes (several words are unreadable) some which require fire rated or area separation walls, and others which do not. The result is that “occupancy” in 230.40, Exception No. 1 is used to justify running service conductors to a number of tenant spaces. With the flexible tenant space nature of many commercial buildings, this results in modified spaces that have no service or panel, or enlarged tenant spaces and may have two sets of service conductors and disconnects within the single, enlarged tenant space. This creates additional Code violations, besides the extremely hazardous situation created by having multiple service locations in the original building configuration.

The National Electrical Code has continually moved forward to promote safety for buildings, the occupants, and rescue personnel. 230.40, Exception No.1 runs counter to those safety concepts. There is no compelling need for this exception, as other provisions in Article 230 provide ample opportunities for installations to be made in every conceivable building and to every occupancy, without the associated hazard of running service conductors to each of them. It is time to remove this unnecessary exception to an otherwise good installation standard for electrical services.

Panel Meeting Action: Reject

Panel Statement: This particular exception has been in the NEC since at least the 1946 NEC where Section 1807 permitted, by special permission, more than one set of service drop in a multi-occupancy building where there was no available space for service equipment accessible to all occupants. This exception permitted the occupant to have access to their own service disconnecting means. Section 1837 required a multiple occupancy building having individual occupancies above the second floor to have the service equipment grouped in a common accessible location and to consist of not more than six switches or circuit breakers. However, any multiple occupancy building that did not have any individual occupancy above the second floor could have the service conductors run to each occupancy and have up to six switches or circuit breakers at that location.

Since this rule has existed since the early 1940s without a major change to the intent, there does not seem to be a compelling reason to change this section of the Code and there was no technical substantiation given in the proposal to provide a reason to delete this rule. The submitter did not provide any specific examples of problems that have occurred where service entrance conductors have been installed in accordance with the current permissive requirements in this section.

Exception 1 to 230.40 is a necessary and commonly used allowance for supplying power in multiple occupancy buildings. The building is still only permitted to have one service riser or lateral that would allow the power to be removed from all occupancies when necessary by the disconnection of the riser or lateral conductors.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-45 Log #1088 NEC-P04 **Final Action: Reject**
(230.41 Exception No. 1)

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Add “except cablebus” after “raceways”.

Substantiation: Edit. Cablebus meets Article 100 definition of raceway and 370.2 indicates (all) circuit conductors are insulated. Since Chapters 2 and 3 are equal in rank, the proposal eliminates a perceived conflict.

Panel Meeting Action: Reject

Panel Statement: This recommendation is not editorial as stated in the substantiation. In Section 370.2, the definition states that cablebus is an assembly of insulated conductors in a completely enclosed, ventilated protective metal housing. Since all the conductors within cablebus are required to be insulated and Section 230.41, Exception, deals with permission to use uninsulated grounded conductors, adding cablebus to this exception would be inappropriate.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-46 Log #2758 NEC-P04 **Final Action: Accept in Part**
(230.42)

Submitter: Truman C. Surbrook, Michigan State University

Recommendation: Add a new first paragraph as follows:

230.42 Minimum Size and Rating. <u>The minimum size of service entrance conductors shall be not less than as specified in (A), (B), and (C).</u>

Delete the first portion of (B) as follows:

(B) Specific Installations. ~~In addition to the requirements of 230.42(A),~~ <u>T</u> he minimum ampacity...

In (C) change less to smaller to read as follows:

(C) Grounded Conductors. The grounded conductor shall not be ~~less~~ <u>smaller</u> than the minimum...

Substantiation: There needs to be a lead statement making it clear that all of the provisions of this section are to be applied where applicable. By adding the new lead paragraph, the first part of the sentence of (B) can be deleted. In (C) the word “less” needs to be replaced with <u>smaller</u> .

Panel Meeting Action: Accept in Part

Accept the part to change “less” to “smaller” in (C) and reject the remainder of the recommendation.

Panel Statement: The phrase “smaller than” is more appropriate, since the issue is an actual size of grounded conductor required. The remainder of the recommendation is rejected, since adding this opening sentence to 230.42 with the phrase “as specified in (A), (B), and (C)” would require service entrance conductors to include a grounded conductor even where one is not provided as part of the source from the utility company, such as where an ungrounded delta system is supplied to the premises.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-47 Log #1326 NEC-P04 **Final Action: Accept in Principle in Part**
(230.42(A))

Submitter: Mike Holt, Mike Holt Enterprises

Recommendation: Revise as follows:

230.42 Minimum Size and Rating.

~~**(A)**~~ **General.** <u>Service-entrance conductors shall have an ampacity not less than required to supply the load as calculated in Parts III, IV, and V of Article 220. Service-entrance conductors that are connected to an overcurrent device assembly shall have a minimum allowable ampacity, before the application of any adjustment or correction factors, that is not less than the noncontinuous load plus 125 percent of the continuous load.</u> ~~The ampacity of the service entrance conductors before the application of any adjustment or correction factors shall not be less than either (A)(1) or (A)(2). Loads shall be determined in accordance with Article 220. Ampacity shall be determined from 310.15. The maximum allowable current shall be that value for which the busway has been listed or labelled.~~

~~(1) The sum of the noncontinuous loads plus 125 percent of continuous loads~~

~~(2) The sum of the noncontinuous load plus the continuous load if the service entrance conductors terminate in an overcurrent device where both the overcurrent device and its assembly are listed for operation at 100 percent of their rating~~

<u>*Exception: Where the assembly, including the overcurrent devices to which the service-entrance conductors terminate, is listed for operation at 100 percent of its rating, the allowable ampacity of the service-entrance conductors shall be permitted to be not less than the sum of the continuous load plus the noncontinuous load.*</u>

Substantiation: “Minimum Rating and Size”: The identical wording should be used for 210.19, 215.2, and 230.42.

This proposal deletes the reference to busways as unnecessary.

Confusion reigns as to under what conditions grounded conductors are subject to the same 125 percent of continuous load sizing requirements as are ungrounded conductors. During the 2005 *Code* cycle this issue was addressed for feeders, but action was deferred. ROC No. 2-145 included a lucid, sound “substantiation” that unfortunately was rejected by CMP 2 at that time. Now is an excellent time to re-evaluate that “substantiation” and adopt its intent.

The basis for the 125 percent requirement stems from the manner in which listed overcurrent devices are tested. During continuous load tests of enclosed overcurrent devices, in order to prevent nuisance tripping, it has been found that it is necessary to limit the current to 80 percent of the device’s rating. Conductors are sized, then, (1) at 125 percent of the continuous current in accordance with the allowable ampacity determined from Table 310.16, and (2) per the terminal temperature limitations of 110.14(C).

The reality is that the enclosed overcurrent devices rely on the mass of the conductors to act as heat sinks that dissipate excess thermal energy and thereby avoid unacceptable nuisance tripping. Of course, since overcurrent devices cannot distinguish between ungrounded and grounded conductors, in both cases the conductor sizes must be based on calculations that include an additional 25 percent factor when the load is continuous. On the other hand, there is no reason to add 25 percent to the load of a conductor that is not connected to a device that is not subject to nuisance tripping, such as in the case of a grounded conductor connected a neutral terminal bus.

The end result of this proposal is twofold:

1. The additional 25 percent continuous load requirement applies only to conductors, both ungrounded and grounded, that connect to an overcurrent device (unless, of course, the assembly is listed for operation at 100 percent of its rating).

2. Grounded conductors that carry continuous loads and that connect only to neutral buses, or to devices not subject to nuisance tripping, are not required to have their loads increased by 25 percent.

This proposal accomplishes that goal and, in hand with similar proposals made in two other Articles, brings into conformity the requirements for branch circuits (210.19), feeders (215.2), and services (230.42).

The deletion of the reference to busways removes obvious, unnecessary information.

Panel Meeting Action: Accept in Principle in Part

In the second sentence in 230.42(A), accept the addition of "Parts III, IV" and "V" but change the "and" to "or". Reject the remainder of the proposal. The second sentence in the 2005 NEC is to read as follows: "Loads shall be determined in accordance with <u>Parts III, IV, or V</u> of Article 220 <u>, as applicable</u> ."

Panel Statement: The word "and" in the recommendation was changed to "or" since service calculations must be based on the standard calculations in Part III, optional calculations in Part IV, or farm calculations based on Part V but not on all three as indicated in the proposal.

The suggested changes as indicated in the proposed second sentence would cover only service entrance conductors that are connected to an overcurrent protective device and would not cover service entrance conductors installed in auxiliary gutters, metal wireways, junction boxes, and other enclosures, unless the conductors were directly connected to an overcurrent protective device. The existing text in the NEC adequately covers the sizing of all service entrance conductors, including those connected to other service entrance conductors that may be larger or smaller but not connected to an overcurrent protective device.

Deleting the sentence requiring the ampacity of the service entrance conductors to be determined from 310.15 would leave the user of the Code without clear direction of where in the NEC the ampacity of a service entrance conductor is established since these conductors are not protected against short circuit and ground fault, but simply overload protection in accordance with 230.90. Furthermore, the maximum allowable ampacity of a busway is determined on the listing or labeling ampacity of the busway, not on 310.15, so this information must also remain in 230.42.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-48 Log #1494 NEC-P04 **Final Action: Reject**

(230.42(A))

Submitter: Larry T. Smith, National Electrical Seminars

Recommendation: Revise text to read as follows:

(1) General. The ampacity of the service-entrance conductors before the application of any adjustment or correction factors shall not be less than either (A)(1) or (A)(2) <u>in accordance with the temperature limitations of 110.14(C)</u> . Loads shall be determined in accordance with Article 220. Ampacity shall be determined from 310.15. The maximum allowable current of busways shall be that value for which the busway has been listed or labeled.

(1) The sum of the noncontinous loads plus 125 percent of continuous loads.

(2) The sum of the noncontinuous load plus the continuous load if the service-entrance conductors terminate in an overcurrent device where both the overcurrent device and its assembly are listed for operation at 100 percent of their rating.

Substantiation: Ignoring the temperature rating of equipment is the most common mistake being made in conductor sizing today. Entirely too many wiremen take no notice of the temperature limitations of 110.14(C) when sizing conductors. They disregard the temperature rating of equipment, and use the 90°C column of Table 310.16 when 90°C rated conductors, such as THHN, are being used. The equipment rating will either be 60° or 75°C, not 90°C.

Observing the temperature rating of the equipment is an integral part of sizing service conductors; it should be included as a requirement of 230.42(A).

Panel Meeting Action: Reject

Panel Statement: Article 110 covers general requirements for the examination and approval, as well as the installation and use of equipment and conductors. Since Section 110.14(C) already covers the temperature limitations of conductor terminations, placing this information into 230.42 is not necessary since it already applies.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-49 Log #2205 NEC-P04 **Final Action: Reject**

(230.43(17))

Submitter: Kyle Cope, Prysmian Cables and Systems

Recommendation: (17) Type PA Cable

Substantiation: Statement of problem: Material technology advancements now allow for cable designs that provide improved mechanical damage protection. i.e., crush and impact, over standard Type MC cable without sacrificing flame performance properties. The characteristics achieved using traditional metallic components can now be realized using polymeric materials. The use of polymeric materials also provides the opportunity for lighter and smaller diameter cables.

Substantiation for Proposal: Type PA has been proposed as a new type (Article 3XX) and should be included in this list (230.43) as it offers enhanced mechanical benefits as an alternate to Type MC cable. See test data provided. A UL Fact-Finding study comparing the subject cable to type MC is ongoing at the time of proposal submittal. This data will be forwarded once the study is complete.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 4-9.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-50 Log #948 NEC-P04 **Final Action: Reject**

(230.43(15) and (16))

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Revise as follows:

(15) Flexible metal conduit, liquidtight flexible metal conduit, <u>or liquidtight flexible nonmetallic conduit,</u> not over 1.8 m (6 ft) long between <u>rigid type</u> raceways, or between <u>rigid</u> <u>type</u> raceway and service equipment with <u>an</u> equipment bonding jumper ~~routed with the flexible metal conduit or the liquidtight flexible metal conduit~~ according to the provisions of 250.102(A), (B), (C), and (D).

Delete (16).

Substantiation: Edit. Rigid type raceway should be specified. Present wording does not prohibit different types of flexible conduit from being daisy chained together in total lengths exceeding 6 ft. The item (16) has no restrictions similar to (15) which is not reasonable.

Panel Meeting Action: Reject

Panel Statement: This proposal is not editorial. The 6-foot restriction in 230.43(15) applies to metal flex or metal liquidtight and the paralleling action that occurs between the metal ribbon of the flex and the bonding jumper installed either internal or external to the flex. Since there is no paralleling action in a liquidtight flexible nonmetallic conduit, there is not reason to require this type of raceway to comply with the 6-foot requirements in (15). The list is not restricted to rigid-type raceways.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-51 Log #1105 NEC-P04 **Final Action: Reject**

(230.44)

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Revise last sentence:

Cable trays used to support <u>open individual</u> service conductors shall only contain service-entrance conductors <u>of a single service</u> .

Delete present exception and substitute:

Exception: Other service-entrance conductors and conductors other than service-entrance conductors shall be permitted under the following conditions:

(1) The service-entrance conductors of each service and the other conductors are installed in a raceway or metal-covered cable specified in 230.43 or:

(2) The service-entrance conductors of each service and conductors other than service-entrance conductors are identified in a manner acceptable to the Authority Having Jurisdiction and separated by a solid fixed continuous barrier compatible with the cable tray.

FPN: See 700.12 (D) and 701.11 (D) for additional separation requirements.

Substantiation: The basic requirement should apply to open conductors of one service. The present exception doesn't require separation of service-entrance conductors of different services and doesn't include separation provided by suitable raceways or cable covering.

Panel Meeting Action: Reject

Panel Statement: The submitter did not provide any technical substantiation for excluding service entrance conductors from one service from occupying the same cable tray with a different service. The text as presently written in the Code applies to service entrance conductors supported by cable trays, not service entrance conductors installed in a cable assembly, a raceway, or some other acceptable wiring method where that wiring method is just supported by the cable tray.

The separations contemplated in Chapter 7 would not allow emergency system service conductors to be installed in the same cable tray as normal service conductors.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-52 Log #1898 NEC-P04 **Final Action: Accept in Principle**
(230.44)

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: In 230.44 add a comma after the first word in the sentence "Conductors" and after the fifth word in the sentence, "conductors" in the exception. Add two new sentences at the end of the exception as follows:

Cable trays shall be identified with permanently affixed labels with the wording "Service-Entrance Conductors" or equivalent. The labels shall be located so as to be visible after installation and placed so that they may be readily traced through the entire length of the cable tray. The exception shall read as follows:

230.44 Cable Trays.

"Exception: Conductors, other than service-entrance conductors, shall be permitted to be installed in a cable tray with service-entrance conductors, provided a solid fixed barrier of a material compatible with the cable tray is installed to separate the service-entrance conductors from other conductors installed in the cable tray. <u>Cable trays shall be identified with permanently affixed labels with the wording "Service-Entrance Conductors" or equivalent and the labels shall be located so as to be visible after installation and placed so that the service entrance conductors may be readily traced through the entire length of the cable tray."</u>

Substantiation: The two commas were added for clarification and correct punctuation. The last two sentences were added to ensure that the cable tray containing a barrier separating the service entrance conductors are clearly identified from feeders and branch circuits installed in the other side of the cable tray. The labels should be visible after the installation of the cable tray since an installer may not be able to differentiate between the service entrance conductor side of the cable tray and inadvertently install protected conductors with unprotected conductors.
Panel Meeting Action: Accept in Principle

Editorially revise the last sentence of the recommended text to read as follows:

<u>Cable trays shall be identified with permanently affixed labels with the wording "Service-Entrance Conductors." The labels shall be located so as to be visible after installation and placed so that the service-entrance conductors may be readily traced through the entire length of the cable tray."</u>

_Accept the remainder of the recommendation.
Panel Statement: The proposed text was modified to make two separate sentences for ease of use and clarity. The words "or equivelant" were removed to avoid ambiguity.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-52a Log #CP400 NEC-P04 **Final Action: Accept**
(230.49 and 230.50)

Submitter: Code-Making Panel 4,
Recommendation: Combine Section 230.49 and 230.50 into one section by making 230.49 into 230.50(A) and 230.50 into 230.50(B) to read as follows:

230.50 Protection Against Physical Damage
(A) Underground Service-Entrance Conductors.
Underground service-entrance conductors shall be protected against physical damage in accordance with 300.5.

(B) All Other Service Entrance Conductors.
All other service-entrance conductors, other than underground service entrance conductors, shall be protected against physical damage as specified in 230.50(B)(1) or (B)(2).

(1) Service Cables. Service cables, where subject to physical damage, shall be protected by any of the following:

(a)	Rigid metal conduit
(b)	Intermediate metal conduit
(c)	Schedule 80 rigid nonmetallic conduit
(d)	Electrical metallic tubing
(e)	Other approved means

(2) Other Than Service Cable. Individual open conductors and cables, other than service cables, shall not be installed within 3.0 m (10 ft) of grade level or where exposed to physical damage.

Exception to (2): Type MI and Type MC cable shall be permitted within 3.0 m (10 ft) of grade level where not exposed to physical damage or where protected in accordance with 300.5(D).
Substantiation: The two sections were combined since both were addressing protection from physical damage, Section 230.49 for underground service-entrance conductors and Section 230.50 for all others. This change will provide specific information and requirements without using the phrase "above ground" and will provide clarity on the physical protection requirements for service-entrance conductors.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-53 Log #1911 NEC-P04 **Final Action: Reject**
(230.50(A))

Submitter: William Wagner, Certification Solutions
Recommendation: Revise as follows:

230.50 Protection of Open Conductors and Cables Against Damage – Above Ground. Service-entrance conductors installed above ground shall be protected against physical damage as specified in 230.50(A) or (B).

(A) Service Cables. Service cables, where subject to physical damage, shall be protected by any of the following:

(1) Rigid metal conduit.
(2) Intermediate metal conduit
(3) Schedule 80 rigid ~~nonmetallic~~ <u>PVC</u> conduit
(4) Electrical metallic tubing
(5) Other approved means

Substantiation: This is a companion proposal for the definition of Rigid Nonmetallic Conduit in Article 100 and the revised Article 352 for Type PVC Conduit. It clarifies that rigid polyvinyl chloride conduit is designated as Type PVC, rather than the broader designation of rigid nonmetallic conduit (Type RNC) which includes PVC, HDPE and RTRC.
Panel Meeting Action: Reject
Panel Statement: The AHJ should have the flexibility to know and enforce the uses of nonmetallic rigid conduit. The submitter did not provide any technical substantiation in the proposal to justify removing the term "nonmetallic conduit" and replacing it with "PVC conduit." Article 352 applies to rigid nonmetallic conduit, as it is used in 230.50(A) at this time, and is under the jurisdiction of Panel 8. Any change to the type of nonmetallic conduit must first be addressed in Article 352.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-54 Log #3659 NEC-P04 **Final Action: Reject**
(230.50(A))

Submitter: Derrick Jones, Local Union #98 IBEW
Recommendation: Service cables, shall be protected by any of the following:

Deleted text: (Where subject to physical damage).

Substantiation: Mostly in residential construction, electricians are installing the service entrance cable in open back driveways and yards with no physical protection. Remember, these are non-fused conductors and are an accident waiting to happen.
Panel Meeting Action: Reject
Panel Statement: The phrase "where subject to physical damage" permits the electrician to install service entrance conductors as service entrance cable, for example, where the cable is not subject to physical damage as permitted by Article 338. This proposed change would require all service entrance cables to be protected, even where the cables are not subject to damage. No technical substantiation was provided showing this total protection is warranted.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-55 Log #2206 NEC-P04 **Final Action: Reject**
(230.50(B) Exception)

Submitter: Kyle Cope, Prysmian Cables and Systems
Recommendation: Revise to read as follows:

Exception: Type PA. Type MI and Type MC cable shall be permitted within 3.0 m (10 ft) of grade level where not exposed to physical damage or where protected in accordance with 300.5(D).

Substantiation: Statement of problem: Material technology advancements now allow for cable designs that provide improved mechanical damage protection. i.e., crush and impact, over standard Type MC cable without sacrificing flame performance properties. The characteristics achieved using traditional metallic components can now be realized using polymeric materials. The use of polymeric materials also provides the opportunity for lighter and smaller diameter cables.

Substantiation for Proposal: Type PA (proposal attached) cable offers enhanced mechanical protection over Type MC Cable for this application. See test data provided. A UL Fact-Finding study comparing the subject cable to type MC is ongoing at the time of proposal submittal. This data will be forwarded once the study is complete.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject

(230.53)

Submitter: Sam Marcovici, NY City Buildings Dept.
Recommendation: Revise text to read as follows:
230.53 Raceways to Drain.
Where exposed to the weather, raceways enclosing service-entrance conductors shall be raintight and arranged to drain. Where embedded in masonry, raceways shall be arranged to drain.
Exception: As ~~permitted~~ specified in 348.12(1).
Substantiation: The Exception refers to 348.12, whose title is "Uses not permitted". By grouping together [via 348.12(1)] the words "permitted" and "not permitted", the statement becomes confusing. Using a word other than "permitted" would clarify the meaning of the Exception.
Panel Meeting Action: Reject
Panel Statement: Even though Section 348.12 is the "not permitted" section, there is permissive text within 348.12(1) where it states flexible metal conduit can be used in a wet location if the conductors are approved for the specific location and liquid is not likely to enter raceways or enclosures to which the conduit is connected. This is a permissive statement and the exception to 230.53 recognizes that permissive statement.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-57 Log #1975 NEC-P04 **Final Action: Reject**
(230.53)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Revise 230.53 as follows:
230.53 Raceways to Drain. Where exposed to the weather, raceways enclosing service-entrance conductors shall be ~~raintight~~ suitable for use in wet locations and arranged to drain. Where embedded in masonry, raceways shall be arranged to drain.
Exception: As permitted in 348.12(1).
Substantiation: The word "raintight" is not appropriate in this section. The "uses permitted" and "uses not permitted" sections in the Articles for each raceway type, including 348.12(1), address the provisions for use in wet locations . The suitability for use of listed conduit and cable raceways has been determined by means which may include a rainwater exclusion test as well as other tests for their suitability within the full scope of the Article 100 definition of "Locations, Wet".
Panel Meeting Action: Reject
Panel Statement: The word "raintight" is appropriate for this application as defined in Article 100 for raintight as constructed or protected so that exposure to a beating rain will not result in the entrance of water under specified test conditions. Using raintight fittings for the service entrance conductor raceway and installing the raceway so that it will drain will ensure that water will not remain inside the raceway, thereby contributing to deterioration of the raceway. Section 230.53 is used in conjunction with 230.54(A), (B), (F), and (G), so that the service entrance conductor raceway, the service head, and all fittings are raintight. Section 230.54(A) and (B) also uses the term "raintight" to describe the service head on the service riser.
CMP-4 encourages the submitter to provide more substantiation for this change.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:
YOUNG, J.: With respect to the raceways specified in the wiring methods in 230.43, the individual articles identify such raceways for their suitability for use in "wet locations." The word "raintight" in 230.53 is overridden, or introduces confusion as to which is the true requirement. The definition of "raceway" in Article 100 does not include fittings. 314.15(A) requires that "... fittings installed in wet locations shall be listed for use in wet locations." Not "raintight". The definition of "raintight" in Article 100 contains unenforceable language "...will not result in entrance of water under specified test conditions" verifiable only for listed raceways. Raceways suitable for use in wet locations are listed for use in wet locations, not "raintight".

4-58 Log #2609 NEC-P04 **Final Action: Accept**
(230.53 Exception)

Submitter: David H. Kendall, Carlon
Recommendation: Revise as follows:
230.53 Raceways to Drain. Where exposed to the weather, raceways enclosing service-entrance conductors shall be raintight and arranged to drain. Where embedded in masonry, raceways shall be arranged to drain.
~~Exception: As permitted in 348.12(1).~~
Substantiation: The exception should be deleted since installations found in Chapter 3 of the code apply generally per 90.3.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:
ODE, M.: This proposal should be a reject to correlate with panel actions on similar Proposal 4-14 and 4-56 dealing with similar issues. This exception was inserted in 230.53 to recognize that flexible metal conduit can be used to enclose service entrance conductors in a wet location and is not required to be raintight as the main rule states. This exception provides information in 230.53 that might be otherwise overlooked by the installer or by the inspector and must remain as a reference.

4-59 Log #1970 NEC-P04 **Final Action: Reject**
(230.54(A))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Revised 230.54(A) as follows:
230.54 Overhead Service Locations.
(A) ~~Raintight~~ Service Head. Service raceways shall be equipped with a ~~raintight~~ service head at the point of connection to service-drop conductors. The service head shall comply with the requirement for fittings in 314.15(A).
Substantiation: The word "raintight" is not appropriate in this Section. A "service head" is a conduit fitting and is intended for installation in damp or wet locations. The requirements in 314.15(A) pertain to all such fittings installed in damp and wet locations. UL 514B, Fittings for Conduit and Cable, contains the requirements for listed service heads.
Panel Meeting Action: Reject
Panel Statement: The word "raintight" is appropriate for this application as defined in Article 100 "as constructed or protected so that exposure to a beating rain will not result in the entrance of water under specified test conditions." Using raintight fittings for the service entrance conductor raceway and installing the raceway so that it will drain will ensure that water will not remain inside the raceway, thereby contributing to deterioration of the raceway. Section 230.53 is used in conjunction with 230.54(A), (B), (F), and (G), so that the service entrance conductor raceway, the service head, and all fittings are raintight so water will not enter the service equipment. The purpose of "raintight" to describe the service head on the service riser in 230.54(A) is to ensure the weatherhead will not permit water to enter the raceway in a driving rain.
The added reference of 314.15(A) is not necessary or complete, since the service raceway may not be connected to a box or a conduit body as covered by Article 314 but may be connected to a cabinet, a cutout box, or a meter socket enclosure that must comply with 312.2. Sections 312.2 and 314.12 already covers these applications, and a reference in 230.54 is not necessary.
The submitter is encouraged to provide additional substantiation on the this change.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:
YOUNG, J.: The definition of "raintight" in Article 100 contains unenforceable language "...will not result in entrance of water under specified test conditions" verifiable only for listed service entrance heads. Since service heads are not required to be listed, the "test conditions" are not "specified". The express purpose of a service head is to prevent water from entering the service mast. All listed service heads are subjected to the same test in UL514B as fittings intended and listed for use in wet locations according to 314.15(A).

4-60 Log #1971 NEC-P04 **Final Action: Reject**
(230.54(B))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Revise 230.54(B) as follows:
230.54 Overhead Service Locations.
(B) Service Cable Equipped with ~~Raintight~~ Service Head or Gooseneck. Service cables shall be equipped with a ~~raintight~~ service head. The service head shall comply with the requirement for fittings in 314.15(A).
Substantiation: The word "raintight" is not appropriate in this section. A "service head" is a conduit fitting and is intended for installation in damp or wet locations. The requirements in 314.15(A) pertain to all such fittings installed in damp and wet locations. UL 514B, Fittings for Conduit and Cable, contains the requirements for listed service heads.

4-61 Log #576 NEC-P04 **Final Action: Reject**
(230.70(A)(1))

Submitter: Larry T. Smith, National Electrical Seminars
Recommendation: Revise as follows:
(1) Readily Accessible Location. The service disconnecting means shall be installed at a readily accessible location either ~~outside of~~ on the exterior o f a building or structure or inside the building or structure nearest the point of entrance of the service conductors.
Substantiation: As it now reads, the service disconnecting means shall be installed at a readily accessible location either outside of a building or structure or inside..., implies that an outside service disconnecting means can be located anywhere, any distance from the building or structure. If it's located inside, it must be nearest the point of the entrance of the service conductors; at Code seminars more than one engineer or electrical contractor has pointed this out to me. If I were an AHJ, and I have been one, I would have a hard time talking them out of their interpretation; it's at this point that we have to resort to, "Well, the intent of the Code is...".
If the intent is for an outside service disconnecting means to be located on the exterior of the building or structure and not adjacent to it, then 230.70(A)(1) should state so, and in plain English.
Panel Meeting Action: Reject
Panel Statement: In recent Code cycles, the panel has tried to develop a particular distance at which the service disconnecting means can be located outside the building or structure, but based on the architectural design of the building, problems with landscape and plant, and other premises problems, a reasonable distance could not be established. If the unprotected utility company conductors remain outside the building, there really is not a hazard associated with these conductors, where properly maintained by the utility company.
Where these unprotected conductors enter into a building, it is now necessary to terminate these conductors in a proper overcurrent protection device at a location nearest the point of entrance of these conductors into the building. Requiring the service disconnecting means to be located on the exterior of the building, instead of somewhere outside the building or structure, would be too restrictive and would result in too many exceptions. This concept has been acceptable, in one form or another, since the 1897 NEC and should remain as presently written.
Number Eligible to Vote: 10

4-62 Log #3211 NEC-P04 **Final Action: Reject**
(230.70(A)(1))

Submitter: H. Dean Schumacher, H. Dean Schumacher Electrical Inspections
Recommendation: Revise text to read as follows:
230.70 (A)(1)...or inside nearest the point of entrance of the service conductors. 0-500 ampere conductors shall enter maximum 3.0 m (10 ft) 50/ampere and above maximum 6.0 m (20 ft).
Substantiation: Ambiguous code statements (nearest the point of entrance) allow varied interpretation. This change would assist installer and Inspector.
Panel Meeting Action: Reject
Panel Statement: The submitter has not presented any technical data to support the defined distances that he has recommended. There was no defined problem described in the submitters substantiation.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-63 Log #3386 NEC-P04 **Final Action: Reject**
(230.70(A)(1))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Revise as follows:
The service disconnecting means shall be installed at a readily accessible location either outside and attached to or immediately adjacent to the building or structure served , or inside nearest the point of entrance of the service conductors.
Substantiation: This provision is sorely in need of some sort of proximity rule for service disconnects. This proposal avoids a prescriptive distance limitation that may be problematic in some cases. It does, however, eliminate the possibility that the service disconnect could be outside the building at any indefinite distance. A service disconnect at long distances, or even at a shorter distance but out of view, represents a safety hazard for occupants in an emergency. Note that if the service disconnect is a stand-alone item, it will not qualify as a structure, and the rules in Part II of Article 225 will not control the disconnection protocol when the conductors finally arrive at the building.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 4-61. The panel reaffirms its previous statement from Comment 4-51 on page 70-114 of the 2004 NEC Report on Comments that the service disconnecting means is not required to be attached to the building.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-72 Log #227 NEC-P04 **Final Action: Reject**
(230.70(A)(4))

Submitter: Chuck Monasmith, Fluor Federal Services
Recommendation: Add text to read as follows:
230.70(A)(4) Relocatable Structures. Service disconnecting means shall not be located on or in structures designed or intended to be relocated.
Substantiation: Structures with utilization equipment, that are designed or intended to be relocated, such as skids or semitrailers, may not have anchorage as secure as a building or other structure with an in-earth foundation. Service conductors not protected in accordance with NEC Article 240 become a hazard when an unanchored structure is moved. This proposal is consistent with service disconnect requirements in NEC Article 550 for mobile homes which also are structures designed to be relocated.
Panel Meeting Action: Reject
Panel Statement: Conductors do not become a hazard when properly installed and used. According to Section 90.3, Articles within Chapter 5 may modify the requirements of Article 230. The submitter has not provided substantiation of any safety issues with installing a service disconnecting means on a relocatable structure as long as the service drop or lateral is de-energized prior to relocating the structure. Section 550.32(B) permits a service to be installed on a manufactured home with certain conditions. While certainly not a mobile home, manufactured homes are designed to be transportable and can be installed on a non-permanent foundation and could be considered to be a relocatable structure.
Some of the structures that are described are already covered by other NEC requirements. Further clarity on what the proposed structures are would be required prior to evaluating the merit of this proposal.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-64 Log #2915 NEC-P04 **Final Action: Reject**
(230.70(B))

Submitter: Marcus Sampson, Lysistrata Electric
Recommendation: Revise as follows:
230.70(B) Marking. Each service disconnect shall be permanently marked to identify it as a service disconnect. Disconnecting means located on the supply side of the service equipment shall be permanently marked to identify it as NOT A SERVICE DISCONNECT.
Substantiation: Many electrical distribution utilities are now requiring a disconnecting switch on the line side of their metering equipment to protect meter technicians. Confusion exists as to whether this switch is now the service disconnecting means. These switches must be identified.
Panel Meeting Action: Reject
Panel Statement: While the NEC recognizes these switches located on the line side of the service disconnecting means as meter disconnect switches in 230.82(3), these switches are technically utility company equipment. If these disconnects are under the exclusive control of the electric utility, then Section 90.2(B)(5) states the NEC does not cover these disconnects. Therefore, requiring marking of any kind in 230.70(B) for utility company equipment would be outside the scope of the NEC.

(230.71)

TCC Action: The Technical Correlating Committee understands that the Panel Action on this proposal is Accept.
Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Revise as follows:
230.71 Maximum Number of Disconnects.
(B) Single-Pole Units. Two or three single-pole switches or breakers, capable of individual operation, shall be permitted on multiwire circuits, one pole for each ungrounded conductor, as one multipole disconnect, provided they are equipped with identified handle ties or a master handle to disconnect all conductors of the service with no more than six operations of the hand.
Substantiation: This change is meant to provide correlation with the 2005 change to 240.20.
Panel Meeting Action: Accept in Part
The panel does not accept the deletion of 230.71(A) and the fine print note.
Panel Statement: The panel accepts the addition of the word "identified" because it correlates with 240.20(B).
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-66 Log #2602 NEC-P04 **Final Action: Accept**
(230.71, 230.82 and 230.94)

Submitter: Joseph P. DeGregoria, Underwriters Laboratories Inc.
Recommendation: Revise text to read:

230.71 Maximum Number of Disconnects.

(A) General. The service disconnecting means for each service permitted by 230.2, or for each set of service-entrance conductors permitted by 230.40, Exception Nos. 1, 3, 4, or 5, shall consist of not more than six switches or sets of circuit breakers, or a combination of not more than six switches and sets of circuit breakers, mounted in a single enclosure, in a group of separate enclosures, or in or on a switchboard. There shall be not more than six sets of disconnects per service grouped in any one location. For the purpose of this section, disconnecting means used solely for power monitoring equipment, surge protective devices ~~transient voltage surge suppressors~~ , or the control circuit of the ground-fault protection system or power-operable service disconnecting means, installed as part of the listed equipment, shall not be considered a service disconnecting means.

(B) Single-Phase Units. Two or three single-pole switches or breakers, capable of individual operation, shall be permitted on multiwire circuits, one pole for each ungrounded conductor, as one multipole disconnect, provided they are equipped with handle ties or a master handle to disconnect all conductors of the service with no more than six operations of the hand.

FPN: See 408.36(A) for service equipment in panelboards, and see 430.95 for service equipment in motor control centers.

230.82 Equipment Connected to the Supply Side of Service Disconnect. Only the following equipment shall be permitted to be connected to the supply side of the service disconnecting means:

(1) Cable limiters or other current-limiting devices

(2) Meters and meter sockets nominally rated not in excess of 600 volts, provided all metal housings and service enclosures are grounded

(3) Meter disconnect switches nominally rated not in excess of 600 volts that have a short-circuit current rating equal to or greater than the available short circuit current, provided all metal housings and service enclosures are grounded

(4) Instrument transformers (current and voltage), impedance shunts, load management devices, ~~and~~ surge arresters and Type 1 surge protective devices

(5) Taps used only to supply load management devices circuits for standby power systems, fire pump equipment, and fire and sprinkler alarms, if provided with service equipment and installed in accordance with requirements for service-entrance conductors

(6) Solar photovoltaic systems, fuel cell systems, or interconnected electric power production sources

(7) Control circuits for power-operable service disconnecting means, if suitable overcurrent protection and disconnecting means are provided

(8) Ground-fault protection systems or Type 2 surge protective devices ~~transient voltage surge suppressors~~ , where installed as part of listed equipment, if suitable overcurrent protection and disconnecting means are provided

230.94 Relative Location of Overcurrent Device and Other Service Equipment. The overcurrent device shall protect all circuits and devices.

Exception No. 1: The service switch shall be permitted on the supply side.

Exception No. 2: High-impedance shunt circuits, surge arresters, Type 1 surge protective devices, surge-protective capacitors, and instrument transformers (current and voltage) shall be permitted to be connected and installed on the supply side of the service disconnecting means as permitted in 230.82.

Exception No. 3: Circuits for load management devices shall be permitted to be connected on the supply side of the service overcurrent device where separately provided with overcurrent protection.

Exception No. 4: Circuits used only for the operation of fire alarm, other protective signaling systems, or the supply to fire pump equipment shall be permitted to be connected on the supply side of the service overcurrent device where separately provided with overcurrent protection.

Exception No. 5: Meters nominally rated not in excess of 600 volts shall be permitted, provided all metal housings and service enclosures are grounded.

Exception No. 6: Where service equipment is power operable, the control circuit shall be permitted to be connected ahead of the service equipment if suitable overcurrent protection and disconnecting means are provided.

Substantiation: This is one of several related proposals affecting Articles 100, 230, 250, 280, 285, 501, and 502 based on the following:

1) UL intends to combine the categories of Surge Arresters (Article 280) and Transient Voltage Surge Suppressors (Article 285) into one category and Standard, UL 1449, renamed Surge Protective Devices(SPDs).

UL 1449 will include SPD designations Type 1 and Type 2 for permanently connected devices for use on circuits not exceeding 600 V.

The technology of both low voltage Surge Arresters and TVSSs are now basically the same, thereby justifying coverage under one Standard, UL 1449, and one test program with consideration given to the installation location on the line side (Type 1) or load side (Type 2) of the service disconnect overcurrent protection.

2) The Surge Arrester designation will only be retained for devices used in circuits of 1 kV and over and evaluated to IEEE C62.11-1999.

Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10
Comment on Affirmative:

BECK, C.: The Technical Correlating Committee should refer this Panel Action to CMP 5 for correlation with Articles 280 and 285.

(230.72(B))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise text to read as follows:

(B) ADDITIONAL SERVICE DISCONNECTING MEANS. The one or more additional service disconnecting means covered in 230.71(A) for fire pumps, emergency systems, legally required standby systems or optional standby systems permitted by 230.2 shall be installed sufficiently remote from the one to six disconnecting means for ~~normal~~ all other services to minimize the possibility of simultaneous interruption of supply.

Substantiation: The present wording does not require the disconnecting means for fire pumps and emergency systems to be remote from each other. There could be a total of twelve disconnects at one location which could be confusing to personnel. Safety should require the disconnecting means for these systems to be remote from all other disconnecting means. There is no guarantee that an "occurrence" in one of these systems is less likely than on "normal" systems. 695.4(B)(2) requires remote location from (all) other disconnecting means. 700.12(D) requires separation of service drops and laterals which infers the disconnecting means where they terminate should be separated. This section is not consistent with that section.
Panel Meeting Action: Reject
Panel Statement: This is a repeat of similar proposals from the previous two Code cycles. The panel continues to say that the AHJ should make that determination. The submitter has not provided sufficient substantiation for this change. The panel reaffirms its position from the 2004 Report on Proposals, dealing with Proposal 4-94 as well as the ROC in Comment 4-61.

4-69 Log #925 NEC-P04 **Final Action: Accept in Principle in Part**
(230.79)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise:

RATING OF SERVICE DISCONNECTING MEANS. The service disconnecting means shall have a current rating, not less than the calculated load to be carried, determined in accordance with Parts I, II, III and IV of Article 200, as applicable . In no case shall the rating be less than specified in 250.79(A), (B), (C), or (D).

(A) ONE CIRCUIT INSTALLATION. For installations supplying only ~~limited~~ loads of a single branch circuit, the service disconnecting means shall have a rating of not less than 15 amperes.

(B) TWO CIRCUIT INSTALLATION For installations consisting of ~~not more than~~ two 2-wire circuits, the service disconnecting means for a 2-wire service shall have a rating of not less than 30 amperes. For installations consisting of two multiwire circuits or two 3-phase branch circuits, the service disconnecting means shall have a rating of not less than 30 amperes.

Substantiation: Edit. "Calculated" load should be specified; some loads are based on 125 percent of ratings. The Style Manual indicates reference should not be made to entie articles. In (A) "limited" is not defined; load is limited by circuit ratings and other requirements. In (B), "not more than" literally includes one circuit which (A) permits to be 15 amperes. Without the proposed part for two multiwire or 3-phase circuits, two such 15 ampere branch circuits require a 60 ampere disconnecting means, per (D), which is excessive.

Panel Meeting Action: Accept in Principle in Part

Accept the addition of the word "calculated" and accept the addition of "Parts III, IV, or V, of Article 220, as applicable" but change the "and" to "or" in the first sentence of the section. Reject the remainder of the proposed changes.

The amended text to read as follows: "230.79 Rating of Service Disconnecting Means.

The service disconnecting means shall have a rating not less than the calculated load to be carried, determined in accordance with Parts III, IV, or V, of Article 220 , as applicable . In no case shall the rating be lower than specified in 230.79(A), (B), (C), or (D)."

The existing text in (A) through (D) is to remain as written in the present Code

Panel Statement: This proposal is not editorial. The submitter is incorrect in citing Article 200. The word "calculated" was accepted to be consistent with the changes in the text in Article 220 and other parts of the NEC in the 2005 NEC. Parts III, IV, or V were inserted to be consistent with Section 4.1.1 of the NEC Style Manual. Parts I and II were not accepted in the recommendation, since Parts III, IV, and V of Article 220 deal with service calculations.

Deleting the word "limited" in (A) would make this section inconsistent with the text in 230.23(B), Exception, that refers specifically to limited loads of a single branch circuit not being required to be smaller than 12 AWG in size for small overhead service drops on limited loads.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-73 Log #3334 NEC-P04 **Final Action: Reject**
(230.82)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc. / Rep. Massachusetts Electrical Code Advisory Committee

Recommendation: Revise this section to read as follows:

230.82. Equipment Connected to the Supply Side of Service Disconnect. Only equipment included in this section shall be permitted to be connected to the supply side of the service disconnecting means.

(A) Unswitched Equipment.

(1) Cable limiters or other current limiting devices

(2) Meters or meter sockets nominally rated not in excess of 600 volts, provided all metal housings and service enclosures are grounded

(3) Instrument transformers (current and voltage), high-impedance shunts, load management devices, and surge arresters

(4) Taps used only to supply load management devices, circuits for standby power systems, fire pump equipment, and fire and sprinkler alarms, if provided with service equipment and installed in accordance with requirements for service-entrance conductors

(5) Solar photovoltaic systems, fuel cell systems, or interconnected electric power production sources

(6) Control circuits for power-operable service disconnecting means, if suitable overcurrent protection and disconnecting means are provided

(7) Ground-fault protection systems or transient voltage surge suppressors, where installed as part of listed equipment, if suitable overcurrent protection and disconnecting means are provided

(B) Meter Disconnect Switches. A disconnecting means shall be permitted to be located ahead of the service equipment provided the installation complies with 230.82(B)(1) through 230.82(B)(3). A separate service disconnecting means that complies with Part V of Article 230 shall be installed, and shall be located as provided in 230.70(A)(1).

(1) Rating. A meter disconnect shall be capable of interrupting the load served. It shall have a short-circuit current rating not less than the available short-circuit current.

(2) Marking. A meter disconnect shall be legibly field marked on its exterior in a manner suitable for the environment substantially as follows:

METER DISCONNECT
NOT SERVICE EQUIPMENT

(3) Grounding. A meter disconnect shall be grounded. The grounding connections shall be permitted to be in accordance with 250.142(A)(1).

Substantiation: This proposal should be read as fully supportive of the technical objectives of the 2002 NEC change in this section that added meter disconnects. The problem is to achieve those objectives in a way that does not create confusion and controversy around a fundamental principle of code application, namely, the determination of exactly which device located where constitutes the service disconnect.

Meter disconnects have been around for a very long time, normally consisting of a multipole circuit breaker mounted within a multifunction meter enclosure or in a self-contained metering pedestal. Theoretically a manufacturer could make any of them as convertible to either "hot sequence" (meter ahead of switch) or "cold sequence" (switch ahead of meter) in the field, to suit local utility requirements. At present, most of this market consists of hot sequence units that aren't field-convertible. If these breakers are on the load side of the service point (the usual case), and if they provide overcurrent protection for the conductors they supply (also the usual case), then what they supply is a conventional feeder, and not a continuation of service conductors.

Although these switches can always be installed as service disconnects, the Advisory Committee understands the practical reluctance to do so in many cases. One major reason is that if they are so classified a grounding electrode would have to be provided at the metering point. If the meter is on the outside of the building that isn't a big problem, but if the meter is hundreds of feet away, it would involve an additional electrode that would meet code but accomplish very little in terms of safety, since there would be no electrical loads at the remote metering point. It would be like requiring a grounding electrode conductor to be brought to every conventional meter socket.

The Committee also recognizes the increased, and justified, utility interest in cold sequence metering, especially on self-contained 480Y/277 volt metering systems, because of the greater safety it affords their service personnel. Pulling a meter under load at 277 volts to ground can result in a severe arc, which is why the NEC has required GFPE on 480Y/277 volt services for the last thirty-five years. The remote switch makes sense, and clearly increases safety.

Considering that the conductors run from the meter to the "service" disconnect are usually run as unprotected service conductors, requiring overload protection for these conductors has no observable safety justification. Remember also that bypass switches in meter sockets are to maintain load continuity, not load interruption, and opening a meter bypass switch under load may destroy the meter socket.

Some other utilities have also expressed interest in this concept where the metering is to be at a roadside, with the service running to the building served typically using an underground wiring method. This is true even on ordinary 120/240 volt single phase services to single family dwellings. Utility representatives point out, correctly, that here as well a remote disconnect adds an additional level of safety. Often electricians have been in the position of needing to pull a meter in order to deenergize service equipment in a flooded basement; a remote disconnect is much safer.

Unfortunately, countless NEC rules depend on a common understanding of exactly where the service is. Allowing two devices, often widely separated on the same property, that each potentially qualify as service disconnecting means is extremely troublesome. This proposal clearly covers this equipment in a way that precludes confusing meter disconnects with service disconnects.

It was only in the 1999 cycle that the following similar allowance was deleted from Section 230.82: "Fuses and disconnecting means or circuit breakers suitable for use as service equipment, in meter pedestals or otherwise provided and connected in series with the ungrounded service conductors and located away from the building supplied." The reason this provision was deleted (Proposal 4-159 in the 1999 NEC cycle) was that such disconnecting means are in fact service disconnects and the normal requirements in Part B of Article 225 should generally apply because the conductors they supply are feeders. Further, the existence of this provision (which originated in the 1971 NEC, long before building disconnects moved from old Section 230-84 to Article 225) was leading to confusion and inconsistent application of the rules because of conflicts with Article 225. That action was essentially correct.

Furthermore, the NEC may finally impose a proximity rule on outdoor service disconnects. Only the lack of consensus within CMP 4 prevented its incorporation in the last two codes, something likely to be resolved soon. Assuming such action takes place, an outdoor disconnect at some distance to be specified from the building could be viewed as the service disconnect. If not, then we would have a switch in the service conductors of the premises wiring system that (1) would be a service disconnect, but (2) could not be, in and of itself, the disconnecting means for the building or structure served. If the remote service disconnect is within a building it doesn't matter because 225.32 imposes the same requirement for a building fed from another building or structure. This adds another potential source of confusion as to what device is the official service disconnect.

The meter disconnect, however, supplies no electric equipment in its vicinity, and therefore requiring all the usual grounding provisions at a service disconnect appears to add little to safety, and discouraging its placement means reducing safety for the sake of editorial purity. On the other hand, a remote disconnect that waddles and quacks like a service disconnect will be treated accordingly by many inspectors, resulting in substantial argument and inconsistency in the application of a fundamental concept, the location of the service disconnect. This proposal provides the appropriate context for these switches, including a field-marking requirement that makes the function obvious.

This version of the previously submitted language responds to CMP 4's objections during the comment stage of the prior cycle. The subsection (B) title now includes the word "switches" to provide a clearer contrast from (A) on unswitched equipment. The former (B)(1) (service disconnect provided) has been moved into the parent language of (B) so as to not create confusion in a section covering equipment ahead of service disconnects. In addition, for the same reason, former (5) covering service equipment has been dropped. A service disconnect placed ahead of a meter is not within the scope of this location.

CMP 4 also raised the issue of "it would not make any sense to locate a meter disconnecting means on the load side of the metering equipment …" The language in this proposal, however, deliberately allows for such switches on either side of the meter based on the fact that utilities differ as to which side of the meter should be disconnected. The wording has also been clarified to avoid the inference that the entire list must be installed. The second sentence for (2) inserts the rating accepted by CMP 4 from Proposal 4-106.

CMP 4 did not respond to the central issue addressed in the 2005 proposal, that being that the switch described here, and with the short-circuit current rating described in Proposal 4-106, may and likely would otherwise qualify as a service disconnect as defined in Article 100, because it would be capable of constituting the main cutoff of supply. This confusion is exacerbated on systems with high available fault currents because the UL Guide Card information can be interpreted as a requirement for a fused switch at this location. The placement of a fused switch at this location will be interpreted by many as a service disconnect, however unintended. Remember that such a switch would fully comply with the overcurrent placement rule in 230.91.

This proposal is essential to avoid extensive field controversies around the location of the real service disconnect, particularly if CMP 4 moves to make express allowances for service disconnects to be installed at some distance from the building or structure served. It is highly significant that the submitter of related Proposal 4-106 is the same person as the submitter of the successful Proposal 4-159 in the 1999 cycle that deleted the prior allowance for such switches ahead of a service disconnect, precisely because of the confusion and conflicts such provisions create. We respectfully invite CMP 4 to carefully reconsider this proposal.

Panel Meeting Action: Reject

Panel Statement: Based on 90.2(B)(5), the NEC has no jurisdiction over installations under the exclusive control of the utility company. The switch being referenced in 230.82(3) and in this proposal is a utility company switch, and the utility company has exclusive control over the switch, its access, and the operation of this switch. To require this meter disconnect switch to be capable of interrupting the load to be served is more of an issue of the service disconnecting means and not a meter disconnect. The utility company can very easily disconnect all loads by turning the service disconnecting means to the off position, thereby unloading the meters so the meters can be pulled under a no-load condition.

In addition, requiring this meter disconnecting means to be rated for the available short circuit current of the system would then place this disconnect under the responsibility of the owner of the facility and would require the owner to change this disconnect whenever the utility company changed the available fault at the facility by installing a lower impedance transformer or by switching to another substation.

This entire issue of permitting a meter disconnecting means on the line side of the service disconnecting means is better addressed in the utility company regulations and the utility company installation manuals by the individual utility companies. As indicated in the substantiation for this proposal, there are utility companies that require the meter disconnecting means to be located on the load side of the service disconnecting means which makes it a feeder disconnect. Some require it on the line side of the meters but where the service disconnecting means is composed of more than six disconnects, such as would be the case for a meter stack for an apartment complex, the disconnect before the meters is the service main.

Ballot Results: Affirmative: 10

4-74 Log #3584 NEC-P04 **Final Action: Reject**

(230.82(9) (New))

Submitter: Wes Hoppler, American Power Technologies Inc.

Recommendation: Add a new additional item (9):

<u>(9) Meter-socket and meter-socket-adapter type transfer switches.</u>

(please note companion proposal for 230.94.)

Substantiation: Portable generator demand and use is increasing, particularly in light of post 9/11 preparedness efforts and more recent large-scale power supply failures (2003 Northeastern grid failure, Gulf Coast hurricanes). Significant numbers of portable generators are improperly connected, leading to dangerous conditions for homeowners and utility line crews engaged in restoration efforts. Although organizations such as IBEW have implemented work practices to minimize the threat posted to line crews, deaths from portable generators backfeeding utility lines still occur (at least one worker has been killed from such a situation in the aftermath of recent Gulf Coast hurricanes). Meter-socket-adapter type transfer to switches provide a cost-effective means for addressing this problem in general, and are also particularly well suited to retrofitting existing power pedestals serving traffic signals. Listed units are already in the marketplace, and we (APT) are in the process of listing additional units. It is impractical to include a grounded conductor disconnecting means within these types of units. These units connect at a point of the service-side of the main disconnect where a ground-neutral bond already exists. Requiring additional connections to the main disconnect is not warranted to produce a safe installation and would result in prohibitively expensive installation. The goal should be to decrease unsafe generator connections. With this code change, and additional, viable means of achieving that goal can be recognized and accepted.

Panel Meeting Action: Reject

Panel Statement: The submitter has not presented any technical documentation for the equipment that recommends be added to this section. The requirement for listed transfer equipment on optional standby systems already appears in Article 702.

Where equipment is under the exclusive control of the serving utility, Section 90.2(B)(5) applies and equipment such as this is not covered by the Code. There are products such as these that are listed in accordance with UL 1008, Standard for Transfer Switches. The listing specifically states the product is intended to be installed by and controlled by the serving utility.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

Comment on Affirmative:

ODE, M.: Meter-socket and meter-socket-adapter type transfer switches can provide a viable method to connect a portable generator to a premises wiring system. The availability of this type product may help to reduce the number of improperly connected portable generators, and also will reduce the possibility of portable generators backfeeding utility lines.

Where listed, these types of products have been investigated and tested to the requirements of UL 1008, and meet the same safety requirements as other listed transfer switches. The listing for these particular transfer switches specifically states they are intended to be controlled and installed by the serving utility, and as such, 90.2(B)(5) is applicable. The panel statement that this equipment is not covered by the code is correct since these transfer switches are installed as part of the utility company meter and meter socket. This agreement with the panel action does not imply that these products cannot be safely used where installed and operated correctly.

4-75 Log #187 NEC-P04 **Final Action: Reject**
(230.82(2))

NOTE: The following proposal consists of Comment 4-71 on Proposal 4-105 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 4-105 was:

Revise text to read as follows:

Meters, meter sockets, meter socket transfer switches, or meter disconnect swicthes nominally rated not in excess of 600 volts, provided all metal housings and service enclosures are grounded.

Submitter: Joseph McCann, City of Coral Springs
Recommendation: Add transfer swtiches (that are listed for service equipment) shall be permitted to be connected to the supply side of the service equipment. 230.82(1)-(7).
Substantiation: Transfer switches are available that are listed as service equipment and should be included in the equipment that are listed in 230.82 (1)-(7).
Panel Meeting Action: Reject
Panel Statement: There are transfer switches that are rated for use as service equipment where there is a center off position and integral overcurrent protection and can be considered to be a service disconnecting means but these transfer switches are not located ahead of the service disconnect since it is the service disconnecting means.

There are also transfer switches that are rated for use as service equipment to comply with 225.36 where the transfer switch must be installed at a separate building or structure, has a center off position but no integral overcurrent protective device but complies as a feeder disconnect at the separate building or structure. Transfer switches without integral overcurrent protection may be rated for use as service equipment but must have a marking to indicate the maximum rating of overcurrent protection to be provided ahead of the transfer switch.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-76 Log #2845 NEC-P04 **Final Action: Reject**
(230.82(2))

Submitter: Doug Eckelkamp, Bell Electric
Recommendation: Revise 230.82(2) by adding the requirement that the meter and meter socket have a marked short-circuit current rating.

230.82 Equipment Connected to the Supply Side of Service Disconnect. Only the following equipment shall be permitted to be connected to the supply side of the service disconnecting means:

(1) Cable limiters or other current-limiting devices

(2) Meters and meter sockets nominally rated not in excess of 600 volts, provided all metal housings and service enclosures are grounded <u>and the marked short-circuit current rating for the meter and meter socket is not exceeded by the available short-circuit current.</u>

The remainder of 230.82 is to remain the same.
Substantiation: Electrical workers are continually installing meters "hot" without knowing if the meter has the ability to withstand the available short-circuit current if a catastrophic fault should occur. This proposal will drive the product standards to begin marking meters with their short-circuit current rating. That will provide a greater degree of safety for workers that are at serious risk today.
Panel Meeting Action: Reject
Panel Statement: Marking a utility company meter for its withstand rating would not accomplish what the submitter is alluding to in his substantiation. Where a worker is reinstalling a meter back into an energized base, the meter would not be fully engaged in the socket at the time of contact to a live part that may cause arcing between the meter and the meter socket. Most accidents with meters being reinserted into meter sockets occur when a meter is not inserted into the socket at the correct angle with the meter socket jaws and the meter blades not correctly aligned. Even if the meter were marked with a withstand rating, this withstand rating would be established with the meter fully engaged into the socket and not as it is being inserted into the socket. These meters are also not designed to be reinserted under full load conditions where motor contribution would come into play in a fault condition, but this would certainly be a factor if someone was reinserting a meter into a socket without having turned any load off.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-77 Log #3476 NEC-P04 **Final Action: Accept in Principle**
(230.82(4))

Submitter: Richard F. Van Wert, Middle Department Inspection Agency / Rep. Benjamin Franklin Chapter IAEI
Recommendation: Revise text to read:

230.82(4) Instrument transformers (current and voltage) impedance shunts, load management devices and <u>surge</u> arresters.
Substantiation: This article needs rewording in order to stay consistent with the rest of the NEC mentions of this item.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action on Proposal 4-66 that seems to satisfy the submitter's concern.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-78 Log #809 NEC-P04 **Final Action: Reject**
(230.82(9))

Submitter: Frank Garcia, Hollister, CA
Recommendation: Transient Voltage Surge Suppressors shall be used for all branch circuits.
Substantiation: Equipment damage is occuring to electronic controlled systems due to no transient voltage surge suppressors. If surge suppression is installed to all branch circuits, damage to equipment would decrease and save on loss of productivity.

Use of transient voltage surge suppressors for all branch circuits would help to curtail the over use of extension cords devices to protect equipment, minimizing the chance of fire.
Panel Meeting Action: Reject
Panel Statement: Section 230.82 is simply recognizing that there may be transient voltage surge suppression devices connected at the service where suitable overcurrent protection has been provided and a proper disconnecting means is provided. In the substantiation, the submitter alludes to the use of transient voltage surge suppressors curtailing the overuse of extension cord devices by being inserted in the branch circuit. The submitter has submitted no technical substantiation for this statement.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-79 Log #913 NEC-P04 **Final Action: Reject**
(230.90)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Change "overload" to "overcurrent" throughout this section.
Substantiation: Edit. The heading refers to overcurrent which is not the same as the definition of overload in Article 100, which does not include short circuits or ground faults. The sections referenced in the exceptions cover overcurrent, not overload.
Panel Meeting Action: Reject
Panel Statement: The proposal is not editorial. The use of the phrase "overload protection" in Section 230.90 recognizes that service conductors are not protected against short circuit and ground fault. These conductors are protected against overload by limiting the load on these ungrounded service conductors, and all of the exceptions to this section recognize the limitation of the load as a protection for these conductors. These conductors connect to an overcurrent protective device at the service disconnecting means, but the load is limited to not more than the conductor rating with exceptions.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-80 Log #1702 NEC-P04 **Final Action: Reject**
(230.91, 230.93, 230.94, and 230.94 Exception No.3)

Submitter: Charles M. Trout, Maron Electric Company
Recommendation: Change title and sections as follows:

Part VII. Service Equipment - ~~Overcurrent~~ <u>Overload and Ground-Fault</u> Protection

230.91 Location. The service ~~overcorrect~~ <u>overload</u> device etc.

230.92 Locked Service ~~Overcurrent~~ <u>Overload</u> Devices. Where the service overcorrect overload devices... and shall of a lower ampere rating than the service ~~overcorrect~~ <u>overload</u> device.

230.94 Relative Location of ~~Overcurrent~~ Device and Other Service Equipment. The ~~overcurrent~~ <u>overload</u> device shall protect all circuits and devices on the supply side.

Exception No. 3: "...on the supply side of the service ~~overcorrect~~ <u>overload</u> device...".
Substantiation: Nothing in Part VII relates to overcurrent protection of service equipment. The location of the required overcurrent device provides overcurrent protection only for the feeders from the service equipment and not the service conductors. Ground-fault protection of equipment is a major part of Part VII and should be included in the title.

Panel Meeting Action: Reject
Panel Statement: While the service conductors are protected against overload by limiting the amount of load connected to the conductors, these conductors are connected to overcurrent protective devices, such as circuit breakers and fusible switches with fuses installed so changing these sections to "overload" devices would not be properly identifying them. The conductors on the load side of these devices are being protected against short circuits, ground faults, and overloads.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-81 Log #2935 NEC-P04 **Final Action: Reject**
(230.92)

Submitter: Philip Simmons, Simmons Electrical Services
Recommendation: Revise existing 230.92 as follows:
230.92 Locked Service Overcurrent Devices. Where the service overcurrent devices are locked or sealed or are not readily accessible to the occupant, branch-circuit overcurrent devices shall be installed on the load side, shall be mounted in a readily accessible location, and shall be of lower ampere rating than the service overcurrent device. <u>Enclosure housing electrical apparatus that are controlled by lock and key shall be considered accessible to qualified persons.</u>
Substantiation: This is a companion proposal to delete the rule from 110.26 and add it to 230.92 and 240.24(B). 110.26 deals with access to working space about electrical equipment and does not apply to access to the equipment itself. It seems the provision on electrical apparatus controlled by a lock and key would more properly be located in 230.92 and 240.24(B).
Many locations come to mind where electrical equipment is locked to prevent unauthorized access. These include schools, colleges, health care facilities, airport terminals and office buildings that are open to the public. These buildings often have either panelboards with locking covers or electrical equipment located in locked rooms. Electrical inspectors recognize the security that is needed in these and other facilities. Locating this rule with the sections that cover locks on equipment will improve the usability of the Code.
Panel Meeting Action: Reject
Panel Statement: The submitter has not presented a definable technical problem with the current language. The NEC is not intended to be written so as to educate people in the practical application of the various requirements. A change in defining the differing types of access that are described in a number of articles if accepted belongs in Chapter 1 of the NEC.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-82 Log #3583 NEC-P04 **Final Action: Reject**
(230.94 Exception No. 7 (New))

Submitter: Wes Hoppler, American Power Technologies Inc.
Recommendation: Add a new additional Exception No. 7:
<u>Exception No. 7: Meter-socket and meter-socket-adapter type transfer switches shall be permitted to be installed and connected on the supply side of the service disconnecting means.</u>
(Please note companion proposal for 230.82)
Substantiation: Portable generator demand and use is increasing, particularly in light of post 9/11 preparedness efforts and more recent large-scale power supply failures (2003 Northeastern grid failure, Gulf Coast hurricanes). Significant numbers of portable generators are improperly connected, leading to dangerous conditions for homeowners and utility line crews engaged in restoration efforts. Although organizations such as IBEW have implemented work practices to minimize the threat posted to line crews, deaths from portable generators backfeeding utility lines still occur (at least one worker has been killed from such a situation in the aftermath of recent Gulf Coast hurricanes). Meter-socket-adapter type transfer to switches provide a cost-effective means for addressing this problem in general, and are also particularly well suited to retrofitting existing power pedestals serving traffic signals. Listed units are already in the marketplace, and we (APT) are in the process of listing additional units. It is impractical to include a grounded conductor disconnecting means within these types of units. These units connect at a point of the service-side of the main disconnect where a ground-neutral bond already exists. Requiring additional connections to the main disconnect is not warranted to produce a safe installation and would result in prohibitively expensive installation. The goal should be to decrease unsafe generator connections. With this code change, and additional, viable means of achieving that goal can be recognized and accepted.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 4-74.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10
Comment on Affirmative:
ODE, M.: See my Affirmative Comment on Proposal 4-74.

4-83 Log #3619 NEC-P04 **Final Action: Reject**
(230.95)

Submitter: John Sioumcas, St. Louis, MO
Recommendation: Revise the existing text in the second paragraph of 230.95 to read:
The rating of the service disconnect shall be considered to be the rating of the actual fuse installed or the highest continuous current trip setting for which the actual overcurrent device installed in a circuit breaker is rated or can be adjusted.
Substantiation: The existing text of 230.95 requires that ALL 1200A or larger fused switches require ground fault protection for the system types specified, regardless of the actual fuse installed. Therefore, a 1200A or larger switch with an 601A, 650A, 700A, 750A, 800A, 801A, or 900A, with appropriate sized and installed conductors would require ground fault protection despite not meeting the overcurrent protection size criteria of 1000A or more.
However, a similar 1200A circuit breaker with a 1200A Trip Unit would not require ground fault protection provided the actual rating plug selected was a fixed rating of 600A, 700A, 800A or 900A with appropriately sized and installed conductors despite the fact that the rating plug can easily and inexpensively increased to 1000A or more.
I understand the Code panels concern about the ability of the user to increase the rating of a fuse in a fused switch, but in reality, it is much easier to change a single $100 rating plug from 800A to 1000A than to change 3-800A fuses to 3-1000A fuses that can total more than $1500. Thus, the belief that a user is going to increase the fuse rating in a service disconnect (where the fuses rarely operate) and conductors after the inspection of the installation just to avoid the addition of ground fault to a fused switch is completely unfounded - and infact more realistic for a circuit breaker type system - in which it is permitted.
Therefore, the text as written should be changed because it requires users who prefer fused equipment to incur unnecessary added cost of ground fault protection for properly installed installations 1000A or less that utilize a 1200A or larger sized switch.
Panel Meeting Action: Reject
Panel Statement: The reason the rating of the fusible disconnecting switch is used is to discourage someone from installing a smaller fuse so that the more costly ground fault protection of equipment does not have to be installed and then increasing the size of the fuse to match the size of the disconnecting means. This is more easily accomplished with a fusible switch than with a circuit breaker and replacing the fuse with a larger size is much less costly than installing the ground fault protection of equipment required in this section.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 8 Negative: 2
Explanation of Negative:
ALLISON, M.: I disagree with the panel action, and vote negative. The proposal should be accepted.
Substantiation: The submitter is correct. A 1200 amp frame circuit breaker used as the service disconnecting means equipped with a smaller than 1000 amp rating plug does not have to be equipped with ground fault protection according to the existing code.
This is a safety concern, as it is with fused switches. The user or installer can easily make the circuit breaker installation 1000, or 1200 amps. It is quite simple and not expensive to install a higher rating plug.
The rational in the panel statement is:
"The reason the rating of the fusible disconnecting switch is used is to discourage someone from installing a smaller fuse so that the more costly ground fault protection of equipment does not have to be installed and then increasing the size of the fuse to match the size of the disconnecting means. This is more easily accomplished with a fusible switch than with a circuit breaker and replacing the fuse with a larger size is much less costly than installing the ground fault protection of equipment required in this section".
This rationale is flawed, in view of the ease of simply installing a higher rating plug. The necessity of GFP 1000 amps and over applied equally if not more appropriately to 1200 amp frame circuit breakers as it does to fused switches. The type of disconnecting means in this case has little bearing on the need for safety.
NAUGHTON, J.: I disagree with the panel action and statement. This proposal needs further consideration, during the comment stage.

4-84 Log #3500 NEC-P04 **Final Action: Accept**
(230.95 Exception No. 2)

Submitter: Jim Pauley, Square D Company
Recommendation: Delete Exception No. 2 of 230.95
~~*Exception No. 2: The ground-fault protection provisions of this section shall not apply to fire pumps.*~~
Substantiation: During the 2005 NEC Cycle, CMP 13 added the provision to prohibit GFPE on fire pumps in 695.6(H). The section reads as follows:
(H) Ground Fault Protection of Equipment. Ground fault protection of equipment shall not be permitted for fire pumps.
Since Chapter 6 can supplement or modify requirements in Chapter 2, there is no need for the exception in 230.95. In fact, the exception adds confusion because code users misinterpret that an exception needs to be in Chapter 2 for Chapter 6 to exempt it.

The deletion is consistent with 90.3 and consistent with the TCC direction to not create redundant rules.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-85 Log #2884 NEC-P04 **Final Action: Reject**
(230.96 (New))

Submitter: B. Wiltse, Mandeville, LA
Recommendation: Add a new 230.96 to read as follows:
230.96 Short-Circuit and Arc-Flash protection of Service-Entrance Conductors. Short-circuit and arc-flash protection shall be provided for service-entrance conductors where the service entrance conductors have an ampacity of 1000 amperes or more. The short-circuit and arc-flash protection shall be located at the service-entrance conductors' source of supply and shall consist of:
(1) Current Limiting Cable Limiters,
(2) Current Limiting Fuses,
(3) Circuit Breakers without short-time delay, or
(4) Current Limiting Circuit Breakers
Substantiation: Workers are being seriously injured and killed by arc-flashes that result from short-circuits that occur in the service equipment that is ahead of or on the line-side of the service entrance overload protective device. This is unprotected territory, "Deadman's Land", because the only hope for protection is for the utility's primary overcurrent device to open, and it is sized so large that it will let the worker burn to death before opening. This short-circuit and arc-flash protection requirement is needed to protect workers from these horrific incidents.
Conductors with ampacity of 1000 amperes were chosen so as not to allow a loophole for the six disconnect rule (For example this short-circuit and arc-flash protection should be required for a 4000 ampere service, even though it consists of five 800 ampere switches.) 1000 was chosen to correlate with 230.95. Circuit breakers without sort-time delay were chosen because they offer a much higher degree of arc-flash protection than circuit breakers with short-time delay. Current limiting cable limiters, current limiting fuses and current limiting circuit breakers were chosen because they offer the very highest degree of arc-flash protection.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided adequate technical substantiation for mandating this radical change in requirements nor evidence of a safety issue or concern with the present language. There is no documentation provided as to how the submitter intends to require the installation of short circuit and arc flash protection at the service-entrance conductor source of supply (supposedly from the serving utility conductors.)
The conductors on the utility side of the service point are utility company conductors and are under the exclusive control of the utility company; so requiring short circuit and arc flash protection would be outside the scope of the NEC. This is adequately explained in Section 90.2(B)(5) of the NEC.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:
NAUGHTON, J.: I disagree with the panel statement. The dangers of arc flash are well documented. This concept has merit and deserves further consideration.

4-86 Log #3214 NEC-P04 **Final Action: Reject**
(230.200, FPN)

Submitter: Donald Cook, Shelby County Development Services
Recommendation: Delete the FPN completely.
Substantiation: A review of 90.2 (A) and (B), the Article 100 definition of service point, the complete NEC text and specifically the text in Articles 225, and 230 leads one to believe that electrical wiring and equipment located on the load side of the service point is under the scope of the NEC. This FPN, which based on the text in 90.5(C) is not enforceable, provides no value to the NEC user.
If industry believes information in the NESC is necessary for installations on the load side of the service point, that information should included as requirements of the NEC, not as a FPN. As an FPN, it only adds to the confusion of designers, installers, and AHJ's working on installations working on premises wiring.
The FPN also appears to include a requirement, which is not permitted to be located in a FPN.
Panel Meeting Action: Reject
Panel Statement: This fine print note does not contain mandatory text or a requirement as stated in the submitter's substantiation. It is providing additional information on where a user of the Code can go to get conductor clearances for utility company conductors on the line side of the service point.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:
NAUGHTON, J.: I agree with the submitter, this FPN gives the impression that for services exceeding 600 Volts, Nominal one must use the NESC for clearances of conductors.

4-87 Log #2952 NEC-P04 **Final Action: Accept**
(230.205(A))

Submitter: James J. Rogers, Bay State Inspectional Agency
Recommendation: Add a second paragraph to read as follows:
For either overhead or underground primary distribution systems on private property the service disconnect shall be permitted to be located in a location that is not readily accessible.
Substantiation: There are many installations where the service point is at the edge of the property and a high voltage switch is the actual service disconnect for the distribution system which then becomes a feeder for multiple buildings on the property, the disconnect requirements in 225 would apply to the buildings.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-88 Log #1772 NEC-P04 **Final Action: Reject**
(230.205(C))

Submitter: Joseph C. Warren, Joseph C. Warren Electrical Consulting Services
Recommendation: Revise text to read as follows:
230.205(C) Remote Control. For multi-building, industrial installations under single management, the service disconnecting means shall be permitted to be located at a separate building or structure. In such cases, the service disconnecting means shall be permitted to be electrically operated by a readily accessible, remote-control device.
<u>This device shall have an "on and off" position showing whether the remote service disconnect is on or off, and a mechanical key interlock to prevent anyone from turning the device on again when it must be turned off for any reason. This remote control device shall be clearly visible to the person who has to turn the circuit off, and shall be clearly marked indicating its purpose.</u>
Substantiation: A person could be injured if the circuit is not locked out. Present language is not definitive enough to establish complete safety of a person working on this circuit.
Panel Meeting Action: Reject
Panel Statement: This remote device is not the service disconnecting means but simply a remote switch that permits operating the high voltage service disconnecting means from a remote location. Any lockout and tagout procedures must still be done at the service main.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-89 Log #3385 NEC-P04 **Final Action: Reject**
(230.211)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Revise as follows:
Metal-enclosed switchgear shall <u>comply with 490.46</u> . ~~consist of a substantial metal structure and a sheet metal enclosure. Where installed over a combustible floor, suitable protection thereto shall be provided.~~
Substantiation: This is a companion proposal to one submitted to create comprehensive minimum safety requirements for this equipment in Article 490. Its acceptance should be conditional on CMP 9 action in 490.46.
Panel Meeting Action: Reject
Panel Statement: Section 490.46 presently covers providing a ground bus in the enclosure for the connection of service cable shields and to facilitate the attachment of safety grounds for personnel protection. It does not provide the same requirements of a substantial metal structure and suitable protection where the equipment is installed over a combustible floor as provided by 230.211, so this text must remain.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

ARTICLE 240 — OVERCURRENT PROTECTION

10-4 Log #669 NEC-P10 **Final Action: Accept in Principle**
(240.2)

Submitter: Jamie McNamara, Hastings, MN
Recommendation: Revise as follows:
<u>**Industrial Installation.** The industrial portions of a facility where all of the following conditions are met:</u>
<u>(1) The premises wiring system has 300 kVA or greater of load used in industrial process(es), manufacturing activities, or both, as calculated in accordance with Article 220.</u>
<u>(2) The premises has at least one service or supply that is more than 150 volts to ground and more than 300 volts phase-to-phase.</u>
<u>This definition excludes installations in buildings used by the industrial facility for offices, warehouses, garages, machine shops, and recreational facilities that are not an integral part of the industrial plant, substation, or control center.</u>
Substantiation: The panels comment in the 2005 code revision cycle were very clear there is a strong need for a definition of industrial installation in the NEC. With no definition for Industrial Installation, people are left to come up

with one on there own, this would help clarify and provide consistent interpretations for what 240.21 (C) (3) means when it reads "Industrial Installation".
Panel Meeting Action: Accept in Principle
Panel Statement: The panel's wording in the action text of Proposal 10-3a (Log #CP1000) clarifies the requirements for an industrial installation in 240.21(C)(3). A definition based on the lower levels of transformer size, etc. is unnecessary.
See panel action and statement on Proposal 10-3a (Log #CP1000).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-5 Log #188 NEC-P10 **Final Action: Accept in Principle**
(240.2. Industrial Installation)

NOTE: The following proposal consists of Comment 10-5 on Proposal 10-8 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 10-8 was:
I underlined added text
<u>Industrial Installation. For the purposes of Part II, the industrial portions of a facility where all of the following conditions are met:</u>
<u>(1) The premises wiring system has 2500 kVA or greater of load used in industrial process(es), manufacturing activities, or both, as calculated in accordance with Article 220.</u>
<u>(2) The premises has at least one service that is more than 150 volts to ground and more than 300 volts phase-to-phase.</u>
<u>This definition excludes installations in buildings used by the industrial facility for offices, warehouses, garages, machine shops, and recreational facilities that are not an integral part of the industrial plant, substation, or control center.</u>
Submitter: Jamie McNamara, Hastings, MN
Recommendation: The definition should read:
Industrial Installation. For the purposes of Part II, the industrial portions of a facility the premises wiring system has 300 kVA or greater of load used in industrial process(es), manufacturing activities, or both, as calculated in accordance with Article 220. This definition excludes installations in buildings used by the industrial facility for offices, warehouses, garages, machine shops, and recreational facilities that are not an integral part of the industrial plant, substation, or control center.
Substantiation: The comments from several of the panel members is clear there is a strong need for a definition of industrial installation.
I agree with the panel member comments that my original proposal was too restrictive.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel's wording in the action text of Proposal 10-3a (Log #CP1000) clarifies the requirements for an industrial installation in 240.21(C)(3). A definition based on the lower levels of transformer size, etc. is unnecessary.
See panel action and Statement on Proposal 10-3a (Log # CP1000).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-6 Log #2690 NEC-P10 **Final Action: Reject**
(240.2. Supervised Industrial Installation)

Submitter: Charles M. Trout, Maron Electric Co. Inc.
Recommendation: Add a new last sentence to 240.2 Definitions, Supervised Industrial Installation, paragraph (1) to read: "Documentation of the qualified person shall be on file at the office of the establishment in charge of the completed installation."
Substantiation: A lesser degree of safety based on an undocumented qualified person hypothetically servicing the installation is permitted. No requirements are present to ensure that the conditions of maintenance and supervision to ensure that only qualified persons service the installation actually exist.
Panel Meeting Action: Reject
Panel Statement: Article 100 provides a definition of "qualified person" as well as a fine print note referencing NFPA 70E.
Special requirements are best determined by the authority having jurisdiction.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-7 Log #189 NEC-P10 **Final Action: Accept in Principle**
(240.2 Industrial Installations)

NOTE: The following proposal consists of Comment 10-6 on Proposal 10-8 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. [Refer to Proposal 10-5 (Log #188).
Submitter: Stan Penrose, Oregon Building Codes Division
Recommendation: Accept this proposal in principle modified by the suggested text in Mr. Frederick's affirmative comment in the ROP.
Substantiation: The term "Industrial Installation" must be defined for those who use the National Electrical Code every day for a living. As inspectors, we need clear guidelines for when the "Industrial Only" rules can be applied. When does a commercial occupancy become an industrial occupancy? Engineers, electricians and inspectors interpret that question very differently. We need help.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel's wording in the action text of Proposal 10-3a (Log #CP1000) clarifies the requirements for an industrial installation as applied in 240.21(C)(3). A definition based on the lower levels of transformer size, etc. is unnecessary. It is outside the scope of Code-Making Panel 10 to develop a global definition of "Industrial Installation".
See panel action and statement on Proposal 10-3a (Log #CP1000).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-8 Log #1466 NEC-P10 **Final Action: Reject**
(240.4and 240.5)

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Rename the term "fixture wires" to "luminaire wires" in 240.4 and 240.5
Substantiation: With the changing of the term "fixture" to "luminaire" it only makes sense that the term "fixture wires" be changed to "luminaire wires".
For the purposes of correlation, this proposal is also being submitted to the following Articles/Sections/Tables/Annexes: 200.6; 210.19; 210.20; 210.24; 240.4; 240.5; 300.17; 310.1; 314.16; Article 402; 517.74; 660.9; Table 1; Table 5; Annex C.
Panel Meeting Action: Reject
Panel Statement: The use of fixture wire is not limited to luminaires. The term "fixture wire" is used in various applications/product listings other than for luminaires. See, for example, UL White Book listings.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-9 Log #1986 NEC-P10 **Final Action: Reject**
(240.4(C) Exception (New))

Submitter: Neil F. LaBrake, Jr., Niagara Mohawk, a National Grid Company / Rep. Edison Electric Institute-Electric Light & Power Group
Recommendation: Revise as follows:
240.4 Protection of Conductors.
Conductors, other than flexible cords, flexible cables, and fixture wires, shall be protected against overcurrent in accordance with their ampacities specified in 310.15, unless otherwise permitted or required in 240.4(A) through (G).
(C) Devices Rated Over 800 Amperes. Where the overcurrent device is rated over 800 amperes, the ampacity of the conductors it protects shall be equal to or greater than the rating of the overcurrent device defined in 240.6.
<u>Exception: For devices rated no more than 1600 Amperes, the next higher standard overcurrent device rating (above the ampacity of the conductors being protected) shall be permitted to be used, provided all of the following conditions are met:</u>
<u>(1) The next higher standard overcurrent device rating (above the ampacity of the conductors being protected) does not exceed 6% above the ampacity of the conductors being protected.</u>
<u>(2) The ampacity of the conductors does not correspond with the standard ampere rating of a fuse or a circuit breaker without overload trip adjustments above its rating (but that shall be permitted to have other trip or rating adjustments).</u>
<u>(3) The next higher standard rating selected does not exceed 1600 amperes.</u>
<u>(4) The overcurrent device has been listed for use with the smaller conductors</u>
Substantiation: By making this change, a 1600-ampere service could be wired with four sets of 500 kcmil, Cu, 75 degrees C wire. This was done for years without any problems and no problems have been encountered for the existing 800 amperes or less, as permitted now in Section 240.3(B). Of course, all the other Code provisions would have to be followed.
Below 800 amperes, the NEC already allows conductors to be protected at the next standard device rating, effectively allowing these conductors to be protected and up to 18 percent above their allowable ampacity. This practice has proven successful in many thousands of NEC installations and in years of practice. This successful practice is with conductors that are smaller and heat more quickly than those above 800 amperes. Also, the overcurrent protective device is smaller and more sensitive to the wire size below 800 amperes. It would seem that, if anything, there would be more technical merit in restricting the smaller devices and conductor, but again long successful practice and experience supports the existing latitude given in 240.3. The five (5) time-current characteristic (TCC) curves I have provided illustrate this practice.
Note: Supporting Material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: There has been no further substantiation presented in this proposal to address the concerns and issues raised by the panel in previous NEC development cycles. There are no specially listed devices that satisfy the proposed 240.4(C)(4), and the impact on the equipment in which these devices are to be used has not been considered.

It is noted that the amount of heat generated in a conductor increases as the square of the current through that conductor, and the characteristics of overcurrent devices are such that overloads are tolerated for significant periods of time before the device operates. At the very least, a study should be conducted to demonstrate that the conductors and equipment would not sustain damage from carrying the current permitted by this proposal. For example, the proposer could approach UL through their open Standards Technical Panel process to address the listing requirements.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

ELDRIDGE, C.: This proposal raises a good concept that should have been accepted. The proposal would have allowed, for devices above 800 amperes, the next higher available size of overcurrent device to be used, where that next higher size was no more than 6% above the allowable conductor ampacity.

Below 800 amperes, the NEC already allows conductors to be protected at the next standard device rating, effectively allowing these conductors to be protected at up to 18% above their allowable ampacity. This practice has proven successful in many thousands of NEC installations and in years of practice. This successful practice is with conductors that are smaller and heat more quickly than those above 800 amperes. Also, the overcurrent protective device is smaller and more sensitive to the wire size below 800 amperes. It would seem that if anything, there would be more technical merit in restricting the smaller devices and conductors, but again long successful practice and experience supports the existing latitude given in 240-3.

There is no technical reason to disallow the modest 5% allowance for conductors above 800 amperes, as proposed in the proposal. Additionally, the requirement for listing would assure that this provision would not be available for use until a manufacturer were to develop devices and equipment that would be able to make use it since there is not as much conductor mass to dissipate (heat sink) the heat.

FREDERICKS, C.: I'm voting against the panel action. This is a concept that has previously been reviewed at length by this panel, receiving support at different voting times. With the additional requirement that any overcurrent device used under this provision be listed for use with the smaller conductors, it is difficult to see a potential safety problem with the proposal.

I believe the original NEC restriction above 800 amps was intended to address large gaps in the standard overcurrent device sequence that existed at the time, for example from 3000 to 4000 amps, not 6% as proposed here, and there would not be a problem with the modest flexibility proposed here.

In response to the panel statement that heat increases with the square of the current through a conductor, I note that temperature rise is a function of current squared multiplied by resistance, multiplied by thermal resistance to the ambient. If a larger device has the same temperature rise as a smaller device, the difference in resistance and thermal resistance to the ambient is compensating for the increase in current squared. In such a case, the larger device will increase in temperature more slowly under an overload condition than a smaller device will.

Comment on Affirmative:

BORTHICK, M.: I support the panel action to reject this proposal. In addition to the points cited in the panel statement, I have concerns that the overcurrent devices will require an extended period of time to open under conditions where the ground-fault current must take a high impedance path. Having seen many instances where the ground-fault return paths have been compromised, my concern is that when a ground fault occurs the conductors could suffer damage due to the extended opening times.

DARLING, D.: For many years, it was a standard in the industry to use a 500 kcmil conductor for 400 amperes even when we were using Type TW insulation rated at 60 degrees C. This is still a standard to use a single 500 kcmil conductor for a 400 ampere feeder and two 500 kcmil conductors per phase for a 800 ampere feeder when there is not a neutral conductor or when there is a very small current in the neutral conductor(s). The proposal is to allow four sets of 500 kcmil conductors to be used for a 1600 amperes feeder under the same neutral conditions as described above. In the case of four sets, each conductor is carrying the same current, 400 amperes, and, therefore, there is not any additional heat assuming that the fours sets of conductors are separated. The most common conductors being used today have insulation rated at 90 degrees C and, therefore, they can actually carry more current than the old TW conductors without that used to be used in this application without damage to the insulation.

This proposal includes the requirement that the circuit breaker or the switch and fuse be listed for this application. There is risk being introduced with this proposal. I predict that if this proposal was accepted, the manufacturers would have their equipment tested and list all of their equipment up to 1600 amperes for 400 amperes per set of 500 kcmil conductors.

10-10 Log #2931 NEC-P10 **Final Action: Accept in Principle**
(240.4(D))

TCC Action: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal as it relates to 110.5. This action will be considered by the Panel as a Public Comment.

Submitter: Todd Lottmann, Cooper Bussmann

Recommendation: Revise as follows:

(D) Small Conductors. Unless specifically permitted in 240.4(E) through (G), the overcurrent protection shall not exceed ~~15 amperes for 14 AWG, 20 amperes for 12 AWG, and 30 amperes for 10 AWG copper; or 15 amperes for 12 AWG and 25 amperes for 10 AWG aluminum and copper clad aluminum~~ <u>the following</u> after any correction factors for ambient temperature and number of conductors have been applied.

(1) 7 amperes for 18 AWG provided all the following conditions are met:
(a) Continuous loads do not exceed 5.6 amperes
(b) Overcurrent protection is provided by one of the following:
(1) Branch circuit rated circuit breakers listed and marked for use with 18 AWG wire
(2) Branch circuit rated fuses listed and marked for use with 18 AWG wire
(3) Class CC, Class J, or Class T fuses
(2) 10 amperes for 16 AWG provided all the following conditions are met:
(a) Continuous loads do not exceed 8 amperes
(b) Overcurrent protection is provided by one of the following:
(1) Branch circuit rated circuit breakers listed and marked for use with 16 AWG wire
(2) Branch circuit rated fuses listed and marked for use with 16 AWG wire
(3) Class CC, Class J, or Class T fuses
(3) 15 amperes for 14 AWG copper or 12 AWG aluminum and copper-clad aluminum
(4) 20 amperes for 12 AWG copper
(5) 25 amperes for 10 AWG aluminum and copper-clad aluminum
(6) 30 amperes for 10 AWG copper

Substantiation: This change correlates with the 2002 Edition of NFPA 79, Electrical Standard for Industrial Machinery. In order to remain competitive in the global marketplace, United States industrial machinery manufacturers on the committee for NFPA 79 (Electrical Standard for Industrial Machinery) expressed the need to be able to utilize power circuit conductors that are smaller than 14 AWG, the existing minimum allowed for branch circuits in the NEC. The use of 16 and 18 AWG conductors for other than control loads should be allowed provided conditions of use are provided. The recommended wording will provide conditions for the use of 16 and 18 AWG conductors in branch circuit applications. The ampacity levels selected correlate with those in UL 508A, UL508, and NEC Table 400.5(A) and the restrictions provided are supported with technical substantiation. This change would provide for the safe protection of 16 and 18 AWG conductors for branch circuit applications.

A UL Special Service Investigation was conducted for the protection of 16 and 18 AWG copper conductors using Class CC, J, or T fuses and the report of this testing is included as substantiation for this change.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle

In the recommendation, add "copper" after "18 AWG" in 3 places, and add "copper" after "16 AWG" in 3 places.

Panel Statement: All research and the UL Special Services investigation were conducted with copper conductors. Therefore, the modifier "copper" needs to be added after "18 AWG" and "16 AWG".

The panel recognizes that acceptance of this proposal will not, by itself, allow for the use of 16 AWG and 18 AWG conductors for branch circuit applications. It simply provides the protection requirements for these conductors if their usage is allowed by other sections of the NEC.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

DARLING, D.: This proposal is for conductors used in Industrial Machinery Control Panels only. #18 and #16 conductors should never be used for standard branch circuits.

FREDERICKS, C.: I agree with the panel action, however I note that while the substantiation demonstrated that specific overcurrent devices could protect the smaller conductors adequately and within assumed I 2 t limits, I believe that other overcurrent devices could be demonstrated to adequately protect the same conductors, possibly while letting through larger I 2 t values than the ICEA values that the substantiation assumed as a limit.

The following assumptions that go with the ICEA physics-based formula for I 2 t limits should be considered:

• The formula assumes all heat generated by the current is stored in the conductor.

• The formula does not take into account cooling of the conductor by heat transfer to the insulation or to the ambient.

• The formula does not consider time duration of any overheating and assumes that damage will instantly occur at the assumed temperature.

• The damage temperatures assumed in the use of the formula were based on longer-duration overheating of medium-voltage conductors, and on older insulation types.

As a result, application of the ICEA formula to small conductor applications can be overly conservative.

10-11 Log #830 NEC-P10 **Final Action: Reject**
(240.4(F))

Submitter: Larry T. Smith, National Electrical Seminars
Recommendation: Revise text to read as follows:

(F) Transformer Secondary Conductors. Except as permitted in 240.21(C) , single-phase (other than 2-wire) and multiphase (other than delta-delta, 3-wire) transformer secondary conductors shall not be considered to be protected by the primary overcurrent protective device. Conductors supplied by the secondary side of a single-phase transformer having a 2-wire (single-voltage) secondary, or a three-phase, delta-delta connected transformer having a 3-wire (single-voltage) secondary, shall be permitted to be protected by overcurrent protection provided on the primary (supply) side of the transformer, provided this protection is in accordance with 450.3 and does not exceed the value determined by multiplying the secondary conductor ampacity by the secondary to primary transformer voltage ratio.

Substantiation: Section 240.4(F) makes an uncompromising statement: unless it's a two-wire single-phase or a three-wire delta-delta transformer, secondary conductor overcurrent protection is required. Yet, 240.21(C) contains six rules where secondary conductors are permitted to be protected by the transformer's primary overcurrent device. 240.4(F) and 240.21(C) are at odds. I've talked with several engineers and designers who unnecessarily provide secondary conductor overcurrent protection because of the wording of 240.4(F). When I remind them of the specific rules in 240.21(C), they nod their heads and respond, "Yes, but you can't ignore 240.4(F)." This simple change will remove the conflict between the two sections.

Panel Meeting Action: Reject

Panel Statement: 240.4(F) is the general rule covering transformer secondary conductor protection. 240.21(C) covers overcurrent protection location in the circuit dealing with the unique application for each set of conductors feeding separate loads.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

10-12 Log #1070 NEC-P10 **Final Action: Accept in Principle in Part**
(240.5(A) (New) and (B) (New))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Add new exception.

Exception: Where permitted elsewhere in this Code to be permanently connected as branch circuit or feeder conductors, extra hard usage flexible cords and flexible cables not in direct contact with equipment containing heat-producing elements shall be permitted to be protected in accordance with 240.4(A) and (B).

(B) BRANCH CIRCUIT OVERCURRENT DEVICE . Flexible cord and fixture wire shall be considered to be protected where supplied by a branch circuit in accordance with one of the methods described in 240.5(B)(1), (2), (3), or (4).

Substantiation: The provisions of 240.4(A), (B) and (G) do not apply to permanently connected flexible cords and cables since the first paragraph excludes them and 310.15 doesn't include them. Permanently connected cords and cables are permitted for motors, cranes and hoists, elevators, material handling magnets, floating buildings, marinas and boatyards. It appears the overcurrent protection permitted by (G) for motor conductors will commonly exceed conductor ampacity specified in Table 400.5(A) and (B) and this should be applicable for other permanently connected installations. Table 520.44 indicates ampacities for extra hard usage cords which exceed ampacities specified in Table 310.16. The proposal doesn't involve ampacities, per se, but seeks to relieve the restriction of overcurrent device requirements.

Panel Meeting Action: Accept in Principle in Part

In the proposed wording, the addition of "considered to be" and the exception are not accepted.

Panel Statement: The addition of "considered to be" is not accepted because 240.5(B)(1), (B)(2), (B)(3), and (B)(4) already contain qualifiers.

The exception is not accepted because the substantiation utilizes Article 520 as an example of needing relief. 90.3 establishes the Code arrangement, and Chapter 5 supplements or modifies Chapters 1 through 4. Therefore, no revision is necessary to provide relief in Article 240.

The addition of the words "fixture wire" is covered by the panel action on Proposal# 10-13.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

10-13 Log #1899 NEC-P10 **Final Action: Accept**
(240.5(B))

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: In 240.5(B), add commas after the word "protected" and after the word "circuit." Delete "(B)(2)" in the first sentence. Add a second sentence as follows:

"Fixture wire shall be protected, where supplied by a branch circuit, in accordance with 240.5(B)(2)."

The overall text in (B) to read as follows:

240.5 Protection of Flexible Cords, Flexible Cables, and Fixture Wires.

(B) Branch Circuit Overcurrent Device. Flexible cord shall be protected, where supplied by a branch circuit, in accordance with one of the methods described in 240.5(B)(1), ~~(B)(2)~~ , (B)(3), or (B)(4). Fixture wire shall be protected, where supplied by a branch circuit, in accordance with 240.5(B)(2).

No change to (B)(1) through (B)(4).

Substantiation: The commas were added to the existing text to provide clarity and to conform to normal punctuation rules.

The existing text in the introduction part of 240.5(B) in the 2005 NEC does not provide coverage for fixture wire, even though (B)(2) covers fixture wire. The deletion of (B)(2) in the first sentence and the addition of the second sentence as proposed will provide the proper coverage of fixture wire connected to the branch circuit. This added text will also provide the necessary tie-in to 210.19(A)(4), Exception No. 2 that permits conductors smaller than 14 AWG to be used for fixtures. In the 2005 NEC, 210.19(A)(4), Exception No. 2 sent the user to 240.5 for conductors smaller than No. 14 AWG but did not have the necessary text in 240.5(B) to permit fixture wire in the sizes provided in (B)(2). This proposed change clears up this inconsistency in the Code and provides a clear path to 240.5(B) for smaller conductors.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

10-14 Log #1751 NEC-P10 **Final Action: Accept in Principle**
(240.5(B)(1))

Submitter: David Belt, Underwriters Laboratores Inc.
Recommendation: Replace the term "portable lamp" with the term "portable luminaire". Revise text as follows:

240.5 Protection of Flexible Cords, Flexible Cables, and Fixture Wires

(B) Branch Circuit Overcurrent Device

(1) Supply Cord of Listed Appliance or Portable ~~Lamps~~ Luminaires . Where flexible cord or tinsel cord is approved for and used with a specific listed appliance or portable ~~lamp~~ luminaire , it shall be considered to be protected when applied within the appliance or portable ~~lamp~~ luminaire listing requirements.

Substantiation: The term "luminaire" has already been accepted in the Code as the correct terminology for a lighting system and replaces the terms "fixture" or "lighting fixture", which were terms for fixed lighting systems.

The term "portable luminaire" has been accepted by the IEC as the correct term for cord and plug connected lighting products and has also been adopted by UL in their ANSI/UL153 Safety Standard, which was previously titled "Portable Electric Lamps" and is now titled "Portable Electric Lunimaires".

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Proposal 10-15. The word "luminaire" has been used as part of the revised text in Proposal 10-15.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

10-15 Log #3336 NEC-P10 **Final Action: Accept in Principle**
(240.5(B)(1))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc. / Rep. Massachusetts Electrical Code Advisory Committee
Recommendation: Revise this paragraph to read as follows:

(1) Supply Cord of Listed Appliance or Luminaire (Fixture). Where flexible cord or tinsel cord is approved for and used with a specific listed appliance or luminaire (fixture), it shall be considered to be protected when applied within the appliance or luminaire (fixture) listing requirements.

Substantiation: This proposal addresses a direct conflict in the NEC. The current wording hinders the orderly application of 410.30(C)(1), since permanently installed luminaires are neither portable lamps nor appliances (as covered in the 2005 NEC), and they never come with 14 or 12 AWG cord supplies. CMP 10 rejected the terminology "utilization equipment" in the comment stage for the 2005 NEC, so as a compromise this proposal limits the application to luminaires (but without a portability restriction) and appliances. The existing (2005) NEC wording is an unintended result of editorial modifications to this section over the years. The 1981 and prior Codes allowed 20 amp. protection on 16 and 18 AWG power supply cords by right, for any load. The 1984 change to "specific listed appliance" was part of a wholesale rewrite of this section (Proposal 4-116), but there was no substantiation provided to restrict the character of load supplied; this restriction appears to be inadvertent. The focus of discussion was on the protection of extension cords and not in this part of the section.

During the 2005 NEC comment stage, CMP 10 stated there was no actual problem with 410.31(C)(1) since the cords in 410.30(C)(1) must be terminated in an attachment plug cap, and a cord- and plug-connected luminaire is inherently one of a portable nature, thereby qualifying under the existing wording of 410.5(B)(1).

Section 410.31(C)(1) allows for a cord-connected luminaire if the luminaire is directly below the outlet, and provided further that the luminaire meets three additional conditions:

It must visible over its entire length outside of the luminaire;

It must not be subject to abuse; and

It must meet one of four connection arrangements, to wit:

It can end in an attachment plug OR

It can end in a busway plug, OR

It can be part of a manufactured wiring system (new in the 2005 NEC), OR

It can be hard wired as part of a luminaire assembly with strain relief and canopy (this is the one in question).

These luminaires are quite common, particularly in higher-end offices and conference rooms. They are not supplied with fuses in their connection canopies. This provision (“d” above) originated in the 1993 NEC and covers permanently installed luminaires that are anything but “portable lamps.” This section [240.5(B)(1)] as now written mandates an unsubstantiated and significant redesign of luminaires developed in the context of 410.30(C)(1)(2)(c).

Panel Meeting Action: Accept in Principle

Add a new last sentence to the wording in the recommendation to read as follows:

“For the purposes of this section, a luminaire (lighting fixture) may be either portable or permanent.”

Panel Statement: The additional wording clarifies that both portable and permanent luminaires are covered in this section. This language will address the use of permanent luminaires where the listing includes the use of flexible cords.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

10-15a Log #3566 NEC-P10 **Final Action: Reject**

(240.14(A) & (B) (New))

Submitter: Edward A. Schiff, Technology Research Corp.

Recommendation: Add new text to read:

440.14 Leakage Current Detection and Interruption (LCDI) Protection.

(A) Definition. Leakage Current Detection and Interruption (LCDI) Protection. A device provided in a power supply cord or cord set that senses leakage current flowing between or from the cord conductors and interrupts the circuit at a predetermined level of leakage current.

(B) Leakage Current Detection and Interruption (LCDI). Indoor extension cord sets shall be provided with factory-installed LCDI protection. The LCDI protection shall be an integral part of the attachment plug or be located in the power supply cord within 300 mm (12 in.) of the attachment plug.

Substantiation: Extension Cord Fire Problem

Faulty or damaged cords or plugs caused an estimated 6,900 attended fires, 91 civilian deaths, 421 civilian injuries, and $115.9 million in direct property damage per year in US homes between 1994 and 1998 according to The US Home Product Report , published January, 2002 by the NFPA. The leading cause of cord and plug fires was short circuits and ground faults (52.3% of fires and 39.2% of deaths). Other electrical failure and overloads account for the majority of the balance.

Electrical cord fires are a leading cause of residential fires in the United States. During the five year period from 1994 to 1998, there were 27,400 cord fires attended by the fire service according to the 1998 Residential Fire Loss Estimates published by the U.S. Consumer Product Safety Commission (CPSC) in 2002. These fires resulted in 350 deaths and 1,680 injuries. Extension cords were responsible for over half of these incidents.

The extension cord fire problem is getting worse. 2002 has been another terrible year for extension cord fires. In January alone, there were seven different fatal extension cord fires in US residences. Additionally, two catastrophic fires have occurred that summer.

1. On August 3, 2002 an overloaded extension cord caused the fire that killed six children (ages 10, 4, 3, 2 and eight month old twins) in Baton Route, LA.

2. On June 11, 2002, an overloaded extension cord melted and set the couch on fire in Silver City, NC killing six family members. The 33 year old mother, daughter 6, two stepsons age 10 and 13, 48 year-old brother, and the children’s 41 year-old aunt died of smoke inhalation. The father and their 2 year-old daughter escaped by braking out a rear window.

These two fires accounted for 12 deaths, nine of which were children. The table entitled, “Fire Event Summary Report”, highlights the severity of the problem.

Causes of Extension Cord Fires.

Extension cord fires have been and continue to be a major problem. There are many causes of cord fires including overload, overheating, pinching, crimping, crushing, customer misuse, fraying, and aging of the cord. These problems can cause combustion on their own or in conjunction with one another.

Extension cords are easily overloaded by exceeding the typical 13 Amp rating of the cord with multiple loads. Circuit breakers are designed to protect the fixed wiring in a dwelling. Their continuous current rating is typically 15A or 20A. A breaker allows an overload to exist for a period of time depending on its inverse-time trip curve; therefore, they do not provide overload protection for cords. Overloading damages the insulation from the inside (next to the conductor) to the outside of the cord.

Extension cords are frequently overheated. Consumers often run them under carpet or leave them coiled for ascetic reasons. Combustibles such as clothes or newspapers are put onto the cords. These scenarios prevent proper cooling and will overheat the cord. As with the overload condition, the insulation is damaged from the inside out. This damage is irreversible and may not be visible to inspection.

Extension cords can be mechanically damaged. They are frequently pinched or cramped by furniture and doorways. This will result in broken conductors within the cord and can cut or scrape the insulation. Cords may also be crushed by pedestrian traffic or by heavy items (furniture being placed on top of the cord). This damage is also irreversible and not visible to inspection.

Customer misuse comes in a variety of fashions including leaving the cord in pedestrian traffic, stapling of the cord to baseboards, using the cord as a permanent extension of premises wiring, and using the cord around pets or infants who chew cords. This misuse can result in fires caused by broken conductors and degraded insulation.

Finally, extension cords wear out in time resulting in cracked insulation and fraying of the conductors. Unlike the proposed LCDI cords, they will continue to pass current even though they present a major fire, injury and loss of life risk.

This damage described above results in insulation degradation and breaking of the current carrying conductors. The damage is irreversible and may not be visible to inspection. Circuit breakers and fuses are not sensitive enough to detect this damage before combustion can occur. Even the arc fault breakers (AFCIs) require a significant arc over a period of time which may be a fire in progress before detection. AFCIs are only being required on certain branch circuits in new homes, when the majority of electrical fires occur in older homes that do not have this limited protection.

Extension cords are used in high risk applications. Some of the common characteristics of these applications include unattended operation, high current loads, operation while people are sleeping and used around children and elderly people.

There are two primary types of cord faults. Series faults (the fault is in series with the load) are partially or completely severed conductors within the cord set. A parallel fault, either line to neutral or a ground fault is typically caused by degraded insulation. Both of these faults will lead to tracking within the cord set, leakage current, arcing and then combustion.

Over the past two decades, efforts have been made to reduce the number of extension cord fires including increased conductor size, improved labeling, improved materials and education. These efforts have reduced the annual number of extension cord fires by 35 percent since 1980. However, data for the most current years (1996 to 1998) demonstrates a plateau in number of extension cord fires (the same is true for other electrical cords). The fires cited in the table indicate the actual number of fatalities for 2002 will show a significant increase. LCDI protected cords provide the ability to eliminate extension cord fires.

LCDI protected cord sets sense leakage current flowing from or between conductors. Leakage current is the precursor to an arcing fault. This technology employs a ground fault sensing circuit as the disconnecting means so it also will prevent ground fault fires beyond the power supply cord and provide shock protection for the cord. Over the past six years, millions of LCDI protected cords have been field proven on extension cords, power strips, space heaters, and other appliance cords.

An additional benefit to this technology is preventing electrocutions and serious injury from electrical shock. According to the 1998 Electrocutions Associated with Consumer Products , published by the U.S. Consumer Product Safety Commission in July, 2001 there were 12 electrocutions caused by extension cords in 1998. Since the LCDI utilizes a ground fault sensing circuit as the disconnect means, these deaths would also be prevented.

Economic Impact

This improvement in safety will have a positive economic impact on society. The current retail price of an eight foot 120V/13A two wire LCDI protected extension cord is under $9.00. TRC anticipates the retail price will be under $5.00 for this product in large scale production. Unprotected indoor extension cords currently sell for between $1.00 and $7.00 dependent on length, gauge, number of conductors and receptacle type. The added cost borne by the consumer will be minimal.

In 1998, the property damage from the 2,800 attended extension cord fires was $57.5 million. These fires resulted in 170 serious injuries. The costs associated with the medical treatments, lost work expense, quality of life and pain and suffering, and product liability from these injuries will likely exceed the property damage. The reduction in fire fighting expenses associated with the 2,800 fires per year will also be in the millions. The rough estimate of well over $100,00,000.00 in annual costs caused by these fires will offset the majority of the added cost of the cords.

It is difficult to put a price tag on the loss of life. The fact that the most of the victims are children, makes this cost to society even greater. 40 people each year die from extension cord fires. An additional 12 lives are lost from electrocution. The ground fault protection provided down stream of the extension cord will prevent additional fires electrocutions, and the related costs of property damage and injuries.

Incorporation into the NEC

There are many precedents for incorporation of this requirement in the code. 440.63 requires either AFCI or LCDI protected cord sets for room air conditioners. Ground fault protection on the cord sets for pressure washers and portable hot tubs are long standing NEC requirements. Immersion protection for hair dryers has been part of the code for years.

The NEC code panels provides the only complete representation of the electrical community. This includes standards organizations, industry trade associations, insurance industry, electrical inspectors, contractors, and electricians. Safety is the primary reason for the code and clearly this is a critical safety issue.

Conclusion

Today's indoor extension cords are cheap. The U.S. Consumer Product Safety Commission (CPSC) recalls hundreds of thousands of extension cords every year. Undersized conductors and fake UL markings are common reasons. Raising the bar on performance to an LCDI protected cord set should reduce the likelihood of recalls.

A serious safety problem continues to exist. A proven, cost effective solution exists. There are many precedents for incorporation of this safety improvement into the NEC including the new requirement for AFCI or LCDI protected cord fires, injuries and reduce property damage and have a positive economic impact on society. Most importantly, adoption of this proposal will save lives!

This proposal was referred by Panel 6 to Article 240 and Article 210 during the last code cycle. None of the panels felt it was in their domain (the opinion of those panels was this is not an overcurrent device nor part of the branch circuit). From the work on the task force, Panel 17 is uniquely aware of the problem and the solution. The submitter respectfully requests that the panel take action on this proposal.

Panel Meeting Action: Reject

Panel Statement: 240.5(B)(3) was introduced during the 2005 Code cycle. This section states that extension cord sets are considered to be protected when applied within the extension cord listing requirements. These listing requirements are developed by a technical panel which includes representation from many areas of industry such as third-party testing and listing organizations, cord manufacturers, inspectors and others. Code-Making Panel 10 fully expects the technical committee of the product standard to address any safety issues associated within the listing requirements of the cord and that a construction requirement is not necessary in the NEC. See the panel Statement on Comment 10-20 in the 2005 Code cycle. It is also noted that numerous concerns that are discussed in the submitter's substantiation could be addressed by several different technologies.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

10-16 Log #2938 NEC-P10 **Final Action: Accept**
(240.15 (New))

TCC Action: The Technical Correlating Committee understands that the panel action on 10-16 moves the text from 240.20 and that 240.20 is deleted from the Code.

Submitter: Philip Simmons, Simmons Electrical Services

Recommendation: Create new 240.15 in Part I of Article 240 to include the text presently in 240.20.

Substantiation: CMP-10 made improvements to the text of 240.20 during the processing of the 2005 NEC. However, the rules in the section are still located in the wrong part of Article 240.

Part II of Article 240 has a title of "Location." Existing 240.20 contains rules on when and how overcurrent protection is required for ungrounded conductors, using circuit breakers as an overcurrent device and overcurrent protection for closed-loop power distribution systems. None of these rules apply to the "Location" of the overcurrent protection.

These rules located in existing 240.20 do not seem to apply to the *location* of the circuit breaker but with the *operation* of the breaker. Thus, it seems more appropriate for the requirements to be located in Part I General, rather than in Part II Location, of Article 240.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

10-17 Log #3166 NEC-P10 **Final Action: Reject**
(240.20(B)(1))

Submitter: Wally Harris, Atlantic Inland Inspections

Recommendation: Delete text as indicated by strikethrough text as follows:

Multiwire Branch Circuit. Except where limited by 210.4(B), individual single-pole circuit breakers, with ~~or without~~ approved handle ties, shall be permitted as the protection for each ungrounded conductor of multiwire branch circuits that serve only single-phase line-to-neutral loads.

Substantiation: In reality 210.4(B) limits nothing relative to this Section. This proposal will help to maintain safety by removing a loophole that allows a dangerous practice of allowing two single pole breakers to be used without a handle tie.

Panel Meeting Action: Reject

Panel Statement: The submitter states that this proposal will address a safety issue; however, the submitter has not provided any substantiation describing the nature of the hazard. This section addresses automatic opening of the overcurrent device; and a handle tie does not establish a common trip mechanism.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

FREDERICKS, C.: I'm voting against the panel action. Multi-wire branch circuits are today widely considered a safety hazard during maintenance, due to energization of the neutral conductor that can occur when not all hot poles are switched off and the neutral is opened. Acceptance of the proposal would serve to minimize this safety hazard.

10-18 Log #1565 NEC-P10 **Final Action: Accept in Principle**
(240.20(B)(3))

TCC Action: The Technical Correlating Committee directs that the action on this proposal be sent to the Technical Correlating Committee Task Group on the definition of "Neutral Conductor" for review and comment.

Submitter: Technical Correlating Committee on National Electrical Code®,

Recommendation: Make the following change in 240.20(B)(3):

Change "neutral" to "neutral conductor."

The revised text would appear as follows:

(3) 3-Phase and 2-Phase Systems. For line-to-line loads in 4-wire, 3-phase systems or 5-wire, 2-phase systems having a grounded neutral <u>conductor</u> and no conductor operating at a voltage greater than permitted in 210.6, individual single-pole circuit breakers with identified handle ties shall be permitted as the protection for each ungrounded conductor.

Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).

The Task Group has proposed the following definitions to be added to Article 100:

- **Neutral conductor.** A circuit conductor connected to the neutral point of a system.
- **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.

This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals

- The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.
- The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.

Additional information is available in the Task Group report.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle

Revise the wording in the recommendation to read as follows:

"(3) 3-Phase and 2-Phase Systems. For line-to-line loads in 4-wire, 3-phase systems or 5-wire, 2-phase systems having a grounded neutral point and no conductor operating at a voltage greater than permitted in 210.6, individual single-pole circuit breakers with identified handle ties shall be permitted as the protection for each ungrounded conductor."

Panel Statement: The word "conductor" has been changed to "point" because a neutral conductor is not required on line-to-line loads.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

10-18a Log #3669 NEC-P10 **Final Action: Accept**
(240.21)

Submitter: James T. Dollard, Jr., IBEW Local 98
Recommendation: Revise as follows:
240.21 Location in Circuit
Overcurrent protection shall be provided in each ungrounded circuit conductor and shall be located at the point where the conductors receive their supply except as specified in 240.21(A) through (G). ~~No~~ ~~c~~ C onductor s supplied under the provisions of 240.21(A) through (G) shall not supply another conductor ~~under those provisions~~ , except through an overcurrent protective device meeting the requirements of 240.4.
Substantiation: The intent of this proposal is editorial in nature and is an attempt to provide clarity in the application of the last sentence of the mother text in 240.21. This requirement prevents an installer from “tapping a tap.”
The present text can be confusing to the user of this code.
The present text is modified in this proposal to provide clarity and usability.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-19 Log #870 NEC-P10 **Final Action: Accept**
(240.21(A))

Submitter: Charles Beck, Seattle, WA
Recommendation: Revise as follows:
“...to have overcurrent protection ~~located~~ as specified in ~~that section~~ 210.20 .
Substantiation: This corrects an invalid reference. 210.19 does not address overcurrent protection, and neither 210.19 nor 210.20 addresses “location” of OCPD.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-20 Log #133 NEC-P10 **Final Action: Reject**
(240.21(B) Exception (New))

Submitter: Gary Schilling, CACI Genesis Team
Recommendation: Add an exception to 240.21(B) “Feeder Taps”.
Tapping without overcurrent protection device(s) is permitted for surge devices provided all the following conditions apply:
• The surge device includes some form of fault protection (such as transient fuses, time delay fuses or appropriately thin conductor intended to act as fault protection) and
• The conductors to the device are rated at least ten times the fault ampacity of the fault protection incorporated within the surge device and
• The connecting leads to the surge device are not more than 1.5 meters (5 ft) in length and
• The lead ends, within the surge device, are mechanically supported or electrically braced and
• The feeder taps are of a mechanical nature (not depending solely on soft solder) and
• The connecting leads are protected by metallic wire-way or the surge device is installed within a metallic enclosure where the taps are made.
FPN: The purpose of a surge device is to dissipate transient energy (reducing the probability of fire, structure or equipment damage and reducing sock hazard to personnel). The effectiveness of the protection is reduced by additional electrical lead length (actual length, lead bends, changes in lead routing, changes in lead characteristics, additional devices, splices, etc.)
Substantiation: Editing of the above verbiage is permitted and expected. This proposal is intended to allow (and encourage) surge device installation with resulting maximum transient protection consistent with minimum safety risk. It should also encourage the incorporation of integral panel and/or disconnect surge device(s).
The additional condition is specifically to allow the most effective installation of Transient Voltage Surge Suppression (TVSS) and/or Surge Protection Device (SPD), collectively, surge devices (SD).
Panel Meeting Action: Reject
Panel Statement: Article 285, which covers transient voltage surge protection devices, has a requirement that they be protected by an overcurrent device. The UL 1449 product standard also establishes a marking requirement for the appropriate overcurrent device ahead of the TVSS. Section 240.21(B) can be applied to the installation of surge protection devices.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-7a Log #CP901 NEC-P09 **Final Action: Accept**
(240.21(B)(1), FPN)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 10 for action. This action will be considered by Code-Making Panel 10 as a public comment.
Submitter: Code-Making Panel 9,
Recommendation: Revise 240.21(B)(1) FPN to read as follows:
FPN: For overcurrent protection requirements for panelboards, see 408.36.
Substantiation: CMP-9 has removed the categories of “lighting and appliance branch circuit panelboard” and “power panelboard” from Article 408 by virtue of its action on Proposal 9-117. This proposal correlates the reference in this fine print note with that action.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

10-21 Log #2877 NEC-P10 **Final Action: Accept in Principle**
(240.21(B)(2)(1))

Submitter: Robert Padgham, Jacksonville, FL
Recommendation: Revise 240.21(B)(2)(1) as follows and add Table 240.21(B)(2)(1).
(1) The ampacity of the tap conductors is not less than one-third of the rating of the overcurrent device protecting the feeder conductors, or the tap conductors are protected in accordance with Table 240.21(B)(2)(1) by the overcurrent device protecting the feeder conductors.
Table 240.21(B)(2)(1) Tap Conductor Short-Circuit Current Ratings. Tap conductors are considered to be protected under short-circuit conditons when their short-circuit temperature llimit is not exceeded. Conductor heating under short-circuit conditions is determined by (1) or (2):
(1) Short-Circuit Formula for Copper Conductors
$(I^2/A^2)\,t = 0.0297 \log_{10} ((T_2 + 234)(T_1 + 234))$
(2) Short-Circuit Formula for Aluminum Conductors
$(I^2/A^2)\,t = 0.0125 \log_{10} ((T_2 + 228)/(T_1 + 228))$
where
I = short-circuit current in amperes
A = conductor area in circular mils
t = time of short-circuit in seconds (for times less than or equal to 10 seconds)
T_1 = initial conductor temperature in degrees Celsius.
T_2 = final conductor temperature in degrees Celsius.
Copper conductor with paper, rubber, varnished cloth insulation $T_2 = 200$
Copper conductor with thermoplastic insulation $T_2 = 150$
Copper conductor wiht crosslinked polyethylene insulation $T_2 = 250$
Copper conductor with ethylene propylene rubber insulation $T_2 = 250$
Aluminum conductor with paper, rubber, varnished cloth insulation $T_2 = 200$
Aluminum conductor with thermoplastic insulation $T_2 = 150$
Aluminum conductor with crosslinked polyethylene insulation $T_2 = 250$
Aluminum conductor with ethylene propylene rubber insulation $T_2 = 250$

Substantiation: North American industry is in a daily struggle to compete with global competitors. As such, we need every possible chance to reduce costs, but with safety as the number one directive. That is the intent of this proposal.
The existing NEC requirements for these feeder taps dictate that the ampacity of the secondary tap conductors be at least 1/3 of the overcurrent device protecting the feeder conductor multiplied by the primary-to-secondary voltage ratio. At first, this sizing seems reasonable when considering that the feeder circuit device is being asked to provide short-circuit protection for the smaller tap conductors. But, this is often extremely conservative and frequently results in a conductor sized much larger than is actually required according to the laws of physics. By using formulas that have been widely utilized by IEEE, the Canadian Electrical Code, and the IEC, much smaller conductors can be installed. This will provide significant cost savings for electrical distribution systems, allowing North American manufacturers to be more competitive in the global marketplace.
An example would be helpful. Assume a feeder conductor is a 3/0 with an ampacity of 200 amperes, and protected with a 200 ampere overcurrent protective device. Also assume a one-to-one voltage ratio for simplicity. According to the 2005 NEC, the smallest 25 foot secondary tap conductor would be a 4 AWG with an ampacity of 85 amperes, even if it were only supplying a 10 ampere load. (Three times the ampacity of a 6 AWG, with an ampacity of 65 only gives 195 amperes, which doesn’t meet the 200 ampere requirement.) According to the physics formula, and UL standards, a 200 ampere Class J fuse will protect a 10 AWG conductor for faults up to 200,000 amperes. (Maximum I^2t let-through of a 200 ampere Class J fuse at 600 volts with 200,000 amperes available is 300×10^3 ampere squared seconds, while

the short-circuit withstand of a 10AWG copper conductor is 303 x 10 3 ampere squared seconds.) As we can imagine the cost savings here will be substantial, and within the safety umbrella of internationally accepted standard physics formulas.

The physics formulas submitted with this proposal are the accepted basis for conductor short-circuit temperatures throughout the world. They are found in the ANSI/IEEE Red, Gray, Buff, and Blue Books and in the Canadian Electrical Code. Similar versions of these formulas are found in IEC60204-1 (IEC Machinery Standard), SAE HS-1738 (Automotive Industry Machinery Standard), and IEC 60364-4-43 (IEC Installation Standard).

Let's give North American industry every possible (safe) option to be competitive in the global market by accepting this proposal.

Panel Meeting Action: Accept in Principle

Insert the text shown below in quotations as 240.92(B) and renumber existing 240.92(B), (C), and (D) as 240.92(C), (D), and (E).

Renumber the proposed Table 240.21(B)(2)(1) as Table 240.92(B).

"(B) Feeder Taps. For feeder taps specified in 240.21(B)(2), (B)(3), and (B)(4), the tap conductors shall be permitted to be sized in accordance with Table 240.92(B)."

Insert the renumbered Table 240.92(B) after the above paragraph.

Panel Statement: The panel action will increase the enforceability needed by the inspection community and limit the application to supervised industrial installations.

This action recognizes the performance of the overcurrent device as a factor in determining the tap conductor size.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

KIMBLIN, C.: NEMA does not support the panel meeting action. The proposed changes to the tap rules, even for supervised industrial installations, could reduce electrical safety. The proposed tap rules require an in-depth knowledge of the overcurrent device characteristics. In particular, this information is required not only during initial system installation, but throughout the maintenance life of the system to ensure replacement by an identical device.

10-22 Log #2882 NEC-P10 **Final Action: Accept in Principle**
(240.21(B)(3) (New) & Table 240.21(B)(3))

Submitter: Robert Padgham, Jacksonville, FL

Recommendation: Revise 240.21(B)(3) as follows and add Table 240.21(B)(3).

(1) The conductors supplying the primary of a transformer have an ampacity at least one-third the rating of the overcurrent device protecting the feeder conductors, or the tap conductors are protected in accordance with Table 240.21(B)(3) by the overcurrent device protecting the feeder conductors.

(2) The conductors supplied by the secondary of the transformer shall have an ampacity that is not less than the value of the primary-to-secondary voltage ratio multiplied by one-third of the rating of the overcurrent device protecting the feeder conductors, or the secondary tap conductors are protected in accordance with Table 240.21(B)(3) by the overcurrent device protecting the feeder conductors.

((3), (4), and (5) are to remain the same).

Table 240.21(B)(3) Tap Conductor Short-Circuit Current Ratings. Tap conductors are considered to be protected under short-circuit conditons when their short-circuit temperature llimit is not exceeded. Conductor heating under short-circuit conditions is determined by (1) or (2):

(1) Short-Circuit Formula for Copper Conductors

$(I^2/A^2)\,t = 0.0297 \log_{10}((T_2 + 234)/(T_1 + 234))$

(2) Short-Circuit Formula for Aluminum Conductors

Explanation of Negative:

KIMBLIN, C.: NEMA votes against the panel action. See the explanation of the negative vote on Proposal 10-21.

10-24 Log #1987 NEC-P10 **Final Action: Reject**
(240.21(B)(5))

Submitter: Neil F. LaBrake, Jr., Niagara Mohawk, a National Grid Company / Rep. Edison Electric Institute-Electric Light & Power Group

Recommendation: Revise as follows:

(5) Outside Taps of Unlimited Length. Where the conductors are located outdoors of a building or structure, except at the point of load termination, and comply with all of the following conditions:

(1) The conductors are protected from physical damage in an approved manner.

~~(2) The conductors terminate at a single circuit breaker or a single set of fuses that limit the load to the ampacity of the conductors. This single overcurrent device shall be permitted to supply any number of additional overcurrent devices on its load side.~~

(2) The sum of the overcurrent devices at the conductor termination limits the load to the conductor ampacity. The overcurrent devices shall consist of not more than six circuit breakers or sets of fuses, mounted in a single enclosure, in a group of separate enclosures, or in or on a switchboard. There shall be no more than six overcurrent devices grouped in any one location. Individual conductors terminating in overcurrent devices of separate enclosures shall be permitted to be supplied from the outside tap conductors.

~~(3) The overcurrent device for the conductors is an integral part of a disconnecting means or shall be located immediately adjacent thereto.~~

(3) The tap conductors are installed outdoors of a building or structure except at the point of load termination.

(4) The overcurrent device(s) for the conductors is an integral part of a disconnecting means or shall be located immediately adjacent thereto.

~~(4)~~ (5) The disconnecting means for the conductors is installed at a readily accessible location complying with one of the following:

a. Outside of a building or structure

b. Inside, nearest the point of entrance of the conductors

c. Where installed in accordance with 230.6, nearest the point of entrance of the conductors

Substantiation: Article 225 recognizes buildings served by a feeder. Part II of Article 225 specifies the required disconnecting means for the building or structure. Whether a building is supplied by a service per Article 230 or a feeder per Article 225, the conductors are protected from overload if such protection complies with 230.90. There is no technical justification to treat the building feeder conductor overcurrent protection differently than that required for service conductors in 230.90. Both must be sized to carry the computed load. This is particularly true recognizing that the feeder conductors have short circuit protection on their supply side. For example, when the ownership of the feeder supply conductors change due to a relocation of the service point as frequently occurs, present 240.21(B)(5) in many instances would require the unnecessary installation of a single main overcurrent device to protect the same tap conductors that are adequately protected by conformance with the requirements of 230.90. Section 225.33 permits the supply feeder to terminate in up to six disconnect switches. This proposal resolves the apparent conflict between the requirements of 225.33 and 240.21(B)(5).

Panel Meeting Action: Reject

Panel Statement: The submitter's substantiation confuses two distinct issues:

1) a feeder to a facility, and

2) a feeder tap conductor.

Six disconnects are permitted for the facility disconnect in 225.33 where the conductors are fully protected on the line side. The six disconnect ensures the facility can be isolated with a reasonable number of throws of the hand as determined by Code-Making Panel 4. The restriction placed on the installation in 240.21(B)(5) is to ensure protection of the feeder conductors of unlimited length where no overload protection has been provided on the line side of those feeders. A single overload protective device is necessary to ensure overload protection of this tap. Here, it is noted that supervised industrial installations may indeed terminate in six devices. Here, there is more facility-control, including changes associated with plant expansion and change of ownership.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 9 Negative: 3

Explanation of Negative:

DARLING, D.: Outside taps of unlimited length should be allowed for existing installations with more than one, but less than six, service disconnects where a property owner purchases installed equipment such as a utility pad-mounted transformer and service laterals from the utility company. All other requirements of the proposal would also have to be met. Even though this system has safely operated for years, it is not NEC code compliant now that the classification of the conductors from the transformer to the service equipment have changed from service laterals to an outside tap of unlimited length. Since this proposal was rejected, a comment should be prepared that would address this concern by adding an exception for existing installations.

ELDRIDGE, C.: Addressing the panel statement, there is no confusion by the submitter. The submitter is fully aware of the difference between a feeder to a facility and an outside feeder tap of unlimited length. The panel is ignoring the fact that this has been done for years with no problems by various suppliers of electricity across the country.

The problem occurs when a supplier sells its facilities to a customer and installs a primary meter. The installation that has been safe for numerous years is now in violation of the tap rules and declaired unsafe. A change in ownership associated with the sale of a suppler's installation to a customer would not change the safety of the former service conductors, now classified as tap conductors. Tap feeder conductors are sized to carry the load and protected at their load end, the same as all taps. Short circuit and ground fault protection is provided at the source of the feeder. The tap conductors would be protected better if the overcurrent protection were in multiple overcurrent devices instead of a single overcurrent device because of the diversity. Overload, short circuit or a ground fault on the load side of the smaller overcurrent device would have lesser effect on the tap conductors than if it were on the load side of a single, larger overcurrent device. The panel statement does not respond to these facts in its assertion that a single overcurrent device is necessary.

FREDERICKS, C.: I'm voting against the panel action. This issue has been raised before, as previously noted, we should consider that up to six disconnects are presently allowed for feeders in Article 225, and for transformer secondary protection in Article 450. Accepting this proposal and Proposal 10-61 would allow correlation with those articles, at no loss in the quality of overcurrent protection. I do not agree that a single overcurrent device is required to limit the load at the end of the tap conductors. In fact, this same effect can also be accomplished with up to six grouped overcurrent devices, in some cases in an improved manner.

There are pros and cons to the installation of either single or multiple overcurrent devices at the end of a feeder, but I believe it is incorrect to claim that one or the other is always best for overcurrent protection, or for personnel safety or for any other purpose. This panel action continues a lack of correlation with Articles 225 and 450.

10-25 Log #3212 NEC-P10 **Final Action: Reject**
(240.21(B)(5))

Submitter: H. Dean Schumacher, H. Dean Schumacher Electrical Inspections
Recommendation: Delete 240.21(B)(5).
Substantiation: 240.21 location of overcurrent requirement and related justification is not diminished due to compliance with 240.21(B)(5) requirements (1) through (4). Overcurrent protection is a vital system component that demands dutiful consideration to ensure personnel and equipment safety.
Panel Meeting Action: Reject
Panel Statement: The panel agrees with the submitter that overcurrent protection is a vital component of the electrical system; however, there has been no substantiation presented that would indicate the present requirement in the NEC is inadequate.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-26 Log #2939 NEC-P10 **Final Action: Accept in Principle**
(240.21(C))

Submitter: Philip Simmons, Simmons Electrical Services
Recommendation: Revise the existing section as follows:

(C) Transformer Secondary Conductors. One or more ~~Each~~ set (s) of conductors ~~feeding separate loads~~ shall be permitted to be connected to a transformer secondary, without overcurrent protection at the secondary, as specified in 240.21(C)(1) through (6). The provisions of 240.4(B) shall not be permitted for transformer secondary conductors.

Retain the existing FPN.

Substantiation: The efforts made by CMP-10 to clarify this section for the 2005 NEC are appreciated. However, it appears the first sentence can be improved upon for clarity. When read literally, sets of conductors are required to feed separate loads, not the same load. We know that more than one set of conductors often supply the same load when installed as parallel sets of conductors.

It seems the changes made by CMP-10 were intended to clarify that more than one set of conductors are permitted to be connected to a transformer secondary so long as the provisions of (C)(1) through (C)(6) are complied with. Hopefully, the above changes will maintain the concept of multiple connections being permitted while not requiring the sets of conductors to supply different loads.

Panel Meeting Action: Accept in Principle

Revise the text in the proposal as follows:

"(C) Transformer Secondary Conductors. A set of conductors feeding a single load, or each set of conductors feeding separate loads, shall be permitted...".

Panel Statement: The panel has added wording to clarify that more than one set of conductors often supply the same load when installed as parallel sets of conductors. The panel does not agree with removal of the reference to separate loads. The intent of the 2005 Code change was to clarify that these secondary conductor rules are not limited in their application to one set per transformer.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-7b Log #CP902 NEC-P09 **Final Action: Accept**
(240.21(C)(2), FPN)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 10 for action. This action will be considered by Code-Making Panel 10 as a public comment.
Submitter: Code-Making Panel 9,
Recommendation: Revise 240.21(C)(2) FPN. to read as follows:

FPN: For overcurrent protection requirements for panelboards, see 408.36.

Substantiation: CMP-9 has removed the categories of "lighting and appliance branch circuit panelboard" and "power panelboard" from Article 408 by virtue of its action on Proposal 9-117. This proposal correlates the reference in this fine print note with that action.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

10-27 Log #3387 NEC-P10 **Final Action: Accept**
(240.21(C)(2)(1)(c))

TCC Action: The Technical Correlating Committee directs that the Code-Making Panel clarify the Panel Action on this Proposal with respect to the location of the added text. This action will be considered by the Panel as a Public Comment.
Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Insert the following clause at the beginning of the list item:

"For field installations where the secondary conductors leave the enclosure or vault in which the supply connection is made,"

Substantiation: This language correlates this new provision with the conventional ten-foot tap rule that inspired it. This submitter was directly involved in the creation of this language in 210.21(B)(1)(4), where it now resides. If this correlation does not happen, there will be unintended and unsubstantiated design effects on unit substations and comparable gear. Suppose, for example, a unit substation with a 2000 ampere secondary is installed, with five sets of 600 kcmil secondary conductors between the transformer and the disconnecting means for the separately derived system. Suppose the ampacity (2100 amperes) reflects the transformer winding ratio, as it must. According to the literal text of the 2005 NEC, conductors on the secondary side of this transformer, and connected directly thereto, must not be smaller than about 3/0 copper. This is problematic for instrumentation supplied with the gear. In addition, if the installation is located within a vault, there is little likelihood of a problem in such short conductors affecting the building as a whole. It was for these reasons that the allowances were inserted in the rules for conventional ten-foot taps (in the 1993 NEC), and they apply equally now that parallel rules are being applied to transformer secondaries.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-3a Log #CP1000 NEC-P10 **Final Action: Accept**
(240.21(C)(3)1.)

Submitter: Code-Making Panel 10,
Recommendation: Add a new (1) to existing 240.21(C)(3) and renumber accordingly, to read as follows:

(1) Conditions of maintenance and supervision ensure that only qualified persons service the systems.
(2) The ampacity of the secondary conductors is not less than the secondary current rating of the transformer, and the sum of the ratings of the overcurrent devices does not exceed the ampacity of the secondary conductors.
(3) All overcurrent devices are grouped.
(4) The secondary conductors are protected from physical damage by being enclosed in an approved raceway or by other approved means.

Substantiation: Section 240.21(C)(3) makes reference to industrial installations. The proposed wording clarifies the requirements for an industrial installation in 240.21(C)(3). A definition based on the lower levels of transformer size, etc. is unnecessary.This panel proposal meets the proposer's intent for Proposals 10-4, 10-5, and 10-7.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-28 Log #1988 NEC-P10 **Final Action: Reject**
(240.21(C)(4))

Submitter: Neil F. LaBrake, Jr., Niagara Mohawk, a National Grid Company / Rep. Edison Electric Institute-Electric Light & Power Group
Recommendation: Revise as follows:

(4) Outside Secondary Conductors Where the conductors are located outdoors of a building or structure, except at the point of load termination, and comply with all of the following conditions:
(1) The conductors are protected from physical damage in an approved manner.
~~(2) The conductors terminate at a single circuit breaker or a single set of fuses that limit the load to the ampacity of the conductors. This single overcurrent device shall be permitted to supply any number of additional overcurrent devices on its load side.~~
(2) The sum of the overcurrent devices at the conductor termination limits the load to the conductor ampacity. The overcurrent devices shall consist of not more than six circuit breakers or sets of fuses, mounted in a single enclosure, in a group of separate enclosures, or in or on a switchboard. There shall be no more than six overcurrent devices grouped in any one location. Individual conductors terminating in overcurrent devices of separate enclosures shall be permitted to be supplied from the outside secondary conductors.

~~(3) The overcurrent device for the conductors is an integral part of a disconnecting means or shall be located immediately adjacent thereto.~~

(3) The tap conductors are installed outdoors of a building or structure except at the point of load termination.

(4) The overcurrent device(s) for the conductors is an integral part of a disconnecting means or shall be located immediately adjacent thereto.

~~(4)~~ (5) The disconnecting means for the conductors is installed at a readily accessible location complying with one of the following:

a. Outside of a building or structure

b. Inside, nearest the point of entrance of the conductors

c. Where installed in accordance with 230.6, nearest the point of entrance of the conductors

Substantiation: Article 225 recognizes buildings served by a feeder. Part II of Article 225 specifies the required disconnecting means for the building or structure. Whether a building is supplied by a service per Article 230 or a feeder per Article 225, the conductors are protected from overload if such protection complies with 230.90. There is no technical justification to treat the building feeder conductor overcurrent protection differently than that required for service conductors in 230.90. Both must be sized to carry the computed load. This is particularly true recognizing that the feeder conductors have short circuit protection on their supply side. For example, when the ownership of the feeder supply conductors change due to a relocation of the service point as frequently occurs, present 240.21(B)(5) in many instances would require the unnecessary installation of a single main overcurrent device to protect the same tap conductors that are adequately protected by conformance with the requirements of 230.90. Section 225.33 permits the supply feeder to terminate in up to six disconnect switches. This proposal resolves the apparent conflict between the requirements of 225.33 and 240.21(B)(5).

Panel Meeting Action: Reject

Panel Statement: The submitter's substantiation confuses two distinct issues:

1) a feeder to a facility, and

2) a feeder tap conductor. Six disconnects are permitted for the facility disconnect in 225.33 where the conductors are fully protected on the line side. The six disconnect's ensure the facility can be isolated with a reasonable number of throws of the hand as determined by Code-Making Panel 4. The restriction placed on the installation in 240.21(C)(4) is to ensure protection of the feeder conductors where no overload protection has been provided on the line side of those feeders. This action reiterates the panel's position that a single overload protective device is necessary to ensure overload protection of this tap. With respect to the equipment, changes associated with a change of ownership, this change is also associated with a change of safety-responsibility.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 9 Negative: 3

Explanation of Negative:

DARLING, D.: Outside taps of unlimited length should be allowed for existing installations with more than one, but less than six, service disconnects where a property owner purchases installed equipment such as a utility pad-mounted transformer and service laterals from the utility company. All other requirements of the proposal would also have to be met. Even though this system has safely operated for years, it is not NEC code compliant now that the classification of the conductors from the transformer to the service equipment have changed from service laterals to an outside tap of unlimited length. Since this proposal was rejected, a comment should be prepared that would address this concern by adding an exception for existing installations.

ELDRIDGE, C.: Addressing the panel statement, there is no confusion by the submitter. The submitter is fully aware of the difference between a feeder to a facility and an outside feeder tap of unlimited length. The panel is ignoring the fact that this has been done for years with no problems by various suppliers of electricity across the country.

The problem occurs when a supplier sells its facilities to a customer and installs a primary meter. The installation that has been safe for numerous years is now in violation of the tap rules and declaired unsafe. A change in ownership associated with the sale of a suppler's installation to a customer would not change the safety of the former service conductors, now classified as tap conductors. Tap feeder conductors are sized to carry the load and protected at their load end, the same as all taps. Short circuit and ground fault protection is provided at the source of the feeder. The tap conductors would be protected better if the overcurrent protection were in multiple overcurrent devices instead of a single overcurrent device because of the diversity. Overload, short circuit or a ground fault on the load side of the smaller overcurrent device would have lesser effect on the tap conductors than if it were on the load side of a single, larger overcurrent device. The panel statement does not respond to these facts in its assertion that a single overcurrent device is necessary.

FREDERICKS, C.: Please see my explanation of negative vote on Proposal 10-24.

10-29 Log #2875 NEC-P10 **Final Action: Reject**

(240.21(C)(6)(1))

Submitter: Robert Padgham, Jacksonville, FL

Recommendation: Revise 240.21(C)(6)(1) as follows and add Table 240.21(C)(6)(1).

(1) The secondary conductors shall have an ampacity that is not less than the value of the primary-to-secondary voltage ratio multiplied by one-third of the rating of the overcurrent device protecting the primary of the transformer, or the secondary tap conductors are protected in accordance with Table 240.21(C)(6)(1) by the overcurrent device protecting the feeder conductors.

Table 240.21(C)(6)(1) Tap Conductor Short-Circuit Current Ratings. Tap conductors are considered to be protected under short-circuit conditons when their short-circuit temperature llimit is not exceeded. Conductor heating under short-circuit conditions is determined by (1) or (2):

(1) Short-Circuit Formula for Copper Conductors

$(I^2/A^2)\,t = 0.0297 \log_{10}((T_2 + 234)(T_1 + 234))$

(2) Short-Circuit Formula for Aluminum Conductors

$(I^2/A^2)\,t = 0.0125 \log_{10}((T_2 + 228)/(T_1 + 228))$

where

I = short-circuit current in amperes

A = conductor area in circular mils

t = time of short-circuit in seconds (for times less than or equal to 10 seconds)

T_1 = initial conductor temperature in degrees Celsius.

T_2 = final conductor temperature in degrees Celsius.

Copper conductor with paper, rubber, varnished cloth insulation T_2 = 200

Copper conductor with thermoplastic insulation T_2 = 150

Copper conductor wiht crosslinked polyethylene insulation T_2 = 250

Copper conductor with ethylene propylene rubber insulation T_2 = 250

Aluminum conductor with paper, rubber, varnished cloth insulation T_2 = 200

Aluminum conductor with thermoplastic insulation T_2 = 150

Aluminum conductor with crosslinked polyethylene insulation T_2 = 250

Aluminum conductor with ethylene propylene rubber insulation T_2 = 250

Substantiation: North American industry is in a daily struggle to compete with global competitors. As such, we need every possible chance to reduce costs, but with safety as the number one directive. That is the intent of this proposal.

The existing NEC requirements for these feeder taps dictate that the ampacity of the secondary tap conductors be at least 1/3 of the overcurrent device protecting the feeder conductor multiplied by the primary-to-secondary voltage ratio. At first, this sizing seems reasonable when considering that the feeder circuit device is being asked to provide short-circuit protection for the smaller tap conductors. But, this is often extremely conservative and frequently results in a conductor sized much larger than is actually required according to the laws of physics. By using formulas that have been widely utilized by IEEE, the Canadian Electrical Code, and the IEC, much smaller conductors can be installed. This will provide significant cost savings for electrical distribution systems, allowing North American manufacturers to be more competitive in the global marketplace.

An example would be helpful. Assume a feeder conductor is a 3/0 with an ampacity of 200 amperes, and protected with a 200 ampere overcurrent protective device. Also assume a one-to-one voltage ratio for simplicity. According to the 2005 NEC, the smallest 25 foot secondary tap conductor would be a 4 AWG with an ampacity of 85 amperes, even if it were only supplying a 10 ampere load. (Three times the ampacity of a 6 AWG, with an ampacity of 65 only gives 195 amperes, which doesn't meet the 200 ampere requirement.) According to the physics formula, and UL standards, a 200 ampere Class J fuse will protect a 10 AWG conductor for faults up to 200,000 amperes. (Maximum I^2t let-through of a 200 ampere Class J fuse at 600 volts with 200,000 amperes available is 300×10^3 ampere squared seconds, while the short-circuit withstand of a 10AWG copper conductor is 303×10^3 ampere squared seconds.) As we can imagine the cost savings here will be substantial, and within the safety umbrella of internationally accepted standard physics formulas.

The physics formulas submitted with this proposal are the accepted basis for conductor short-circuit temperatures throughout the world. They are found in the ANSI/IEEE Red, Gray, Buff, and Blue Books and in the Canadian Electrical Code. Similar versions of these formulas are found in IEC60204-1 (IEC Machinery Standard), SAE HS-1738 (Automotive Industry Machinery Standard), and IEC 60364-4-43 (IEC Installation Standard).

Let's give North American industry every possible (safe) option to be competitive in the global market by accepting this proposal.

Panel Meeting Action: Reject

Panel Statement: The panel continues to limit this allowance to supervised industrial installations. See 240.92.

The complexity of the calculation, along with the associated installation and maintenance issues, requires that this be limited to supervised industrial installations.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

10-30 Log #2759 NEC-P10 **Final Action: Reject**
(240.21(C)(6)(4))

Submitter: Truman C. Surbrook, Michigan State University
Recommendation: Add a new statement of the requirement that the primary conductors are protected from overcurrent to read as follows:
(4) The primary conductors are protected from overcurrent in accordance with 240.4(B) or (C) .
Substantiation: This section assumes the primary conductors are protected from overcurrent in accordance with 240.4, but there is no stated requirement that the conductors be protected.
Panel Meeting Action: Reject
Panel Statement: Section 240.21(C) addresses the conductors on the secondary of the transformer. Since the protection on the primary is addressed in other areas of the NEC, it is unnecessary to reiterate the need for this protection in the secondary conductor protection requirements.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-31 Log #693 NEC-P10 **Final Action: Reject**
(240.21(D))

Submitter: Don A. Hursey, Durham County Inspections Department
Recommendation: Revise as follows:
Service Conductors. Service-entrance conductors shall be permitted to be protected by overcurrent devices in accordance with 230.91. The provisions of 240.4(B) shall not be permitted for service conductors.
Substantiation: The 2005 no longer permits the tap conductors and transformer secondary conductors to use the provisions of 240.48. Service conductors should not be allowed to use 240.13.
Panel Meeting Action: Reject
Panel Statement: The panel understands the reference to be to 240.4(B) and not 240.48. The additional sentence did not change the requirement from the 2002 NEC. The additional sentence placed in 240.21(B) referencing 240.4(B) is somewhat redundant and may be unnecessary, since all of the tap rules require conductors to be sized “not less than” the overcurrent protection. However, it was added to assist with clarity. No substantiation has been presented that supports further restrictions within 240.21(D).
The submitter’s comment regarding 240.13 is in conflict with 230.95.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-32 Log #908 NEC-P10 **Final Action: Accept in Part**
(240.21(D))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise:
Service- ~~entrance-~~ conductors shall be ~~permitted to be~~ protected by overcurrent devices in accordance with 230.91.
Substantiation: Edit. The heading includes service-lateral conductors which should be included in the text. 230.91 is a requirement, not a “permitted” rule. The definition of Service-Entrance Conductors, Underground System indicates there may be no service-entrance conductors.
Panel Meeting Action: Accept in Part
The panel accepts the deletion of the word “entrance” and rejects the proposed deletion of “permitted to be.”
Panel Statement: The general rule in 240.21 requires conductors to be protected where they received their supply. 240.21(D) is permitting this protection to be provided in service conductors at a location other than the supply end of the conductors.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-33 Log #1672 NEC-P10 **Final Action: Reject**
(240.21(H))

Submitter: Paul E. Guidry, Fluor Enterprises, Inc.
Recommendation: Add text to read as follows:
(H) Battery Conductors. Each set of battery conductors feeding separate loads shall be permitted to be connected to storage batteries, without overcurrent protection at the battery, as specified in 240.21(H)(1).
(1) Industrial Battery Conductors Not Over 7.5m (25 ft.) Long. For industrial installations, where the length of the battery conductors do not exceed 7.5m (25 ft) and complies with all of the following:
(1) T HE AMPACITY OF THE BATTERY CONDUCTORs is not less than the ampacity of the storage batteries and the sum of the ratings of the overcurrent devices does not exceed the ampacity of the battery conductors.
(2) All overcurrent devices are grouped.
(3) T he battery conductors are protected from physical damage by being enclosed in an approved raceway or by other approved means from the battery terminals to the overcurrent device.
(4) W here multiple overcurrent devices are supplied from batteries, the number of overcurrent devices shall not exceed six circuit breakers or six sets of fuses.
(2) B attery Conductors From Chargers. Conductors from the battery charger to the batteries shall be protected from physical damage by being enclosed in an approved raceway or by other approved means. The conductors shall be protected by an overcurrent device rated not more than the ampacity of the conductors. The overcurrent device may be an integral part of the battery charger.
FPN: In some instances, the conductors from the batteries to the overcurrent device are the same conductors as those connected to the charger.
Substantiation: For many years taps and transformer secondary conductors have been addressed by the NEC. In industrial substations such as those for petrochemical facilities, there are UPS systems and station batteries that have conductors leaving the batteries feeding either a panelboard or an overcurrent device. There are currently no restrictions on how far these conductors may be routed without an overcurrent device and nothing specifically requires them to be physically protected.
These conductors are unique because not only are the batteries a source of power, they are also a load when they are charging. The conductors are usually protected by the battery charger in the case of the batteries being the load. However, protection should also be required when the batteries are the source.
This proposal is patterned after 2005 NEC 240.21(C)(3) and should suffice for battery installations as well.
Panel Meeting Action: Reject
Panel Statement: The panel disagrees with the subtantiation that there are no restrictions. Section 480.3 subjects the wiring of batteries to the general requirements of the NEC.
This proposal would apply only to industrial locations, and some installations would be large enough to need more than 25 ft.
The submitter has not substantiated a length limitation.
The panel requests that the Technical Correlating Committee appoint a task group, comprised of members from Code-Making Panels 10 and 13, to review this issue and develop comments.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
ELDRIDGE, C.: I agree with Mr. Fredrick’s Explanation of Negative Vote.
FREDERICKS, C.: I’m voting against the panel action. The panel action is inconsistent in that it asserts the basic rule of 240.21 should apply to battery conductors, while at the same time acknowledging that allowing 25 feet to the first overcurrent device might not be enough for some larger installations.
The basic rule of 240.21 should not be applied to battery installations without any length allowances. Length allowances are presently accepted in 240.21 for conductors fed from both generators and from transformers.
It can be impractical and undesirable to place an overcurrent device near a vented storage battery bank, for reasons including possible exposure to a hazardous flammable atmosphere and also possible exposure to acid and corrosives.
The proposal should have been accepted in part in principle, creating new rules for all freestanding storage battery installations as follows:
(H) Battery Conductors. Each set of battery conductors feeding separate loads shall be permitted to be connected to storage batteries, without overcurrent protection at the battery, as specified in 240.21(H)(1) or 240.21(H)(2).
(1) Battery Conductors. Conductors from battery terminals shall be permitted to be protected from overload where the following conditions are met:
(1) The battery conductors are protected from physical damage by being enclosed in an approved raceway or by other approved means, from the battery terminals to the overcurrent device. The positive and negative conductors may be enclosed in separate non-magnetic raceways.
(2) The ampacity of the battery conductors is not less than the design load and is also not less than the 60-minute rated discharge current of the storage batteries.
(3) Where multiple overcurrent devices are used, all overcurrent devices are grouped, and the number of overcurrent devices does not exceed six circuit breakers or six sets of fuses
(4) The sum of the ratings of the overcurrent devices does not exceed the ampacity of the battery conductors.
(2) Battery Conductors From Chargers. Conductors from the battery charger to the batteries shall be protected from physical damage by being enclosed in an approved raceway or by other approved means. The conductors shall be protected by an overcurrent device rated not more than the ampacity of the conductors. The overcurrent device may be an integral part of the battery charger.
FPN: In some instances, the conductors from the batteries to the overcurrent device are the same conductors as those connected to the charger.
The proposed text above is a revision of the submitter’s proposal and would apply to all storage battery installations, excluding those installations that are part of listed equipment and that typically employ valve-regulated or non-vented batteries.
A length limitation for the battery conductors is not shown in the proposed text. This because there is no incentive in design or in the field to make these conductors longer than necessary, and lengths that are readily justifiable for a larger battery installation might be too long for a smaller installation.

If the panel preferred to give a limitation for the battery conductors based on length, I believe it would be adequate to require a maximum voltage drop of 2% at design load for the battery conductors. This would be consistent with NEC guidance for feeders and would assure an adequate combination of conductor size and length. This was left out of the proposed text above, considering that this might be too much of a design consideration to make an NEC requirement.

Storage battery installations are generally ungrounded systems, so another option to reduce the probability of a short circuit in the battery conductors would be to require the positive and negative conductors to be routed separately in non-magnetic raceways. This was also seen as a design consideration, so not included in the proposed text above.

Comment on Affirmative:

KOVACIK, J.: In the case of storage batteries acting as a power source, there is concern not only for the conductors but also for the hazards presented by the batteries themselves. 480.3 governs wiring and equipment supplied from batteries and should continue to. Allowing a "tap rule" relaxation of the overcurrent requirements risks minimizing the hazard potentially created by the battery itself.

10-34 Log #416 NEC-P10 **Final Action: Reject**
(240.24)

Submitter: Darrel Pinkston, Bright Electric LLC
Recommendation: Would like to see a new (F) paragraph to read: "not located in bedrooms."
Substantiation: It seems to me that since arc-fault is required on all devices located in a bedroom that allowing overcurrent devices in bedrooms would seem to violate 210.12(B).
Panel Meeting Action: Reject
Panel Statement: Section 210.12 requires protection of the branch circuit supplying outlets in the bedroom have AFCI protection. Panelboards located in the bedroom would not be required to have AFCI devices installed for those branch circuits feeding outlets outside the bedroom. Code-Making Panel 2 has jurisdiction over the protected circuits.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-35 Log #1446 NEC-P10 **Final Action: Reject**
(240.24)

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise as follows:
240.24 Location in or on Premises.
(A) Accessibility.
(1) For busways, as provided in 368.12.
(2) For supplementary overcurrent protection ~~, as described in 240.10.~~
(3) For overcurrent devices, as described in 250.40 and 230.92.
(4) For overcurrent devices adjacent to utilization equipment that they supply, access shall be permitted to be by portable means.
Substantiation: With the addition of "supplementary overcurrent device" to Article 100 in the 2005 NEC, there is no reason to reference 240.10 anymore.
Panel Meeting Action: Reject
Panel Statement: The definition provides no guidance for location. The reference to 240.10 establishes location and accessibility.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-36 Log #3165 NEC-P10 **Final Action: Reject**
(240.24)

Submitter: Wally Harris, Atlantic Inland Inspections
Recommendation: Rewrite this Section to combine 240.24(C) and (D) into one Section as follows in underlined type to help streamline the Code. Please also note a change to the spelling of the word Ignitable above. This spelling differs from the use of *Ignitible* in the 2005 Code which appears to be a spelling error. Change the present 240.24(E) to 240.24(D) to compensate for this change if this proposal is accepted.
<u>(C) Not Exposed to Physical Damage. Overcurrent devices shall not be located where they will be exposed to physical damage, or in the Vicinity of Easily Ignitable Material such as in clothes closets.</u>
<u>FPN:See 110.11, Deteriorating Agents.</u>
Substantiation: This proposal will contribute to clarity and to streamlining the Code process, thus making the Code easier for users to understand.
Panel Meeting Action: Reject
Panel Statement: This is a proposed clarification without any intended technical changes; however, the panel does not see this proposal as adding clarity to this area of the NEC.

Two separate ideas are involved. 240.24(C) addresses physical damage that may occur to the overcurrent protective device. 240.24(D) addresses the fire hazard associated with the proximity of ignitible material to the overcurrent device.

Further, by having different headings, the Code will remain more user friendly.

According to the American Heritage© Dictionary of the English Language, Third Edition, both versions of ignitible are acceptable and have the same meaning.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-37 Log #2035 NEC-P10 **Final Action: Accept**
(240.24(B))

Submitter: James T. Dollard, Jr., IBEW Local 98
Recommendation: Revise text to read as follows:
240.24(B) Occupancy. Each occupant shall have ready access to all overcurrent devices protecting the conductors supplying that occupancy <u>unless otherwise permitted in 240.24(B)(1) and (B)(2).</u>
<u>**(1) Service and Feeder Overcurrent Devices.**</u> ~~Exception No. 1:~~ Where electric service and electrical maintenance are provided by the building management and where these are under continuous building management supervision, the service overcurrent devices and feeder overcurrent devices supplying more than one occupancy shall be permitted to be accessible to only authorized management personnel in the following:
(1) Multiple-occupancy buildings
(2) Guest rooms or guest suites ~~of hotels and motels that are intended for transient occupancy~~
<u>**(2) Branch Circuit Overcurrent Devices.**</u> ~~Exception No. 2:~~ Where electric service and electrical maintenance are provided by the building management and where these are under continuous building management supervision, the branch circuit overcurrent devices supplying any guest rooms or guest suites <u>without permanent provisions for cooking</u> shall be permitted to be accessible to only authorized management personnel. ~~for guest rooms of hotels and motels that are intended for transient occupancy.~~
Substantiation: The proposed revision to 240.24(B) is primarily editorial in nature seeking to eliminate exceptions by using positive text to improve clarity. The qualifier "intended for transient occupancies" is deleted and the text in the proposed second level subdivision (B)(2) is modified to address "guest rooms" and "guest suites" with permanent provisions for cooking.

The exceptions are editorially eliminated and rolled into the positive text in two second level subdivisions.

The text in the present exceptions No. 1 & 2 which applies these rules to only guest rooms & guest suites "intended for transient occupancies" is deleted. These terms, "guest room" and "guest suite" are now defined in Article 100. There is no longer a need for the qualifier "intended for transient occupancy," due to the addition of these definitions in Article 100 and qualifying requirements for "guest rooms" and "guest suites" in Article 210.

In essence the only difference between a "guest room" or "guest suite" and a "dwelling unit" is a requirement for permanent provisions for cooking. Where a "guest room" or "guest suite" is provided with "permanent provisions for cooking," section 210.18 requires the following:

210.18 Guest Rooms and Guest Suites

Guest rooms and guest suites that are provided with permanent provisions for cooking shall have branch circuits and outlets installed to meet the rules for dwelling units.

This section, new in 2005, now requires that "guest rooms" and "guest suites" equipped with "permanent provisions for cooking" are treated the same as dwelling units in regard to the branch circuit requirements contained in Parts I, II, and III of Article 210. This includes small appliance branch circuits in 210.11(C)(1), laundry branch circuits in 210.11(C)(2) and bathroom branch circuits in 210.11(C)(3). This also includes AFCI protection in 210.12 for all branch circuits supplying bedroom outlets. Access to these overcurrent devices must be readily accessible to the occupant.

These "guest rooms" and "guest suites" with "permanent provisions for cooking" are capable of as well as intended for "extended stay" and will be used more like a dwelling unit than a "guest room" or "guest suite." Occupants will bring appliances and other loads with them, dramatically increasing the need for readily accessible overcurrent protective devices for their "extended stay."
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-38 Log #2936 NEC-P10 **Final Action: Reject**
(240.24(B))

Submitter: Philip Simmons, Simmons Electrical Services
Recommendation: Revise existing 240.24(B) as follows:
(B) Occupancy. Each occupant shall have ready access to all overcurrent devices protecting the conductors supplying that occupancy. <u>Enclosures housing electrical apparatus that are controlled by lock and key shall be considered accessible to qualified persons.</u>
Exceptions to remain unchanged.

Substantiation: This is a companion proposal to delete the rule from 110.26 and add it to 230.92 and 240.24(B). 110.26 deals with access to working space about electrical equipment and does not apply to access to the equipment itself. It seems the provisions on electrical apparatus controlled by a lock and key would more properly be located in 230.92 and 240.24(B).

Many locations come to mind where electrical equipment is locked to prevent unauthorized access. These include schools, colleges, health care facilities, airport terminals and office buildings that are open to the public. These buildings often have either panelboards with locking covers or electrical equipment located in locked rooms. Electrical inspectors recognize the security that is needed in these and other facilities. Locating this rule with the sections that cover locks on equipment will improve the usability of the Code.

Panel Meeting Action: Reject

Panel Statement: The introductory sentence to 240.24(B) focuses on accessibility by each occupant. The subsequent exceptions also focus on each occupant. It is inappropriate and confusing to add this sentence dealing with qualified persons. Further, deleting this accessibility permission from 110.26 and moving it to this article and 230.92 will place further restrictions on where a lock limits accessibility.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

10-39 Log #911 NEC-P10 **Final Action: Reject**

(240.24(D))

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Add "dormitories" after "dwelling units."

Substantiation: Edit. Dormitories without cooking facilities do not meet the definition of dwelling unit, and should be included.

Panel Meeting Action: Reject

Panel Statement: The recommendation is unclear, as the term "dwelling unit" does not exist in 240.4(D).

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

10-40 Log #1633 NEC-P10 **Final Action: Reject**

(240.24(F))

Submitter: L. Keith Lofland, International Association of Electrical Inspectors

Recommendation: Add new text as follows:

<u>240.24(F) Not located in Stairways. Overcurrent devices shall not be located in the interior of a stairway.</u>

Substantiation: 110.26(A)(3) requires the work space to be clear and extend from the grade, floor, or platform to the height required by 110.26(E). Floors, platforms, and grade are all defined in the building code, and so is stairs. However, stairways are not mentioned in 110.26 of this section. Local Authorities Having Jurisdictions (AHJs) have prohibited panel boards form being installed in a stairway, but it seems that no clear Code language was present in 110.26 to support this stance. Stairways in the standing area of the required working space create a hazard, and are not a good practice, yet are not currently restricted.

240.24(A) requires overcurrent devices to be readily accessible and be installed so that the center of the grip of the operating handle of the switch or circuit breaker, when in its highest position, is not more than 2.0 m (6 ft 7 in.) above the <u>floor or working platform</u> unless any of the provisions in 240.24(A)(1) through (4) apply. When a panelboard is installed in a stairway, where does one take this required measurements from to meet the requirements of 240.24(A)? Which stairway tread do you measure from? Allowing overcurrent devices to be installed in a stairway creates a hazard to electrical workers and occupants alike as a level working space is not provided.

Panel Meeting Action: Reject

Panel Statement: The panel requests that this proposal be referred to Code-Making Panel 1 for Comment.

Switches are permitted over steps. This appears to be broader than overcurrent protection.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

DOLLARD, JR., J.: We are voting negative to the panel action to reject proposal 10-40. Our comments are as follows:

The action taken on this proposal should have been to "Accept." In the statement to reject proposal 10-40, the panel states that the issue raised by the submitter appears to be broader than overcurrent protection. We agree that the issue may be broader than overcurrent protection. In the panel statement it is also noted that switches are permitted over steps. These statements may give the reader of the ROP the false impression that CMP-10 is of the opinion that overcurrent devices, in panelboards for example, may be mounted in stairways. We do not believe that CMP-10 would agree that the mounting of panelboards for example in stairways would be an acceptable practice. There is no practical reason to permit or allude to a perceived permission to allow overcurrent protective devices to be installed in stairways.

The installation of panelboards, or overcurrent protective devices of any type are prohibited in stairways by building codes in commercial and institutional occupancies. Electrical equipment is prohibited in stairways or egress corridors unless that equipment directly serves the stair or corridor such as emergency lighting, fire alarm tamper/flow switches and purge/pressurization fans. The installation of panelboards in the stairway of dwelling units however, may not be a violation of local building codes. The enforcement community needs this text to prohibit the installation of overcurrent protective devices in stairways. This is a serious safety issue. If a panelboard is mounted in a stairway, the installer, maintainer, inspector and occupant must stand in the stairway facing a side wall to access the panelboard. The initial installation, all additional work and all access to the panelboard to energize or deenergize circuits would be performed with the installer, maintainer, inspector or occupant standing in the middle of a stairway on a single tread. This may occur in the dark as the occupant attempts to reset a tripped lighting circuit.

KOVACIK, J.: Upon consideration, we are in agreement with the comments in the negative ballot provided by Mr. Dollard to Proposal 10-40. We agree for all of the reasons that Mr. Dollard presents that, "There is no practical reason to permit or allude to a perceived permission to allow overcurrent protective devices to be installed in stairways." In addition to the reasons provided by Mr. Dollard, we believe that the panel action to reject this proposal is contrary to the intent of NFPA 101, the Life Safety Code that requires that routes of egress not be impeded. Consequently, we are changing our vote from Affirmative to Negative to the Panel action.

Comment on Affirmative:

BORTHICK, M.: I support the panel action to reject this proposal. Section 110.26 requires that the working space permits safe operation and maintenance of equipment. Requiring someone to stand on two levels (such as on two risers of a stairway) to work on a panelboard seems to violate this requirement for safe operation and maintenance. Additionally, 110.26(B) requires that if panelboards are located in a passageway the working space, within the passageway, is to be suitably guarded when live parts are exposed. Since a stairway would be considered a passageway the working space required by 110.26 would have to be guarded while servicing the panelboard. The logistics of performing service on a panelboard installed in a stairway (or any passageway) discourages such installations. However, to mandate that absolutely no overcurrent devices be installed in a stairway would include supplemental OCPD's as well. It seems more appropriate that a proposal to clarify working space as being on one level be submitted to Code-making Panel 1.

10-41 Log #2887 NEC-P10 **Final Action: Reject**

(240.30(C))

Submitter: B. Wiltse, Mandeville, LA

Recommendation: Add a new 240.30(C) Marking.

<u>(C) Marking. Enclosures containing service, feeder, and branch circuit overcurrent protective devices shall be field marked with:</u>

<u>(1) The amount of available short-circuit current, or</u>

<u>(2) A note that the available short-circuit is 10,000 amperes or less.</u>

Substantiation: It is critical for the available short-circuit current to be marked on the enclosures containing overcurrent protective devices for two very critical reasons:

(1) The electrical inspector needs the information to assure compliance with 110.9.

(2) The worker needs the information in order to comply with OSHA and NFPA 70E for the proper PPE. Where the available short-circuit is less than 10,000 amperes, as might be found in single-family residences, enforcement of 110.9 and arc-flash are not an issue, so the exact available short-circuit current should not be a requirement.

Finally, this type of information must be field marked because the manufacturer won't know where their equipment will be installed.

Panel Meeting Action: Reject

Panel Statement: The substantiation indicates that marking the available fault current on overcurrent protection enclosures makes it easier for the inspector to review the job. However, the inspector must still ensure that any such marking be correct from plan review.

The second reason given for marking is for arc-flash protection. It should be noted that an arc-flash calculation, for the electrical enclosure that is going to be entered, is based on the overcurrent device ahead of that particular enclosure. The marking requirement for arc-flash is addressed in 110.16 and is outside the scope of Code-Making Panel 10.

The panel also disagrees with the submitter that a system delivering 10 kA or less is not an issue.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

DOLLARD, JR., J.: We are voting negative to the panel action to reject proposal 10-41. Our comments are as follows:

The panel statement on the action to reject this proposal contains the following sentence: "It should be noted that an arc-flash calculation, for the electrical enclosure that is going to be entered, is based on the overcurrent device ahead of that particular enclosure."

It is important to note that the amount of available short circuit current available, in addition to the characteristics of the overcurrent device ahead of an enclosure, must also be determined to calculate the incident energy or to apply the hazard risk categories in NFPA-70E. It is obvious that the intent of the submitter is to provide information for electrical workers to aid in the determination of the incident energy or the application of the hazard risk categories in NFPA-70E. The panel determined that marking the available short circuit current was not necessary. We disagree.

Perhaps the intent of the submitter could be met by accepting this proposal in principle. The intent of the submitter can be met by revising the proposed text to identify the upstream overcurrent protective device, as noted in the panel statement, instead of the available short circuit current as follows:

(C) Marking. Enclosures containing feeder and branch circuit overcurrent devices shall be field marked to identify the location, type, size or setting of the overcurrent protective device supplying the enclosure.

In the panel statement to Reject this proposal it is noted that the proposed text is outside of the scope of CMP-10, and is more appropriate in 110.16. We strongly disagree. The scope of Article 110 is limited to general requirements. The scope of Article 240 specifically includes "..general requirements for overcurrent protection and overcurrent protective devices.." All marking requirements for overcurrent protective devices are under the purview of CMP-10.

OCKULY, G.: This proposal should have been accepted knowing the available short-circuit current is absolutely necessary for determining compliance with numerous code requirements, especially 110.9.

This proposal, as written, has significant safety merit. The proposal stands on its own without the introduction of arc-flash energy as noted in (2) of the substantiation.

The panel statement brings up a good point about systems with 10 kA or less of available short-circuit current. This proposal would therefore be more appropriate if it did not allow for the elimination of the marking for situations where the available short-circuit current was less than 10 kA. It would then read:

(C) Marking. Enclosures containing service, feeder, and branch circuit overcurrent protective devices shall be field marked with the amount of available short-circuit current.

10-42 Log #2838 NEC-P10 **Final Action: Reject**
(240.34)

Submitter: Tracy Missey, Midlothian, VA
Recommendation: Add a new section 240.34

240.34 Marking. An enclosure, containing one or more overcurrent protective devices, shall be field marked with the available short-circuit current and the date on which that calculation was determined.

Exception: Marking the available short-circuit current and date of calculation shall not be required for enclosures containing overcurrent device(s):

(1) In feeders or branch circuits when the available short-circuit current at the service entrance equipment, or any upstream (line-side) enclosure, is 10,000 amperes or less, and the circuit voltage at the downstream (load-side) enclosure is the same as the circuit voltage at the service entrance equipment or upstream (line-side) enclosure, and

(2) The enclosure is field marked to indicate

a. that the available short-circuit current is 10,000 amperes or less, and

b. the date that the field label was installed.

Substantiation: Since knowledge of the available short-circuit current is required to

(1) determine the proper interrupting rating as required by 110.9 to,

(2) comply with requirements for component short-circuit current ratings in 110.10, 230.82(3), 409.110, 430.8, 440.4(B), and 670.3(A),

(3) Comply with requirements for selective coordination in 517.17, 620.62, 700.27, and 701.18,

(4) size equipment grounding conductors per 250.122 and,

(5) determine conductor protection per 240.100(C),

It is obvious that users of this Code must already be calculating the available short-circuit current (or should be calculating the available short-circuit current. Unfortunately, there is no requirement to mark this available short-circuit current on the equipment). There are two major problems with this current method. The first problem is that it is difficult for electrical inspectors to enforce those Sections described above. Matching equipment on the jobsite with short-circuit currents written on the plans is always time-consuming and often difficult to impossible to do. By placing the available short-circuit current on the equipment, it becomes a simple process for the inspector to compare the equipment rating with the available short-circuit current. The second problem arises when a worker needs the available short-circuit current to determine the arc-flash energy. If it is not marked on the equipment, the worker has no easy method to determine the level of protective clothing to ear. If the available short circuit current were marked on the equipment, the worker could utilize readily available printed materials or software to determine the PPE to wear.

The exception is needed for those circuits where the available short-circuit current is 10,000 amperes or less. In circuits of this type there are very few violations of the Code sections listed in(1) through (5) above and the arc-flash energies are of much less concern. Marking the enclosure with information that the available short-circuit current is less than 10,000 amperes provides some assurance that the system was analyzed, at least as of the date on the label.

Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 10-41.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:

DOLLARD, JR., J.: We are voting negative to the panel action to reject proposal 10-42. See our negative comment on proposal 10-41.

OCKULY, G.: The proposal would improve safety and assist the electrical inspector to enforce compliance with 110.9. I do not agree with the submitter's statement that enforcement of 110.9 is not an issue below 10,000 amperes. For example, a 5,000 AIC overcurrent protective device installed on a system capable of delivering 9,000 amperes is a potential hazard if the overcurrent protective device is required to interrupt a fault beyond the limits of its interrupting rating. See my Explanation of Negative Vote on Comment on 10-41.

10-43 Log #2844 NEC-P10 **Final Action: Reject**
(240.35)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 1 for action in Article 110. This action will be considered by Code-Making Panel 1 as a public comment.

Submitter: Doug Eckelkamp, Bell Electric
Recommendation: Add a new 240.35.

240.35 Marking. An enclosure, in other than dwelling occupancies, containing overcurrent protective devices, shall be field marked with the available arc-flash energy and the flash protection boundary.

Substantiation: 110.16 requires an arc-flash warning label on specific types of equipment that might be worked while energized. This is an appropriate general requirement. However, the degree of the arc-flash hazard is always associated with an overcurrent protective device, specifically, the time that it takes for the overcurrent device to clear. Thus, it is appropriate that more specific requirements, such as those found in this proposal, be found in Article 240, covering the specific requirements for overcurrent protection.

NFPA 70E and OSHA require that a workman wear personal protective equipment that is adequate for the location and hazard at hand. The only way for a worker to pick the correct personal protective equipment is to first understand the degree of hazard. That degree of hazard is always associated with an overcurrent protective device. Thus, it makes sense to associate the hazard with the enclosure that houses the overcurrent protective device(s).

Panel Meeting Action: Reject
Panel Statement: This is outside of the scope of Panel 10 and should be referred to Code-Making Panel 1.

Marking the arc flash parameters is broader than overcurrent protection enclosures and should be addressed in 110.16.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:

DOLLARD, JR., J.: We are voting negative to the panel action to reject proposal 10-43. Our comments are as follows:

See our negative comment on proposal 10-41. In the panel statement to Reject this proposal it is noted that the proposed text is outside of the scope of CMP-10, and would be under the purview of CMP-1. We strongly disagree. The scope of Article 110 is limited to general requirements. The scope of Article 240 specifically includes "..general requirements for overcurrent protection and overcurrent protective devices.." All marking requirements for overcurrent protective devices are under the purview of CMP-10.

OCKULY, G.: I agree with the proposal as submitted, and take issue with the panel statement that this is outside the scope of Panel 10. The requirements for selecting overcurrent protective devices are contained in Article 240. The selection of overcurrent protective devices determines the arc-flash energy on the load side of the overcurrent protective device. As such, I believe that this is well within the scope of Article 240.

10-44 Log #2868 NEC-P10 **Final Action: Reject**
(240.37)

Submitter: Jamie Arnold, Tampa, FL
Recommendation: Add a new Part IV. Watthour Meters and a new 240.37 Short-Circuit Current Rating. Remember existing Parts IV through IX as V through X.

IV. Watthour Meters and Watthour Meter Sockets.

240.37 Short-Circuit Current Rating. Watthour meters and watthour meter sockets shall be marked with a short-circuit current rating and be protected from overcurrent so that the short-circuit current rating is not exceeded.

Substantiation: Current product standards require meter sockets to have a short-circuit current rating, but there is no requirement for that rating to be marked on the equipment by the NEC®. The bigger issue is that the watthour meters themselves are specifically exempted from the requirement to have a short-circuit current rating by the product standards. Thus, every electrical worker that installs or replaces a meter while energized is being put at significant risk of a serious burn injury or death whenever the available short-circuit current exceeds the short-circuit current rating of the meter. The way to

assure that the product standard is changed is to put the requirements into the NEC. Once the watthour meters are marked with a short-circuit current rating, installers and electrical inspectors can watch to see that the equipment is being installed within its short-circuit current rating.
Panel Meeting Action: Reject
Panel Statement: The substantiation is attempting to address a work practice issue with a short-circuit current rating. No substantiation has been presented that requiring such a marking will address the safety concern of the submitter. A meter and meter socket is not rated or recognized as a load break switch, nor will a short-circuit current rating protect a worker when installing or withdrawing a meter from a meter socket. It appears the intent of the submitter is to change the product standard. Here, it is noted that a product standard is changed through submitting a proposal to the organization responsible for the product standard. It should also be noted that this is a complex issue that received extensive industry/utility discussion during the mid-1980s on this very issue and the product equipment standard was revised to ensure appropriate safety.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-45 Log #1566 NEC-P10 **Final Action: Accept in Principle**
(240.50(A)(2))

TCC Action: The Technical Correlating Committee directs that the action on this proposal be sent to the Technical Correlating Committee Task Group on the definition of "Neutral Conductor" for review and comment.
Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Make the following change in 240.50(A)(2):
Change "neutral" to "neutral conductor."
The revised text would appear as follows:
(2) Circuits supplied by a system having a grounded neutral <u>conductor</u> where the line-to-neutral voltage does not exceed 150 volts.
Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).
The Task Group has proposed the following definitions to be added to Article 100:
- **Neutral conductor.** A circuit conductor connected to the neutral point of a system.
- **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.

This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals
- The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.
- The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.

Additional information is available in the Task Group report.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
Revise the proposed wording to read as follows:
"(2) Circuits supplied by a system having a grounded neutral <u>point</u> where the line-to-neutral voltage does not exceed 150 volts."
Panel Statement: The word "conductor" has been changed to "point" because a neutral conductor is not required on line-to-line loads, e.g., water heaters operating at 240 volts.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-46 Log #1654 NEC-P10 **Final Action: Reject**
(240.51)

Submitter: John Steinke, Reno, NV
Recommendation: Add second paragraph:
Plug fuses may be replaced by listed circuit breakers.
Substantiation: Mechanical Products manufacturers 15 and 20 amp circuit breakers for Edison base fuseholders. They are UL listed. Yet the NEC only speaks of plug fuses, and type "S" fuses; a strict reading of the text would suggest to some that the use of a circuit breaker is not allowed.
These fuse holders have long been recognized as subject to over-fusing. It is my belief that a resettable breaker reduces the temptation to simply put a larger fuse in, and can lead to load discipline (don't run microwave and hair dryer at same time) on the part of the occupant.
Circuit breakers also have the advantage of letting the occupant find the problem, and fix it, without making five trips to the hardware store.
Unfortunately, I am not aware of any such breakers made to fit in the type "S" adapters.
Panel Meeting Action: Reject
Panel Statement: 240.51 is dealing solely with Edison base fuses. There is nothing in the Code to prohibit the use of the circuit breakers that the submitter references where used as replacements only.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-47 Log #2867 NEC-P10 **Final Action: Reject**
(240.60(D))

Submitter: Jamie Arnold, Tampa, FL
Recommendation: Modify the requirements of 240.60(D) so as to prohibit the use of all Class H and K fuses instead of just Renewable Class H fuses. This can be accomplished by the following revised text:
<u>(D) Class H and K Fuses. Class H and K fuses shall not be permitted.</u>
Substantiation: When used within their ratings, Class H and K fuses have safely protected circuits for decades. Today however, utility systems are much stronger and now often deliver available short-circuit currents will in excess of the interrupting rating of these fuses. This becomes a safety issue for personnel that might try to install a Class H or K fuse on one of today's modern distribution systems. With this change, (1) the minimum interrupting rating of branch fuses would be 100,000 amperes, adequate for the majority of building distribution systems, (2) all branch-circuit rated fuses would be current-limiting under short-circuit conditions, providing for a greater degree of arc-flash protection and equipment short-circuit protection.
Panel Meeting Action: Reject
Panel Statement: Section 240.60(D) was added during the 2005 NEC cycle in order to address misapplication of "renewable" type fuses. Expanding the restriction to other fuse types based on increased available fault current from the utility would unnecessarily restrict such fuses from being used in other areas of the electrical system where they are appropriately rated.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-48 Log #2833 NEC-P10 **Final Action: Reject**
(240.83(C))

Submitter: Nathan Goff, AMF Electric
Recommendation: Delete the last sentence of this requirement.
~~The interrupting rating shall not be required t be marked on circuit breakers used for supplementary protection.~~
Substantiation: There are many supplementary circuit breakers on the market today that have the look and feel of branch-circuit circuit breakers. It is next to impossible for an electrical inspector to tell the difference between some branch-circuit breakers and the look-alike supplementary circuit breakers. With no interrupting rating marked on these supplementary circuit breakers, an inspector is likely to assume that they have a 5,000 ampere rating, when in fact they could have interrupting ratings much, much lower than that, as supported by the 200 ampere default rating in Table SB4.1 of UL 508A Supplement SB.
Requiring all types of circuit breakers to be marked will help inspectors enforce the important interrupting rating safety requirements.
Panel Meeting Action: Reject
Panel Statement: The requirements found within 240.83(C) specifically address circuit breakers, not supplementary protectors. Circuit breakers are used as supplementary protection in other areas of the NEC such as 424.22(B) and (C).
Section 424.22(C) requires the supplemental protection to be suitable for branch circuit protection, which requires a circuit breaker and not a supplementary overcurrent protective device as defined in Article 100. It should be recognized that a supplementary overcurrent protective device as defined in Article 100 carries a recognized component mark, not a listing mark.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-49 Log #2832 NEC-P10 **Final Action: Reject**
(240.83(C), FPN (New))

Submitter: Nathan Goff, AMF Electric
Recommendation: Add the following new FPN to 240.83(C):
<u>FPN: Circuit breakers that clear a short-circuit at or near their interrupting rating may require testing, servicing, or replacement, before being reset.</u>
Substantiation: Where a circuit breaker has experienced such a fault and is placed back into service without testing or replacement, serious implications may result, impacting the safety of the installer/maintainer as well as building occupants. The manufacturers fully agree with this approach as can be seen in the NEMA sponsored article, written by Vince Baclawski, that appeared in the January, 1995 issue of EC& M Magazine.
"After a high level fault has occurred in equipment that is properly rated and installed, it is not always clear to investigating electricians what damage has occurred inside encased equipment. The circuit breaker may well appear virtually clean, while its internal condition is unknown. For such situations, the NEMA AB4 "Guidelines for Inspection and Preventive Maintenance of MCCBs Used in Commercial and Industrial Applications" may be of help. Circuit breakers unsuitable for continued service may be identified by simple inspection under these guidelines. Testing outlined in the document is another

and more definite step that will help to identify circuit breakers that are not suitable for continued service."

The addition of this material will help warn workers that they should not simply reset a circuit breaker after it has tripped. And, they should be especially careful when the circuit breaker saw a short-circuit at or near its interrupting rating.

Panel Meeting Action: Reject

Panel Statement: The Code is an installation document not a maintenance document. NFPA 70B addresses the maintenance of electrical equipment. The practice of inspecting the entire electrical system may be necessary after a high fault condition and is not limited to the overcurrent protection device.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

10-50 Log #1958 NEC-P10 **Final Action: Reject**
(240.86)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Recommendation: Revise text to read as follows:

240.86 Series Ratings. Where a circuit breaker is used on a circuit having an available fault current higher than the marked interrupting rating by being connected on the load side of an acceptable overcurrent protection device having a higher rating, the circuit breaker shall meet the requirements specified in (A) ~~or (B) and (C)~~ and <u>(B)</u> .

~~(A) Selected under engineering supervision in existing installations. The series rated combination devices shall be selected by a licensed professional engineer engaged primarily in the design or maintenance of electrical installations. The selection should be documented and stamped by the professional engineer. This documentation shall be available to those authorized to design, install, inspect, maintain, and operate the system. This series combination rating, including identification of the upstream device, shall be field marked on the end use equipment.~~

~~(B~~) <u>(A)</u> Tested Combinations. The combination of line-side overcurrent device and load-side circuit breaker(s) is tested and marked on the end use equipment, such as switchboards and panelboards.

~~(C)~~ <u>(B)</u> Motor Contribution. Series ratings shall not be used where

(1) Motors are connected on the load side of the higher rated overcurrent device and on the line side of the lower rated overcurrent device, and

(2) The sum of the motor full-load currents exceeds 1 percent of the interrupting rating of the lower-rated circuit breaker.

Substantiation: Series ratings involve the use of downstream circuit breakers that, operating alone, do not have the ability to interrupt the available fault current at the downstream location. At first glance, this is a departure from 110.9 of the Code that requires "Equipment intended to interrupt current at fault levels shall have an interrupting rating sufficient for the nominal circuit voltage and the current that is available at the line terminals of the equipment". However, the code permits series ratings where, for fault currents above the downstream breaker rating, the interruption is aided by the simultaneous operation of an upstream device (circuit breaker or fuse) that is fully rated for the application. Safety is maintained by the correct operation of both the downstream and upstream devices, and UL 489 Section 7.12 contains extensive test requirements to ensure this safety. Devices that meet the requirements of UL 489 Section 7.12 are UL Recognized Components, and UL will only List an assembly (panelboard or switchboard) that contains these Recognized Components following UL's consideration of the interaction between the series rated components and the assembly. For tens of years, and from a safety standpoint, this has been the only code-permitted method of permitting circuit breakers to be used at circuit locations where the available fault current exceeds the circuit breaker's interrupting ability. This method is covered by 240.86(B) of the present code language and should be retained.

But 240.86 of the NEC 2005 now contain an alternative method for determining Series Ratings: (A) Selected under Engineering Supervision in Existing Installations. Here it is possible to depart from 110.9 of the Code provided the series rated combination is selected by a licensed professional engineer engaged primarily in the design or maintenance of electrical installations. However, from the standpoint of all circuit breaker manufacturers, this is a serious departure from electrical safety (1). If it were possible to select circuit breaker combinations or fuse/circuit breaker combinations on a reliable and safe basis, then circuit breaker manufacturers would have been pressing for this allowance for many years. Testing is expensive and time consuming. However, circuit breaker manufacturers have been unable to determine methods for combination-selection that ensure public safety. A further concern with the present code language is that there is absolutely no qualification on the devices that can be considered for selection. Thus the IEEE Representative, Dennis Darling provided an Affirmative Comment (ROC May 2004, page 780-140) that reads in part "Field selection of series combinations for existing breakers can only be done on breakers classified as passive devices that will not attempt to open instantly on high fault currents. All engineers who are field selecting series combinations for existing installations should be aware that all molded case circuit breakers and almost all power breakers not shipped with current limiting devices are active devices that attempt to interrupt the circuit instantly. This introduces dynamic arc impedance that will tend to lower fault available at the current limiting fuse. This is true even if the breakers do not have an instantaneous setting, and, therefore, should not be used in a series combination that is not tested as a combination device with a current limiting fuse". None of the qualifications and cautions addressed by the IEEE Representative appears in the present code language.

In addition, it must be stressed that untested combinations will have unknown performance. By having the engineering selection method in the NEC, users of the NEC assume that there is a solid basis for accepting them. But even if the upstream device clears the circuit, the damage at the downstream position can be significant in the event of a short circuit above the rating of the downstream circuit breaker. With unknown performance, does CMP-10 consider these ratings suitable for application under 110.9? With unknown results, are these considered "series ratings"?

If the desire is to have an allowance for a lesser requirement for existing installations that are unlikely to be upgraded for safety, these lesser requirements do not belong in the National Electrical Code that deals with safety requirements for new and upgraded installations.

1. "Engineered Series Ratings: Is it Practical?", NEMA Whitepaper, 2005

Panel Meeting Action: Reject

Panel Statement: The submitter has not supplied any new information to necessitate the removal of this provision.

The limited allowance for use of engineered systems as permitted in 240.86(A) is needed to provide safety alternatives in existing installations.

The panel understands the concerns expressed during review of this proposal. See panel action and statement on Proposal 10-50a (Log #CP1001).

Number Eligible to Vote: 12

Ballot Results: Affirmative: 9 Negative: 3

Explanation of Negative:

KIMBLIN, C.: NEMA considers that 240.86(A) dealing with the selection of series ratings under engineering supervision should be deleted. The additional wording of panel Proposal 10-50a (Log #CP1001) provides only one of the necessary safety parameters that would make an engineered series rating possible. The performance of the equipment bus and enclosure(s) also need to be considered. Thus, the entire assembly is considered in the test combination of 240.86(B). The interests of electrical safety are best served by overall deletion of 240.86(A), and series ratings selected under engineering supervision should be reserved for the special permissions granted by 90.4.

KOVACIK, J.: Allowing the determination of acceptable series combinations under engineering supervision is technically counter to the experience and expertise of the manufacturers of the affected downstream products (circuit breakers). It is important for the panel to keep the history of series ratings in mind. Years ago, systems were "engineered" to try to accomplish exactly what is being proposed. Manufacturers learned through field and laboratory experience that the "engineering" methods employed were flawed and could result in problems with the application of products in the field. Since learning of those issues, extensive testing programs under strict third party supervision have been developed to determine appropriate safe combinations of overcurrent devices. That testing program is the only accepted means available to the industry today. The panel is assuming that a "licensed professional engineer" can determine what is needed to engineer a safe system. Circuit breaker manufacturers have licensed engineers that are engaged every day in circuit breaker design and application and those engineers have not been able to establish an acceptable "engineering" method that can consistently and coherently be applied. If an acceptable safe method were available, circuit breaker manufacturers would use it to avoid expensive testing associated with establishing series ratings between circuit breaker combinations and fuse/circuit breaker combinations. The bottom line is that the code panel is allowing a code rule to exist that permits a product to be used in a manner that is directly counter to the instructions issued by the manufacturer and the listing of the product.

We believe that Code-Making Panel 10 has stepped outside of its scope in allowing engineering supervision as a means of series combination selection to remain. We believe that this attempts to redefine the safety performance of a product in a manner that is above and beyond its rating, directly counter to the product standard and counter to 110.3(B).

WILLIAMS, G.: There is no recognized standard that supports this method of engineering calculation and there is no means for the inspector to insure the engineering method used was correct.

Section 240.86(A) creates a false sense of security to the installer and anyone who services this type of installation; this causes great concern for the workers safety if there was a fault. Attending safety seminars instructed by OSHA and other recognized specialists showed that most faults occur when the person is working on equipment when it is energized.

To this day the only way to be sure that the combination of overcurrent devices is working properly is by controlled laboratory testing. I do not believe that NEMA has come up with any equipment that would be suitable to apply calculations to determine the adequacy of a series rating.

10-50a Log #CP1001 NEC-P10 **Final Action: Accept**
(240.86(A))

Submitter: Code-Making Panel 10,

Recommendation: In the existing Code text, add a new last sentence to 240.86(A) to read as follows:

"For calculated applications, the engineer shall ensure that the downstream circuit breaker(s) that are part of the series combination remain passive during the interruption period of the line side fully rated, current-limiting device."

Substantiation: This sentence is added to clarify the requirement for the licensed professional engineer.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
KOVACIK, J.: This recommendation, though a compromise effort falls short in that there is no reliable, foolproof method for an engineer to determine whether a circuit breaker, especially one that has been in service for some time will truly behave as a passive device during an interrupting event. We continue to maintain that the testing of series combinations remains the only consistently reliable method for ensuring safe performance and the reliable protection of conductors, equipment and individuals.

10-51 Log #562 NEC-P10 **Final Action: Reject**
(240.86(A))

Submitter: John W. Young, Siemens Energy & Automation
Recommendation: Revise text to read:
(A) Selected Under Engineering Supervision in Existing Installations. The series rated combination devices shall be selected by a licensed professional engineer engaged primarily in the design or maintenance of electrical installations. the selection shall be documented and stamped by the professional engineer. This documentation shall be available to those authorized to design, install, inspect, maintain, and operate the system. This series combination rating, including identification of the upstream device, shall be field marked on the end use equipment. <u>The name and identification of the engineer determining the rating shall be clearly marked on the end use equipment.</u>
Substantiation: The 2005 NEC was revised by CMP-10 to allow engineered series ratings to be determined by someone other than the manufacturer of the products. The revision did require that the rating be field marked on the end use equipment but it does not require that the engineer determining the rating and claiming the rating to be identified. This information should be marked on the product to clearly identify who determined the rating.
Panel Meeting Action: Reject
Panel Statement: The existing provisions in 240.86(A) provide adequate and specific requirements for design documentation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-52 Log #567 NEC-P10 **Final Action: Accept in Principle in Part**
(240.86(A))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 1 for comment.
Submitter: Jeffrey A. Fecteau, City of Peoria, Arizona
Recommendation: Revise as follows:
The series rated combination devices shall be selected by a licensed professional engineer engaged primarily in the design or maintenance of electrical installations. The selection shall be documented and stamped by the professional engineer. This documentation shall be available to those authorized to design, install, inspect, maintain, and operate the system. This series combination rating, <u>actual fault current, and</u> identification of the upstream device, shall be field marked on the end use equipment. <u>When the series combination rated line side overcurrent device is remotely located from the load side circuit breaker(s), identification of the line side series combination rated device shall be legibly marked in the field to indicate the equipment has been applied with a series combination rating and shall indicate its series rating and replacement type.</u>
<u>CAUTION – SERIES COMBINATION RATED SYSTEM REPLACE WITH:</u>
<u>TYPE BREAKER</u>
<u>TYPE FUSE</u>
Substantiation: By marking the actual fault current on the end use equipment, this would identify what the minimum AIC rating of the circuit breaker(s) that may be installed and considered fully rated.
By requiring the field marking at the line side device of a remotely located series rated combination, this will identify this device as part of a series rated combination. As currently allowed by the NEC, the series rated load side device may be compromised by replacement of the line side series rated device with a device not identified as compatible with the series rated combination. This will also add clarity to 110.22 "...the equipment enclosure(s) shall be legibly marked in the field to indicate the equipment has been applied with a series combination rating." I would consider the term enclosure(s) with the (s) to mean where the line side overcurrent device is located remotely from the load side device; both enclosures shall be marked and readily visible. This clarity is needed to limit the confusion and promote consistency within the electrical inspection and installation communities.
Panel Meeting Action: Accept in Principle in Part
Revise the proposed wording to read as follows:
"The series rated combination devices shall be selected by a licensed professional engineer engaged primarily in the design or maintenance of electrical installations. The selection shall be documented and stamped by the professional engineer. This documentation shall be available to those authorized to design, install, inspect, maintain, and operate the system. This series combination rating, including identification of the upstream device, shall be field marked on the end use equipment.
The marking shall be readily visible and state the following:
CAUTION – SERIES COMBINATION SYSTEM
RATED _______ AMPERES. REPLACE WITH:
_________TYPE BREAKER
________TYPE FUSE"
Insert the text added by the action on Proposal 10-50a (Log #CP1001) here.
Panel Statement: The wording "actual fault current, and" has been deleted as a result of the panel actions and statements on Proposal 10-41 and 10-42.
The remainder of the proposal text has been modified to clarify that both line side and load side devices are required to be marked regardless of where they are located.
In addition, the panel requests that the Technical Correlating Committee forward this proposal to Code-Making Panel 1 for comment.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-53 Log #2686 NEC-P10 **Final Action: Reject**
(240.86(A))

Submitter: Dorothy Kellogg, American Chemistry Council
Recommendation: Revise 240.86(A), as follows:
(A) Selected Under Engineering Supervision in Existing Installations. The series rated combination devices shall be selected by a person knowledgeable through experience and training in the design and maintenance of such electrical installations. The selection shall be documented and shall be available to those authorized to design, install, inspect, maintain, and operate the system. This series combination rating, including identification of the upstream device, shall be field marked on the end use equipment.
Substantiation: <u>Problem:</u> The existing text is too specific about the nature of the person making the design determination. The NEC is used in locations outside the United States that have different regulations regarding design work, and engineering regulations vary even within the United States.
<u>Substantiation:</u> There are many electrical design activities under the scope of the Code that are of similar complexity but do not have similar code text about the design and documentation. It should be sufficient here to require that the calculations be performed by a sufficiently qualified individual. Local and state laws governing electrical design and engineering already cover issues such as certification (document stamping) requirements for engineering work, and the NEC should not attempt to duplicate or rewrite these regulations, which again will vary from location to location.
It is felt that the proposed revision is functionally equal to or stronger than the original language, without being too specific about the credentials of the person performing the work or how the work is to be certified.
Panel Meeting Action: Reject
Panel Statement: The panel had significant discussions on this specific topic during the development of the 2005 NEC and concluded that in order to address the safety concerns of the panel it was deemed necessary to require a licensed professional engineer.
Section 90.4 provides the ability to permit alternate qualifications.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
FREDERICKS, C.: I'm voting against the panel action. I agree with the submitter's substantiation that there could be personnel well-qualified to perform this task who are not licensed professional engineers.

10-54 Log #3489 NEC-P10 **Final Action: Reject**
(240.86(A))

Submitter: Alan Manche, Square D Co.
Recommendation: Delete NEC **240.86(A) Selected Under Engineering Supervision in Existing Installations.**
~~**NEC 240.86(A) Selected Under Engineering Supervision in Existing Installations.** The series rated combination devices shall be selected by a licensed professional engineer engaged primarily in the design or maintenance of electrical installations. The selection shall be documented and stamped by the professional engineer. This documentation shall be available to those authorized to design, install, inspect, maintain, and operate the system. This series combination rating, including identification of the upstream device, shall be field marked on the end use equipment.~~
Substantiation: I have been asked to speak to a number of engineers, consultant, and inspectors across the country on this subject. Much confusion resides around this topic with numerous professional engineers, contractors and inspectors. The NEC provides absolutely no guidance on how to apply this section and the information available to the industry fails to demonstrate any clear procedure or confidence that a set of parameters exists to support applying this section. How can compliance with this section be assured and meet the level of performance necessary for a safe installation? The erroneous application of this section places people and facilities at risk; therefore it is prudent to delete this section.
Evident from Mr. Callanan's testimony at the NFPA Standards Council meeting on July 14, 2004, he takes a strong position on electrical safety for people and facilities that we all share. I along with my company share the same

goal in electrical safety and this section is unfortunately undermining electrical safety and being misapplied. We have leaned on the professional engineering community to solve a technical issue that goes well beyond their expertise. We have ask the contractor and inspection community to "trust" these engineering judgments. Do you "trust" the engineer or do you follow the manufacturer's instructions and ratings in accordance with 110.3(b)? By accepting the provision of this section of the NEC, the contractor and inspector are ask to violate NEC 110.3(b) and utilize the equipment outside the parameters for which it was designed.

Here are a few facts and testimony that should be reviewed:

1) Listed Molded Case Circuit Breakers (UL 489) are not passive devices. This NEC section should not be applied when Listed molded case circuit breakers are a component of the system under consideration for an engineered series rating.

Mr. Ockuly's testimony at the NFPA Standards Council meeting held on July 14, 2004 with regard to this issue indicates that this section of the NEC is not intended for installations that use molded case circuit breakers which exhibit dynamic impedance, it is intended for "installations out in the field where there are circuit breakers, many of them airframe circuit breakers, that do not even come under the standard that Mr. Gregory refers to as UL 489."

2) The series rating under consideration may not be limited to the first overcurrent device in the system. All overcurrent devices located in the system that are underrated must be included in the engineering evaluation. The performance of the overcurrent protective devices for a series rating would be considered acceptable if all of the following four criteria are met by the upstream overcurrent protective device:

(1) It reduces the let-through current to a value below the interrupting rating of the downstream circuit breaker.

(2) It clears the circuit at a time before the contacts of the downstream circuit breaker **begin** to open.

(3) Items (1) and (2) are true for all current levels from the rating of the downstream circuit breaker through the series rating of the combination (not just at the maximum current level of the system).

(4) It has an interrupting rating at or above the engineered series rating.

How does the professional engineer obtain the information to satisfy the necessary criteria in items 1 or 2 above? Test data is required on the circuit breaker in order to understand when the contacts begin to part not only at the maximum fault level but across the range of fault current the devices may see during the fault condition.

3) The ANSI/IEEE 37.13 document provides cautionary guidance on the application of series ratings with low voltage power circuit breakers that may have catastrophic results if inappropriately applied. It notes that fused Low Voltage Power Circuit Breakers may have additional contacts and heavier operating springs than the standard circuit breaker to allow them to withstand the higher current they will see when subjected to a short circuit above their rating. These design differences also address higher temperatures they experience when operated together with a fuse. ANSI/IEEE C37.13 recommends against the application of series ratings.

The proponents of this section of the NEC appear to recognize the extremely limited application of this section, however instead of utilizing 90.4 in a very special circumstance for an airframe breaker, this section has not only opened the door for misapplication but has the electrical community using it as justification for misapplying fuses, molded case circuit breakers and power circuit breakers. From committee member comments, the section was introduced as a "better" solution that what was available at this point. A "better" solution is a dangerous path for any electrical safety committee to embrace when the technology and equipment is and has been available for decades to address the safety issues in the section of the NEC. To further fuel the issue it is unfortunate that engineers and jurisdictions have attempted to use this section to justify installations based on the panel introducing this section which creates a more significant safety hazard that was attempting to be solved.

Permission in the NEC to utilize products beyond their ratings places our company, which manufactures these products, in an interesting position. How is our customer service department to respond? How are we to defend the proper application of our products with such product application in the NEC? The manufacturer is in the best position to understand and provide appropriate guidance for the application of product and yet the panel as well as the engineering community believes they have enough information to establish these ratings and understand this issue better than the manufacturer. This will result in the misapplication of product above its rating and the engineering community making a decision to apply products in accordance with the NEC against the recommendations for manufacturer.

I urge the committee to accept this proposal and delete permission for the selection of series ratings under engineering supervision.

Panel Meeting Action: Reject

KOVACIK, J.: See my explanation of negative vote on Proposal 10-50.

10-55 Log #2977 NEC-P10 **Final Action: Reject**
(240.87)

Submitter: Paul A. Keleher, Paul Keleher Electrical Services

Recommendation: Add text to read as follows:

<u>240.87 Defined Instantaneous Trip (DIT) Circuit Breakers.</u>

<u>(A) Definitions. The nominal instantaneous trip current is 11 times the rated current of the circuit breaker. A standard circuit breaker manufactured with a fixed instantaneous pick-up setting shall open the circuit within 1/2 cycle of being subjected to the nominal instantaneous trip current or greater, with an acceptable variation in the listing test range of 130-210 amperes.</u>

<u>(B) Circuit Breakers Installed in Dwelling Units. Standard circuit breakers installed in a dwelling unit to protect branch circuits rated 20 amperes or less at 120 volts to ground shall be of the DIT type.</u>

<u>(C) Marking. Any standard circuit breaker installed in accordance with 240.87(B) shall be marked by the manufacturer such that the letters "DIT" will be clearly visible after installation.</u>

Substantiation: Overcurrent in a branch circuit can occur as a result of a current load placed on a circuit that exceeds the rating of the circuit, or from damage to one or more components or the insulation in the circuit that results in current flowing where it should not flow, a fault condition. The overcurrent protection means required by 240.21 in branch circuits should be required to provide specific protection from the hazardous effects of overcurrent from both overload conditions and from fault conditions. UL standard No. 489 requires that standard circuit breakers be tested to respond to decreasing time pick-up tests of 135 percent, 200 percent and 600 percent of the rated current of the circuit breaker as protection against excess loading of a circuit 1 ; however, no protective response to fault-level overcurrent is specified in the requirements for standard circuit breakers. The submitter suggests that the optimal fault-level overcurrent protection in a standard circuit breaker requires limiting the energy delivered from a fault that is capable of causing ignition to the greatest extent possible in order to mitigate the risk of fire. This can be easily achieved by incorporating an instantaneous trip setting that is as low as possible without incurring an undue risk of nuisance tripping from normal inrush and starting load currents. A UL investigation 2 and the long experience of circuit breaker manufacturers have demonstrated a sufficient understanding of the threshold required to eliminate nusiance tripping in residential environments to now safely require all standard circuit breakers rated 20 amperes or less installed in dwelling units to provided a defined instantaneous pick-up as protection against fault conditions in addition to their present requirements for long-time pick-up and other existing requirements.

The fact that the major manufacturers of standard circuit breakers commonly installed in dwelling units voluntarily provide an instantaneous response in their residential product lines, despite the fact that they are not required to do so, is implicit testimony that circuit breaker manufacturers must believe that an instantaneous response is necessary. The instantaneous pick-up setting of this voluntary response is set at the discretion of each manufacturer. Prior to the mid 1990's these settings ranged from 10-25 times the rated current of the circuit breaker resulting in a fault current as high as 450 amperes necessary to clear the overcurrent immediately. Underwriters Laboratories found in a fact-finding study conducted in 1993 that the average available short circuit current in 943 15-amp residential branch circuits studied is 300 amperes. 2 Following publication of this study, several several manufacturers of residential thermal/magnetic circuit breakers voluntarily reduced the instantaneous pick-up settings of their residential lines of 15 and 20-amp circuit breakers to self-defined settings that the UL study suggested would reduce the incidence of fire from the hazards of overcurrent. In addition, at least two manufacturers have consistently maintained and successfully implemented similar instantaneous pick-up settings for many years, reflecting their connviction of the positive value in keeping the instantaneous pick-up setting as low as possible in residential environments. The experience of these circuit breaker manufacturers with millions of circuit breakers in the field over a long period of time has demonstrated that an instantaneous pick-up setting in the range suggested by this study will not incur significant incidence of nuisance tripping in typical residential environments. In addition, the UL study referenced in footnote 2 conducted testing for nuisance tripping and concluded in summary that nuisance tripping does not occur in any circuit breaker with a nominal instantaneous trip setting higher than 105 amperes. A nominal instantaneous trip setting of 11 times the rated current of the breaker should provide ample margin for tolerance from nuisance tripping. Furthermore, this proposal should not require a significant deviation from current practice for breaker manufacturers, but rather will simply make an instantaneous trip setting that is close to current practice standardized and part of permanent practice. Without modification, the present standard will not prevent any manufacturer from reverting to a higher instantaneous pick-up setting or even eliminating it altogether if they should so choose. This proposal will merely bring the standards for requirements into line with existing practice. This proposal is directed toward standard circuit breakers since they make up the vast majority of overcurrent protection installed in residential circuits. This proposal is not intended to have any impact on the requirements for AFCI, GFCI or HACR circuit breakers, which are listed separately from standard circuit breakers.

The requirement for DIT rated circuit breakers is limited to dwelling units where inrush currents have been studied and similar instantaneous settings have been in regular use for many years. Non-resideníal commercial/industrial environments and heavier, 240-volts branch circuits ranging from 30A-60A have, therefore, been excluded from the requirements of this proposed article since those circuits are likely to contain appliance loads with a wider variety of inrush and starting currents than are found in typical residential environments.

The purpose of the proposed 240.87(C) is to facilitate the obligation of the Authority Having Jurisdiction to assure installation of a branch circuit breaker listed per 240.87 by requiring the manufacturer of DIT circuit breakers to clearly identify this performance characteristics on the exterior surface of the breaker where it will be visible after installation.

For a detailed explanation of the specific changes to UL489 that would be acceptable under this proposal, the submitter refers the code panel to a proposed revision to UL489 entitled SUPPLEMENT FOR MOLDED CASE CIRCUIT BREAKERS HAVING SPECIFIED INSTANTANEOUS TRIP LEVELS, pages A-1 through A-3, which is part of the Underwriters Laboratories, October 25, 1993 Fact-Finding Report on An evaluation of Branch Circuit Breaker Instantaneous Trip Levels, file E87837 cited elsewhere in this proposal and provided hereto by reference. The submitter offers that the above-cited Supplement to Standard UL489 is acceptable in its entirety with the following exception: The paragraph entitled, “PERFORMANCE/ Instantaneous Trip Test” be changed to read as follows: “A 15 or 20 ampere rated circuit breaker having a defined instantaneous trip shall trip in 1/2-cycle (or less) when tested in accordance with the following test procedure: A fault current in the range of 130-210 amperes shall be applied for a 1/2-cycle.”

1 Underwriters Laboratories standard: UL 489/10-31-1996; pp 33.35.36: Tests for Standard Circuit Breakers

2 Underwriters Laboratories, October 25, 1993 Fact-Finding Report on An evaluation of Branch Circuit Breaker Instantaneous Trip Levels, file E87837, Summary, pages 14-17

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The panel understands that the submitter’s intent is to limit the energy delivered from a fault condition “that is capable of causing ignition to the greatest extent possible in order to mitigate the risk of fire.” The “DIT” concept was presented to the NEC during the development of the 1996 NEC, and it was determined that such protection and technology would not provide the level of protection necessary. This is recognized by the submitter’s substantiation that protection would be “the greatest extent possible.” At that time, the panel also took into consideration UL Fact Finding Report E878837. The arc-fault circuit interruption technology was accepted as an answer to address the protection sought from the 1993 proposal and is a technology that will more comprehensively address the concern of the submitter.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

10-56 Log #2696 NEC-P10 **Final Action: Accept**

(240.91 (New))

TCC Action: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal with respect to introducing a single subsection. This action will be considered by the Panel as a Public Comment.

Submitter: Dorothy Kellogg, American Chemistry Council

Recommendation: Add new 240.91, as follows:

240.91 Protection of Conductors. Conductors shall be protected in accordance with 240.4, unless otherwise permitted in 240.91(A).

(A) Devices Rated over 800 Amperes. Where the overcurrent device is rated over 800 amperes, the ampacity of the conductors it protects shall be equal to or greater than 95% of the rating of the overcurrent device defined in 240.6, where the conductor is protected within recognized time vs. current limits for all short circuit currents of up to 1000 seconds duration.

Substantiation: Problem: Existing NEC rules that effectively require large conductor overload protection at 100% of the ampacity by the overcurrent device are unnecessary and result in inefficient use of conductor materials in Supervised Industrial Installations.

Substantiation: The proposal introduces the equivalent of a “next standard size” exception for large conductors in Supervised Industrial Installations. In these installations, conductors are protected against overload by load calculation and by monitoring, and against short circuit by selection of the overcurrent device as part of an overcurrent coordination study. These factors make overload protection by the overcurrent protection device less critical for these installations. The proposed rule would allow standard conductor sizes to be more readily used with standard overcurrent device sizes in these installations.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 9 Negative: 3

Explanation of Negative:

KIMBLIN, C.: This change is the relaxation of a safety rule that has been in place for over 40 years and NEMA does not accept the substantiation statement that the factors associated with Supervised Industrial Installations make overload protection by the overcurrent device selection less critical. No testing has been performed to show that a 95% ampacity rule permits the safe application of lower ampacity conductors for all currents above 800A. Here it is noted that a 5% reduction in conductor ampacity will be associated with a 10% increased heating load. Further, products such as circuit breakers and switches are evaluated with conductors of the correct ampacity. One reason is to determine acceptable temperature rises at device terminals. However, the substantiation does not address the product impact of these additional heating effects due to smaller conductors. It is noted that a similar Proposal, 10-9, dealt with a relaxation of ampacity protection requirements to 1600A. This proposal was rejected, and the panel statement reflects the panel’s reservations. The safety concerns expressed in that 10-9 panel statement are not resolved by permitting relaxed ampacity protection requirements in supervised industrial installations.

KOVACIK, J.: The issue here is virtually identical to that raised in Proposal 10-9, which the Panel rejected. Specifically, quoting from the Panel Statement on Proposal 10-9, “It is noted that the amount of heat generated in a conductor increases as the square of the current through that conductor, and the characteristics of overcurrent devices are such that overloads are tolerated for significant periods of time before the device operates. At the very least, a study should be conducted to demonstrate that the conductors and equipment would not sustain damage from carrying the current permitted by this proposal. For example, the proposer could approach UL through their open Standards Technical Panel process to address the listing requirements.”

SOBEL, R.: Submitter offers no technical substantiation. See panel statement for the rejection of Proposal 10-9.

10-57 Log #1564 NEC-P10 **Final Action: Accept**

(240.100(A)(1))

Submitter: Technical Correlating Committee on National Electrical Code

Recommendation: Make the following change in 240.100(A)(1):

Change “neutral” to “neutral conductor.”

The revised text would appear as follows:

An overcurrent relay element, operated from a current transformer that links all phases of a 3-phase, 3-wire circuit, shall be permitted to replace the residual relay element and one of the phase-conductor current transformers. Where the neutral conductor is not regrounded on the load side of the circuit as permitted in 250.184(B), the current transformer shall be permitted to link all 3-phase conductors and the grounded circuit conductor (neutral).

Substantiation: This proposal was developed by the TCC Task Group on the definition of “Neutral Conductor.” Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).

The Task Group has proposed the following definitions to be added to Article 100:

● **Neutral conductor.** A circuit conductor connected to the neutral point of a system.

● **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.

This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals

● The use of the word ”neutral” as a noun should be avoided. The terms “neutral conductor” or “neutral point” should be used wherever grammatically possible.

● The phrase “grounded circuit conductor (neutral)” should be avoided. The phrases “grounded circuit conductor” or “grounded circuit conductor or neutral conductor” should be used as appropriate.

Additional information is available in the Task Group report.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

10-58 Log #1108 NEC-P10 **Final Action: Reject**

(240.100(A)(2))

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Revise as follows:

A fuse shall be connected in series with each ungrounded conductor and also the grounded conductor where fuses are used for overload protection .

Substantiation: This is required in 430.36. Fuses are permitted for overload protection in 430.225(B)(1) for over 600 volt motors.

Panel Meeting Action: Reject

Panel Statement: Fuses are not used for motor overload protection at high voltage. The reference to 430.36 in the submitter’s substantiation applies to corner grounded delta systems that are not utilized for high voltage motor applications.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

ARTICLE 250 — GROUNDING

5-48 Log #1540 NEC-P05 **Final Action: Accept**
(250)

TCC Action: The Technical Correlating Committee notes that in the proposal the text for 250.96(A) is incorrect in that it does not reflect the existing code text. The Technical Correlating Committee understands that the word "effectively" is to be deleted in 250.96(A). The Technical Correlating Committee directs that the panel reconsider the proposal and verify the action in 250.96(A). This action will be considered by the panel as a public comment.

The Technical Correlating Committee further directs that this proposal be referred to the the Technical Correlating Committee Task Group on Grounding and Bonding for comment.

Submitter: Technical Correlating Committee on National Electrical Code

Recommendation: Delete the term "effectively" from the terms "effectively grounded" and "effectively bonded" from Articles 250 and revise text as shown for the affected NEC sections.

250.52(A)(1): (1) Metal Underground Water Pipe. A metal underground water pipe in direct contact with the earth for 3.0 m (10 ft) or more (including any metal well casing ~~effectively~~ bonded to the pipe) and electrically continuous (or made electrically continuous by bonding around insulating joints or insulating pipe) to the points of connection of the grounding electrode conductor and the bonding conductors. Interior metal water piping located more than 1.52 m (5 ft) from the point of entrance to the building shall not be used as a part of the grounding electrode system or as a conductor to interconnect electrodes that are part of the grounding electrode system.

250.52(A)(7): (7) Other Local Metal Underground Systems or Structures. Other local metal underground systems or structures such as piping systems, underground tanks, and underground meCtal well casings that are not ~~effectively~~ bonded to a metal water pipe.

250.53(B): (B) Electrode Spacing. Where more than one of the electrodes of the type specified in 250.52(A)(5) or (A)(6) are used, each electrode of one grounding system (including that used for air terminals) shall not be less than 1.83 m (6 ft) from any other electrode of another grounding system. Two or more grounding electrodes that are ~~effectively~~ bonded together shall be considered a single grounding electrode system.

250.58 Two or more grounding electrodes that are ~~effectively~~ bonded together shall be considered as a single grounding electrode system in this sense.

250.92(A): (A) Bonding of Services. The non–current-carrying metal parts of equipment indicated in 250.92(A)(1), (A)(2), and (A)(3) shall be ~~effectively~~ bonded together.

250.96(A): (1) Supply Cord or Permanent Feeder. The green-colored insulated equipment grounding conductor ~~wire~~ in the supply cord or permanent feeder wiring shall be connected to the equipment grounding terminal bar ~~bus~~ in the distribution panelboard or disconnecting means.(2) Electrical System. In the electrical system, all exposed metal parts, enclosures, frames, lamp fixture canopies, and so forth shall be connected ~~effectively bonded~~ to the equipment grounding terminal bar or enclosure of the distribution panelboard.

250.136: 250.136 Equipment Considered ~~Effectively~~ Grounded. Under the conditions specified in 250.136(A) and (B), the normally non–current-carrying metal parts of the equipment shall be considered ~~effectively~~ grounded.

Substantiation: 250.52(A)(1): The term "effectively bonded" is undefined and is undefined in the NEC, vague, and not enforceable. The revision deletes the word "effective" without impact to the meaning or requirement in the rule.

250.52(A)(7): The term "effectively bonded" is undefined and is undefined in the NEC, vague, and not enforceable. The revision deletes the word "effective" without impact to the meaning or requirement in the rule.

250.53(B): The term "effectively bonded" is undefined and is undefined in the NEC, vague, and not enforceable. The revision deletes the word "effective" without impact to the meaning or requirement in the rule.

250.58: The term "effectively bonded" is undefined and is undefined in the NEC, vague, and not enforceable. The revision deletes the word "effective" without impact to the meaning or requirement in the rule.

250.92(A): The term "effectively bonded" is undefined and is undefined in the NEC, vague, and not enforceable. The revision deletes the word "effective" without impact to the meaning or requirement in the rule.

250.96(A): This section has been revised to be more prescriptive regarding the use of the term "equipment grounding conductor and connections to it.

The term "effectively bonded" is undefined and is undefined in the NEC, vague, and not enforceable. The revision deletes the word "effective" without impact to the meaning or requirement in the rule.

250.136: The definition is ambiguous and very subjective without any defined values or parameters for one to judge as either "effective" or "ineffective."

This is the result of the TCC Task Group on Grounding and Bonding in resolve of the 2005 NEC cycle actions related to Proposal 5-1 and Comment 5-1 as directed by the Technical Correlating Committee. This is a companion proposal to delete the term "grounded, effectively" and its definition from Article 100 and other companion proposals throughout the NEC relative to this Task Group's recommendations. The substantiation of this proposal is as follows.

The term "Effectively Grounded" is used 29 times in the NEC. It appears as though in the majority of the locations where it is used, the word "grounded" or phrase "connected to an equipment grounding conductor" could be used. Other proposals are submitted to make those changes.

The 1996 NEC in Section 250.51 used the term "effective grounding path," and those concepts were incorporated in 250.2 (1999 NEC) and then expanded in 250.4(A) and (B) in the 2002 NEC. The performance criteria of grounding and bonding are currently provided in Section 250.4 and include the concepts contained in the vague definition of the term "effectively grounded."

The definition "Effectively Grounded" is very subjective and without any defined values or parameters for one to judge grounding as either "effective" or "ineffective." "Effective" is described in Section 250.4(A) and (B), but it relates to the effective ground-fault current path as a performance criteria. Deleting the term in the NEC and the definition is logical because there are no definitive parameters for Code users to make a determination on what constitutes "effectively grounded." Systems are solidly grounded, grounded through a resistor or impedance, or ungrounded. Equipment (normally noncurrent-carrying metal parts are grounded where connected to an equipment grounding conductor.

This proposal is to change the term "Effectively Bonded" to just "Bonded" in each of the section where it is used. The term "Effectively Bonded" is currently not defined in the NEC.

The term "effectively bonded" is also used a few times in the NEC and is undefined. The same situation exists. There are no defined parameters for Code users to judges what the difference between "Effectively Bonded" and "Bonded" really is. Where the term appears in the NEC, it is revised to just "bonded" and still has the same meaning in each rule.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-49 Log #1669 NEC-P05 **Final Action: Reject**
(250)

Submitter: Ben Jacks, Seattle, WA

Recommendation: Revise Article 250 Parts I thru IV 70-92 through 70-105 with new title:

Article 250 Electrical Ground Provisions

Substantiation: Eliminates context confusion between use of grounding and bonding and establishes clarity of an electrical "bond" as a connective joint application and "ground" as electrical conductive path relative to shared ground plane interfacing categories.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The existing article title and section titles are accurate in describing the content of the material. The suggested changes do not offer an improvement in clarity. The submitter makes numerous other proposed changes for which no substantiation was provided.

Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-50 Log #1775 NEC-P05 **Final Action: Reject**
(250)

Submitter: Ben Jacks, Seattle, WA

Recommendation: Revise Articles 250 Parts VI, VII, VIII, IX, and X to reflect changes of title and part numbering resequenced by relocating Part V as Article 251.

Substantiation: Changes are needed for sequential re-identification of the latter sections of Article 250.110 through 250.190.

Panel Meeting Action: Reject

Panel Statement: The submitter has not provided evidence that developing a new Article 251 from the current Part V of Article 250 is warranted. The proposed revision is not necessary and does not add clarity to Article 250.

Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-51 Log #444 NEC-P05 **Final Action: Reject**
(250.2)

Submitter: W. Creighton Schwan, Hayward, CA

Recommendation: In line 2, replace "permanent" with "reliable" so as to read:

An intentionally constructed, ~~permanent,~~ reliable, low-impedance electrically conductive path... (balance unchanged).

Substantiation: The Webster definition of "permanent" is, in part: "lasting, durable, intended to last or function indefinitely, not subject to removal."

The only connections in Article 250 that meet this definition are the irreversible compression-type connector and the exothermic welding process called for (plus bus bar connections) in 250.64(C). All of the others can be removed using appropriate tools.

Other methods of ground-fault current paths are recognized in 250.8 and 250.70 in particular, and in Parts V and VI of Article 250 in general.

Aside from the need for the NEC to be clear and specific in its requirements, there is the practical problem that the use of the word "permanent" where it is not intended may lead an unqualified inspector to make unreasonable requirements based on the literal wording.

Panel Meeting Action: Reject

Panel Statement: Section 3.2.4 of the NEC Style Manual recognizes the use of standard terms that have been established through accepted use or by definition. The proposed word "reliable" does not add clarity or improve usability in this section. The word "permanent" is generally understood as it relates specifically to the characteristics and integrity of the electrical installation and can more readily be applied by inspectors in practical application. The word "reliable" is subjective and less enforceable than the generally understood word "permanent" as used in this section.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-52 Log #1704 NEC-P05 **Final Action: Reject**
(250.2)

Submitter: Charles M. Trout, Maron Electric Company

Recommendation: Add new definition as follows:

Supplementary Grounding Electrode. A grounding electrode permitted to be installed, but not required to be installed.

Substantiation: There is considerable confusion in the field relating to the meaning of supplementary in Article 250. Webster's dictionary defines supplementary as forming a supplement. It defines supplement as something added to complete a thing or forming an addition to. Article 250 uses the term supplemental in 250.53(D)(2) requiring that a metal underground water pipe be supplemented by an additional electrode. Webster's dictionary defines additional as being supplementary.

Panel Meeting Action: Reject

Panel Statement: Defining supplementary grounding electrode is not necessary as the provisions for the installation are clearly stated in Section 250.54. The panel concludes that adding this definition will not add clarity.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-53 Log #1857 NEC-P05 **Final Action: Reject**
(250.2)

Submitter: Margarito Aragon, Jr., Santa Fe, NM

Recommendation: Add new text to 250.2 to read as follows:

<u>Objectionable Current. Current that flows through paths other than the intended grounded circuit conductors during normal operation of a system.</u>

Substantiation: Objectionable current is not defined in the NEC. ANSI/IEEE std 446-1987 has interpreted objectionable current, and states the following:

That neutral currents that flow through paths other than the intended grounded (neutral) circuit conductors during normal operation of a system will be deemed objectionable if they contribute to any of the following:

(1) Interference with the proper operation of equipment, devices, or systems that are sensitive to electromagnetic interference, such as electronic equipment, communications systems, computer systems, etc.

(2) Interference with the proper sensing and operation of ground-fault protection equipment.

(3) Arcing of sufficient energy to ignite flammable materials.

(4) Detonation of explosives during production, storage, or testing.

(5) Overheating due to heat generated in raceways, etc., as a result of stray current.

Panel Meeting Action: Reject

Panel Statement: The proposed definition does not match and is not supported by the submitter's substantiation. The definition is not appropriate, since it is not always feasible to avoid some current flow due to inductive and capacitive coupling within equipment and wiring systems.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-54 Log #3505 NEC-P05 **Final Action: Reject**
(250.2)

Submitter: Paul Dobrowsky, Holley, NY

Recommendation: Revise 250.2 as follows:

Effective ~~Ground~~ -Fault Current Path. An intentionally constructed, permanent, low-impedance electrically conductive path designed and intended to carry current under ~~ground-~~ fault conditions from the point of a ~~ground~~ fault on a wiring system to the electrical supply source and that facilitates the operation of the overcurrent protective device or ground fault detectors on high-impedance grounded systems.

Substantiation: The word "ground" should be deleted from this definition. The ground (earth) is not an effective fault current path and should not be use in the definition.

Panel Meeting Action: Reject

Panel Statement: The term "fault" applies to both short circuits and to ground faults. Both types of faults are the result of a breakdown of the insulation medium to a point that current flows. In the case of short circuits this breakdown is between ungrounded conductors and other phase ungrounded conductors or the system grounded conductor. A ground fault is a breakdown of insulation between an ungrounded conductor and the normally non-current-carrying metal enclosures, raceways, the equipment grounding conductor, the grounding electrode conductor, all of which are ultimately connected to ground (earth) and the earth. The revised term would not lead to greater clarity and would add confusion by not identifying the type of fault being addressed. The term "ground-fault" is very widely used in the electrical industry and is also defined in the IEEE Dictionary of Terms from which the NEC definition was derived.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-55 Log #3506 NEC-P05 **Final Action: Reject**
(250.2)

Submitter: Paul Dobrowsky, Holley, NY

Recommendation: Revise text to read:

~~Ground-~~ Fault Current Path. An electrically conductive path from the point of a ~~ground~~ fault on a wiring system through normally non–current-carrying conductors, equipment, or the earth to the electrical supply source.

FPN: Examples of ~~ground-~~ fault current paths could consist of any combination of equipment grounding conductors, metallic raceways, metallic cable sheaths, electrical equipment, and any other electrically conductive material such as metal water and gas piping, steel framing members, stucco mesh, metal ducting, reinforcing steel, shields of communications cables, and the earth itself.

Substantiation: The word "ground" should be deleted from this definition. The ground (earth) is not an effective fault current path and should not be use in the definition.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 5-54.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-56 Log #3599 NEC-P05 **Final Action: Accept in Principle**
(250.2)

Submitter: Douglas Hansen, Code Check

Recommendation: Add the words "or grounded circuit" as follows:

250.2 Ground Fault. An unintentional, electrically conducting connection between an ungrounded or grounded circuit conductor of an electrical circuit and the normally non–current-carrying conductors, metallic enclosures, metallic raceways, metallic equipment, or earth.

Substantiation: A fault between a grounded conductor and an equipment grounding conductor downstream of a point where those conductors are intended for bonding is a ground fault, and allows objectionable current on equipment grounding conductors. In a circuit with GFCI protection, such a ground fault will activate the ground fault mechanism.

The addition of these words does not create any inconsistency with other uses of the term "ground fault" in the NEC. The multi-grounded neutral systems in 250.184(C) are intentional connections, not the unintentional connections described in this section.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Proposal 5-57.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-57 Log #190 NEC-P05 **Final Action: Accept**
(250.2. Ground Fault.)

NOTE: The following proposal consists of Comment 5-35 on Proposal 5-49 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 5-49 was:

Revise the definition of "Ground Fault" as follows:

Ground Fault. An unintentional, electrically conducting connection between an ungrounded <u>or grounded</u> conductor of an electrical circuit and the normally non–current-carrying conductors, metallic enclosures, metallic raceways, metallic equipment, or earth.

The Technical Correlating Committee directs that Proposal 5-49 and Comment 5-35 be reported as "Hold".

The Technical Correlating Committee has recognized that the use of the term "ground fault" in other Articles such as 230 and 430 is inconsistent with the definition of "ground fault" proposed by Panel 5.

The Technical Correlating Committee will establish a Task Group to study this issue.

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Recommendation: Accept the proposal in principle, but consider the following suggested wording:

Ground Fault. An unintentional, electrically conducting connection between ~~an ungrounded or grounded~~ a normally current carrying conductor of an electrical circuit , and the normally non-current-carrying conductors, metallic enclosures, metallic raceways, metallic equipment, or earth.

Substantiation: The previously proposed words "an ungrounded or grounded conductor" are technically all inclusive. Everything is either ungrounded or grounded. It would be clearer and more specific to state between "normally current carrying" and "normally non-current carrying" conductors.

Panel Meeting Action: Accept

Panel Statement: This definition is located within Article 250.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-58 Log #1733 NEC-P05 **Final Action: Accept in Principle**
(250.2, FPN (New))

Submitter: Ronald J. Toomer, Toomer Electrical Company, Inc.

Recommendation: Add following:

FPN: Intentional or unintentional grounding connections to the grounded conductor on the load side of the service disconnecting means or the load side of a separately derived system, creates one type of ground fault condition addressed in the definition of ground fault.

Substantiation: The FPN informs users of one type of ground fault condition addressed in the definition of ground fault.

Panel Meeting Action: Accept in Principle

Remove the phrase "intentional or" so as to read as follows: FPN: Unintentional grounding connections to the grounded conductor on the load side of the service disconnecting means or the load side of a separately derived system, creates one type of ground fault condition addressed in the definition of ground fault.

This FPN should be placed after the definition of Ground Fault.

Panel Statement: The words "intentional or" were removed because Article 250 permits the grounded conductor to be regrounded in some cases, such as 250.32(B(2).

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-59 Log #551 NEC-P05 **Final Action: Accept**
(Table 250.3)

Submitter: Michael J. Johnston, Plano, TX

Recommendation: Add the following to Table 250.3:

Natural and Artificially Made Bodies of Water Article 682 Sections 682.30, 682.31, 682.32, 682.33

Substantiation: Article 682 was new for the 2005 NEC and includes Part III which is titled "Grounding and Bonding." Part III includes 682.30 and 680.31 which cover grounding, and 682.32 and 682.33 cover bonding. It seems appropriate to add the reference to Article 682 Part III to Table 250.3 for correlation.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

5-60 Log #488 NEC-P05 **Final Action: Accept**
(250.3 and Table 250.3)

Submitter: Michael J. Johnston, Plano, TX

Recommendation: Revise text to read:

250.3 Application of Other Articles. In other articles applying to particular cases of installation of conductors and equipment, grounding and bonding requirements are identified in Table 250.3 that are in addition to, or modifications of, those of this article.

Table 250.3 Additional Grounding and Bonding Requirements

Substantiation: The title of Article 250 was revised from "Grounding" to "Grounding and Bonding" in the 2005 NEC to be reflective of what is covered by the article. The articles and sections in other articles that are referred to from Table 250.3 often include not only grounding rules but also include bonding rules. It is appropriate to revise the title of the table to "Additional Grounding and Bonding Requirements."

Examples: Communications Circuits Article 800. Section 800.100(D) Bonding of Electrodes. 800.106 Primary Protector Grounding and Bonding at Mobile Homes, Article 610 Cranes and Hoists.

There are several more articles and sections referred to by Table 250.3 that include bonding requirements in addition to grounding requirements.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-61 Log #1519 NEC-P05 **Final Action: Accept in Principle**
(250)

TCC Action: The Technical Correlating Committee directs that the action on this proposal be sent to the Technical Correlating Committee Grounding and Bonding task group for review and comment.

Submitter: Technical Correlating Committee on National Electrical Code

Recommendation: Revise Article 250 as described in the following:

Figure 250.4 Title: Revise Figure 250.4 (Title) to read as follows: **Figure 250.4 Grounding and Bonding**

250.6 Title: Revise title to read as follows:

250.6 Objectionable Current over Equipment Grounding Conductors

250.24(A)(1): Revise Section 250.24(A)(1) as follows:

(1) General. The grounding electrode conductor connection shall be made at any accessible point from the load end of the service drop or service lateral to and including the terminal or bus to which the grounded service conductor is connected at the service disconnecting means.

250.24(A)(2) Exception: Revise Section 250.24(A)(2) Exception as follows:

Exception: The additional grounding electrode conductor connection shall not be made on high-impedance grounded neutral systems. The system shall meet the requirements of 250.36.

250.24(A)(3): Revise Section 250.24(A)(3) as follows:

(3) Dual Fed Services. For services that are dual fed (double ended) in a common enclosure or grouped together in separate enclosures and employing a secondary tie, a single grounding electrode conductor connection to the tie point of the grounded conductor(s) from each power source shall be permitted.

250.24(A)(5): Revise Section 250.24(A)(5) as follows:

(5) Load-Side Grounding Connections. A grounded conductor shall not be connected to ground, normally non-current-carrying metal parts of equipment, or equipment grounding conductor(s) ~~A grounding connection shall not be made to any grounded conductor~~ on the load side of the service disconnecting means. except as otherwise permitted in this article.

250.30(A)(3) Exception No. 2: Revise Section 250.30(A)(3) Exception No. 2 as follows:

Exception No. 2: Where a separately derived system originates in listed equipment suitable as service equipment, the grounding electrode conductor from the service or feeder equipment to the grounding electrode shall be permitted as the grounding electrode conductor for the separately derived system, provided the grounding electrode conductor is of sufficient size for the separately derived system. Where the equipment ground ing terminal bus internal to the equipment is not smaller than the required grounding electrode conductor for the separately derived system, the grounding electrode connection for the separately derived system shall be permitted to be made to the bus.

250 Part IV Title: Revise the title of Part IV of Article 250 as follows:

IV. Enclosure, Raceway, and Service Cable Connections ~~Grounding~~

Substantiation: Figure 250.4 Title: The words "and Bonding" were added to the Figure title to be consistent with the title of Article 250 since this figure describes the contents of the entire article.

250.6 Title: The word "Equipment" was added to this title to more specifically describe the conductor and grounding path being referred to in this section.

250.24(A)(1): These changes clarify the present requirement in more prescriptive language. This revision adds the words "electrode conductor" to provide more specific wording that relates to a defined term "grounding electrode conductor" rather than a more general term "grounding."

250.24(A)(2) Exception: These changes clarify the present requirement in more prescriptive language. This revision adds the words "electrode conductor" in the exception to provide more specific wording that relates to a defined term "grounding electrode conductor" rather than a more general term "grounding."

250.24(A)(3): These changes clarify the present requirement in more prescriptive language. This revision adds the word "conductor" to provide more specific wording that relates to a defined term "grounding electrode conductor" rather than a more general term "electrode" connection.

250.24(A)(5): These changes clarify the present requirement in more prescriptive language. This proposed revision adds more specific restrictions of the grounded conductor connections to any ground connection on the load side of the service disconnect. No other technical changes to the section are proposed, just clarification.

250.30(A)(3) Exception No. 2: The revision in this section changes the term "equipment ground bus" to "equipment grounding terminal bus" to provide consistency with the same term used in various other code sections.

250 Part IV Title: This change clarifies the present requirement in more prescriptive language in the title of this part in Article 250.

This is the result of the TCC Task Group on Grounding and Bonding in resolve of the 2005 NEC cycle actions related to Proposal 5-1 and Comment 5-1 as directed by the Technical Correlating Committee. This is a companion proposal to the proposed revision to the terms "bonded", "grounded", and "equipment grounding conductor" in Article 100 relative to this Task Group's recommendations. These changes clarify the present requirement in more prescriptive language.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle

Revise Article 250 as described in the following:

Item 1. Figure 250.4 Title: Revise Figure 250.4 (Title) to read as follows:

Figure 250.4 Grounding and Bonding

Item 2. Section 250.6 Title: Revise title to read as follows:

250.6 Objectionable Current ~~over~~ Equipment ~~Grounding Conductors~~

Item 3. Section 250.24(A)(1): Revise Section 250.24(A)(1) as follows:

(1) General. The grounding electrode conductor connection shall be made at any accessible point from the load end of the service drop or service lateral to and including the terminal or bus to which the grounded service conductor is connected at the service disconnecting means.

Item 4. Section 250.24(A)(2) Exception: Revise Section 250.24(A)(2) Exception as follows:

Exception: The additional grounding electrode conductor connection shall not be made on high-impedance grounded neutral systems. The system shall meet the requirements of 250.36.

Item 5. Section 250.24(A)(3): Revise Section 250.24(A)(3) as follows:

(3) Dual Fed Services. For services that are dual fed (double ended) in a common enclosure or grouped together in separate enclosures and employing a secondary tie, a single grounding electrode conductor connection to the tie point of the grounded conductor(s) from each power source shall be permitted.

Item 6. Section 250.24(A)(5): Revise Section 250.24(A)(5) as follows:

(5) Load-Side Grounding Connections. A grounded conductor shall not be connected to normally non-current-carrying metal parts of equipment, to equipment grounding conductor(s),or be reconnected to ground ~~A grounding connection shall not be made to any grounded conductor~~ on the load side of the service disconnecting means. except as otherwise permitted in this article.

Item 7. Section 250.30(A)(3) Exception No. 2: Revise Section 250.30(A)(3) Exception No. 2 as follows:

Exception No. 2: Where a separately derived system originates in listed equipment suitable as service equipment, the grounding electrode conductor from the service or feeder equipment to the grounding electrode shall be permitted as the grounding electrode conductor for the separately derived system, provided the grounding electrode conductor is of sufficient size for the separately derived system. Where the equipment ground ing bus internal to the equipment is not smaller than the required grounding electrode conductor for the separately derived system, the grounding electrode connection for the separately derived system shall be permitted to be made to the bus.

Item 8. Article 250, Part IV, Title: Revise the title of Part IV of Article 250 as follows:

IV. Enclosure, Raceway, and Service Cable Connections ~~Grounding~~

Panel Statement: The following itemized list is the substantiation for each itemized panel action that was changed from the proposal recommendation.

Item 2. Section 250.6 Title - Removed the words "over equipment grounding conductors" from the title to reflect what is covered in 250.6.

Item 6. Reorganized for clarity.

Item 7. Deleted "terminal" to be consistent with the product standards.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-62 Log #2104 NEC-P05 **Final Action: Accept in Principle**
(Figure 250.4)

Submitter: Rocco Prock, Efficient Electric

Recommendation: Revise the caption for Figure 250.4 as follows:

Figure 250.4 Grounding and Bonding .

Substantiation: The caption for Figure 250.4 Grounding should reflect what is included in the figure. Both grounding and bonding are represented in the figure.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Proposal 5-61.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-63 Log #1237 NEC-P05 **Final Action: Accept in Principle in Part**
(250.4(A)(2), (3) and (4))

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Revise text:

(2) Exposed noncurrent-carrying conductive material enclosing electrical conductors or equipment, or forming part of such equipment, where grounded, shall be connected to earth so as to limit the voltage to ground on these materials.

(3) Exposed noncurrent-carrying conductive materials enclosing electrical conductors or equipment or forming a part of such equipment, where grounded , shall be connected together and to the electrical supply source in a manner that establishes an effective ground-fault current path.

(4) Non-current-carrying electrically conductive materials...(remainder unchanged)..

Substantiation: Edit. Present wording does not allow for non-grounding of internal nonaccessible parts, double insulated equipment, or other Code provisions which exempt or prohibit grounding. The bonding requirements of (3) are not necessary where equipment is not grounded. Present wording of (4) includes conductors, which are conductive materials.

Panel Meeting Action: Accept in Principle in Part

Revise 250.4(A)(1) thru (A)(4) to read as follows:

(A) Grounded Systems

(1) Electrical System Grounding. Electrical systems that are grounded shall be connected to earth in a manner that will limit the voltage imposed by lightning, line surges, or unintentional contact with higher-voltage lines and that will stabilize the voltage to earth during normal operation.

(2) Grounding of Electrical Equipment. Normally non–current-carrying conductive materials enclosing electrical conductors or equipment, or forming part of such equipment, shall be connected to earth so as to limit the voltage to ground on these materials.

(3) Bonding of Electrical Equipment. Normally non–current-carrying conductive materials enclosing electrical conductors or equipment, or forming part of such equipment, shall be connected together and to the electrical supply source in a manner that establishes an effective ground-fault current path.

(4) Bonding of Electrically Conductive Materials and Other Equipment. Normally non-current carrying e lectrically conductive materials that are likely to become energized shall be connected together and to the electrical supply source in a manner that establishes an effective ground-fault current path.

Panel Statement: It is inappropriate to add the word "exposed" because the term, as defined in Article 100, would limit the performance concepts included in 250.4 in an unacceptable manner.

Adding "where grounded" is inappropriate, as doing so would limit the performance concepts in this section in an unacceptable manner.

Technical improvements are made to the language proposed for 250.4, (A)(2), (A)(3), and (A)(4) by adding the word "normally".

The panel does not accept the proposed changes to (2) and (3). The requirements of these sections apply to conditions where non-current-carrying parts are exposed or not. The Panel accepts the addition of non-current-carrying in (4), as it is accurate and adds clarity.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-64 Log #85 NEC-P05 **Final Action: Reject**
(250.4(A)(5))

Submitter: Joe Riley, City of Arlington

Recommendation: Revise as follows:

Electrical equipment and wiring and other electrically conductive material likely to become energized shall be ~~installed~~ effectively grounded in a manner that creates a permanent, low impedance circuit that will facilitate the operation of the overcurrent device or ground detector for high-impedance grounded systems.

Substantiation: The text "installed in a manner" does not imply its effectiveness whereas "effectively grounded in a manner" implies just that.

Panel Meeting Action: Reject

Panel Statement: The proposed wording is unnecessary. Providing a connection to ground (earth) has very little effect on facilitating the operation of overcurrent devices. The term "effectively" as related to a connection to ground is being deleted because the details of how to determine its meaning are not included in the NEC.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-65 Log #445 NEC-P05 **Final Action: Reject**
(250.4(A)(5))

Submitter: W. Creighton Schwan, Hayward, CA

Recommendation: In line 4, replace "permanent" with "reliable" so as to read:

(5) Effective Ground-Fault Current Path. Electrical equipment and wiring and other electrically conductive material likely to become energized shall be installed in a manner that creates a ~~permanent~~ reliable low-impedance circuit facilitating the operation of the overcurrent device... (balance unchanged).

Substantiation: The Webster definition of "permanent" is, in part: "lasting, durable, intended to last or function indefinitely, not subject to removal."

The only connections in Article 250 that meet this definition are the irreversible compression-type connector and the exothermic welding process called for (plus bus bar connections) in 250.64(C). All of the others can be removed using appropriate tools.

Other methods than these two are recognized in 250.8 and 250.70 in particular and in Parts V and VI of Article 250 in general.

Aside from the need for the NEC to be clear and specific in its requirements, there is the practical problem that the use of the word "permanent" where it is not intended may lead an unqualified inspector to make unreasonable requirements based on the literal wording.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 5-51.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-66 Log #3527 NEC-P05 **Final Action: Reject**
(250.4(A)(5))

Submitter: Steven R. Musial, II, CJL Engineering
Recommendation: Revise second sentence as follows:
"It shall be capable of carrying the maximum ground fault current likely to be imposed on it from any point on the wiring system where a ground fault may occur to the electrical supply source according to IEEE Std. 80-1989 which identifies the maximum withstand fault current a grounding conductor can carry."
Substantiation: Example: 250.66(A) states that the maximum size grounding electrode conductor required to be connected to a made electrode is a 6 AWG copper or 4 AWG aluminum. Unfortunately, a 6 AWG copper can only handle about 12,000 amps of short circuit current before melting through. If a service entrance switchboard is rated at 65 KAIC RMS symmetrical, a grounding electrode conductor capable of carrying 65 KAIC must be selected.
Panel Meeting Action: Reject
Panel Statement: The effective ground fault path, referenced in 250.4(A)(5), does not include the grounding electrode conductor. This path is the equipment grounding conductor back to the source, which is sized by Table 250.122. Table 250.122 takes into account the size of the fault current. The submitter's concern about the size of the grounding electrode conductor based on the available fault current is incorrect.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-67 Log #446 NEC-P05 **Final Action: Reject**
(250.4(B)(2))

Submitter: W. Creighton Schwan, Hayward, CA
Recommendation: In line 5, replace "permanent" with "reliable" so as to read:
(2) Bonding of Electrical Equipment. Non-current-carrying conductive materials enclosing electrical conductors or equipment, or forming part of such equipment, shall be connected together and to the supply system grounded equipment in a manner that creates a ~~permanent~~ reliable low-impedance path for ground-fault current... (balance unchanged).
Substantiation: The Webster definition of "permanent" is, in part: "lasting, durable, intended to last or function indefinitely, not subject to removal."
The only connections in Article 250 that meet this definition are the irreversible compression-type connector and the exothermic welding process called for (plus bus bar connections) in 250.64(C). All of the others can be removed using appropriate tools.
Other methods than these two are recognized in 250.8 and 250.70 in particular and in Parts V and VI of Article 250 in general.
Aside from the need for the NEC to be clear and specific in its requirements, there is the practical problem that the use of the word "permanent" where it is not intended may lead an unqualified inspector to make unreasonable requirements based on the literal wording.

Ballot Results: Affirmative: 15

5-69 Log #339 NEC-P05 **Final Action: Accept in Principle**
(250.4(B)(4))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read as follows:
(4) Path for Fault Current. Electrical equipment, wiring, and other electrically conductive material likely to become energized shall be installed in a manner that creates a permanent, low-impedence circuit from any point on the wiring system to the electrical supply source to facilitate the operation of overcurrent devices should a second fault occur on any other ungrounded conductor of the wiring system. ~~occur on the wiring system.~~ The earth shall not be considered as an effective fault-current path.
FPN No. 1: A second fault that occurs on any other ungrounded conductor supplied by the ungrounded system through the equipment enclosures and bonding is considered a ground fault.
FPN No. 2: See Figure 250.4 for information on the organization of Article 250.
Substantiation: The revision clarifies that the overcurrent device operates when a second phase to ground fault occurs on a different ungrounded phase conductor supplied by the system. The FPN was revised to be consistent with the language changed in the rule. The proposed change is intended to clarify how the performance of the overcurrent device is initiated.
Panel Meeting Action: Accept in Principle
First, revise text to read as follows:
(4) Path for Fault Current. Electrical equipment, wiring, and other electrically conductive material likely to become energized shall be installed in a manner that creates a permanent, low-impedence circuit from any point on the wiring system to the electrical supply source to facilitate the operation of overcurrent devices should a second ground fault from a different phase occur on the wiring system. The earth shall not be considered as an effective fault-current path.
Second, delete FPN No. 1.
Third, renumber existing FPN No. 2 to FPN.
Panel Statement: This revision is intended to combine the concepts from this proposal and proposal 5-71. Editorial and technical improvements are intended. The panel removed FPN No. 1 because the action taken in the revised text clarifies the facilitation of the operation of the overcurrent protection device.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-70 Log #448 NEC-P05 **Final Action: Reject**
(250.4(B)(4))

Submitter: W. Creighton Schwan, Hayward, CA
Recommendation: In line 3, replace "permanent" with "reliable" so as to read:
(4) Path for Fault Current. Electrical equipment, wiring, and other electrically conductive material likely to become energized shall be installed in a manner that creates a ~~permanent~~ reliable low-impedance circuit from any point... (balance unchanged).
Substantiation: The Webster definition of "permanent" is, in part: "lasting, durable, intended to last or function indefinitely, not subject to removal."
The only connections in Article 250 that meet this definition are the irreversible compression-type connector and the exothermic welding process called for (plus bus bar connections) in 250.64(C). All of the others can be removed using appropriate tools.
Other methods than these two are recognized in 250.8 and 250.70 in particular and in Parts V and VI of Article 250 in general.

Ballot Results: Affirmative: 15

5-71 Log #1900 NEC-P05 **Final Action: Accept in Principle**
(250.4(B)(4))

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: Add the phrase "from a different phase" after the phrase "second fault" in 250.4(B)(4) to read as follows:
"Electrical equipment, wiring, and other electrically conductive material likely to become energized shall be installed in a manner that creates a permanent, low-impedance circuit from any point on the wiring system to the electrical supply source to facilitate the operation of overcurrent devices should a second fault from a different phase occur on the wiring system. The earth shall not be considered as an effective fault-current path."

Substantiation: A second fault on the system from the same phase may not increase the fault current being sensed by the overcurrent protective device since the amount of impedance in the fault current path may be increased due to the arcing fault at the second point. A second fault in a different phase will certainly cause the operation of the overcurrent device since that fault now becomes a phase-to-phase fault.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 5-69.

5-74 Log #2603 NEC-P05 **Final Action: Accept**
(250.6)

Submitter: Joseph P. DeGregoria, Underwriters Laboratories Inc.
Recommendation: Revise text to read:
250.6 Objectionable Current Over Grounding Conductors.
(A) Arrangement to Prevent Objectionable Current. The grounding of electrical systems, circuit conductors, surge arresters, <u>surge protective devices</u> and conductive non-current-carrying materials and equipment shall be installed and arranged in a manner that will prevent objectionable current over the grounding conductors or grounding paths.
(B) Alterations to Stop Objectionable Current. If the use of multiple grounding connections results in objectionable current, one or more of the following alterations shall be permitted to be made, provided that the requirements of 250.4(A)(5) or (B)(4) are met:
(1) Discontinue one or more but not all of such grounding connections.
(2) Change the locations of the grounding connections.
(3) Interrupt the continuity of the conductor or conductive path interconnecting the grounding connections.
(4) Take other suitable remedial and approved action.
(C) Temporary Currents Not Classified as Objectionable Currents. Temporary currents resulting from accidental conditions, such as ground-fault currents, that occur only while the grounding conductors are performing their intended protective functions shall not be classified as objectionable current for the purposes specified in 250.6(A) and (B).
(D) Limitations to Permissible Alterations> The provisions of this section shall not be considered as permitting electronic equipment from being operated on ac systems or branch circuits that are not grounded as required by this article. Currents that introduce noise or data errors in electronic equipment shall not be considered the objectionable currents addressed in this section.
(E) Isolation of Objectionable Direct-Current Ground Currents. Where isolation of objectionable dc ground currents from cathodic protection systems is required, a listed ac coupling/dc isolating device shall be permitted in the equipment grounding path to provide an effective return path for ac ground-fault current while blocking dc current.
Substantiation: This is one of several related proposals affecting Articles 100, 230, 250, 280, 285, 501, and 502 based on the following:
1) UL intends to combine the categories of Surge Arresters (Article 280) and Transient Voltage Surge Suppressors (Article 285) into one category and Standard, UL 1449, renamed Surge Protective Devices(SPDs).
UL 1449 will include SPD designations Type 1 and Type 2 for permanently connected devices for use on circuits not exceeding 600 V.
The technology of both low voltage Surge Arresters and TVSSs are now basically the same, thereby justifying coverage under one Standard, UL 1449, and one test program with consideration given to the installation location on the line side (Type 1) or load side (Type 2) of the service disconnect overcurrent protection.
2) The Surge Arrester designation will only be retained for devices used in circuits of 1 kV and over and evaluated to IEEE C62.11-1999.
Panel Meeting Action: Accept
Panel Statement: The panel understands that only the phrase “surge protective devices” was added to Section 250.6(A) by the action of this proposal.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
DOBROWSKY, P.: This proposal should probably have been accepted in principle. Additional action is taken on this section by proposal 5-75a (Log #CP500).

5-75 Log #3543 NEC-P05 **Final Action: Reject**
(250.6)

Submitter: Redwood Kardon, Code Check Institute
Recommendation: Revise as follows:
250.6 Objectionable Current over <u>Equipment</u> Grounding Conductors <u>or Supplemental Grounding Electrode Conductors</u> .
(A) Arrangement to Prevent Objectionable Current. The grounding of electrical systems, circuit conductors, surge arresters, and conductive noncurrent-carrying materials and equipment shall be installed and arranged in a manner that will prevent objectionable current over the <u>equipment</u> grounding conductors or <u>supplemental</u> grounding ~~of the~~ electrode conductors.
(B) Alterations to Stop Objectionable Current. If the use of multiple grounding electrode connections results in objectionable current, one or more of the following alterations shall be permitted to be made, provided that the requirements of 250.4(A)(5) or (B)(4) are met:
(1) Discontinue one or more but...
Substantiation: As used currently in this article the terms “grounding conductors” and “grounding paths” are vague and nonspecific. The term “grounding conductor” as currently used in 250.6 does not conform to the definition provided in Article 100. The term “ground path” is not defined and conflicts with the term effective fault current path.
Specificity of language is crucial to facilitating compliance with the performance requirements of 250.4. I have concurrently submitted a definition for a supplemental grounding electrode conductor.
Panel Meeting Action: Reject
Panel Statement: The proposal would improperly limit the application of the section. There are additional grounding paths other than the two mentioned by the submitter that this section should cover. This proposal would unnecessarily eliminate them from being subject to the section.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-75a Log #CP500 NEC-P05 **Final Action: Accept**
(250.6(A))

Submitter: Code-Making Panel 5,
Recommendation: Revise 250.6(A) to read as follows:
(A) Arrangement to Prevent Objectionable Current. The grounding of electrical systems, circuit conductors, surge arresters, <u>surge protective devices,</u> and conductive <u>normally</u> non–current-carrying <u>metal parts</u> ~~materials~~ ~~and~~ <u>of</u> equipment shall be installed and arranged in a manner that will prevent objectionable current. ~~over the equipment grounding conductors or equipment grounding paths.~~
Substantiation: The editorial revisions to the TCC Task Group on Grounding and Bonding proposals are incorporated into the identified sections such as 250.6(A) to be consistent with the work of CMP-5 at the Report on Proposal Meeting for the 2008 NEC. The panel added the words “normally” and changing the words “materials and” to “metal parts of” making the wording

consistent with the task group work. The words “equipment grounding conductors or equipment grounding conductor paths” were deleted to reflect that objectional current can be in all paths, including the equipment grounding conductor. The words “surge protective devices “ were added as a result of the action on Proposal 5-74.
Panel Meeting Action: Accept

Ballot Results: Affirmative: 15

5-76 Log #1520 NEC-P05 **Final Action: Accept in Principle**
(250)

TCC Action: The Technical Correlating Committee directs that the action on this proposal be sent to the Technical Correlating Committee Grounding and Bonding task group for review and comment.
Submitter: Technical Correlating Committee on National Electrical Code
Recommendation: Revise Article 250 as described in the following, relative to the term bonding.

250.6(A): Revise 250.6(A) to read as follows:
(A) Arrangement to Prevent Objectionable Current. The grounding of electrical systems, circuit conductors, surge arresters, and conductive normally non–current-carrying metal parts ~~materials~~ ~~and~~ of equipment shall be installed and arranged in a manner that will prevent objectionable current over the equipment grounding conductors or equipment grounding paths.

250.24(C) and Exception: Revise Section 250.24(C) as follows:
(C) Grounded Conductor Brought to Service Equipment. Where an ac system operating at less than 1000 volts is grounded at any point, the grounded conductor(s) shall be run to each service disconnecting means and shall be connected ~~bonded~~ to each disconnecting means enclosure. The grounded conductor(s) shall be installed in accordance with 250.24(C)(1) through (C)(3).
Exception: Where more than one service disconnecting means are located in an assembly listed for use as service equipment, it shall be permitted to run the grounded conductor(s) to the assembly, and the conductor(s) shall be connected ~~bonded~~ to the assembly enclosure.

250.28(C): Revise Section 250.28(C) as follows:
(C) Attachment. Main bonding jumpers and system bonding jumpers shall be connected ~~attached~~ in the manner specified by the applicable provisions of 250.8.

250.30(A)(2): Revise Section 250.30(A)(2) as follows:
(2) Equipment Bonding Jumper Size. Where a n equipment bonding jumper of the wire type is run with the derived phase conductors from the source of a separately derived system to the first disconnecting means, it shall be sized in accordance with 250.102(C), based on the size of the derived phase conductors.

250.30(A)(3): Revise Section 250.30(A)(3) as follows:
(3) Grounding Electrode Conductor, Single Separately Derived System. A grounding electrode conductor for a single separately derived system shall be sized in accordance with 250.66 for the derived phase conductors and shall be used to connect the grounded conductor of the derived system to the grounding electrode as specified in 250.30(A)(7). This connection shall be made at the same point on the separately derived system where the system bonding jumper is connected ~~installed~~ .

250.30(A)(6): Revise Section 250.30(A)(6) as follows:
(6) Bonding. Structural steel and metal piping shall be ~~bonded~~ connected to the grounded conductor of a separately derived system in accordance with 250.104(D).

250.30(A)(8): Revise Section 250.30(A)(8) as follows:
(8) Grounded Conductor. Where a grounded conductor is installed and the system bonding jumper connection is not located at the source of the separately derived system, 250.30(A)(8)(a), (A)(8)(b), and (A)(8)(c) shall apply.

250.32(A) Exception: Revise Section 250.32(A) Exception as follows:
Exception: A grounding electrode shall not be required where only a single branch circuit supplies the building or structure and the branch circuit includes an equipment grounding conductor for grounding the ~~conductive~~ normally non–current-carrying metal parts of equipment. For the purpose of this section, a multiwire branch circuit shall be considered as a single branch circuit.

250.32(B): Revise Section 250.32(B) as follows:
(B) Grounded Systems. For a grounded system at the separate building or structure, the connection to the grounding electrode, the ~~and~~ grounding and ~~or~~ bonding of equipment, structures, or frames required to be grounded and ~~or~~ bonded shall comply with either 250.32(B)(1) or (B)(2).

250.32(B)(1): Revise Section 250.32(B)(1) as follows:
(1) Equipment Grounding Conductor. An equipment grounding conductor as described in 250.118 shall be run with the supply conductors and connected to the building or structure disconnecting means and to the grounding electrode(s). The equipment grounding conductor shall be used for grounding ~~or~~ and bonding of equipment, structures, or frames required to be grounded and ~~or~~ bonded. The equipment grounding conductor shall be sized in accordance with 250.122. Any installed grounded conductor shall not be connected to the equipment grounding conductor or to the grounding electrode(s).

250.32(B)(2): Revise Section 250.32(B)(2) as follows:
(2) Grounded Conductor. Where (1) an equipment grounding conductor is not run with the supply to the building or structure, (2) there are no continuous metallic paths ~~bonded~~ connected to the grounding system in each building or structure involved, and…

250.32(B)(3): Revise Section 250.32(B)(3) as follows:
(3) ground-fault protection of equipment has not been installed on the supply side of the feeder(s), the grounded conductor run with the supply to the building or structure shall be connected to the building or structure disconnecting means and to the grounding electrode(s) and shall be used for grounding and ~~or~~ bonding of equipment, structures, or frames required to be grounded and ~~or~~ bonded. The size of the grounded conductor shall not be smaller than the larger of either of the following:

250.32(D)(1): Revise Section 250.32(D)(1) as follows:
(1) The connection of the grounded conductor to the grounding electrode, normally non-current-carrying metal parts of equipment, or equipment grounding conductor at a separate building or structure shall not be made.

250.32(D)(2): Revise Section 250.32(D)(2) as follows:
(2) An equipment grounding conductor for grounding and bonding any normally non–current-carrying metal parts of equipment, interior metal piping systems, and building or structural metal frames is run with the circuit conductors to a separate building or structure and ~~bonded~~ connected to existing grounding electrode(s) required in Part III of this article, or, where there are no existing electrodes, the grounding electrode(s) required in Part III of this article shall be installed where a separate building or structure is supplied by more than one branch circuit.

250.32(D)(3): Revise Section 250.32(D)(3) as follows:
(3) The connection between ~~Bonding~~ the equipment grounding conductor and ~~to~~ the grounding electrode at a separate building or structure shall be made in a junction box, panelboard, or similar enclosure located immediately inside or outside the separate building or structure.

250.34(A)(2): Revise Section 250.34(A)(2) as follows:
(2) The normally non–current-carrying metal parts of equipment and the equipment grounding conductor terminals of the receptacles are connected ~~bonded~~ to the generator frame.

250.34(B)(3): Revise Section 250.34(B)(3) as follows:
(3) The normally non–current-carrying metal parts of equipment and the equipment grounding conductor terminals of the receptacles are connected ~~bonded~~ to the generator frame.

250.34(C): Revise Section 250.34(C) as follows:
(C) Grounded Conductor Bonding. A system conductor that is required to be grounded by 250.26 shall be connected ~~bonded~~ to the generator frame where the generator is a component of a separately derived system.

250.36(F): Revise Section 250.36(F) as follows:
(F) Grounding Electrode Conductor Location. The grounding electrode conductor shall be connected ~~attached~~ at any point from the grounded side of the grounding impedance to the equipment grounding connection at the service equipment or first system disconnecting means.

250.68(B): Revise 250.68(B) as follows:
250.68(B) Effective Grounding Path. The connection of a grounding electrode conductor or bonding jumper to a grounding electrode shall be made in a manner that will ensure a permanent and effective grounding path. Where necessary to ensure the grounding path for a metal piping system used as a grounding electrode, effective bonding shall be provided around insulated joints and around any equipment likely to be disconnected for repairs or replacement. Bonding ~~conductors~~ jumpers shall be of sufficient length to permit removal of such equipment while retaining the integrity of the ~~bond~~ grounding path.

250.84: Revise 250.84 as follows:
250.84 Underground Service Cable or Raceway.
(A) Underground Service Cable. The sheath or armor of a continuous underground metal-sheathed or armored service cable system that is connected ~~bonded~~ to the grounded ~~underground~~ system conductor on the supply side shall not be required to be connected to the grounded system conductor at the building or structure. The sheath or armor shall be permitted to be insulated from the interior conduit or piping.
(B) Underground Service Raceway Containing Cable. An underground metal service raceway that contains a metal-sheathed or armored cable bonded to the grounded underground system conductor shall not be required to be connected to the grounded system conductor at the building or structure. The sheath or armor shall be permitted to be insulated from the interior raceway or piping.

250.97 Exception: Revise the exception of Section 250.97 as follows:
Exception: Where oversized, concentric, or eccentric knockouts are not encountered, or where a box or enclosure with concentric or eccentric knockouts is listed to provide a permanent, reliable ~~electrical bond~~ bonding connection , the following methods shall be permitted: …

250.102(D) 2nd paragraph: Revise Section 250.102(D) second paragraph as follows:
A single common continuous equipment bonding jumper shall be permitted to ~~bond~~ connect two or more raceways or cables where the bonding jumper is sized in accordance with Table 250.122 for the largest overcurrent device supplying circuits therein.

250.112(M): Revise Section 250.112(M) as follows:
Where a submersible pump is used in a metal well casing, the well casing shall be ~~bonded~~ connected to the pump circuit equipment grounding conductor.

250.184(B)(5): Revise 250.184(B)(5) as follows:

(5) An equipment ~~bonding~~ grounding conductor shall be provided to each building, structure, and equipment enclosure.

Substantiation: 250.6(A): Adding the words "normally" and changing the words "materials and" to "metal parts of" makes the wording consistent with the proposed definition of the term "Equipment Grounding Conductor" which is the grounding path being described here. The word "equipment" was added in two locations to more specifically describe the conductor and grounding path being referred to in this section.

250.24(C) and Exception: These changes clarify the present requirement in more prescriptive language and to clarify the connection referred to in the section and the exception. Connected is proposed to work cooperatively with the proposed revision of the definition of bonded (bonding).

250.28(C): These changes clarify the present requirement in more prescriptive language and to clarify the connection referred to in the section and the exception. Connected is proposed to work cooperatively with the proposed revision of the definition of bonded (bonding).

250.30(A)(2): These changes clarify the present requirement in more prescriptive language. This proposed revision just adds the word "equipment" to this section to match its title.

250.30(A)(3): These changes clarify the present requirement in more prescriptive language. This section is revised to reflect a location of a "connection" point to be more specific than an "installation" point.

250.30(A)(6): These changes clarify the present requirement in more prescriptive language and adds more specifics as to what conductor the steel and water is required to be bonded to.

250.30(A)(8): These changes clarify the present requirement in more prescriptive language. Revised to reference a connection point.

250.32(A) Exception: These changes clarify the present requirement in more prescriptive language. Revised to add the words "normally" and "metal" to provided consistency with proposed revisions to the definition of equipment grounding conductor.

250.32(B): These changes clarify the present requirement in more prescriptive language. Revisions are to include both grounding and bonding rather than a choice of either by the use of the word "or" in this section.

250.32(B)(1): These changes clarify the present requirement in more prescriptive language. Revisions are to include both grounding and bonding rather than a choice of either by the use of the word "or" in this section.

250.32(B)(2): The phrase "… shall be connected…" is the preferred requirement. Revised to reference a connection point.

250.32(B)(3): The phrase "… shall be connected…" is the preferred requirement. Revisions are to include both grounding and bonding rather than a choice of either by the use of the word "or" in this section.

250.32(D)(1): The phrase "… shall be connected…" is the preferred requirement. Revised to add the words "normally" and "metal" to provided consistency with proposed revisions to the definition of equipment grounding conductor.

250.32(D)(2): The phrase "… shall be connected…" is the preferred requirement.

Grounding and bonding functions are required here. The proposed revision adds bonding to this language.

Revised to add the words "normally" and "metal" to provided consistency with proposed revisions to the definition of equipment grounding conductor.

250.32(D)(3): The phrase "… shall be connected…" is the preferred requirement. This section is referring to a connection rather than the process of bonding as the definition has been revised.

250.34(A)(2): The phrase "… shall be connected…" is the preferred requirement. Adding the word "normally" provides consistency with where it was inserted at other locations where the term "non-current-carrying metal parts" is used.

250.34(B)(3): The phrase "… shall be connected…" is the preferred requirement.

250.34(C): The phrase "… shall be connected…" is the preferred requirement. The proposed word "connection" is more specific than the word "bonded."

250.36(F): The phrase "… shall be connected…" is the preferred requirement. The proposed word "connection" is more specific than the word "attached" and is also consistent with other sections where the word "connected" or "connection" is used.

250.68(B): Bonding jumper is a defined term. The term "grounding path" is the portion of the circuit that requires integrity.

250.84: The word "connected" is the preferred requirement and is also consistent with other sections where the word "connected" or "connection" is used.

250.97 Exception: The phrase "… reliable bonding connection" is the preferred requirement.

250.102(D) 2nd paragraph: The phrase "… shall be permitted to connect…" is the preferred requirement.

250.112(M): The phrase "… shall be connected…" is the preferred requirement.

250.184(B)(5): The term "bonding" was replaced by the term "grounding" to consistently and specifically describe conductor and grounding path being referred to in this section.

This is the result of the TCC Task Group on Grounding and Bonding in resolve of the 2005 NEC cycle actions related to Proposal 5-1 and Comment 5-1 as directed by the Technical Correlating Committee. This is a companion proposal to the proposed revision to the term "bonded (bonding)" in Article 100 relative to this Task Group's recommendations. These changes clarify the present requirement in more prescriptive language.

Note: Supporting material is available for review at NFPA Headquarters.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

Comment on Affirmative:

MELLO, C.: Accept the panel actions on all items except for the action on 250.24(C) and the exception to 250.24(C). The revised text would literally now require the grounded circuit conductor to be connected to the service disconnecting means enclosure. This could easily be interpreted as being "directly" connected which is not a proper installation. The proper termination point for the service grounded conductor is to the grounded conductor terminal or bus intended and identified for the termination of this conductor. The main bonding jumper is in fact the conductor that connects the service grounded conductor terminal or bus to the service equipment enclosure (green screw, strap, bus, or wire type MBJ). Similarly in the exception, the grounded conductor would appear to be required to be connected to the assembly enclosure and not to the service grounded conductor terminal(s) or bus provided for that purpose. The grounded conductor is to be connected to that terminal or bus and the main bonding jumper then connects that terminal or bus to the assembly enclosure. Under the definition in the 2005 code using the word "bonded" allowed the correct installation of terminating on the lug or bus, but then some mean of "bonding" of this terminal or bus was provided. The following text is suggested as an alternative to resolve this situation and continue to use the term "connected" as intended by the Task Group.

250.24(C) and Exception: Revise Section 250.24(C) and exception as follows:

(C) Grounded Conductor Brought to Service Equipment. Where an ac system operating at less than 1000 volts is grounded at any point, the grounded conductor(s) shall be run to each service disconnecting means and shall be connected ~~bonded~~ to each disconnecting means grounded conductor(s) terminal or bus . A main bonding jumper shall connect the grounded conductor(s) to each service disconnecting means enclosure. The grounded conductor(s) shall be installed in accordance with 250.24(C)(1) through (C)(3).

Exception: Where more than one service disconnecting means are located in a ~~n~~ single assembly listed for use as service equipment, it shall be permitted to run the grounded conductor(s) to the assembly common grounded conductor(s) terminal or bus . The assembly shall have a main bonding jumper for connecting the grounded conductor(s) ~~and the conductor(s) shall be connected b onded~~ to the assembly enclosure.

5-77 Log #1521 NEC-P05 **Final Action: Accept in Principle**
(250)

TCC Action: The Technical Correlating Committee directs that the action on this proposal be sent to the Technical Correlating Committee Grounding and Bonding task group for review and comment.
Submitter: Technical Correlating Committee on National Electrical Code
Recommendation: Revise Article 250 as described in the following, relative to the term grounding.

250.6(B) through (E) Revise 250.6(B) through (E) to read as follows:

(B) Alterations to Stop Objectionable Current. If the use of multiple ~~grounding~~ connections to ground results in objectionable current, one or more of the following alterations shall be permitted to be made, provided that the requirements of 250.4(A)(5) or (B)(4) are met:

(1) Discontinue one or more but not all of such ~~grounding~~ connections to ground .

(2) Change the locations of the ~~grounding~~ connections to ground .

(3) Interrupt the continuity of the conductor or conductive path causing the objectionable current over the equipment grounding conductors or equipment grounding paths. ~~interconnecting the grounding connections~~ .

(4) Take other suitable remedial and approved action.

(C) Temporary Currents Not Classified as Objectionable Currents. Temporary currents resulting from accidental conditions, such as ground-fault currents, that occur only while the equipment grounding conductor (s) are performing their intended protective functions shall not be classified as objectionable current for the purposes specified in 250.6(A) and (B).

(D) Limitations to Permissible Alterations. The provisions of this section shall not be considered as permitting electronic equipment from being operated on ac systems or branch circuits that are not connected to an equipment grounding conductor ~~grounded~~ as required by this article. Currents that introduce noise or data errors in electronic equipment shall not be considered the objectionable currents addressed in this section.

(E) Isolation of Objectionable Direct-Current Ground Currents. Where isolation of objectionable dc ground currents from cathodic protection systems is required, a listed ac coupling/dc isolating device shall be permitted in the equipment grounding conductor path to provide an effective return path for ac ground-fault current while blocking dc current.

250.30 (A) Grounded Systems. A separately derived ac system that is grounded shall comply with 250.30(A)(1) through (A)(8). Except as otherwise permitted in this article, a grounded conductor shall not be connected to ground normally non-current-carrying metal parts of equipment, or equipment grounding conductor(s) ~~grounding connection shall not be made to any grounded circuit conductor~~ on the load side of the point of grounding of the separately derived system . ~~except as otherwise permitted in this article.~~

250.32(B): Revise 250.32(B) as follows:

250.32(B) … ~~grounded~~ connected to the equipment grounding conductor …

250.80 and 250.80 Exception: Revise 250.80 and its exception as follows:

250.80 Service Raceways and Enclosures. Metal enclosures and raceways for service conductors and equipment shall be connected to the grounded system conductor if the electrical system is grounded or to the grounding electrode conductor for electrical systems that are not grounded .

Exception: A metal elbow that is installed in an underground installation of rigid nonmetallic conduit and is isolated from possible contact by a minimum cover of 450 mm (18 in.) to any part of the elbow shall not be required to be ~~grounded~~ connected to the grounded system conductor or grounding electrode conductor .

250.86 and 250.86 Exception Nos. 1, 2, and 3: Revise entire 250.86 and its exceptions as follows:

250.86 Other Conductor Enclosures and Raceways. Except as permitted by 250.112(I), metal enclosures and raceways for other than service conductors shall be connected to the equipment grounding conductor ~~grounded~~ .

Exception No. 1: Metal enclosures and raceways for conductors added to existing installations of open wire, knob and tube wiring, and nonmetallic-sheathed cable shall not be required to be connected to the equipment grounding conductor ~~grounded~~ where these enclosures or wiring methods comply with (1) through (4) as follows:

(1) Do not provide an equipment ground

(2) Are in runs of less than 7.5 m (25 ft)

(3) Are free from probable contact with ground, grounded metal, metal lath, or other conductive material

(4) Are guarded against contact by persons

Exception No. 2: Short sections of metal enclosures or raceways used to provide support or protection of cable assemblies from physical damage shall not be required to be connected to the equipment grounding conductor ~~grounded~~ .

Exception No. 3: A metal elbow shall not be required to be connected to the equipment grounding conductor ~~grounded~~ where it is installed in a nonmetallic raceway and is isolated from possible contact by a minimum cover of 450 mm (18 in.) to any part of the elbow or is encased in not less than 50 mm (2 in.) of concrete.

250.110 and 250.110 Exception No. 3: Revise first paragraph of 250.110 and 250.110 Exception No. 3 as follows:

250.110 Equipment Fastened in Place or Connected by Permanent Wiring Methods (Fixed). *Exposed non–current-carrying metal parts of fixed equipment likely to become energized shall be ~~grounded~~ connected to the equipment grounding conductor under any of the following conditions: …*

Exception No. 3: Listed equipment protected by a system of double insulation, or its equivalent, shall not be required to be ~~grounded~~ connected to the equipment grounding conductor . Where such a system is employed, the equipment shall be distinctively marked.

250.112 Revise the first paragraph of 250.112 and 250.113 items (K) and (M) as follows:

250.112 Fastened in Place or Connected by Permanent Wiring Methods (Fixed) — Specific. Exposed, non–current-carrying metal parts of the kinds of equipment described in 250.112(A) through (K), and non–current-carrying metal parts of equipment and enclosures described in 250.112(L) and (M), shall be ~~grounded~~ connected to the equipment grounding conductor regardless of voltage. …

(K) Skid Mounted Equipment. Permanently mounted electrical equipment and skids shall be ~~grounded~~ connected to the ~~with an~~ equipment grounding ~~bonding~~ conductor ~~jumper~~ sized as required by 250.122. …

(M) Metal Well Casings Where a submersible pump is used in a metal well casing, the well casing shall be ~~bonded~~ connected to the pump circuit equipment grounding conductor.

250.114 and 250.114 Exceptions: Revise first paragraph of 250.114 and all 250.114 Exceptions as follows:

250.114 Equipment Connected by Cord and Plug. Under any of the conditions described in (1) through (4), exposed non–current-carrying metal parts of cord-and-plug-connected equipment likely to become energized shall be ~~grounded~~ connected to the equipment grounding conductor .

Exception: Listed tools, listed appliances, and listed equipment covered in (2) through (4) shall not be required to be ~~grounded~~ connected to the equipment grounding conductor where protected by a system of double insulation or its equivalent. Double insulated equipment shall be distinctively marked. …

Exception No. 1: Motors, where guarded, shall not be required to be ~~grounded~~ connected to the equipment grounding conductor .

Exception No. 2: Metal frames of electrically heated appliances, exempted by special permission, shall not be required to be ~~grounded~~ connected to the equipment grounding conductor , in which case the frames shall be permanently and effectively insulated from ground. …

Exception: Tools and portable handlamps likely to be used in wet or conductive locations shall not be required to be ~~grounded~~ connected to the equipment grounding conductor where supplied through an isolating transformer with an ungrounded secondary of not over 50 volts.

250.116 and 250.116 FPN: Revise 250.116 and its FPN as follows:

250.116 Nonelectric Equipment. The metal parts of nonelectric equipment described in this section shall be connected to the equipment grounding conductor ~~grounded~~ .

FPN: Where extensive metal in or on buildings may become energized and is subject to personal contact, connecting to the equipment grounding conductor ~~adequate bonding and grounding~~ will provide additional safety.

250.118: Revise 250.118 and add FPN No. 1 as follows:

250.118 Types of Equipment Grounding Conductors. The equipment grounding conductor run with or enclosing the circuit conductors shall be one or more or a combination of the following:

FPN No. 1: For effective ground-fault current path see 250.2 Definition.

(1) A copper, aluminum, or copper-clad aluminum conductor. This conductor shall be solid or stranded; insulated, covered, or bare; and in the form of a wire or a busbar of any shape.

(2) Rigid metal conduit.

(3) Intermediate metal conduit.

(4) Electrical metallic tubing.

(5) Listed flexible metal conduit meeting all the following conditions:

a. The conduit is terminated in fittings listed ~~for grounding~~ for use in the effective ground-fault current path.

b. The circuit conductors contained in the conduit are protected by overcurrent devices rated at 20 amperes or less.

c. The combined length of flexible metal conduit and flexible metallic tubing and liquidtight flexible metal conduit in the same ground return path does not exceed 1.8 m (6 ft).

d. Where used to connect equipment where flexibility is necessary after installation, an equipment grounding conductor shall be installed.

(6) Listed liquidtight flexible metal conduit meeting all the following conditions:

a. The conduit is terminated in fittings listed ~~for grounding~~ for use in the effective ground-fault current path.

b. For metric designators 12 through 16 (trade sizes through ½), the circuit conductors contained in the conduit are protected by overcurrent devices rated at 20 amperes or less.

c. For metric designators 21 through 35 (trade sizes ¾ through 1¼), the circuit conductors contained in the conduit are protected by overcurrent devices rated not more than 60 amperes and there is no flexible metal conduit, flexible metallic tubing, or liquidtight flexible metal conduit in trade sizes metric designators 12 through 16 (trade sizes through ½) in the grounding path.

d. The combined length of flexible metal conduit and flexible metallic tubing and liquidtight flexible metal conduit in the same ground return path does not exceed 1.8 m (6 ft).

e. Where used to connect equipment where flexibility is necessary after installation, an equipment grounding conductor shall be installed.

(7) Flexible metallic tubing where the tubing is terminated in fittings listed ~~for grounding~~ for use in the effective ground-fault current path and meeting the following conditions:

a. The circuit conductors contained in the tubing are protected by overcurrent devices rated at 20 amperes or less.

b. The combined length of flexible metal conduit and flexible metallic tubing and liquidtight flexible metal conduit in the same ground return path does not exceed 1.8 m (6 ft).

(8) Armor of Type AC cable as provided in 320.108.

(9) The copper sheath of mineral-insulated, metal-sheathed cable.

(10) Type MC cable where listed and identified ~~for grounding~~ for use in the effective ground-fault current path in accordance with the following:

a. The combined metallic sheath and grounding conductor of interlocked metal tape–type MC cable

b. The metallic sheath or the combined metallic sheath and grounding conductors of the smooth or corrugated tube type MC cable

(11) Cable trays as permitted in 392.3(C) and 392.7.

(12) Cablebus framework as permitted in 370.3.

(13) Other listed electrically continuous metal raceways and listed auxiliary gutters.

(14) Surface metal raceways listed ~~for grounding~~ for use in the effective ground-fault current path .

250.132: Revise 250.132 as follows:

250.132 Short Sections of Raceway. Isolated sections of metal raceway or cable armor, where required to be grounded, shall be ~~grounded~~ connected to an equipment grounding conductor in accordance with 250.134.

250.134 and 250.134(A) and (B): Revise 250.134 as follows:

250.134 Equipment Fastened in Place or Connected by Permanent Wiring Methods (Fixed) — Grounding

Unless grounded by connection to the grounded circuit conductor as permitted by 250.32, 250.140, and 250.142, non–current-carrying metal parts of equipment, raceways, and other enclosures, if grounded, shall be ~~grounded~~ connected to an equipment grounding conductor by one of the following methods.

(A) Equipment Grounding Conductor Types. By connecting to any of the equipment grounding conductors permitted by 250.118.

(B) With Circuit Conductors. By connecting to an equipment grounding conductor contained within the same raceway, cable, or otherwise run with the circuit conductors.

250.136(A) and (B): Revise 250.136 (A) and (B) as follows:

250.136 (A) Equipment Secured to Grounded Metal Supports. Electrical equipment secured to and in electrical contact with a metal rack or structure provided for its support and ~~grounded~~ connected to an equipment grounding conductor by one of the means indicated in 250.134. The structural metal frame of a building shall not be used as the required equipment grounding conductor for ac equipment.

(B) Metal Car Frames. Metal car frames supported by metal hoisting cables attached to or running over metal sheaves or drums of elevator machines that are ~~grounded~~ connected to an equipment grounding conductor by one of the methods indicated in 250.134.

250.138: Revise the first paragraph of 250.138 and 250.138(B) as follows:

250.138 Cord-and-Plug-Connected Equipment. Non–current-carrying metal parts of cord-and-plug-connected equipment, if grounded, shall be ~~grounded~~ connected to an equipment grounding conductor by one of the methods in 250.138(A) or (B). …

(B) By Means of a Separate Flexible Wire or Strap. By means of a separate flexible wire or strap, insulated or bare, connected to an equipment grounding conductor, and protected as well as practicable against physical damage, where part of equipment.

250.140 and 250.140 Exception: Revised 250.140 and 250.140 Exception as follows:

250.140 Frames of Ranges and Clothes Dryers. Frames of electric ranges, wall-mounted ovens, counter-mounted cooking units, clothes dryers, and outlet or junction boxes that are part of the circuit for these appliances shall ~~be grounded~~ connected to the equipment grounding conductor in the manner specified by 250.134 or 250.138.

Exception: For existing branch circuit installations only where an equipment grounding conductor is not present in the outlet or junction box, the frames of electric ranges, wall-mounted ovens, counter-mounted cooking units, clothes dryers, and outlet or junction boxes that are part of the circuit for these appliances shall be permitted to be ~~grounded~~ connected to the grounded circuit conductor if all the following conditions are met.

(1) The supply circuit is 120/240-volt, single-phase, 3-wire; or 208Y/120-volt derived from a 3-phase, 4-wire, wye-connected system.

(2) The grounded conductor is not smaller than 10 AWG copper or 8 AWG aluminum.

(3) The grounded conductor is insulated, or the grounded conductor is uninsulated and part of a Type SE service-entrance cable and the branch circuit originates at the service equipment.

(4) Grounding contacts of receptacles furnished as part of the equipment are bonded to the equipment.

250.142 Exception No. 1: Revise 250.142(B) Exception No. 1 as follows:

250.142 (B) *Exception No.1: The frames of ranges, wall-mounted ovens, counter-mounted cooking units, and clothes dryers under the conditions permitted for existing installations by 250.140 shall be permitted to be ~~grounded~~ connected ~~by a~~ to the grounded circuit conductor.*

250.144: Revise 250.144 as follows:

250.144 Multiple Circuit Connections. Where equipment is required to be grounded and is supplied by separate connection to more than one circuit or grounded premises wiring system, a n ~~means for grounding~~ equipment grounding conductor shall be provided for each such connection as specified in 250.134 and 250.138.

250.146(D): Revise 250.146 (D) as follows:

250.146 **(D) Isolated Receptacles.** Where required for the reduction of electrical noise (electromagnetic interference) on the grounding circuit, a receptacle in which the grounding terminal is purposely insulated from the receptacle mounting means shall be permitted. The receptacle grounding terminal shall be ~~grounded~~ connected ~~by~~ to an insulated equipment grounding conductor run with the circuit conductors. This grounding conductor shall be permitted to pass through one or more panelboards without connection to the panelboard grounding terminal as permitted in 408.40, Exception, so as to terminate within the same building or structure directly at an equipment grounding conductor terminal of the applicable derived system or service.

FPN: Use of an isolated equipment grounding conductor does not relieve the requirement for grounding the raceway system and outlet box.

250.148 and 250.148(C): Revise first paragraph of 250.148 and 250.148(C) as follows:

250.148 Continuity and Attachment of Equipment Grounding Conductors to Boxes

Where circuit conductors are spliced within a box, or terminated on equipment within or supported by a box, any equipment grounding conductor(s) associated with those circuit conductors shall be ~~spliced or joined~~ connected within the box or to the box with devices suitable for the use in accordance with 250.148(A) through (E). …

(C) Metal Boxes. A connection shall be made between the one or more equipment grounding conductors and a metal box by means of a grounding screw that shall be used for no other purpose, equipment listed for grounding, or a listed grounding device.

250.170: Revise 250.170 as follows:

250.170 Instrument Transformer Circuits. …shall be ~~grounded~~ connected to the equipment grounding conductor …

250.172: Revise 250.172 as follows:

250.172 Instrument Transformer Cases. …shall be ~~grounded~~ connected to the equipment grounding conductor …

250.174: Revise 250.174 as follows:

250.174 Cases of Instruments, Meters and Relays Operating at Less Than 1000 Volts. …shall be ~~grounded~~ connected to the equipment grounding conductor …

250.174(A): Revise 250.174(A) as follows:

250.174(A) Not on Switchboards. …shall have the cases and other exposed metal parts ~~grounded~~ connected to the equipment grounding conductor …

250-174(B): Revise 250.174(B) as follows:

250.174(B) On Dead-Front Switchboards. …shall have the cases ~~grounded~~ connected to the equipment grounding conductor …

250.174(C): Revise 250.174(C) as follows:

250.174(C) On Live-Front Switchboards. …shall not have their cases ~~grounded~~ connected to the equipment grounding conductor …

250.176: Revise 250.176 as follows:

250.176 Cases of Instruments, Meters, and Relays – Operating Voltage 1 kV and Over. Their cases shall not be ~~grounded~~ connected to the equipment grounding conductor …

250.178: Revise 250.178 as follows:

250.178 Instrument Grounding Conductor. The equipment grounding conductor for the secondary circuits …and no additional equipment grounding conductor shall be required.

250.184(C)(2): Revise 250.184(C)(2) as follows:

(2) The multigrounded neutral conductor shall be ~~grounded~~ connected at each transformer and at other additional locations ~~by connection~~ to a ~~made or existing~~ grounding electrode.

250.190: Revise last paragraph of 250.190 as follows:

Equipment g ~~G~~ rounding conductors not an integral part of a cable assembly shall not be smaller than 6 AWG copper or 4 AWG aluminum.

Substantiation: 250.6(B) through (E): The wording in (B)(3) was changed to more prescriptively specify the path being referred to in this subsection.

The word "equipment" was added to more specifically describe the conductor and grounding path being referred to in (C).

The wording was changed to more prescriptively specify the grounding path being referred to in (D).

The word "conductor" was added to more specifically describe the conductor and grounding path being referred to in (E).

250.30(A): These changes clarify the present requirement in more prescriptive language. This proposed revision adds more specific restrictions of the grounded conductor connections to any ground connection on the load side of the service disconnect. No other technical changes to the section are proposed, just clarification.

250.32(B): These changes clarify the present requirement in more prescriptive language.

250.80 and 250.80 Exception: These changes clarify the present requirement in more prescriptive language.

250.86 and 250.86 Exception Nos. 1, 2, and 3: These changes clarify the present requirement in more prescriptive language.

250.110 and 250.110 Exception No. 3: These changes clarify the present requirement in more prescriptive language.

250.112: These changes clarify the present requirement in more prescriptive language.

250.114 and 250.114 Exceptions: These changes clarify the present requirement in more prescriptive language.

250.116 and 250.116 FPN: These changes clarify the present requirement in more prescriptive language.

250.118: The term “listed for grounding” is very important to require the fittings and raceways to be lsited for the purpose; however, this change complies with Section 3.3.1.1 of the NEC Style Manual.

250.132: These changes clarify the present requirement in more prescriptive language.

250.134 and 250.134(A) and (B): These changes make the text consistent with those changes proposed in 250.110, 112, and 114.

250.136(A) and (B): These changes clarify the present requirement in more prescriptive language.

250.138: These changes clarify the present requirement in more prescriptive language.

250.140 and 250.140 Exception: These changes clarify the present requirement in more prescriptive language.

250.142 Exception No. 1: These changes clarify the present requirement in more prescriptive language.

250.144: These changes clarify the present requirement in more prescriptive language.

250.146(D): These changes clarify the present requirement in more prescriptive language.

250.148 and 250.148(C): These changes clarify the present requirement in more prescriptive language.

250.170: These changes clarify the present requirement in more prescriptive language.

250.172: These changes clarify the present requirement in more prescriptive language.

250.174: These changes clarify the present requirement in more prescriptive language.

250.174(A): These changes clarify the present requirement in more prescriptive language.

250.174(B): These changes clarify the present requirement in more prescriptive language.

250.174(C): These changes clarify the present requirement in more prescriptive language.

250.176: These changes clarify the present requirement in more prescriptive language. The use of the term “grounded” is appropriate within the text of the Exception.

250.178: These changes clarify the present requirement in more prescriptive language.

The use of the term “grounded” in this clause is appropriate.

250.184(C)(2): The proposed wording more prescriptively describes the action required and is more consistent with the style implemented last cycle concerning made or existing electrodes.

250.190: These changes clarify the present requirement in more prescriptive language.

The use of the term “grounded” in this clause is appropriate.

This is the result of the TCC Task Group on Grounding and Bonding in resolve of the 2005 NEC cycle actions related to Proposal 5-1 and Comment 5-1 as directed by the Technical Correlating Committee. This is a companion proposal to the proposed revision to the terms “grounded” and “equipment grounding conductor” in Article 100 relative to this Task Group’s recommendations. These changes clarify the present requirement in more prescriptive language.

Note: Supporting material is available for review at NFPA Headquarters.

Comment on Affirmative:

HARDING, G.: I agree with the panel action of Accept in Principle, however, the individual action on item 250.32(B) should have been to revert back to the language of the 2005 NEC referring to Proposal 5-119 for revisions to this section.

5-77a Log #CP501 NEC-P05 **Final Action: Accept**
(250.6(B), (B)(1), (B)(2), (B)(3), (C))

Submitter: Code-Making Panel 5,

Recommendation: Revise to read as follows:

(B) Alterations to Stop Objectionable Current. If the use of multiple grounding connections results in objectionable current, one or more of the following alterations shall be permitted to be made, provided that the requirements of 250.4(A)(5) or (B)(4) are met:
(1) Discontinue one or more but not all of such grounding connections.
(2) Change the locations of the grounding connections.
(3) Interrupt the continuity of the conductor or conductive path causing the objectionable current. ~~interconnecting the grounding connections~~ .
(4) Take other suitable remedial and approved action.

(C) Temporary Currents Not Classified as Objectionable Currents. Temporary currents resulting from accidental conditions, such as ground-fault s, ~~currents, that occur only while the equipment grounding conductor (s) are performing their intended protective functions~~ shall not be classified as objectionable current for the purposes specified in 250.6(A) and (B).

(D) Limitations to Permissible Alterations. The provisions of this section shall not be considered as permitting electronic equipment from being operated on ac systems or branch circuits that are not connected to an equipment grounding conductor ~~grounded~~ as required by this article. Currents that introduce noise or data errors in electronic equipment shall not be considered the objectionable currents addressed in this section. (E) Isolation of Objectionable Direct-Current Ground Currents. Where isolation of objectionable dc ground currents from cathodic protection systems is required, a listed ac coupling/dc isolating device shall be permitted in the equipment grounding conductor path to provide an effective return path for ac ground-fault current while blocking dc current.

Substantiation: The editorial revisions to the TCC Task Group on Grounding and Bonding proposals are incorporated into the identified sections of 250.6(B) thru (C) to be consistent with the work of CMP-5 at the Report on Proposal Meeting for the 2008 NEC.

Changes to Proposal from Grounding and Bonding Task Group:

(B)	Reverted to 2005 NEC text.
(B)(1)	Reverted to 2005 NEC text.
(B)(2)	Reverted to 2005 NEC text.

(B)(3) Accepted the strikeout at the end of the sentence from GB Task Group, revised the proposed additional text to delete “over the equipment grounding conductors or equipment grounding paths.”

(C) Revised text to remove, “ ~~currents, that occur only while the equipment grounding conductor (s) are performing their intended protective functions”~~ .

(D) and (E) remains as in the original proposal.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-78 Log #191 NEC-P05 **Final Action: Accept in Principle**
(250.8)

NOTE: The following proposal consists of Comment 5-40 on Proposal 5-57 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 5-57was:

Revise Section 250.8 as follows:

250.8 Connection of Grounding and Bonding Equipment.

Grounding conductors and bonding jumpers shall be connected by exothermic welding, listed pressure connectors, listed clamps, or other listed means. Connection devices or fittings that depend solely on solder shall not be used. Sheet metal screws shall not be used to connect <u>terminals or</u> grounding conductors to enclosures.

The Technical Correlating Committee directs that the Panel Action on Comment 5-40 only be reported as "Hold" consistent with Section 4-4.6.2.2 of the NFPA Regulations Governing Committee Projects. The comment adds new material that has not had adequate public review. The action on Proposal 5-57 stands as shown in the Report on Proposals.

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Recommendation: Accept the proposal in principle. Revise the last sentence to read as follows:

"Where screws are used to make field connections of grounding conductors or grounding terminals to enclosures, machine screws or thread-forming screws with machine threads shall be used."

Substantiation: The disallowance of sheet metal screws for this purpose is appropriate, but the wording has raised three questions: what about metal-to-metal connections in listed enclosures, where the continuity has been evaluated by the testing laboratory (presumably OK), and on field connections, what about other screws, such as wood screws that are even less suitable than sheet-metal screws? What about "teck" thread forming screws that result in machine threads, but that are often referred to as a type of sheet metal screw? This comment answers those questions. The real technical issue addressed in this requirement is the poor mechanical advantage offered by a conventional sheet metal screw with its very coarse threads. The submitter is aware that this comment may need to be held in accordance with 4-4.6.2.2(a) of the Regulations, but wanted to bring the issues to the attention of CMP 5.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Proposal 5-84.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-79 Log #1656 NEC-P05 **Final Action: Accept in Principle**
(250.8)

Submitter: John Steinke, Reno, NV

Recommendation: Delete last sentence, beginning with "Sheet metal screws...".

Substantiation: This provision does not belong here, for three basic reasons:

1) It may conflict with 110.14(A); 2) Connection requirements ought to apply to all wire connections, and not just grounding wires; and, 3) This sentence has opened a host of other issues.

110.14(A) makes reference to wire-binding heads. The common machine screw, often cited as the preferred fastener, has a rather narrow head, which may not grip the wire firmly. The common "Teks" screw, which is often used to illustrate the violation of 250.8, has a "washer" head, which approximates a binding head with its' large diameter. Moreover, the Teks screw, by drilling it's own hole, cannot help but have a good connection- which is not the case of a common sheet metal screw that is placed into an opening too large for the threads to effectively grip. (Remember, that was the original intent of this sentence). I submit that a wood screw, put through a large hole, with a washer on it, can effectively connect a grounding wire- provided that the screw/washer combination holds the wire firmly in contact with the box.

Why should this provision apply only to grounding wires? As now in the code, I can legally attach lugs to the neutral buss with a sheet metal screw; I think we can agree that a good connection is even more critical there!

Finally, this sentence has opened the door to endless debate of what is a sheet metal screw, what to do where older equipment lacks prepared holes, what size screw is necessary, need it be green, etc. This is the NEC, not "Machinery's Manual," for pete's sake!

Perhaps we would be better served were 110.14(A) to include a statement to the effect that 'connectors will be used in the manner for which they are intended, on materials for which they are designed, and tightened sufficiently.'

Since it IS in 250, however, it is only proper for this committee to work it out with the 110 committee.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Proposal 5-84.

Ballot Results: Affirmative: 15

5-80 Log #1854 NEC-P05 **Final Action: Reject**
(250.8)

Submitter: Wayne Treamer, Goffstown, NH

Recommendation: Revise as follows:

~~Sheet metal screws shall not~~ (<u>Only listed screws shall)</u> be used to connect grounding conductors or connection devices to enclosures.

Substantiation: Specifying sheet metal screws only allows the use of many other types of hardware to connect devices to enclosures. Requiring only listed screws assures the connectivity of the device.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 5-84. Screws are not listed.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-81 Log #1855 NEC-P05 **Final Action: Accept in Principle**
(250.8)

Submitter: Margarito Aragon, Jr., Santa Fe, NM

Recommendation: Add new text in third sentence of 250.8 to read as follows:

Grounding conductors and bonding jumpers shall be connected by exothermic welding, listed pressure connectors, listed clamps, or other listed means. Connection devices or fittings that depend solely on solder shall not be used. <u>Screws with threads similar to</u> sheet metal screws shall not be used to connect grounding conductors or connection devices to enclosures.

Substantiation: This revision will clarify that the advancing spiral type of threads is what is being prohibited not the sheet metal screw, but any screw with a corkscrew (advancing spiral) like threads.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Proposal 5-84.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-82 Log #2225 NEC-P05 **Final Action: Accept in Principle**
(250.8)

Submitter: Donald A. Ganiere, Ottawa, IL

Recommendation: Revise as follows:

250.8 Connection of Grounding and Bonding Equipment. Grounding conductors and bonding jumpers shall be connected by exothermic welding, listed pressure connectors, listed clamps, or other listed means. Connection devices or fittings that depend solely on solder shall not be used. ~~Sheet metal screws shall not be used to connect grounding conductors or connection devices to enclosures~~ . <u>Screws used to connect grounding conductors or connection devices shall be machine screws with a minimum of two threads engaged in the enclosure or secured on the back side with a nut.</u>

Substantiation: The current rule only prohibits the use of "sheet metal" screws for this purpose. There are any number of screw types that are not suitable for this purpose. The code needs to specify what type of screw that can be used, not just prohibit a single type of inappropriate screw. The existing wording would permit the use of drywall screws as it only prohibits the use of sheet metal screws.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Proposal 5-84.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-83 Log #2254 NEC-P05 **Final Action: Accept in Principle**
(250.8)

Submitter: Bryan P. Holland, Holland Electric

Recommendation: Revise the last sentence in this section to read:

"Sheet metal screws shall not be used to connect grounding conductors, <u>bonding conductors</u> , or connection devices to enclosures."

Substantiation: The title and most content of this section include the term "bonding" but then neglects to include the term in the last sentence. If sheet metal screws are neither adequate nor suitable for the connection of grounding conductors, they would not be suitable for bonding conductors or connection devices. It is common to see bonding lugs attached to pool cages by means of a sheet metal screw and without the proper wording in 250.8 this practice may continue without proper enforcement.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Proposal 5-84.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-84 Log #3365 NEC-P05 **Final Action: Accept in Principle**
(250.8)

Submitter: Paul Dobrowsky, Holley, NY
Recommendation: Revise text to read:
250.8 Connection of Grounding and Bonding Equipment. Grounding conductors and bonding jumpers shall be connected by devices listed as grounding and bonding equipment, or by the exothermic welding process. Connection devices or fittings that depend solely on solder shall not be used. Only machine screw type fasteners shall be permitted and shall engage not less than two threads.
Exception. Devices that are part of a listed assembly such as terminals in panelboards, self tapping screws, shall not be required to be specifically listed as grounding and bonding equipment if they are included in overall product listing.
~~Grounding conductors and bonding jumpers shall be connected by exothermic welding, listed pressure connectors, listed clamps, or other listed means. Connection devices or fittings that depend solely on solder shall not be used. Sheet metal screws shall not be used to connect grounding conductors or connection devices to enclosures.~~
Substantiation: This section needs to be clarified. Devices that are used for grounding and bonding need to comply with the requirements of the product standard that is applicable (UL 467) unless thay are evaluate as part of the entire product. Existing text prohibits sheet metal screws but does not prohibit drywall or wood screws. Providing two threads of engagement either in a tapped hole or by using a nut will help specify what is required.
Panel Meeting Action: Accept in Principle
250.8 Connection of Grounding and Bonding Equipment.
(A) Permitted Methods. Grounding conductors and bonding jumpers shall be connected by one of the following means:
(1) listed pressure connectors
(2) terminal bars
(3) pressure connectors listed as grounding and bonding equipment
(4) the exothermic welding process
(5) machine screw-type fasteners that engage not less than two threads or are secured with a nut
(6) thread-forming machine screws that engage not less than two threads in the enclosure
(7) Connections that are part of a listed assembly
(8) Other listed means
(B) Methods Not Permitted. Connection devices or fittings that depend solely on solder shall not be used.
Panel Statement: The panel action on this proposal intends to incorporate acceptable concepts included in other proposals on this section. The panel also incorporated language from Comment 5-40 (log #2137) of the 2004 Report on Comments, which is Propoasl 5-78 in this Report on Proposals.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-85 Log #2996 NEC-P05 **Final Action: Accept in Principle**
(250.8(a) through (d))

Submitter: Kevin Swotek, Goodwin Tucker Group
Recommendation: Added text to 250.8:
250.8
(a) Penetrations or studs that are made or used to allow fastening of listed pressure connectors, listed clamps and other listed means shall be made the same diameter as the diameter of the stud size of the mounting holes of the listed pressure connectors, listed clamps or other listed means to be mounted.
(b) Unless listed mechanical fasteners are used to fasten the listed pressure connectors, listed clamps and other listed means. The mechanical fasteners fastening the listed pressure connectors, listed clamps and other listed means to Penetrations of (6 mm) 1/4 in. or greater shall be fastened with Hex head bolts and nuts. Mechanical fasteners shall have the same diameter as the penetration holes used to allow the mounting of the listed pressure connectors, listed clamps and other listed means. Lock washers and washers shall be permitted to be installed.
(c) Preformed surface mounting holes used to mount listed pressure connectors, listed clamps or other listed means. The mechanical fasteners shall adequately match any preformed threads of any surface mounting holes or the mechanical fasteners shall at least be the same diameter or greater of any preformed surface mounting holes. Any use of any self tapping mechanical fasteners shall be listed for the purpose and shall be green in color. Mounting holes of any listed pressure connectors, listed clamps or other listed means shall not be enlarged.
(d) Mechanical fasteners shall be made up wrench tight to secure the listed pressure connectors, listed clamps and other listed means to the mounting surface. The installation of listed pressure connectors, listed clamps and other listed means shall comply with 250.12.
Substantiation: My reason for this proposal is to resolve problems commonly found with the installation of listed pressure connectors, listed clamps or other listed means. As the above example can be commonly found fastened in place with sheet metal screws, and specifically 6-32 and 8-32 machine screws and nuts. Please note that the common stud size opening is 1/4 in. and larger depending on the connector size. These connectors are commonly found loose due to the use of small fasteners being used and the small fastener not being able to be adequate torque so it properly fastens connector.
Problems that have been founded with this type of installation are ground faults not causing the tripping of the circuit breaker due to loose connections. And, also where a ground fault occurs and trips the circuit breaker but burns off the small size fastener that is fastening the connector and this allows the circuit breaker to be reset and the fault energizes the equipment or enclosure without further tripping of the overcurrent protection and leaving frame energized and creating a hazard.
This common type of installation is not addressed by NEC which allows this type of installations to be done with some very inadequate fastening means.
The first suggestion (a) would cause the use of a more adequate size of mechanical fastener to be used to fasten the connector in place and certainly not allow the installer to use sheet metal screws or smaller fasteners that are not adequate.
The second suggestion (b) would be effective in making sure that the type of mechanical fastener used could be adequate torque to insure adequate fastening of the connector.
The third suggestion (c) would allow the use of listed equipment with prethreaded holes or predrilled mounting holes to allow installation of connectors and specifying that a small mechanical fastener shall not be used. Also, this would specifically not allow the use of sheet metal screws. Also, this would not allow a too small of a connector to be modified and being not adequate for the intended purpose to be installed by modification.
The fourth suggestion (d) would insure good installation integrity.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 5-84.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-86 Log #1856 NEC-P05 **Final Action: Accept in Principle**
(250.8, FPN (New))

Submitter: Margarito Aragon, Jr., Santa Fe, NM
Recommendation: Add new text in the form of a FPN to 250.8 read as follows:
FPN: It is not the intent of this section to prohibit only the use of sheet metal screws, but to prohibit any screw that has the advancing spiral (corkscrew) type of threads to connect grounding conductors or connection devices to enclosures.
Substantiation: The intent of this proposal is to clarify the restriction of not using only sheet metal screws. The requirement is to prohibit the use of any screw with threads similar to sheet metal screws. Any connection means that are listed, that are part of listed equipment, or that are exothermically welded.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 5-84.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-87 Log #269 NEC-P05 **Final Action: Reject**
(250.10)

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
Ground clamps or other fittings shall be approved for general use without protection or shall be protected from ~~physical~~ damage as indicated in (1) or (2).
Substantiation: The word is superfluous. In some instances, one could argue for the use of "mechanical" to differentiate that from e.g., "thermal" damage, but context makes the intended sense quite clear, rendering anything like this completely unnecessary.
Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."
Panel Meeting Action: Reject
Panel Statement: Protection against physical damage is a special term recognized by the NEC Style manual in Section 3.2.5.5.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-88 Log #1759 NEC-P05 **Final Action: Reject**
(250.14)

Submitter: Percy E. Pool, Verizon NS
Recommendation: Add new 250.14 as follows:
250.14 Routing. Bonding and grounding conductors shall not be any longer than necessary to complete the connection without disturbing the permanent parts of the installation and shall avoid unnecessary bends and loops.
Substantiation: 250.4(A)(1) and 250.4(B)(1) state: "…shall be connected to earth in a manner that will limit the voltage imposed by lightning, line surges, or unintentional contact with higher-voltage lines …". This is not enforceable or inspectable.

One of the functions of the bonding and grounding conductors is to reduce potential differences between metallic parts. The ability to reduce potential differences is degraded if conductor has unneeded loops or bends. The proposed change will provide guidance to the installer and facilitate enforcement. The phrase "without disturbing the permanent parts of the installation" clarifies that this requirement is not intended to force drilling through concrete, walls, etc.
Panel Meeting Action: Reject Panel Statement: The requirements in the proposal are too subjective and would be difficult to implement. This text may be more suitable as a fine print note.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-89 Log #1889 NEC-P05 **Final Action: Reject**
(250.14)

Submitter: Jeffrey Boksiner, Telcordia Technologies, Inc. / Rep. Alliance for Telecommunications Industry Solutions
Recommendation: Add new 250.14 as follows:
250.14 Routing. Bonding and grounding conductors shall not be any longer than necessary to complete the connection without disturbing the permanent parts of the installation and shall avoid unnecessary bends and loops.
Substantiation: One of the functions of the bonding and grounding conductors is to reduce potential differences between metallic parts. For example, Sections 250.4 (A)(1) and 250.4 (B)(1) state: Electrical systems that are grounded shall be connected to earth in a manner that will limit the voltage imposed by lightning, line surges, or unintentional contact with higher-voltage lines and that will stabilize the voltage to earth during normal operation.

This ability to reduce potential differences is degraded if conductor has unneeded loops or bends. The proposed change will provide guidance to the installer facilitate enforcement. The phrase "without disturbing the permanent parts of the installation" emphasizes that this requirement is not intended to force drilling through concrete, walls, etc.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 5-88.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-90 Log #3389 NEC-P05 **Final Action: Accept**
(250.14 (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Insert a new Section 250.14 as follows:

250.14 Continuity of Grounded Conductors. The continuity of a grounded conductor shall not depend on a connection to a metallic enclosure, raceway, or cable armor.
Substantiation: There are instances where a grounded conductor is permitted to be connected to a metallic enclosure, as in the case of a main bonding jumper installed within service equipment. If that service equipment supplies a downstream panel that includes grounded circuits, the feeder will include a grounded circuit conductor. Nothing in the present NEC prohibits the unsound practice of terminating that grounded circuit conductor on an equipment grounding terminal on a separate equipment grounding busbar within the service equipment enclosure. The grounded conductor termination meets all the restrictions in 250.24 because it occurs within the service equipment. The wire or busbar limitation in 250.24(A)(4) addresses grounding electrode conductor connections, not this problem. No rules in Article 200 nor 300.13 address this problem either.

Nevertheless, under the conditions stated, a metal enclosure would now be employed as a grounded circuit conductor, with the circuit path running over the enclosure between the termination and the main bonding jumper. It is highly doubtful that what is essentially an equipment grounding connection would function as intended after it carries routine current, perhaps in the hundreds of amperes, over the life of the installation. This practice stands on its head the outstanding work done by CMP 5 over recent code cycles to fully divorce equipment grounding connections from applications that routinely carry load current. Routine load currents on grounded circuit conductors should be confined to conductors recognized in Article 310, or busbars, etc. This practice must be clearly prohibited. This proposal locates the prohibition in Part I because it is a potential issue any time a grounded/grounding interconnection is permitted within an enclosure, including 250.30(A)(1) and 250.32(B)(2).
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:

MELLO, C.: The panel should have rejected this proposal. The intent is correct but the requirements are in the wrong Article. The grounded conductor is permitted or required to be connected to the grounding system under specific conditions in Article 250 so as to provide for the grounded conductor to also serve an equipment grounding function or to establish which conductor is the grounded conductor for a system. The example of the main bonding jumper being called a "grounded conductor" is a clear misapplication of terms and creates confusion. The connection of the grounded conductor in and out of any enclosure must be on a suitable conductor, as indicated in the proposal's substantiation, and not use the metal enclosure for the current carrying path.

5-91 Log #3645 NEC-P05 **Final Action: Accept in Part**
(250.20)

Submitter: Sergio Panetta, IPC Resistors.com
Recommendation: Amend 250.20 to read:

Alternating-Current grounded systems to Be Grounded.

Alternating-Current systems shall be grounded as provided for in 250.20(A), (B), (C), (D), **or (E)** ...
Substantiation: (E) is listed as a suitable form of grounding but excluded from the text.
Panel Meeting Action: Accept in Part

Revise Section 250.20, first sentence to read as follows:

Alternating-current systems shall be grounded as provided for in 250.20(A), (B), (C), (D), or (E) .
Panel Statement: There is no technical substantiation to change the title.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-92 Log #1107 NEC-P05 **Final Action: Accept in Principle**
(250.20(A)(3))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Add "or structure".
Substantiation: Edit. All structures are not deemed "buildings".
Panel Meeting Action: Accept in Principle
Revise 250.20(A)(3) to read as follows:

(3) Where installed outside as overhead conductors ~~outside of buildings~~
Panel Statement: This revision meets the intent of the submitter. The revised text resolves the issue of being outside of a building or structure.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:

RAPPAPORT, E.: Deletion of buildings will expand the application of this requirement substantially without any specific public proposal or need. The submitter was looking for the addition of "structures" not the deletion of "buildings". "Overhead" is not defined in the NEC and does not necessarily mean "bare overhead conductors". As amended by the panel, all overhead conductors will be required to be grounded. This will include lighting systems operating at 30 volts or less as covered in Article 411.

Lighting operating at 30 volts or less sometimes requires overhead conductors. 411.5(A) mandates "Secondary circuits shall not be grounded". This is in conflict with 250.20(A). Also, this will prohibit the use of listed tools operated at 12 volts, ungrounded, for safety inside the vessels and tanks. Conductors to such vessels are routed overhead from the transformer to the vessels and tanks to avoid damage. As previously written, this requirement applied to only overhead conductors outside the buildings.

250.20(A) should either be deleted or amended to replace "shall be grounded" by "shall be permitted to be grounded". Primary intent of this requirement in 250.20(A) is for personnel safety. Contact with voltages below 50 volts is not considered to be a hazard even by OSHA. OSHA 1910.303(g)(2) requires guarding of live parts over 50 volts only for safety. Comments by users of the National Electrical Code are solicited to determine pros and cons of deletion or amending of 250.20(A), thereby not requiring mandatory grounding of systems below 50 volts.

5-93 Log #1582 NEC-P05 **Final Action: Accept**
(250.20(B)(2))

Submitter: Technical Correlating Committee on National Electrical Code
Recommendation: Make the following change in 250.20(B)(2):

Change "neutral" to "neutral conductor."

The revised text would appear as follows:

(2) Where the system is 3-phase, 4-wire, wye connected in which the neutral conductor is used as a circuit conductor.
Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).

The Task Group has proposed the following definitions to be added to Article 100:

● **Neutral conductor.** A circuit conductor connected to the neutral point of a system.

● **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.

This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals

● The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.

● The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.

Additional information is available in the Task Group report.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-94 Log #340 NEC-P05 **Final Action: Accept in Principle**
(250.20(D))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read as follows:

(D) Separately Derived Systems. Separately derived systems, as covered in 250.20(A) or (B), shall be grounded as specified in 250.30 (A) .

Substantiation: Grounded systems are required to be grounded in accordance with the requirements of 250.30(A). 250.30(B) provides the rules for ungrounded systems. This revision provides a more specific reference to the rules for grounded systems in 250.30(A) rather than referencing all of 250.30.

Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 5-95.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-95 Log #341 NEC-P05 **Final Action: Accept in Principle**
(250.20(D))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read as follows:

(D) Separately Derived Systems. Separately derived systems, as covered in 250.20(A) or (B), shall be grounded as specified in 250.30. Where an alternate source such as an on site generator is provided with transfer equipment that includes a grounded conductor that is not solidly interconnected to the service supplied grounded conductor, the alternate source (derived system) shall be grounded in accordance with 250.30(A).

FPN No. 1: An alternate ac power source such as an on-site generator is not a separately derived system if the grounded conductor neutral is solidly interconnected to a service-supplied system grounded conductor ~~neutral~~ . An example of such situations is where alternate source transfer equipment does not include a switching action in the grounded conductor and allows it to remain solidly connected to the service supplied grounded conductor when the alternate source is operational and supplying the load served.

FPN No. 2: For systems that are not separately derived and are not required to be grounded as specified in 250.30, see 445.13 for minimum size of conductors that must carry fault current.

Substantiation: This proposal is an effort to roll information contained in the fine print note into affirmative text to provide clear direction in the form of a rule where systems that meet this criteria are installed. It always seems to be a questionable item in the field where generators and transfer switches are installed and used. Having more concise and clear language in the rule and the additional text in FPN No. 1 will provide better direction for Code users. The proposed language may need to be adjusted editorially.

Panel Meeting Action: Accept in Principle

250.20(D) Separately Derived Systems. Separately derived systems, as covered in 250.20(A) or (B), shall be grounded as specified in 250.30 (A) . Where an alternate source such as an on site generator is provided with transfer equipment that includes a grounded conductor that is not solidly interconnected to the service supplied grounded conductor, the alternate source (derived system) shall be grounded in accordance with 250.30(A).

FPN No. 1: An alternate ac power source such as an on-site generator is not a separately derived system if the grounded conductor ~~neutral~~ is solidly interconnected to a service-supplied system grounded conductor ~~neutral~~ . An example of such situations is where alternate source transfer equipment does not include a switching action in the grounded conductor and allows it to remain solidly connected to the service supplied grounded conductor when the alternate source is operational and supplying the load served.

FPN No. 2: For systems that are not separately derived and are not required to be grounded as specified in 250.30, see 445.13 for minimum size of conductors that must carry fault current.

Panel Statement: "(A)" was added editorially after 250.30 in the first sentence from Proposal 5-94 and the word neutral in FPN No. 1 was struck through.

Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:

TOOMER, R.: The usage 'an example is where' in FPN No. 1 is awkward and non-standard. It would be clearer if the two sentences were combined as "An alternate ac power source such as an on-site generator is not a separately derived system if the grounded conductor is solidly interconnected to a service-supplied system grounded conductor and is not disconnected by the switching action of alternate source transfer equipment."

5-96 Log #1583 NEC-P05 **Final Action: Reject**
(250.20(D), FPN 1)

Submitter: Technical Correlating Committee on National Electrical Code
Recommendation: Make the following change in 250.20(D) FPN No. 1:

Change "neutral" to "neutral conductor."

The revised text would appear as follows:

FPN No. 1: An alternate ac power source such as an on-site generator is not a separately derived system if the neutral conductor is solidly interconnected to a service-supplied system neutral conductor .

Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).

The Task Group has proposed the following definitions to be added to Article 100:

● **Neutral conductor.** A circuit conductor connected to the neutral point of a system.

● **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.

This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals

● The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.

● The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.

Additional information is available in the Task Group report.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 5-95, which removed the word "neutral" from the FPN.

Ballot Results: Affirmative: 15

5-97 Log #672 NEC-P05 **Final Action: Reject**
(250.21)

Submitter: Jamie McNamara, Hastings, MN
Recommendation: Revise as follows:

250.21 Exception: Systems of less than ~~120 volts to ground~~ 150 volts phase to phase as permitted by this Code shall not be required to have ground detectors.

Substantiation: The requirement is for non-grounded systems in a non-grounded system theoretically there are zero volts to ground.

Panel Meeting Action: Reject
Panel Statement: Accepting this change would permit ungrounded 120 volt circuits without ground detection. The definition of Voltage to ground indicates that for ungrounded circuits, the voltage to ground is the greatest voltage between the given conductor and any other conductor of the circuit.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-98 Log #3391 NEC-P05 **Final Action: Accept in Principle**
(250.21)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Delete the exception following the concluding paragraph; revise the concluding paragraph as follows:

Ungrounded alternating current systems operating at 120 volts to 1000 volts to ground shall have ground detectors installed on the system.

Substantiation: This is an editorial proposal aimed at simplifying what should be a simple requirement. This wording incorporates the exception, and leaves the control circuit ground detector requirement intact, that applies regardless of voltage.

Panel Meeting Action: Accept in Principle

Proposed Revised Text:

250.21 Alternating-Current Systems of 50 Volts to 1000 Volts Not Required to Be Grounded.

<u>(A) General.</u> The following ac systems of 50 volts to 1000 volts shall be permitted to be grounded but shall not be required to be grounded:

(1) Electric systems used exclusively to supply industrial electric furnaces for melting, refining, tempering, and the like

(2) Separately derived systems used exclusively for rectifiers that supply only adjustable-speed industrial drives

(3) Separately derived systems supplied by transformers that have a primary voltage rating less than 1000 volts, provided that all the following conditions are met:

a. The system is used exclusively for control circuits.

b. The conditions of maintenance and supervision ensure that only qualified persons service the installation.

c. Continuity of control power is required.

~~d. Ground detectors are installed on the control system.~~

(4) Other systems that are not required to be grounded in accordance with the requirements of 250.20(B).

~~Where an alternating-current system is not grounded as permitted in 250.21(1) through (4), ground detectors shall be installed on the system.~~

~~Exception: Systems of less than 120 volts to ground as permitted by this Code shall not be required to have ground detectors.~~

<u>(B) Ground Detectors. Ungrounded alternating current systems as permitted in 250.21(A)(1) through (A)(4) operating at 120 Volts to 1000 Volts to ground shall have ground detectors installed on the system.</u>

Panel Statement: The additional reference in 250.21(3)(d) for ground detectors is deleted since this is now a universal requirement when the voltage of the system is above 120 volts. The proposed text is modified to ensure the cross reference back to those systems as permitted under this section having the requirement for ground detectors. The exception was changed into positive text. The section was renumbered and titles were added to conform to the NEC Style Manual.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-99 Log #2908 NEC-P05 **Final Action: Reject**

(250.22(2))

Submitter: Peter D. Noval, Jr., Philadelphia, PA

Recommendation: Revise text to read as follows:

(2) Circuits in health care facilities as provided in ~~517.61~~ <u>517.62</u> and 517.160.

Substantiation: The exception to 517.62 directly addresses circuits not to be grounded. 517.61 makes no such reference.

Panel Meeting Action: Reject

Panel Statement: Section 517.61(A)(1) specifically addresses power circuits in the flammable anesthetizing location and requires isolation from the supply distribution system. The reference from 517.61 to 517.160 provides the user the necessary requirement that these circuits are not permitted to be grounded.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-100 Log #1205 NEC-P05 **Final Action: Accept**

(250.22(5) (New))

Ballot Results: Affirmative: 15

5-101 Log #127 NEC-P05 **Final Action: Reject**

(250.24(A)(3))

Submitter: Wayne Webb, Town of Prescott Valley, Arizona

Recommendation: Revise as follows:

For multiple services that are "freestanding" and independent of each other and dedicated to separate equipment located in close proximity to each other, the grounding electrode systems of all systems shall be connected or shared.

Substantiation: In the case of multiple, separate services installed in close proximity, there can be a possibility of step voltage occurring between separately grounded services. This would reduce this possibility. I have encountered this circumstance in relation to separate Telco and cellular services placed near each other and grounded independently. Gradient fault currents could potentially be present in an event, and this would prevent or reduce the possibility of injury or death.

Panel Meeting Action: Reject

Panel Statement: The submitter has not provided substantiation for step potential concerns.

The phrase "in close proximity" is vague and would be difficult to enforce.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-102 Log #2393 NEC-P05 **Final Action: Reject**

(250.24(A)(5), FPN)

Submitter: Mike Holt, Mike Holt Enterprises

Recommendation: Revise text to read:

250.24 Grounding Service-Supplied Alternating-Current Systems.

(A) System Grounding Connections. A premises wiring system supplied by a grounded ac service shall have a grounding electrode conductor connected to the grounded service conductor, at each service, in accordance with 250.24(A)(1) through (A)(5).

(5) Load-Side Grounding Connections. A grounding connection shall not be made to any grounded conductor on the load side of the service disconnecting means except as otherwise permitted in this article.

FPN: See 250.30(A) for separately derived systems ~~, 250.32 for connections at separate buildings or structures~~ , and 250.142 for use of the grounded circuit conductor for grounding equipment.

Substantiation: This is a companion proposal to my proposal to delete 250.32(B)(2). If 250.32(B)(2) is deleted as I am requesting, this FPN will need to be revised as well.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 5-119. The reference to 250.32 is still appropriate.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-103 Log #1707 NEC-P05 **Final Action: Accept**

(250.24(D))

Submitter: Danny Thomas, Henderson, NC

Recommendation: Add a new sentence at the end of the first paragraph to read as follows:

<u>This conductor shall be sized in accordance with 250.66.</u>

Substantiation: 250.24(B) tells us where to go to size the "main bonding jumper" and 250.24(C)(1) and (2) tells us how to size the "grounded conductor", therefore, I feel that alerting the code user to how we size the grounding electrode conductor early on in Article 250 makes the Code much more user friendlier.

Panel Meeting Action: Accept

Recommendation: Insert "rigid" ahead of "metal" in the last sentence.

Substantiation: Edit. 230.43 permits flexible metal enclosures for service conductors, which are not suitable.

Panel Meeting Action: Reject

Panel Statement: Use of the term "rigid" is not approprate for all enclosures that are applicable for this section.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-105 Log #2189 NEC-P05 **Final Action: Reject**

(250.26)

Submitter: Dann Strube, Strube Consulting

Recommendation: Relocate 250.26 as 250.21 and renumber 250.21 and 250.22 as needed.

Substantiation: This change places 250.26 next to the section where it is used.

Panel Meeting Action: Reject

Panel Statement: Sections 250.21 and 250.22 both refer to systems not to be grounded. Section 250.24 initiates discussion on how to ground. The next logical step is which conductor to ground. Therefore, the panel concludes that 250.26 is in the appropriate location and should continue to directly follow 250.24.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

DOBROWSKY, P.: The proposal should be accepted. Relocating this section immediately following 250.20 make sense as this is the section it relates to. If you are not grounding the system then which conductor "would be used" if the system was grounded does not matter.

5-106 Log #910 NEC-P05 **Final Action: Reject**
(250.26(5))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise:
"Multiphase systems in which one phase is used as in (2) - the ~~neutral~~ mid-phase connected conductor.
Substantiation: Edit. In a 4-wire delta connected system the voltage between the grounded conductor and the phase conductors are not equal; can this conductor be called a neutral?
Panel Meeting Action: Reject
Panel Statement: This proposal is not editorial. The proposed changes do not add clarity to or improve usability of this section. A new term (mid-phase connected) is introduced to users that might not be clearly understood. The current language used in this section clearly indicates which conductor of high-leg systems is required to be grounded. Also, see panel action and statement on Proposal 5-36.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-107 Log #2012 NEC-P05 **Final Action: Accept in Principle**
(250.28(D))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read as follows:
(D) Size. Main bonding jumpers and system bonding jumpers shall be sized in accordance with 250.28(D)(1) through (D)(3) .
(1) Main bonding jumpers and system bonding jumpers shall not be smaller than the sizes shown in Table 250.66. Where the supply conductors are larger than 1100 kcmil copper or 1750 kcmil aluminum, the bonding jumper shall have an area that is not less than 12 1/2 percent of the area so the largest phase conductor except that, where the phase conductors and the bonding jumper are of different materials (copper or aluminum), the minimum size of the bonding jumper shall be based on the assumed use of phase conductors of the same material as the bonding jumper and with an ampacity equivalent to that of the installed phase conductors.
(2) Where a service consists of more than a single enclosure as permitted in 230.71(A), the main bonding jumper for each enclosure shall be sized in accordance with 250.28(D)(1) based on the largest ungrounded service conductor serving that enclosure.
(3) Where a separately derived system supplies more than a single enclosure, the system bonding jumper for each enclosure shall be sized in accordance with 250.28(D)(1) based on the largest ungrounded service conductor serving that enclosure or a single system bonding jumper shall be installed at the source and sized in accordance with 250.28(D)(1) based on the equivalent size of the largest supply conductor determined by the largest sum of the areas of the corresponding conductors of each set.
Substantiation: This proposal adds language to help clarify sizing requirements for main bonding jumpers and system bonding jumpers where the service disconnecting means or the first system overcurrent device for separately derived systems consists of more than a single enclosure. The proposal provides users with clear criteria to use for determining the minimum sizes where multiple enclosures are used for either situation.
Panel Meeting Action: Accept in Principle
Revise text of the recommendation to read as follows:
(D) Size. Main bonding jumpers and system bonding jumpers shall be sized in accordance with 250.28(D)(1) through (D)(3) .
(1) Main bonding jumpers and system bonding jumpers shall not be smaller than the sizes shown in Table 250.66. Where the supply conductors are larger than 1100 kcmil copper or 1750 kcmil aluminum, the bonding jumper shall have an area that is not less than 12 1/2 percent of the area so the largest phase conductor except that, where the phase conductors and the bonding jumper are of different materials (copper or aluminum), the minimum size of the bonding jumper shall be based on the assumed use of phase conductors of the same material as the bonding jumper and with an ampacity equivalent to that of the installed phase conductors.
(2) Where a service consists of more than a single enclosure as permitted in 230.71(A), the main bonding jumper for each enclosure shall be sized in accordance with 250.28(D)(1) based on the largest ungrounded service conductor serving that enclosure.
(3) Where a separately derived system supplies more than a single enclosure, the system bonding jumper for each enclosure shall be sized in accordance with 250.28(D)(1) based on the largest ungrounded feeder conductor serving that enclosure or a single system bonding jumper shall be installed at the source and sized in accordance with 250.28(D)(1) based on the equivalent size of the largest supply conductor determined by the largest sum of the areas of the corresponding conductors of each set.
Panel Statement: The panel changed the word "service" to "feeder" in the first sentence of (3) to correct an error.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-107a Log #CP502 NEC-P05 **Final Action: Accept**
(250.30(A))

Submitter: Code-Making Panel 5,
Recommendation: Revise to read as follows:
250.30(A) Grounded Systems. A separately derived ac system that is grounded shall comply with 250.30(A)(1) through (A)(8). Except as otherwise permitted in this article, a grounded conductor shall not be connected to ~~ground,~~ normally non-current carrying metal parts of equipment, ~~or~~ to equipment grounding conductors, or be reconnected to ground ~~A grounding connection shall not be made to any grounded conductor~~ on the load side of the point of grounding of a separately derived system ~~except as otherwise permitted in this article~~ .
Substantiation: The editorial revisions to the TCC Task Group on Grounding and Bonding proposals are incorporated into the identified section 250.30(A) to be consistent with the work of CMP-5 at the Report on Proposal Meeting for the 2008 NEC. These panel changes clarify the present requirement in more prescriptive language. This proposed revision adds more specific restrictions of the grounded conductor connections to any ground connection on the load side of the service disconnect. No other technical changes to the section are proposed, just clarification. Correlated with the text in 250.24(A)(5) from Proposal 5-61. Revisions were made to ensure consistency between the rules for services and separately derived systems.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-108 Log #2394 NEC-P05 **Final Action: Reject**
(250.30(A))

Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Revise text to read:
250.30 Grounding Separately Derived Alternating-Current Systems.
(A) Grounded Systems. A separately derived ac system that is grounded shall comply with 250.30(A)(1) through (A)(8). A grounding connection shall not be made to any grounded circuit conductor on the load side of the ~~point of grounding~~ system bonding jumper of the separately derived system except as otherwise permitted in this article.
FPN: See ~~250.32 for connections at separate buildings or structures, and~~ 250.142 for use of the grounded circuit conductor for grounding equipment.
Substantiation: This is a companion proposal to my proposal to delete 250.32(B)(2). If 250.32(B)(2) is deleted as I am requesting, this FPN will need to be revised as well. This change also correlates the code language of the existing text with new term "system bonding jumper", introduced in the 2005 cycle.
Panel Meeting Action: Reject
Panel Statement: The existing language correctly indicates the panel's intent for grounding connection not to be made on the load side of the point of grounding. See panel action and statement on Proposal 5-119. The reference to 250.32 is still appropriate.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-109 Log #1441 NEC-P05 **Final Action: Reject**
(250.30(A)(4))

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise as follows:
(4) Remain unchanged
Exception No. 1: Remain unchanged
Exception No. 2: Remain unchanged
(a) Common Grounding Electrode Conductor Size. The common grounding electrode conductor shall not be smaller than 3/0 AWG copper or 250 kcmil aluminum
Exception: The common grounding electrode conductor shall be permitted to be sized in accordance with 250.66(A), (B) or (C), as applicable .
(b) Remain unchanged.
Substantiation: As written, the common grounding electrode conductor would have to be 3/0 AWG, regardless of the type of electrode employed. The allowances in 250.66(A), (B), and (C) should be permitted, depending upon the type of electrode used for the separately derived systems.
Panel Meeting Action: Reject
Panel Statement: There is no technical substantiation to eliminate Section 250.30(A)(4)(c).
Number Eligible to Vote: 15
Ballot Results: Affirmative: 12 Negative: 3
Explanation of Negative:
BOKSINER, J.: While, I agree with Panel Statement regarding the entire proposal, the proposed exception is consistent with the sizing requirements in 250.66 and should be accepted.
BRETT, JR., M.: I do not believe it was the intent of the submitter to delete 250.30(A)(4)(c), therefore, I believe the panel statement is incorrect. However, the submitter is correct that there is no technical substantiation for requiring that the grounding electrode conductor be larger than required by 250.66.

RAPPAPORT, E.: The proposal should have been Accepted.

The panel statement does not technically address the submitter's proposal. The submitter's substantiation is correct. It is not technically defensible to require a larger grounding electrode conductor for separately derived systems than would be required for a service. The same requirements that apply to a grounding electrode conductor in 250.66(A), (B), and (C) are applicable to 250.30(A)(1) and (2) but not for (C). For instance, what is the technical basis for requiring a 3/0 AWG copper grounding electrode conductor for connection to a concrete encased electrode in 250.30(A) when 250.66(B) for connection based on Service Entrance conductor states that "...shall not be required to be larger than 4 AWG copper wire"? If a #4 AWG copper connection to a concrete encased electrode is acceptable based on Service Entrance conductors [250.66(B)], it should also be acceptable for a separately derived system defined in 250.30(A).

When this provision (requiring 3/0 AWG for multiple separately derived systems) was originally introduced, it was argued that: What if...? What if more separately derived systems are added onto the common grounding electrode conductor? Will the grounding electrode conductor be large enough? The answer is that the common grounding electrode conductor needs to be large enough for the largest separately derived system connected to it - not the sum of all system capacities. The reason is that the purpose of the grounding electrode conductor is for system grounding - not ground fault current. System grounding provides for stabilization of voltage, for lightning current discharge to ground, and for fault current path in the event of a transformer failure due to secondary conductor contact with a higher voltage system. All of these items are singular in nature because it is not probable that a lightning strike or a high voltage contact to secondary conductors will occur on more than one system at a time. System stabilization requires very minimal current. It, therefore, follows that the common grounding electrode conductor should be sized for the largest separately derived system to be connected to it. In addition, since the grounding electrodes referencedin 250.66(A), (B), and (C) have limited current carrying capability as evidenced by the maximum required conductor connection, it also follows that any grounding electrode conductor, whether from a service or a separately derived system, should also be bound by the same rules.

5-110 Log #1649 NEC-P05 **Final Action: Accept**
(250.30(A)(4))

Submitter: Jim Davis, Electrical Education Services, LLC
Recommendation: Add new text as follows:

250.30(A)(4) Grounding Electrode Conductor, Multiple Separately Derived Systems. Where more than one separately derived system is installed, it shall be permissible to connect a tap from each separately derived system to a common grounding electrode conductor. Each tap conductor shall connect the grounded conductor of the separately derived system to the common grounding electrode conductor. The grounding electrode conductors and taps shall comply with 250.31(A)(4)(a) through (A)(4)(c). <u>This connection shall be made at the same point on the separately derived system where the system bonding jumper is installed.</u>

Substantiation: The 2005 NEC provides guidance on where to make the GEC connection for SINGLE SEPARATELY DERIVED SYSTEMS in 250.30(A)(3), but does not do so for multiple separately derived systems anywhere in 250.30(A)(4). The addition of this text will provide such needed guidance and reduce possible confusion for code users.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-111 Log #449 NEC-P05 **Final Action: Reject**
(250.30(A)(4),(c) (1))

Submitter: W. Creighton Schwan, Hayward, CA
Recommendation: Revise to read:

(1) A listed <u>irreversible compression-type</u> connector.

Substantiation: This change will assure compliance with 250.30(A)(5) and the referral therein to 250.64(C)(1) where the irreversible compression-type or the exothermic welding type of connections are required.
Panel Meeting Action: Reject
Panel Statement: Many listed connectors that are specifically listed for grounding and bonding are available as non-irreversible types.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:

DOBROWSKY, P.: I support the panel's action on this proposal but believe other sections need to be modified also. Connectors that are specifically listed as grounding and bonding devices should be suitable for grounding electrode "splices" even if they are not irreversible.

5-112 Log #1972 NEC-P05 **Final Action: Reject**
(250.30(A)(4)(c)(1))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Revise as follows:

250.30(A)(4)(c) Connections. All tap connections to the common grounding electrode conductor shall be made at an accessible location by one of the following methods:

1. A <u>n</u> ~~listed~~ <u>irreversible compression</u> connector <u>listed as grounding and bonding equipment</u> .

Substantiation: During the 2005 cycle, the phrase "listed for the purpose" was removed. The code making panel failed to include this in the rewrite of the section. In addition, there was no technical substantiation provided that allows any type connector to be used. Irreversible compression connectors are more permanent than mechanical connectors, which was the rationale for this requirement. Grounding electrode conductors are expected to carry short time, high current due to exposed lightning. A listed connector is not tested to perform a short time, high current test to be listed. This revision makes this requirement the same as the 2002 NEC, before the rewrite.
Panel Meeting Action: Reject
Panel Statement: The panel determined that standard listed connectors have served this purpose inside of switchboards and panelboards for years as well as split bolt-type connectors for service grounding electrode conductor taps. Listed connectors should be required and not the restrictive connectors listed for grounding and bonding. In addition, the proposed text would now become even more restrictive where the connector would have to be a listed irreversible compression-type connector where there are other than irreversible compression-type connectors listed for grounding and bonding.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 12 Negative: 3
Explanation of Negative:

BRENDER, D.: It was pointed out by one Panel member, who is a manufacturer of these devices, that there is a difference between "listed irreversible compression connector" and "listed as grounding and bonding equipment", in that the latter must pass a high current test to be listed, while the former does not.

BRETT, JR., M.: I agree with the other explanations of negative votes.

STEINMAN, G.: Common grounding electrode conductors are expected to carry lightning induced current and fault current. Listed electrical connectors are not evaluated to carry short-time high current. Connectors listed as grounding and bonding equipment are evaluated to UL 467, Bonding and Grounding Equipment, which includes a short-time high current test. Irreversible compression type connectors are more permanent than mechanical type connectors. Because irreversible compression type connectors limit the installation variables when installed, it provides a more reliable connection.
Comment on Affirmative:

DOBROWSKY, P.: See my comment on 5-111.

5-113 Log #1078 NEC-P05 **Final Action: Reject**
(250.30(A)(4)a.)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise text to read as follows:

(a) COMMON GROUNDING ELECTRODE CONDUCTOR SIZE . The common grounding electrode conductor shall ~~not be smaller than 3/0 AWG copper or 250 kcmil aluminum~~ <u>be sized in accordance with 250.66 based on the sum of the total circular mil area of the largest derived phase conductors from each separately derived system connected to the common grounding electrode conductor.</u>

Substantiation: Substantiation for a 3/0 or 250 cmil conductor seemed to be based primarily on the possibility of added systems, with no data indicating multiple system additions, or that previous size requirements were not being enforced. 90.1(B) indicates Code provisions are not necessarily for future expansions which this section obviously covers. Present requirement has no relationship to capacities. Two separately derived systems from two 1 kVA transformers would require a common 3/0 or 250 kcmil bonding conductor to other electrodes per 250.53, 250.58, and 250.104(D)(5). This rule does not correlate with 250.66(A) of reconnection to rod, pipe, or plate electrodes where the grounding electrode conductor does not have to be larger than 6 AWG copper or 4 AWG aluminum.
Panel Meeting Action: Reject
Panel Statement: The panel affirms its actions on this proposal through its actions and statements on Proposal 5-78 and Comment 5-61 in the 2005 NEC cycle. See panel action and statements to Comment 5-61 on page 70-150 of the 2004 NEC Report on Comments publication.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:

DOBROWSKY, P.: The proposal should be accepted. Common grounding electrode conductors should be sized based on what is actually installed, not on some perceived expected future need.

5-114 Log #2190 NEC-P05 **Final Action: Reject**
(250.30(A)(7) Exception)

Submitter: Dann Strube, Strube Consulting
Recommendation: Add new text as follows:
Where the source of the separately derived system is located outside the building, at least one additional grounding connection shall be made from the derived grounded conductor to a grounding electrode, either at the source of the separately derived system or elsewhere outside the building.
Exception: The additional grounding connection shall not be made on high-impedance grounded neutral systems. The system shall meet the requirements of 250.36.
Substantiation: This proposal is an extension of my Proposal 5-88 (Log #1508) for the 2005 NEC. The language is derived from 250.24 for services.
The major purpose for a second electrode is to deal with lightning introduced into the system between the source and the building. If this is an issue for a service it is also an issue here.
The panel statement for my rejected 2005 proposal was full of defective logic. Some, but not all services are run in steel raceways providing an equipment grounding conductor. The same is true of derived systems. It is not true that all derived system have a grounding conductor between the source and the building. In fact, 250.142 deals with this quite well.
The panel statement indicates that an outdoor transformer is a structure. A transformer is not a structure. It is, in fact,equipment. Chapter 4 covers equipment for general use and Article 450 is part of Chapter 4. While a transformer may meet the definition of structure, it also clearly meets the definition of equipment.
The panel statement indicated that bonding at two points is limited to cases where a parallel path is not created. The fact is it is not necessary to bond in order to connect the neutral to earth.
If you persist with the concept that a transformer is a structure, you raise a major issue with Article 225. 225.32 covers the location of disconnects and, therefore, it would require a disconnect at each outdoor transformer. Since the disconnect cannot be inside the transformer, it will need to be mounted on the outside of the transformer case.
The rule for derived system must be the same as the rule for service. In both installations, there may be parallel paths established. The real question here is not parallel paths. The question is do I want lightning or high-voltage crossovers or do I put up with the parallel path?
Panel Meeting Action: Reject
Panel Statement: The panel determined that mandatory connection of the grounded conductor at the outside transformer would unnecessarily restrict the options provided in 250.30 on grounding of separately derived systems.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:
BRENDER, D.: The proposal should have been accepted as the substantiation is correct. The ownership of many existing electrical installations is being transferred to property owners as electric utilities move back toward the property line. The rules in 250.24(A)(2) for the installation of services mandate the installation of a grounding electrode(s) if a transformer is located outdoors. Why shouldn't the rules for the owner's premises wiring system offer identical safety rules?
DOBROWSKY, P.: The proposal should be accepted. Some interpret an outside transformer as a structure and some do not.

5-115 Log #2191 NEC-P05 **Final Action: Reject**
(250.30(A)(7) Exception No. 1)

Submitter: Dann Strube, Strube Consulting
Recommendation: Change Exception No. 1 back into 250.3(A)(7) List Item 3. Renumber Exception No. 2.
Substantiation: This returns the section to the format used in the 2002 NEC. As an exception, the "near as practicable" condition of the main rule would not apply to these other electrodes. In the old format, the "near as practicable" condition would still apply to other electrodes. An alternate solution would be to add the "near" language to the existing exception.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its actions on Proposal 5-78 (Log #1725) in the 2005 NEC cycle. The proposal does not add clarity or improve usability of this section. The work of the task group on revising Section 250.30(A) in the 2005 NEC cycle should be upheld. As near as practicable, it applies to Exception No. 1 as well.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
DOBROWSKY, P.: The proposal should be accepted. The submitter has a point and the proposed language is clearer.

5-116 Log #932 NEC-P05 **Final Action: Reject**
(250.30(B))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise:
(B) The <u>exposed noncurrent-carrying metal parts of enclosures, raceways, cables, and</u> equipment of an ungrounded separately derived system <u>supplied by a stand-alone power source such as an engine-generator, or wind-driven generator</u> , shall be grounded as specified in 250.30(B)(1) and (B)(2).
Revise last sentence of (1):
This connection shall be made at ~~any point on~~ the source of the separately derived system. ~~From the source to the first system disconnecting means.~~
Substantiation: The unmodified word "equipment" is too general, including material, conductors, devices, fuses, etc., which cannot be grounded, and equipment which has no exposed metal parts. If an EGC is connected at the first system disconnecting means which is supplied and grounded by conductors in a metal raceway or cable approved for grounding or by a separate grounding conductor, it is no different than a connection anywhere on the system.
Panel Meeting Action: Reject
Panel Statement: This proposal lessens the current requirements without substantiation. The submitter provided no technical or practical substantiation to support why grounding non-current-carrying metal parts should be a requirement limited to those that are exposed. They should be grounded whether exposed or not. No substantiation has been provided to require the grounding conductor connection to the electrode to be limited to being made only at the source enclosure.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-117 Log #1114 NEC-P05 **Final Action: Reject**
(250.30(B)(1)and Exception (New))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise last sentence of (1):
This connection shall be made at ~~any point on~~ the source of the separately derived system ~~from the source to the first system disconnecting means.~~
<u>Exception: Where the separately derived system power source is supped by a circuit originating in the same building or structure and is grounded in accordance with (250.118) (Part IV), a grounding electrode conductor shall not be required</u> . Alternate choices in parentheses.
Substantiation: If the GEC is connected at the first (separate) system disconnect which is supplied by conductors in a metal raceway or cable approved for grounding or by a separate wire-type equipment grounding conductor, this would be no different than a connection anywhere to a metal enclosure in the system and no different from grounding the source metal by an equipment grounding conductor run with the supply circuit to a transformer. Equipment grounding is already required by Part IV. This GEC does not stabilize any voltage or minimize transient voltages. Other purposes of the GEC to protect from lightning or contact with higher voltage systems are not unique to separately derived systems. If a transformer for a separately derived system is installed two feet from a primary disconnecting means in a service equipment panelboard there are essentially two GEC for the same equipment. A 500 va transformer (ungrounded system per 411.5) with 12 AWG conductors requires a No. 8 AWG copper EGC even though the transformer enclosure is grounded with an equipment grounding conductor in the supply circuit. If two such transformers are connected to a common GEC it has to be 3/0 copper or 250 kcmil aluminum. Three phase 3-wire delta systems are not required to be grounded even if possibly subject to lightning or transient overvoltages.
Panel Meeting Action: Reject
Panel Statement: The proposed change lessens the current minimum requirements of this section. The submitter provided no technical substantiation to remove the requirement for a grounding electrode for a separately derived system that is ungrounded. The reference in the submitter's substantiation provides a reference to Section 250.118 which covers the types of acceptable equipment grounding conductors. Equipment grounding is required for equipment supplied by separately derived systems whether they are grounded systems or not in accordance with Parts IV and VI of Article 250. This equipment grounding conductor connection does not relieve the requirement for eliminating the required grounding electrode and grounding electrode conductor for an ungrounded system.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-118 Log #1329 NEC-P05 **Final Action: Accept in Principle**
(250.32)

Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Revise as follows:
250.32 Buildings or Structures Supplied by Feeder(s) or Branch Circuit(s).
(A) Grounding Electrode. Building(s) or structure(s) supplied by feeder(s) or branch circuit(s) shall have a grounding electrode or grounding electrode system installed in accordance with 250.50. The grounding electrode conductor(s) shall be connected in accordance with 250.32(B) or (C). Where there is no existing grounding electrode, the grounding electrode(s) required in 250.50 shall be installed.
Exception: A grounding electrode shall not be required where only a single branch circuit, either 2-wire or multiwire , supplies the building or structure and the branch circuit includes an equipment grounding conductor for grounding the conductive non–current-carrying parts of equipment. ~~For the purpose of this section, a multiwire branch circuit shall be considered as a single branch circuit.~~
Substantiation: Article 100 clearly indicates that a multiwire Branch Circuit is to be considered a single circuit, even if this single circuit supplies multiple loads, as is the case with a 3 wire branch circuit supplying two lighting loads. Since a multiwire branch circuit is always considered a single circuit, the last sentence of 250.32 exception is not needed.
Panel Meeting Action: Accept in Principle
Revise only the exception to 250.32(A) to read as follows:
Exception: A grounding electrode shall not be required where only a single branch circuit, including a multiwire branch circuit, supplies the building or structure and the branch circuit includes an equipment grounding conductor for grounding the conductive non–current-carrying parts of equipment. ~~For the purpose of this section, a multiwire branch circuit shall be considered as a single branch circuit.~~
Panel Statement: The revised wording adds clarity to the code.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-119 Log #2395 NEC-P05 **Final Action: Accept in Principle**
(250.32)

Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Revise text to read:
250.32 Buildings or Structures Supplied by Feeder(s) or Branch Circuit(s).
(A) Remain unchanged.
(B) Grounded Systems. For a grounded system at the separate building or structure, the connection to the grounding electrode and grounding or bonding of equipment, structures, or frames required to be grounded or bonded shall comply with ~~either~~ 250.32(B)(1) ~~or (B)(2)~~ .
(1) Equipment Grounding Conductor. An equipment grounding conductor as described in 250.118 shall be run with the supply conductors and connected to the building or structure disconnecting means and to the grounding electrode(s). The equipment grounding conductor shall be used for grounding or bonding of equipment, structures, or frames required to be grounded or bonded. The equipment grounding conductor shall be sized in accordance with 250.122. Any installed grounded conductor shall not be connected to the equipment grounding conductor or to the grounding electrode(s).
~~(2) Grounded Conductor. Where (1) an equipment grounding conductor is not run with the supply to the building or structure, (2) there are no continuous metallic paths bonded to the grounding system in each building or structure involved, and (3) ground fault protection of equipment has not been installed on the supply side of the feeder(s), the grounded conductor run with the supply to the building or structure shall be connected to the building or structure disconnecting means and to the grounding electrode(s) and shall be used for grounding or bonding of equipment, structures, or frames required to be grounded or bonded. The size of the grounded conductor shall not be smaller than the larger of either of the following:~~
~~(1) That required b y 220.61.~~
~~(2) That required by 250.122.~~
Substantiation: There are many, many issues that need to be addressed in this Code allowance. First, the allowance itself is very restrictive, when you look at the parameters that must be followed in order to use this allowance. Consider item (2), which requires that no continuous metal paths are installed between the structures. This is too difficult to enforce, when this permission has been used, only to have another tradesperson install such a metal path after the original installation. While I understand that Panel 5 cannot predict future violations, I think some proactive thinking is in order here. Panel 5 exercised good judgment last code cycle when it set forth the sizing requirements for a common grounding electrode conductor for multiple separately derived systems, based on the possibility of a future change to premises wiring system [250.30(A)(4)(a)]. Such logic should be used once again for this code rule, which is not only difficult to enforce, but also could create very significant hazards.
In addition to the enforcement issues, let us examine the safety issues that might result from this rule:
Multiple neutral-to-ground connections, that would occur if parallel continuous metallic paths are installed at a later date, create a condition where neutral current and ground-fault current will flow through conductive metal parts of a building or electrical system. This current flow can cause death from electric shock and property damage from fires. Preventing these two issues is the very purpose of the Code, as set forth in 90.1(A).
Electric Shock - Electric shock can occur if the feeder grounded conductor to a separate structure is open because the allowed neutral-to-ground connection permits neutral current to flow onto the metal parts of the electrical system.
Electric Shock from No Safety Ground. If the feeder grounded conductor is open, the low-impedance path used to clear ground-fault current is lost. Under this condition, a ground-fault will not be cleared and all metal parts of the electrical system will be energized to line-voltage.
Fire. A fire is created when heat is sufficient to cause ignition. In electrical systems, heat is generated whenever current flows. The temperature rise is dependent on the square of the current flow (I) and the resistance of the material (R), as well as the duration of the current flow (12R). A neutral-to-ground connection (even if it meets the NEC requirements) can cause a fire, and sometimes an explosion, due to an electric arc if the grounded conductor is open.
When the grounded conductor is open, neutral current flows onto the metal parts of the electrical system because a neutral-to-ground connection is allowed within the structure disconnect enclosure. When the grounded conductor is opened in wood frame construction, neutral current seeking a return path to the power supply travels into the moist wood members. After many years, the wood is converted into charcoal (wood with no moisture) because of the heat generated from the current flow. The ignition temperature of the wood is decreased and the temperature of the wood is increased because of neutral current.
For the purposes of correlation, companion proposals have been submitted to the following sections:
250.134, 250.24, 250.30, 250.142, 338.10(B), 450.5, 501.30, 502.30, 503.30, 505.25, 506.25, 547.9, 550.33, and 551.76.
Panel Meeting Action: Accept in Principle
Revise 250.32(B)(2) into an exception to read as follows:
Exception: For existing premises wiring systems only, new or existing buildings or structures only, the grounded conductor run with the supply to the building or structure shall be permitted to be connected to the building or structure disconnecting means and to the grounding electrode(s) and shall be used for grounding or bonding of equipment, structures, or frames required to be grounded or bonded where all the requirements of (1), (2), and (3) are met:
(1) An equipment grounding conductor is not run with the supply to the building or structure,
(2) There are no continuous metallic paths bonded to the grounding system in each building or structure involved, and
(3) Ground-fault protection of equipment has not been installed on the supply side of the feeder(s),
Where the grounded conductor is used for grounding in accordance with the provision of this exception, ~~T~~ t he size of the grounded conductor shall not be smaller than the larger of either of the following:
(1) That required by 220.61
(2) That required by 250.122
Panel Statement: The panel does not accept the concept of deleting Section 250.32(B)(2) from the NEC. There are instances where this method of grounding for a separate building or structure is warranted and can be accomplished by compliance with the current provisions of the Code. The panel does accept the concept of continuation of migrating away from the use of the grounded circuit conductor for grounding as emphasized clearly by the submitter. By changing provisions in 250.32(B)(2) to an exception to a base rule in 250.32(B)(1), the code can continue to include requirements that would be applicable to existing buildings or structures grounded in this manner, and at the same time strengthen the requirement in 250.32(B)(1) as the main rule with having to qualify to use the method provided in the exception [former 250.32(B)(2)] which is more restrictive. This change as suggested by the submitter would help reduce the number of designs that purposely invite the possibilities of inappropriate neutral-to-ground connections that can and often do happen at a later date, which is uncontrollable by any code rule. Revise the proposed changes to retain the text of 250.32(B)(2), but incorporate those provisions into an exception to Section 250.32(B)(1). The change is consistent with they way the Code currently addresses the grounding of frames of existing dryers and ranges as provided in Sections 250.140 Exception, and 250.142, which is by exception. This action promotes code text that is consistent with Section 3.1.1 of the NEC Style Manual by removing a mandatory section that conflicts with another mandatory section.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
TOOMER, R.: Deletion of this provision in the code, which has been successfully used for many years, is not warranted by the submitter's substantiations. No specific safety incidents or evidence has been provided to warrant this major change.

5-120 Log #1298 NEC-P05 **Final Action: Accept**
(250.32(A))

Submitter: Joseph Whitt, JW Electric
Recommendation: Revise text to read:
250.32 Buildings or Structures Supplied by Feeder(s) or Branch Circuit(s).
(A) Grounding Electrode. Building(s) or structure(s) supplied by feeder(s) or branch circuit(s) shall have a grounding electrode or grounding electrode system installed in accordance with ~~250.50~~ Part III of 250 . The grounding electrode conductor(s) shall be connected in accordance with 250.32(B) or (C). Where there is no existing grounding electrode, the grounding electrode(s) required in 250.50 shall be installed.
Substantiation: As now worded, 250.32(A) only states that this grounding electrode is required to conform to the provisions of 250.50 and nowhere in 250.50 does it refer to 250.53(D) nor 250.56.
As an instructor of both electrical contractors and inspectors in the state of North Carolina, the most asked questions on grounding are about 250.32(A).
The questions I am always asked are:
What are the requirements for the grounding electrode system at a building or structure fed by a feeder? If a water pipe that is in contact with the earth for more than ten feet and then it is connected to a nonmetallic pipe is used as the grounding electrode is it required to conform with 250.53(D)?
If a ground pipe or rod is used as the electrode, is it required to conform to 250.56?
By adding that 250.32(A) must comply to Part III of 250 would be all encompassing and include the supplementary addition of another electrode outlined in 250.53(D)(2) and the resistance to ground of a rod, pipe, or plate found in 250.56. There would be conformity to the grounding electrode system between a feeder that supplies another building or structure and at a service.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-121 Log #3338 NEC-P05 **Final Action: Reject**
(250.32(A) Exception)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc. / Rep. Massachusetts Electrical Code Advisory Committee
Recommendation: Revise the Exception to read as follows:
Exception: A grounding electrode at a separate building or structure shall not be required where no branch circuits originate at that building or structure. The branch circuit(s) shall include an equipment grounding conductor for grounding the noncurrent-carrying parts of all equipment.
Substantiation: This rewrite differs from the 2005 NEC in that a second building fed with branch circuits from another could be wired without a grounding electrode if there were none available. The 1996 NEC, without any published technical substantiation, removed the prior provision that an electrode had to be provided only if the second building itself supplied the multiple branch circuits (i.e., was supplied with a feeder.) This proposal assures that a suitable enclosure (usually a panelboard) is available to make the connection.
This proposal restores the allowance to omit the provision of a grounding electrode and GE conductor in those cases where there are multiple branch circuits, but they originate in the first building. This is very common in dwellings with detached garages. Although the 2005 NEC improved the situation somewhat, by allowing a multwired branch circuit under this allowance, it does not go far enough. A 20A receptacle circuit and a 15A lighting circuit, for example, are unlikely to have been multiwired. In addition, some detached buildings have even more circuits supplying them, all without a suitable enclosure for a grounding electrode connection.
Remember, for the usual case of grounding electrodes run outside raceways (or armored cable assemblies) the minimum size conductor is 6 AWG, and an installer must generally terminate this in a device box. Note that if a qualified grounding electrode is available, however, it must be used. That was required in the 1993 NEC and would be unchanged under this proposed revision.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposals 5-118. See also Section 225.30. The fundamental rule is a single branch circuit or a single feeder unless special conditions exist.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-121a Log #CP503 NEC-P05 **Final Action: Accept**
(250.32(B))

Submitter: Code-Making Panel 5,
Recommendation: Revise Section 250.32(B) as follows:
(B) Grounded Systems. For a grounded system at the separate building or structure, the connection to the grounding electrode, the ~~and~~ grounding and ~~or~~ bonding of equipment, structures, or frames required to be grounded and ~~or~~ bonded shall comply with either 250.32(B)(1) or (B)(2)
Substantiation: The editorial revisions to the TCC Task Group on Grounding and Bonding proposals are incorporated into the identified sections to be consistent with the work of CMP-5 at the Report on Proposal Meeting for the 2008 NEC. These panel changes clarify the present requirement in more prescriptive language. Revisions are to include both grounding and bonding rather than a choice of either by the use of the word “or” in this section. This action is correlated with Proposal 5-119.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-122 Log #2552 NEC-P05 **Final Action: Accept in Principle**
(250.32(B)(2))

Submitter: Edward Mitchell, City of Los Angeles, CA
Recommendation: Delete the following text:
~~(2) Grounded Conductor. Where (1) and equipment grounding conductor is not run with the...shall not be smaller than the larger of the following:~~
~~(1) That required by 220.61~~
~~(2) That require by 250.122~~
Substantiation: This section becomes more awkward with every code cycle and should be deleted for several reasons. It defies 250.24(A)(5) which prohibits a grounding connection to any grounded conductor on the load side of a service disconnecting means. A panelboard or a disconnect does not know if it exists in a “separate” building, so why are there separate rules? The very principle of electrical safety depends upon the grounding and grounded conductors being bonded only at the service (or separately derived system) and to be isolated from each other at all other times. When a building or structure is supplied by a feeder or branch circuit, run an equipment grounding conductor!!!
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 5-119.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
TOOMER, R.: See my Explanation of Negative for Proposal 5-119.

5-123 Log #1274 NEC-P05 **Final Action: Accept in Principle**
(250.32(B)(2))

Submitter: Jim Davis, Electrical Education Services, LLC
Recommendation: Revise as follows:
“ In existing installation w (~~W~~)here (1) an equipment grounding conductor is not run with the supply to the building or structure, (2) there are no continuous metallic paths bonded to the grounding system in each building or structure involved, and (3) ground-fault protection of equipment has not been installed on the supply side of the feeder(s), the grounded conductor run with the supply to the building or structure shall be connected to the building or structure disconnecting means and to the grounding electrode(s) and shall be used for grounding or bonding of equipment, structures, or frames required to be grounded or bonded.”
Substantiation: This proposed change intends to resolve conflict with the NEC Style Manual as well as within this section of the NEC, and to reduce confusion in the electrical industry. According to 3.1.1 of the 2003 NEC Style Manual, the use of the word “shall” indicates a mandatory NEC rule. As used in 250.32(B)(1), the word “shall” seems to REQUIRE the installation of an equipment grounding conductor to be run with the supply conductors to a separate building or structure. This requirement conflicts with present wording in 250.32(B)(2), which allows for installations without an EGC under certain circumstances, with some believing there is simply a choice of two allowed methods in new electrical installations.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 5-119.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
TOOMER, R.: See my Explanation of Negative for Proposal 5-119.

5-124 Log #1018 NEC-P05 **Final Action: Reject**
(250.32(B)(2)(2))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise as follows:
Where there are no continuous metallic paths bonded to the grounding system in each building or structure involved, including grounded conductors or grounding conductors .
Substantiation: Edit. In addition to metallic paths provided by metal piping for example, it may be overlooked that grounded or grounding conductors at the supply source and the building supplied can provide a parallel path.
Panel Meeting Action: Reject
Panel Statement: The current language in this section covers all metallic paths. The proposal does not add clarity or improve the requirements of this section.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-125 Log #1282 NEC-P05 **Final Action: Accept**
(250.32(D))

Submitter: Mark R. Hilbert, State of New Hampshire
Recommendation: Add the following underlined text to the main paragraph:
(D) Where one or more disconnecting means supply one or more additional buildings or structures under single management, and where these disconnecting means are located remote from those buildings or structures in accordance with the provisions of 225.32, Exceptions 1 and 2, 700.12(B)(6), 701.10(B)(5) or 702.11 all of the following conditions shall be met:
Substantiation: The addition of this new text will correlate the important grounding and bonding conditions contained in 250.32(D) with the allowances to locate the building disconnecting means remote from the building or structure in 700.12(B)(6), 701.10(B)(5) and 702.11. The permission in these sections to locate the disconnecting means remote from the building or structure creates essentially the same condition that results from applying Exceptions 1 and 2 to 225.32. The inclusion of these sections into 225.32 will provide guidance as to how the grounding and bonding is to be performed when the disconnecting means for the alternate system is located remote from the building or structure. See the drawing I have provided.
Note: Supporting Material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept
Panel Statement: Editorially correct the reference from 701.10(B)(5) to 701.11(B)(5).
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-125a Log #CP504 NEC-P05 **Final Action: Accept**
(250.32(D)(1))

Submitter: Code-Making Panel 5,
Recommendation: Revise Section 250.32(D)(1) as follows:
(1) The connection of the grounded conductor to the grounding electrode, to normally non-current-carrying metal parts of equipment, or to the equipment grounding conductor at a separate building or structure shall not be made.
Substantiation: The editorial revisions to the TCC Task Group on Grounding and Bonding proposals are incorporated into the identified sections to be consistent with the work of CMP-5 at the Report on Proposal Meeting for the 2008 NEC.
Changes to Proposal from Grounding and Bonding Task Group:
The phrase "… shall be connected…" is the preferred requirement. Revised to add the words "normally" and "metal" to provided consistency with proposed revisions to the definition of equipment grounding conductor. Add the word "to" twice in the recommended text for clarity.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-126 Log #962 NEC-P05 **Final Action: Reject**
(250.34)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Delete present wording and substitute the following:
(A) PORTABLE AND VEHICLE-MOUNTED ALTERNATING CURRENT GENERATORS . The frame of a portable or vehicle- mounted generator shall not be required to be connected to a grounding electrode as defined in 250.52 for a system that is required or permitted to be grounded by 250.20 and supplied by the generator and shall be considered grounded under the following conditions:
(1) The generator supplies only equipment mounted on the generator or vehicle, cord-and-plug connected equipment through receptacles mounted on the generator or vehicle, or both, and
(2) The non-current-carrying metal parts of equipment and the equipment grounding conductor terminals of the receptacles are bonded to the generator frame, and
(3) A system supply conductor specified in 250.26 shall be bonded directly to the generator frame ahead of any disconnecting means or overcurrent device(s) with a conductor in accordance with 250.28(A), (B), and (C) and sized in accordance with Table 250.66 for the derived phase conductors.
(4) A vehicle-mounted generator is bonded to the vehicle frame.
(B) PORTABLE AND VEHICLE-MOUNTED DIRECT-CURRENT GENERATORS . The frame of a vehicle-mounted direct-current generator shall not be required to be connected to a grounding electrode as defined in 250.52 for a system that is required or permitted to be grounded in 250.20, and supplied by the generator, and shall be considered grounded under the following conditions:
(1) the generator supplies only equipment mounted on the generator or vehicle, cord- and plug-connected equipment through receptacles mounted on the generator or vehicle, or both, and
(2) The non current-carrying exposed metal parts of equipment and the receptacle terminals for the connection of the equipment bonding conductor are bonded to the generator frame;
(3) A system negative polarity or neutral conductor is directly bonded to the generator frame ahead of any disconnecting means and overcurrent device(s) with a conductor sized in accordance with 250.166(A) and (B).
Substantiation: Unless these systems are specifically indicated to be considered grounded, color identification and other requirements for grounded conductors do not apply, nor can identified (grounded conductor) terminals of receptacles and equipment be reasonably assured of proper connection. There is no present requirement to bond a system conductor to the generator frame. Without a bond, there is no ground-fault current return path to operate overcurrent devices. If one conductor of the system shorts to portable or fixed equipment, the frame or equipment has the same potential; a short of another system conductor to a portable tool impresses the line voltage between the tool and frame or another tool. The proposal provides for a bond and specifies requirements for size which correlate with requirements for other separately derived ac systems and grounded dc systems. Present wording does not differentiate ac or dc generators, while Part VIII does.
Panel Meeting Action: Reject
Panel Statement: If the generator is not connected to earth, it is not considered grounded.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-127 Log #2551 NEC-P05 **Final Action: Reject**
(250.34(B))

Submitter: Edward Mitchell, City of Los Angeles, CA
Recommendation: Revise text to read as follows:
(2) The generator supplies only equipment located on the vehicle or cord-and plug-connected equipment through receptacles mounted on the vehicle, or both equipment located on the vehicle and cord- and plug-connected equipment through receptacles mounted on the vehicle or on the generator, or the generator is isolated from the earth and supplies power exclusively to portable wiring and equipment in compliance with Article 530 and...".
Substantiation: The motion picture industry employs trained, qualified persons to install all of their wiring and equipment. This wiring and equipment is used on a temporary basis for production purposes only. When the generator is the sole source of power for this equipment, it makes no difference in safety whether the equipment is plugged into receptacles mounted "directly" on the generator, or into receptacles mounted "remotely" from the generator; provided that all requirements of 250.34(B) are met, especially 250.34(B)(3) which requires equipment grounding all the way back to the generator frame which is bonded to the vehicle.
The motion picture industry frequently sets up and strikes their equipment at multiple locations during the course of a single day. Drilling holes in concrete to drive ground rods provides no additional electrical safety. The fact is they do NOT drive ground rods and they do NOT run a grounding electrode conductor for their single generator setups. There are no recorded incidents with the I. A.T.S.E Studio Electrical Lighting Technicians, Local 728 (Los Angeles County Jurisdiction), of problems with generators grounded as proposed. This proposal will bring the code language into line with the safe, practical application of generator grounding for the motion picture industry. This proposal was previously submitted to, and rejected by, code-making panel No. 15 (which regulates Article 530) because it deals with generator grounding.
Panel Meeting Action: Reject
Panel Statement: The submitter is proposing something that already applies. The submitter is proposing isolating the generator from the earth, which is the case with some portable or vehicle-mounted generators but is not practical or possible with others, depending on conditions at each unique installation. The proposal introduces language that would be difficult to enforce.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-128 Log #3503 NEC-P05 **Final Action: Reject**
(250.35 (New))

Submitter: Paul Dobrowsky, Holley, NY
Recommendation: Add a new section 250.35 as follows.
Permanently Installed Generators. The wiring methods supplied from permanently installed generators that are not separately derived systems shall include a conductor that provides an effective fault current path. This conductor shall either be a grounded conductor that is bonded to the generator frame or an equipment bonding jumper that is run with the supplying conductors. The conductor shall be sized in accordance with 250.102(C) based on the size of the derived phase conductors if they are on the supply side of the overcurrent device(s).If the overcurrent device is located on the generator the conductor shall be sized in accordance with 250.102(D).
Substantiation: Single phase 120/240V generators are commonly installed at dwellings as optional standby systems and are located outside of the building. If the generator is permanently installed, 250.34 doesn't apply.
Many transfer switch suppliers use 2 pole devices, I suspect because they are less expensive. Connected this way makes the generator "not" a separately derived system so 250.30 does not apply. Section 250.32 doesn't seem to apply either because the generator is not "supplied"- it is the "supply".
The service grounding electrode system grounds the system because the generator neutral is solidly connected to the service neutral.

Other that 250.4 there does not seem to be a specific requirement to provide an effective fault current path from the generator.

I'm not sure this is the best location for this requirement but it needs to be clarified. The issue of parallel paths might also need to be addressed such as they are in 250.32.

Panel Meeting Action: Reject

Panel Statement: The panel does not accept the concept of re-grounding the grounded conductor of generator systems that are not separately derived.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

MELLO, C.: The substantiation provided by the submitter clearly indicates a significant safety problem and also an area where the NEC is lacking guidance. There are clear requirements for connection of generators that are in fact separately derived systems but there is no direction on all the connections for non-separately derived systems for permanently installed units. This is particularly true when large generators are installed in parallel to separate paralleling switchgear, which contain both the generator disconnecting means and overcurrent protection. What are the requirements for connecting the generator frame to this switchgear enclosure since it is ahead of the overcurrent protection? This is the same case the panel clarified in the 2002 NEC for separately derived systems with the added equipment bonding jumper between the derived system and the first disconnecting means enclosure. While I agree with the panel's desire not to create another situation where the system grounded conductor is connected to ground again, creating possible parallel paths, the panel should have considered revised language to address the problem. The following language does address this issue and does address the panel's concern about reconnecting the grounded conductor to ground.

250.35 Permanently Installed Generators. A means that provides an effective ground fault current path shall be installed from a permanently installed generator(s) to the enclosure for the first disconnecting means in accordance with 250.35(A) and (B).

250.35(A) Bonding Means. Where the generator is a separately derived system the requirements in 250.30 shall apply. Where the generator is not a separately derived system, the generator shall be bonded to the disconnecting means enclosure by one of the following:

(1) Direct metal-to-metal attachment of the disconnecting means enclosure to the generator frame

(2) Installing the generator feeder conductors in rigid metal conduit, intermediate metal conduit, electrical metallic tubing or wireway

(3) Installing a wire type equipment bonding jumper between the generator terminal enclosure and the first disconnecting means enclosure.

250.35(B) Equipment Bonding Jumper Size. Where on the supply side of the generator overcurrent device, the conductor shall be sized in accordance with 250.102(C) based on the size of the derived phase conductors. Where on the load side of the overcurrent device, the conductor shall be sized in accordance with 250.102(D).

5-129 Log #1457 NEC-P05 **Final Action: Accept**
(250.36)

Submitter: Ryan Jackson, West Valley City, UT

Recommendation: Revise as follows:

250.36 High-Impedance Grounded Neutral Systems. High-impedance grounded neutral systems in which a grounding impedance, usually a resistor, limits the ground-fault current to a low value shall be permitted for 3-phase ac systems of 480 volts to 1000 volts where all the following conditions are met.

(1) The conditions of maintenance and supervision ensure that only qualified persons service the installation.

~~(2) Continuity of power is required.~~

~~(3)~~ <u>(2)</u> Ground detectors are installed on the system.

~~(4)~~ <u>(3)</u> Line-to-neutral loads are not served.

High-impedance grounded neutral systems shall comply with the provisions of 250.36(A) through (G).

Substantiation: Continuity is never required by the NEC. Rather, it is the inclination of the designer. Because of this, it is a design issue, and, therefore, should not be addressed in this code, per 90.1(C).

Panel Meeting Action: Accept

Panel Statement: The provision for "continuity or power" is not creating a Code requirement that continuity must be maintained, but the provision in 250.36(2) is one of the conditions that must be met when the designer is opting to use a high impedance grounded system. The condition that must be met as determined by the designer and accepted by the AHJ is that continuity of power is required.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-130 Log #3350 NEC-P05 **Final Action: Accept in Principle**
(250.36)

Submitter: Paul Dobrowsky, Holley, NY

Recommendation: Revise as follows:

250.36 High-Impedance Grounded Neutral Systems. High-impedance grounded neutral systems in which a grounding impedance, usually a resistor, limits the groundfault current to a low value shall be permitted for 3-phase ac systems of 480 volts to 1000 volts where all the following conditions are met:

(1) The conditions of maintenance and supervision ensure that only qualified persons service the installation.

~~(2) Continuity of power is required.~~

(2) ~~(3)~~ Ground detectors are installed on the system.

(3) ~~(4)~~ Line-to-neutral loads are not served.

Substantiation: The need for "continuity of power is required" should not be necessary to allow the use of high resistance grounding systems for personal safety. The vast majority of faults originate as line to ground faults because only one insulation failure can cause the fault. One presentation at the 2005 IEEE Electrical Safety Workshop indicated that 98% of faults originate as line to ground faults. Allowing this system to be used in other situations will help protect workers because the initial fault current will be significantly less resulting in considerably less potential incident energy exposure to a worker.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and substantiation on Proposal 5-129.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-131 Log #3643 NEC-P05 **Final Action: Reject**
(250.36(1))

Submitter: Sergio Panetta, IPC Resistors.com

Recommendation: Delete the following text:

250.36(1) requires the use of qualified personnel to service high resistance grounded installations.

Substantiation: We believe that all installations should be serviced by qualified personnel only. In fact it should be stated in the beginning of the NEC that only qualified personnel should service any electrical installations.

Panel Meeting Action: Reject

Panel Statement: No technical substantiation was provided to remove this requirement.

This type of system is not routine in premise wiring and therefore not familiar to all who do such work.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-132 Log #3644 NEC-P05 **Final Action: Accept in Principle**
(250.36(2))

Submitter: Sergio Panetta, IPC Resistors.com

Recommendation: Delete the following text:

250.36(2) allows the use of High Resistance grounding for service continuity.

Substantiation: The IEEE Green book states that high resistance grounding is chosen to reduce arc flash hazard. 250.186 allows high resistance grounded systems in higher voltages without the restrictions stated in 250.36.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Proposals 5-129 and 5-130.

Ballot Results: Affirmative: 15

5-133 Log #1584 NEC-P05 **Final Action: Accept**
(250.36(A))

Submitter: Technical Correlating Committee on National Electrical Code

Recommendation: Make the following change in 250.36(A):

Change "neutral" to "neutral conductor" in first two location. Change third appearance of "neutral" to "neutral point."

The revised text would appear as follows:

(A) Grounding Impedance Location. The grounding impedance shall be installed between the grounding electrode conductor and the system neutral <u>conductor</u> . Where a neutral <u>conductor</u> is not available, the grounding impedance shall be installed between the grounding electrode conductor and the neutral <u>point</u> derived from a grounding transformer.

Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).

The Task Group has proposed the following definitions to be added to Article 100:

● **Neutral conductor.** A circuit conductor connected to the neutral point of a system.

● **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.

This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals

● The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.

● The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.

Additional information is available in the Task Group report.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:

MELLO, C.: The panel action should have been to accept in principle. Changing the term "neutral" to "neutral conductor" is incorrect in accordance with the definition of the term "neutral conductor" accepted by the panel. Since this conductor is not expected to carry current, unbalanced or from non-linear loads, under normal conditions, then it cannot be called a neutral conductor. Adding the term "neutral point" is clearer and bypasses the necessity of naming this conductor, which may really be a bonding conductor or another variation of a grounding conductor. The revised text for the main section would then read as follows:

250.36(A) Grounding Impedance Location. The grounding impedance shall be installed between the grounding electrode conductor and the system neutral <u>point</u> . Where a neutral point is not available, the grounding impedance shall be installed between the grounding electrode conductor and the neutral <u>point</u> derived from a grounding transformer.

5-134 Log #1585 NEC-P05 **Final Action: Accept**
(250.36(D))

Submitter: Technical Correlating Committee on National Electrical Code
Recommendation: Make the following change in 250.36(D):

Delete "Neutral Conductor Routing". Replace with "Neutral Point to Grounding Impedance Conductor Routing".

The revised text would appear as follows:

(D) ~~Neutral Conductor Routing~~ <u>Neutral Point to Grounding Impedance Conductor Routing</u> . The conductor connecting the neutral point of the transformer or generator to the grounding impedance shall be permitted to be installed in a separate raceway. It shall not be required to run this conductor with the phase conductors to the first system disconnecting means or overcurrent device.

Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).

The Task Group has proposed the following definitions to be added to Article 100:

● **Neutral conductor.** A circuit conductor connected to the neutral point of a system.

● **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.

This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals

● The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.

● The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.

The change in this section is proposed because according to the new definition of a "neutral conductor," the conductor between the neutral point of the supply and the grounding impedance is not a neutral conductor as it is not a circuit conductor.

Additional information is available in the Task Group report.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:

MELLO, C.: In this case, just deleting the term "neutral" is the best solution. The specific conductor being addressed is clarified by the first part of the first sentence, which states "The conductor connecting the neutral point of the transformer or generator to the grounding impedance", and does not need any additional label. The term neutral conductor as defined now is to carry current under certain normal conditions and in this application, the only time this conductor has current flow is under ground fault (abnormal) conditions. Deleting the term "neutral" altogether would have the section read as follows:

D) ~~Neutral~~ Conductor Routing. The conductor connecting the neutral point of the transformer or generator to the grounding impedance shall be permitted to be installed in a separate raceway. It shall not be required to run this conductor with the phase conductors to the first system disconnecting means or overcurrent device.

5-135 Log #132 NEC-P05 **Final Action: Reject**
(250.50)

Submitter: William Whitehead, City of Macon
Recommendation: Add a new statement:

Any new construction utilizing a concrete footing, Article 250.50(C) shall apply.

Substantiation: In many locations, there is a problem meeting a 25 ohm resistance or even good resistance. The Concrete-Encased Electrode will not likely be compromised by alterations or other means of compromise. I have applied CEE for several years.

Prior to the implementation of our requirement for Concrete-Encased Electrodes, we had many cases of residential customers who had electronics being damaged. In most cases, this was due to lightning but in some cases the problem was traced to lack of grounding electrodes. These were cases where there was only one rod type electrode. The application of required water pipe grounding helped, but in some cases the piping is of a nonmetallic piping.

In my area, there is an abundance of soft limestone at ground level. In other areas, there is sandy soil, both which do not lean to good grounding resistance. Likewise, there is a high corrosive content to the soil. I have seen pipe and galvanized rods, which were corroded to thin rods or pipe. Copper clad rods in many cases are hollowed out. Of course, this does not prohibit a copper-clad rod's performance but the galvanized are useless.

In 1999, my inspection jurisdiction began a push for Concrete-Encased Electrodes. During this period, we have not had one case of damage to electronics in one of these structures.

Presently, the enforcement language of NEC, 1999 *250-50 says that; If available on the premises at each building or structure served...

If there is another statement added to 250-50 which says; any new construction utilizing a concrete footing 250.50(C) shall apply.

Panel Meeting Action: Reject
Panel Statement: The submitter has not been specific in how the text is to be added, revised, or deleted.
The proposal does not meet the requirements of Section 4-3.3 Regulations Governing Committee Projects. The panel understands that the proposal uses the a 1999 Code reference.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-136 Log #2192 NEC-P05 **Final Action: Reject**
(250.50)

Submitter: Dann Strube, Strube Consulting
Recommendation: Add new sentence:

All electrodes used shall be installed in accordance with 250.53.

Substantiation: This change calls attention to 250.53 and should reduce the number of installation errors.
Panel Meeting Action: Reject
Panel Statement: Not all grounding electrodes in the system are installed. Some are inherent to the building construction and are established through the construction process. The concept of the proposal would provide only limited correlation.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-137 Log #2642 NEC-P05 **Final Action: Accept in Principle**
(250.50)

Submitter: Robert A. Jones, IEC Texas Gulf Coast
Recommendation: Add a new sentence between first and second sentence of 250.50 to read:

Where multiple concrete-encased electrodes are present at a building or structure it shall be permissible to bond only one into the grounding electrode system.

Substantiation: Several foundations are designed with isolated rebar sections that meet the definition of a concrete-encased electrode. A pier and beam foundation may have several piers that are concrete-encased electrodes but are not tied together by any conductive path. 90.1 states "practical safeguarding" and requiring all of the concrete-encased electrodes to be bonded together is not practical.

If the piers or isolated sections of rebar did not meet the definition of a concrete-encased electrode, as in the case of encapsulated rebar or a vapor barrier between the concrete and earth, and none of the grounding electrodes described in 250.52(A)(1) through (A)(6) were present then one grounding electrode specified in 250.52(A)(4) through (A)(7) would be acceptable. Designers of residences and other structures will not hesitate to eliminate their concrete foundations as concrete-encased electrodes, by using encapsulated rebar or other means, if an NEC requirement adds unnecessary cost or increases the time to complete a foundation. A better grounding electrode would be present by allowing one of the piers or one isolated rebar section to serve as the grounding electrode rather than having all of them eliminated by design.

The foundation drawing titled "Jackson Hill Lofts" is an example of a pier and beam foundation. On drawing S1.0 there appears to be 8 concrete-encased electrodes present. The main slab would be one and then there are seven isolated locations, 4 individual piers and 3 locations with 3 piers connected by concrete and rebar. The seven locations have been circled for easy identification.

A more extreme example would be a pier and beam foundation similar to the "Jackson Hill Lofts" only without the concrete slab connecting the main foundation piers. This type of foundation has been used for several years in this area. Instead of a concrete slab and grade beam, wooden beams connect the piers. In this case there would be 49 concrete-encased electrodes present at this house. Would it be reasonable to expect all of these electrodes to be bonded together?

The foundation drawing title "Wilshire Homes" is an example of a post-tensioned slab with isolated sections of grade beam. These sections have been circled for each identification. This foundation also includes two columns that may be concrete-encase electrodes.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle

Add a new senternce to Section 250.52(A)(3) to read as follows:

Where multiple concrete-encased electrodes are present at a building or structure, it shall be permissible to bond only one into the grounding electrode system.

Panel Statement: The panel concludes that the requirements for the concrete encased electrode belong in 250.52(A)(3) and that 250.50 should only contain the requirements to establish a grounding electrode or grounding electrode system.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

BRENDER, D.: The proposal would have the effect of permitting multiple, independent electrodes to be present without bonding in-between. This would allow the earth to serve as a current-carrying conductor during lightning or similar transient conditions.

5-138 Log #3392 NEC-P05 **Final Action: Reject**
(250.50)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Recommendation: I. Add the following sentences to the end:

"Structural steel components including unencapsulated reinforcing steel shall be considered bonded where welded, bolted, or tied with the usual steel tie wires made tight. Where the grounding electrode conductor run to a structural steel component complies with 250.64(F), additional grounding electrode conductor connections shall not be required."

II. Designate the existing exception as Exception No. 1 and add the following Exception No. 2:

Exception No. 2: Where multiple concrete encased electrodes as described in 250.52(A)(3) are present, and at least one of the concrete encased electrodes is connected to the grounding electrode system, it shall be permitted to omit from the grounding electrode system such electrodes located more than 6.0 m (20 ft), from the point of attachment of the grounding electrode conductor. Where multiple systems are connected, this distance shall be measured independently for the grounding electrode conductor connection for each system, but 250.58 shall still apply. Where a concrete-encased electrode is extended outside of concrete encasement, this distance shall apply horizontally from the point within the footing or base of the foundation where the electrode first qualifies for use under 250.52(A)(3).

Substantiation: This proposal addresses many of the field questions that have arise since the advent of concrete-encased electrodes becoming mandatory elements of many grounding electrode systems where they weren't previously. The first part of the proposal clarifies that if building steel is effectively bonded to a concrete encased electrode (something that would need field verification by inspection), then it is not necessary to run an actual wire to the remote concrete-encased electrode. Although the NEC for some time has allowed grounding electrode conductors to run from electrode to electrode (with the parent conductor sized for the worst-case exposure) there is no explicit recognition of this particular connection, and a separate wire might be required. Since the steel is likely even a superior connection overall, (due to the likely multiplicity of connections) it seems appropriate to expressly recognize this procedure.

The second part of the proposal squarely addresses the fact that all qualified grounding electrodes at any given premises have been required to be included in a grounding electrode system. For example, if a copper domestic water piping lateral exists side-by-side with a cast iron sprinkler main, and both are continuous and in contact with earth for at least 10 ft, then both should be picked up by the grounding electrode conductor. In the case of concrete-encased electrodes, however, this can get excessive, particularly on large buildings completed in segments. This proposal suggests a reasonable limitation on the numbers of connections that must be made.

Any qualified concrete-encased electrodes not made into a unified group by tying or actual jumpers would need to be picked up within the 20-ft radius that defines the minimum extent of a qualified concrete-encased electrode in the first place. A simple example involves the reinforcement in many dwelling unit footings, where two parallel No. 4 reinforcing bars run the length of the footing in parallel, and not tied together. Both bars would be picked up in this example. Another example involves 20 ft of 4 AWG copper laid in a footing with reinforcing steel along side; the copper and the reinforcing would be picked up in this case as well. However, in a large commercial or industrial building with two (or more) voltage systems from differing services at different locations, the rule would require local connections only, however, 250.58 still applies. Note also that if the reinforcing is extended long vertical distances (even if over 20 ft) through foundation walls, the 20-ft requirement continues in the usually understood sense because of the insertion of the word "horizontally" and other requirements at the end of the proposed exception.

Panel Meeting Action: Reject

Panel Statement: The first recommendation includes concepts that should be placed in different sections from what is being proposed. The second recommendation contains proposed requirements that would be difficult for installers to comply with and inspectors to enforce.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

Comment on Affirmative:

DOBROWSKY, P.: The proposal should actually be accepted in principle based on the action on proposal 5-137.

5-139 Log #3612 NEC-P05 **Final Action: Reject**
(250.50)

Submitter: Joseph A. Hertel, State of Wisconsin

Recommendation: Replace the word present with available.

Substantiation: The current language requires that all reinforcing steel in a structure (since it is present) be bonded to form the grounding electrode system. This is becoming a design issue where in a large facility we are compelled to install an equipotential bonding plane similar to that of swimming pools or agricultural facilities. What is the Code trying to do?

Panel Meeting Action: Reject

Panel Statement: The submitter provides no technical substantiation to revert back to the language in the 2002 NEC that uses the words "if available" in this section. The panel reaffirms that its actions on Comments 5-73 through 5-81 to Proposal 5-115 in the 2005 NEC cycle are also consistent with the requirements of the NEC Style Manual, Section 3.2.1, that identify the word "available" as a word that should be avoided because it is vague and unenforceable.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-140 Log #806 NEC-P05 **Final Action: Reject**
(250.50 and 250.52(A))

Submitter: John MacLennan, Prescott, WI

Recommendation: Although this Ufer ground is a good ground and has been installed for years in well engineered power plants and desert areas, the code falls short of dealing with the plastic coated re-bars used in todays projects. The code should address that either the continuity of the encased electrode with the Concrete has to be assured or an uncoated section should be used.

Substantiation: A ground is only as good as its path to ground. The coated re-bar rods of today do not meet this standard solely because they are laying in Concrete!

Panel Meeting Action: Reject

Panel Statement: No proposed language is provided by the submitter. The proposal does not meet the requirements of Section 4.3.3 Regulations Governing Committee Projects.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

(250.50 through 250.53)

Submitter: Michael P. O'Quinn, MOGO Enterprises, Inc.
Recommendation: Revise text to read as follows:

250.50 Grounding Electrode System.

All grounding electrodes as described in 250.52(A)(1) through (A)(4 ~~6~~) that are present at each building or structure served shall be bonded together to form the grounding electrode system. Where none of these grounding electrodes exist, one or more of the grounding electrodes specified in 250.52(A)(2 ~~4~~) through (A)(5 ~~7~~) shall be installed and used.

Exception: Concrete-encased electrodes of existing buildings or structures shall not be required to be part of the grounding electrode system where the steel reinforcing bars or rods are not accessible for use without disturbing the concrete.

250.52 Grounding Electrodes.

(A) Electrodes Permitted for Grounding.

~~(1) Metal Underground Water Pipe. A metal underground water pipe in direct contact with the earth for 3.0 m (10 ft) or more (including any metal well casing effectively bonded to the pipe) and electrically continuous (or made electrically continuous by bonding around insulating joints or insulating pipe) to the points of connection of the grounding electrode conductor and the bonding conductors. Interior metal water piping located more than 1.52 m (5 ft) from the point of entrance to the building shall not be used as a part of the grounding electrode system or as a conductor to interconnect electrodes that are part of the grounding electrode system.~~

~~Exception: In industrial and commercial buildings or structures where conditions of maintenance and supervision ensure that only qualified persons service the installation, interior metal water piping located more than 1.52 m (5 ft) from the point of entrance to the building shall be permitted as a part of the grounding electrode system or as a conductor to interconnect electrodes that are part of the grounding electrode system, provided that the entire length, other than short sections passing perpendicular through walls, floors, or ceilings, of the interior metal water pipe that is being used for the conductor is exposed.~~

~~(2) Metal Frame of the Building or Structure. The metal frame of the building or structure, where any of the following methods are used to make an earth connection:~~

~~(1) 3.0 m (10 ft) or more of a single structural metal member in direct contact with the earth or encased in concrete that is in direct contact with the earth~~

~~(2) The structural metal frame is bonded to one or more of the grounding electrodes as defined in 250.52(A)(1), (A)(3), or (A)(4)~~

~~(3) The structural metal frame is bonded to one or more of the grounding electrodes as defined in 250.52(A)(5) or (A)(6) that comply with 250.56, or~~

~~(4) Other approved means of establishing a connection to earth.~~

(1 ~~3~~) Concrete-Encased Electrode. An electrode encased by at least 50 mm (2 in.) of concrete, located within and near the bottom of a concrete foundation or footing that is in direct contact with the earth, consisting of at least 6.0 m (20 ft) of one or more bare or zinc galvanized or other electrically conductive coated steel reinforcing bars or rods of not less than 13 mm (½ in.) in diameter, or consisting of at least 6.0 m (20 ft) of bare copper conductor not smaller than 4 AWG. Reinforcing bars shall be permitted to be bonded together by the usual steel tie wires or other effective means.

(2 ~~4~~) Ground Ring. A ground ring encircling the building or structure, in direct contact with the earth, consisting of at least 6.0 m (20 ft) of bare copper conductor not smaller than 2 AWG.

(3 ~~5~~) Rod and Pipe Electrodes. Rod and pipe electrodes shall not be less than 2.5 m (8 ft) in length and shall consist of the following materials.

(a) Electrodes of pipe or conduit shall not be smaller than metric designator 21 (trade size ¾) and, where of iron or steel, shall have the outer surface galvanized or otherwise metal-coated for corrosion protection.

(b) Electrodes of rods of iron or steel shall be at least 15.87 mm (in.) in diameter. Stainless steel rods less than 16 mm (in.) in diameter, nonferrous rods, or their equivalent shall be listed and shall not be less than 13 mm (½ in.) in diameter.

(4 ~~6~~) Plate Electrodes. Each plate electrode shall expose not less than 0.186 m^2 (2 ft^2) of surface to exterior soil. Electrodes of iron or steel plates shall be at least 6.4 mm (¼ in.) in thickness. Electrodes of nonferrous metal shall be at least 1.5 mm (0.06 in.) in thickness.

(5 ~~7~~) Other Local Metal Underground Systems or Structures. Other local metal underground systems or structures such as piping systems, underground tanks, and underground metal well casings that are not effectively bonded to a metal water pipe.

(B) Electrodes Not Permitted for Grounding. The following shall not be used as grounding electrodes:

(1) Metal underground gas piping system

(2) Aluminum electrodes

FPN: See 250.104(B) for bonding requirements of gas piping.

250.53 Grounding Electrode System Installation.

FPN: See 547.9 and 547.10 for special grounding and bonding requirements for agricultural buildings.

(A) Rod, Pipe, and Plate Electrodes. Where practicable, rod, pipe, and plate electrodes shall be embedded below permanent moisture level. Rod, pipe, and plate electrodes shall be free from nonconductive coatings such as paint or enamel.

(B) Electrode Spacing. Where more than one of the electrodes of the type specified in 250.52(A)(5) or (A)(6) are used, each electrode of one grounding system (including that used for air terminals) shall not be less than 1.83 m (6 ft) from any other electrode of another grounding system. Two or more grounding electrodes that are effectively bonded together shall be considered a single grounding electrode system.

(C) Bonding Jumper. The bonding jumper(s) used to connect the grounding electrodes together to form the grounding electrode system shall be installed in accordance with 250.64(A), (B), and (E), shall be sized in accordance with 250.66, and shall be connected in the manner specified in 250.70.

~~(D) Metal Underground Water Pipe. Where used as a grounding electrode, metal underground water pipe shall meet the requirements of 250.53(D)(1) and (D)(2).~~

~~(1) Continuity. Continuity of the grounding path or the bonding connection to interior piping shall not rely on water meters or filtering devices and similar equipment.~~

~~(2) Supplemental Electrode Required. A metal underground water pipe shall be supplemented by an additional electrode of a type specified in 250.52(A)(2) through (A)(7). Where the supplemental electrode is a rod, pipe, or plate type, it shall comply with 250.56. The supplemental electrode shall be permitted to be bonded to the grounding electrode conductor, the grounded service-entrance conductor, the nonflexible grounded service raceway, or any grounded service enclosure.~~

~~Exception: The supplemental electrode shall be permitted to be bonded to the interior metal water piping at any convenient point as covered in 250.52(A)(1), Exception.~~

(E) Supplemental Electrode Bonding Connection Size. Where the supplemental electrode is a rod, pipe, or plate electrode, that portion of the bonding jumper that is the sole connection to the supplemental grounding electrode shall not be required to be larger than 6 AWG copper wire or 4 AWG aluminum wire.

(F) Ground Ring. The ground ring shall be buried at a depth below the earth's surface of not less than 750 mm (30 in.).

(G) Rod and Pipe Electrodes. The electrode shall be installed such that at least 2.44 m (8 ft) of length is in contact with the soil. It shall be driven to a depth of not less than 2.44 m (8 ft) except that, where rock bottom is encountered, the electrode shall be driven at an oblique angle not to exceed 45 degrees from the vertical or, where rock bottom is encountered at an angle up to 45 degrees, the electrode shall be permitted to be buried in a trench that is at least 750 mm (30 in.) deep. The upper end of the electrode shall be flush with or below ground level unless the aboveground end and the grounding electrode conductor attachment are protected against physical damage as specified in 250.10.

(H) Plate Electrode. Plate electrodes shall be installed not less than 750 mm (30 in.) below the surface of the earth.

Substantiation: Metal Underground Water Piping has been a practical problem for use as a grounding electrode because of the prevalence of non-metal piping systems, both inside the structure as well as being supplied by the municipality. The Code® solution has been to require another electrode in addition to the metal piping [250.53(D)(2)]. Since 250.104(A) requires bonding the metal piping system, the elimination of metal underground water piping as a grounding electrode would still provide an effective ground-fault current path, satisfying 250.4(A)(5), and since there are other possible electrodes covered in 250.52, eliminating metal underground water piping will not adversely effect the grounding electrode system.

If the metal underground water piping is in "direct contact with the earth for 3.0 m (10 ft) or more (including any metal well casing effectively bonded to the pipe) and electrically continuous (or made electrically continuous by bonding around insulating joints or insulating pipe) to the points of connection of the grounding electrode conductor and the bonding conductors" [250.53(D)], this would become an additional unrequired grounding electrode, adding to the effectiveness of the required grounding electrode system, as outlined in 250.50.

Portions of the changes in the 2005NEC in Metal Frame of Buildings or Structures [250.52(A)(2)] were in conflict with the new definition of grounding electrode in Article 100 – "A device that establishes an electrical connection to the earth.", specifically 250.52(A)(2) and 250.52(A)(3). This called the metal frame of buildings and structures "grounding electrodes" when in fact they were merely bonded to another grounding electrode(s).

Eliminating metal frames of buildings and structures as a grounding electrode will not adversely effect the grounding electrode system as there are other possible electrodes covered in 250.52. And since 250.104(C) requires bonding metal building structures, this would provide for an effective ground-fault current path as required in 250.4(A)(5).

Additionally, eliminating both metal underground water piping and metal frames of buildings and structures forces attention to the other electrodes listed in 250.52: concrete-encased electrodes, ground rings, driven ground rods, and ground plates. This will require the installer, AHJ, and equipment manufacturers to more effectively utilize these grounding electrodes and provide for more effective ground references.

Panel Meeting Action: Reject

Panel Statement: No technical substantiation has been provided to support the proposal. The panel maintains that metal underground water pipes and structural metal frames of buildings that qualify as grounding electrodes in accordance with 250.52(A) are required to be included in the grounding electrode system.

Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-142 Log #3647 NEC-P05 **Final Action: Reject**
(250.50 Exception (New))

Submitter: Lawrence Brown, National Association of Home Builders (NAHB)
Recommendation: Add New Exception as follows:

250.52 Grounding Electrode System. All grounding electrodes as described in 250.52(A)(1) through (A)(6) that are present at each building or structure served shall be bonded together to form the grounding electrode system. Where none of these grounding electrodes exist, one or more of the grounding electrodes specified in 250.52(A)(4) through (A)(7) shall be installed and used.

Exception No. 1 : Concrete-encased electrodes of existing buildings or structures shall not be required to be part of the grounding electrode system where the steel reinforcing bars or rods are not accessible for use without disturbing the concrete.

Exception No. 2: A single concrete-encased electrode shall be permitted in the grounding electrode system for one- and two-family dwellings where the service is rated 300 amperes or less.

Substantiation: The concern is how to apply the provisions in Section 250.52(3) that reads, " **Concrete-Encased Electrode** . An electrode encased by at least 50 mm (2 in.) of concrete, located within and near the bottom of a concrete foundation or footing that is in direct contact with the earth, consisting of at least 6.0 m (20 ft) of one or more bare or zinc galvanized or other electrically conductive coated steel reinforcing bars or rods of not less that 13 mm (1/2 in.) in diameter, or consisting of at least 6.0 m (20 ft) of bare copper conductor not smaller that 4 AWG. Reinforcing bars shall be permitted to be bonded together by the usual steel tire wires or other effective means."

Main concerns center on Section 250.52(C) and what is the maximum length of rebar in the footing that would need to be bonded to the grounding electrode system to comply with this provision. The text of this Section states that the electrode, "…consisting of at least 6.0 m (20 ft) of one or more…steel reinforcing bars or rods…." is needed. But, is the 20 feet dimension the maximum length needed to comply, or does all of the steel in the footing need to be tied (bonded) together to form the electrode, no matter what the total length. This question is especially important as many footings for residential dwellings do not contain reinforcing steel, or only contains reinforcing steel in certain area such as the corners, where piping is placed under the footing, or in isolated pads for column support. It would seem impractical to bond a few five-foot rods together where they are 20 to 50 feet apart. NAHB's has also submitted a Proposal on Section 250.52(C) that is related to this concern.

The homebuilders understand the intent of the revised text of Section 250.50 for the 2005 NEC, and understand that a concrete-encased electrode may be a more reliable electrode that a metal water pipe or rod electrode. The homebuilders also believe that a service of 300 amps or less incorporating a single 20-foot concrete-encased electrode will pose no greater concern and if the service grounding electrode system was only a ground rod and perhaps a metal water pipe.

The homebuilders thank you in advance for your consideration of this matter.

Panel Meeting Action: Reject
Panel Statement: The substantiation does not support an exception limited to one- and two-family dwellings. See the panel's action on Proposal 5-137 which reduces the extent of bonding requirements for concrete-encased grounding electrode systems.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:

DOBROWSKY, P.: The proposal should actually be accepted in principle based on the action on proposal 5-137.

5-143 Log #1673 NEC-P05 **Final Action: Reject**
(250.50(A))

Submitter: Paul E. Guidry, Fluor Enterprises, Inc.
Recommendation: Add text to read as follows:

250.50(A): Under engineering supervision, it shall be permissible to eliminate the bonding of the concrete-encased steel reinforcing bars in foundations to the grouding electrode system where it has been determined corrosion of the steel reinforcing bars will occur due to galvanic corrosion.

FPN: Refer to NACE Standard Recommended Practice RP0290-2000. Item No. 21403, Impressed Current Cathodic Protection of Reinforcing Steel In Atmospherically Exposed Concrete Structures, for more information regarding steel corrosion and other deterioration phenonema associated with concrete.

Substantiation: While it is recognized that concrete-encased steel reinforcing bars provide a low impedance path to earth and should, under most circumstances, be bonded to the other grounding electrode system components, there is an exception that needs to be considered.

Industrial refineries and petrochemical plants typically utilize a low-impedance grounding electrode system consisting of many copper-clad ground rods and bare copper conductors (typically #4/0 AWG or larger in a grid or ring fashion) for the grounding electrode system. Bonding the concrete-encased steel reinforcing bars in foundations to large amounts of buried copper will create a corrosion cell and corrosion of the anode will occur. Corrosion is an electrochemical process involving the flow of electrons and ions and will cause deterioration of the steel reinforcing bars leading to structural weakness and/or failure of the concrete. A corrosion cell consists of an anode, a cathode, a common electrolyte containing the anode and cathode, and a metallic path between the annode and cathode. In this case, the copper-clad rod is the cathode, the steel rebar is the anode, the soil and concrete are the electrolyte and the bonding jumper is the metallic path between the cathode and anode. This is the same principle on which common batteries work.

Previous to the 2005 NEC, this wasn't an issue because the words "If available on the premises at each building or structure served..." seemingly allowed the design engineer some discretion to either bond the concrete-encased steel or not. The change to the 2005 NEC has effectively closed this option.

The Code needs to allow engineering judgment to be used to determine if a corrosion problem exists and a means to mitigate the issue. Grounding should not take precedence over structural integrity.

Panel Meeting Action: Reject
Panel Statement: There are methods of bonding the concrete-encased grounding electrode to the grounding electrode system that would minimize or eliminate any possibilities of corrosion due to galvanic reactions in concrete structures. These methods can be incorporated into building foundation designs where the conditions presented in this proposal are a concern of detriment to the structural design.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-146 Log #2293 NEC-P05 **Final Action: Reject**
(250.52(A)(1) Exception)

Submitter: Andre R. Cartal, Princeton Borough Building Dept.
Recommendation: Revise text to read as follows:

Add "institutional" to the building/structures that are permitted.

Substantiation: There is no reason to exclude institutions. For example, Princeton University employs an electrical maintenance team of licensed and trained electricians that easily meet the requirements.
Panel Meeting Action: Reject
Panel Statement: The panel concludes that the qualification for commercial buildings includes institutional facilities where conditions of maintenance and supervision ensure that only qualified persons will service the work.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:

MELLO, C.: The panel should have acted to Accept in Principle and revise the existing text to delete the terms "industrial and commercial". The problem raised by the submitter is common when there are NEC definitions for some types of buildings and there are Building Code definitions and names that are different from the NEC. The panel's statement is correct that the intent is to include "institutional" buildings in the group of "industrial and commercial". The question for the panel is what other type of occupancies are intended to be included that is now open to wide interpretation? The real question that needs to be asked is if the building type, industrial, commercial, health care facility, institutional, multi-family dwelling, multiple occupancy, etc. matters where the key qualifier is having continuous maintenance and supervision that ensures the original system is not impaired through actions of other trades over the building or structures life. If the qualified staff and supervision are present then the building or business type really would not appear to matter. Deleting the qualifier "industrial and commercial" altogether would be a better alternative than adding "institutional" as proposed and continue the list building evolution that will assuredly come.

Comment on Affirmative:

BRETT, JR., M.: I agree with the panel action to reject, however, the terms "industrial" "commercial" and "institutional" need a definition. Many large campus type facilities such as military bases, college campuses, steel mills, etc. have areas or buildings that need to be defined so that the inspector as well as the designer can determine the correct application of the NEC requirements. These definitions would be more appropriate in Article 100.

5-147 Log #1697 NEC-P05 **Final Action: Reject**
(250.52(A)(1) Exception)

Submitter: Charles M. Trout, Maron Electric Company
Recommendation: Delete 250.52(A)(1) Exception in its entirety.
Substantiation: The body of the text in 250.52(A)(1) satisfactorily contains the necessary requirements for the use of a metal underground water pipe as a grounding electrode regarding the use of interior metal water piping. The exception permits a lesser degree of safety based on an undocumented qualified person hypothetically servicing the installation. No requirements are present to ensure that the conditions of maintenance and supervision to ensure that only qualified persons service the installation actually exist.

Panel Meeting Action: Reject
Panel Statement: The submitter did not provide any evidence of a problem. The present practice has been successfully used for many years. The panel reaffirms its action and statement on the same proposal in the 2005 NEC cycle. See panel action and statement on Proposal 5-122 (Log # 3453) on page 550 of the Report on Proposal in the 2005 NEC cycle.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-148 Log #342 NEC-P05 **Final Action: Accept in Principle**
(250.52(A)(2))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read as follows:
(2) Metal Frame of the Building or Structure. The metal frame of the building or structure that is connected to the earth in either of the following methods: ~~where any of the following methods are used to make an earth connection:~~
(1) 3.0 m (10 ft) or more of a single structural metal member in direct contact with the earth or encased in concrete that is in direct contact with the earth.
~~(2)~~ (2) The structural metal frame is effectively connected to the reinforcing bars of a concrete-encased electrode as provided in 250.52(A)(3) ~~bonded to one or more of the grounding electrodes as defined in 250.52(A)(1), (A)(3), or (A)(4)~~
~~(3) The structural metal frame is bonded to one or more of the grounding electrodes as defined in 250.52(A)(5) or (A)(6) that comply with 250.56, or~~
~~(4) Other approved means of establishing a connection the earth.~~
Substantiation: This proposed revision is an effort to clean up a conflict that was created in the 2005 NEC when this language was added to the NEC. The revision had little or no effect on clarifying when metal building frames are suitable for use as grounding electrodes. The electrodes provided in 250.52(A) all include being connected to the earth (direct contact is the Code language used). The problem was created in the 2005 NEC because the water pipe electrode is required to be supplemented as required by 250.53(D)(2). If an underground water pipe electrode provides the earth connection for the metal building frame electrode as provided in 250.52(A)(2)(2) the metal frame should not be considered as supplement to the water pipe electrode. The supplemental electrode is anticipated to to be the only electrode if and when the water pipe electrode is replaced with nonmetallic components. Grounding electrodes, including metal building frame electrodes, should be directly connected to the earth and not be questionable connections to the earth.
Panel Meeting Action: Accept in Principle
Revise text of the recommendation to read as follows:
(2) Metal Frame of the Building or Structure. The metal frame of the building or structure that is connected to the earth in either of the following methods: ~~where any of the following methods are used to make an earth connection:~~
(1) 3.0 m (10 ft) or more of a single structural metal member in direct contact with the earth or encased in concrete that is in direct contact with the earth
(2) The structural metal frame is ~~effectively~~ connected to the reinforcing bars of a concrete-encased electrode as provided in 250.52(A)(3) ~~bonded to one or more of the grounding electrodes as defined in 250.52(A)(1), (A)(3), or (A)(4)~~
~~(3) The structural metal frame is bonded to one or more of the grounding electrodes as defined in 250.52(A)(5) or (A)(6) that comply with 250.56, or~~
(~~4~~ 3) Other approved means of establishing a connection the earth
Panel Statement: The panel removes “effectively,” as the term is vague and unenforceable.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 12 Negative: 3
Explanation of Negative:
BRENDER, D.: Insufficient technical substantiation was presented for the panel to change current language in 250.52(A)(2)(3). If replacement of the conductive water pipe with nonconductive material occurs, I agree with the submitter that the metal frame should not be considered the supplement to the water pipe.
However, the circular argument would be better eliminated by striking reference to the water pipe (250.52(A)(1)) from 250.52(A)(2)(2).
250.52(A)(2)(3) is correct as presently worded. Reference to any of the electrodes in 250.52(A)(5) and (6) if less than 25 ohms can and should remain.
Editorial note: The word “to” is needed between “connection” and “the earth” to correctly reflect present code language. If panel action is accepted, the revised 250.52(A)(3) should read: (3) Other approved means of establishing a connection to the earth.
BRETT, JR., M.: I agree with the other explanations of negative votes.
RAPPAPORT, E.: The submitter is using a bulldozer to remove an anthill. The intention is to remove the possibility of a metal frame that is connected to ground through a water pipe from being the supplement to the water pipe. In order for a metal frame to be an independent electrode, its connection to ground should not depend upon its connection to an electrode that requires supplementing. Removal of “250.52(A)(1)” in 250.52(A)(2)(2) would remove that conflict and still retain the ability to use a metal frame that complies with 250.52(A)(3) or (A)(4) or 250.52(A)(5) or (A)(6) where the latter two also comply with 250.56.
Removal of 250.52(A)(2)(3) which allowed the metal frame of the building or structure when bonded to one or more of the grounding electrodes as defined in 250.52(A)(5) - Rod and Pipe Electrodes; and 250.52(A)(6) - Plate Electrodes; will essentially require all metal structures to be rebar grounded or a ground ring be installed. It is not common to have structural steel members in direct contact with earth as required in 250.52(A)(2)(1). Concrete encased grounding electrodes could only be used if 6 m (20 ft) of 13 mm (1/2 in.) rebar is present at the bottom of the foundation.
For structures such as pipe racks, where each foundation may not have 20 ft of 1/2 in. rebar at the bottom of the foundation, it is a long time industrial practice to install rod electrodes at set intervals to ground the steel pipe racks. A ground ring is normally not an option since 250.52(A)(2)(4) requires “... encircling the building or structure”. No substantiation has been provided that grounding by rod or pipe electrodes has created any unsafe installations.
Comment on Affirmative:
BOKSINER, J.: The proposal and Panel Action are in general appropriate and address certain conflicts in the existing language. However, the proposed change removes the possibility of using Metal Frame of the Building or Structure as a grounding electrode where the metal frame is connected to other acceptable grounding electrode. Such application may be important under 250.30(A)(7). In this case, it is more appropriate to label the metal frame as a grounding electrode conductor. However, the permission to use the Metal Frame of the Building or Structure as a grounding electrode to connect to the grounding electrode system in a manner equivalent to the existing rule should be provided in 250.30. Thus, 250.30(A)(7)(2) should be modified to correlate with the proposal as follows:
(2) Structural metal grounding electrode as specified in 250.52(A)(2) or metal frame of the building or structure serving as a grounding electrode conductor that is bonded to the grounding electrode system as specified in 250.50.
TOOMER, R.: This panel action includes a third option so “either of the following methods” should be changed to “one of the following methods.”

5-149 Log #542 NEC-P05 **Final Action: Reject**
(250.52(A)(2))

Submitter: Edward G. Kroth, Academy Electric, Inc.
Recommendation: Revise text to read:
(2) Effectively Grounded Metal Frame of the Building or Structure. The metal frame of the building or structure shall be considered effectively grounded where any of the following methods are used to make an earth connection.
Substantiation: As an instructor in IBEW Local 159’s night school program, I have found that having the phrase “Effectively Grounded” as part of the previous code edition helped to reinforce the concept that not all building steel is necessarily a grounding electrode. I would hate to lose this concept. However, I do appreciate that in ‘05, 250.52(A)(2)(A)(1) through (4) helps to clarify when structural metal is “effectively grounded.”
Panel Meeting Action: Reject
Panel Statement: The panel concludes that the term “effectively,” while it adds emphasis, is vague and unenforceable.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-150 Log #2226 NEC-P05 **Final Action: Accept in Principle**
(250.52(A)(2))

Submitter: Donald A. Ganiere, Ottawa, IL
Recommendation: Revise as follows:
(2) Metal Frame of the Building or Structure. The metal frame of the building or structure, where ~~any of the following methods are used to make an earth connection:~~
~~(1)~~ 3.0 m (10 ft) or more of a single structural metal member is in direct contact with the earth or encased in concrete that is in direct contact with the earth
~~(2) The structural metal frame is bonded to one or more of the grounding electrodes as defined in 250.52(A)(1), (A)(3), or (A)(4)~~
~~(3) The structural metal frame is bonded to one or more of the grounding electrodes as defined in 250.52(A)(5) or (A)(6) that comply with 250.56, or~~
~~(4) Other approved means of establishing a connection to earth.~~
Substantiation: Only the portion of the metal frame that is actually and directly in contact with the earth should be called a grounding electrode per the Article 100 definition.
“Grounding Electrode. A device that establishes an electrical connection to the earth.”
The other parts of the metal frame or structure would be more correctly called effectively grounded metal structural frame.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 5-148.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-151 Log #543 NEC-P05 **Final Action: Accept in Principle**
(250.52(A)(2)(2))

Submitter: Edward G. Kroth, Academy Electric, Inc.
Recommendation: Revise text to read:
(2) The structural metal frame is bonded to one or more of the grounding electrodes as defined in 250.52 ~~(A)(1),~~ (A)(3) ~~,~~ or (A)(4).
Substantiation: As presently written, in the NFPA 70, 2005 edition, I perceive a conflict with the intention of 250.53(D)(2) for supplementing a water pipe grounding electrode. It is my understanding that the reason for a supplemental ground is to cover the possibility that in the future the underground metal water pipe could be changed to a nonconductive water pipe. It is possible to have the following scenario: we could have a metal structure that is only effectively grounded due to a bonding connection to the metal underground water pipe. This would appear to satisfy the requirement of 250.53(D)(2). Now some time later this metal water pipe is replaced by a nonconductive water pipe thus rendering the building steel useless as a grounding electrode and potentially leaving the service without a grounding electrode unless the water had been supplemented by some additional grounding electrode different from building steel.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 5-148.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-152 Log #1330 NEC-P05 **Final Action: Reject**
(250.52(A)(3))

Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Revise as follows:
250.52(A)(3) Concrete-Encased Electrode. An electrode encased by at least 50 mm (2 in.) of concrete, located within ~~and near the bottom of~~ a concrete foundation or footing that is in direct contact with the earth, consisting of at least 6.0 m (20 ft) of one or more bare or zinc galvanized or other electrically conductive coated steel reinforcing bars or rods of not less than 13 mm (1/2 in.) in diameter, or consisting of at least 6.0 m (20 ft) of bare copper conductor not smaller than 4 AWG. <u>If the amount of reinforcing bars that meet this requirement exceed 6 m (20 ft), not less than 6 m (20 ft) shall be bonded to form the electrode.</u> Reinforcing bars shall be permitted to be bonded together by the usual steel tie wires or other effective means.
Substantiation: The phrase "and near the bottom" might be construed as meaning that this section does not apply if the rebar is in the middle of the concrete.
As currently written, the Code requires all rebar, 1/2 inch or greater, to be bonded together to form the grounding electrode system. This proposal makes it clear that 6 m (20 ft) of rebar forms a sufficient electrode; more is not necessary.
Panel Meeting Action: Reject
Panel Statement: One of the factors contributing to the effectiveness of concrete-encased grounding electrodes is that they are located near the bottom of the footing and encased in not less than 50 mm (2 in.) of concrete. Removing this requirement for this section does not add clarity to this section and lessens the installation criteria for this type of electrode without substantiation. The findings of UFER were based on concrete-encased grounding electrodes that were installed in a manner that is consistent with the current language in this section. The proposed additional sentence is not necessary because the current language is clear that if the electrode consists of not less than 6.0 m (20 ft) of encased reinforcing bars, located as required by this section, then it qualifies as a grounding electrode. Tie wire can be used to bond sections of reinforcing bars together to meet this minimum length requirement in the rule.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 12 Negative: 3
Explanation of Negative:
BRETT, JR., M.: I agree with the other explanations of negative votes.
DOBROWSKY, P.: The proposal should be accepted. Many foundations are presently installed using piers and the reinforcing members are not necessarily near the bottom. These foundations still typically provide a much better "earth connection" than a single rod.
RAPPAPORT, E.: The proposal should be Accepted.
There is no technical justification to require that concrete encased electrode (rebars) be located near the bottom of a concrete foundation. When the National Electrical Code can accept a rod or pipe electrode of 2.5 m (8 ft) installed vertically, we should be able to accept 20 ft of rebar installed vertically. It is more important to have the required length of the rebars than a location at the bottom. The reason that the Ufer ground is so effective is due to the fact that the concrete has a much larger surface area in contact with the earth than a 5/8 in. diameter rod. In addition, the steel rods or copper conductor in the concrete is in intimate contact with the concrete. These two facts occur whether the rebars are at the bottom of the foundations or vertical in a column. If it is necessary for the rebars to be horizontal and well below the surface, then ground rods should also be required to be buried horizontally some distance below the surface. This would be an absurd requirement because there is no evidence that vertical ground rods have not been effective. We generally agree that concrete encased electrodes provide a better grounding electrode. We need to make it easier for this type of electrodes to be installed.
Concrete gives out moisture slowly wherever it is in contact with the earth, not just a the bottom of the foundation. Concrete absorbs moisture quickly and loses moisture very slowly. The mineral properties of concrete (lime and others) and their inherent pH means concrete has a supply of ions to conduct current. The soil around concrete becomes "doped" by the concrete, as a result, the pH of the soil rises and reduces what would normally be 1000 ohm meter soil conditions (hard to get a good ground). The moisture present, (concrete gives up moisture very slowly), in combination with the "doped" soil, make a good conductor for electrical energy or lightning currents.
A common method of installing foundations is by drilling. It is done by auger and special drill bits that create a bell at the bottom instead of excavating and refilling the space. In this method, there is very little concrete or rebars at the bottom. In this type of foundation, there may be more than 20 ft of 1/2 in. rebar, but not necessarily at the bottom of the foundation. All of the rebars are in a vertical section. It is a common type of installation for pipe racks and structures where qualified structural engineers calculate the load bearing capacity of soil and design a foundation for the required loading.

5-153 Log #3648 NEC-P05 **Final Action: Reject**
(250.52(A)(3))

Submitter: Lawrence Brown, National Association of Home Builders (NAHB)
Recommendation: Add a new text to 250.52(A)(3) as follows:
(3) Concrete-Encased Electrode . An electrode encased by at least 50 mm (2 in.) of concrete, located within and near the bottom of a concrete foundation or footing that is in direct contact with the earth, consisting of <u>one or more bare or zinc galvanized or other electrically conductive coated steel reinforcing bars or rods of not less that 13 mm (1/2 in.) in diameter and a minimum total length of</u> ~~at least~~ 6.0 m (20 ft) ~~of one or more bare or zinc galvanized or other electrically conductive coated steel reinforcing bars or rods of not less that 13 mm (1/2 in.) in diameter~~ , or consisting <u>of a bare copper conductor not smaller that 4 AWG and a minimum total length of</u> ~~at least~~ 6.0 m (20 ft) ~~of bare copper conductor not smaller that 4 AWG~~ . Reinforcing bars shall be permitted to be bonded together by the usual steel tire wires or other effective means. <u>All reinforcing steel with a length of 6.0 m (20 ft) or greater shall be bonded together as required by Section 250.50.</u> <u>Isolated steel reinforcing bars less than 6.0 m (20 ft) in length shall not be required to be bonded together to form a concrete-encased electrode.</u>
Substantiation: The revised text would read as follows: (Only the new text is underlined, moved edited text is not)
(3) Concrete-Encased Electrode . An electrode encased by at least 50 mm (2 in.) of concrete, located within and near the bottom of a concrete foundation or footing that is in direct contact with the earth, consisting of one or more bare or zinc galvanized or other electrically conductive coated steel reinforcing bars or rods of not less that 13 mm (1/2 in.) in diameter and a minimum total length of 6.0 m (20 ft), or consisting of a bare copper conductor not smaller that 4 AWG and a minimum total length of 6.0 m (20 ft). Reinforcing bars shall be permitted to be bonded together by the usual steel tire wires or other effective means. <u>All reinforcing steel with a length of 6.0 m (20 ft) or greater shall be bonded together as required by Section 250.50.</u> <u>Isolated steel reinforcing bars less than 6.0 m (20 ft) in length shall not be required to be bonded together to form a concrete-encased electrode.</u>
The first new last sentence will help make clear that all reinforcing steel 20 ft or greater in length is a concrete-encased electrode and is required to be bonded as part of the grounding electrode system. The second new sentence will help make it clear that isolated individual pieces of reinforcing steel, such as those located at corner bends, cross braces, and other random pieces of reinforcing steel in a footing do not meet the criteria of a concrete-encased electrode and are not required to be bonded together as part of the grounding electrode system. This is an NAHB companion Proposal to that submitted on Section 250.50, that provides additional insight into the need for this proposal.
The homebuilders thank you for your consideration of this matter.
Panel Meeting Action: Reject
Panel Statement: The proposal would unnecessarily restrict the creation of a concrete-encased grounding electrode by not permitting the connecting together of two or more lengths of reinforcing steel to equal 20 ft or more in length.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-154 Log #3649 NEC-P05 **Final Action: Reject**
(250.52(A)(3), FPN)

Submitter: Lawrence Brown, National Association of Home Builders (NAHB)
Recommendation: Add a new Fine Print Note (FPN) to 250.52(A)(3) as follows:
(3) Concrete-Encased Electrode . An electrode encased by at least 50 mm (2 in.) of concrete, located within and near the bottom of a concrete foundation or footing that is in direct contact with the earth, consisting of at least 6.0 m (20 ft) of one or more bare or zinc galvanized or other electrically conductive coated steel reinforcing bars or rods of not less that 13 mm (1/2 in.) in diameter, or consisting of at least 6.0 m (20 ft) of bare copper conductor not smaller that 4 AWG. Reinforcing bars shall be permitted to be bonded together by the usual steel tire wires or other effective means.

FPN: It is not the intent of this section to require that isolated individual reinforcing bars or rods, or a group of reinforcing bars or rods that are bonded together by steel tie wires or other effective means and do not meet the 6.0 m (20 ft) minimum length for concrete-encased electrodes, such as those installed to insure the structural integrity of a post tension cable or other similar foundation design, to be bonded together to assure that there is a concrete encased electrode of at least 6.0 m (20 ft) present.

Substantiation: This added paragraph will make clear that individual corner bends, cross braces and apron reinforcement designs using reinforcing bars or rods in post tension and other foundation designs that do not primarily depend on reinforcing steel as the main reinforcement for a structural concrete foundation do not have to be bonded together so as to meet the design criteria for a concrete-encased electrode. Currently, there seems to be an opinion in many enforcing jurisdictions of the US that a concrete encased electrode is required whether the design of the foundation forms one in a natural state per the foundation design or if it is enforced to be formed by requiring individual and isolated pieces of reinforcing steel or rods to be bonded together using 6 or 4 AWG copper wire. Also, in some cases, the individual pier reinforcing steel is require to be bonded together so as to insure that there is at least one or more concrete-encased electrode present in the foundation design. This is a companion proposal to ones made to Sections 250.50 250.52(c) concerning this same subject.

The homebuilders thank you in advance for your consideration of this matter.

Panel Meeting Action: Reject

Panel Statement: The NEC Style Manual does not permit requirements to be included in fine print notes. The rule adequately covers the requirement.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-155 Log #3184 NEC-P05 **Final Action: Reject**

(250.52(A)(4))

Submitter: Donald A. Ganiere, Ottawa, IL

Recommendation: Revise text as follows:

(4) Ground Ring or Grounding Lateral . A ground ring encircling the building or structure, or a grounding lateral in direct contact with the earth, consisting of at least 6.0 m (20 ft) of bare copper conductor not smaller than 2 AWG.

Substantiation: What is the magic about a ground ring? A 20 ft. copper conductor not smaller than 2 AWG installed as a radial or lateral will perform at least as well as the ground ring encircling the building or structure. The length of the copper in direct contact with the earth is the main factor, not the layout of the copper.

Panel Meeting Action: Reject

Panel Statement: The submitter has not provided any substantiation with the proposed revision to allow a length of copper wire 6.0 (20 ft) or more buried at the depth required by this section to qualify as a grounding electrode. The term “ground lateral” is confusing and is not currently used or defined in the NEC.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

MELLO, C.: The panel’s statement does not support the panel action. 250.52 and its various subparts are what defines what constitutes a grounding electrode. The panel statement that a “ground lateral” is not currently defined is negated by the fact that a “ground ring” is also not currently defined except by 250.5(A)(4) exactly where the submitter wants to add this other option. The panel’s statement that there was no substantiation is also incorrect. No more substantiation than the statement that a ground ring is acceptable is needed and is sufficient to what is proposed, otherwise the panel needs to technically substantiate why the ring continues to be accepted and that the proposed “grounding lateral” is not. The IEEE green book and a number of long time engineering practices for telecommunications and power distribution sites (high voltage transmission towers) have recognized the “counterpoise” or “ground lateral”, or whatever term is to be used, as a suitable grounding electrode. The proposed “grounding lateral” is no more than the already accepted “ground ring” straightened out instead of being in a circular shape. If 20 feet of 2 AWG copper in a circular shape around a building or structure is acceptable, what is the technical reason for 20 feet of 2 AWG copper buried along side the building or structure or radiating out from one or more sides or corners not acceptable? The same earth contact is achieved at the same burial depth etc. The panel action should have been to accept this proposal.

5-156 Log #631 NEC-P05 **Final Action: Reject**

(250.52(A)(5))

Submitter: Michael J. Johnston, Plano, TX

Recommendation: Revise text to read as follows:

(5) Rod ~~and Pipe~~ Electrodes. Rod ~~and pipe~~ electrodes shall be listed. Rod electrodes shall not be less than 2.5 m (8 ft) in length and shall consist of the following materials.

~~(a) Electrodes of pipe or conduit shall not be smaller than metric designator 21 (trade size 3/4) and where of iron or steel, shall have the outer surface galvanized or otherwise metal coated for corrosion protection.~~

~~(b~~) (a) ~~Electrodes of rods~~ Rod electrodes of iron , ~~or~~ steel, or copper coated steel shall be at least 15.87 mm (5/8 in.) in diameter. ~~Stainless steel rods less than 16 mm (5/8 in.) in diameter nonferrous rods, or their equivalent shall be listed and shall not be less than 13 mm (1/2 in.) in diameter.~~

(b) Stainless steel rods ~~less than 16 mm (5/8 in.) in diameter, nonferrous rods,~~ or their equivalent ~~shall be listed and~~ shall not be less than 13 mm (1/2 in.) in diameter.

Substantiation: There is a product standard that ground rods can be evaluated and listed to. Inspectors generally use listing as a basis for approvals. The information in this section is long overdue for revision and clarification. The proposal is an effort to remove conduit from this section as it is rarely ever used in current installations. Where 3/4 steel conduit is used, it has to be driven as required by 250.53(G). While listed ground rods are evaluated for being driven, among other things, and required to be of substantial construction to withstand the impact of being driven, rigid metal conduit and intermediate metal conduit is not, and is listed and evaluated for other purposes than being driven and serving as a grounding electrode.

The second change proposed in this section deals with clarifying that nonferrous rods are actually ferrous rods that are coated with a nonferrous material (copper coated). The whole rod is not a nonferrous rod. Adding a listing requirement in this section is an effort to provide enforcement officials with reasonable assurances that listed rods will meet the minimum size characteristics set forth in the Code for diameter and length. Unlisted rod type electrodes that do not meet the minimum length or diameter requirements that are currently being installed will no longer be permitted. Where the enforcement community can require a listed rod because of a Code rule, there are reasonable assurances it will meet the minimum criteria in the NEC. With the product standard requiring listing and other information about the rod to be marked on the rod within 12 in. of the top of the rod, it will provide enforcement with more ready means of verifying compliance with the minimum depth requirements contained in the installation rules for grounding electrodes of the rod types in 250.53(G).

Panel Meeting Action: Reject

Panel Statement: Insufficient substantiation was provided to add the word “listed” or for deleting “pipe” type electrodes. Pipe electrodes are successfully used.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 13 Negative: 2

Explanation of Negative:

HAMMEL, D.: The panel agreed, during the ROP, that though very few pipe or conduit electrodes are used, there was insufficient substantiation to warrant the removal of the code recognition of such electrodes where they are used successfully. If the word pipe were to be deleted from this section, pipe electrodes would not be prohibited by the NEC. Pipe or conduit electrodes could be used though they would not meet the requirements of 250.50. Given the panel statement to Proposal 5-164 the panel recognizes this fact.

Also in the panel statement, for Proposal 5-164 (in regard to listed electrodes) is the concern for installation requirements. There are product standards that contain installation instructions for listed electrodes. I do not think the panel agreed on how conduit and pipe are successfully installed. Conduit and pipe are not evaluated for being driven. I do not see the logic in the code recognition of pipe and conduit electrodes that can be driven with a sledgehammer yet listed products with instructions are not recognized.

MELLO, C.: The panel action should have been to Accept in Part. The part to delete the “pipe” electrode was substantiated by the fact, indicated by the installer representatives on the panel, that galvanized pipe or rigid conduit is still used, although infrequently in the United States. With regard to ground rods the action should have been to Accept in Principle. Over the past three Code cycles there have been numerous proposals about hard set size, vs. hard or soft metric conversions, tolerances due to nominal manufacturing size, copper vs. galvanized coating, etc. The submitter made a good case for the enforcement agencies to have all ground rods listed to eliminate this continued flow of proposals and the field issues the many installers and AHJs have to wrestle with about if this one acceptable or is that acceptable, or can I use this splice connector on this rod, and so on. UL 467 already deals with the make up of the rod materials, dimensions, coating issues, suitability of the coating to withstand the impact of installation, compatibility of splice connectors etc. Listing can and do exist for ground rods of diameters 5/8 inch or greater. One of the major manufacturer’s in his presentation to the panel confirmed that Listing would resolve many of the controversies and issues coming from the industry. In addition, by requiring Listing, some of the existing convoluted Code language can be simplified into a list format as follows with the incorporation of panel accepted actions:

Revise 250.52(A)(5) to read as follows

250.52(A)(5) Rod Type and Pipe Electrodes. Rod and pipe type electrodes shall meet the following requirements:

(a) ~~Electrodes of~~ Pipe or conduit type electrodes shall not be smaller than metric designator 21 (trade size ¾) and, where of iron or steel, shall have the outer surface galvanized or otherwise metal-coated for corrosion protection.

(b) Rod type electrodes shall be listed.

(c) Rod type electrodes shall not be less than ~~2.5~~ 2.44 m (8 ft) in length ~~and shall consist of the following materials.~~

(d) Rod type electrodes of steel, ~~S~~ s tainless steel rods ~~less than 15.87 mm (5/8 in.) in diameter, nonferrous rods,~~ or their equivalent ~~shall be listed and~~ shall not be less than 13 mm (½ in.) in diameter.

(~~b~~ e) Rod type electrodes ~~of rods~~ of ~~iron or~~ steel, other than stainless steel, shall be coated with copper or zinc ~~and be at least 15.87 mm (5/8 in.) 13mm (1/2 in) in diameter~~

This simplifies the NEC requirements for rods to be a minimum 1/2-inch diameter, be a minimum 8-foot in length and for steel rods to be coated with copper or be galvanized or be constructed of stainless steel. This lets the product standard, the Listing and the continued follow-up deal with variations posed by manufacturers and lets installers and AHJs get the job done by looking for the Listing mark and following the guide card and installation instructions that go with the listing.

5-157 Log #807 NEC-P05 **Final Action: Reject**
(250.52(A)(5))

Submitter: John MacLennan, Prescott, WI
Recommendation: The wording regarding use of galvanized pipe as a ground electrode needs mention of the galvanic action that needs to be addressed whenever copper and galvanized materials come in contact.
Substantiation: Galvanic action is well known in the electrical and plumbing trades and should always be addressed. Possibly as a seperate heading under methods of positive grounding?
Panel Meeting Action: Reject
Panel Statement: No proposed language is provided by the submitter. The proposal does not meet the requirements of Section 4-3.3 Regulations Governing Committee Projects.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-158 Log #825 NEC-P05 **Final Action: Reject**
(250.52(A)(5))

Submitter: Kim Parker, Austin, TX
Recommendation: Revise text to read as follows:

(5) Rod and Pipe Electrodes. Rod and pipe electrodes shall not be less than 2.5 m (8 ft) in length and shall consist of the following materials.

(a) Electrodes of standard pipe or rigid metal conduit shall not be smaller than metric designator 21 (trade size 3/4) and, where of iron or steel, shall ~~have the outer surface~~ be hot dip galvanized ~~or otherwise metal coated for corrosion protection.~~

(b) Electrodes of rods of iron or steel shall be at least 15.87 mm (5/8 in.) in diameter. ~~Stainless~~ Iron or steel core rods less than 16 mm (5/8 in.) in diameter ~~,~~ but not less than 13 mm (1/2 in.) in diameter , ~~nonferrous rods, or their equivalent~~ shall be listed ~~and shall not be less than 13 mm (1/2 in.) in diameter.~~

Substantiation: Very few pipe electrodes are used in the US because of the effort necessary to install such electrodes and much of that is used water pipe that is rusted and not full standard size when installed as an electrode. There are many more thicknesses of pipe than there was when pipe electrodes were first allowed as a grounding electrode. Wall thickness size of pipe is actually classified as tubing when it measures less than standard pipe size but such tubing is still utilized as pipe electrodes. When metal conduit is utilized as a pipe electrode, it should be as close to standard pipe size as possible and intermediate metal conduit does not meet that wall thickness. As to corrosion protection, a pipe electrode is going to be subjected to moisture both inside and outside the pipe and in all types of wet and corrosive soil conditions that makes only hot dip galvanization of a pipe used as an electrode feasible. Also, the allowance to allow, "or otherwise metal-coated for corrosion protection", is vague and unenforceable and could even mean protected by paint not classified as enamel as per 300.6(A)(1). This simply should not be allowed as electrode installations are not installations that are normally checked after installation and are somewhat assumed to be able to last the life of the service or system they are grounding. Acceptance of this proposal will help such electrodes maintain their integrity as grounding electrodes.

The proposal for (b) is meant to clarify the meaning of "or their equivalent" that is vague as there is no explanation of what equivalency means in this requirement. Also, there are few if any nonferrous rods made or available at any electrical supply dealer in this country. It is also a fact that the greatest majority, if not all, copper-coated and galvanized ground rods have steel or iron cores that make them rods of ferrous material but with a coating or platting process applied. Also, as rods less than 15.87 mm (5/8 in.) in diameter but that are not less than 13 mm (1/2 in.) in diameter are required to be listed for compliance with 250.52(A)(5), there is no reason for a laundry list of the various types of rod electrodes as long as they are listed and labeled rods.
Panel Meeting Action: Reject
Panel Statement: The proposed editorial revisions to this section do not improve clarity and are not substantiated. The current text in (a) covers the specific types of pipe mentioned in the proposal. The proposed revisions to (b) do not improve the current requirements of this section.

Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-159 Log #1984 NEC-P05 **Final Action: Reject**
(250.52(A)(5))

Submitter: Laurens Willard, Charlotte, NC
Recommendation: Revise text to read:

(5) Rod and Pipe Electrodes. Rod and pipe electrodes shall not be less than ~~2.5~~ 2.44 m (8 ft) in length , shall be listed, and shall consist of the following materials.

(a) Electrodes of pipe or conduit shall not be smaller than metric designator 21 (trade size ¾) and, where of iron or steel, shall have the outer surface galvanized or otherwise metal-coated for corrosion protection.

(b) Electrodes of rods of copper or zinc coated ~~iron or~~ steel , or stainless steel, shall be at least ~~15.87 mm (5/8 in.) in diameter. Stainless steel rods less than 16mm (5/8 in.) in diameter, nonferrous rods, or their equivalent shall be listed and shall not be less than 13~~ 12.7 mm (1/2 in.) in diameter.

Substantiation: It is confusing that the existing code is interpreted so that some unlisted rods comply with the NEC while others do not. Consequently, rods of various lengths, diameters, coating material and thickness are in use. The correction above eliminates enforcement confusion by requiring all rods to be listed, while leaving the rod electrodes currently, correctly being manufactured and used without change. If a rod is listed it can be easily checked by inspecting for a listing mark, and can be reasonably expected to comply with the requirements of the NEC.

The above changes correct errors in the existing standard related to metric conversion.

The above changes eliminate the use of the confusing term "nonferrous". All driven rod electrodes consist of an iron or steel (ferrous) core and are coated, either with zinc or copper, for corrosion protection. Therefore, all driven rods are "ferrous" in nature.
Panel Meeting Action: Reject
Panel Statement: There is no field report identified that nonlisted electrodes that comply with the physical requirements in the NEC do not perform adequately.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-160 Log #1985 NEC-P05 **Final Action: Accept in Principle**
(250.52(A)(5))

Submitter: Roger J. Montambo, Glavan Industries, Inc.
Recommendation: Revise text to read:

Rod and Pipe Electrodes. Rod and pipe electrodes shall not be less than ~~2.5~~ 2.44 m (8 ft) in length and shall consist of the following materials.

(a) Grounding ~~E~~ electrodes of pipe or conduit shall not be smaller than metric designator 21 (trade size ¾) and, where of ~~iron or~~ steel, shall have the outer surface hot-dip galvanized or otherwise metal-coated for corrosion protection.

(b) Grounding ~~E~~ electrodes ~~of rods~~ of stainless steel, copper or zinc coated ~~iron or~~ steel shall be at least ~~15.87~~ 15.88 mm (5/8 in.) in diameter ~~.~~ unless ~~Stainless steel rods less than 16 mm (5/8 in.) in diameter, nonferrous rods, or their equivalent shall be~~ listed and ~~shall~~ not ~~be~~ less than 12.70 ~~13~~ mm (1/2 in.) in diameter.

Substantiation: · Electrical inspectors, due to confusing wording of coating types, often interpret this section incorrectly.

· Copper and/or zinc-coated rods are both produced from the same "ferrous" steel core and coated with the appropriate "non-ferrous" coating (copper or zinc) specified by the user.

· Decimal (mm) equivalents should more accurately represent inch values, and be consistent within document.

· Couplings for 5/8 inch galvanized rods are available, and exiting clamps are fully interchangeable.

· Longevity is NOT a part of the NEC, but integral to the engineering evaluation in proper electrode selection.

· Encouraging "listed" grounding electrodes would provide reasonable assurance the various parameters (length, diameter, etc) and performance of an "installed rod" is NEC compliant.

· Listed products are certified by a listing laboratory, and are subject to performance testing.

· The ground rod electrodes addressed herein are "UL" listed and include permanent marking on the rod.

· Marking on the rod provides a method for the inspectors to visually inspect the installed rod for compliance.
Panel Meeting Action: Accept in Principle

Revise text of the recommendation to read:

Rod and Pipe Electrodes. Rod and pipe electrodes shall not be less than ~~2.5~~ 2.44 m (8 ft) in length and shall consist of the following materials."

(a) Grounding ~~E~~ electrodes of pipe or conduit shall not be smaller than metric designator 21 (trade size ¾) and, where of ~~iron or~~ steel, shall have the outer surface galvanized or otherwise metal-coated for corrosion protection.

(b) Grounding ~~E~~ electrodes ~~of rods~~ of stainless steel, copper or zinc coated ~~iron or~~ steel shall be at least 15.87 mm (5/8 in.) in diameter ~~.~~ unless ~~Stainless steel rods less than 16 mm (5/8 in.) in diameter, nonferrous rods, or their equivalent shall be~~ listed and ~~shall~~ not ~~be~~ less than 12.70 ~~13~~ mm (1/2 in.) in diameter.

Panel Statement: The panel rejects the additional words "hot dipped". There are other suitable methods for electrode galvanizing. The panel retains 15.87 mm because 15.88 is incorrect.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 13 Negative: 2

Explanation of Negative:

BRENDER, D.: The panel is proposing to allow 1/2-in. diameter galvanized rods in place of 5/8-in. diameter, although no technical substantiation was presented to justify this reduced diameter. I have witnessed corrosion testing where galvanizing seems not to perform well compared to other coating materials, although all metals used over steel corrode in time. In an extensive grounding study, not yet published, galvanized rods performed poorly in respect to corrosion in the course of only a few years.

Contrary to the written substantiation for this proposal, a UL representative noted that listing of a ground rod by UL does not involve performance or corrosion testing, only physical dimensions. Thus, UL listing cannot be a technical reason for allowing a smaller diameter rod. If the zinc surface should corrode, a thicker steel core would last longer than a thinner, which I believe is the reason the panel previously insisted on 3/4-in. diameter, with a 5/8-in. minimum.

Longevity is indeed a characteristic that concerns the code, and is the reason for the words "corrosion resistant" throughout, or why aluminum electrodes are not permitted.

BRETT, JR., M.: I agree with the other explanations of negative votes.

5-161 Log #3590 NEC-P05 **Final Action: Accept in Principle**
(250.52(A)(5))

Submitter: Michael Gassman, ERICO, Inc.

Recommendation: Revise as follows:

Rod and Pipe Electrodes. Rod and pipe electrodes shall not be less than ~~2.5~~ 2.44 m (8 ft) in length and shall consist of the following materials.

Substantiation: The change will allow the NEC to be consistent with other standards. Technical committees of both NEMA GR1 and the NESC (NESC Rule 094B2a) have agreed in principle to recommend a change in length to 2.44 m.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Proposal 5-160.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-162 Log #2285 NEC-P05 **Final Action: Reject**
(250.52(A)(5)(a))

Submitter: Andre Michalik, AMI Electric Co. / Rep. ABCD Academy-Instructor

Recommendation: Add sentence at end of 250.52(A)(5)(a) to read:

...Steel galvanized conduit not smaller than metric designator 21 (trade size 3/4) used for underground service lateral and installed as 250.53(G) shall be considered as pipe electrode.

Substantiation: It is obvious, that proper length of steel rigid conduit used for underground service buried in trench at least 30 in. deep has good contact to earth as 5/8 in. rod or other 3/4 in. pipe installed under that same condition. In my business, I realized that some of the inspectors consider the service conduit as grounding electrode, while the others do not agree, telling that kind of electrode is not mentioned in the NEC.

Panel Meeting Action: Reject

Panel Statement: Steel conduit installed in this manner generally is connected to the earth if not coated or otherwise isolated, and already meets the definition of grounding electrode and thus provides the function as a grounding electrode, but is not listed in 250.52. Service laterals installed in steel conduit are not all regulated by the NEC requirements which can lead to inconsistencies and deficiencies from a Code enforcement perspective. Electrodes installed in accordance with 250.53(G) are generally required to be driven.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-163 Log #3591 NEC-P05 **Final Action: Accept in Principle**
(250.52(A)(5)(b) & (c))

Submitter: Michael Gassman, ERICO, Inc.

Recommendation: Revise as follows:

(b) Electrodes of rods of iron or steel or surface galvanized shall be at least 15.87 mm (5/8 in.) in diameter.

(c) Solid rod electrodes of stainless steel, ~~rods~~ or copper or suitable nonferrous metal, and coated solid rod electrodes of iron or steel having a stainless steel or copper or suitable nonferrous metal coating less than ~~16 mm~~ 15.87 mm (5/8 in.) in diameter, ~~nonferrous rods, or their equivalent~~ shall be listed and shall not be less than ~~13 mm~~ 12.7 mm (1/2 in.) in diameter

Substantiation: This paragraph is often the subject of loose interpretation. Two differing metric equivalents are used for 5/8. By splitting the paragraph into 2 paragraphs, the change clearly identifies size and electrode types for electrical inspectors. The change eliminates interpretation and simplifies the inspection process.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Proposal 5-160.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

5-144 Log #2965 NEC-P05 **Final Action: Reject**
(250.52(A)(5) Exception (New))

Submitter: Andre R. Cartal, Princeton Borough Building Dept.

Recommendation: Add an exception: A single electrode shall be permitted where the single electrode has a resistance to ground 25 Ohms or less.

Substantiation: This proposal makes clear that a resistant value applies to a single electrode only.

Panel Meeting Action: Reject

Panel Statement: Section 250.52(A)(5) addresses the details and descriptions of rod and pipe electrodes. The concerns of the submitter are directed toward the resistance in the connection between the electrode and the earth. The concerns of the submitter are presently addressed in the provisions of 250.56.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

DOBROWSKY, P.: The proposal should be accepted in principle and the concept included in 250.56. This would improve the clarity of 250.56.

5-164 Log #3309 NEC-P05 **Final Action: Reject**
(250.52(A)(6) (New))

Submitter: Redwood Kardon, Code Check Institute

Recommendation: Add new subsection 250.52(A)(6), renumber current subsection 250.52(A)(6) to 250.52(A)(7), renumber current 250.52(A)(7) to 250.52(A)(8) and reference 250.50 text to reflect change.

250.52(A) (6) Listed Electrodes.

(7) Plate Electrodes.

(8) Other Local Metal Underground Systems or Structures.

250.50 Grounded Electrode System. All grounding electrodes as described in 250.52(A)(1) through (A)(7) that are...

Substantiation: Currently, 250.52 does not recognize commonly installed listed electrode systems that utilize metal tubing (copper or stainless steel) rather than a rod or pipe. NRTLs make a distinction between pipe and tubing when it comes to the classification of ground clamps. Extending these logic to these "ground well" systems, they would not properly fall under the category of pipe or rod. These systems should not be grouped with rod or pipes because unlike rod or pipe these are not "driven" and are not necessarily required to be 8 ft in contact with the soil.

Listed electrode systems have a long track record of effectiveness and should be included in this article.

Panel Meeting Action: Reject

Panel Statement: The proposal is incomplete. Installation requirements need to be provided in the appropriate sections. These listed electrodes are not prohibited by the NEC.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 13 Negative: 2

Explanation of Negative:

HAMMEL, D.: See my explanation of negative vote on Proposal 5-156.

MELLO, C.: The panel action should have been to Accept. While the panel statement that there is nothing to specifically prohibit the Listed tube type chemical ground rods, the fact that 250.52 is a distinct list and that 250.50 only recognizes the grounding electrodes identified in 250.52 effectively makes use of anything else that might be suitable, not acceptable to many AHJs without long discussions, and potential project delays. To just add the ability to use Listed grounding electrodes to the list of existing does not create any burden and meets the same thing the panel statement is saying is not prohibited.
If there are installation requirements, these would have to be dealt with as part of the listing and be covered by 110.3(B) since not every type of Listed electrode is known. If there are concerns specifically for the chemical rod type electrodes, then those can be dealt with in future Code cycles in 250.53. I do not believe the lack of installation requirements for one type of Listed electrode used as an example in the substantiation should be sufficient reason not to allow the use of Listed grounding electrodes in general in 250.52.

5-145 Log #2966 NEC-P05 **Final Action: Reject**
(250.52(A)(6) Exception (New))

(250.52(B))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read:
(B) ~~Electrodes~~ Not permitted for Use as Grounding Electrodes. The following shall not be used as grounding electrodes:
(1) Metal underground gas piping system
(2) Aluminum ~~electrodes~~
Substantiation: This proposal is intended as an editorial revision for clarity. The title of the subdivision (B) starts out with the word "electrodes." This section includes a list of elements not permitted as electrodes.
Panel Meeting Action: Accept in Principle
Revise the proposed text editorially to add an "s" in the word "system" in item (1) as follows:
(B) ~~Electrodes~~ Not Permitted for Use as Grounding Electrodes . The following systems and materials shall not be used as grounding electrodes:
(1) Metal underground gas piping system s
(2) Aluminum ~~electrodes~~
Panel Statement: "Systems and materials" was added to add clarity. Other editorial changes were made for clarity.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-166 Log #2968 NEC-P05 **Final Action: Reject**
(250.52(B), FPN (New))

Submitter: James H. Maxfield, Dover, NH
Recommendation: Add text to read as follows:
FPN: For further information see NFPA 13, Standard for the Installation of Sprinkler Systems and NFPA 24, Standard for the Installation of Private Fire Service and Their Appurtenances, for the limited use of these systems as grounding electrodes.
Substantiation: In the 2001 ROP code Proposal 5-165 (Log #3313) included a recommendation to revise section 250-52(A) by adding "Water Based Fire Protection Piping Systems" to be prohibited as a grounding electrode. The panel rejected the recommendation concluding the following statement applies, "The intentional bonding of all the utilities in a building creates an equipotential ground plane that minimizes the voltage differential between the different systems under normal and abnormal operating conditions. The result is an environment safer from the hazards of electrocution and fire. (Excerpt from January/February, 2000, NFPA Journal article "Grounding, Bonding, and Sprinklers", by John Caloggero).
There is no disagreement that the bonding of all systems results in a safer environment, however, there is a distinct difference between grounding and bonding as defined in Article 100 of the NEC.
Currently, the NEC does not appear to reference the limited use of these piping systems as part of the grounding electrode system. Therefore, the insertion of a FPN in Part B of this section referencing the limited use of these piping systems would not only be prudent, it will provide continuity between NFPA publications while achieving a more user friendly document.
Panel Meeting Action: Reject
Panel Statement: These metal water piping systems that meet the criteria in 250.52(A)(1) are grounding electrodes naturally, and as such are required to be bonded to the grounding electrode system. A provision that allows these piping systems to be isolated from the grounding electrode system is not substantiated. The NEC does not differentiate between the various water piping systems that qualify as grounding electrodes, neither does it exempt any.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-167 Log #1982 NEC-P05 **Final Action: Reject**
(250.53(3))

Submitter: David Prior, American Galvanizers Association
Recommendation: Revise text to read:
An electrode encased by at least 50 mm (2 in.) of concrete, located within and near the bottom of a concrete foundation or footing that is in direct contact with the earth, consisting of at least 6.0 m (20 ft.) or more ~~bare or zinc~~ of hot dip galvanized or other electrically conductive coated steel reinforcing bars or rods of not less than 13 mm (1/2 in.) in diameter, or consisting of at least 6.0 m (20 ft.) of bare copper conductor not smaller than 4 AWG. Reinforcing bars shall ~~be permitted to~~ be bonded together by the usual steel tie wires or other effective means.
Substantiation: Corrosion of bare steel in atmospheric service is continuous and ongoing even in areas with relatively low humidity. Steel that is exposed without the benefit of some form of corrosion protection will ultimately degrade and fail. The protection afforded by galvanizing is inexpensive, readily available, and has a documented history extending the life of steel in atmospheric, buried and in concrete reinforcement exposures.
Reinforced concrete has been used as a composite material for decades, and experience has shown that corrosion of reinforcement continues to be the major cause of deterioration of concrete structures. The stability of reinforced concrete in aggressive environments is influenced as much by the integrity of the steel as concrete, and both are of serious concerns to engineers and designers. Departments of Transportation (DOT's) have strict limits on the amount of admixtures (accelerators/decelerators) allowable in bridge construction, and on the water/cement ratios allowable to achieve the density and level of permeability required for long term performance of reinforced concrete. Homebuilders are not constrained by these same parameters and concrete durability is left to local skill and homeowner awareness.
The total life of the galvanized coating in concrete is made up of the time taken for the zinc to depassivate, which is known to be longer than that for "black" steel, plus the time for the dissolution of the alloy layers in the coating. In quality concrete which has been properly compacted and cured, and where the bar has adequate depth of cover to suit the exposure conditions, the galvanizing of reinforcement does afford long-term protection against corrosion, including concrete exposed to severe, high-chloride conditions.
Galvanized reinforcement develops a concrete bond that is equivalent to or greater than the bond to bare steel. Galvanized reinforcement can give a cost-effective enhanced durable service life through a substantial increase in initiation time and in protection time against corrosion. The benefits of galvanized reinforcement can be schematically represented by the figure below, which is an extension of the model proposed by Yeomans and Swamy.
Research data over the past 40 years ranging from the highly scientific to everyday practical applications has been conducted in countries throughout the world. This fact indicates a worldwide interest in galvanizing as a viable means of corrosion protection for steel reinforcement. The weight of evidence from this research has provided sufficient data to substantiate the superior performance of galvanized reinforcement when compared to black steel in concrete.
Galvanizing extends the time to the initiation of corrosion of the rebar compared to black steel and significantly delays and perhaps even avoids cracking of the concrete in many types of structures for 30-50 years and beyond. Galvanizing may eliminate the need for the first cycle of repair and maintenance of traditionally reinforced concrete, which would more than recover the costs associated with its initial use.
Note: Supporting Material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: This article does not specify how to build foundations. It is only saying that if certain conditions exist within a foundation, then it must be used as a grounding electrode.
No field data were provided that indicate uncoated steel should not continue to be allowed.
The panel suspects that the submitter meant to submit his proposal to 250.52(A)(3).
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-168 Log #498 NEC-P05 **Final Action: Reject**
(250.53(A))

Submitter: Bryan P. Holland, Holland Electric
Recommendation: Add to the end of the section:
Where more than one rod or pipe electrode are used for the same system, the distance between electrodes shall not be less than the length of the longest rod or pipe and not exceed four times the length of the longest rod or pipe.
Substantiation: 1. 250.56 should be deleted completely. (Proposal already submitted for this).
2. The spacing requirements in 250.56 only apply to rod, plate, and pipe electrodes installed to meet that section. There is no requirement for electrode spacing under any other purpose for the same system.
3. 250.53(B) spacing requirements only apply to electrodes of different systems.
4. One of the primary purposes of electrode system grounding is to limit the voltage imposed by lightning as indicated in 250.4(A)(1). Per the NFPA 780 section A.4.13.2.4,
" No benefit is gained from the second ground rod if placed closer than the length of the longer rod. No additional benefit is gained if the second rod is placed over times the length of the longer rod." This finding should be shared into the NEC.

Panel Meeting Action: Reject
Panel Statement: The requirements of this section [250.53(A)] have to do with installation criteria only and do not address performance (resistance to ground) issues for rod, pipe, and plate electrodes. Section 250.56 clearly indicates that "where multiple rod, pipe, or plate electrodes are installed to meet the requirements of this section", the spacing requirements contained in 250.56 apply. The performance requirements (resistance to ground) for a single rod, pipe, or plate electrode are provided in 250.56. No technical substantiation has been provided related to the distances proposed between rod, pipe, or plate electrodes.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-169 Log #1662 NEC-P05 **Final Action: Reject**
(250.53(G))

Submitter: James Jackson, Carlisle, IN
Recommendation: Revise text to read as follows:
~~2.44 m (8 ft)~~ 3.048 m (10 ft)
Substantiation: 250.4(A)(1) "... limit voltage imposed by lightning"
675.15 "Lightning Protection"
NFPA 780 2004 Edition 4.13.2.3(A) and 4.13.2(B) "The groundrods shall extend vertically not less than (10 ft) 3 m into the earth"
This proposal is to make NFPA 70 the same as NFPA 780 for lightning protection.
Panel Meeting Action: Reject
Panel Statement: It would be inappropriate for this section to impose the requirements of NFPA 780. Grounding electrodes installed to comply with NFPA 780 are required to be bonded to the electrical system grounding electrode by 250.106.
The requirements of NFPA 780 apply to the installation of lightning protection systems and do not necessarily apply to the NEC.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-170 Log #1398 NEC-P05 **Final Action: Accept in Principle**
(250.54)

Submitter: George Stolz, II, Pierce, CO
Recommendation: Change the term "supplementary" to "superfluous", or anything that sounds and looks dissimilar from "supplementary" and is less comical.
Substantiation: The two terms, "supplemental" and "supplementary" are synonymous in the English language. It would be easier to distinguish between the two concepts if the term used to define the type of electrode function specified in 250.54 were changed.
Supplemental is generally defined as "compensating for a deficiency", which can make sense when applied to the requirement described in 250.53(D)(2).
The function described in 250.54 would be more aptly renamed, as there is no deficiency in the grounding electrode system that this electrode is serving, and often is superfluous in its nature.
Panel Meeting Action: Accept in Principle
Change existing 250.54 to read as follows:
"Auxiliary Grounding Electrodes. One or more grounding electrodes shall be permitted to be connected …".
Panel Statement: To delete the term "supplementary" which is too close to the term "supplemental" used in other sections of Article 250.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-171 Log #385 NEC-P05 **Final Action: Reject**
(250.56)

Submitter: Bryan P. Holland, Holland Electric
Recommendation: Delete the entire section. Delete reference to this section in 250.53(D)(2).
Substantiation: There is no substantiation for having a resistance to ground 25 ohms or less. There is no evidence having a resistance to ground less than 25 ohms provides any more safety or reliability than ground resistances over 25 ohms. The section is based on design and not a minimum standard. No other electrodes are required to meet minimum resistances to ground, nor should rod, plate, or pipe electrodes. There are thousands of single-family homes in my community alone with single rod electrodes. There have been no reported cases of problems or hazards due to this. Performance grounding of the electrical service should be left to the electrical designer and engineer, and not the electrical installer.
Panel Meeting Action: Reject
Panel Statement: Insufficient substantiation has been provided to remove this section from the NEC. The panel concludes that deleting 250.56 reduces current minimum requirements. The panel affirms that the provisions in 250.56 are needed for installations using rod, pipe, or plate electrodes. See panel action and statement on Proposal 5-144 (Log#1858 and Proposals 5-128 (Log #1856) and 5-133 (Log #1857) in the 2004 ROP.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-172 Log #1833 NEC-P05 **Final Action: Reject**
(250.56)

Submitter: Mark T. Rochon, Mark J. Rochon Master Electrician
Recommendation: Revise as follows:
Where multiple rod, pipe, or plate electrodes are installed to meet the requirements of this section, they shall not be less than 1.8 m (6 ft) apart <u>with the burial depth of the conductor in accordance with Table 300.5 column (5).</u>
Substantiation: A dangerous trip hazard is present between electrodes, with no code article to enforce a safe installation to protect persons.
Panel Meeting Action: Reject
Panel Statement: The proposed revisions to this section are addressing the grounding electrode conductor installation and do not belong in this section. See also panel action and statement on Comment 5-116 (Log #372) in the 2004 ROC which rejected a proposed Code requirement for burial depths for grounding electrode conductors in accordance with 300.5 as proposed in Proposal 5-154 (Log # 2345) of the 2004 NEC ROP.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-173 Log #1983 NEC-P05 **Final Action: Reject**
(250.56)

Submitter: Frank Brewer, Bill Wade & Associates
Recommendation: Revise text to read:
250.56 Resistance of Rod, Pipe, Concrete Encased Electrodes, and Plate Electrodes. A single electrode consisting of a rod, pipe, concrete encased electrode, or plate that does not have a resistance to ground of 25 ohms or less shall be augmented by one additional electrode of any of the types specified by 250.52.(A)(2) through (A)(7). Where multiple rod, pipe, or plate electrodes are installed to meet the requirements of this section, they shall not be less than 1.8 m (6 ft) apart.
Substantiation: For safety reasons, it is important to have an additional electrode to supplement the "ufer" ground. This section was originally written to improve the ground system by requiring an extra electrode when the testing resulted in 25 ohms or less or when testing was not performed at all. If the logic exists for supplementing the other electrodes, it should exist for supplementing the concrete encased electrode also. Concrete encased electrodes should be treated in the same manner as other electrodes. The lack of a means to inspect whether the grounding conductor is properly attached to the rebar also warrants the need for another grounding electrode to assure integrity. A tester for testing resistance of rebar is commercially available.
Panel Meeting Action: Reject
Panel Statement: No substantiation has been provided to require concrete-encased grounding electrodes to be augmented by an additional electrode as required for a single rod, pipe, or plate electrode that does not meet the resistance requirements in 250.56. Concrete-encased grounding electrodes typically have low resistance values as documented in the findings of UFER.
Number Eligible to Vote: 15

5-174 Log #2967 NEC-P05 **Final Action: Reject**
(250.56)

Submitter: Andre R. Cartal, Princeton Borough Building Dept.
Recommendation: Delete 250.56.
Substantiation: The resistence values provided in this section are proposed for 250.52(A)(5) & (6).
Panel Meeting Action: Reject
Panel Statement: See the panel actions and statements on Proposals 5-144 and 5-145.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-175 Log #3325 NEC-P05 **Final Action: Reject**
(250.56)

Submitter: David Pattison, Sky Electric
Recommendation: Revise text to read:
...25 ohms or less shall be augmented by ~~one~~ additional electrodes of any of the types specified by 250.52(A)(2) through (A)(7) <u>until 25 ohms or less is achieved</u> .
Substantiation: It is unclear if the intent of the code would be to continue driving ground rods until 25 ohms is achieved. If not what is the significance of 25 ohms or less?
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided substantiation to include the restrictions proposed. Single electrodes indicated in this section must meet the 25 ohm provisions of 250.56. One additional electrode is required where this resistance value exceeds 25 ohms. The panel affirms that it is not required to

install multiple rod, pipe, or plate electrodes until 25 ohms or less resistance is achieved. It is not the intent of this section to achieve a resistance of 25 ohms or less due to varying soil conditions. See also panel action and statement on Proposal 5-143 (Log # 293) in the 2004 NEC cycle.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-176 Log #386 NEC-P05 **Final Action: Reject**
(250.58)

Submitter: Bryan P. Holland, Holland Electric
Recommendation: Add new text as follows:
Where separate services, feeders, or branch circuits supply a building and are required to be connected to a grounding electrode(s), the same grounding electrode(s) shall be used <u>and the provisions of (1) are met:</u>
<u>(1) An approved audible or visible alarm shall be installed at each service to indicate the grounded conductor brought to the service has opened.</u>
<u>Exception No. 1: In industrial installations, with written safety procedures, where conditions of maintenance and supervision ensure that only qualified persons service the equipment.</u>
<u>Exception No. 2: Where electric service and electrical maintenance are provided by the building management and where these are under continuous building management supervision.</u>
Substantiation: Upon the opening of the grounded (neutral) conductor at one service, potentially dangerous current will flow between the common electrodes to both services. Any person who comes in contact with exposed metal parts at the service equipment or grounding electrode system could be exposed to lethal current.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any technical substantiation to require monitoring grounding electrode and grounding electrode conductor integrity by audible and visible alarms. The Code is not structured to protect against abnormal conditions such as open neutrals that may develop.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-177 Log #3504 NEC-P05 **Final Action: Reject**
(250.58)

Submitter: Paul Dobrowsky, Holley, NY
Recommendation: Delete this entire section.
Substantiation: This section is not necessary and causes confusion. Section 250.50 already requires a electrodes to be bonded together. Having one section apply without duplicating the requiremet, using different and addiaitoal language does not help usability. If there is opposition to deleting any additional details contained in the section, then those details should be added to 250.50.
Panel Meeting Action: Reject
Panel Statement: The current requirements in 250.58 are needed. Removing this section could lead to conditions where separate electrodes for different services or other systems might not be bonded together. The direct wording addressing multiple services on one building or structure in 250.58 should be retained.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-178 Log #574 NEC-P05 **Final Action: Reject**
(250.62)

Submitter: Alan H. Nadon, City of Elkhart, IN
Recommendation: Add to the end of the existing text:
<u>The grounding electrode conductor(s) in switchboards, panelboards, cutout boxes, transfer switches, and other enclosures, shall be identified according to 250-119</u> .
Substantiation: The grounding electrode conductor is not currently required to be identified, unless it is also used for bonding. It is a common, minimum practice to identify this conductor, to reduce the possibility that it may be mistaken for a current carrying conductor. Many installers identify this conductor to facilitate verification of a proper installation. Because it is a common practice to identify this conductor, but not a requirement, some installers are not identifying it, and the distinct possibility exists that it may be confused with a current carrying conductor and an improper connection could result in serious damage or injury to persons.
Panel Meeting Action: Reject
Panel Statement: This section covers the required conductor material for the grounding electrode conductor. No substantiation has been provided by the submitter to indicate there is a safety concern related to the proposed more restrictive identification requirements. The identification requirements for equipment grounding conductors are provided in 250.119. The grounding electrode conductor is currently not required or prohibited from being identified by any of the means specified in 250.119.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-179 Log #1071 NEC-P05 **Final Action: Reject**
(250.62)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Add: Insulated or covered conductors shall not have white or gray color or marking. Where the grounding electrode conductor is installed in a cable tray, raceway or enclosure with other conductors, it shall be identified by tagging or other effective means acceptable to the authority having jurisdiction.
Substantiation: There is no Code prohibition of installation in raceways or other enclosures with other conductors. Since no identification is required, it may be assumed to be a grounded or grounding conductor. While a connection of an equipment grounding conductor to this conductor may not pose a hazard, it does not comply with the connection point specified in the definition of equipment grounding conductor.
Panel Meeting Action: Reject
Panel Statement: This section covers the required conductor material for the grounding electrode conductor. No substantiation has been provided by the submitter to indicate there is a safety concern related to the proposed more restrictive identification requirements. The identification requirements for equipment grounding conductors are provided in 250.119. The grounding electrode conductor is currently not required or prohibited from being identified by any of the means specified in 250.119.
Sections 200.6 and 200.7 already universally restrict the use of the colors white and gray and therefore the requirement does not need to be repeated.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-180 Log #2591 NEC-P05 **Final Action: Reject**
(250.62)

Submitter: Jebediah Novak, Cedar Rapids Electrical JATC
Recommendation: Add the following to the end of the existing text.
<u>Bare copper conductors shall not be permitted for use in aluminum raceways.</u>
Substantiation: Due to the galvanic action between these two dissimilar metals, when a bare copper conductor is installed in an aluminum raceway, the raceway corrodes and deteriorates very quickly. 110.14 addresses dissimilar metals in terminations and splices, this will only expand on that same theory.
Panel Meeting Action: Reject
Panel Statement: The existing language in 250.62 makes the proposed change unnecessary.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-181 Log #91 NEC-P05 **Final Action: Reject**
(250.64(B))

Submitter: Neil Birchmeier, New Lothrop, MI
Recommendation: Add a new sentence at the end of the paragraph as follows:
" <u>Where run outside on an exterior surface, an exposed grounding electrode conductor shall be secured to the surface at an interval of not to exceed 600 mm (2 ft)."</u>
Substantiation: The first sentence only requires the exposed grounding electrode wire to be secured to the surface. This requirement is frequently met and the cable is still subject to snagging that results in damage to the cable. By securing the cable at 600 mm (2 ft) intervals, the cable is held tight enough to the surface to minimize any chance of the cable being snagged. At greater support intervals, the cable can be easily pulled away from the surface. There will be fewer cases of damaged grounding electrode conductors with this rule, and there will be a rule to follow for the inspector when the presently unspecified support spacing is obviously too great in some cases.
Panel Meeting Action: Reject
Panel Statement: Section 250.64(B) adequately covers the installation requirements.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-182 Log #99 NEC-P05 **Final Action: Reject**
(250.64(B))

Submitter: Brian Kincaid, Swartz Creek, MI
Recommendation: Add a new last sentence to this paragraph to read as follows:
<u>Where run away from the surface of a building or structure for connection to a grounding electrode, unprotected grounding electrode conductors shall be run below grade level.</u>
Substantiation: There were proposals during the last cycle to prevent grounding electrode conductors from being run exposed across the surface of the ground where they can easily be damaged. Presently, there is no rule against running grounding electrode conductors across the surface of the earth.

The depth of burial seemed to be an issue, so why not omit the depth and just require the cable to be placed below the surface of the earth when run away from a building or structure. Perhaps, this will be acceptable so grounding electrode wires will be installed less likely to be damaged, or exposed along the ground surface where they pose a tripping hazard.
Panel Meeting Action: Reject
Panel Statement: Section 250.64(B) adequately covers the protection requirements.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-183 Log #101 NEC-P05 **Final Action: Reject**
(250.64(B))

Submitter: Justin Ptak, Wyandotte, MI
Recommendation: Add a new last sentence to this paragraph to read as follows:
"A grounding electrode conductor run away from a building or structure a distance of more than 600 mm (1 ft) shall be installed beneath a concrete or similar cover or buried to a depth of not less than 200 mm (4 in.)"
Substantiation: I can't understand why there is opposition to running a conductor as important as a grounding electrode conductor under the surface of the earth so it cannot be damaged. All too often the exposed cable is run along the surface of the earth to make connection to a grounding electrode. The 600 mm distance from the building or structure was included to take care of those situations where the electrode is installed close to the building or structure. Granted the length of the grounding electrode conductor should be as short as possible for best performance, but a damaged grounding electrode conductor certainly has impaired performance.
Panel Meeting Action: Reject
Panel Statement: Section 250.64(B) adequately covers the protection requirements.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-184 Log #450 NEC-P05 **Final Action: Reject**
(250.64(B))

Submitter: W. Creighton Schwan, Hayward, CA
Recommendation: Insert a new third sentence to read:
Where protection is provided by a raceway, it shall be RMC, IMC, RNC, or EMT.
Substantiation: The last sentence prohibits the use of flexible metal conduit for enclosing a grounding electrode conductor smaller than 6 AWG. This makes sense, because current flow in a single conductor in a metal raceway is approximately 90 percent on the raceway, 5 percent on the conductor. Flexible metal conduit is a relatively poor conductor due to the oil used in its manufacture interrupting the turn-to-turn conductivity and resulting in a metal ribbon conductor three times the length of the raceway itself. This added sentence will make the rule the same for 4 AWG and larger as it is for 6 AWG and smaller.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided technical substantiation that would restrict the current accepted use of listed bare armored conductors for use as grounding electrode conductors, which is a current common practice. There is no evidence provided that indicates there is a problem with these types of cables installed as grounding electrode conductors.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-185 Log #972 NEC-P05 **Final Action: Reject**
(250.64(B))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise as follows:
~~Where exposed:~~ A grounding electrode conductor or its enclosure shall be securely supported and f astened in place ~~to the surface on which it is carried~~ except where fished between access points where concealed in finished buildings or structures where supporting and fastening is impractical. A ~~4~~ 6 AWG or larger ~~copper or aluminum~~ conductor shall be protected if exposed to ~~severe~~ physical damage. A 6 AWG or larger grounding conductor that is ~~free from exposure~~ not exposed to physical damage shall be permitted to run along the surface of the building or structure without being enclosed in a raceway or cable armor ~~metal covering or protection~~ where it is securely supported and fastened in place to the construction or it shall be permitted to be installed in any approved raceway, subject to the provisions of the raceway article . Otherwise, it shall be rigid metal conduit, intermediate metal conduit, ~~rigid nonmetallic conduit, electrical metallic tubing~~ , or cable armor. Grounding electrode conductors smaller than 6 AWG shall be in rigid metal conduit, intermediate metal conduit, ~~rigid nonmetallic conduit, electrical metallic tubing~~ or cable armor except that electrical; metallic tubing and rigid nonmetallic conduit shall be permitted where not subject to physical damage. An unprotected grounding electrode conductor that is directly buried in the earth for a distance of more than 600 mm (2 ft) shall be installed at a depth of not less than 450 mm (18 in.) below grade.
Substantiation: "Fastened" does not assure support if distance between fastenings is great. Allowance should be made for fishing. Conductors larger than 6 AWG should also be protected if subject to damage. Structures which are not "buildings" should be included for the 6 AWG conductor. "Metal covering or protection" is not specific re: type, thickness, etc. If a 6 AWG can be run without covering or protection installation in any suitable raceway should be permitted; it is more than no protection or covering and may be desirable for esthetics or added protection. A directly buried 6 AWG conductor (maximum for made electrodes) run for extended lengths without concrete slab or protection should warrant a depth requirement since Table 300.5 may be interpreted as not applicable to grounding electrode conductors.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 5-116 (Log No. 372) in the 2004 NEC ROC.
In addition, there is no substantiation for an 18 in. below grade requirement.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-186 Log #1901 NEC-P05 **Final Action: Accept**
(250.64(C))

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: In 250.64(C), delete (3) & (4) and move it to 250.64(F). The section to read as follows:
(C) Continuous. Grounding electrode conductor(s) shall be installed in one continuous length without a splice or joint except as permitted in (1) through ~~(4)~~ (3):
(1) Splicing shall be permitted only by irreversible compression-type connectors listed as grounding and bonding equipment or by the exothermic welding process.
(2) Sections of busbars shall be permitted to be connected together to form a grounding electrode conductor.
~~(3) Bonding jumper(s) from grounding electrode(s) and grounding electrode conductor(s) shall be permitted to be connected to an aluminum or copper busbar not less than 6 mm x 50 mm (1/4 in. x 2 in.) The busbar shall be securely fastened and shall be installed in an accessible location. Connections shall be made by a listed connector or by the exothermic welding process.~~
~~(4) Where aluminum busbars are used, the installation shall comply with 250.64(A).~~
Substantiation: The (3) text covering bonding jumpers connected to the aluminum or copper busbar more appropriately belongs in 250.64(F) since it clearly addresses bonding jumpers installed from grounding electrodes to the busbar. The grounding electrode conductor should be installed without a splice from the point of connection at the grounded conductor at the service to the busbar and the bonding jumpers are then installed from this point to all of the electrodes in the system. With the busbar text presently in 250.64(C), it implies that all of the conductors connected to the busbar are grounding electrode conductors but (3) actually covers bonding jumpers to electrodes from a primary grounding electrode conductor. Deleting (3) from 250.64(C) should focus on the exceptions permitting splicing of grounding electrode conductors, not an exception permitting connection of bonding jumpers for other electrodes. This is a companion proposal to relocate the busbar text from 250.64(C) to 250.64(F).
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
DOBROWSKY, P.: The term "irreversible" should also be deleted. See my comment on proposal 5-11.

5-187 Log #3305 NEC-P05 **Final Action: Reject**
(250.64(C))

Submitter: Redwood Kardon, Code Check Institute
Recommendation: Revise text to read as follows:
"250.64(C) Continuous. Grounding electrode conductor(s) shall be installed to connect the grounding electrode system in one continuous length without a splice or joint...".
Substantiation: There is a common misconception that a grounding electrode conductor must be run continuously to each of the various electrodes that comprise the grounding electrode system prescribed in Article 250.50. Adding the words "to connect to the grounding electrode system" will help further delineate the function of the grounding electrode conductor and make it clear this conductor does not have to be run continuously from electrode to electrode.
Panel Meeting Action: Reject
Panel Statement: The proposed wording does not add clarity to the Code and may cause confusion.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-188 Log #826 NEC-P05 **Final Action: Accept in Principle**
(250.64(C)(3))

Submitter: Kim Parker, Austin, TX
Recommendation: Revise text to read as follows:
(C) Continuous. Grounding electrode conductor(s) shall be installed in one continuous length without a splice or joint except as permitted in (1) through (4):
(1) Splicing shall be permitted only by irreversible compression-type connectors listed as grounding and bonding equipment or by the exothermic welding process.
(2) Sections of busbars shall be permitted to be connected together to form a grounding electrode conductor.
~~(3) Bonding jumper(s) from grounding electrode(s) and grounding electrode conductor(s) shall be permitted to be connected to an aluminum or copper busbar not less than 6 mm × 50 mm (1/4 in. × 2 in.). The busbar shall be securely fastened and shall be installed in an accessible location. Connections shall be made by a listed connector or by the exothermic welding process.~~
~~(4)~~ (3) Where aluminum busbars are used, the installation shall comply with 250.64(A).
Substantiation: The inclusion of item (3) into 250.64(C) was a mistake as bonding jumpers are not grounding electrode conductors in the sense of splicing as covered by 250.64(C) and this inclusion tends to make them so. The provisions for use of a separate bonding busbar to make various electrode connections is not new to the industry just since the 2005 NEC but rather has been used in many areas for years. The electrical installers congratulate the panel on the inclusion of this provision in the 2005 NEC, as it is now a legal choice for connecting electrodes. However, this new provision should have been included in 250.64(F). This proposal is one of two proposals with a companion proposal also being submitted to revise 250.64(F).
Panel Meeting Action: Accept in Principle
Panel Statement: See panel actions and statements on Proposals 5-186 and 5-203.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-189 Log #2159 NEC-P05 **Final Action: Reject**
(250.64(C)(3))

Submitter: Richard E. Loyd, Sun Lakes, AZ
Recommendation: Revise text to read:
~~Bonding jumper(s) from grounding electrode(s) and g~~ Grounding electrode conductor(s) from each electrode and the common grounding electrode conductor shall be permitted to be connected to an aluminum or copper busbar not less than 6 mm × 50 mm (1/4 in. × 2 in.). The busbar shall be securely fastened and shall be installed in an accessible location. Connections shall be made by a listed connector or by the exothermic welding process.
Substantiation: To clarify that each grounding electrode conductor shall be sized in accordance with 250.66 where spliced at a busbar. The term "bonding jumper" is understood as a short wire or strap to connect two items together or a tap to another item such as "jumper to ground". In this situation, it is clearly the GEC from the electrode to the busbar.
Panel Meeting Action: Reject
Panel Statement: Section 250.53(C) clearly states the interconnection of grounding electrodes is by a bonding jumper. The definition of bonding jumper and most applications in the Code do not restrict or imply restrictions on length. To identify the conductors between grounding electrodes or from one of the electrodes to the common bus bar as "grounding electrode conductors" would impose many added requirements that do not have technical substantiation.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-190 Log #451 NEC-P05 **Final Action: Accept in Principle**
(250.64(D))

Submitter: W. Creighton Schwan, Hayward, CA
Recommendation: Revise the last sentence to read as follows:
The tap conductors shall be connected to the common grounding electrode conductor by means of irreversible compression type connectors or by the exothermic welding process and in such a manner that the common grounding electrode conductor remains without a splice or joint.
Substantiation: The lack of this specific requirement has led some to assume that these connections can be made by the use of split-bolt connectors, in violation of 250.64(C).
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 5-192.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-191 Log #868 NEC-P05 **Final Action: Accept in Principle**
(250.64(D))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise as follows:
(D) Grounding Electrode Conductor Taps. Where a service consists of more than a single enclosure as permitted in 230.71(A), it shall be permitted to connect taps to the common grounding electrode conductor. Each such tap conductor shall extend to the inside of each such enclosure. The common grounding electrode conductor shall be sized in accordance with 250.66 based on the sum of the circular mil area of the largest ungrounded service entrance conductors. Where more than one set of service entrance conductors as permitted by 230.40, Exception No. 2 connect directly to a service drop or lateral, the common grounding electrode conductor shall be sized in accordance with Table 250.66 Note 1. The tap conductors shall be permitted to be sized in accordance with the grounding electrode conductors specified in 250.66 for the largest conductor serving the respective enclosures. The tap conductors shall be connected to the common grounding electrode conductor in accordance with 250.8 and in such a manner that the common grounding electrode conductor remains without a splice or joint.
Substantiation: 250.64(D) provides an alternative for using grounding electrode conductor taps connected to a common grounding electrode conductor. The common grounding electrode conductor is required to remain without a splice or joint, but that doesn't apply to the grounding electrode conductor taps as addressed in this section. Adding this text that references Section 250.8 should provide the additional clarity needed for what methods are permitted to be used when connecting a grounding electrode conductor tap to a common grounding electrode conductor.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 5-192.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-192 Log #2396 NEC-P05 **Final Action: Accept in Principle**
(250.64(D))

Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Revise text to read:
(D) Multiple Disconnecting Means. Where a service consists of more than a single enclosure as permitted in 230.71(A), it shall be permitted to connect to the grounding electrode system in accordance with (1) or (2).
~~(D)~~ (1) Grounding Electrode Conductor Taps. ~~Where a service consists of more than a single enclosure as permitted in 230.71(A), it shall be permitted to connect~~ Taps to the common grounding electrode conductor shall be permitted . Each such tap conductor shall extend to the inside of each such enclosure. The common grounding electrode conductor shall be sized in accordance with 250.66, based on the sum of the circular mil area of the largest ungrounded service entrance conductors. Where more than one set of service entrance conductors as permitted by 230.40, Exception No. 2 connect directly to a service drop or lateral, the common grounding electrode conductor shall be sized in accordance with Table 250.66 Note 1. The tap conductors shall be permitted to be sized in accordance with the grounding electrode conductors specified in 250.66 for the largest conductor serving the respective enclosures. The tap conductors shall be connected to the common grounding electrode conductor in such a manner that the common grounding electrode conductor remains without a splice or joint.
(2) It shall be permitted to connect each enclosure to one or more of the grounding electrodes individually with a grounding electrode conductor. Such grounding electrode conductor shall be permitted to be sized in accordance with 250.66 for the largest conductor serving the respective enclosures.
Substantiation: As written presently, the Code does not specifically address the installation of multiple grounding electrode conductors for separate disconnecting means enclosures. The existing code language only addresses taps to the common grounding electrode conductor, but does not address individual grounding electrode conductors terminated to the electrode itself.
Panel Meeting Action: Accept in Principle
Recommendation: Revise 250.64(D) to read:
(D) Service with Multiple Disconnecting Means Enclosures. Where a service consists of more than a single enclosure as permitted in 230.71(A), grounding electrode connections shall be made in accordance with (1), (2) or (3).
(1) Grounding Electrode Conductor Taps.
Where the service is installed as permitted by 230.40, Exception No. 2, a common grounding electrode conductor and grounding electrode conductor taps shall be installed. The common grounding electrode conductor shall be sized in accordance with 250.66, based on the sum of the circular mil area of the largest ungrounded service entrance conductor(s). Where the service-entrance conductors connect directly to a service drop or service lateral, the common grounding electrode conductor shall be sized in accordance with Table 250.66, Note 1.

A tap conductor shall extend to the inside of each service disconnecting means enclosure. The grounding electrode conductor taps shall be sized in accordance with 250.66 for the largest conductor serving the individual enclosure. The tap conductors shall be connected to the common grounding electrode conductor by exothermic welding or with connectors listed as grounding and bonding equipment in such a manner that the common grounding electrode conductor remains without a splice or joint.

(2) Individual Grounding Electrode Conductors. A grounding electrode conductor shall be connected between the grounded conductor in each service equipment disconnecting means enclosure and the grounding electrode system. Each grounding electrode conductor shall be sized in accordance with 250.66 based on the service-entrance conductor(s) supplying the individual service disconnecting means.

(3) Common Location. A grounding electrode conductor shall be connected to the grounded service conductor(s) in a wireway or other accessible enclosure on the supply side of the service disconnecting means. The connection shall be made with exothermic welding or a connector listed as grounding and bonding equipment. The grounding electrode conductor shall be sized in accordance with 250.66 based on the service-entrance conductor(s) at the common location where the connection is made.

Panel Statement: This proposal includes concepts that are included in Proposals 5-190, 5-191, 5-192 and 5-193. In addition, item No. 3 was added to include the provision in 250.24 for making the grounding electrode connection at an accessible location on the load side of the service drop or service lateral.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

Comment on Affirmative:

TOOMER, R.: The proposed changes clarify the requirements for the installation of multiple grounding electrode conductors. However, the changes also introduce additional listing requirements by requiring that tap connections be made with "connectors listed as grounding and bonding equipment" in sub-paragraphs one and three. This change would prohibit some commonly used tap connectors with no technical substantiation for the limitation.

5-193 Log #346 NEC-P05 **Final Action: Accept in Principle**
(250.64(E))

Submitter: Michael J. Johnston, Plano, TX

Recommendation: Add text to read as follows:

<u>(E) Multiple Service Disconnect Enclosures. Where the service disconnecting means consists of more than a single enclosure as permitted in 230.71(A), it shall be permitted to run individual grounding electrode conductors from a common electrode as covered in 250.58, to each service disconnecting means. Each of the individual grounding electrode conductors shall be extended to the inside of each such service disconnecting means enclosure. The size of each individual grounding electrode conductor installed in accordance with this section shall be sized in accordance with 250.66 based on the size of the largest ungrounded service conductor serving the respective enclosure. The installation of such conductors shall meet the requirements of 250.64(A), (B), and (E).</u>

Substantiation: The proposed method of installing individual grounding electrode conductors is a common practice in many areas and follows the same concept of grounding electrode conductor taps as provided in 250.64(D) except the individual GECs connect directly to the electrode(s). The Code has not previously included clear provisions that recognize this method of installing grounding electrode conductors to multiple service disconnects grouped in the same location. This additional alternative will provide language in the NEC to apply to such practices that are already ongoing and recognized in industry. An example: Three service switchboards are installed in a large facility and there is a service disconnect (main) in each switchboard and they are all grouped in the same location. Currently, individual grounding electrode conductors are being run to each service switchboard. This is not an installation of three services, but three service disconnects (one on each switchboard) grouped in the same location. The proposed wording could also be applied where multiple service disconnect enclosures (smaller varieties) are installed grouped in one location to form a service disconnecting means. This proposed wording would provide Code rules that could be applied to such situations.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Proposal 5-192.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-194 Log #1240 NEC-P05 **Final Action: Reject**
(250.64(E))

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Delete "ferrous" in the first and third sentences; delete second sentence.

Substantiation: Edit. 250.92(A) requires bonding and continuity for "any" metallic raceway, which includes nonferrous aluminum, brass, or copper.

Panel Meeting Action: Reject

Panel Statement: The revised wording does not add clarity to the Code. There is no substantiation to delete the entire second sentence.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-195 Log #2905 NEC-P05 **Final Action: Accept in Principle**
(250.64(E))

Submitter: Peter D. Noval, Jr., Philadelphia, PA

Recommendation: Revise text to read as follows:

(E) Enclosures for Grounding Electrode Conductors. Ferrous metal enclosures for grounding electrode conductors shall be electrically continuous from the point of attachment to cabinets or equipment to the grounding electrode and shall be securely fastened to the ground clamp or fitting.

Nonferrous metal enclosures shall not be required to be electrically continuous. Ferrous metal enclosures that are not physically continuous from cabinets or equipment to the grounding electrode shall be made electrically continuous by bonding each end of the raceway or enclosure to the grounding electrode conductor. Bonding shall apply at each end and to all intervening ferrous raceways, boxes, and enclosures between the ~~service equipment~~ <u>cabinets or equipment</u> and the grounding electrode. The bonding jumper for a grounding electrode conductor raceway or cable armor shall be the same size as, or larger than, the required enclosed grounding electrode conductor. Where a raceway is used as protection for a grounding electrode conductor, the installation shall comply with the requirements of the appropriate raceway article.

Substantiation: Grounding electrode conductor installations pertain to more than just service equipment.

Replacing "service equipment" with "cabinets or equipment" addresses this point. In addition, this revision provides consistency throughout 250.64(E) and helps to eliminate the potential for misinterpretation with regard to bonding requirements. Such clarification will help inspectors and installers alike.

Panel Meeting Action: Accept in Principle

Revise text to read as follows:

(E) Enclosures for Grounding Electrode Conductors. Ferrous metal enclosures for grounding electrode conductors shall be electrically continuous from the point of attachment to cabinets or equipment to the grounding electrode and shall be securely fastened to the ground clamp or fitting.

Nonferrous metal enclosures shall not be required to be electrically continuous. Ferrous metal enclosures that are not physically continuous from cabinets or equipment to the grounding electrode shall be made electrically continuous by bonding each end of the raceway or enclosure to the grounding electrode conductor. Bonding shall apply at each end and to all intervening ferrous raceways, boxes, and enclosures between the service equipment, <u>cabinets, or equipment</u> and the grounding electrode. The bonding jumper for a grounding electrode conductor raceway or cable armor shall be the same size as, or larger than, the ~~required~~ enclosed grounding electrode conductor. Where a raceway is used as protection for a grounding electrode conductor, the installation shall comply with the requirements of the appropriate raceway article.

Panel Statement: There is no technical substantiation to remove "service equipment."

The word "required" was delete by Proposal 5-196.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-196 Log #2907 NEC-P05 **Final Action: Accept in Principle**
(250.64(E))

Submitter: Peter D. Noval, Jr., Philadelphia, PA

Recommendation: Delete text to read as follows:

(E) Enclosures for Grounding Electrode Conductors. Ferrous metal enclosures for grounding electrode conductors shall be electrically continuous from the point of attachment to cabinets or equipment to the grounding electrode and shall be securely fastened to the ground clamp or fitting.

Nonferrous metal enclosures shall not be required to be electrically continuous. Ferrous metal enclosures that are not physically continuous from cabinets or equipment to the grounding electrode shall be made electrically continuous by bonding each end of the raceway or enclosure to the grounding electrode conductor. Bonding shall apply at each end and to all intervening ferrous raceways, boxes, and enclosures between the service equipment and the grounding electrode. The bonding jumper for a grounding electrode conductor raceway or cable armor shall be the same size as, or larger than, the ~~required~~ enclosed grounding electrode conductor. Where a raceway is used as protection for a grounding electrode conductor, the installation shall comply with the requirements of the appropriate raceway article.

Substantiation: Field experience has shown that grounding electrode conductors are sometimes installed in sizes larger than the minimum required by the National Electrical Code or the design professional.

Frequently, this "oversizing" occurs simply because the larger size is readily available on the job site and the smaller "required" size is not.

Subsequently, bonding jumpers are then installed on the enclosing raceway to provide electrical continuity, but they are the same size as the "required" grounding electrode conductor.

In these instances, the bonding jumpers are smaller than the enclosed grounding electrode conductor.

From an inspector's prospective, the result is an installation that may not be readily determined to be code-compliant.

Therefore, to eliminate any confusion amongst installers and inspectors alike, and to facilitate inspections, delete the word "required".

This would clarify the requirement that bonding jumpers be the same size as, or larger than, the enclosed grounding electrode conductor.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Proposal 5-195. The action to remove the word "required" is taken in Proposal 5-195.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-197 Log #2925 NEC-P05 **Final Action: Reject**

(250.64(E))

Submitter: Peter D. Noval, Jr., Philadelphia, PA

Recommendation: Revise text to read as follows:

(E) Enclosure for Grounding Electrode Conductors. Strike metal enclosures for grounding electrode conductors shall be electrically continuous from the point of attachment to cabinets or equipment to the grounding electrode and shall be securely fastened to the ground clamp or fitting.

~~Nonferrous metal enclosures shall not be required to be electrically continuous. Ferrous~~ metal enclosures that are not physically continuous from cabinets or equipment to the grounding electrode shall be made electrically continuous by bonding each end of the raceway or enclosure to the grounding electrode conductor. Bonding shall apply at each end and to all intervening ferrous metal raceways, boxes, and enclosures between the service equipment and the grounding electrode. The bonding jumper for a grounding electrode conductor raceway or cable armor shall be the same size as, or larger than the required enclosed grounding electrode conductor. Where a raceway is used as protection for a grounding electrode conductor, the installation shall comply with the requirements of the appropriate raceway article.

Substantiation: Under certain conditions (lightning strike, voltage surge, ground-fault, etc.) unbonded sections of electrically conductive metal raceways, fittings, and enclosures may be subjected to arcing, resulting in a possible fire hazard.

This would be the case whether the metal was ferrous or nonferrous.

Therefore, to exempt nonferrous metal enclosures and raceways from the bonding requirements specifically called out for ferrous enclosures and raceways make no sense, with respect to the fire hazard.

In addition, due to the "skin effect", when properly bonded both ferrous and nonferrous raceways only add to the current-carrying capacity of the grounding electrode conductor installation (as the raceway is connected in parallel with the conductor) as well as lowering overall impedance of the path to ground.

The inclusion of "ferrous" to the exclusion of "nonferrous" perhaps was added to the previous 2002 NEC text in this section to address the choke effect that can be experienced with improperly bonded steel raceway.

However, as written, this text presently ignores the intent of the "bonding" part of Article 250 for all metal electrically conductive non-current carrying raceways, conductors, and enclosures.

The revised text brings the section back in line with the rest of Article 250.

Panel Meeting Action: Reject

Panel Statement: Determination of when bonding of floating nonferrous metal is required to prevent flashovers is an engineering consideration and should not be required in the NEC.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-198 Log #2926 NEC-P05 **Final Action: Accept in Principle in Part**

(250.64(E))

Submitter: Peter D. Noval, Jr., Philadelphia, PA

Recommendation: Revise the text to read as follows:

(E) Enclosures for Grounding Electrode Conductors. ~~Ferrous~~ metal Enclosures. For grounding electrode conductors shall be of electrically continuous from the point of attachment to cabinets or equipment to the grounding electrode ~~and shall be securely fastened to the ground clamp or fitting~~ .

~~Nonferrous metal enclosures shall not be required to be electrically continuous~~ . ~~Ferrous~~ metal enclosures that are not physically continuous from cabinets or equipment to the grounding electrode shall be made electrically continuous by bonding each end of the raceway or enclosure to the grounding electrode conductor. Bonding shall apply at each end and to all intervening ferrous <u>metal</u> raceways, boxes, and enclosures between the ~~service equipment~~ <u>cabinets or equipment</u> and the grounding electrode. The bonding jumper for a grounding electrode conductor raceway or cable armor shall be the same size as or larger than the ~~required~~ enclosed grounding electrode conductor. Where a raceway is used as protection for a grounding electrode conductor, the installation shall comply with the requirements of the appropriate raceway article.

Substantiation: The revised text clarifies the intent of the code with respect to:

1) Bonding <u>all</u> metal enclosures vs nonferrous only.

2) Bonding of enclosed vs. securely fastening to clamps or fittings.

3) Bonding between the grounding electrode and cabinets or equipment vs. service equipment only and;

4) Sizing of bonding jumpers relative to enclosed grounding electrode conductor size.

Panel Meeting Action: Accept in Principle in Part

Panel Statement: See panel action and statement on Proposal 5-195. All text changes occur within Proposal 5-195. See panel action and statement in Proposal 5-197 for why the panel does not accept bonding <u>all</u> metal enclosures vs nonferrous only

See panel action and statement in Proposal 5-199 for why the panel does not accept bonding of enclosed vs. securely fastening to clamps or fittings.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-199 Log #2927 NEC-P05 **Final Action: Reject**

(250.64(E))

Submitter: Peter D. Noval, Jr., Philadelphia, PA

Recommendation: Delete text to read as follows:

(E) Enclosures for Grounding Electrode Conductors. Ferrous metal enclosures for grounding electrode conductors shall be electrically continuous from the point of attachment to cabinets or equipment to the grounding electrode ~~and shall be securely fastened to the ground, clamp or fitting.~~ Nonferrous metal enclosures shall not be required to be electrically continuous. Ferrous metal enclosures that are not physically continuous from cabinets or equipment to the grounding electrode shall be made electrically continuous by bonding each end of the raceway or enclosure to the grounding electrode conductor. Bonding shall apply at each end and to all intervening ferrous raceways, boxes, and enclosures between the service equipment and the grounding electrode. The bonding jumper for a grounding electrode conductor raceway or cable armor shall be the same size as, or larger than, the required enclosed grounding electrode conductor. Where a raceway is used as protection for a grounding electrode conductor, the installation shall comply with the requirements of the appropriate raceway article.

Substantiation: The requirement for a grounding electrode enclosure to be "securely fastened to the ground clamp or fitting" serves no practical purpose in this section. Requiring grounding electrode conductor enclosures to be securely fastened to the ground clamps on the end of ground rods, for example, appears to be one literal interpretation of this section as presently written that is rarely, if ever, complied with.

Further, subsequent wording in this section allows for bonding where grounding electrode conductor enclosures are not physically continuous from end to end.

Therefore, deleting the text as indicated will eliminate ambiguity (securely fastened vs. bonding), clarify the intent of the code and improve installations and enforcement under this section.

Panel Meeting Action: Reject

Panel Statement: The proposal lessens the requirements of this section without technical substantiation. The electrically continuous requirement applies to metal enclosures for grounding electrode conductors and is the general requirement of this section. The bonding requirements are applicable where the metal enclosure is not electrically continuous from the cabinet or enclosure to the grounding electrode.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-200 Log #1631 NEC-P05 **Final Action: Reject**

(250.64(E), FPN)

Submitter: Peter Ramus, Town of Hanover

Recommendation: Add FPN as follows:

<u>FPN: When used as a bonding method for grounding electrode conductor enclosures, flexible metallic conduits may require the use of an external bonding jumper. See 250.4(A)(5), 250.90, 250.118(5), 250.118(6) and 250.118(7).</u>

Substantiation: Flexible metallic conduit is frequently used to enclose grounding electrode conductors at transformers and service equipment. The effects of impedance and the need for enclosures to safely carry fault current in this application are not always understood. Application of the performance requirements of 250.4(A)(5) and 250.90 are often overlooked by installers and not enforced by inspectors. This proposed FPN will serve to flag the issue and provide reference to pertinent sections.

Panel Meeting Action: Reject

Panel Statement: Flexible metal conduit is not permitted as one of the methods listed in the last sentence of 250.64(B) for providing this protection.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

Comment on Affirmative:

DOBROWSKY, P.: I do not necessarily agree with the panel statement related to all sizes of grounding electrode conductors.

5-201 Log #824 NEC-P05 **Final Action: Accept in Principle**
(250.64(F))

Submitter: Kim Parker, Austin, TX
Recommendation: Revise text to read as follows:
(F) To Electrode(s). A grounding electrode conductor shall be permitted :
(1) T ~~t~~ o be run to any convenient grounding electrode available in the grounding electrode system with bonding jumpers allowed to connect individually to or between the other electrodes utilized , or
(2) T ~~t~~ o one or more grounding electrode(s) individually, or
(3) T ~~t~~ o ~~the~~ an aluminum or copper busbar not less than 6 mm × 50 mm (1/4 in. × 2 in.) where ~~permitted in 250.64(C). B~~ b onding jumper(s) from grounding electrode(s) ~~and grounding electrode conductor(s)~~ shall be permitted to be connected to ~~an~~ the aluminum or copper busbar ~~not less than 6 mm × 50 mm (1/4 in. × 2 in.).~~ The busbar shall be securely fastened and shall be installed in an accessible location. Connections shall be made by a listed connector or by the exothermic welding process.
The grounding electrode conductor (s) and bonding jumper(s) shall be sized for the largest grounding electrode conductor required among all the electrodes connected to it.
Substantiation: This is a companion proposal to a proposal made to 250.64(C). The inclusion of item (3) into 250.64(C) in the 2005 NEC was a mistake as bonding jumpers are not grounding electrode conductors in the sense of splicing as covered by 250.64(C) and this inclusion tends to make them so with this provision being more applicable for inclusion in 250.64(F). Thus, this proposal is aimed at addressing that issue. Added wording is also suggested for item (1) in this proposal as there does not seem to be any current words in the NEC that actually allows bonding jumper(s) to be extended from where the grounding electrode conductor has been terminated on the first electrode to complete the grounding electrode system even though it is generally understood that this is the intent of the panel. It is also suggested that additional wording be added that will clarify the size of multiple grounding electrode conductors as well as bonding jumper(s) where utilized. The revision to a list style of presentation is for clarity and usability.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 5-203.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-202 Log #875 NEC-P05 **Final Action: Reject**
(250.64(F))

Submitter: Noel Williams, Noel Williams Consulting
Recommendation: Revise last sentence to read as follows:
" Each ~~The~~ grounding electrode conductor or bonding jumper connecting to one or more electrodes shall be sized for the largest grounding electrode conductor required among all the electrodes connected to it."
Substantiation: This proposal addresses two issues. First, "the grounding electrode conductor..." implies one and only one in spite of the preceding language - a fact that was supposedly addressed in a previous change. Second, the rule needs to also address the sizing of bonding jumpers that interconnect electrodes.
Panel Meeting Action: Reject
Panel Statement: Section 250.53(C) provides the sizing requirements of bonding jumpers between grounding electrodes.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
DOBROWSKY, P.: The proposal should be accepted because it increases the usability of this section.

5-203 Log #1902 NEC-P05 **Final Action: Accept**
(250.64(F))

TCC Action: The Technical Correlating Committee directs that the Code-Making Panel clarify the Panel Action on this Proposal with respect to the wording of the subsections (1) through (4) and their relationship to (F). This action will be considered by the Code-Making Panel as a Public Comment.
Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: Move the deleted text from 250.64(C)(3) & (4) to 250.64(F) as a new (3) & (4). The first two items existing in (F) are to be numbered as new (1) and (2). The section will read as follows:
"(F) To Electrodes(s). A grounding electrode conductor shall be permitted in (1), (2), (3) or (4).
(1) ~~to~~ Be run to any convenient grounding electrode available in the grounding ~~electrode available in the grounding~~ electrode system, ~~or~~
(2) ~~to~~ One or more grounding electrode(s) individually, or
(3) Bonding jumper(s) from grounding electrode(s) and grounding electrode conductor(s) shall be permitted to be connected to an aluminum or copper busbar not less than 6 mm x 50 mm (1/4 in. x 2 in.). The busbar shall be securely fastened and shall be installed in an accessible location. Connections shall be made by a listed connector or by the exothermic welding process.
(4) Where aluminum busbars are used, the installation shall comply with 250.64(A). The grounding electrode conductor shall be sized for the largest grounding electrode conductor required among all the electrodes connected to it."
Substantiation: The (3) text covering bonding jumpers connected to the aluminum or copper busbar more appropriately belongs in 250.64(F) since it clearly addresses bonding jumpers installed from grounding electrodes to the busbar. The grounding electrode conductor should be installed without a splice from the point of connection at the grounded conductor at the service to the busbar and the bonding jumpers are then installed from this point to all of the electrodes in the system. This is companion proposal to relocate the busbar text from 250.64(C) to 250.64(F).
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-204 Log #909 NEC-P05 **Final Action: Reject**
(250.65(A), 250.64(A))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise last sentence:
"Where used outside, aluminum or copper-clad aluminum grounding electrode conductors not in a raceway, and connections to a grounding electrode(s) shall not be ~~terminated~~ within 450 mm (18 in.) of the earth.
Substantiation: Edit. An open run of bare conductor other than at the the termination to an electrode (connection) may be subject to corrosion.
Panel Meeting Action: Reject
Panel Statement: The panel assumes that the submitter intended to propose a revision to 250.64(A) and not 250.65(A,) which does not exist. The submitter added text without substantiation. The submitter misquoted the existing Code text. The proposed wording is confusing.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-205 Log #1437 NEC-P05 **Final Action: Reject**
(250.66)

Submitter: Danish Verma, Bowie, MD
Recommendation: Add new text as follows:
250.66(D) Connection to Enclosures. Termination of the grounding electrode conductors entering cabinets, cutout boxes and other equipment enclosures shall be done using only listed devices such as lugs, clamps, pressures connectors or other listed means. Ground clamps or fittings shall be listed for the materials of the grounding electrode conductor. Not more than one conductor shall be connected to a single clamp or fitting unless the clamp or fitting is listed for multiple conductors.
Substantiation: The grounding electrode connection to enclosures, cutout boxes requires standardization. The current wiring practice of using no fitting or an unlisted fitting or a fitting not listed for grounding poses many problems.
1. Difference of potential.
2. Choke effect.
3. Does not comply with the appropriate ANSI/UL Standards.
4. Not in compliance with NFPA 780 recommendations for bonding the electrode to the enclosures, sideflash.
5. Using a fitting listed for bonding and grounding will ensure positive bonding jumper connection under severe fault conditions, surges, over voltages or if one were to misapply or fail to install the proper bonding jumper at the service enclosure. The fitting would provide a safety net in these applications. Not to mention possibility of cross threading or over tightening or breaking of the bonding screw.
The NEC recognizes the connection of the grounding electrode conductor at the electrode under 250.70, but does not identify the connection at the cabinet. The use of listed fittings will ensure proper support, proper strain relief (torque value) and ensure proper bonding. Will clarify the requirements of 312.5(A) NEC "Openings to be Closed" in cutout boxes and cabinets by using a proper listed grounding and bonding fitting.
Strain relief testing is required under both UL 486A Standards for Connectors and UL 467 Standard for Grounding and Bonding. Although I have witnessed arguments over whether strain relief is necessary, without the use of a proper fitting the grounding electrode conductor can work loose from the grounded bar after being struck by hand held mower equipment without proper strain relief. UL Standards requires a push pull test on connectors and fittings. It's appropriate to apply the standard. UL 486A 12.1 requires a pullout test for connectors, Table 12.1 provides the test values for the pull out test. Example: 6 AWG requires 100 LB pullout force.
UL 467, Table 13.1 Short - time test currents: present practice of not using a listed fitting fails to meet the short-time current test of the standard. Knowing that the NEC now identifies these product safety standards in Annex A, I believe it's just as important to adhere to these recognized standards. UL 467, Table 13.1 requires a 3/0 copper conductor to withstand 8030 amperes for 9 seconds without burning away from the enclosure. Unlisted fittings do not meet these requirements/standards.

Panel Meeting Action: Reject
Panel Statement: The panel concludes that specific listed fittings are not required where grounding electrode conductors enter cabinets or other enclosures. Protection for the grounding electrode conductor may be required where the grounding electrode conductor enters the enclosure and is already covered by other general installation provisions of the NEC. See also panel action and statement on Proposal 5-167 (Log #1053) in the 2004 Report on Proposal.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-206 Log #2162 NEC-P05 **Final Action: Reject**
(Table 250.66)

Submitter: Lawrence Cross, Local Union #98 IBEW
Recommendation: Revise text to read:
Table 250.66 Grounding Electrode Conductor for Alternating-Current Systems (ONLY)
New Table 250.67 Grounded Conductor, Bonding and Main Bonding Jumpers Alternating-Current Systems.
Substantiation: The problem with Table 250.66 is very misleading and confusing. The Table 250.66 is labeled as Grounding Electrode Conductor Alternating-Current Systems BUT ALSO SIZES the Grounded Conductor, Bonding and Main Bonding Jumpers. This is misleading and confusing because many times the electrician will size the Grounded Conductor, Bonding and Main Bonding Jumpers with the idea that the table is at the maximum conductor size 3/0 Copper and 250 Kcmil Aluminum with No consideration or calculation as per 250.24(C)(1), 250.28(D) and 250.30(A)(1) for the 12 1/2 percent rule for sizing conductors over 1100 Kcmil Copper and 1750 Kcmil Aluminum as per Table 8 Chapter 9. Note: See Example.

Copper Phase Conductor (Kcmil)	Copper Conductor Grounded Conductor, Bonding and Main Bonding Conductor (Kcmil)
1500	4/0 AWG
2000	250 Kcmil
2500	350 Kcmil
3000	400 Kcmil
3500	450 Kcmil
4000	500 Kcmil
5000	600 Kcmil
6000	750 Kcmil
7000	900 Kcmil
7500	1000 Kcmil
8000	1000 Kcmil
9000	1250 Kcmil
10000	1250 Kcmil
