Panel Meeting Action: Reject
Panel Statement: The proposed table does not resolve the problem identified by the submitter. The phase conductor sizes are all based on copper per the first column heading where aluminum or copper-clad aluminum is used for services and feeders. There are no size ranges provided nor instruction on how to size the proposed "grounded conductor, bonding and main bonding jumper" when the ungrounded conductor size falls between the ones provided. The substantiation indicates that the reason for the table is that the users are not applying Code requirements, sections cited in the substantiation, already in place. If the requirement, that point to Table 250.66 with the qualifiers of sizing over 1100 Kcmil copper or 1750 Kcmil aluminum were being followed, then this table would be unnecessary.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-207 Log #2594 NEC-P05 **Final Action: Reject**
(Table 250.66)

Submitter: Jebediah Novak, Cedar Rapids Electrical JATC
Recommendation: Revise Table 250.66 to read as shown below.
Substantiation: An individual sizing a grounding electrode conductor looks to the table and sees, for example, a 350 referenced in the first column. They then oversize the GEC based on that, not realizing it is for over 350 kcmil. This change will better correspond with the first three rows, making the table more user friendly.
Panel Meeting Action: Reject
Panel Statement: The panel concludes that the existing table is clear. The table as written allows for all sizes of conductors.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-208 Log #3134 NEC-P05 **Final Action: Reject**
(250.66)

Submitter: Eric Stromberg, Stromberg Engineering, Inc.
Recommendation: Revise text as follows:
250.66 Size of Alternating-Current Grounding ~~Electrode~~ Conductor.
Substantiation: 250.66 is used for all grounding conductors that are not associated with circuits protected by over current protection. The word "Electrode" in the title makes it appear that 250.66 only applies to the Grounding Electrode Conductor. This is not the case.
Panel Meeting Action: Reject
Panel Statement: The title of the table is appropriate and is intended for grounding electrode conductors. There are current Code rules that are clear where Table 250.66 is used for sizing conductors or jumpers other than grounding electrode conductors.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-209 Log #3651 NEC-P05 **Final Action: Reject**
(Table 250.66)

Submitter: Larry Cross, Local Union #98 IBEW
Recommendation: Table 250.66 Grounding Electrode Conductor for Alternating - Current Systems (ONLY) New Table 250.67 Grounded Conductor, Bonding and Main Bonbding Jumpers Alternating - Current Systems.
Substantiation: The problem with Table 250.66 is very misleading and confusing. The Table 250.66 is labeled as Grounding Electrode Conductor Alternating - Current Systems BUT ALSO SIZES the Grounded Conductor, Bonding and Main Bonding Jumpers. This is misleading and confusing because many times the electrician will size the Grounded Conductor, Bonding and Main Bonding Jumpers with the idea that the table is at the maximum conductor size 3/0 Copper and 250 Kcmil Aluminum with no consideration or calculation as per 250.24(C)(1), 250.28(D) and 250.30(A)(1) for the 12 1/2 percent rule for sizing conductors over 1100 Kcmil Copper and 1750 Kcmil

[Proposal 5-207 (Log #2594)]

Table 250.66 Grounding Electrode Conductor for Alternating-Current Systems

Size of Largest Ungrounded Service-Entrance Conductor or Equivalent Area for Parallel Conductors (AWG/kcmil)		Size of Grounding Electrode Conductor (AWG/kcmil)	
Copper	**Aluminum or Copper-Clad Aluminum**	**Copper**	**Aluminum or Copper-Clad Aluminum**
2 or smaller	1/0 or smaller	8	6

8000 1000Kcmil
9000 1250Kcmil
10000 1250Kcmil

Panel Meeting Action: Reject

Panel Statement: The proposed table does not resolve the problem identified by the submitter. The phase conductor sizes are all based on copper per the first column heading where aluminum or copper-clad aluminum is used for services and feeders. There are no size ranges provided nor instruction on how to size the proposed "grounded conductor, bonding and main bonding jumper" when the ungrounded conductor size falls between the ones provided. The substantiation indicates that the reason for the table is that the users are not applying Code requirements, sections cited in the substantiation, already in place. If the requirements that point to Table 250.66 with the qualifiers of sizing over 1100 Kcmil copper or 1750 Kcmil aluminum were being followed, then this table would be unnecessary.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-210 Log #2253 NEC-P05 **Final Action: Reject**

(250.66 and Table 250.66)

Submitter: Bryan P. Holland, Holland Electric

Recommendation: Delete Table 250.66 and revise 250.66 to state: "The size of the grounding electrode conductor of a grounded or ungrounded ac system shall not be less than 4 AWG copper wire or 2 AWG aluminum wire, except as permitted in 250.66(A). Delete 250.66(B).

Substantiation: The NEC is a minimum standard. If a structure or building is compliant to the code and completely safe with only #4 AWG to a concrete-encased electrode, then there is no reason to require a different electrode type to be connected with anything larger. It's not logical nor should be a code requirement to require anything above the minimum. Simply changing the electrode type shouldn't change the minimum safety requirement. If the table is accurate, it could be assumed that systems connected to only ground rods or to a concrete-encased electrode are less safe then a similar structure with a metal underground water pipe system or metal frame. It is generally understood that the concrtete-encased electrode is the most effective and low-impedance electrode of choice yet it is only required to be connected with a #4 AWG while other possibly less effective electrodes require such large conductors. The requirement in 250.4(A)(1) and (2) can be satisfied with a grounding electrode conductor no larger than #4 AWG regardless what electrode it is connected to.

Panel Meeting Action: Reject

Panel Statement: Deleting Table 250.66 as proposed lessens the minimum requirements of the NEC without substantiation. Sections 250.66(A), (B), and (C) only apply where the grounding electrode conductor is a sole connection to any of the types of electrodes in those sections.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-211 Log #2296 NEC-P05 **Final Action: Reject**

(250.66(D))

Submitter: Andre R. Cartal, Princeton Borough Building Dept.

Recommendation: Add (D) Existing Installations

In a single family dwelling where the existing grounding electrode conductor to the water system is rendered inaccessible, an existing copper grounding electrode conductor not smaller than 6 AWG shall be permitted for a service not larger than 200 amperes, providing that conductor continuity can be verified.

Substantiation: Frequently on a service upgrade to an existing dwelling, the grounding electrode conductor has been enclosed by remodeling. It becomes difficult to install a new conductor without damage to the structure.

Panel Meeting Action: Reject

Panel Statement: There is no technical substantiation that a reduction in the size of the grounding electrode conductor is appropriate. There is no technical reason given that a single family-dwelling specifically should have a reduction in the size of the grounding electrode conductor.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-212 Log #3188 NEC-P05 **Final Action: Reject**

(250.68(A))

Submitter: Donald Cook, Shelby County Development Services

Recommendation: Delete 250.68(A) and exceptions completely. Renumber existing 250.68(B) as 250.68.

Substantiation: Panel 5 rejected the same concept for the 2005 NEC (Proposal 5-175) and indicated that no substantiation was provided. They also indicated that accessibility is required for connections that are not inherently protected from damage. The panel also accepted an additional exception to the accessibility requirement in 2005 [250.68(A) Exception No.2] allowing specific connections to structural metal that was fire-proofed.

Nothing in either of the current exceptions seem to have anything to do with providing added inherent protection of the connection of the grounding electrode conductor termination. A grounding electrode conductor termination covered by wall coverings in a building would provide more inherent protection of the termination than an access hole in the wall covering.

As an AHJ enforcing and in many cases trying to help owners, designers, installers, and political interest understand that the purpose of the NEC is practical safeguarding of persons and property from hazards arising from the use of electricity, it is difficult to explain why a termination to a metal water pipe made underground and then covered, or a termination to rebar in a footing and then covered, or a termination to structural steel and then covered with fire-proofing is safe from hazards, but a water pipe termination or a rebar termination or a structural steel termination that is covered by an interior wall covering is now hazardous.

Panel Meeting Action: Reject

Panel Statement: If a mechanical connection becomes damaged or loosened during the construction of a building, it is necessary to have accessibility so it can be tightened or replaced.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

DOBROWSKY, P.: The proposals concept should be accepted. Based on the action on 5-213 a mechanical means will not be required to be accessible.

5-213 Log #3393 NEC-P05 **Final Action: Accept in Principle**

(250.68(A) Exception No. 2)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Recommendation: Revise in one of the following two ways:

"Exothermic or irreversible compression connections that constitute all elements of the final connection between the grounding electrode conductor and fireproofed structural metal shall not be required to be accessible."

OR

"Exothermic or irreversible compression connections used at terminations, together with the mechanical means used to attach such terminations to fireproofed structural metal whether or not the mechanical means is reversible, shall not be required to be accessible."

IF the second option is correct, THEN AND ONLY THEN modify 250.68(A) to read as follows:

"All mechanical elements used to terminate a grounding electrode conductor at a grounding electrode shall be accessible."

Substantiation: This submitter thought the NEC text clearly meant the first of the two above suggestions was the appropriate interpretation, because the literal text includes the phrase "exothermic or irreversible compression connection to fire-proofed structural metal." The rule under exception applies to the connection between conductor and electrode, and this defines the scope of the exception. Hence, the exception can only apply to the structural metal/ wire termination interface, which must be either welded (usual case) or perhaps hydraulically crimped if the structural metal would allow it, as in the case of reinforcing steel (unusual). However, the leading analysis now in print on the 2005 NEC changes shows a hydraulically crimped terminal lug attached to fireproofed building steel with a conventional nut and bolt, with a caption that clearly implies that the connection need not be accessible, i.e., conforms to the second wording above. It is apparent that clarification is in order.

Panel Meeting Action: Accept in Principle

Modify 250.68(A) to read as follows:

250.68 Grounding Electrode Conductor and Bonding Jumper Connection to Grounding Electrodes.

(A) Accessibility. ~~The connection of~~ All mechanical elements used to terminate a grounding electrode conductor or bonding jumper to a grounding electrode shall be accessible.

Exception No 1: An encased or buried connection to a concrete encased, driven, or buried grounding electrode shall not be required to be accessible.

Exception No. 2: ~~An~~ Exothermic or irreversible compression connections used at terminations, together with the mechanical means used to attach such terminations to fireproofed structural metal whether or not the mechanical means is reversible, shall not be required to be accessible.

Panel Statement: This action meets the submitter's intent.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-213a Log #CP505 NEC-P05 **Final Action: Accept**
(250.68(B))

Submitter: Code-Making Panel 5,
Recommendation: Revise 250.68(B) to read as follows:
250.68(B) ~~Effective~~ Grounding Path. The connection of a grounding electrode conductor or bonding jumper to a grounding electrode shall be made in a manner that will ensure a permanent ~~and~~ ~~effective~~ grounding path. Where necessary to ensure the grounding path for a metal piping system used as a grounding electrode, ~~effective~~ bonding shall be provided around insulated joints and around any equipment likely to be disconnected for repairs or replacement. Bonding ~~conductors~~ jumpers shall be of sufficient length to permit removal of such equipment while retaining the integrity of the ~~bond~~ grounding path.
Substantiation: The editorial revisions to the TCC Task Group on Grounding and Bonding proposals are incorporated into the identified sections to be consistent with the work of CMP-5 at the Report on Proposal Meeting for the 2008 NEC.
Bonding jumper is a defined term. The term "grounding path" is the portion of the circuit that requires integrity. The panel removed the word "effective" because it is an unenforceable term. This is consistent with other task group work in handling the term "effective."
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-214 Log #452 NEC-P05 **Final Action: Reject**
(250.68(B))

Submitter: W. Creighton Schwan, Hayward, CA
Recommendation: In line 4, replace "a permanent and," with "an" so as to read:
(B) Effective Grounding Path. The connection of a grounding electrode conductor or bonding jumper to a grounding electrode shall be made in a manner that will ensure ~~a permanent and~~ an effective grounding path. (Remainder to remain unchanged.)
Substantiation: The Webster definition of "permanent" is, in part: "lasting, durable, intended to last or function indefinitely, not subject to removal."
The only connections in Article 250 that meet this definition are the irreversible compression-type connector and the exothermic welding process called for (plus bus bar connections) in 250.64(C). All of the others can be removed using appropriate tools.
Other methods than these two are recognized in 250.8 and 250.70 in particular and in Parts V and VI of Article 250 in general.
Aside from the need for the NEC to be clear and specific in its requirements, there is the practical problem that the use of the word "permanent" where it is not intended may lead an unqualified inspector to make unreasonable requirements based on the literal wording.
Panel Meeting Action: Reject
Panel Statement: Section 3.2.4 of the NEC Style Manual recognizes the use of standard terms that have been established through accepted use or by definition. The word "permanent" is generally understood as it relates specifically to the characteristics and integrity of the electrical installation and can more readily be applied by inspectors in practical application.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-215 Log #459 NEC-P05 **Final Action: Reject**
(250.70)

Submitter: Lloyd Mathieson, Security Electric Inc.
Recommendation: Revise text to read as follows:
~~Not more than~~ One or more conductor s shall be connected to the grounding electrode each by a single clamp or fitting unless the clamp or fitting is listed for multiple conductors.
Substantiation: I first read this paragraph some years ago and it caused some confusion in that it implied that only one conductor can be connected to the electrode unless the clamp or fitting is listed for multiple conductors. I then called the inspector and he said two separate clamps would be code.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The current wording has been used in the NEC for many years. There is no technical substantiation that a problem exists. The revised wording will not add clarity to the code. It is the panel's intent that only one conductor be connected to the grounding electrode by a single clamp or fitting unless the fitting is listed for multiple conductors.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-216 Log #869 NEC-P05 **Final Action: Reject**
(250.80 through 250.106 and 251 (New))

Submitter: Ben Jacks, Seattle, WA
Recommendation: Revise:
Make V. Bonding 250.80 through 250.106 a new Article 251.
Substantiation: Eliminates confusion that "bonding" is not "grounding" (this change also affects title of 250 and all subsequent sections 250.4 through 250.86 that use bond, bonded, and bonding out of context when referring to grounding.)
Panel Meeting Action: Reject
Panel Statement: Insufficient substantiation has been provided to warrant developing a new Code article dedicated to just bonding. The panel maintains that grounding and bonding rules are both adequately covered by Article 250. Part V of the article provides specific bonding requirements. Both grounding and bonding are functions that are generally accomplished through a single conductor or component of the grounding and bonding system, no matter what that conductor is called. The two functions appropriately belong in the same article.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-217 Log #1903 NEC-P05 **Final Action: Accept**
(250.84(A))

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: In 250.84(A), delete the word "conduit" after the word "raceway" in the last line to read as follows:
250.84 Underground Service Cable or Raceway.
(A) Underground Service Cable. The sheath or armor of a continuous underground metal-sheathed or armored service cable system that is bonded to the grounded underground system shall not be required to be grounded at the building or structure. The sheath or armor shall be permitted to be insulated from the interior metal raceway ~~conduit~~ or piping.
Substantiation: This is probably an errata more than an intentional addition to the 2005 NEC but should be removed for the 2008 NEC.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-217a Log #CP506 NEC-P05 **Final Action: Accept**
(250.84(B))

Submitter: Code-Making Panel 5,
Recommendation: Revise Section 250.84(B) to read as follows:
(B) Underground Service Raceway Containing Cable. An underground metal service raceway that contains a metal-sheathed or armored cable ~~bonded~~ connected to the grounded ~~underground~~ system conductor shall not be required to be connected to the grounded system conductor at the building or structure. The sheath or armor shall be permitted to be insulated from the interior raceway or piping.
Substantiation: The editorial revisions to the TCC Task Group on Grounding and Bonding proposals are incorporated into the identified sections to be consistent with the work of CMP-5 at the Report on Proposal Meeting for the 2008 NEC. The word "connected" replaces the word "bonded" and is consistent with other task group work where the word "connected" or "connection" is used. See Proposal 5-217 which removed the word "conduit" from the text.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-218 Log #1331 NEC-P05 **Final Action: Reject**
(250.86)

Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Delete provision for concrete encasement
250.86 Other Conductor Enclosures and Raceways.
Except as permitted by 250.112(I), metal enclosures and raceways for other than service conductors shall be grounded.
Exception No. 3: A metal elbow shall not be required to be grounded where it is installed in a nonmetallic raceway and is isolated from possible contact by a minimum cover of 450 mm (18 in.) to any part of the elbow. ~~or is encased in not less than 50 mm (2 in.) of concrete~~ .
Substantiation: This change makes exception three to 250.86 mirror the exception to section 250.80. The protection afforded by 2 inches of concrete encasement should not be considered as equivalent to 18 inches of earth cover. Two inches of concrete encasement does not provide protection from electrical shock, as can be demonstrated by the equipotential bonding provisions found in articles 547 and 680.

Panel Meeting Action: Reject
Panel Statement: The exception to 250.80 deals only with rigid wiring methods and is necessary, whereas the 250.86 exception deals with the other wiring methods.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-219 Log #1335 NEC-P05 **Final Action: Accept**
(250.92)

Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Delete Parenthetical 3

250.92 Services.

(A) Bonding of Services. The non–current-carrying metal parts of equipment indicated in 250.92(A)(1), (A)(2), and (A)(3) shall be effectively bonded together.

(1) The service raceways, cable trays, cablebus framework, auxiliary gutters, or service cable armor or sheath except as permitted in 250.84.

(2) All service enclosures containing service conductors, including meter fittings, boxes, or the like, interposed in the service raceway or armor.

~~(3) Any metallic raceway or armor enclosing a grounding electrode conductor as specified in 250.64(B). Bonding shall apply at each end and to all intervening raceways, boxes, and enclosures between the service equipment and the grounding electrode.~~

Substantiation: Parenthetical 3 is an unnecessary redundancy. The requirement for bonding a metal enclosure for a grounding electrode is already spelled out clearly in 250.64(E). This requirement is not only for service equipment, which is the scope of 250.92, but also for separately derived systems. Sections 250.104(D) and 250.30(A)(3) and 250.30(A)(4) do not repeat the entire requirement of 250.64(C) like 250.92 does, because it is simply not necessary. 250.92 should address service equipment only, not service equipment and grounding electrode conductor enclosures. Also, article 100 defines Service Equipment as "The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service conductors to a building or other structure, or an otherwise designated area, and intended to constitute the main control and cutoff of the supply." An enclosure for a grounding electrode conductor does not fall into this definition.
Panel Meeting Action: Accept
Panel Statement: Editorially delete the reference to (A)(3) in the lead-in sentence.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-220 Log #1886 NEC-P05 **Final Action: Accept in Principle**
(250.94)

Submitter: Jeffrey Boksiner, Telcordia Technologies, Inc. / Rep. Alliance for Telecommunications Industry Solutions
Recommendation: Revise 250.94 **Bonding for Other Systems** as follows:

Bonding for Other Systems. <u>An intersystem grounding termination for connecting intersystem bonding and grounding conductors required for other systems shall be provided external to enclosures at the service equipment and at the disconnecting means for any additional buildings or structures. The intersystem grounding termination shall be accessible for connection and inspection. The intersystem grounding termination shall have the capacity for connection of not less than three intersystem bonding conductors. The intersystem grounding termination shall be one of the following:</u>

<u>(1) A set of terminals securely mounted to the meter socket enclosure and electrically connected to the meter socket enclosure. This terminals and the enclosure shall be listed for grounding.</u>

<u>(2) A bonding bar near the service equipment enclosure, meter socket enclosure or raceway for service conductors. The bonding bar shall be connected with a 6 AWG copper conductor to an equipment grounding conductor(s) in the service equipment enclosure, meter socket enclosure or exposed nonflexible metallic raceway.</u>

<u>(3) A bonding bar near the grounding electrode conductor. The bonding bar shall be connected to the grounding electrode conductor with a 6 AWG copper conductor.</u>

<u>Exception:In existing buildings or structures where any of the intersystem bonding and grounding conductors required by 770.93, 800.100(B), 810.21(F), 820.100(B), 830.100(B) exist, installation of the Intersystem Grounding Termination is not required</u> . An accessible means external to enclosures for connecting intersystem bonding and grounding electrode conductors shall be provided at the service equipment and at the disconnecting means for any additional buildings or structures by at least one of the following means:

(1) Exposed nonflexible metallic raceways

(2) Exposed grounding electrode conductor

(3) Approved means for the external connection of a copper or other corrosion-resistant bonding or grounding conductor to the grounded raceway or equipment

FPN No. 1: A 6 AWG copper conductor with one end bonded to the grounded nonflexible metallic raceway or equipment and with 150 mm (6 in.) or more of the other end made accessible on the outside wall is an example of the approved means covered in 250.94 .

Substantiation: This is one of several correlated proposals (100 Definitions, 250.95, Chapter 8 Articles) to improve the requirements related to intersystem bonding and grounding of communication systems. The intent is to create a dedicated and well-defined location for terminating the grounding conductors required in Chapter 8 Articles and 770.93. These grounding conductors also provide between communication and power systems (intersystem bonding). The proposed termination would have sufficient capacity to handle multiple communication systems (telecom, satellite, CATV) on premises. See the figures I have provided.

Intersystem bonding accomplished by connection of a communication grounding conductor to the power system is an important safety measure to prevent occurrences of voltages between communication system and power system. However, the existing requirements are not adequate. Bonding is becoming difficult to implement due to changes in building construction practices such as increased prevalence of flush construction and use of PVC conduits. Frequently, in new construction, the grounding electrode, the raceway and the grounding electrode conductor are hidden behind walls and not accessible for bonding connection.

Even in older construction with accessible equipment, the requirement for installation of intersystem bonding connection is subject to varying interpretation because there is not a clearly defined dedicated bonding location. The connection to the power system is sometimes haphazard. Installers are sometimes confused over where the connection should be made especially if multiple Communication Systems are present on premises.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
Revise 250.94 **Bonding for Other Systems** as follows:

Bonding for Other Systems. <u>An intersystem bonding termination for connecting intersystem bonding and grounding conductors required for other systems shall be provided external to enclosures at the service equipment and at the disconnecting means for any additional buildings or structures. The intersystem bonding termination shall be accessible for connection and inspection. The intersystem bonding termination shall have the capacity for connection of not less than three intersystem bonding conductors. The intersystem bonding termination shall be one of the following:</u>

<u>(1) A set of terminals securely mounted to the meter socket enclosure and electrically connected to the meter socket enclosure. This terminals and the enclosure shall be listed for grounding.</u>

<u>(2) A bonding bar near the service equipment enclosure, meter socket enclosure or raceway for service conductors. The bonding bar shall be connected with a minimum 6 AWG copper conductor to an equipment grounding conductor(s) in the service equipment enclosure, meter socket enclosure or exposed nonflexible metallic raceway.</u>

<u>(3) A bonding bar near the grounding electrode conductor. The bonding bar shall be connected to the grounding electrode conductor with a minimum 6 AWG copper conductor.</u>

<u>Exception:In existing buildings or structures where any of the intersystem bonding and grounding conductors required by 770.93, 800.100(B), 810.21(F), 820.100(B), 830.100(B) exist, installation of the Intersystem Bonding Termination is not required</u> . An accessible means external to enclosures for connecting intersystem bonding and grounding electrode conductors shall be <u>permitted</u> ~~provided~~ at the service equipment and at the disconnecting means for any additional buildings or structures by at least one of the following means:

(1) Exposed nonflexible metallic raceways

(2) Exposed grounding electrode conductor

(3) Approved means for the external connection of a copper or other corrosion-resistant bonding or grounding conductor to the grounded raceway or equipment

FPN No. 1: A 6 AWG copper conductor with one end bonded to the grounded nonflexible metallic raceway or equipment and with 150 mm (6 in.) or more of the other end made accessible on the outside wall is an example of the approved means covered in 250.94, Exception, (3).

Retain 2005 NEC FPN No. 2 as written.
Panel Statement: This action correlated with definition of intersystem bonding termination. The word minimum twas added o allow larger conductors where desired.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:

BRETT, JR., M.: See my explanation of negative vote on Proposal 5-20. This adds cost and requirements to the electrical contractor (installer) that is not substantiated or justified. The present text is adequate and it is the responsibility of the CATV and telephone installers to make the connection. It is only the electrical installer's responsibility to make sure there is access to do this. This proposal should be rejected.
Comment on Affirmative:

WHITE, C.: EEI is voting in the affirmative on this proposal because we see it as a good first step towards solving a hazardous field condition that currently exists. Often the device that is used to provide this inter-system bonding termination is installed on the cover or door of service and/or meter enclosures thus preventing their routine opening. In these cases, the only option available to properly operate or maintain this equipment is to remove the inter-system bonding termination device from the service or meter enclosure. This proposal may not go far enough to solve this problem entirely. EEI recommends that

Panel 5 further consider four proposals; 16-168, 16-237, 16-300 and 16-396. These proposals are recommended to be forwarded to Panel 5 from Panel 16. These proposals will provide some additional wording that can be incorporated into 250.94 that will provide prescriptive requirements mandating the proper installation of bonding terminations at these locations.

5-221 Log #1336 NEC-P05 **Final Action: Accept**
(250.96(B))

Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Replace "required" with "installed"

B) Isolated Grounding Circuits. Where ~~required~~ installed for the reduction of electrical noise (electromagnetic interference) on the grounding circuit, an equipment enclosure supplied by a branch circuit shall be permitted to be isolated from a raceway containing circuits supplying only that equipment by one or more listed nonmetallic raceway fittings located at the point of attachment of the raceway to the equipment enclosure. The metal raceway shall comply with provisions of this article and shall be supplemented by an internal insulated equipment grounding conductor installed in accordance with 250.146(D) to ground the equipment enclosure.

Substantiation: Generally speaking, isolated ground circuits are not required to be installed. When they are installed it is because of a designer's inclination, not a *Code* or manufacturer's requirement. This section should be changed to reflect this.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-222 Log #1996 NEC-P05 **Final Action: Reject**
(250.96(B))

Submitter: Robert Schuerger, EYP Mission Critical Facilities, Inc.
Recommendation: Revise as follows:

250.96(B) ~~Isolated~~ Insulated Grounding Receptacles . Where required for the reduction...

FPN: Use of an ~~isolated~~ insulated equipment grounding conductor does not relieve the requirement for grounding the raceway system and outlet box.

Substantiation: The use of the term "isolated" has caused confusion which has led to improper and unsafe installations in which a separate grounding electrode and grounding system is installed isolated from the rest of the grounding system of the building. Since the separate grounding system is not properly bonded to the grounding system of the building, a hazardous voltage can be developed between the two grounding systems by an electrical fault or lightning strike.

There have been many cases of this type of installation in the past, with data procession equipment, machine tools and other sensitive electronic equipment. The 2005 edition of IEEE Standard 1100, Recommended Practice for Powering and Grounding Electronic Equipment has "insulated ground receptacle" as the recommended terminology and has recommended the "isolated ground" and "isolated ground receptacle" be avoided.

Panel Meeting Action: Reject
Panel Statement: Section 250.96(B) covers isolated grounding circuits, not receptacles. The insulation referred to in this section has to do with insulation on the circuit conductors.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:

DOBROWSKY, P.: The proposal should be accepted. The term "isolated" is confusing. Too often individuals are interpreting this section as permitting a connection to an electrode that is (isolated) instead of installing a conductor that provides an effective fault current path.

MELLO, C.: The panel should reconsider the action and not reject the entire proposal outright. The receptacles should continue to be referred to as "isolated grounding receptacles" since the yoke is in fact isolated from the green equipment grounding screw provided for connecting the third (grounding) receptacle sleeve.

The change to the fine print note should be further considered and possibly use the term "dedicated" in place of "isolated" when referring to the equipment grounding conductor. In the 2002 cycle the term "dedicated" was suggested and the panel statement at that time indicated that dedicated could be inferred to mean a separate equipment grounding conductor for each receptacle. The term dedicated means "to set apart for a definite use" (Websters New Collegiate Dictionary), which is exactly what is intended. The "dedicated equipment grounding conductor" is set apart from the required equipment grounding conductor for a definite use limiting electronic noise interference. The confusion in the industry indicated by the submitter is in dealing with the insulated green wire that comes from the isolated grounding receptacle. I agree the term "isolated" is poor and has caused great confusion and down right dangerous installations to be completed. I believe the panel action should have been to Accept in Principle and In Part. The change to the name of the receptacle should continue to be rejected, but the change of the term in the FPN to "dedicated" should have been considered.

5-223 Log #453 NEC-P05 **Final Action: Reject**
(250.97 Exception)

Submitter: W. Creighton Schwan, Hayward, CA
Recommendation: In line 4, delete "permanent" so as to read:

Exception: Where oversized, concentric, or eccentric knockouts are not encountered, or where a box or enclosure with concentric or eccentric knockouts listed to provide a ~~permanent~~ reliable electrical bond, the following methods shall be permitted: (Balance of exception to remain unchanged.)

Substantiation: The Webster definition of "permanent" is, in part: "lasting, durable, intended to last or function indefinitely, not subject to removal."

The only connections in Article 250 that meet this definition are the irreversible compression-type connector and the exothermic welding process called for (plus bus bar connections) in 250.64(C). All of the others can be removed using appropriate tools.

Other methods than these two are recognized in 250.8 and 250.70 in particular and in Parts V and VI of Article 250 in general.

Aside from the need for the NEC to be clear and specific in its requirements, there is the practical problem that the use of the word "permanent" where it is not intended may lead an unqualified inspector to make unreasonable requirements based on the literal wording.

Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 5-51.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-224 Log #876 NEC-P05 **Final Action: Accept**
(250.97 Exception)

Submitter: Noel Williams, Noel Williams Consulting
Recommendation: Revise exception to read as follows:

"... with concentric or eccentric knockouts listed to provide a permanent, reliable electrical bond is installed , the following methods shall be permitted."

Substantiation: This proposal is intended to correct a grammatical error only. Alternatively, the exception should say "is listed to provide..." to complete the sentence.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-224a Log #CP510 NEC-P05 **Final Action: Accept**
(250.97 Exception)

Submitter: Code-Making Panel 5,
Recommendation: 250.97, Exception:
Revise the exception of Section 250.97 as follows: *Exception: Where oversized, concentric, or eccentric knockouts are not encountered, or where a box or enclosure with concentric or eccentric knockouts is listed to provide a permanent, reliable ~~electrical bond~~ bonding connection is installed , the following methods shall be permitted:* …
Substantiation: The editorial revisions to the TCC Task Group on Grounding and Bonding proposals are incorporated into the identified sections to be consistent with the work of CMP-5 at the Report on Proposal Meeting for the 2008 NEC. The phrase "… reliable bonding connection" is the preferred requirement. The words "is installed" were added due to action on Proposal 5-224
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-225 Log #1239 NEC-P05 **Final Action: Accept**
(250.100)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Change "Article 500" to "500.5".
Substantiation: Edit. To conform to Style Manual.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-226 Log #2227 NEC-P05 **Final Action: Accept in Principle**
(250.100)

Submitter: Donald A. Ganiere, Ottawa, IL
Recommendation: Revise as follows:

250.100 Bonding in Hazardous (Classified) Locations. Regardless of the voltage of the electrical system, the electrical continuity of non-current-carrying-metal parts of equipment, raceways, and other enclosures in any hazardous (classified) location as defined in Article 500 shall be ensured by any of the methods specified in 250.92(B)(2) through (B)(4) that are approved for the wiring method used. One or more of these bonding methods shall be used whether or not ~~supplementary~~ equipment grounding conductors are installed.

Substantiation: The deletion of the word "supplementary" will make it very clear that this bonding is always required in classified locations.
Panel Meeting Action: Accept in Principle
Revise the recommendation to read as follows:
250.100 Bonding in Hazardous (Classified) Locations. Regardless of the voltage of the electrical system, the electrical continuity of non–current-carrying metal parts of equipment, raceways, and other enclosures in any hazardous (classified) location as defined in ~~Article 500~~ 500.5 shall be ensured by any of the bonding methods specified in 250.92(B)(2) through (B)(4) ~~that are approved~~ ~~for the wiring method used~~. One or more of these bonding methods shall be used whether or not ~~supplementary~~ equipment grounding conductors of the wire type are installed.
Panel Statement: The reference to Article 500 was revised to 500.5 to comply with the NEC style manual for references and from Proposal 5-225. The panel agreed with the deletion of the word supplementary but added the word "of the wire type" because there will always be an equipment grounding conductor provided and the "supplementary" was referring to an additional wire type equipment grounding conductor in the raceway equipment grounding conductor. The panel deleted the text "that are approved for the wiring methoods used," since it added no clarity.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-227 Log #3507 NEC-P05 **Final Action: Reject**
(250.102(C))

Submitter: Paul Dobrowsky, Holley, NY
Recommendation: Revise text to read:
(C) Size — Equipment Bonding Jumper on the Supply Side of overcurrent devices ~~Service~~. The bonding jumper shall not be smaller than the sizes shown in Table 250.66 for grounding electrode conductors. Where the supp ly ~~service-entrance~~ phase conductors are larger than 1100 kcmil copper or 1750 kcmil aluminum, the bonding jumper shall have an area not less than 12½ percent of the area of the largest phase conductor except that, where the phase conductors and the bonding jumper are of different materials (copper or aluminum), the minimum size of the bonding jumper shall be based on the assumed use of phase conductors of the same material as the bonding jumper and with an ampacity equivalent to that of the installed phase conductors. Where the supply ~~service-entrance~~ conductors are paralleled in two or more raceways or cables, the equipment bonding jumper, where routed with the raceways or cables, shall be run in parallel. The size of the bonding jumper for each raceway or cable shall be based on the size of the supply ~~service-entrance~~ conductors in each raceway or cable.
Substantiation: This section is referenced by other sections such as 250.30 and also apply to other than service conductors.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 5-244.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-244 Log #3508 NEC-P05 **Final Action: Reject**
(250.102(D))

Submitter: Paul Dobrowsky, Holley, NY
Recommendation: Revise text to read:
(D) Size — Equipment Bonding Jumper on Load Side of overcurrent devices ~~Service~~. The equipment bonding jumper on the load side of ~~the service~~ overcurrent devices shall be sized, as a minimum, in accordance with the sizes listed in Table 250.122, but shall not be required to be larger than the largest ungrounded circuit conductors supplying the equipment and shall not be smaller than 14 AWG.
A single common continuous equipment bonding jumper shall be permitted to bond two or more raceways or cables where the bonding jumper is sized in accordance with Table 250.122 for the largest overcurrent device supplying circuits therein.
Substantiation: This section is referenced by other sections that apply to other than service conductors.
Panel Meeting Action: Reject
Panel Statement: The present code is clear. Making the suggested changes will add confusion due to the multiple references made elsewhere in the Code.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-228 Log #1455 NEC-P05 **Final Action: Reject**
(250.104)

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise as follows:
250.104 Bonding of Piping Systems and Exposed Structural Steel.
(A) Metal Water Piping. Remain unchanged.
(B) Other Metal Piping. Where installed in or attached to a building or structure, metal piping system(s), including gas piping, that is likely to become energized shall be bonded to the service equipment enclosure, the grounded conductor at the service, the grounding electrode conductor where of sufficient size, or to the one or more grounding electrodes used. The bonding jumper(s) shall be sized in accordance with 250.122, using the rating of the circuit that is likely to energize the piping system(s). The equipment grounding conductor for the circuit that is likely to energize the piping shall be permitted to serve as the bonding means. The points of attachment of the bonding jumper(s) shall be accessible.
~~FPN: Bonding all piping and metal air ducts within the premises will provide additional safety.~~
(C) Structural Metal. Exposed structural metal that is interconnected to form a metal building frame and is not intentionally grounded and is likely to become energized shall be bonded to the service equipment enclosure, the grounded conductor at the service, the grounding electrode conductor where of sufficient size, or the one or more grounding electrodes used. The bonding jumper(s) shall be sized in accordance with Table 250.66 and installed in accordance with 250.64(A,)(B), and (E). The points of attachment of the bonding jumper(s) shall be accessible.
(D) Other Metal. Where installed in or attached to a building or structure, metal objects that are likely to become energized shall be bonded to the service equipment enclosure, the grounded conductor at the service, the grounding electrode conductor where of sufficient size, or to the one or more grounding electrodes used. The bonding jumper(s) shall be sized in accordance with 250.122, using the rating of the circuit that is likely to energize the piping system(s). The equipment grounding conductor for the circuit that is likely to energize the piping shall be permitted to serve as the bonding means. The points of attachment of the bonding jumper(s) shall be accessible.
(E) Separately Derived Systems. Remain unchanged.
Substantiation: It is evident that code understands the fact that bonding isolated metal is an enhancement in safety. This can be verified by referring to the fine print notes of 250.104(B) and 250.116. Because there are, in fact, documented deaths that have occurred because of the lack of bonding of such things as nonstructural metal wall framing and ducting systems, this concept should be a requirement, and not just a suggestion in the form of a fine print note. This proposal uses the existing text of 250.104(B) in an effort to provide consistent code language between the two subsections.
A companion proposal to delete the FPN to 250.116 will be submitted for correlating purposes.
Panel Meeting Action: Reject
Panel Statement: The terms "other metal" and "metal objects" are vague and unenforceable as used in this context.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-229 Log #1484 NEC-P05 **Final Action: Accept in Principle**
(250.104)

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise as follows:
250.104 Bonding of Piping Systems and Exposed Structural Steel.
(A) Metal Water Piping. The metal water piping system shall be bonded as required in (A)(1), (A)(2), or (A)(3) of this section. The bonding jumper(s) shall be installed in accordance with 250.64(A), (B), and (E). The points of attachment of the bonding jumper(s) shall be accessible.
(1) Remain unchanged.
(2) Buildings of Multiple Occupancy. In buildings of multiple occupancy where the metal water piping system(s) installed in or attached to a building or structure for the individual occupancies is metallically isolated from all other occupancies by use of nonmetallic water piping, the metal water piping system(s) for each occupancy shall be permitted to be bonded to the equipment grounding terminal of the panelboard or switchboard enclosure (other than service equipment) supplying that occupancy. The bonding jumper shall be sized in accordance with Table 250.122, based on the overcurrent protection device for the feeder circuit supplying the occupancy.
Substantiation: Simply referring the code user to Table 250.122 is not adequate. The user must know which overcurrent protection device is being used when referring to the table. Because of the allowance of this code section, it makes sense that the feeder protection device should be used. The code should tell the user this information.
Panel Meeting Action: Accept in Principle
Revise the proposed wording in the last sentence to read as follows:
The bonding jumper shall be sized in accordance with Table 250.122, based on the rating of the overcurrent protective device for the circuit supplying the occupancy.
Panel Statement: The panel accepts the revisions as providing clarity and improvement in usability to this section.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-230 Log #1402 NEC-P05 **Final Action: Reject**
(250.104(A))

Submitter: George Stolz, II, Pierce, CO
Recommendation: Revise 250.104(A) as follows:
(A) Metal Water Piping. Where metal water piping systems do not meet the criteria for a grounding electrode as described in 250.52(A)(1), interior metal piping shall be bonded as required in (A)(1), (A)(2), or (A)(3) of this section.

The bonding jumpers shall be installed in accordance with 250.64(A), (B), and (E). The points of attachment for the bonding jumpers shall be accessible.
Substantiation: This would clarify that this section only becomes effective when the water piping does not qualify as a Grounding Electrode. This is submitted to coordinate with a proposal for 250.104(A).
Panel Meeting Action: Reject
Panel Statement: The proposed revision does not add clarity or improve the requirements of this section and is not necessary. Metal piping is required to be bonded whether or not the piping qualifies as a grounding electrode in accordance with 250.52(A)(1). It is recognized that the grounding electrode conductor in these cases accomplishes both grounding and bonding.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-231 Log #3215 NEC-P05 **Final Action: Reject**
(250.104(A))

Submitter: Gus Bryan, Deputy ELectrical Inspector State of TN
Recommendation: Add text to read as follows:
"...bonding jumpers shall be accessible. (add) Effectively grounded metal water piping shall have jumpers sized per 250.66, metal water piping not effectively grounded shall have jumpers installed per 250.122."
Substantiation: Metal water piping systems that are not effectively grounded are no different from process piping, etc. and should not require bonding beyond that required by 250.104(B).
Panel Meeting Action: Reject
Panel Statement: The submitter proposes lessening the minimum sizes required for bonding jumpers for metal water piping systems without substantiation. The panel maintains that the minimum size of the bonding jumpers for metal water piping systems is required to be in accordance with Table 250.66.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-232 Log #2120 NEC-P05 **Final Action: Reject**
(250.104(A) Exception)

Submitter: Bud Swathwood, Bud Swathwood Consulting
Recommendation: Add an exception to read as follows:
Exception: For the purpose of this section metal water piping shall not include metal eave troughs or down spouts for roof drainage.
Substantiation: Some inspectors are actually requiring this to be done: there have been suspicious fires caused by dry leaves in the trough catching fire because of the arcing of the loose joint in the eave troughs and down spouts.
Panel Meeting Action: Reject
Panel Statement: Metal trough gutters, scuppers, down spouts, and so forth are not metal water piping systems as covered by this section. These other metal objects qualify for what is presently addressed in the FPN to Section 250.104(B).
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-233 Log #2136 NEC-P05 **Final Action: Reject**
(250.104(A) Exception (New))

Submitter: Russell LeBlanc, Peterson School of Engineering
Recommendation: Add exception to read as follows:
Isolated sections of metal water piping that are not likely to become energized, shall not be required to be bonded.
Substantiation: If a short section of metal water pipe was used in a plastic water piping, system it would be required to be bonded even if there was no likelihood of it ever becoming energized. There are no exceptions.
Panel Meeting Action: Reject
Panel Statement: Isolated sections of metal water piping are covered by 250.104(B). Section 250.104(A) is specifically for "systems" meaning complete systems consisting all of metal water piping.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-234 Log #121 NEC-P05 **Final Action: Reject**
(250.104(A)(1))

Submitter: Arthur J. Carlson, Chubbuck, ID
Recommendation: Add new paragraph:
"If the building or structure has a nonmetallic water service, the metal water piping may be bonded in accordance with 250.104(B)."
Substantiation: A nonmetallic water service makes the interior and exterior water piping no different than gas, air, etc.
Panel Meeting Action: Reject
Panel Statement: The proposed revision does not add clarity or improve the requirements of this section and is not necessary. Metal piping is required to be bonded whether or not the piping qualifies as a grounding electrode in accordance with 250.52(A)(1). The submitter proposes amending the sizes required for bonding jumpers for metal water piping systems without substantiation. The panel maintains that the minimum size of the bonding jumpers for metal water piping systems is required to be in accordance with Table 250.66. See panel action and statement on Proposal 5-231.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-235 Log #1834 NEC-P05 **Final Action: Reject**
(250.104(A)(1))

Submitter: Mark T. Rochon, Mark J. Rochon Master Electrician
Recommendation: Revise as follows:
~~General~~ Combination metal water piping system(s) separated by nonmetallic water piping system(s) where may become energized installed in or attached to a building or structure shall be bonded to the service equipment enclosure, the grounded conductor at the service, the grounding electrode conductor where of sufficient size, or the one or more grounding electrodes used.
Substantiation: Nonmetallic water piping systems are being inserted between our metal water piping system and today's code is not recognizing these changes.
Panel Meeting Action: Reject
Panel Statement: The conditions indicated in the substantiation are already covered by 250.104(B) where there is not a complete metallic water piping system.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-236 Log #2432 NEC-P05 **Final Action: Reject**
(250.104(A)(1))

Submitter: Robert P. McGann, City of Cambridge
Recommendation: Revise text to read as follows:
Metal water piping system(s) that is likely to be energized , installed in or attached to a building or structure shall be bonded.
Substantiation: With much expanded use of plastic water piping system(s) isolating section of metal piping systems. This type of installation leaves contractors and inspectors what is required to be bonded.
Panel Meeting Action: Reject
Panel Statement: The requirements of 250.104(A) apply to complete metallic water piping systems. Where there is no complete metallic water piping system, then the requirements of 250.104(B) would apply for those portions of isolated metal water piping system likely to become energized.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-237 Log #3216 NEC-P05 **Final Action: Reject**
(250.104(A)(1))

Submitter: Gus Bryan, Deputy ELectrical Inspector State of TN
Recommendation: Revise text to read as follows:
"...shall be sized in accordance with Table 250.66 for effectively grounded piping and Table 250.122 for non-effectively grounded metal water piping .
Substantiation: Metal water piping that is not effectively grounded is no different from air lines, process piping, etc. and, in that it is not being used as a grounding electrode, should not require bonding beyond 250-122.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 5-234. The submitter proposes amending the sizes required for bonding jumpers for metal water piping systems without substantiation. The panel maintains that the minimum size of the bonding jumpers for metal water piping systems is required to be in accordance with Table 250.66.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-238 Log #1232 NEC-P05 **Final Action: Reject**
(250.104(A)(2))

Submitter: Michael Dempsey, Municipal Code Inspections
Recommendation: Revise text to read as follows:
Buildings of multiple occupancy and one and two family dwellings .
Substantiation: There is no difference between a bond in a multi-occupancy and a one- and two-family for metal water piping in the interior of a dwelling unit when the water piping is not part of a grounding electrode.
Panel Meeting Action: Reject
Panel Statement: As used in this section, the term "multiple occupancies" includes one- and two-family dwellings. The Code does not differentiate between the types of multiple occupancy buildings referred to in this section.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-239 Log #1413 NEC-P05 **Final Action: Reject**
(250.104(B))

Submitter: Technical Committee on Lightning Protection,
Recommendation: Revise the existing Fine Print Note in NFPA 70 250.104(B) as follows (proposed new text underlined):

FPN: Bonding all piping and metal air ducts within the premises will provide additional safety. <u>For structures with a lightning protection system, all grounding media in or on a structure is required to be interconnected to provide a common ground potential. This interconnection shall include lightning protection, electric service, telephone, and communication system grounds, as well as underground metallic piping systems. For further information see NFPA 780-2004, Standard for the Installation of Lightning Protection Systems.</u>

Substantiation: The proposed additional text provides additional guidance for specified potential equalization bonding of building grounded systems detailed in NFPA 780 to minimize sideflash. This information is taken from paragraphs 4.14.1 and 4.14.1.1 of NFPA 780. The addition of this text will aid in the coordination between NFPA Standards Committees in the bonding of grounding systems and metallic piping installed in a structure.
Panel Meeting Action: Reject
Panel Statement: Mandatory text in a fine print note is not appropriate.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-240 Log #1448 NEC-P05 **Final Action: Reject**
(250.104(B))

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise as follows:

(B) Other Metal Piping. Where installed in or attached to a building or structure, metal piping system(s), including gas piping <u>and fire sprinkler piping</u>, that is likely to become energized shall be bonded to the service equipment enclosure, the grounded conductor at the service, the grounding electrode conductor where of sufficient size, or to the one or more grounding electrodes uses. The bonding jumper(s) shall be sized in accordance with 250.122 using the rating of the circuit that is likely to energize the piping system(s). The equipment grounding conductor for the circuit that is likely to energize the piping shall be permitted to serve as the bonding means. The points of attachment of the bonding jumper(s) shall be accessible.

FPN: Bonding all piping and metal air ducts within the premises will provide additional safety

Substantiation: There is a long-standing debate as to whether fire sprinkler piping is a 250.104(A) or 250.104(B) type of piping. I have spoken with several code experts on this issue, including multiple members of Panel 5, and have received different answers on this issue. Accepting this proposal would end this debate, and would be a step forward in the uniform interpretation of this rule, which is something that we should all be striving for.
Panel Meeting Action: Reject
Panel Statement: A metallic fire sprinkler piping system is metal water piping system that is covered by Section 250.104(A). Section 250.104(A) does not differentiate or exclude between the various types of metal water piping systems that might be present in a building or structure. Section 250.104(B) covers metal piping systems other than those metal water piping systems covered by 250.104(A).
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-241 Log #2803 NEC-P05 **Final Action: Reject**
(250.104(B), FPN (New))

Submitter: Jeff Sellon, Western Engineering & Research Corporation
Recommendation: ...to add the following new fine print note to the existing wording of 250.104(B) Other Metal Piping of the 2005 edition of the NEC:

<u>FPN: See Installation of Sprinkler Systems (NFPA 13 Article 10.6.8 and A.10.6.8) for more information about the fire protection piping systems, which extend underground.</u>

Substantiation: Significant confusion persists over the bonding and/or grounding of fire protection piping systems that extend underground. (There is confusion among electrical inspectors, fire department inspectors, electricians, and engineers). Recently, in Colorado, stray current corrosion in an underground ductile iron fire protection piping caused a failure in the pipe, which resulted in millions of dollars of building and building foundation damage.

The failure occurred within several years of the pipe's installation. There have been some other similar failures, which I have investigated and know about. Such stray current failures typically occur just outside the building's foundation where current can flow around electrically discontinuous joints (bell & spigot) through moist conductive soil. The rubber gasket joints (unrestrained push-on or mechanical joints) of underground and above ground fire protection piping are not considered electrically continuous, although some joints can conduct current, depending how any particular joint fits together. Said differently, from an electrical perspective, such a fire protection piping system (inside a building and underground) consists of many individual piping segments, which may or may not conduct current.

NFPA 70, the National Electrical Code, does not require that all the individual piping segments be bonded together, nor could such a system be used as a grounding electrode since often the underground fire protection piping is coated or wrapped in plastic for corrosion protection. 250.104(B) allows that the equipment-grounding conductor for the circuit that is likely to energize the piping shall be permitted to serve as the bonding means. Thus, the ground of the electrical circuit for a tamper switch, for example, is allowed to bond the entire piping system even though the piping system itself may not be electrically continuous.

On occasion, when stray current does flow through the underground ductile iron fire protection piping, the potential for corrosion is increased and can result in rapid corrosion in this type of piping system.

Electrical isolation (via electrically insulated joints) of sections of underground piping systems has been used in various corrosion protection schemes for years.

Installing an electrically insulated joint between the underground fire protection piping and the above ground fire protection piping will stop stray current flow from 1) the building's electrical system into the underground fire protection piping and from 2) any source outside the building (such as an electric utility system) flowing into the building's low resistance grounding electrode system through the underground fire protection piping. Such as insulated joint would not change the electrical status of the piping system since it is already just a group of individual piping segments from an electrical perspective. Further, the underground ductile iron fire protection piping is often coated with a bonded or unbonded material, or wrapped in plastic, or cathodic protected with an active or inactive system to help protect against corrosion. An electrically insulating gasket installed between the underground and above ground fire protection piping would be part of the corrosion protection system.

Article 10.6.8 of the 2002 NFPA 13 describes this problem to some degree and it is further described in the associated 2002 Handbook. Last year, I proposed that an annex paragraph A.10.6.8 be added to NFPA 13 to further explain the problem and my proposal was accepted in principle (See 13-722 (Log #778) AUT-PRI **Final Action**: Accept in Principle (A.10.6.8).

My current proposal to add the above Fine Print Note (FPN) to 250.104(B) simply coordinates NFPA 70 and NFPA 13.
Panel Meeting Action: Reject
Panel Statement: The panel concludes that "bonding all piping and metal air ducts within the premises will provide additional safety."
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-242 Log #1195 NEC-P05 **Final Action: Reject**
(250.104(D))

Submitter: Michael J. Timpanaro, Lake County Building Services
Recommendation: Revise as follows:

250.104 Bonding of Piping Systems, Exposed Structural Steel, <u>and Metal Framing Members.</u>

(D) Metal Framing Members. Metal Framing members shall be bonded to the equipment grounding conductor for the circuit that may energize the framing, and be sized in accordance with 250.122. For the purpose of this section, a grounded metal outlet box attached to the framing shall be permitted.

Substantiation: This proposal for bonding metal framing members was submitted for the 1999 code because a woman was shocked in a shower due to energized metal framing members. The proposal was rejected. This year an appliance installer died from electrocution due to an energized metal framing member that came in contact with the metal duct that was connected to the appliance.
Panel Meeting Action: Reject
Panel Statement: The panel notes that the submitter references 250.104(D) and that this section deals with the bonding of separately derived systems. Structural metal is covered by 250.104(C) for general cases and by 250.104(D)(2) for separately derived systems. Bonding of metal studs is not prohibited based on the condition of installation.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:

BRENDER, D.: The submitter points to the incorrect code section, but raises a valid point that could be easily corrected. In one of the previous code cycles, one submitter cited a death or serious injury that resulted from steel framing members becoming energized. Elimination of the word "exposed" in 250.104(C) and installation of one metal box would go a long way toward solving the problem.

5-243 Log #2842 NEC-P05 **Final Action: Reject**
(250.104(D))

Submitter: Edward Mitchell, City of Los Angeles, CA
Recommendation: Revise text to read as follows:

(1) Metal Water Piping System(s). The grounded conductor of each separately derived system shall be bonded to the nearest available point of the metal water piping system(s) ~~in the area served by each separately derived system.~~ This connection shall be made at the same point on the separately derived system where the grounding electrode conductor is connected. Each bonding jumper shall be sized in accordance with Table 250.66 based on the largest ungrounded conductor of the separately derived system.

Exception No.1: A separate bonding jumper to the metal water piping system shall not be required where the metal water piping system is used as the grounding electrode for the separately derived system.

Exception No. 2: A separate water piping bonding jumper shall not be required where the metal frame of a building or structure is used as the grounding electrode for a separately derived system ~~and is bonded to the metal water piping in the area served by the separately derived system.~~

(2) Structural Metal. Where exposed structural metal that is interconnected to form the building frame exists ~~in the the area served by the separately derived system,~~ it shall be bonded to the grounded conductor of each separately derived system. This connection shall be made at the same point on the separately derived system where the grounding electrode conductor is connected. Each bonding jumper shall be sized in accordance with Table 250.66 based on the largest ungrounded conductor of the separately derived system.

Exception No. 1: A separate bonding jumper to the building structural metal shall not be required where the metal frame of a building or structure is used as the grounding electrode for the separately derived systems.

Exception No 2: A separate bonding jumper to the building structural metal shall not be required where the water piping of a building or structure is used as the grounding electrode for a separately derived system and is bonded to the building structural metal ~~in the area served by the separately derived system.~~

(3) Common Grounding Electrode Conductor . Where a common grounding electrode conductor is installed for multiple separately derived systems as permitted by 250.30(A)(4), and exposed structural metal that is interconnected to form the building frame or interior metal piping exists ~~in the area served by the separately derived system,~~ the metal piping and the structural metal member shall be bonded to the common grounding electrode conductor.

Exception: A separate bonding jumper from each derived system to metal water piping and to structural metal members shall not be required where the metal water piping and the structural metal members ~~in the area served by the separately derived system~~ are bonded to the common grounding electrode conductor.

Substantiation: All references to “the area served by the separately derived system” should be deleted. What does that really mean anyway? If a transformer serves three floors of a building, do we need to bond to metal water piping on every floor? If a transformer on the first floor feeds a panelboard on the second floor, and that panelboard feeds branch circuits on the second and third floor, do we need a bonding connection to the metal water piping system on all three floors? In every room served by a branch circuit from that panelboard?

Exception No.1 to Metal Water Piping System(s) recognizes that when a separately derived system is bonded to the portion of the metal water piping system defined as the grounding electrode, no bonding is required in “the area served by the separately derived system” because the metal water piping system is in fact bonded from the “electrode portion” of the metal water piping system continuously throughout the building. When the separately derived system is bonded at <u>any point</u> to the metal water piping system, it is in fact bonded to the entire metal water piping system, including all “areas served by the separately derived system”. Similarly, when the separately derived system is bonded at <u>any point</u> to the structural metal, it is in fact bonded to the entire structural metal, including all “areas served by the separately derived system”.

Panel Meeting Action: Reject

Panel Statement: If there is no water piping in the area served, bonding to the water piping outside the area served would not be effective, since there will not be a direct connection through the separately derived systems.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-245 Log #2785 NEC-P05 **Final Action: Accept in Principle**
(250.104(D)(1) Exception No. 1)

Submitter: Ted Smith, Ludvik Electric Co. / Rep. International Electrical Instructors & Students Assoc.

Recommendation: Revise as follows:

(D) Separately Derived Systems. Metal water piping systems and structural metal that is interconnected to form a building frame shall be bonded to separately derived systems in accordance with (D)(1) through (D)(3).

(1) Metal Water Piping System(s). The grounded conductor of each separately derived system shall be bonded to the nearest available point of the metal water piping system(s) in the area served by each separately derived system. This connection shall be made at the same point on the separately derived system where the grounding electrode conductor is connected. Each bonding jumper shall be sized in accordance with Table 250.66 based on the largest ungrounded conductor of the separately derived system.

~~Exception No. 1: A separate bonding jumper to the metal water piping system shall not be required where the metal water piping system is used as the grounding electrode for the separately derived system.~~

Exception No. 2: A separate water piping bonding jumper shall not be required where the meal frame of a building or structure is used as the grounding electrode for a separately derived system and is bonded to the meal water piping in the area served by the separately derived system.

Substantiation: The exception No. 1 added in the 2005 code cycle should be removed from the NEC. The intent of requiring the bonding to the water pipe in the area served by the transformer was to ensure that the water piping system remained bonded to the electrical system throughout large buildings. It is critical that the entire water piping system remain bonded and electrically continuous throughout the entire building so that accidental contact of an energized conductor or equipment to the water piping system will cause the activation of an overcurrent device. Failure to provide this protection can result in portions of water piping system to become an energized conductor. This is all the more important to safeguard against now that more and more pieces of equipment connected to the water piping system are electrically energized.

Water piping systems that are bonded to the electrical system at the water main when the water main is used as the grounding electrode are subject to potential problems as the water piping system spreads throughout the building. Expansion fittings are installed and the electrical continuity of the water piping system can be lost. Parts of the water piping system may be replaced with nonconductive material during the life of the building causing the electrical continuity of the water piping system to be lost. Parts of the water piping system are removed for maintenance during the life of the building. If an electrical connection were made to the water piping system on the opposite side of the removed piece, from the watermain, then the maintenance person could be exposed to electrical shock from the now energized portion of the water piping system.

480V/208V transformers are equipment that is installed commonly throughout large structures. They are separately derived systems and are installed in numerous locations and spread out through the building. Requiring a bonding jumper to the water pipe in the area supplied by these separately derived systems, regardless of the means of obtaining a grounding electrode, is an effective means of ensuring the water piping system remains bonded throughout the building.

This bonding jumper was never intended to serve as a grounding electrode conductor. The grounding electrode is a necessary and important part of the safe electrical installation as is this bonding jumper. Both conductors need to be installed to ensure a safe electrical installation and neither conductor should be considered to be doing the job of the other or negate each other.

Panel Meeting Action: Accept in Principle

Revise the recommended text for 250.104(D)(1,) Exception No. 1 to read as follows:

Exception No. 1: A separate bonding jumper to the metal water piping system shall not be required where the metal water piping system is used as the grounding electrode for the separately derived system <u>and the water piping system is in the area served.</u>

Panel Statement: The panel does not accept the deletion of this exception. The intent is to not require both a grounding electrode conductor under 250.30 and a bonding jumper under 250.104 from the separately derived system to the same point on the metallic water pipe.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-246 Log #1414 NEC-P05 **Final Action: Accept**
(250.106)

Submitter: Technical Committee on Lightning Protection,

Recommendation: Delete the word “spacing” in Fine Print Note No. 1 and replace it with “sideflash distance”.

Revised FPN will read as follows:

FPN No. 1: See 250.60 for use of air terminals. For further information, see NFPA 780-2004, Standard for the Installation of Lightning Protection Systems, which contains detailed information on grounding, bonding, and ~~spacing~~ <u>sideflash distance</u> from lightning protection systems.

Substantiation: NFPA 780 shows the method for calculating sideflash distance based on factors related to the design of the lightning protection system. Grounded metallic bodies within the sideflash distance are interconnected with the system, and those outside the calculated distance are not. The term “spacing” misleads the user, who may believe that a grounded system could be separated from the lightning protection system with no connection, when in reality all grounded systems must be interconnected at grade level minimum. The evaluation of sideflash distance then occurs at roof level, and at intermediate height levels. Sections 4.19 to 4.21 of NFPA 780 cover this method of determination.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-247 Log #1415 NEC-P05 **Final Action: Accept in Part**
(250.106)

Submitter: Technical Committee on Lightning Protection,

Recommendation: Revise Fine Print Note No. 2 as follows to change from the “typical” spacing of 6 feet to the calculated sideflash distance as required by NFPA 780:

FPN No. 2: Metal raceways, enclosures, frames, and other non-current-carrying metal parts of electric equipment installed on a building equipped with a lightning protection system may require bonding or spacing from the lightning protection conductors in accordance with NFPA 780-2004, Standard for the Installation of Lightning Protection Systems. ~~Separation from lightning~~

~~protection conductors is typically 1.8 m (6 ft) through air or 900 mm (3 ft) through dense materials such as concrete, brick, or wood.~~

Bonding is required if the grounded metal object is within the sideflash distance of the lightning protection system calculated at that location. Sideflash distance is calculated based on the vertical distance from the nearest bond, the number of proximate lightning protection down conductors, and the material the flashover must travel through. See NFPA 780 Sections 4.19 through 4.21 for the method of calculation.

Substantiation: Grounded metal bodies must be evaluated for additional interconnections at intermediate vertical heights. Ungrounded or floating metal bodies must be evaluated based on their ability to provide a short circuit path from the lightning protection system to another grounded building system. The indication of a "typical" distance is misleading, since evaluation of the factors involved can led to a sideflash potential distance as small as 1 foot or larger than 10 feet depending on the various system design factors. This proposal clarifies the current requirements of NFPA 780.

Panel Meeting Action: Accept in Part

Revise Fine Print Note No. 2 as follows to change from the "typical" spacing of 6 feet to the calculated sideflash distance as required by NFPA 780:

FPN No. 2: Metal raceways, enclosures, frames, and other non-current-carrying metal parts of electric equipment installed on a building equipped with a lightning protection system may require bonding or spacing from the lightning protection conductors in accordance with NFPA 780-2004, Standard for the Installation of Lightning Protection Systems. ~~Separation from lightning protection conductors is typically 1.8 m (6 ft) through air or 900 mm (3 ft) through dense materials such as concrete, brick, or wood.~~

Panel Statement: The panel agrees with the substantiation to delete the last sentence of the FPN No. 2. The panel does not accept the additional wording of the FPN, as it includes mandatory text and violates the NEC Style Manual.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

MELLO, C.: The panel action and the final language for FPN 2 do not match. The panel action was to delete the typical distance of 6 feet and replace this with "calculated sideflash distance" per NFPA 780. The only actual change that occurred in the revised text was to delete the last sentence to remove the "typical distance" reference but there was no replacement with a "calculated side flash distance". This leaves the user no information at all instead of what could be incorrect information if the typical distance was used without qualification by true calculations. The following is suggested language to resolve this apparent conflict:

250.106

FPN No. 2: Metal raceways, enclosures, frames, and other non–current-carrying metal parts of electric equipment installed on a building equipped with a lightning protection system may require bonding to or spacing from the lightning protection conductors based on the calculated sideflash distances in accordance with NFPA 780-2004, Standard for the Installation of Lightning Protection Systems. ~~Separation from lightning protection conductors is typically 1.8 m (6 ft) through air or 900 mm (3 ft) through dense materials such as concrete, brick, or wood.~~

5-247a Log #CP507 NEC-P05 **Final Action: Accept**
(250.112)

Submitter: Code-Making Panel 5,

Recommendation: Revise only the mentioned sections of Section 250.112 to read as follows:

250.112 Fastened in Place or Connected by Permanent Wiring Methods (Fixed) — Specific. Except as permitted in 250.112(I), ~~E~~ e xposed, non–current-carrying metal parts of the kinds of equipment described in 250.112(A) through (K), and non–current-carrying metal parts of equipment and enclosures described in 250.112(L) and (M), shall be ~~grounded~~ connected to the equipment grounding conductor regardless of voltage. … (K) Skid Mounted Equipment. Permanently mounted electrical equipment and skids shall be ~~grounded~~ connected to the ~~with an~~ equipment grounding ~~bonding~~ conductor ~~jumper~~ sized as required by 250.122. …

(M) Metal Well Casings Where a submersible pump is used in a metal well casing, the well casing shall be ~~bonded~~ connected to the pump circuit equipment grounding conductor. This proposal only modifies these sections within 250.112.

Substantiation: The editorial revisions to the TCC Task Group on Grounding and Bonding proposals are incorporated into the identified sections to be consistent with the work of CMP-5 at the Report on Proposal Meeting for the 2008 NEC. The panel incorporated the text from Proposal 5-248 and the Task Group work as proposed in Proposal 5-77 and 5-218.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

(250.112)

Submitter: Noel Williams, Noel Williams Consulting

Recommendation: Revise 250.112 to read as follows:

" Except as permitted in 250.112(I), ~~E~~ e xposed, non-current carrying metal parts..." (remainder to be unchanged).

Substantiation: The current rule literally requires grounding of parts described in 250.112(I) "regardless of voltage," even though the system grounding requirements of Parts II and VIII are applied based on voltage. 250.112(I) exempts some things from grounding, but this is not clear in the main rule. Wording is from 250.86.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-249 Log #1041 NEC-P05 **Final Action: Reject**
(250.112(F))

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Revise as follows:

Electric equipment in ~~commercial~~ garages, theaters, and motion picture studios ~~except pendant lampholder supplied by circuits not over 150 volts to ground.~~

Substantiation: Metal parts of pendant lampholders over 150 volts to ground are not exempt from grounding, therefore, it can be inferred a shock hazard may exist which also exists for 120 volt systems. 250.114(3)(e) and (4)(e) require portable cord and plug connected handlamps to be grounded. A pendant supported lampholder is also subject to being energized.

Panel Meeting Action: Reject

Panel Statement: There was no substantiation provided to delete the term "commercial," which then imposes this rule on all garages, which is undefined and could include residential garages. The exception is specifically for pendant style lampholders, and no technical substantiation was provided for removing the exemption.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-250 Log #1190 NEC-P05 **Final Action: Accept in Principle**
(250.112(G))

Submitter: Stephen G. Kieffer, Kieffer & Co., Inc. / Rep. International Sign Association

Recommendation: Revise section to read as follows:

250.112 Fastened in Place or Connected by Permanent Wiring Methods (Fixed) —Specific.

(G) Electric Signs. Electric signs, outline lighting, and associated equipment ~~as provided in Article 600~~ . See 600.7 for supplemental requirements.

Substantiation: As defined in 90.3 Code Arrangement, Article 600, Section 600.7 supplements or modifies the general rules of Article 250. 600.7 does not contain all of the grounding requirements for signs and outline lighting systems. Therefore, it is not appropriate to imply that Article 600 is the source of all grounding and bonding requirements for this equipment.

Panel Meeting Action: Accept in Principle

Revise section to read as follows:

250.112 Fastened in Place or Connected by Permanent Wiring Methods (Fixed) —Specific.

(G) Electric Signs. Electric signs, outline lighting, and associated equipment as provided in ~~Article 600~~ 600.7.

Panel Statement: Editorially corrected to meet the NEC style Manual.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-251 Log #1185 NEC-P05 **Final Action: Accept in Principle**
(250.112(I))

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Revise as follows:

~~POWER-LIMITED~~ REMOTE-CONTROL, SIGNALING, AND FIRE ALARM CIRCUITS . Equipment supplied by Class I ~~power-limited~~ circuits operating at over 50 volts, nominal, shall be grounded. Equipment powered by Class I power-limited circuits, Class 2 and Class 3 remote control and signaling, and by fire alarm circuits shall be grounded where the system is grounded ~~grounding is~~ as required or permitted by Part II or Part VIII of this article.

Substantiation: Equipment supplied by an unlimited power Class I circuit from an ungrounded 480 volt or 600 volt 3-phase 3-wire system does not have to be grounded, per this section. Other equipment supplied by such systems is generally required to be grounded. 250.174 requires instruments, meters, and relays (which may be connected to Class I circuits) to be grounded.

Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 5-252.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-252 Log #3339 NEC-P05 **Final Action: Accept**
(250.112(I))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc. / Rep. Massachusetts Electrical Code Advisory Committee
Recommendation: Revise this paragraph to read as follows:
(I) Remote Control, Signaling, and Fire Alarm Circuits. Equipment supplied by Class 1 circuits shall be grounded unless operating at less than 50 volts. Equipment supplied by Class 1 power-limited circuits, Class 2, and Class 3 remote control and signaling circuits, and by fire alarm circuits, shall be grounded where system grounding is required by Part II or Part VIII of this article.
Substantiation: The literal text of the current section allows an ungrounded 480-volt (or 600-volt) Class 1 control circuit to omit equipment grounding because the control system need not be system-grounded, and therefore need not carry an equipment grounding conductor. Remember also that 250.21(3) recognizes omission of system grounding on some control circuits that operate at hazardous voltages. This proposal requires equipment grounding in such cases. The wording in this proposal responds to the CMP 5 reservation in the 2005 comment period with respect to somewhat different wording that would have required Class 1 control circuits to incorporate equipment grounding even if operating below 50 volts.
Panel Meeting Action: Accept
Number Eligible to Vote: 15

Recommendation: Revise this section as follows:
250.118 Types of Equipment Grounding Conductors. The equipment grounding conductor run with or enclosing the circuit conductors shall be one or more or a combination of the following:
FPN No. 1: For effective ground-fault current path, see 250.2 Definition.
(1) A copper, aluminum, or copper-clad aluminum conductor. This conductor shall be solid or stranded; insulated, covered, or bare; and in the form of a wire or a busbar of any shape.
(2) Rigid metal conduit.
(3) Intermediate metal conduit.
(4) Electrical metallic tubing.
(5) Listed flexible metal conduit meeting all the following conditions:
a. The conduit is terminated in listed fittings ~~listed for grounding~~ .
b. The circuit conductors contained in the conduit are protected by overcurrent devices rated at 20 amperes or less.
c. The combined length of flexible metal conduit and flexible metallic tubing and liquidtight flexible metal conduit in the same ground return path does not exceed 1.8 m (6 ft).
d. Where used to connect equipment where flexibility is necessary after installation, an equipment grounding conductor shall be installed.
(6) Listed liquidtight flexible metal conduit meeting all the following conditions:
a. The conduit is terminated in listed fittings ~~listed for grounding~~ .
b. For metric designators 12 through 16 (trade sizes through ½), the circuit conductors contained in the conduit are protected by overcurrent devices rated at 20 amperes or less.
c. For metric designators 21 through 35 (trade sizes ¾ through 1¼), the circuit conductors contained in the conduit are protected by overcurrent devices rated not more than 60 amperes and there is no flexible metal conduit, flexible metallic tubing, or liquidtight flexible metal conduit in trade sizes metric designators 12 through 16 (trade sizes through ½) in the grounding path.
d. The combined length of flexible metal conduit and flexible metallic tubing and liquidtight flexible metal conduit in the same ground return path does not exceed 1.8 m (6 ft).
e. Where used to connect equipment where flexibility is necessary after installation, an equipment grounding conductor shall be installed.
(7) Flexible metallic tubing where the tubing is terminated in listed fittings ~~listed for grounding~~ and meeting the following conditions:
a. The circuit conductors contained in the tubing are protected by overcurrent devices rated at 20 amperes or less.
b. The combined length of flexible metal conduit and flexible metallic tubing and liquidtight flexible metal conduit in the same ground return path does not exceed 1.8 m (6 ft).
(8) Armor of Type AC cable as provided in 320.108.
(9) The copper sheath of mineral-insulated, metal-sheathed cable.
(10) Type MC cable where listed and identified for grounding in accordance with the following:
a. The combined metallic sheath and grounding conductor of interlocked metal tape–type MC cable
b. The metallic sheath or the combined metallic sheath and grounding conductors of the smooth or corrugated tube type MC cable

(11) Cable trays as permitted in 392.3(C) and 392.7.
(12) Cablebus framework as permitted in 370.3.
(13) Other listed electrically continuous metal raceways and listed auxiliary gutters.
(14) Surface metal raceways listed for grounding.

Substantiation: The editorial revisions to the TCC Task Group on Grounding and Bonding proposals are incorporated into the identified sections to be consistent with the work of CMP-5 at the Report on Proposal Meeting for the 2008 NEC. The revisions identified above were added for clarity. Revisions were also made to restore text to the 2005 NEC where appropriate. This proposal correlates with Proposal 5-254.

Ballot Results: Affirmative: 15

5-254 Log #609 NEC-P05 **Final Action: Accept in Principle**
(250.118)

Submitter: Michael J. Johnston, Plano, TX

Recommendation: Revise Section 250.118 as follows:

250.118 Types of Equipment Grounding Conductors. The equipment grounding conductor shall provide an effective ground-fault current path and a grounding connection for connected equipment. The wiring methods identified in 250.118 shall be used with fittings that are suitable for use in the effective ground-fault current path.

FPN No. 1: Equipment grounding conductor(s) serve as a means of grounding equipment and also performs bonding in addition to functioning as an effective ground-fault current path. See 250.4(A)(5) and 250.4(B)(4).

FPN No. 2: Listed fittings identified for use with the wiring methods identified in 250.118 must be suitable for grounding and suitable for use in the effective ground-fault current path. Fittings listed for grounding are also listed for bonding.

The equipment grounding conductor run with or enclosing the circuit conductors shall be one or more or a combination of the following wire-type conductors, busbars, or any of the wiring methods:

(1) A copper, aluminum, or copper-clad aluminum conductor. This conductor shall be solid or stranded; insulated, covered, or bare; and in the form of a wire or a busbar of any shape.
(2) Rigid metal conduit.
(3) Intermediate metal conduit.
(4) Electrical metallic tubing.
(5) Listed flexible metal conduit meeting all the following conditions:
(a) The conduit is terminated in fittings listed for bonding and grounding.
(b) The circuit conductors contained in the conduit are protected by overcurrent devices rated at 20 amperes or less.
(c) The combined length of flexible metal conduit and flexible metallic tubing and liquidtight flexible metal conduit in the same effective ground -fault current ~~return~~ path does not exceed 1.8 m (6 ft).
(d) Where used to connect equipment where flexibility is necessary after installation, an equipment grounding conductor shall be installed.
(6) Listed liquidtight flexible metal conduit meeting all the following conditions:
(a) The conduit is terminated in fittings listed for bonding and grounding.
(b) For metric designators 12 through 16 (trade sizes 3/8 through 1/2), the circuit conductors contained in the conduit are protected by overcurrent devices rated at 20 amperes or less.
(c) For metric designators 21 through 35 (trade sizes 3/4 through 1-1/4), the circuit conductors contained in the conduit are protected by overcurrent devices rated not more than 60 amperes and there is no flexible metal conduit, flexible metallic tubing, or liquidtight flexible metal conduit in trade sizes metric designators 12 through 16 (trade sizes 3/8 through 1/2) in the effective ground-fault current ~~grounding~~ path.
(d) The combined length of flexible metal conduit and flexible metallic tubing and liquidtight flexible metal conduit in the same effective ground -fault current ~~return~~ path does not exceed 1.8 m (6 ft).
(e) Where used to connect equipment where flexibility is necessary after installation, an equipment grounding conductor shall be installed.
(7) Flexible metallic tubing where the tubing is terminated in fittings listed for bonding and grounding and meets ~~ings~~ all of the following conditions:
(a) The circuit conductors contained in the tubing are protected by overcurrent devices rated at 20 amperes or less.
(b) The combined length of flexible metal conduit and flexible metallic tubing and liquidtight flexible metal conduit in the same effective ground -fault current ~~return~~ path does not exceed 1.8 m (6 ft).
(8) Armor of Type AC cable as provided in 320.108.
(9) The copper sheath of mineral-insualted, metal-sheathed cable.
(10) Type MC cable where listed and identified for grounding and bonding in accordance with the following:
(a) The combined metallic sheath and equipment grounding conductor (s) of interlocked metal tape–type MC cable.
(b) The metallic sheath or the combined metallic sheath and equipment grounding conductor (s) of the smooth or corrugated tube type MC cable.
(11) Cable trays as permitted in 392.3(C) and 392.7.
(12) Cablebus framework as permitted in 370.3.
(13) Other listed electrically continuous metal raceways and listed auxiliary gutters.
(14) Surface metal raceways listed for bonding and grounding.

Substantiation: This proposal is a continuation of a larger effort being extended to use the correct terms related to grounding and bonding in Code rules. The proposed revisions to this section address two items primarily. First, the new first paragraph provides the user with clear information about the functionality of the equipment grounding conductor. This conductor serves as a means of grounding equipment and equally important, it also serves as an effective ground-fault current path. This should be stated within this section and correlate with 250.4. The proposed fine print notes indicate that the equipment grounding conductor also performs bonding and functions as an effective ground-fault current path because that is what it does in addition to grounding.

The second item addressed in this proposal has to do with the fittings used with any of the wiring methods identified in this section. This section previously required fittings that are listed for grounding to be used with these wiring methods that are recognized as equipment grounding conductors. The problem here is that the fittings (connectors and couplings) are performing bonding functions. The connectors connect (bond) the raceways to enclosures and the couplings connect (bond) conduit raceways and tubing together. The more appropriate term to use in this section where the term "listed for grounding" is used is "listed for bonding" because bonding is really what is being accomplished by the fittings. This is also how they are evaluated by testing laboratories. See attachments 1 and 2 that I have provided. The proposed revision changes the term "listed for grounding" to listed for bonding because both functions are inherent to their use.

It is recognized that product standards and guide card directory information also currently indicate that such fittings are listed for grounding. The reality here is that these publications also need to be revised to correctly indicate how the fittings are listed. Bonding is basically the function of connecting things together, which is what conduit and tubing fittings do. Grounding is connecting something to the earth. If the conduit or tubing is grounded at the source or service by connection to a grounding electrode, as the fittings are installed, the function of bonding and grounding is ongoing.

Proposals will also be presented to the UL Electrical Council at the 2006 May meeting to revise the guide care information and standards as appropriate to reflect how fittings are actually listed and evaluated. The attachments I have provided are an illustration and photo of how the fittings are tested for their ability to establish an effective connection between the conduit or tubing and an enclosure (this is bonding). Note that there is no connection to ground in the test model illustration, yet the guide card indicates that the fittings are listed for grounding. The Code should indicate that they are listed for both functions. That is what they do.

The Code should include language that is clear and means what it implies within the requirement.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Proposals Proposal 5-253a (Log CP509) and Proposal 5-77

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-255 Log #3394 NEC-P05 **Final Action: Reject**
(250.118(10)b. (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Recommendation: Insert a new "b.", relettering the existing "b." as "c." as follows:

b. The combined metallic armor and enclosed bonding conductor of interlocked metal tape-type MC cable where specifically listed for equipment grounding without an enclosed equipment grounding conductor.

Substantiation: This proposal supplies the missing NEC authorization for full recognition of a new generation of interlocking armor Type MC cable with an enclosed bonding conductor that meets all 250.122 sizing requirements. Although there has been considerable discussion as to whether a change in the NEC is necessary, I have consistently believed that it was required, and this proposal will provide the required public review for this cycle.

Panel Meeting Action: Reject

Panel Statement: The panel concludes the present text in 250.118(10) and the additional requirements stated in 250.118(10)(a) cover the product identified by the submitter. The metal armor with the internal bare grounding conductor of the combined metal sheath and grounding conductor on interlocked metal tape type MC cable listed and identified for use as an equipment grounding conductor means the armor is suitable as an equipment grounding conductor. Any additional insulation wire type equipment grounding conductor contained within the cable assembly is an additional equipment grounding conductor.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-256 Log #3021 NEC-P05 **Final Action: Reject**
(250.118(2) Exception (New))

Submitter: James Conrad, Tyco Thermal Control
Recommendation: Add exception to 250.118(2) Rigid metal conduit.
Exception: When rigid metal conduit is used to enclose circuit conductors that are a part of an Electrical Circuit Protective System (also known as fire-rated cables), the equipment grounding conductor shall be installed in the raceway. The type of wire used as the equipment grounding conductor is identified in the Electrical Circuit Protective System write-up and should only be used for that specific system.
Substantiation: Electrical Circuit Protective Systems are used to protect critical circuits from fires in Articles 695, 700 and 760. Some systems use a fire-rated cable installed in a steel raceway to achieve a fire-rated system. Although the steel raceway maintains excellent integrity during the fire, the grounding aspect of the conduit is lost or minimized at the couplings and fittings because of oxidation and thermal expansion, therefore, the conduit should not be used as the sole equipment grounding conductor. A separate ground wire, sized per Table 250.122, should be installed in each conduit. The type(s) of wire, such as RHH, RHW, etc., used as the ground is identified in each system write-up and should be the only ground wire permitted in the conduit of that systems. See FHIT Guide Information in the UL Fire Resistive Directory for more information on Electrical Circuit Protective Systems and grounding.
Panel Meeting Action: Reject
Panel Statement: Studies show that all steel conduit is a reliable equipment grounding conductor in high temperature situations. UL white book does not require a wire type equipment grounding conductor. The technical substantiation does not support the proposal.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
BRENDER, D.: Fire-rated cables are related to life safety and installation of an equipment grounding conductor would enhance safety. Conduit alone is not a reliable grounding path.

5-257 Log #3020 NEC-P05 **Final Action: Reject**
(250.118(3))

Submitter: James Conrad, Tyco Thermal Control
Recommendation: Add exception to 250.118(3) Intermediate metal conduit.
Exception: When intermediate metal conduit is used to enclose circuit conductors that are a part of an Electrical Circuit Protective System (also known as fire-rated cables), the equipment grounding conductor shall be installed in the raceway. The type of wire used as the equipment grounding conductor is identified in the Electrical Circuit Protective System write-up and should only be used for that specific system.
Substantiation: Electrical Circuit Protective Systems are used to protect critical circuits from fires in Articles 695, 700 and 760. Some systems use a fire-rated cable installed in a steel raceway to achieve a fire-rated system. Although the steel raceway maintains excellent integrity during the fire, the grounding aspect of the conduit is lost or minimized at the couplings and fittings because of oxidation and thermal expansion, therefore, the conduit should not be used as the sole equipment grounding conductor. A separate ground wire, sized per Table 250.122, should be installed in each conduit. The type(s) of wire, such as RHH, RHW, etc., used as the ground is identified in each system write-up and should be the only ground wire permitted in the conduit of that systems. See FHIT Guide Information in the UL Fire Resistive Directory for more information on Electrical Circuit Protective Systems and grounding.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 5-256.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
BRENDER, D.: See my negative vote on proposal 5-256.

5-258 Log #3019 NEC-P05 **Final Action: Reject**
(250.118(4) Exception (New))

Submitter: James Conrad, Tyco Thermal Control
Recommendation: Add exception to 250.118(4) Electrical metallic tubing.
Exception: When EMT is used to enclose circuit conductors that are part of an Electrical Circuit Protective System (also known as fire-rated cables), the equipment grounding conductor shall be installed in the raceway. The type of wire used as the equipment grounding conductor is identified in the Electrical Circuit Protective System write-up and should only be used for that specific system.
Substantiation: Electrical Circuit Protective Systems are used to protect critical circuits from fires in Articles 695, 700 and 760. Some systems use a fire-rated cable installed in a steel raceway to achieve a fire-rated system. Although the steel raceway maintains excellent integrity during the fire, the grounding aspect of the conduit is lost or minimized at the couplings and fittings because of oxidation and thermal expansion, therefore, the conduit should not be used as the sole equipment grounding conductor. A separate ground wire, sized per Table 250.122, should be installed in each conduit. The type(s) of wire, such as RHH, RHW etc., used as the ground is identified in each system write-up and should be the only ground wire permitted in the conduit of that system. See FHIT Guide Information in the UL Fire Resistive Directory for more information on Electrical Circuit Protective Systems and grounding.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 5-256.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
BRENDER, D.: See my negative vote on proposal 5-256. EMT is a particularly unreliable grounding path as connections involving set screws are sometimes not tightened correctly, or can grow loose due to vibration. Corrosion at joints can also be an issue affecting reliability.

5-259 Log #2697 NEC-P05 **Final Action: Reject**
(250.118(5), FPN (New))

Submitter: Dorothy Kellogg, American Chemistry Council
Recommendation: Revise text of section as follows:
250.118(5)
Add a FPN to read as follows:
FPN. For the purposes of this section a need for flexibility does not include adjustment or vibration.
Substantiation: The revision of this section has created confusion. Flexibility can be interpreted as including vibration. Flexible conduit is used for movement “while in use” and also for vibration or infrequent adjustment. Flexible conduit is also used in many applications to reduce vibration from being applied to the raceway system. Adding this FPN will clarify the intent of the section.
Proposals were submitted for sections 250.118(5), 250.118(6), 348.60, and 350.60.
Panel Meeting Action: Reject
Panel Statement: The proposal does not add clarity or improve the requirements of this section. The panel acted in the 2005 cycle to clarify what was intended by flexibility in this section. See panel actions and statements on Proposals 5-216, 5-217 and 5-218 in the 2004 NEC Report on Proposals. By specifically addressing the requirement for flexibility for installation, the section does not exclude installations where flexible metal conduit is installed to address the conditions pointed out by the submitter in the proposal.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-260 Log #2698 NEC-P05 **Final Action: Reject**
(250.118(6))

Submitter: Dorothy Kellogg, American Chemistry Council
Recommendation: Revise text of section as follows:
250.118(6)
Add a FPN to read as follows:
FPN. For the purposes of this section a need for flexibility does not include adjustment or vibration.
Substantiation: The revision of this section has created confusion. Flexibility can be interpreted as including vibration. Flexible conduit is used for movement “while in use” and also for vibration or infrequent adjustment. Flexible conduit is also used in many applications to reduce vibration from being applied to the raceway system. Adding this FPN will clarify the intent of the section.
Proposals were submitted for sections 250.118(5), 250.118(6), 348.60, and 350.60.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 5-259.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-261 Log #2147 NEC-P05 **Final Action: Reject**
(250.119)

Submitter: Roger Hewitt, Puget Sound Electrical Apprenticeship / Rep. IBEW LU #46
Recommendation: Delete existing text from 250.119 and replace with:
Equipment grounding conductors shall be identified in accordance with 310.12(B).
Substantiation: Multiple sections of the NEC must now be consulted to ensure proper conductor identification. Combining all conductor identification requirements in one section in Article 310 is logical.

Panel Meeting Action: Reject
Panel Statement: According the scope of Article 250 specific requirements of grounding conductors are covered in this article. 250.119 is the appropriate location for this requirement. The proposal removes the equipment grounding conductor identification requirements without substantiation and creates a circular loop in the Code that includes no rules. Section 310.12 currently does not include any identification requirements for equipment grounding conductors, but refers to Section 250.119 for those requirements.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-262 Log #2555 NEC-P05 **Final Action: Reject**
(250.119)

Submitter: Jeff Holmes, Saint Charles, MO
Recommendation: Revise text to read as follows:
250.119 Identification of Equipment Grounding Conductors.
Unless required elsewhere in this Code, equipment grounding conductors shall be permitted to be bare, covered, or insulated. Conductors with insulation or individual covering that is green, green with one or more yellow stripes, or otherwise identified as permitted by this section shall not be used for ungrounded or grounded circuit conductors.
(A) Conductors 6 AWG and Smaller.
Individually covered or insulated equipment grounding conductors shall have a continuous outer finish that is either green or green with one or more yellow stripes except as permitted in this section.
(B) Equipment grounding conductors larger than 6 AWG shall comply with 250.119(B)(1) and (B)(2).
(1) An insulated or covered conductor larger than 6 AWG shall be permitted, at the time of installation, to be permanently identified as an equipment grounding conductor at each end and at every point where the conductor is accessible.
Exception: Conductors larger than 6 AWG shall not be required to be marked in conduit bodies that contain no splices or unused hubs.
(2) Identification shall encircle the conductor and shall be accomplished by one of the following:
a. Stripping the insulation or covering from the entire exposed length
b. Coloring the exposed insulation or covering green
c. Marking the exposed insulation or covering with green tape or green adhesive labels
(C) Multiconductor Cable. Where the conditions of maintenance and supervision ensure that only qualified persons service the installation, one or more insulated conductors in a a multiconductor cable, at the time of installation, shall be permitted to be permanently identified as equipment grounding conductors at each end and at every point where the conductors are accessible by one of the following means:
(1) Stripping the insulation from the entire exposed length
(2) Coloring the exposed insulation green
(3) Marking the exposed insulation with green tape or green adhesive labels
(D) Flexible Cord. An uninsulated equipment grounding conductor shall be permitted, but, if individually covered, the covering shall have a continuous outer finish that is either green or green with one or more yellow stripes.
Substantiation: In areas that I have worked in, I still see 6 and 8 AWG equipment grounding conductors being installed with black insulation and then identified with green tape. When this section is taught to the students, it is also confusing, since 200.6 is much more specific on the identification of the grounded conductor.
The rewording of this Article does not attempt to change the intent of the Article, but, make the Article “user friendly”, so that the Article is more consistent with other code articles and that the standard can be met in all installations.
Panel Meeting Action: Reject
Panel Statement: The added text in proposed 250.119(A) is redundant to the text in the main body of the section which requires all equipment grounding conductors of any size that are covered or insulated to have the indicated identification.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-263 Log #2592 NEC-P05 **Final Action: Reject**
(250.119)

Submitter: Jebediah Novak, Cedar Rapids Electrical JATC
Recommendation: Add the following to the end of the existing text.
Bare copper conductors shall not be permitted for use in aluminum raceways.
Substantiation: Due to the galvanic action between these two dissimilar metals, when a bare copper conductor is installed in an aluminum raceway, the raceway corrodes and deteriorates very quickly. 110.14 addresses dissimilar metals in terminations and splices, this will only expand on that same theory.
Panel Meeting Action: Reject
Panel Statement: Insufficient technical substantiation was submitted. Section 250.119 deals with the identification of equipment grounding conductors and the issue raised by the submitter is an installation issue not one of identification.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-264 Log #878 NEC-P05 **Final Action: Reject**
(250.119 Exception (New))

Submitter: Noel Williams, Noel Williams Consulting
Recommendation: Add the following exception before (A):
Exception: Where equipment is connected by multiconductor cable and equipment grounding conductors are not required, the solid color green may be used for other than grounding conductors.
Substantiation: This is intended to correct an oversight in the 2005 NEC that effectively outlawed a standard industry-wide practice in which the color green is used for ungrounded fan control in Class 2 thermostat circuits. Most such circuits (and similar circuits using communications cables) are not required to be grounded.
Panel Meeting Action: Reject
Panel Statement: The rewording of the proposed exception is too broad. A cable that is installed to a piece of equipment not required to be grounded, may remain in place for many years. If equipment is replaced that requires grounding a hazard may result from improper wiring.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
DOBROWSKY, P.: The proposal should be accepted. The submitter is correct that an insulated conductor that is colored green should be able to be used for other purposes if providing a fault current path is not necessary. This is similar in concept to the permitted use of a white conductor in 200.7(B).

5-265 Log #2553 NEC-P05 **Final Action: Reject**
(250.119 Exception (New))

Submitter: Tom Baker, Puget Sound Electrical Training
Recommendation: Revise text to read as follows:
Unless required elsewhere in this Code, equipment grounding conductors shall be permitted to be bare, covered, or insulated. Individually covered or insulated equipment grounding conductors shall have a continuous outer finish that is either green or green with one or more yellow stripes except as permitted in this section. Conductors with insulation or individual covering that is green, green with one or more yellow stripes, or otherwise identified as permitted by this section shall not be used for ungrounded or grounded circuit conductors.
Exception: A green or green with yellow stripe conductor may be used for other than equipment grounding purposes for traffic signals, when the conditions of maintenance and supervision ensure that only qualified persons service the installation, and a listed traffic signal cable is used.
Substantiation: The 2005 NEC restricted a green or green with a yellow stripe conductor for use only as the equipment grounding conductor. Traffic signal heads commonly use a 5 conductor cable, where black is a spare, white is the grounded conductor, red supplies the red signal, yellow supplies the yellow signal and green supplies the green signal. There are thousands of traffic signals installed with the green conductor supplying the green signal.
There is a UL Listing for Traffic Signal Cable, Classified in Accordance with IMSA (International Municipal Signal Association) Specifications (XNTL), which states “this cable employs a color-code scheme that permits a conductor with green insulation to be used for other than grounding purposes”. This proposal would continue to allow the use of a listed traffic signal cable where installed and maintained by qualified persons.
Panel Meeting Action: Reject
Panel Statement: Load side wiring from a traffic light controller is not covered by the NEC. Load side wiring to signal, push button, sensors and inter system conductors are covered by other standards such as standards developed by IMSA.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 12 Negative: 3
Explanation of Negative:
BRETT, JR., M.: I agree with the other explanations of negative votes.
DOBROWSKY, P.: The proposal should be accepted. The panel statement is not necessarily correct. Traffic signals are also used on private property and are covered by the NEC.
STEINMAN, G.: The proposal reflects safer wiring practice regarding traffic signals. Only qualified persons should be persons handling the wiring in a signal head. The IMSA classifications are generally accepted in the industry.

5-266 Log #454 NEC-P05 **Final Action: Accept**
(250.119(A)(2) b. and c.)

Submitter: W. Creighton Schwan, Hayward, CA
Recommendation: Revise b. to read:
Coloring the ~~exposed~~ insulation or covering green at the termination .
Revise c. to read:
Marking the ~~exposed~~ insulation or covering with green tape or green adhesive labels at the termination .

Substantiation: Confusion exists because on the one hand there is the requirement that the identification encircle the conductor, while on the other hand the entire exposed insulation or covering must be colored green. This change should have been made when the "encircle" proposal was accepted for the 2002 NEC. This change will coordinate with the identification requirements for the grounded conductor in 200.6(B).

A few turns of green tape near the termination of the conductor is adequate, and represents common practice in the field.

Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-267 Log #2416 NEC-P05 **Final Action: Reject**
(250.119(D) (New))

Submitter: Dan Frohberg, Northeast Community College
Recommendation: Add new text to read:

(D) Where grounding conductors of different systems are installed in the same raceway, cable, box, auxiliary gutter, or other type of enclosure, each grounding conductor shall be identified by system. Identification that distinguishes each system grounding conductor shall be permitted by one of the following means:

(1) One system grounding conductor shall have an outer covering conforming to 250.119

(2) The other grounding conductor of other systems shall have a different outer covering conforming to 250.119

This means of identification shall be permanently posted at each branch circuit panelboard.

Substantiation: We have as a matter of code changes separated grounded conductors of different systems and posted those markings at each panelboard. The requirement for distinguishing grounding conductors should be done to help facilitate the opening of overcurrent devices for those particular systems within a building.

Panel Meeting Action: Reject
Panel Statement: Grounded conductors of different systems need to be clearly identified so the current under normal conditions returns to the proper source, whereas the equipment grounding systems do not require such separation.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-268 Log #3170 NEC-P05 **Final Action: Reject**
(250.120)

Submitter: Karl Williamson, Boulder, CO
Recommendation: NEC should specify allowed wiring methods specific for separately run equipment grounding conductors.
Substantiation: 250.130(C) and 250.134(B) Ex. 1 and 2 allow the equipment grounding conductor (EGC) to be run separately from the circuit conductors under certain conditions. But I don't see guidance for the permitted wiring methods for this separately run conductor. 250.120 doesn't really help, except to say that aluminum must be isolated from things like earth, and that if smaller than 6 AWG, the EGC must be protected from physical damage. 250.118 applies only when the EGC is run WITH the circuit conductors, and 250.120(A) only when within some other wiring method. One can infer that an EGC can be a wire from 250.122(A), and it also gives the wires minimum required size. (I am presuming a larger size is not required even though there will be more impedance due to less magnetic field cancellation.) And, from 250.8, a listed means of connecting it must be used. But, I don't see anywhere answers to things like: if a separately run EGC must be continuous, or if it can be spliced (if so how?), how it is to be supported and attached, etc.

Panel Meeting Action: Reject
Panel Statement: The proposal does not meet the requirements set forth in Section 4-3.3 of the NFPA Regulations Governing Committee Projects. There is no proposed revision for the existing text of this section.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-269 Log #2940 NEC-P05 **Final Action: Reject**
(250.120(B))

Submitter: Philip Simmons, Simmons Electrical Services
Recommendation: Add a new last sentence to existing 250.120(B) as follows:

(B) Aluminum and Copper-Clad Aluminum Conductors. Equipment grounding conductors of bare or insulated aluminum or copper-clad aluminum shall be permitted. Bare conductors shall not come in direct contact with masonry or the earth or where subject to corrosive conditions. Aluminum or copper-clad aluminum conductors shall not be terminated within 450 mm (18 in.) of the earth.

Aluminum conductors shall not be directly buried.

Substantiation: Experience has shown that aluminum conductors fail at a high rate when installed in direct-burial applications. When the conductor insulation has a defect or is damaged by backfill, the aluminum conductor turns to a white powder and opens.

If this happens to energized conductors, there will be some indication of the problem as equipment will not work properly. When this happens to an equipment grounding conductor, the conductor can fail with no indication of an open circuit until the conductor is called upon to carry fault current and it doesn't. This open circuit can result in equipment being at a dangerous voltage above ground.

This issue was recently mentioned to a group of journeyman electricians. One of them volunteered that they make repairs to failed aluminum conductors every week so this is a widespread problem.

Panel Meeting Action: Reject
Panel Statement: Aluminum conductors with insulation suitable for direct burial are listed for that purpose. As with all conductors, care in handling and installation by qualified persons is also required to have a Code compliant installation. Any conductor directly buried with damaged insulation can experience failure under different soil conditions.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:

BRENDER, D.: This proposal will enhance safety. Aluminum conductors corrode quickly when exposed to moisture. The failure of an aluminum equipment ground would not normally be noticed until a safety hazard exists. It has been reported that a widespread problem with direct buried aluminum cable exists in the field.

5-270 Log #1183 NEC-P05 **Final Action: Reject**
(250.120(C))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise as follows:

Where not run with the circuit conductors in a raceway, cable, or cable tray e equipment grounding conductors ~~smaller than 6 AWG~~ shall be protected from physical damage ~~by a raceway or cable armor~~ except where run in hollow spaces of ~~walls or partitions~~ a building or structure, or as overhead spans of open conductors .

Substantiation: This section appears intended to apply to separately run equipment grounding conductors, as in 225.1, 250.130(C), 250.134(B) Exceptions No. 1 and 2, and Articles 225, 394 and 398. However, literal wording includes equipment grounding conductors in nonmetallic sheathed cable. Conductors larger than 6 AWG should also be protected from physical damage, which could be by height, location, burial, or other conditions other than raceway or armor. Present literal wording requires a smaller than 6 AWG conductor in a cable tray to be in a raceway or armor. "Walls or partitions" may be inferred as not including ceiling or floor spaces; structures which are not "buildings" should be included.

Panel Meeting Action: Reject
Panel Statement: The suggested changes do not add clarity.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-271 Log #149 NEC-P05 **Final Action: Reject**
(Table 250.122)

Submitter: Victor Timpanaro, Municipal Electrical Inspectors
Recommendation: Revise as follows:

Where necessary to comply with 250.4(A)(5) or (B)(4) (in accordance with Section 250.122(A)).

Substantiation: The language at 250.4(A)(5) or (B)(4) is too broad in language and could, therefore, be interpreted broadly where the reference to these two sections at 250.122 specifically limit its application to a raceway or cable armor used as a EGC.

Panel Meeting Action: Reject
Panel Statement: Table 250.122 only applies to equipment grounding conductors of the wire type. The proposal does not add clarity or improve usability.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-272 Log #1242 NEC-P05 **Final Action: Accept**
(250.122(A))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise last sentence: Where a cable tray , a raceway, or a cable armor...(remainder unchanged).
Substantiation: Edit. 250.118 and 392.7(B) permit cable tray which is not a raceway, as an equipment grounding conductor.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:

BRETT, JR., M.: I agree with the other explanations of negative votes.

MELLO, C.: The panel should not accept this change without qualification. Cable tray is suitable as an equipment grounding conductor when Listed (Classified) and when installed with the instructions, hardware and accessories provided or specified by the manufacturer. As worded with this change, cable tray has been made equivalent to raceways where no such listing (Classification) is necessary and may lead to confusion and unsafe installations. At most the panel should Accept in Principle and add the appropriate qualifiers as stated above. Otherwise the panel should reject the proposal since it is incomplete and may allow unsafe installations.

5-273 Log #1666 NEC-P05 **Final Action: Reject**
(250.122(A))

Submitter: James Tente, City of Naperville
Recommendation: Revise text to read as follows:
250.122 Size of Equipment Grounding Conductors.
(A) General. A sole copper, aluminum, or copper clad aluminum equipment grounding conductor of the wire type shall not be smaller than shown in Table 250.122, but shall not be required to be larger than this circuit conductors supplying the equipment. (remainder unchanged)
Substantiation: Where more than one equipment grounding conductor is run with a circuit, for example: a metal raceway as given in 250.118 is supplemental by an additional equipment grounding conductor of the wire type, the wire equipment ground shall not be required to be sized to Table 250.122 since the raceway already provides the minimum equipment grounding conductor.
Panel Meeting Action: Reject
Panel Statement: The panel has established that all equipment grounding conductors including both those required and those that are optionally added shall comply with all the applicable. requirements of the NEC. No technical substantiation was provide that the "additional" equipment grounding conductor could be reduced in size and provide suitable safety as a low impedance path.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-274 Log #3490 NEC-P05 **Final Action: Reject**
(250.122(A))

Submitter: Alan Manche, Square D Co.
Recommendation: Revise NEC 250.122 with the additions (underlined) and deletions (strike through) as shown. The entire text of 250.122(A) is shown for clarity, but only those changes shown underlined or strike through are part of this proposal.
250.122 Size of Equipment Grounding Conductors.
(A) General. Copper, aluminum, or copper-clad aluminum equipment grounding conductors of the wire type shall not be smaller than shown in Table 250.122 but shall not be required to be larger than the circuit conductors supplying the equipment. Where the conductor supplying the equipment is smaller than 14 AWG, the equipment grounding conductor shall not be required to be larger than the circuit conductor. Where a raceway or a cable armor or sheath is used as the equipment grounding conductor, as provided in 250.118 and 250.134(A), it shall comply with 250.4(A)(5) or (B)(4).
Substantiation: There are various power limited applications in the NEC (NEC Article 725, 760,,,,) which permits wiring methods with wire sizes smaller than 14 AWG, however there is not a provision in these articles or in NEC article 250 that would permit a power limited cable or circuit to have a grounding conductor smaller that 14 AWG. NEC 250.122(E) is the only permission for smaller grounding conductors when used in flexible cord and with fixture wire. Permission is needed within NEC article 250 in order to address power limit circuits such as Class 3 circuits where the supply conductors are smaller than 14 AWG.
Panel Meeting Action: Reject
Panel Statement: The first sentence in 250.122 provides the relief the submitter is requesting. Section 250.122 states that the equipment grounding conductor shall not be required to be larger than the circuit conductors to the equipment.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
DOBROWSKY, P.: The proposal should be accepted. the smallest conductor in Table 250.122 is a 14 AWG.

5-275 Log #343 NEC-P05 **Final Action: Accept in Principle**
(250.122(B))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Add text to read as follows:
(B) Increased in Size. Where ungrounded conductors are increased in size, equipment grounding conductors, where installed, shall be increased in size proportionately according to circular mil area of the ungrounded conductors.
Exception: Where conductors are increased in size as a result of ampacity adjustment factors required by 310.15(B)(2)(a), the minimum size equipment grounding conductor shall be not less than the minimum size required by Table 250.122.
Substantiation: Where ampacity correction factors are applied, the conductor is required to be protected at its ampacity after the adjustments, or it can be increased in size. Conductors are often increased in size when ampacity correction factors are necessary rather than reducing the size of the overcurrent protective device. The feeder or branch circuit equipment grounding conductor in these cases is not impacted from a performance standpoint and the Code should not require more than the minimum sizes provided in Table 250.122 in these specific cases.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 5-276.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-276 Log #345 NEC-P05 **Final Action: Accept**
(250.122(B))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read as follows:
(B) Increased in Size. Where ungrounded conductors are increased in size for reasons other than application of ampacity adjustments factors, equipment grounding conductors, where installed, shall be increased in size proportionately according to circular mil area of the ungrounded conductors.
Substantiation: Where ampacity correction factors are applied, the conductor is required to be protected at its ampacity after the adjustments, or it can be increased in size. Conductors are often increased in size when ampacity correction factors are necessary rather than reducing the size of the overcurrent protective device. The feeder or branch circuit equipment grounding in these cases is not impacted from a performance standpoint and the Code should not require more than the minimum sizes provided in Table 250.122 in these specific cases.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:
BRENDER, D.: This is a major change in the intent and application of the Code without any technical substantiation submitted. The panel should reconsider the sense-of-the-panel vote.
Using Table 310.16 et al, ampacity must be adjusted for ambient temperature. As temperatures rise, resistance of any conductor increases. This increased circuit resistance decreases fault current, and may cause the overcurrent device to open later than planned, or not open at all. There were no calculations or supporting data submitted to show the proposal would represent safe practice.
The submitter is suggesting that Table 250.122 is moot in this circumstance with no justifying reasons shown.
BRETT, JR., M.: I agree with the other explanations of negative votes.

5-277 Log #1263 NEC-P05 **Final Action: Reject**
(250.122(B))

Submitter: Nicholas Alger, Modjeski and Masters Inc.
Recommendation: Modify 250.122(B) as follows:
(B) Ungrounded Conductors Increased in Size. Where ungrounded conductors are increased in size, ~~equipment grounding conductors, where installed, shall be increased in size proportionately according to circular mil area of the ungrounded conductors~~ and equipment grounding conductors are installed, one of the methods described in (1) and (2) of this section shall be utilized.
(1) The equipment grounding conductors shall be increased in size proportionately according to circular mil area of the ungrounded conductors.
(2) Where ground-fault protection is installed, the equipment grounding conductors in a multiconductor cable shall be permitted to be sized in accordance with Table 250.122 on the basis of the trip rating of the ground-fault protection where the following conditions are met:
(1) Conditions of maintenance and supervision ensure that only qualified persons will service the installation.
(2) the ground-fault protection equipment is set to trip at not more than the ampacity of the ungrounded conductor of the cable.
(3) The ground-fault protection is listed for the purpose of protecting the equipment grounding conductor, or is integral to a listed adjustable speed drive.
Substantiation: Increasing the size of an equipment grounding conductor (EGC) as required by 250.122(B) may preclude the use of standard multiconductor cables because such cables are often supplied with EGCs which would be too small to satisfy 250.122(B). This situation is similar to that considered in 250.122(F)(2) where multiconductor cables installed in parallel would require EGCs which are larger than those generally supplied in standard cables. Sizing the EGC in a multiconductor cable based on the ground fault protection trip rating, as allowed for parallel cables by 250.122(F), would permit the use of standard manufactured cables rather than expensive custom cables. The wording at the end of condition (3) regarding ground-fault protection which "is integral to a listed adjustable speed drive" is included here for coordination and consistency with my proposal to add similar language to 250.122(F)(2).

Also note that, as currently written, 250.122(B) and (F) contain a "loop hole". Instead of increasing the size of ungrounded conductors in a cable and being forced to use a custom manufactured cable due to 250.122(B), a clever designer and/or installer may elect to take advantage of 250.122(F) and use standard manufactured cables in parallel. The proposed change effectively does away with this inconsistency between 250.122(B) and (F).
Panel Meeting Action: Reject
Panel Statement: There is no technical substsntiation for how an adjustable speed drive provides protection for the equipment grounding conductor.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-278 Log #1264 NEC-P05 **Final Action: Accept in Principle**
(250.122(B))

Submitter: Nicholas Alger, Modjeski and Masters Inc.
Recommendation: Modify 250.122(B) as follows:
(B) Increased in Size. Where ungrounded conductors are increased in size <u>beyond what is required by this code</u> , equipment grounding conductors, where installed, shall be increased in size proportionately according to circular mil area of the ungrounded conductors.
<u>FPN: The requirements of 250.122(B) do not apply when ungrounded conductors are increased in size to accommodate ampacity correction such as for ambient temperature or number of current-carrying conductors. The requirements of 250.122(B) do apply when ungrounded conductors are increased in size to compensate for voltage drop, to comply with the recommendations of equipment manufacturers, or for similar reasons not considered by this code.</u>
Substantiation: Historically, the requirement to increase the size of an equipment grounding conductor (EGC) proportionately to ungrounded conductors seems to be intended to ensure that ground-fault impedance is kept low enough to facilitate operation of the circuit ground fault protection device(s); the rationale being that if ungrounded conductors are increased to compensate for voltage drop (i.e., to reduce circuit impedance) then the EGC should also be increased to reduce its overall impedance. However, during the 2002 Code revision cycle, the requirement to increase EGCs was expanded to cover cases where the ungrounded conductors are increased for reasons other than voltage drop (see Proposal 5-264 (Log #1750) from the May 2001 Report on Proposals). The stated intent of the submitter was to reduce "abuse and misinterpretation" of the original wording.
Setting aside any debate over whether or not this reasoning represents sufficient substantiation for the change, a strict interpretation of 250.122(B), as currently written, would also require an EGC to be increased in size if the circuit conductors are increased in size due to ampacity correction as required elsewhere in the code, resulting in an unnecessarily large EGC. This was probably not the intent of the submitter of the 2002 change and cannot be substantiated based on the goal of maintaining low ground-fault impedance.
The proposed modification to 250.122(B) and the new fine print note would clarify that it is unnecessary to increase the EGC size where the only reason for increasing the ungrounded conductor size is for ampacity correction, while still requiring an increase in EGC size where the underlying reason for increasing the ungrounded conductors is voltage drop (impedance) or is unknown.
Note: Supporting Material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 5-276.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-279 Log #3141 NEC-P05 **Final Action: Reject**
(250.122(B))

Submitter: Dale Rooney, Municipality of Anchorage
Recommendation: Delete text after "where installed," and add:
shall comply with 1 or 2 below.
(1) For circuits rated 15 or 20 amps the equipment grounding conductor shall be the same size as the ungrounded conductors.
(2) For circuits rated more than 20 amps the equipment grounding conductor shall comply with 250.102(C). Where conductors are paralleled the equipment grounding conductor size shall be based on the equivalent area of the ungrounded conductors.
Substantiation: The current procedure for resizing equipment grounds is unnecessarily complex. Table 250.66 which is referenced by 250.102(C) is intended to maintain a adequate proportion of ungrounded to grounded (or bonding) conductor area and is well understood by the industry. Adopting this change would enhance the usability of the code.
Panel Meeting Action: Reject
Panel Statement: The proposed text does not add clarity.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-280 Log #3253 NEC-P05 **Final Action: Reject**
(250.122(B))

Submitter: Donald Dekker, N. Muskegon, MI
Recommendation: Revise text to read as follows:
...equipment grounding conductors, where installed, shall be increased in size proportionately according to (~~circular mil~~) (<u>the cross sectional</u>) area of the ungrounded conductors.
Substantiation: The NEC is moving towards metric units of measure. Circular mil refers only to English measurements, not metric. If we change to the phrase 'the cross sectional" area it will apply to any unit of measure.
Panel Meeting Action: Reject
Panel Statement: The Code uses kcmil or AWG for sizes of conductors, not cross-sectional area.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
HAMMEL, D.: In this code section the rule uses the term "proportionately". A proportion is a statement, which states that two ratios are equal to each other. In determining a ratio, the final answer does not contain unit identification. The proposal is technically correct.

5-281 Log #585 NEC-P05 **Final Action: Reject**
(250.122(B) Exception (New))

Submitter: Charles N. Landey, Wisconsin Dept. of Transportation
Recommendation: Add exception to 250.122(B) and add FPN to the exception
Exception: Street lighting, traffic signals, and similar outside branch circuits not connected to building wiring, where each pole or standard is equipped with a supplementary grounding electrode that provides effective grounding.
FPN: The effectiveness of supplementary grounding electrodes varies with soil conditions.
Substantiation: The proposal provides for effective equipment grounding at lower cost than the existing requirement. The proposal does not require supplementary grounding electrodes but does waive the requirement for up-sized equipment grounding conductors where the supplementary grounding electrodes are installed. Also, the proposal legalizes what some jurisdictions do and will continue to do anyway.
Panel Meeting Action: Reject
Panel Statement: Supplementary grounding electrodes are not permitted as equipment grounding conductors as indicated in 250.54 and 250.4. The proposed FPN provides no functionality, clarity, or improvement in usability of this section. The earth does not provide an effective ground-fault current path.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-282 Log #1262 NEC-P05 **Final Action: Reject**
(250.122(B) Exception (New))

Submitter: Nicholas Alger, Modjeski and Masters Inc.
Recommendation: Add an exception to 250.122(B) as follows:
Exception: Equipment grounding conductors shall not be required to be increased in size where analysis performed under engineering supervision demonstrates that the impedance of the equipment grounding conductors remains low enough to facilitate overcurrent protective device operation within a time period which prevents damage to either the ungrounded conductors or equipment grounding conductors under line-to-ground fault conditions.
Substantiation: 250.122(B), as currently written, requires an equipment ground conductor (EGC) to be increased in size proportionately to the ungrounded conductors irregardless of the reason for increasing the size of the ungrounded conductors. This provides for a conservative approach to sizing the EGC in cases where a detailed engineering analysis of the grounding system under line-to-ground fault conditions is not performed. However, it also has the undesirable effect of causing an EGC to be increased in size even if an analysis of grounding system performance shows that this increase is unnecessary.
There are many reasons why a circuit designer may elect to increase the size of ungrounded conductors. This change would permit the designer to undertake an appropriate analysis to determine if the EGC should also be increased in size instead of simply increasing it blindly. Stipulating that such an analysis may be performed only under "engineering supervision" will prevent unqualified persons from using this new exception as an excuse for undersizing an EGC. There is already precedent in the code for allowing such analyses in lieu of blind application of a rating or requirement (see 310.15(C)).
Panel Meeting Action: Reject
Panel Statement: The panel concludes that the prescriptive text is correct. See panel action on Proposal 5-276 regarding ampacity adjustments.

Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:

BRETT, JR., M.: I agree with the panel action to reject, however, I believe it is important to note that Table 250.122 is a prescriptive minimum. Engineering software is available to provide designers and installers a means to determine the safe minimum equipment grounding conductor size. Dr. A. P. Sakis Meliopoulos at the Georgia Institute of Technology, Atlanta, GA has performed equipment grounding studies that resulted in the development of a software program (GEMI @2.2b August 2004) which can be downloaded free at www.steelconduit.org.

5-282a Log #CP513 NEC-P05 **Final Action: Accept**
(250.122(C))

Submitter: Code-Making Panel 5,
Recommendation: Proposed text: Revise Section 250.122(C) to read as follows:

(C) Multiple Circuits. Where a single equipment grounding conductor is run with multiple circuits in the same raceway <u>,</u> ~~or~~ cable <u>or cable tray</u> , it shall be sized for the largest overcurrent device protecting conductors in the raceway <u>,</u> ~~or~~ cable <u>or cable tray</u> . <u>Equipment grounding conductors installed in cable trays shall meet the minimum requirements of 392.3(B)(1)(c).</u>

Substantiation: This change, working in conjunction with present language of 300.3(B), will help clarify that a common equipment grounding conductor is permitted to be used within a cable tray. This long established trade practice needs clarification in the Code.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-283 Log #93 NEC-P05 **Final Action: Reject**
(250.122(D))

Submitter: Tom Smith, Fowler, MI
Recommendation: Add new language to the section as follows:

(D) Motor Circuits. <u>The minimum size equipment grounding conductor shall be determined by (1) or (2):</u>

<u>(1) The equipment grounding conductor size shall not be smaller than determined by Table 250.122 based on the rating of the branch circuit short-circuit and ground-fault protective device. The equipment grounding conductor shall not be required to be sized larger than the largest ungrounded motor circuit conductor.</u>

<u>(2)</u> Present language that is in paragraph (D).

Substantiation: Based upon my experience in the field, it is just not clear to electricians and inspectors how to determine the minimum size of equipment grounding conductor for a motor circuit. Frequently, at least a bonding jumper must be installed across a flexible section of raceway that connects to the motor. It is usually omitted or just not sized correctly. The rule needs to be made clear. The present section (D) is titled motor circuits, that leads the reader to believe it applies to motor circuits in general when it only applies to cases where the branch circuit short-circuit and ground-fault protective device is an instantaneous trip circuit breaker or short-circuit protector. This revision preserves the present method in (D) while stating the rule for motor circuits, in general, as I understand the rule.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided that there is a problem with existing wording or how this will improve the Code.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:

HAMMEL, D.: Proposals 5-283 and 5-284 merit more consideration. First, Table 250.122 uses the term “Overcurrent Device”. Overcurrent is defined in Article 100 as resulting “from overload, short circuit, or ground fault. In Article 430 “Motor Branch-Circuit Overload Protection” and “Motor Branch-Circuit Short-Circuit and Ground-Fault Protection” is typically achieved through the use of separate devices. A fact not delineated by Table 250.122.
Secondly, a motor overload protection device is not intended or designed for operation at fault current levels and, therefore, should not be used to size an equipment grounding conductor.

5-284 Log #3395 NEC-P05 **Final Action: Reject**
(250.122(D))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Delete this paragraph.
Substantiation: The present wording allows the highest rated overcurrent devices to have the smallest equipment grounding conductors, since ITCBs can have grounding conductors sized by entering Table 250.122 at 125% (typically) of motor current, but the grounding conductors with conventional overcurrent protection enter the table sized at 175% or 250% of motor current. Remember that the basic function of Table 250.122 is to provide suitable equipment grounding conductors under ground-fault conditions, and the protective device ratings used to enter Table 250.122 on motor circuits are in part ground-fault protective devices. CMP 5 rejected this in the comment stage in the 2005 cycle, stating that there was no substantiation provided to prohibit reductions in grounding conductors sizes for motor circuits using fuses or inverse-time circuit breakers. That statement is both true and beside the point, since the paragraph proposed for deletion only applies to instantaneous-trip circuit breakers; the sizing of grounding conductors on other circuits is unaffected.

Please refer to Proposal 5-297 and comment 5-215 in the 1999 cycle for more information. Please review in particular the exhaustive explanation of negative vote offered by Mr. Rappaport in support of this effort, as follows:

“RAPPAPORT: When this paragraph was originally proposed for the 1993 NEC, the Panel assumed that a 100 ampere ITCB (instantaneous trip circuit breaker) that will trip at 1200 percent of rating was, in fact, a 1200 ampere overcurrent device. Thus, for a 25 horsepower three phase motor at 208 volts, Table 250-95 would (according to CMP 5) require a #3/0 copper equipment grounding conductor instead of a #6 which would be required with short circuit protection rated at 175 percent of the motor full load current Exception No. 2 of Section 250-95 would have limited the equipment grounding conductor to a #2 copper.

“Application of paragraph 5 now permits a #8 copper equipment ground which is smaller than that required using normal fuse or circuit breaker short circuit protection. The intent of Table 250-95 is to provide a sufficiently low impedance for ground fault current so as to permit an overcurrent device to operate and clear the fault The use of a #8 instead of a #6 will limit the fault current and, if the fault is an arcing fault to ground, may not provide sufficient fault current to operate the 1TCB. The use of a #8 in this case is less than the minimum size presently required for the same motor with different short circuit protection and there has never been any substantiation that the deviation is safe. If this exception applies for ITCB, why should it not apply for fuses and inverse time circuit breakers?

“A review of manufacturer’s catalog information for ITCBs indicates that they are, in fact, rated in nominal amperes with an additional rating of “adjustable trip range”. Thus an ITCB <u>rated</u> for 100 amperes can be obtained with an adjustable trip range of 150 to 580 amperes (150 to 580 percent or 300 to 1100 amperes (300 to 1100 percent). The CMP should recognize that motor overloads are not intended or designed for operation at fault current levels and are only intended for protection against persistent overcurrent for a sufficient length of time to protect equipment from dangerous overheating.

“This fifth paragraph should be deleted as proposed in order to insure that adequate fault current will flow during a fault. The panel statement is without foundation and technical basis. Adequate technical substantiation has been provided by the submitter in Proposal 5-297.”

If this paragraph is deleted, motor circuits using instantaneous-trip circuit breakers would still have permission to use 250.122(A) which limits the required upward sizing of grounding conductors to the size of the circuit conductors. The result would be that they would have grounding conductors comparably sized to those with other motor circuits. In fact, even before the 1993 NEC, it was never required to size grounding conductors based on the full ITCB current rating, and it will not be so in the future if this proposal is accepted.
Panel Meeting Action: Reject
Panel Statement: The panel concludes that deleting this will cause confusion in the industry. This section is necessary for sizing equipment grounding conductors for instantaneous trip circuit breakers and motor short circuit protectors.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:

HAMMEL, D.: See my explanation of negative vote on Proposal 5-283.

RAPPAPORT, E.: The submitter’s substantiation has merits. It very correctly points out errors and inconsistency in sizing equipment grounding conductor for motor circuits as stipulated in 250.122(D).

The submitter is correct that the highest rated overcurrent device, Instantaneous Trip Circuit Breakers (ITCB), results in the smallest size equipment grounding conductors in some cases. The EGC sized based on motor overload (125 percent of motor full load current) is less than the UL sizing of EGC contained in multi conductor cables.

Further, it is technically not defensible to refer to Overload for sizing of EGC. EGC is only in the circuit during ground fault or short circuit conditions. An Overload in the motor circuit is not expected to operate during short circuit and is not rated to interrupt fault currents. In Article 100 - Definitions, Overload is a condition described as “Operation of equipment in excess of rated normal full load rating, or of a conductor in excess of rated ampacity when it persists for a <u>sufficient length of time</u> .” The definition further sites, “ <u>A fault such as a short circuit or ground fault, is not an overload</u> ”.

The standard EGC contained in UL listed cables appears to be consistent with an EGC sizing based on Time delay fuses sized at 175 percent of motor full load currents. (A spreadsheet has been provided that displays this comparison for motor sizes from 5 horsepower to 150 horsepower and for UL listed cables from 14 AWG through 4/0 AWG.)

The spreadsheet shows the EGC sized based upon 125 percent (overload), 175 percent (short circuit fuses), 250 percent short circuit inverse time breaker, and 1300 percent ITCB (instantaneous trip breaker) of full load current compared with UL sizing of EGC in cables. Using 175 percent TD fuses provides sizes consistent with EGC contained in UL listed cables.

A better approach would to be amend 250.122(D) to indicate that "For motor circuits, the equipment grounding conductor shall be based on Time delay fuse sized at 175 percent of motor full load current as shown in Table 250.122." This will harmonize with EGC provided in UL listed cables, consistency with Table 250.122, and provide clear sizing guidelines to users and consistent sizing of EGC for motor applications.

Note: Supporting material is available for review at NFPA Headquarters.

5-285 Log #3550 NEC-P05 **Final Action: Reject**
(250.122(F)(1))

Submitter: Larry Watkins, Alcan Cable
Recommendation: Revise as follows:
(1)...with Table 250.122 <u>but shall not be required to be larger than the circuit conductors supplying the equipment.</u>
Substantiation: Clarification. 250.122(A) applies to conductors not required to be larger than circuit conductors supplying equipment.
Panel Meeting Action: Reject
Panel Statement: The proposal lessens the current requirements of the Code without technical or practical substantiation. Conductors in parallel could be small and protected by large overcurrent devices.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-286 Log #1261 NEC-P05 **Final Action: Reject**
(250.122(F)(2))

Submitter: Nicholas Alger, Modjeski and Masters Inc.
Recommendation: Modify condition (3) of 250.122(F)(2) as follows:
(3) The ground-fault protection is listed for the purpose of protecting the equipment grounding conductor <u>, or is integral to a listed adjustable speed drive</u> .
Substantiation: Because most modern adjustable speed drives employ solid-state power conversion, the load side of such drives behave as separately derived systems and ground fault protection equipment installed on the line side of such drives will not operate during ground faults on their load side. Consequently, the third condition of 250.122(F)(2), as currently written, would not be satisfied which may preclude the installation of standard multiconductor cables in parallel on the load side of adjustable speed drives. However, most such drives also include integral load side ground fault protection which will protect the load side circuit and equipment grounding conductors. This proposed change would allow such integral ground fault protection to satisfy condition (3) of 250.122(F)(2), provided that the adjustable speed drive is listed, and therefore allow standard multiconductor cables to be installed in parallel on the load side of adjustable speed drives.
Panel Meeting Action: Reject
Panel Statement: There is no listing or product standards submitted for technical substantiation. There has been no product information introduced to support this application.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-287 Log #3491 NEC-P05 **Final Action: Accept**
(250.122(F)(2))

Submitter: Alan Manche, Square D Co.
Recommendation: Delete NEC 250.122(F) (2)
~~**(2) Ground-Fault Protection of Equipment Installed.** Where ground-fault protection of equipment is installed, each parallel equipment grounding conductor in a multiconductor cable shall be permitted to be sized in accordance with Table 250.122 on the basis of the trip rating of the ground-fault protection where the following conditions are met:~~
~~(1) Conditions of maintenance and supervision ensure that only qualified persons will service the installation.~~
~~(2) The ground-fault protection equipment is set to trip at not more than the ampacity of a single ungrounded conductor of one of the cables in parallel.~~
~~(3) The ground-fault protection is listed for the purpose of protecting the equipment grounding conductor.~~
Substantiation: This section of the NEC was introduced into the NEC as a concept by placing a listing requirement on the ground-fault protection equipment with the expectations that a product would be listed for this application. After a number of code cycles in the NEC, this section is simply creating confusion among the electrical community. I receive a number of phone calls asking how to apply this section. There is no listing requirement and there is no product standard with listing requirements for this application and there has been no product introduced to support this application. Therefore, it is only prudent to delete this requirement from the NEC to eliminate the unnecessary potential for misapplication which is present in the NEC by this permission remaining in the NEC.

5-288 Log #3569 NEC-P05 **Final Action: Reject**
(250.122(H) (New))

Submitter: Fred W. Brown, HI Electron
Recommendation: Add a new 250.122 (H) as follows:
(H) Isolated equipment ground conductor. An isolated equipment grounding conductor shall be sized by 250.122(H)(1), 250.122(H)(2) and 250.122(H)(3).
(1) An isolated equipment grounding conductor run with the derived phase conductors from the source of a separately derived system to the first disconnecting means, shall be sized in accordance with 250.102(C) and based on the size of the derived phase conductors.
(2) An isolated equipment grounding conductor run with feeder conductors shall not be smaller than shown in Table 250.122 based on the rating of the overcurrent device ahead of the feeder but shall not be required to be larger than the feeder conductors.
(3) An isolated equipment grounding conductor run with branch circuit conductors shall not be smaller than shown in Table 250.122 based on the rating of the overcurrent device ahead of the feeder but shall not be required to be larger than the branch circuit conductors.
Substantiation: There needs to be a method to size isolated equipment grounding conductors in the code. The proper installation of these types of equipment grounding conductors (bonding conductors) has been wrongly applied without guidance as to the proper way to size them. I have seen a No. 12 AWG copper isolated equipment grounding conductor installed with 4/0 AWG copper derived phase conductors from the source of a separately derived system to the first disconnecting means. The derived phase conductors were installed by 240.21(C)(2), Transformer Secondary Conductor tap rule. The separately derived system was a 75 KVA, 120/208 volt, three-phase, four wire system. The system bonding jumper and grounding electrode conductor point of attachment was located at the transformer secondary conductor terminals. The electrician was under the impression that the No. 12 AWG was appropriate since it was being used for multiple branch circuits with 20 ampere overcurrent protection devices. This type of installation poses a large safety issue.
Panel Meeting Action: Reject
Panel Statement: The proposal introduces mandatory requirements that exceed the minimum requirements of the NEC regarding design considerations for isolated grounding conductors without technical substantiation of a problem in the field. Section 250.146(D) and 408.40 Exception allow for a branch circuit conductor to be run through one or more panelboards so as to terminate at the applicable service or derived system. If only one circuit is involved in this provision, that is generally part of a design consideration, installers should not have to install an equipment grounding conductor with the feeder or secondary conductors of a separately derived system that is in excess of minimum requirements. This is a design concern expressed by the submitter in this proposal.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-289 Log #982 NEC-P05 **Final Action: Reject**
(250.130(C))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Add text to read as follows:
Branch circuit extensions shall be permitted to be supplied through a ground-fault circuit-interrupter where the supplied outlets are marked in accordance with 406.3(D)(3)(c).
Substantiation: The provisions of 406.3(D) should be suitable for extensions that do not supply receptacles.
Panel Meeting Action: Reject
Panel Statement: The revised wording will not add clarity to the code. Section 406.3(D)(3)(c) address the condition where no equipment grounding conductor exits. Section 250.130(C) address the connection where there is an equipment grounding conductor installed. The requirements for ground-fault circuit-interrupters are covered in both Articles 210 and 406.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-290 Log #3580 NEC-P05 **Final Action: Reject**
(250.130(C)(6))

Submitter: Randy Marsh, City of Hillsboro
Recommendation: Add new text to read:
(6) For ungrounded circuit extensions, and no accessible point of attachment to grounding electrode is available, the use of a ground fault circuit breaker or ground-fault circuit-interrupting type of receptacle shall be permitted. The equipment grounding conductor shall not be connected to any outlet, fixture, switch or device. The equipment grounding conductor, if present, must be insulated by appropriate means.

Substantiation: Working in older homes poses unique challenges. One of which is the grounding issue. The following is an example of an installation that would benefit from this proposal. In a finished second floor, the hallway has insufficient lighting. To add a remodel recessed fixture to the existing wiring would require an equipment grounding conductor to be connected to the electrode system. This would cause more wall repair to allow access for the installation of this conductor. In some cases the metallic water piping is being replaced with plastic. This adds further difficuly to locating a suitable grounding electrode. The use of a breaker of the entire circuit provides the necessary protection as a ground-fault circuit-interrupting type of receptacle does in 406.3(D)(3) for circuit extensions. The use of this type of breaker also affords protection to the rest of the nongrounded circuit. Just installing a connection from the new wiring to the grounding electrode system, only gives protection for the portion of the circuit connected to new wiring.

Panel Meeting Action: Reject

Panel Statement: The revised wording will not add clarity to the code. Section 406.3(D)(3)(c) address the condition where no equipment grounding conductor exits. Section 250.130(C) address the connection where there is an equipment grounding conductor installed. The requirements for ground-fault circuit-interrupters are covered in both Articles 210 and 406.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-291 Log #2397 NEC-P05 **Final Action: Reject**

(250.134)

Submitter: Mike Holt, Mike Holt Enterprises

Recommendation: Revise text to read:

250.134 Equipment Fastened in Place or Connected by Permanent Wiring Methods (Fixed) - Grounding. Unless grounded by connection to the grounded circuit conductor as permitted by ~~250.32,~~ 250.140, and 250.142, non-current-carrying metal parts of equipment, raceways, and other enclosures, if grounded, shall be grounded by one of the following methods.

(A) Remain unchanged.

(B) Remain unchanged.

Substantiation: This is a companion proposal to my proposal to delete 250.32(B)(2). If 250.32(B)(2) is deleted as I am requesting, this section will need to be revised as well.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 5-119.

Number Eligible to Vote: 15

5-292 Log #2082 NEC-P05 **Final Action: Reject**

(250.134(B) Exception No. 2)

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum

Recommendation: Delete Exception No. 2

~~Exception No. 2: For DC circuits, the equipment grounding conductor shall be permitted to be run separately from the circuit conductors.~~

Substantiation: When this exception was added to the *Code* , the drafters correctly realized that pure direct currents do not have any oscillatory tendencies as do ac currents that would cause transformer-like heating in metal when the equipment-grounding conductor is separated from the circuit conductors. They likewise realized that there is no frequency-dependent impedance factor associated with dc currents that might cause higher than desired reactance in the dc circuits, which could prevent the operation of overcurrent devices.

However, with the resurgence of dc power systems (renewable energy systems, fuel cells, uninterruptible power systems, and various industrial processes), this exception needs to be reconsidered. *IEEE/ANSI Standard 1375, Guide for the Protection of Stationary Battery Systems* provides an excellent tutorial on the issues associated with using overcurrent devices in dc circuits. One of the many issues that this standard points out is the difficulty in getting proper overcurrent device operation as the circuit time constant goes above 10 milliseconds (the time-constant limit of testing in UL Standards 198 and 489). The Guide points out that fuses and circuit breakers may not operate properly when inductance in the circuit results in a time constant exceeding 10 milliseconds. Calculations shown in the IEEE Standard indicate that the normal circuit inductance in many dc systems results in time constants between 5 and 10 milliseconds. It wouldn't take much additional spacing between the equipment-grounding conductor and the circuit conductors to increase the fault-circuit time constant to greater than 10 milliseconds. If Exception number 2 in 250.134(B) is followed, the routing of the equipment-grounding conductor away from the circuit conductors may allow the time constant under ground-fault conditions to exceed 10 milliseconds. These longer time constants, under ground-fault conditions, could prevent the dc overcurrent devices from functioning properly.

A second issue is that many dc currents are not pure. Any single-phase dc-to-ac power inverter will have a 120 Hz sine wave imposed on the dc current that may have a RMS value greater than the average dc current value. In a similar manner, battery chargers that rectify the ac line to get dc to charge batteries will have 120 Hz ripple currents. Under fault conditions, these dc ripple currents act just like ac currents in that they may cause metal heating if the two (or three) circuit conductors are not routed together. Excess separation leading to increased inductance will also lead to increased impedance in the fault circuit and may not allow overcurrent devices to function properly. The impedance is a function of the frequency, and at 120 Hz the increased impedance will be higher than at 60 Hz. This is another reason why Exception 2 to 250.134(B) should be deleted.

Panel Meeting Action: Reject

Panel Statement: Dc systems with significant ripple are not generally considered dc systems. The product standards limit the ripple peak to peak not exceeding 10% of the average value. As for conductor separation, IEEE 1375 states "... long time constant in excess of level used in UL testing are unlikely for stationary battey systems." The presence of large motors, coils, crane rails, etc. may produce time constants used in UL testing." Determination of proper spacing between dc conductors is an engineering decision.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-293 Log #2398 NEC-P05 **Final Action: Reject**

(250.142)

Submitter: Mike Holt, Mike Holt Enterprises

Recommendation: Revise text to read:

250.142 Use of Grounded Circuit Conductor for Grounding Equipment.

(A) Supply-Side Equipment. A grounded circuit conductor shall be permitted to ground non-current-carrying metal parts of equipment, raceways, and other enclosures at any of the following locations:

(1) On the supply side or within the enclosure of the ac service-disconnecting means

~~(2) On the supply side or within the enclosure of the main disconnecting means for separate buildings as provided in 250.32(B).~~

~~(3)~~ (2) On the supply side or within the enclosure of the main disconnecting means or overcurrent devices of a separately derived system where permitted by 250.30(A)(1)

(B) Load-Side Equipment. Except as permitted in 250.30(A)(1) ~~and 250.32(B)~~ , a grounded circuit conductor shall not be used for grounding non-current-carrying metal parts of equipment on the load side of the service disconnecting means or on the load side of a separately derived system disconnecting means or the overcurrent devices for a separately derived system not having a main disconnecting means.

Substantiation: This is a companion proposal to my proposal to delete 250.32(B)(2). If 250.32(B)(2) is deleted as I am requesting, this section will need to be revised as well.

Ballot Results: Affirmative: 15

(Note: Sequence 5-296 was not used)

5-297 Log #628 NEC-P05 **Final Action: Accept**
(250.146)

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read as follows:
250.146 Connecting Receptacle Grounding Terminal to Box. An equipment bonding jumper shall be used to connect the grounding terminal of a grounding-type receptacle to a grounded box unless grounded as in 250.146(A) thru (D). <u>The equipment bonding jumper shall be sized in accordance with Table 250.122 based on the rating of the overcurrent device protecting the circuit conductors.</u>
Substantiation: This proposal is an effort to provide users with ready sizing information for the equipment bonding jumpers addressed in this section at outlet and junction boxes. It is understood that equipment bonding jumper sizing rules in 250.102(D) can be used and applied to this installation. There continues to be many inspected installations where the equipment bonding jumper is smaller than the branch circuit conductors (14 AWG for 20 ampere circuit for example). Having the sizing requirement within the rule that requires the bonding jumper adds usability. See exhibit 314.3 in the NEC Handbook (2005) where the equipment bonding jumper size could be an issue if it is not 12 AWG. In this two-gang box it appears like a 20-ampere circuit for the receptacle and a 15-ampere circuit for the switch, but this information is not provided. However, if this is the case, the equipment bonding jumper should be a AWG copper to the box from the wire connector. It appears that the bare 14 AWG conductor is wrapped around the grounding screw and then routed to the wire connector (wire nut). It is pretty common to see this in the field as well.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-298 Log #387 NEC-P05 **Final Action: Reject**
(250.146(A))

Submitter: Bryan P. Holland, Holland Electric
Recommendation: Revise text to read as follows:
At least one of the ~~insulating~~ <u>retaining washers for the installation screws</u> shall be removed from receptacles that do not have a contact yoke or device that complies with 250.146(B) to ensure direct metal-to-metal contact.
Substantiation: The purpose of the washer is for retaining the screw during shipping, not insulating the receptacle. Even though the washer may have insulating properties, it is not intended to serve as an insulating medium between the receptacle and box. Calling it an insulating washer is not accurate and may create confusion. This change will provide clarity. Supporting material is a letter from Leviton Mfg. Technical Support stating this fact.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The panel concludes that only insulsated washers must be removed from surface mounted non self grounding receptacles. If a manufacturer chooses to make one of the washers from conductive metal, it does not have to be removed.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-299 Log #2247 NEC-P05 **Final Action: Reject**
(250.146(A))

Submitter: Joseph Penachio, Joe Penachio Electrician
Recommendation: Revise as follows:
(A) Surface Mounted Box. Where the box is mounted on the surface, direct metal-to-metal contact between the device yoke and the box, <u>or device extension, raised cover that is secured to the box with a minimum two 8/32 in. screws and is in direct metal-to-metal contact to the box and complies with 406.4(C)</u> , or a contact yoke or device that complies with 250.146(B) shall be permitted to ground the receptacle to the box. At least one of the insulating washers shall be removed from receptacles that do not have a contact yoke or device that complies with 250.146(B) to ensure direct metal-to-metal contact. ~~This provision shall not apply to cover mounted receptacles unless the box and cover combination are listed as providing satisfactory ground continuity between the box and the receptacle.~~
Substantiation: A 4 in. square blank cover is not required to have a bonding jumper installed to ground it to the box because it is considered effectively grounded by being secured by two screws and having metal to metal contact between the box and the cover. In fact, there is more yoke contact to a raised cover than there is from a yoke to a handy box which is allowed as metal to metal contact. Being secured by two 8/32 in. and complying with 406.4(C) makes the device electrically and mechanically secure. Removing the cover with the receptacle on it does not pose any more danger to a qualified person than if a jumper were installed.
Panel Meeting Action: Reject
Panel Statement: The proposal does not add clarity or improve usability of this section. The concerns of the submitter are addressed in the last sentence of this provision in 250.146(A) which addresses cover-mounted receptacles.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-300 Log #2484 NEC-P05 **Final Action: Accept**
(250.146(A))

Submitter: William Slater, South Bend, IN
Recommendation: Add additional text at the end of NEC 250.146(A) stating:
A listed exposed work cover shall be permitted to be the grounding and bonding means when (1) the device is attached to the cover with at least two fasteners that are permanent (such as a rivet) or have a thread locking or screw locking mans and (2) when the cover mounting holes are located on a flat non-raised portion of the cover (aka crushed corner cover).
Substantiation: (1) The present article applies only to receptacles of the grounding type. It does not apply to any other device nor to non-grounded (two wire) receptacles. (2) Exposed work covers are now required to have two fasteners to attach the receptacle to the cover in order to be listed. This has been found to be an acceptable grounding and bonding means. (3) Other covers such as mud rings are approved for grounding and bonding. The crushed corner exposed work covers attach to the box using the exact same screws as the mud rings. (4) The cover-mounting hole of the exposed work cover provides better electrical contact to the screw than the slots of the raised covers. (5) A ground wire from the receptacle to the box does not provide any shock protection when the cover is off and the power is on. It is not a GFCI. If you touch an exposed live wire or the brass screw of the receptacle, you will still be shocked with or without the ground wire. (6) To protect against shock from the cover becoming live using the prescribed ground wire requires the assumption there is an adequate bonding connection between the cover and device. The very thing that was assumed inadequate by the article in the first place. If it is not adequate, then the ground wire connection is also not adequate. You can't have it both ways. (7) If shock protection with the cover off and the power on is a concern why is it applied only to receptacles of the grounding type and no other device?
Panel Meeting Action: Accept
Panel Statement: Editorially correct "mans" to "means" in the recommendation. Editorially remove the statement (aka crushed corner cover).
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:
STEINMAN, G.: Under present NEC 250.146, a cover-mounted receptacle is required to be connected to ground by a jumper wire unless per 250.146(A) the box/cover combination is specifically Listed as insuring box/receptacle grounding continuity.
Grounding integrity to the receptacle's grounding contact is established by the quality of screw-fastening assembly at BOTH the cover-mounting AND the receptacle-mounting. Loosening of either on existing covers (i.e., those NOT specifically Listed as insuring box/receptacle grounding continuity) defeats grounding integrity. It is reasonable to expect that box-mounting screws might be later loosened for access and not fully re-torqued. Casual contact of the screw shank with the cover resulting from incomplete retightening of the cover-mounting screws might reestablish bonding of the cover but does not insure adequate grounding of the receptacle's grounding contact.
I disagree with the substantiation that GFCIs are not addressed; receptacle-type GFCIs are still receptacles. Switches and dimmers on branch circuits must be bonded; they are not grounded as they have no grounding contact nor do they convey grounding to connected equipment.
TOOMER, R.: The proposed additional language is unnecessary and does not add clarity. The last sentence of 250.146(A) already permits the type of installation described.

5-301 Log #3512 NEC-P05 **Final Action: Accept in Principle**
(250.146(A))

Submitter: Paul Dobrowsky, Holley, NY
Recommendation: Add the following sentence to 250.146(A).
<u>A listed surface mounted box shall be permitted as providing the continuity without an equipment bonding jumper if a listed exposed work cover is used to complete the enclosure.</u>

Substantiation: There has been a change in the product standard for these products. Receptacles must now be attached to exposed work covers with two screws in order to be listed. The nuts and machine screws required to do this must be supplied with the cover.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action and substantiation on Proposal 5-300.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
TOOMER, R.: The proposed additional language is unnecessary and does not add clarity. The last sentence of 250.146(A) already permits the type of installation described.

5-301a Log #CP514 NEC-P05 **Final Action: Accept**
(250.146(D))

Submitter: Code-Making Panel 5,
Recommendation: 250.146 (D) Isolated Receptacles. Where installed ~~required~~ for the reduction of electrical noise (electromagnetic interference) on the grounding circuit, a receptacle in which the grounding terminal is purposely insulated from the receptacle mounting means shall be permitted. The receptacle grounding terminal shall be ~~grounded~~ connected ~~by~~ to an insulated equipment grounding conductor run with the circuit conductors. This grounding conductor shall be permitted to pass through one or more panelboards, boxes, wireways, or other enclosures without a connection to the panelboard grounding terminal bar as permitted in 408.40, Exception, so as to terminate within the same building or structure directly at an equipment grounding conductor terminal of the applicable derived system or service.
FPN: Use of an isolated equipment grounding conductor does not relieve the requirement for grounding the raceway system and outlet box
Substantiation: The editorial revisions to the TCC Task Group on Grounding and Bonding proposals are incorporated into the identified sections to be consistent with the work of CMP-5 at the Report on Proposal Meeting for the 2008 NEC. Correlated with Panel action on Proposals 5-302 and 5-303.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-302 Log #438 NEC-P05 **Final Action: Accept in Principle**
(250.146(D))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read as follows:
(D) Isolated Receptacles. Where required for the reduction of electrical noise (electromagnetic interference) on the grounding circuit, a receptacle in which the grounding terminal is purposely insulated from the receptacle mounting means shall be permitted. The receptacle grounding terminal shall be grounded by an insulated equipment grounding conductor run with the circuit conductors. This grounding conductor shall be permitted to pass through one or more panelboards, boxes, wireways, or other enclosures without a grounding connection or without a connection to the panelboard grounding terminal bar as permitted in 408.40, Exception, so as to terminate within the same building or structure directly at an equipment grounding conductor terminal of the applicable derived system or service.
Substantiation: Isolated, insulated equipment grounding conductors installed in accordance with 250.146(D) and 408.40 Exception, not only have to pass through one or more panelboards to get to the point of grounding for the applicable service or separately derived system, but they generally also pass through outlet boxes, junction and pull boxes, wireways, etc. without connection to ground in those items so the conductor remains an isolated insulated equipment grounding conductor. No companion proposal has been submitted for Section 408.40 Exception since that section deals with just the panelboards.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
(D) Isolated Receptacles. Where ~~required~~ installed for the reduction of electrical noise (electromagnetic interference) on the grounding circuit, a receptacle in which the grounding terminal is purposely insulated from the receptacle mounting means shall be permitted. The receptacle grounding terminal shall be grounded by an insulated equipment grounding conductor run with the circuit conductors. This grounding conductor shall be permitted to pass through one or more panelboards, boxes, wireways, or other enclosures ~~without connection~~ without a connection to the panelboard grounding terminal bar as permitted in 408.40, Exception, so as to terminate within the same building or structure directly at an equipment grounding conductor terminal of the applicable derived system or service.
Panel Statement: These actions meet the intent of the submitter. The word "required" was changed to "installed" based on the recommendation and substantiation from Proposal 5-303.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
TOOMER, R.: The language as proposed does not address connections in boxes, wireways or other enclosures which the grounding conductor passes through since there is not a panelboard terminal bar located therein. The proposer had covered this by stating "...without a grounding connection or without a connection to the panelboard terminal bar...". That portion of the language, as originally proposed, should be restored to the change.

5-303 Log #1337 NEC-P05 **Final Action: Accept in Principle**
(250.146(D))

Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Replace "required" with "installed"
D) Isolated Receptacles. Where ~~required~~ installed for the reduction of electrical noise (electromagnetic interference) on the grounding circuit, a receptacle in which the grounding terminal is purposely insulated from the receptacle mounting means shall be permitted. The receptacle grounding terminal shall be grounded by an insulated equipment grounding conductor run with the circuit conductors. This grounding conductor shall be permitted to pass through one or more panelboards without connection to the panelboard grounding terminal as permitted in 408.40, Exception, so as to terminate within the same building or structure directly at an equipment grounding conductor terminal of the applicable derived system or service.
Substantiation: Generally speaking, isolated ground circuits are not required to be installed. When they are installed it is because of a designer's inclination, not a *Code* or manufacturer's requirement. This section should be changed to reflect this.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 5-302 and it meets the intent of the submitter.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-304 Log #1995 NEC-P05 **Final Action: Reject**
(250.146(D))

Submitter: Robert Schuerger, EYP Mission Critical Facilities, Inc.
Recommendation: Revise as follows:
250.146(D) ~~Isolated~~ Insulated Grounding Receptacles . Where required for the reduction...
FPN: Use of an ~~isolated~~ insulated equipment grounding conductor does not relieve the requirement for grounding the raceway system and outlet box.
Substantiation: The use of the term "isolated" has caused confusion which has led to improper and unsafe installations in which a separate grounding electrode and grounding system is installed isolated from the rest of the grounding system of the building. Since the separate grounding system is not properly bonded to the grounding system of the building, a hazardous voltage can be developed between the two grounding systems by an electrical fault or lightning strike.
There have been many cases of this type of installation in the past, with data procession equipment, machine tools and other sensitive electronic equipment. The 2005 edition of IEEE Standard 1100, Recommended Practice for Powering and Grounding Electronic Equipment has "insulated ground receptacle" as the recommended terminology and has recommended the "isolated ground" and "isolated ground receptacle" be avoided.
Panel Meeting Action: Reject
Panel Statement: The current wording has been used in the NEC for many years. The term "insulated equipment grounding conductor" is not technically correct. An insulated equipment grounding conductor can be used whether or not the receptacle is of the isolated equipment grounding type. The revised wording will not add clarity to the code. See Proposal 5-222.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:
DOBROWSKY, P.: See my comment on proposal 5-222.
MELLO, C.: See my ballot comments on proposal 5-222. The panel should consider using the term "dedicated equipment grounding conductor" in the fine print note.

5-305 Log #2491 NEC-P05 **Final Action: Reject**
(250.146(D))

Submitter: Lanny G. McMahill, Phoenix, AZ
Recommendation: Revise text to read as follows:
(D) Isolated Receptacles. Where required for the reduction of electrical noise (electromagnetic interference) on the grounding circuit, a receptacle in which the grounding terminal is purposely insulated from the receptacle mounting means shall be permitted. The receptacle grounding terminal shall be grounded by an insulated equipment grounding conductor run with the circuit conductors. This grounding conductor shall ~~be permitted to pass through one or more panelboards without connection to the panelboard grounding terminal as permitted in 408.40, Exception, so as to~~ terminate within the same building or structure directly at an equipment grounding conductor terminal on the load side of the applicable derived system or service.
Substantiation: This proposal is intended to clarify the requirement and condense the language. As currently worded, the insulated equipment grounding conductor must be routed back to the applicable derived system or source. This seems overly restrictive. Where the insulated equipment grounding

conductor terminates should be a design consideration - especially when considering that it is required to terminate on the load side of the source or system. For example, the source could be 300 ft away from the receptacle. A designer may wish to provide the isolate equipment grounding terminal in a panelboard located within 50 ft of the receptacle. Why prohibit this or for that matter what is the safety concern? In addition, requiring the conductor to be routed all the way back to the source or system could be in conflict with the requirements for an "effective ground-fault current path." The code should not mandate on the load side of the source or system where this conductor must terminate as it has nothing to do with electrical safety. Whether the conductor terminates directly at the source or somewhere downstream should be a design consideration. In addition, the reference to 408.40, Exception is unnecessary, as it is only applicable to panelboards; "pass through one or more panelboards..." is unnecessary too as the conductor may need to pass through equipment, such as a junction or device box.

Panel Meeting Action: Reject

Panel Statement: Isolated ground circuits are not required to be installed. The use of the term permitted allows the isolated grounding conductor to be terminated in any panelboard in which the circuit is routed. See panel action and statement on Proposal 5-302.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-306 Log #475 NEC-P05 **Final Action: Reject**

(250.148)

Submitter: Ernest Harju, MJ Electric

Recommendation: Revise text to read:

A metal enclosure or box installed with a nonconductive raceway on a nonconductive surface shall be bonded to the equipment grounding conductor.

Substantiation: This section gives the impression that an equipment grounding conductor is in, all instances, not required to be bonded to the metal box if the wire is not broken in the box. When say 4 in. PVC is used with a metal box the box is left floating. Thus can become hot!

Panel Meeting Action: Reject

Panel Statement: The proposed revision does not add clarity or improve usability to this section. The concerns of the submitter are already addressed in the requirements contained in Sections 250.148 and 250.148(C).

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-307 Log #1077 NEC-P05 **Final Action: Reject**

(250.148)

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Revise text to read as follows:

CONTINUITY and ATTACHMENT of EQUIPMENT GROUNDING <u>and BONDING CONDUCTORS</u> to <u>ENCLOSURES</u> ~~BOXES~~ . ~~Where circuit conductors are spliced within a box or terminated on equipment within or supported by a box, any~~ <u>Wire-type</u> equipment grounding or bonding conductors ~~associated with those circuit conductors shall be spliced or joined within the box or to the box~~ <u>entering metal enclosures other than conduit bodies shall be attached to the enclosure</u> . ~~With devices suitable for the use in accordance with 250.148(A) through (E).~~

Exception; no change.

(A) CONNECTIONS . Connections ~~and splices~~ shall be in accordance with <u>250.8</u> . ~~110.14(B) except that insulation shall not be required.~~

(B) GROUNDING <u>and BONDING</u> CONTINUITY . The arrangement of grounding <u>and bonding</u> connections shall be such that the disconnection or removal of ~~a receptacle, luminaire (fixture), or other device fed from the box~~ <u>any equipment supported by or supplied from the enclosure</u> does not interfere with or interrupt the grounding <u>or bonding</u> continuity.

Delete present (C) change present (D) to (C) and revise:

(C) NONMETALLIC ENCLOSURES BOXES . One or more equipment grounding or bonding conductors ~~brought into~~ <u>entering</u> a nonmetallic ~~outlet box~~ <u>enclosure</u> shall be arranged such that a connection can be made to any ~~fitting or device~~ <u>equipment</u> in ~~that box~~ or supplied from the <u>enclosure</u> ~~requiring grounding~~ <u>that is to be grounded or bonded</u> .

Delete (E).

Substantiation: Edit. Enclosures other than "boxes" should be included. Reference to circuit conductors is superfluous and irrelevant and limits the requirements to where circuit conductors are spliced or terminated on equipment within or supported by a box but not where conductors run through without a splice. Wire type grounding and bonding conductors should be specified, as grounding and bonding can be done by other means. Bonding conductors (wire type) may also enter enclosures by way of raceways per 250.102(E). Where installed on the outside of raceways, terminal fittings with lugs provide for attachment. The phrase "or to the box" appears to literally be an option NOT to connect it to the box. "Devices suitable for use" is superfluous, already covered by (A). In (A), a reference to 250.8 is more specific for grounding and bonding conductors. In (B), a reference to bonding conductors is also applicable. The proposed reference to 250.8 in (A) makes present (C) and (E) unnecessary. The requirement in present (D) should apply whether grounding is required or done by choice.

Panel Meeting Action: Reject

Panel Statement: This proposal is not editorial. The is no technical substantiation to remove the phrase "spliced or joined within the box or to the box ". The proposed text does not add clarity.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-308 Log #534 NEC-P05 **Final Action: Reject**

(250.148(C) Exception)

Submitter: Scott Cooper, Piper Electric Co.

Recommendation: Revise text to read:

(C) Metal Boxes. A connection shall be made between the one or more equipment grounding conductors and a metal box by means of a grounding screw that shall be used for no other purpose, or a listed grounding device.

<u>Exception: If the metal box is used solely as a pull box and there are no splices, devices, or terminations present, and no concentric or eccentric knock outs were utilized, the grounding requirement shall be waived.</u>

Substantiation: 250.148 states where circuit conductors are spliced within in a box, or terminated on equipment within or supported by a box, any equipment grounding conductor(s) associated with those circuit conductors shall be spliced or joined within the box or to the box with devices suitable for the use in accordance with 250.148(A) through (E).

250.148(C) only makes reference to metal boxes. Addressing pull boxes specifically, would help eliminate any confusion with the interpretation of this section of the code.

Panel Meeting Action: Reject

Panel Statement: The proposal does not add clarity or improve usability of this section. The concerns of bonding are already addressed in Sections 250.110, 250.134, and 314.4.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-309 Log #1012 NEC-P05 **Final Action: Reject**

(250.160)

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Revise as follows:

GENERAL . Direct-current systems shall comply with Part VIII and other <u>applicable</u> sections of Article 250 ~~not specifically intended for alternating-current systems.~~

Substantiation: Many of the rules in Article 250 specifically relate to ac systems; some do not. In the 2004 ROP, the panel statement was 250.28 does not exclude dc systems. However, that section requires a main bonding jumper at the service disconnect which is not permitted by 250.164(A). Also, the size of the bonding jumper specified in 250.28(D) conflicts with 250.168. An assumption can be made that 250.28 does not apply to dc systems.

Panel Meeting Action: Reject

Panel Statement: The proposed text does not add clarity. The existing wording is clear.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-310 Log #2064 NEC-P05 **Final Action: Accept**

(250.166)

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum

Recommendation: Revise 250.166 as follows so that 250.166 (C), (D), and (E) are clearly exceptions to 250.166 (A) and (B) as they were in the *1996 NEC* .

250.166 Size of the Direct-Current Grounding Electrode Conductor. The size of the grounding electrode conductor for a dc system shall be as specified in 250.166 (A) and (B), <u>except as permitted by 250.166 (C) through (E).</u>

Substantiation: As Section 250.166 is currently written, sections 250.166 (A) and (B) are in direct conflict with sections 250.166(C), (D), and (E). Many electricians and inspectors are not able to determine which section takes precedence. For example, many dc systems are not as described in Section 260.166 (A), so section 250.166 (B) applies. However, the use of a ground rod electrode would require Section 250.166(C) to be applied. Sections 250.166 (B) and (C) dictate two different sizes of grounding electrode conductors. Revising the first sentence in this section as shown will add clarity to the code. This language parallels the language in 250.66 for ac grounding-electrode conductors.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-311 Log #956 NEC-P05 **Final Action: Reject**

(250.166(A))

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Revise as follows:

(A) Where the dc system consists of a 3-wire balancer set or a balancer winding with overcurrent protection as provided in 445.12(D) the grounding electrode conductor shall not be smaller than the largest conductor supplied by

the system if made of the same material, or if made of different materials shall have an ampacity not less than the ampacity of the largest conductor supplied by the system and not smaller than 8 AWG copper or 6 AWG aluminum.
Substantiation: Edit. Consideration should be given to neutral and grounding conductors of different material.
Panel Meeting Action: Reject
Panel Statement: This proposal is not editorial. The proposed text does not add clarity. The present text is clear.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-312 Log #1112 NEC-P05 **Final Action: Reject**
(250.167 (New))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Add:
GROUNDING ELECTRODE CONDUCTOR TAPS . It shall be permissible to connect taps from multiple direct-current separately derived systems to a common grounding electrode conductor provided:
1. Each tap conductor is sized in accordance with 250.166.
2. All tap connections to the common grounding electrode conductor are accessible and made by irreversible compression connections, listed connectors to a copper busbar not less than 6 mm x 50 mm (1/4 in. x 2 in.) or by exothermic welding, in a manner such that the common grounding electrode conductor is continuous without splice or joint. The common grounding electrode conductor shall be sized in accordance with 250.166 based on the total area of the neutral conductor(s) as covered in 250.166(A), or the largest conductor(s) as covered in 250.166(B), as applicable.
Exception: The common grounding electrode conductor shall be permitted to be sized in accordance with 250.166(C), (D), an (E).
Substantiation: 250.30(A)(4) and 250.64(D) have provisions for ac system taps which should be applicable for separately derived dc systems.
Panel Meeting Action: Reject
Panel Statement: There is no demonstrated need for such a provision. There is no technical substantiation for this proposal.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-313 Log #999 NEC-P05 **Final Action: Reject**
(250.168)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
DIRECT CURRENT SYSTEMS B onding J umper. For direct current grounded systems an unspliced bonding jumper shall be used to connect the equipment grounding conductor(s) to the grounded conductor at the source where the system is grounded. ~~For direct current systems~~ T he size of the bonding jumper shall not be smaller than the system grounding electrode conductor s pecified in 250.166 and shall comply with the provisions of 250.28(A), (B), and (C) .
Substantiation: There doesn't seem to be a specific requirement to install a bonding jumper for a grounded conductor and equipment grounding conductors. 250.28 doesn't appear to include dc systems. (See my proposas for 250.160, 250.34(C) doesn't cover dc generators since the reference to 250.26 involves only ac systems.
Panel Meeting Action: Reject

(250.170 Exception No. 2 (New))

Submitter: Thomas F. Mueller, Southern Company Services
Recommendation: Add another exception to this paragraph as follows:
Exception No. 2: Where current transformer secondaries are connected in a three phase delta configuration.
Substantiation: Differential relaying circuits that "wrap around" wye-delta transformers are required to also be connected wye and delta. That is, the set on the delta side is connected in wye while the set on the wye side is connected in delta. Grounding of the delta side current transformers cannot be done if proper relaying is to be accomplished.
Panel Meeting Action: Accept in Principle
Revise the recommendation to add another exception to this paragraph as follows:
Exception No. 2: Current transformer secondaries connected in a three phase delta configuration shall not be required to be grounded.
Panel Statement: The panel action meets the intent of the submitter. The exception was reworded to form a complete sentence.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-315 Log #1567 NEC-P05 **Final Action: Accept**
(250.182)

Submitter: Technical Correlating Committee on National Electrical Code
Recommendation: Make the following change in 250.182:
Change "neutral" to "neutral point."
The revised text would appear as follows:
A system neutral point derived from a grounding transformer shall be permitted to be used for grounding high-voltage systems.
Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).
The Task Group has proposed the following definitions to be added to Article 100:
● **Neutral conductor.** A circuit conductor connected to the neutral point of a system.
● **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.
This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals
● The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.
● The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.
Additional information is available in the Task Group report.
Note: Supporting material is available for review at NFPA Headquarters.

Ballot Results: Affirmative: 15

5-318 Log #2429 NEC-P05 **Final Action: Reject**
(250.184(A)(1) Exception No. 1, 2 & 3)

Submitter: Donald W. Zipse, Zipse Electrical Engineering, Inc.

Recommendation: Delete Section 250.184 (A) (1) Exception 1 & Exception 2 and Exception 3.

Substantiation: It is important to re-state the **PURPOSE OF THE NEC: It is the safeguarding of persons from hazards arising from the use of electricity.**

By continuing to allow the "grounded circuit conductors", commonly referred to as the neutral to be installed bare allows the neutral current to flow uncontrolled over the earth. This uncontrolled flow of "stray current" results in the potential to harm not only humans but to cows and pigs.

When a person reports to me that, they are getting an electric shock from their swimming pool, hot tub, shower or a dairy farmer with cows, the first thing I determine is if the neutral conductors within the structure is free from neutral conductor-to-earth faults. This eliminates the owner of the property from contributing to the problem. The NEC by continuing to allow the installation of bare grounded circuit conductors, the neutral, contributes to the flow of uncontrolled dangerous and hazardous neutral currents over the earth.

There are three (3) sources of these dangerous and hazardous stray currents. One is from stray bare grounded circuit conductors (NEC) the neutral originating from the utility's secondary power, the service entrance source. The second source is the bastardized transformer's high voltage primary neutral to secondary neutral connection.

The third source is multigrounded neutral electrical distribution system neutral connection to earth four (4) times per mile. The stray current either enter the bare neutral conductor and travel back to the substation or conversely the stray current flows into the bare grounded conductor and enters the earth on its way back to the substation. In either case, the dangerous and hazardous stray current is flowing one way or the other and the NEC allowed bare neutral conductor is in the circuit.

EPRI: "Created by the nation's electric utilities in 1973, EPRI is one of America's oldest and largest research consortia, with some 700 members and an annual budget of about $ 500 million. Linked to a global network of technical specialists, EPRI scientists and engineers develop innovative solutions to the world's toughest energy problems while expanding opportunities for a dynamic industry."

An EPRI document states that 40 to 60 percent of the neutral return current in a multigrounded neutral electrical distribution system returns over the earth. We have measured 88 percent of the neutral current returning over the earth (Court documents).

This dangerous and hazardous stray current will use the bare grounded circuit conductor, the neutral, that is presently allowed by the NEC to either flow from the multigrounded neutral electrical distribution system into the earth on its way back to the substation or will flow onto the bare neutral conductor, the neutral, and onto the multigrounded neutral electrical distribution system in order to get back to the substation.

I suggest that for your own edification you obtain the proposal to eliminate the equipotential planes in 547.2 and 547.10. In addition, if you are interested in more information on multigrounded neutral electrical distribution system see the technical paper titled, "The Hazardous Multigrounded Neutral Distribution System and Dangerous Stray Currents", Copyright Material IEEE Paper No. PCIC-03-03.

Zipse's Law states "In order to have and maintain an electrical installation safe from electrical shocks and to prevent electrocution from stray current: All continuously, flowing current shall be contained within a conductor, insulated from earth, except at one place within the system and only one place can the neutral be connected to earth."

This is accomplished within industrial facilities since they do not make the bastardized electrical transformer connection between the primary neutral and the secondary neutral, which allows the continuous flow of dangerous and hazardous high voltage neutral current over the equipment grounding conductor and the earth. The industrial facilities keep the neutral insulated and carry the ground conductor with the phase conductors. (See IEEE Standard 141, "Recommended Practice for Industrial Electrical Power Distribution", The Red Book.

Panel Meeting Action: Reject

Panel Statement: The submitter has presented no credible evidence that supports his claim that normal neutral return current that leaves the confines of an un-insulated grounded conductor, is "dangerous or hazardous". The exceptions the submitter wishes to delete do not mandate any type of installation. They are permissive statements that provide options for design. The NEC is a minimum standard of electrical safety. It is not a design standard. The design of an electrical system is specific to its purpose. For systems in excess of 1000 volts there are a variety of factors that may dictate system design (e.g. industrial processes, system size, system location, etc.). The existing code for Systems and Circuits of 1 kV and Over appropriately allows for a variety of grounding alternatives. Acceptance of this proposal would significantly limit system design capabilities and unnecessarily make the affected section of the NEC a design standard, not a safety standard.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

RAPPAPORT, E.: The submitter has presented credible evidence both here and in Proposal 5-327 of the hazards of multi-ground neutral systems. In this case, he is attempting to remove a hazard in Exception No. 1 that occurs when either a multi-grounded neutral system or a single point grounded system has a bare neutral conductor in the ground. In the multi-grounded neutral system, the neutral conductor has a continuous connection to the earth which is not permitted. What is permitted is the connection to earth every 400 meters and at transformers - not continuous connection. In the single point grounded system, the neutral is being connected to ground at more than one point in violation of 250.184(B)(7). See also Negative Comment on Proposal 5-327.

Comment on Affirmative:

HAMMEL, D.: See my comment on Proposal 5-327.

5-319 Log #1569 NEC-P05 **Final Action: Accept**
(250.184(A)(1) Exception No. 2)

Submitter: Technical Correlating Committee on National Electrical Code

Recommendation: Make the following change in 250.184(A)(1) Exception No. 2:

Change "neutral" to "neutral conductor."

The revised text would appear as follows:

Exception No. 2: Bare conductors shall be permitted for the neutral conductor of overhead portions installed outdoors.

Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).

The Task Group has proposed the following definitions to be added to Article 100:

● **Neutral conductor.** A circuit conductor connected to the neutral point of a system.

● **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.

This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals

● The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.

● The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.

Additional information is available in the Task Group report.

Note: Supporting material is available for review at NFPA Headquarters.

5-320 Log #1570 NEC-P05 **Final Action: Accept**

(250.184(A)(1) Exception No. 3)

Submitter: Technical Correlating Committee on National Electrical Code

Recommendation: Make the following change in 250.184(A)(1) Exception No. 3:

Change "neutral grounded conductor" to "grounded neutral conductor."

The revised text would appear as follows:

Exception No. 3: The ~~neutral grounded~~ grounded neutral conductor shall be permitted to be a bare conductor if isolated from phase conductors and protected from physical damage.

Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).

The Task Group has proposed the following definitions to be added to Article 100:

● **Neutral conductor.** A circuit conductor connected to the neutral point of a system.

● **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.

This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals

● The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.

● The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.

In this section, a grammatical change is proposed to be consistent with the proposed new defintition

Additional information is available in the Task Group report.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-321 Log #1571 NEC-P05 **Final Action: Accept**

(250.184(B))

Submitter: Technical Correlating Committee on National Electrical Code

Recommendation: Make the following change in 250.184(B):

Add the word "Neutral" to the Title.

The revised text would appear as follows:

(B) Single Point Grounded <u>Neutral</u> System. Where a single point grounded neutral system is used, the following shall apply:

Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).

The Task Group has proposed the following definitions to be added to Article 100:

● **Neutral conductor.** A circuit conductor connected to the neutral point of a system.

● **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.

This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals.

● The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.

● The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.

In this section, a clarification is proposed for consistency with modifications done last cycle.

Additional information is available in the Task Group report.

Note: Supporting material is available for review at NFPA Headquarters.

(250.184(B)(1))

Submitter: Technical Correlating Committee on National Electrical Code

Recommendation: Make the following change in 250.184(B)(1):

Add the word "neutral" before "system."

The revised text would appear as follows:

(1) A single point grounded <u>neutral</u> system shall be permitted to be supplied from (a) or (b):

Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).

The Task Group has proposed the following definitions to be added to Article 100:

● **Neutral conductor.** A circuit conductor connected to the neutral point of a system.

● **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.

This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals

● The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.

● The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.

In this section, a clarification is proposed for consistency with modifications done last cycle.

Additional information is available in the Task Group report.

Note: Supporting material is available for review at NFPA Headquarters.

Ballot Results: Affirmative: 15

5-323 Log #1573 NEC-P05 **Final Action: Accept**

(250.184(B)(1)b.)

Submitter: Technical Correlating Committee on National Electrical Code

Recommendation: Make the following change in 250.184(B)(1):

Change "neutral" to "neutral conductor." Add the word "neutral" before "system."

The revised text would appear as follows:

b. A multigrounded neutral system with an equipment grounding conductor connected to the multigrounded neutral <u>conductor</u> at the source of the single point grounded <u>neutral</u> system.

Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).

The Task Group has proposed the following definitions to be added to Article 100:

● **Neutral conductor.** A circuit conductor connected to the neutral point of a system.

● **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.

This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals

● The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.

● The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.

In addition in this section, a clarification is proposed for consistency with modifications done last cycle.

(250.184(C))

Submitter: Donald W. Zipse, Zipse Electrical Engineering, Inc.
Recommendation: Delete Section 250.184 (C).
Substantiation: I thank Code Making Panel 5 for the detailed response to my 2005 Proposal.
I remind the Panel of Zipse's Law which states "In order to have and maintain an electrical installation safe from electrical shocks and to prevent electrocution from stray current: All continuously, flowing current shall be contained within a conductor, insulated from earth, except at one place within the system and only one place can the neutral be connected to earth." This should be your guiding light.
Over the past three years additional information has been obtained that clearly shows the error of Code Making Panel 5 in accepting the expanded section on the multigrounded neutral electrical distribution system into the NEC.
The following peer reviewed Institute of Electrical and Electronic Engineers Technical paper will provide the previously requested existing science or engineering principles, which is attached. See NFPA 70, Report on Proposals – May 2004 page 622, 5-257 Log #3370. The basis of the paper is technical papers by others dating back to the early 1900s.
The studies cited in the Panel's Statement are slowly being negated and proven to be false especially since most were funded by the utilities. (Fact) Consult Gorewit v. Behr defamation suit that will result in the demand on the Journal of Dairy Science to retract the two articles published in 1992 reporting this research and placing Cornell studies in questionable state.
It is doubtful if the reader of the final report of VitaTech Engineering, hired by the National Regulatory Institute was analyzed since it is clearly evident that in the prime case (FACT) 5.5 amperes of stray current was returning over the earth as Vita Tech measured at the substation. This was in addition to the stray current that Vita Tech found all over the area. (Opinion DWZ) It is also evident from the testimony present to the New Jersey Board was one sided and failed to present the whole picture.
Since you want facts and you used Vita Tech in you reply, I therefore can also use the very same information to prove my point that stray current is harmful. Pity anyone of the Panel members who have similar stray current problems as (FACT) it is doubtful if your house will be accepted by a realtor for sale, nor will a mortgage be available to any house with stray current problems similar to the NJ problem.
(FACT) I have measured the NJ house and there is stray current coming from the utilities multigrounded neutral electrical distribution system that shocked the homeowner.

(FACT) It should be noted that Vita Tech recommendation did not work out. I am quoted in the Asbury Park Press as stating increasing the neutral to a larger size would not solve the stray current problem. In fact, a year later Georgia Institute of Technology also stated the solution suggested by Vita Tech would not work. I wonder why the Panel selected such a questionable report for a response to my proposal.

In fact, in the New Jersey case the electrical distribution system was a three wire with the transformers connected phase-to-phase. (FACT) It was not until the distribution system was changed about 5 years ago to the unsafe multigrounded neutral electrical distribution system that there were any stray voltage, stray current problems.

As far as California is concerned, the GO-95 is not retroactive as is the NEC. In September 2004, I personally visited several electric companies in the north-central part of the state where the dairy industry is re-locating, and found NOT ONE company using the multigrounded neutral electrical distribution system. In fact, they were aware of the dangers and stated how unsafe the multigrounded neutral electrical distribution system was.

Now let us discuss the Minnesota Science Advisors report that the Panel relies upon to discredit D. W. Zipse's proposal.

(FACT) The Supreme Court of Wisconsin states the utility "WEPCO also references the report of the so-called Minnesota Science Advisors concerning the influence of ground currents on dairy farms. It quotes a conclusion in that report at page 14 of its Brief, but fails to note evidence introduced at trial that one of the Science Advisors, Dr. Charles Polk publicly disagreed with the way the conclusion was expressed. According to Dr. Polk, the Science Advisors "could have just as well said that we have not found credible, scientific evidence that (ground currents) are **not** causes of poor health and milk production in dairy herds." (R.169, p. 89) Further, the Science Advisors made no mention in the Conclusion of their report of finding "significant differences between high and low-producing herds in the levels of electrical step potentials and soil resistivity in the field." (R.169, p. 90) "

So the citing of the Minnesota Science Advisors report is less than a foolproof document supporting the Panel's position. For more comments against the report see Hoffmann v. WEPCO STATE OF WISCONSIN SUPREME COURT, Appeal No. 00-2703.

The Panel's Statement included the following: "The fact that multi-grounded systems above 1000 volts are presently allowed in the NEC and have been there for many years, seems to contradict the submitter's comment that these systems are a recent addition to the NEC." That is partially true. It was extensively revised about two cycles ago by a special committee led by Mr. William M. Lewis. I did not learn of the extent of the danger and hazard of the multigrounded neutral electrical distribution systems until I under took an extensive 2 to 3 month research project on multigrounded neutral electrical distribution systems begun in January of 2002.

The panel stated that I was "attempting to mandate as the only method" the uni-grounded system. (Last paragraph page 623, 2005 ROP) (FACT) Section 250.184 allows only two methods, a safe and an unsafe solidly grounded method. Section 250.186 also allows another type of electrical system.

If one were to read the attached technical paper, they would see that there are several safe wiring methods. There are several variations of the uni-grounded system. All begin at the substation transformer with a single point ground on the neutral, uni-grounded. However, there are several variations of the uni-grounded systems:

1) Three wire delta distribution systems with phase-to-phase connected transformers;

2) The four-wire delta distribution system with phase-to-phase connected transformers with a multiple grounded conductor (equipment ground) and

3) The five-wire electrical distribution system with a multigrounded (equipment) ground conductor and an insulated and isolated neutral which is similar if not exactly the same as is used extensively in industry and commercial buildings.

In addition, there exist substations with un-grounded distributions systems.

There are options, two safe types of distributions systems and one unsafe system, the multigrounded neutral electrical distribution system.

NEW INFORMATION

EPRI: "Created by the nation's electric utilities in 1973, EPRI is one of America's oldest and largest research consortia, with some 700 members and an annual budget of about $ 500 million. Linked to a global network of technical specialists, EPRI scientists and engineers develop innovative solutions to the world's toughest energy problems while expanding opportunities for a dynamic industry."

(FACT) An EPRI document states that 40 to 60 percent of the neutral return current in a multigrounded neutral electrical distribution system returns over the earth. (TR-113566, section 1- page 5) We have measured 88 percent of the neutral current returning over the earth (Court documents).

(FACT) The multigrounded neutral distribution system came into use after the Second World War. One of the first Institute of Electrical and Electronic Engineers' technical papers on multigrounded neutral distribution systems was published in 1946 and it detailed the savings in installation costs - no words about safety as the hazardous and dangerous effects of the multigrounded neutral distribution system were not known or recognized until about 1980.

(FACT) 1914 J. P. Jollyman, et al., writes about the Pacific Gas and Electric Company's practices of using the neutral allowing one less wire, one less fuse cutout, one less lightning arrester, less insulators, the list goes on and on of the cost savings. Many farms were not still connected to the electrical distribution systems and those that were had only a well pump and a cream separator along with resistance loads such as lights, ovens and hot water heaters.[Electricity On The Farm, Feb. to Aug. 1930, G. E. History, Schenectady Museum, Schenectady, NY.] The loads were small and insufficient amounts of stray current flowed over the earth and did little harm then. As the electrical loads increased more and more electric current flowed over the earth resulting in more and more harm.

(FACT) Farmers were forced out of the business (Allen v. WPS) Since the utility, WPS failed to correct the electrical distribution system Mr. Allen was forced to sell his cows. (FACT) Three years ago on one farm alone five cows died per day, over 1800 per year - the herd was replaced twice - as a result of stray current emanating from the utility multigrounded neutral distribution system. (Victory Farms v. Wheatstone, SD) (FACT) Cows will not drink since they get shocked. Without water, they develop mastitis and die. (Consult the Ag. Red Book)

Do not forget Zipse's Law.

The multigrounding of the neutral results in uncontrolled flow of current across the earth causing harm to animals, cows and pigs and to humans. For the latest human electrical problems resulting from multigrounded neutrals & stray current also know (incorrectly) as stray voltage see www.app.com and scroll down to "stray voltage" where there are over a dozen articles of persons in NJ with problems with multigrounded neutrals.

California Public Service Commission has prohibited using the earth as a return conductor, either partial or total since 1994. There are no reports of stray current from the utilities electrical distribution systems in the dairy areas of CA. (FACT – Testimony of Mr. L. C. Neubauer). Multigrounded neutral electrical distribution systems are inherently hazardous and dangerous. Otherwise why would the Attorney General of Michigan be bringing cause in the PUC against a utility that admits that 70 percent of the return current flows uncontrolled over the earth causing fatal harm to cows.

Multiple legal cases are in the courts against the utilities now for causing harm against animals and humans. (FACT) Wisconsin Supreme court has ruled on such a suit requiring the utility to rewire the multigrounded neutral electrical distribution system to a farm and it was decided for the dairy farmer. Since this case went all the way to the WI Supreme Court, the details follow. (ALLAN HOFFMANN and BEVERLY HOFFMANN, Plaintiffs-Respondents-Cross-Appellants, Supreme Court WI, Appeal No. 00-2703 vs. WISCONSIN ELECTRIC POWER CO., Defendant-Appellant-Cross-Respondent-Petitioner. Appeal From The Circuit Court Of Waupaca County The Honorable Philip M. Kirk, Presiding Trial Court Case No: 97-CV-144)

(FACT) One of the questions asked, "Was the jury's verdict supported by substantial evidence?" The Court answered, "This question was answered in the affirmative by both the trial court and the Court of Appeals."

(FACT) The Court also stated, "The plaintiffs also introduced substantial evidence that ground currents harmed their cows." Healthy cows and humans have approximately the same internal resistance, 500 Ohms.

Now the Panel's reply to this proposal in the 2005 cycle consisted mainly of using the following reason, "The submitter's use of farm and livestock examples are not only anecdotal in nature, they are off the mark." As has been shown above the statements have now been declared "FACT" by submitting court records, other factual substantiation and best of all using the panel's own citation of Vita Tech report, which actually agreed with Mr. Zipse's statements.

When jury after jury made up of non-electrical persons and also lack knowledge about electrical distribution systems, the common folk can understand the harm of multigrounded neutral electrical distribution systems, one would expect the panel members with electrical knowledge to acquiesce, comply without protest, agree with this proposal.

The problem with multigrounded neutral electrical distribution systems will not go away. They are unsafe and the Panel needs to remove the section NOW and not after another 17 years.

The following paper is attached:

"The Hazardous Multigrounded Neutral Distribution System And Dangerous Stray Currents", Copyright Material IEEE, Paper No. PCIC-03-03

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The submitter has presented no credible evidence that supports his claim that normal neutral return current that leaves the confines of an un-insulated grounded conductor, is "dangerous or hazardous".

The section the submitter wishes to delete does not mandate any type of installation. This section provides guidance if a multi-grounded neutral system is chosen by a designer. The NEC is a minimum standard of electrical safety. It is not a design standard. The design of an electrical system is specific to its purpose. For systems in excess of 1000 volts there are a variety of factors that may dictate system design (e.g. industrial processes, system size, system location, etc.). The existing code for Systems and Circuits of 1 kV and Over appropriately allows for a variety of grounding alternatives. Acceptance of this proposal would significantly limit system design capabilities and unnecessarily make the affected section of the NEC a design standard, not a safety standard.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

RAPPAPORT, E.: This proposal should be Accepted.

The panel statement that no credible evidence has been presented indicates that the panel has not bothered to read the substantiation with an open mind.

Mr. Zipse has presented example after example of the effects of stray current. He has included numerous additional substantiation not previously submitted. In addition, he included, in Proposal 5-318, an EPRI report that indicated that 40 to 60 percent of neutral current (on multi-grounded neutral systems) return through the earth. EPRI is primarily a Utility funded organization. How much more substantiation is necessary? As a matter of fact, this section was added into this Article several cycles ago based upon the substantiation that the same text exists in the National Electrical Safety Code. The fact that the NESC is applicable to electric utility wiring and not applicable to premises wiring was not relevant at the time.

The submitter has presented credible documented evidence of how stray currents from multi-grounded neutral systems get into the earth and are hazardous. It doesn't take a rocket scientist to see that the earth is in parallel with each multiple grounding point and, by Kirchoff's Laws, the current will divide inversely proportional to the impedance in each path.

What were the arguments to reject this proposal? This method is permitted by the NESC and the utilities follow this practice. This Code is not applicable to the utilities as clearly stated in the Scope in 90.2(B)(5) which states under the heading "Not Covered" "Installations under the exclusive control of an electric utility...". Another argument was that there are some large tracts of land (such as logging) that are fed primary and the distribution is premises wiring. Industrials with similar large tract installations have installed dedicated transformers to supply the required load without multi-grounding neutral conductors. One alternative is to provide an exception for existing installations. This would insure that all new installations after the effective date of the Code would use single point neutral grounding systems only. If multi-point neutral grounding is acceptable for high voltage systems (1 Kv and over), why is similar flexibility not provided for low voltage systems (below 1 Kv)? Is it the panel's rationale that it is unsafe to multi-ground neutral conductors in systems below 1 Kv but it is OK to do so in systems of 1 Kv and over?

This issue will not go away. It is a safety issue and not a design issue. It would be informative to have feedback from the public on the use, disuse, or misuse of multi-grounded neutral systems for premises wiring by deleting this option at this time.

Comment on Affirmative:

HAMMEL, D.: This section should provide some guidance as to where a multi-grounded neutral system can be safely chosen by a designer. The NEC is a minimum standard of electrical safety. There is a need to design safety into an electrical system.

5-328 Log #1577 NEC-P05 **Final Action: Accept**
(250.184(C)(1))

Submitter: Technical Correlating Committee on National Electrical Code
Recommendation: Make the following change in 250.184(C)(1):

Change "neutral" to "neutral conductor."

The revised text would appear as follows:

(1) The neutral <u>conductor</u> of a solidly grounded neutral system shall be permitted to be grounded at more than one point. Grounding shall be permitted at one or more of the following locations:

Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).

The Task Group has proposed the following definitions to be added to Article 100:

- **Neutral conductor.** A circuit conductor connected to the neutral point of a system.
- **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.

This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals

- The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.
- The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.

Additional information is available in the Task Group report.

Note: Supporting material is available for review at NFPA Headquarters.

5-331 Log #1579 NEC-P05 **Final Action: Accept**
(250.184(C)(3))

Submitter: Technical Correlating Committee on National Electrical Code
Recommendation: Make the following change in 250.184(C)(3):
Delete the word "circuit."
The revised text would appear as follows:
(3) At least one grounding electrode shall be installed and connected to the multigrounded neutral ~~circuit~~ conductor every 400 m (1300 ft).
Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).
The Task Group has proposed the following definitions to be added to Article 100:
● **Neutral conductor.** A circuit conductor connected to the neutral point of a system.
● **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.
This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals
● The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.
● The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.
In this section, the word "circuit" is not needed with the new proposed definition of "neutral."
Additional information is available in the Task Group report.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-332 Log #1580 NEC-P05 **Final Action: Accept**
(250.186(C))

Submitter: Technical Correlating Committee on National Electrical Code
Recommendation: Make the following change in 250.186(C):
Change "neutral" to "neutral conductor."
The revised text would appear as follows:
(C) System Neutral Connection. The system neutral <u>conductor</u> shall not be connected to ground, except through the neutral grounding impedance.
Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).
The Task Group has proposed the following definitions to be added to Article 100:
● **Neutral conductor.** A circuit conductor connected to the neutral point of a system.
● **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.
This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals
● The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.
● The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.
Additional information is available in the Task Group report.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept
Panel Statement: Editorially revise the title of (c) to read as follows: System Neutral <u>Conductor</u> Connection.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-333 Log #1581 NEC-P05 **Final Action: Accept**
(250.188(A))

Submitter: Technical Correlating Committee on National Electrical Code
Recommendation: Make the following change in 250.188(A):
Change "neutral" to "neutral conductor" in first location. Change second appearance of "neutral" to "neutral point and associated neutral conductor."
The revised text would appear as follows:
(A) Portable or Mobile Equipment. Portable or mobile high-voltage equipment shall be supplied from a system having its neutral <u>conductor</u> grounded through an impedance. Where a delta-connected high-voltage system is used to supply portable or mobile equipment, a system <u>neutral point and associated neutral conductor</u> shall be derived.
Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).
The Task Group has proposed the following definitions to be added to Article 100:
● **Neutral conductor.** A circuit conductor connected to the neutral point of a system.
● **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.
This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals
● The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.
●The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.
Additional information is available in the Task Group report.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept
Panel Statement: Editorially adjust underlined text in last sentence of 250.188(A) in the recommendation to read as follows:
Where a delta-connected high-voltage system is used to supply portable or mobile equipment, a system neutral <u>point and associated neutral conductor</u> shall be derived.

Ballot Results: Affirmative: 15

5-334 Log #1668 NEC-P05 **Final Action: Reject**
(251 (New))

Submitter: Ben Jacks, Seattle, WA
Recommendation: Add new Article 251 Electrical Bonding. Along with the proposed general requirements, new definitions, scope, and sections related to the proper bonding of all conductors, etc. to read as follows:

Article 251
ELECTRICAL BONDING

I. General
251.1 Scope. This article governs general requirements for bonding of electrical conductors and requirements in the following (1) through (6) parameters:
(1) Surfaces permitted, or not permitted to be bonded.
(2) Conductor bonding of dissimilar metal surfaces
(3) Surface parent material plating or coating maintained
(4) Area bonding surface for conductor sizes
(5) Methods of Permanent and Semi-permanent bonds
(6) Electrical Conditions bond connection requirements
251.2 Definitions
Bond Fault. An unintentional, electrically non-conducting connection between current-carrying conductors or parts and other intended bonded conductors.
Effective bonding joint path. An intentionally constructed permanent or semi-permanent conductive connection interface between metal or semi-conductors designed and intended to carry current under environmental conditions from all points of mechanical installation.
Faying Surface. Joining surfaces that allow an intentional unimpeded current flow through the conductive parts.
Permanent Bond. Fused, welded, compressed, or crimped electrical conductors joined to be inseparable as comparable to current carrying parent material conductors.
Semi-Permanent Bond. Mechanical connections of conductors that require fastening hardware for a properly torqued connection force value to maintain an effective low impedance or low dc resistive characteristic applicable.

251.3 Application of Other Articles. In other articles applying to particular cases of installation of conductors and equipment, requirements of electrical condition purposes and classifications for bonds are identified in Table 251.3

251.4 General Requirements for Bonding. The general requirements identify what bonding of electrical conductors are required to accomplish. The methods contained in Article 250 shall be compliant to the prescriptive baseline of TABLE 251.3 requirements.

251.5 Circuit Power-Return Path (Class C). Circuit power quality is maintained with a default voltage drop standard value of 3.5% (4 volts for 120-volt systems). The drop allowed divided by the maximum current delivered shall give a total resistance in a circuit. The resistance includes the conductor wire, its connectors, and all the bonded joints in the path. The resistance limit for each joint can then be allocated.

251.6 Equipment Fault Protection (Class H). Fault current due to equipment case, frame, and structure, etc. leakage may develop potentials by induced or shorted failures. An electrical conductive bond with a resistance of 0.1 ohm or less at each joint connection is required to ensure operation of overcurrent protection devices to trip within 0.2 seconds after a hard short to case. Metallic conduit, cable trays, and other conductive objects susceptible to short circuits shall have a low resistance of 0.1 ohm or less for each joint connection to the system single point ground at the main service disconnect equipment.

251.7 Lightning Strike, Transients (Class L). Provisions for the lightning current and high voltage transients through bond joint areas of interfacing enclosure equipment include conduit, frames, and all conductive materials that converge into the single point ground bus of the main disconnect panel. This main ground bus also comprises both the grounded neutral and equipment grounding conductor terminal bars and is the main channel for lightning passage through the bond connected low impedance grounding of grounding electrode conductors and the grounded service conductor leading to any present earth embedded parallel electrodes.

251.8 Electromagnetic & Radio Frequency (Class R)
Direct contact between mating parts is the preferred faying surface method of electrical bonding. The dc resistance across each bond joint is 5 milliohm maximum to provide a uniform low-impedance path through the system. Where equipment is vibration prone or thermally isolated, bonding straps are alternate.

251.9 Electrostatic & Frictional Static (Class S).
Static and triboelectric charges can usually be dissipated through a low resistance requirement obtained by good bond contact between conductive and semi-conductive surfaces. Non-metallic plastic materials or composite structures are known to accumulate and discharge static energy that is capable of igniting reactive or unstable vapors, battery fumes, combustion fuels, and even suspended dust particles. A one-ohm strap bonded to ground is normally sufficient.

251.10 Services.

(A) Bonding of Services. The non-current-carrying metal parts of equipment indicated in 251.10 (A) (1), (A) (2), and (A) (3)
shall effectively bonded together.

(1) The service raceways, cable trays, cablebus framework, auxiliary gutters, or service cable armor or sheath except as permitted in 250.84.

(2) All service enclosures containing service conductors, including meter fittings, boxes or the like, interposed in the service raceway or armor.

(3) Any metallic raceway or armor enclosing a grounding electrode conductor as specified in 250.64(B). Bonding shall apply at each end and to all intervening raceways, boxes, and enclosures between the service equipment and the grounding electrode.

(B) Method of Bonding at the Service. Electrical continuity
at service equipment, service raceways, and service conductor enclosures shall be ensured by one of the following methods:

(1) Bonding equipment to the grounded service conductor in a manner provided in 250.8

(2) Connections utilizing threaded couplings or threaded
bosses on enclosures where made up wrench tight.

(3) Threadless couplings and connectors where made up tight for metal raceways and metal-clad cables

(4) Other listed devices, such as bonding-type locknuts, bushings, or bushings with jumper conductors.

Bonding jumpers meeting the other requirements of this article shall be used around concentric or eccentric knockouts that
are punched or otherwise formed as to impair the electrical connection to ground. Standard locknuts or bushings shall not be the sole means for the bonding required by this section.

Table 251.3 Bond Classifications Requirements

BOND CLASSIFICATIONS ESTABLISHED FOR ELECTRICAL CONDITIONS*

BOND CLASS	PURPOSE OF BOND	BOND REQUIREMENT	DC BOND RESISTANCE	FREQUENCY	CURRENT
CLASS 'C' CIRCUIT POWER & RETURN	Maintain power & reduce voltage losses of conductors required for intentional circuit current return to the AC system source.	Requires low impedance & low voltage across joints to assure adequate power prescribed to the load.	Bond resistance maximum depends load current.	Low	High
CLASS 'H' SHOCK HAZARD FAULT PROTECTION	Increases protection from inadvertent fire and shock hazards due to fault current shorts to equipment case, frame, parts or structure.	Requires low impedance & low voltage across joints to prevent fire hazards and reduce shock due to electrical shorts on non-energized metallic parts. Straps & jumpers are acceptable	Bond resistance 0.1 ohm or less. Special requirements when near flammable environs	Low	High
CLASS 'L' LIGHTING & TRANSIENTS PROTECTION	Applies to equipment, structure, and other parts that would carry current resulting from a lightning strike.	Requires low impedance at moderate frequency. Bonding components must withstand high current. Straps, conduit, jumpers stable at high magnetic forces.	Bond resistance requirement depends on current. Low inductance required.	High	High
CLASS 'R' RADIO FREQUENCY & ELECTRO-MAGNETIC INTERFERENCE	Applies to equipment that could generate retransmit, or be susceptible to RFI or EMI energy. Covers wide frequency range.	Requires low RF impedance at high frequency. Direct contact preferred without jumpers. Short wide strap may be used as last resort.	Bond resistance requirement 5.0 millonhms or less. Low inductance Required.	High	Low
CLASS 'S' ELECTRO STATIC	Protects materials from electrostatic charge or any item subject to static charging.	Allows moderate impedance. Jumpers & straps acceptable	Typical bonding resistance 1.0 ohm or less.	Low	Low

• Permanent Bond =Weld, compress, crimp. • High Frequency Bonds require low inductance paths. • High Current Bonds require large cross-sectional areas. • Semi-permanent=Bolt, Screw, rivet, clamp. • Low Frequency Bonds allow use of straps and jumpers. • Low Current Bonds allow use of small contact areas.

*Classification data taken from NASA-STD-PO23

251.11 Bonding for Other Systems. An accessible means external to enclosures for connecting intersystem grounding electrode conductors shall be provided at the service
equipment and at the disconnecting means for any additional buildings or structures by at least one of the following means:

(1) Exposed non-flexible metallic raceways

(2) Exposed grounding electrode conductor

(3) Approved means for the external bond connection of a copper or other corrosion-resistant grounding conductor to the grounded raceway or equipment

FPN No. 1: A 6 AWG copper conductor with one end bonded to the grounded non-flexible metallic raceway or equipment and with 150 mm (6 in.) or more of the other end made accessible on the outside wall is an example of the approved means as covered in 251.11(3).

FPN No. 2: See 800.100, 810.21, and 820.100 for grounding requirements for communication circuits, radio, and television equipment, and CATV circuits. Bonding is applicable to 251.3.

251.12 Bonding Other Enclosures.

(A) General. Metal raceways, cable trays, cable armor, cable sheath, enclosures, frames, fittings, and other metal non-current-carrying parts that are to serve as grounding conductors, with or without the use of supplementary equipment grounding conductors, shall be effectively bonded where necessary to ensure electrical continuity and the capacity to conduct safely any fault current likely to be imposed on them. Any non-conductive paint, enamel, or similar coating shall be removed at threads, contact points, and faying surfaces to be connected by means of fittings designed so as to make such removal unnecessary.

(B) Isolated Grounding Circuits. Where required for the reduction of electrical noise from Radio Frequency or Electromagnetic Interference on the grounding circuit, an equipment enclosure supplied by a branch circuit shall be permitted to be isolated from a raceway containing circuits supplying only that equipment by one or more listed non-metallic raceway fittings located at the point of attachment of the raceway to the equipment enclosure. The metal raceway shall comply with provisions of this article and shall be supplemented by an internal insulated equipment grounding conductor installed in accordance with 250.146(D) to ground the equipment enclosure.

FPN: Use of an isolated equipment grounding conductor does not relieve the requirement for grounding the raceway system.

251.13 Bonding for Over 250 volts. For circuits of over 250 volts to ground, the electrical continuity of metal raceways and cables with metal sheaths that contain any conductor other than service conductors shall be ensured by one or more of the methods specified for services in 251.10(B), except for (B)(1).

Exception: Where oversized, concentric, or eccentric knockouts are not encountered, or where a box or enclosure with concentric or eccentric knockouts is listed to provide a permanent, reliable electrical bond, the following methods shall be permitted:

(1) Threadless couplings and connectors for cables with metal sheaths

(2) Two locknuts, on rigid metal conduit or intermediate metal conduit, one inside and one outside of boxes and cabinets

(3) Fittings with shoulders that seat firmly against the box or cabinet, such as electrical metallic tubing connectors, flexible metal conduit connectors, and cable connectors, with one locknut on the inside of boxes and cabinets

(4) Listed fittings

251.14 Bonding Loosely Jointed Metal Raceways. Expansion fittings and telescoping sections of metal raceways shall be made electrically continuous by bonding equipment with jumpers or other means.

251.15 Bonding in Hazardous (Classified) Locations. Regardless of the voltage of the electrical system, the electrical continuity of non-current-carrying metal parts of equipment, raceways, and other enclosures in any hazardous location as defined in Article 500 shall be ensured by any of the methods specific in 251.10(B)(2) through (B)(4) that are approved for the wiring method used. One or more of these bonding methods shall be used whether or not supplementary equipment grounding conductors are installed.

251.16 Equipment Ground Jumpers.

(A) Material. Equipment jumpers shall be of copper or other corrosion-resistant material. A jumper shall be a wire, strap, terminal bar or bus, screw, or similar suitable conductor with capacity for the bond connection.

(B) Attachment. Equipment jumpers shall be attached in the manner specified by the applicable provisions of 250.8 for circuits and equipment and by 250.70 for grounding electrodes.

(C) Size- Equipment Grounding Jumper on the Supply Side of the Service. The jumper conductor shall not be smaller than the sizes shown in Table 250.66 for grounding electrode conductors. Where the service-entrance phase conductors are larger than 1100 kcmil copper or 1750 kcmil aluminum, the jumper shall have an area not less than 12 ½ percent of the area of the largest phase conductor except that, where the phase conductors and the grounding jumper are of different materials (copper or aluminum), the minimum size of the grounding jumper shall be based on the assumed use of phase conductors of the same material as the jumper conductor and with an ampacity equivalent to that of the installed phase conductors. Where the service-entrance conductors are paralleled in two or more raceways or cables, the equipment grounding jumper conductor where routed with the raceways or cabling shall be run in parallel. The size of the jumper conductor for each raceway or cable shall be based on the size of the service-entrance conductors in each raceway or cable.

(D) Size-Equipment Grounding Jumper on the Load Side of the Service. The equipment jumper conductor on the load side of the service overcurrent devices shall be sized, as a minimum in accordance with the sizes listed in Table 250.122, but shall not be required to be larger than the largest ungrounded circuit conductors supplying the equipment and shall not be smaller than 14 AWG. A single common continuous equipment grounding jumper conductor shall be permitted to bond two or more raceways or cables where the jumper conductor is sized in accordance with Table 250.122 for the largest overcurrent device supplying circuits therein.

(E) Installation. The equipment grounding jumper conductor shall be permitted to be installed inside or outside of a raceway or enclosure. Where installed on the outside, the length of the equipment grounding jumper conductor shall comply with the requirements of 250.119 and 250.148.

Exception: An equipment grounding jumper conductor longer than 1.8 m(6ft) shall be permitted at outside pole locations for the purpose of grounding isolated sections of metal raceways or elbows installed in exposed risers of metal conduit or other metal raceway.

251.17 Bonding of Piping Systems and Exposed Structural Steel.

(A) Metal Water Piping. The metal water piping system shall be bonded as required in (A) (1), (A) (2), or (A) (3) of this section. The jumpers shall be installed in accordance with 250.64(A), (B), and (E). The bond points of attachment jumpers shall be accessible.

(1) General. Metal water piping system(s) installed in or attached to a building or structure shall be bonded to the service equipment enclosure, the grounded conductor at the service, the grounding electrode conductor where of sufficient size or to the one or more grounding electrodes used. The jumper conductor(s) shall be sized in accordance with Table 250.66 except as permitted in 251.17 (A) (2) and (A) (3).

(2) Buildings of Multiple Occupancy. In buildings of multiple occupancy where the metal water piping system(s) installed in or attached to a building or structure for the individual occupancies is metallically isolated from all other occupancies by use of non-metallic water piping, the metal water piping system(s) for each occupancy shall be permitted to be bonded to the equipment grounding terminal bar or the panelboard or switchboard enclosure (other than service equipment) supplying that occupancy. The grounding jumper conductor(s) shall be sized in accordance with Table 250.122.

(3) Multiple Buildings or Structures Supplied by a Feeder(s) or Branch Circuit(s). The metal water piping system(s) installed in or attached to a building or structure shall be bonded to the building or structure disconnecting means enclosure where located at the building or structure,
to the grounding equipment conductor run with the supply conductors or to the one or more grounding electrodes used. The jumper conductor(s) shall be sized in accordance with Table 250.66 based on the size of the feeder or branch circuit conductors that supply the building.

(B) Other Metal Piping. Where installed in or attached to a building or structure, metal piping system(s), including gas piping, that is likely to become energized shall be bonded to the service equipment enclosure, the grounded conductor at the service, the grounding electrode conductor where of sufficient size, or to the one or more grounding electrodes used. The jumper conductor(s) shall be sized in accordance with 250.122, using the rating of the circuit that is likely to energize the piping system(s). The equipment grounding conductor for the circuit that is likely to energize the piping shall be permitted to serve as the bonding means. The bond points of the jumper conductor attachments shall be accessible.

FPN: Bonding all piping and metal air ducts within the premises will provide additional safety.

(C) Structural Metal. Exposed structural metal that is interconnected to form a metal building frame and is not intentionally grounded and is likely to become energized shall be bonded to the service equipment enclosure, the grounded conductor at the service, the grounding electrode conductor where of sufficient size, or the one or more grounding electrodes used. The jumper conductor(s) shall be sized in accordance with Table 250.66(A), (B), and (E). The points of attachment of the jumper conductor bonds shall be accessible.

(D) Separately Derived System(s). Metal water piping systems and structural metal that is interconnected to form a building frame shall be bonded to separately derived systems in accordance with (D) (1) through (D) (3).

(1) Metal Water Piping Systems(s). The grounded conductor of each separately derived system shall be bonded to the nearest available point of the metal water piping system(s) in the area served by each separately derived system. This bond connection shall be made at the same point on the separately derived system where the grounding electrode conductor is connected. Each bonding jumper conductor shall be sized in accordance with Table 250.66 based on the largest ungrounded conductor of the separately derived system.

Exception No. 1: A separate bonding jumper conductor to the metal water piping system shall not be required where the metal water piping system is used as the grounding electrode for the separately derived system.

Exception No.2: A separate water piping bonding jumper conductor shall not be required where the metal frame of a building or structure is used as the grounding electrode for a separately derived system and is bonded to the metal water piping in the area served by the separately derived system.

(2) Structural Metal. Where exposed structural metal exists to form an interconnected building frame in the area served by the separately derived system, the frame(s) shall be bond-connected to the grounded conductor of each separately derived system. This connection shall be made at the same point on the separately derived system where the grounding electrode

conductor is connected. Each bonding jumper conductor shall be sized in accordance with Table 250.66 based on the largest ungrounded conductor of the separately derived system.

Exception No. 1: A separate bonding jumper conductor to the building structural metal shall not be required where the metal frame of a building or structure is used as the grounding electrode for the separately derived system.

Exception No. 2: A separate bonding jumper conductor to the building structural metal shall not be required where the water piping of a building or structure is used as the grounding electrode for a separately derived system and is bonded to the building structural metal in the area served by the separately derived system.

(3) Common Grounding Electrode Conductor. Where a common grounding electrode conductor is installed for multiple separately derived systems as permitted by 250.30 (A) (4), and exposed structural metal that is interconnected to form the building frame or interior metal piping exists in the area served by the separately derived system, the metal piping and the structural member shall bond to the common grounding electrode conductor.

Exception: A separate bonding jumper conductor from each derived system to metal water piping and to structural metal members shall not be required where the metal water piping and the structural metal members in the area served by the separately derived system are bonded to the common grounding electrode conductor.

251.18 Lightning Protection Systems. The lightning protection system ground terminals shall be bonded to the building or structure grounding electrode system.

FPN No.1: See 250.60 for use of air terminals. For further information, see NFPA 780-2004. Standard for the Installation of Lightning Protection Systems, which contains detailed information on grounding, bonding, and spacing from lightning protection systems.

FPN No. 2: Metal raceways, enclosures, frames, and other non-current-carrying metal parts of electric equipment installed on a building equipped with a lightning protection system may require bonding or spacing from the lightning protection conductors in accordance with NFPA 780-2004, Standard for the Installation of Lightning Protection Systems. Separation from lightning protection conductors is typically 1.8 m
(6 ft.) through air or 900 mm (3 ft.) through dense material such as concrete, brick, or wood.

Substantiation: This new section defines bonding with physical requirements for connection integrity of all conductive surface interfaces. (i.e. new installation rules that eliminate substandard assembly habits from “loose” interpretation of bonding and quality work.)

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The proposed new Article 251 does not add clarity or improve usability in the NEC. Bonding requirements are covered with Article 250 which covers both grounding and bonding. See Proposal 5-49. The submitter has not provide technical substantiation for the introduction of new terminology. The submitter has not identified the material that has been extracted from that which is new or any substantiation for new material.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

ARTICLE 280 — SURGE ARRESTERS

5-335 Log #2599 NEC-P05 **Final Action: Accept in Principle**
(280)

TCC Action: The Technical Correlating Committee advises that Article Scope statements and Titles are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.

Submitter: Joseph P. DeGregoria, Underwriters Laboratories Inc.

Recommendation: Revise text to read:

ARTICLE 280 Surge Arresters , 1 kV and Over

I. General.

280.1 Scope. This article covers general requirements, installation requirements, and connection requirements for surge arresters installed on premises wiring systems.

~~280.2 Definition.~~

~~Surge Arrester. A protective device for limiting surge voltages by discharging or bypassing surge current, and it also prevents continued flow of follow current while remaining capable of repeating these functions.~~

280.3 Number Required. Where used at a point on a circuit, a surge arrester shall be connected to each ungrounded conductor. A single installation of such surge arresters shall be permitted to protect a number of interconnected circuits, provided that no circuit is exposed to surges while disconnected from the surge arresters.

~~280.4 Surge Arrester Selection.~~

~~(A) Circuits of Less Than 1000 Volts. Surge arresters installed on a circuit of less than 1000 volts shall comply with all of the following:~~

~~(1) The rating of the surge arrester shall be equal to or greater than the maximum continuous phase-to-ground power frequency voltage available at the point of application.~~

~~(2) Surge arresters installed on circuits of less than 1000 volts shall be listed.~~

~~(3) Surge arresters shall be marked with a short circuit current rating and shall not be installed at a point on the system where the available fault current tis in excess of that rating.~~

~~(4) Surge arresters shall not be installed on ungrounded systems, impedance grounded systems, or corner grounded delta systems unless listed specifically for use on these systems.~~

~~(B) Circuits of 1 kV and Over~~ 280.4 Silicon Carbide Types. The rating of a silicon carbide-type surge arrester shall be not less than 125 percent of the maximum continuous phase-to-ground voltage available at the point of application.

FPN No. 1: For further information on surge arresters, see ANSI/IEEE C62.1-1989, Standard for Gapped Silicon-Carbide Surge Arresters for AC Power Circuits; ANSI/IEEE C62.2-1987, Guide for the Application of Gapped Silicon-Carbide Surge Arresters for Alternating-Current Systems; ANSI/IEEE C62.11-199 9 ~~3~~ , Standard for Metal Oxide Surge Arresters for Alternating-Current Power Circuits (> 1 kV) ; and ANSI/IEEE C62.22-199 7 ~~1~~ , Guide for the Application of Metal-Oxide Surge Arresters for Alternating-Current Systems.

FPN No. 2: The selection of a properly rated metal oxide arrester is based on considerations of maximum continuous operating voltage and the magnitude and duration of over voltages at the arrester location as affected by phase-to-ground faults, system grounding techniques, switching surges, and other causes. See the manufacturer’s application rules for selection of the specific arrester to be used at a particular location.

280.5 Listing. A surge arrester shall be a listed device.

II. Installation.

280.11 Location. Surge arresters shall be permitted to be located indoors or outdoors. Surge arresters shall be made inaccessible to unqualified persons, unless listed for installation in accessible locations.

280.12 Routing of Surge Arrester Connections. The conductor used to connect the surge arrester to line or bus and to ground shall not be any longer than necessary and shall avoid unnecessary bends.

III. Connecting Surge Arresters.

280.21 Installed at Services ~~of Less Than 1000 Volts~~ . ~~Line and ground connecting conductors shall not be smaller than 14 AWG copper or 12 AWG aluminum.~~ The arrester grounding conductor shall be connected to one of the following:

(1) Grounded service conductor

(2) Grounding electrode conductor

(3) Grounding electrode for the service

(4) Equipment grounding terminal in the service equipment

~~280.22 Installed on the Load Side Services of Less Than 1000 Volts. Line and ground connecting conductors shall not be smaller than 14 AWG copper or 12 AWG aluminum. A surge arrester shall be permitted to be connected between any two conductors — ungrounded conductor(s), grounded conductor, grounding conductor. The grounded conductor and the grounding conductor shall be interconnected only by the normal operation of the surge arrester during a surge.~~

280.23 ~~Circuits of 1 kV and Over~~ Surge-Arrester Conductors. The conductor between the surge arrester and the line and the surge arrester and the grounding connection shall not be smaller than 6 AWG copper or aluminum.

~~280.24 Circuits of 1 kV and Over~~ Interconnections. The grounding conductor of a surge arrester protecting a transformer that supplies a secondary distribution system shall be interconnected as specified in 280.24(A), (B), or (C).

(A) Metallic Interconnections. A metallic interconnection shall be made to the secondary grounded circuit conductor or the secondary circuit grounding conductor provided that, in addition to the direct grounding connection at the surge arrester, the following occurs:

(1) The grounded conductor of the secondary has elsewhere a grounding connection to a continuous metal underground water piping system. However, in urban water-pipe areas where there are at least four water-pipe connections on the neutral and not fewer than four such connections in each mile of neutral, the metallic interconnection shall be permitted to be made to the secondary neutral with omission of the direct grounding connection at the surge arrester.

(2) The grounded conductor of the secondary system is a part of a multiground neutral system or static wire of which the primary neutral or static wire has at least four ground connections in each mile of line in addition to a ground at each service.

(B) Through Spark Gap or Device. Where the surge arrester grounding conductor is not connected as in 280.24(A) or where the secondary is not grounded as in 280.24(A) but is otherwise grounded as in 250.52, an interconnection shall be made through a spark gap or listed device as follows:

(1) For ungrounded or unigrounded primary systems, the spark gap or listed device shall have a 60-Hz breakdown by voltage of at least twice the primary circuit voltage but not necessarily more than 10 kV, and there shall be at least one other ground on the grounded conductor of the secondary that is not less than 6.0 m (20 ft) distant from the surge arrester grounding electrode.

(2) For multigrounded neutral primary systems, the spark gap or listed device shall have a 60-Hz breakdown of not more than 3 kV, and there shall be at least one other ground on the grounded conductor of the secondary that is not less than 6.0 m (20 ft) distant from the surge arrester grounding electrode.

(C) By Special Permission. An interconnection of the surge arrester ground and the secondary neutral, other than as provided in 280.24(A) or (B), shall be permitted to be made only by special permission.

280.25 Grounding. Except as indicated in this article, surge arrester grounding connections shall be made as specified in Article 250. Grounding conductors shall not be run in metal enclosures unless bonded to both ends of such enclosure.

Substantiation: This is one of several related proposals affecting Articles 100, 230, 250, 280, 285, 501, and 502 based on the following:

1) UL intends to combine the categories of Surge Arresters (Article 280) and Transient Voltage Surge Suppressors (Article 285) into one category and Standard, UL 1449, renamed Surge Protective Devices(SPDs).

UL 1449 will include SPD designations Type 1 and Type 2 for permanently connected devices for use on circuits not exceeding 600 V.

The technology of both low voltage Surge Arresters and TVSSs are now basically the same, thereby justifying coverage under one Standard, UL 1449, and one test program with consideration given to the installation location on the line side (Type 1) or load side (Type 2) of the service disconnect overcurrent protection.

2) The Surge Arrester designation will only be retained for devices used in circuits of 1 kV and over and evaluated to IEEE C62.11-1999.

Panel Meeting Action: Accept in Principle

Revise the recommendation to read as follows:

ARTICLE 280 Surge Arresters , Over 1 kV

I. General

280.1 Scope. This article covers general requirements, installation requirements, and connection requirements for surge arresters installed on premises wiring systems over 1 kV.

~~280.2 Definition.~~
~~Surge Arrester. A protective device for limiting surge voltages by discharging or bypassing surge current, and it also prevents continued flow of follow current while remaining capable of repeating these functions.~~

280.2 Uses Not Permitted. A surge arrester shall not be installed where the rating of the surge arrester is less than the maximum continuous phase-to-ground power frequency voltage available at the point of application.

280.3 Number Required. Where used at a point on a circuit, a surge arrester shall be connected to each ungrounded conductor. A single installation of such surge arresters shall be permitted to protect a number of interconnected circuits, provided that no circuit is exposed to surges while disconnected from the surge arresters.

~~280.4 Surge Arrester Selection.~~
~~(A) Circuits of Less Than 1000 Volts. Surge arresters installed on a circuit of less than 1000 volts shall comply with all of the following:~~
~~(1) The rating of the surge arrester shall be equal to or greater than the maximum continuous phase-to-ground power frequency voltage available at the point of application.~~
~~(2) Surge arresters installed on circuits of less than 1000 volts shall be listed.~~
~~(3) Surge arresters shall be marked with a short circuit current rating and shall not be installed at a point on the system where the available fault current is in excess of that rating.~~
~~(4) Surge arresters shall not be installed on ungrounded systems, impedance grounded systems, or corner grounded delta systems unless listed specifically for use on these systems.~~
~~(B) Circuits of 1 kV and Over —~~

280.4 Surge Arrester Selection. The surge arresters shall comply with all of the following:

(A) The rating of a surge arrester shall be equal to or greater than the maximum continuous phase-to-ground voltage available at the point of application.

(B) Silicon Carbide Types. The rating of a silicon carbide-type surge arrester shall be not less than 125 percent of the maximum continuous phase-to-ground voltage available at the point of application.

FPN No. 1: For further information on surge arresters, see ANSI/IEEE C62.1-1989, Standard for Gapped Silicon-Carbide Surge Arresters for AC Power Circuits; ANSI/IEEE C62.2-1987, Guide for the Application of Gapped Silicon-Carbide Surge Arresters for Alternating-Current Systems; ANSI/IEEE C62.11-199 9 ~~3~~ , Standard for Metal-Oxide Surge Arresters for Alternating-Current Power Circuits (> 1kV) ; and ANSI/IEEE C62.22-199 7 ~~1~~ , Guide for the Application of Metal-Oxide Surge Arresters for Alternating-Current Systems.

FPN No. 2: The selection of a properly rated metal oxide arrester is based on considerations of maximum continuous operating voltage and the magnitude and duration of overvoltages at the arrester location as affected by phase-to-ground faults, system grounding techniques, switching surges, and other causes. See the manufacturer's application rules for selection of the specific arrester to be used at a particular location.

280.5 Listing. A surge arrester shall be a listed device.

II. Installation

280.11 Location. Surge arresters shall be permitted to be located indoors or outdoors. Surge arresters shall be made inaccessible to unqualified persons, unless listed for installation in accessible locations.

280.12 Routing of Surge Arrester Grounding Conductors ~~Connections~~ . The conductor used to connect the surge arrester to line, bus, or equipment and to a grounding conductor connection point as provided in 280.21 ~~ground~~ shall not be any longer than necessary and shall avoid unnecessary bends.

III. Connecting Surge Arresters

280.21 Connection ~~of Less Than 1000 Volts.~~
~~Line and ground connecting conductors shall not be smaller than 14 AWG copper or 12 AWG aluminum.~~ The arrester grounding conductor shall be connected to one of the following:

(1) Grounded service conductor
(2) Grounding electrode conductor
(3) Grounding electrode for the service
(4) Equipment grounding terminal in the service equipment

~~280.22 Installed on the Load Side Services of Less Than 1000 Volts.~~
~~Line and ground connecting conductors shall not be smaller than 14 AWG copper or 12 AWG aluminum. A surge arrester shall be permitted to be connected between any two conductors — ungrounded conductor(s), grounded conductor, grounding conductor. The grounded conductor and the grounding conductor shall be interconnected only by the normal operation of the surge arrester during a surge.~~

280.23 ~~Circuits of 1 kV and Over —~~ Surge-Arrester Conductors. The conductor between the surge arrester and the line and the surge arrester and the grounding connection shall not be smaller than 6 AWG copper or aluminum.

280.24 ~~Circuits of 1 kV and Over —~~ Interconnections.
The grounding conductor of a surge arrester protecting a transformer that supplies a secondary distribution system shall be interconnected as specified in 280.24(A), (B), or (C).

(A) Metallic Interconnections. A metallic interconnection shall be made to the secondary grounded circuit conductor or the secondary circuit grounding conductor provided that, in addition to the direct grounding connection at the surge arrester, the following occurs:

(1) The grounded conductor of the secondary has elsewhere a grounding connection to a continuous metal underground water piping system. However, in urban water-pipe areas where there are at least four water-pipe connections on the neutral conductor and not fewer than four such connections in each mile of neutral conductor, the metallic interconnection shall be permitted to be made to the secondary neutral conductor with omission of the direct grounding connection at the surge arrester.

(2) The grounded conductor of the secondary system is a part of a multiground neutral system or static wire of which the primary neutral conductor or static wire has at least four ground connections in each mile of line in addition to a ground at each service.

(B) Through Spark Gap or Device. Where the surge arrester grounding conductor is not connected as in 280.24(A) or where the secondary is not grounded as in 280.24(A) but is otherwise grounded as in 250.52, an interconnection shall be made through a spark gap or listed device as follows:

(1) For ungrounded or unigrounded primary systems, the spark gap or listed device shall have a 60-Hz breakdown voltage of at least twice the primary circuit voltage but not necessarily more than 10 kV, and there shall be at least one other ground on the grounded conductor of the secondary that is not less than 6.0 m (20 ft) distant from the surge arrester grounding electrode.

(2) For multigrounded neutral primary systems, the spark gap or listed device shall have a 60-Hz breakdown of not more than 3 kV, and there shall be at least one other ground on the grounded conductor of the secondary that is not less than 6.0 m (20 ft) distant from the surge arrester grounding electrode.

(C) By Special Permission. An interconnection of the surge arrester ground and the secondary neutral conductor, other than as provided in 280.24(A) or (B), shall be permitted to be made only by special permission.

280.25 Grounding Conductor Connections and Enclosures. Except as indicated in this article, surge arrester grounding conductor connections shall be made as specified in Article 250, Parts III and X. ~~Grounding conductors shall not be run in metal enclosures unless bonded to both ends of such enclosure~~ . Grounding conductors installed in metal enclosures shall comply with 250.64(E).

Panel Statement: The panel accepts concepts and some proposed text from proposals 5-336, 5-337, 5-344, 5-345, 5-347, 5-348. The definitions were moved to Article 100 by action on Proposal 5-340. Revised text for clarity and to correlate with revisions from other proposals. The panel understands that the article title and scope statement in this revised article is under the purview of the Technical Correlating Committee.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

STEINMAN, G.: Silicon Carbide Type arresters have not been manufactured for several years. Presently, only metal oxide arresters are available for new installations or upgrading of existing installations.

In 280.4 delete all present text for (B) and replace this text with that of FPN No. 2, changing the first sentence to read: "The selection of a properly rated metal oxide arrester shall be based on the maximum continuous operating voltage and the magnitude and duration of overvoltage at the arrester location as affected by phase-to-ground faults, system grounding techniques, switching surges, and other causes." Delete FPN No. 2.

Revise FPN No. 1 by deleting all text referring to C62.1 and C62.2. Correct the year of C62.11 to be C62.11-2005.

Revise text of 280.12 by deleting "Grounding" in the title as the text refers to line and ground conductors.

Delete new 280.5 requiring listing of surge arresters.

These arresters are not presently listed. There was no substantiation provided to demonstrate listing is required or serves a safety purpose.

280.11 requires these be installed inaccessible to unqualified persons.

Presently, there are no listed surge arresters. A listing requirement will preclude use of surge arresters in premises wiring systems, leaving these systems subject to damage from lighting and switching surge voltages. These arresters are supplied in large numbers to electric utilities and only a small number (less than 0.1%) are installed in premises wring systems. The vast utility experience shows no value in listing.

5-336 Log #1208 NEC-P05 **Final Action: Accept in Principle in Part (280 and 285)**

Submitter: Kenneth J. Brown, Leviton Mfg. Co. Inc.

Recommendation: Revise Article 280 as follows. Article 285 should be removed:

I. General.

280.1 Scope. This article covers general requirements, installation requirements, and connection requirements for surge protective devices (SPDs) installed on premises wiring systems. SPDs include both secondary surge arresters (Type 1 SPDs) and panel type TVSS devices (Type 2 SPDs).

Type 1 - Permanently connected SPD intended for installation between the secondary of the distribution transformer and the line side of the service disconnect overcurrent device, including the watt-hour meter socket enclosures.

Type 2 - Permanently connected SPD intended for installation on the load side of the service disconnect overcurrent device at the branch panel, utilization equipment, etc.

280.2 Definition.

Surge Protective Device (SPD). An assembly of one or more component(s) intended to limit or divert surges. The device contains at least one nonlinear component.

280.3 Number Required. Where used at a point on a circuit, the SPD shall be connected to each ungrounded conductor.

280.4 Listing. A SPD shall be a listed device.

280.5 Short Circuit Current Rating. The SPD shall be marked with a short circuit current rating and shall not be installed at a point on the system where the available fault current is in excess of that rating. This marking requirement shall not apply to receptacles.

280.6 SPD Selection.

(A) Circuits of less than 1000 Volts. SPDs installed on a circuit of less than 1000 volts shall comply with all of the following:

(1) The rating of an SPD shall be equal to or greater than the maximum continuous phase-to-ground power frequency voltage available at the point of application.

(2) SPDs shall not be installed on ungrounded systems, impedance grounded systems, or corner grounded delta systems unless listed specifically for use on these systems.

(B) Circuits of 1 kV and Over — Silicon Carbide Types. The rating of a silicon carbide-type surge arrester shall be not less than 125 percent of the maximum continuous phase-to-ground voltage available at the point of application.

FPN No. 1: For further information on surge arrestors, see ANSI/IEEE 6211-1989, Standard for Gapped Silicon-Carbide Surge Arresters for AC Power Circuits; ANSI/IEEE C62.21-1987, Guide for the Application of Gapped Silicon - Carbide Surge Arresters for Alternating-current Systems; ANSI/IEEE C62.11-1993, Standard for Metal-Oxide SPDs for Alternating-Current Power Circuits; and ANSI/IEEE C62.22-1991, Guide for the Application of Metal-Oxide SP's for Alternating-Current Systems.

FPN No. 2; The selection of a properly rated metal oxide arrester is based on considerations of maximum continuous operating voltage (MCOV) and the magnitude and duration of Temporary Overvoltages at the arrester location as affected by phase-to ground faults, system grounding techniques, switching surges and other causes. See the manufacturer's application rules for selection of the specific SPD to be used at a particular location.

II. Installations.

280.11 Location. SPDs shall be permitted to be located indoors or outdoors. SPDs shall be made inaccessible to unqualified persons, unless listed for installation in accessible locations.

280.12 Routing of SPD Connections. The conductor used to connect the SPD to line or bus and to ground shall not be longer than necessary and shall avoid unnecessary bends.

280.13 Where the rating of the SPD is less than the maximum continuous phase-to-ground power frequency voltage available at the point of application.

III. Connecting SPDs

280.21 Installed at Services of Less Than 1000 Volts. Line and ground connecting conductors shall not be smaller than 14 AWG copper or 12 AWG aluminum. The arrester grounding conductor shall be connected to one of the following:

(1) Grounded service conductor
(2) Grounding electrode conductor
(3) Grounding electrode for the service
(4) Equipment grounding terminal in the service equipment

280.22 Installed on the Load Side Services of Less than 1000 Volts. A Surge Arrestor (Type 1) SPD shall be permitted to be connected between any two conductors ungrounded conductor(s), grounded conductor, grounding conductor. The grounded conductor and the grounding conductor shall be interconnected only by the normal operation of the surge arrester during a surge.

280.23 Circuits of 1 kV and Over — Surge-Arrester Conductors. The conductor between the surge arrester and the line and the surge arrester and the grounding connection shall not be smaller than 6 AWG copper or aluminum.

280.24. Circuits of 1 kV and Over — Interconnections. The grounding conductor of a surge arrester protecting a transformer that supplies a secondary distribution system shall be interconnected as specified in 280.24(A), (B), or (C).

(A) Metallic Interconnections. A metallic interconnection shall be made to the secondary grounded circuit conductor or the secondary circuit grounding conductor provided that, in addition to the direct grounding connection at the surge arrester, the following occurs:

(1) The grounded conductor of the secondary has elsewhere a grounding connection to a continuous metal underground water piping system. However, in urban water-pipe areas where there are at least four water-pipe connections on the neutral and not fewer than four such connections in each mile of neutral, the metallic interconnection shall be permitted to be made to the secondary neutral with omission of the direct grounding connection at the surge arrester.

(2) The grounded conductor of the secondary system is a part of a multiground neutral system or static wire of which the primary neutral or static wire has at least four ground connections in each mile of line in addition to a ground at each service.

(B) Through Spark Gap or Device. Where the surge arrester grounding conductor is not connected as in 280.24(A) or where the secondary is not grounded as in 280.24(A) but is otherwise grounded as in 250.52, an interconnection shall be made though a spark gap or listed device as follows:

(1) For ungrounded or ungrounded primary systems, the spark gap or listed device shall have a 60-Hi breakdown voltage of at least twice the primary circuit voltage but not necessarily more than 10 kV, and there shall be at least one other ground on the grounded conductor of the secondary that is not less than 6.0 m (20 ft) distance from the surge arrester grounding electrode.

(2) For ungrounded neutral primary systems, the spark gap or listed device shall have a 60-Hz breakdown of not more than 3 kV, and there shall be at least one other ground on the grounded conductor of the secondary that is not less than 6.0 m (20 ft) distance from the surge arrester grounding electrode.

(C) By Special Permission. An interconnection of the surge arrester ground and the secondary neutral, other than as provided in 280.24(A) or (B) shall be permitted to be made only by special permission.

280.25 Grounding. Except as indicated in this article, surge arrester grounding connections shall be made as specified in Article 250. Grounding conductors shall not be run in metal enclosures unless bonded to both ends of such enclosure.

FPN: For further information on TVSS Type SPD's see NEMA LS-1; 1992. Standard for Low Voltage Surge Suppression Devices. The selection of a properly rated SPD is based on criteria such as maximum continuous operating voltage the magnitude and duration of the overvoltages at the suppressor location as affected by phase-to-ground faults, system grounding techniques and switching surges.

III. Connecting Transient voltage Surge Suppressors.

280.21 Connection. Where an SPD (Type 2) is installed, it shall be connected as follows:

(A) Location.

(1) Service Supplied Building or Structure. The transient voltage surge suppressor shall be connected on the load side of a service disconnect overcurrent device required in 230.91, unless installed in accordance with 230.82(8).

(2) Feeder Supplied Building or Structure. The transient voltage surge suppressor shall be connected on the load side of the first overcurrent device at the building or structure.

(3) Separately Derived System. The SPD (Type 2) shall be connected on the load side of the first overcurrent device in a separately derived system.

(B) Conductor Size. Line and ground connecting conductors shall not be smaller than 14 AWG copper or 12 AWG aluminum.

(C) Connection Between Conductors. A SPD shall be permitted to be connected between any two conductors — ungrounded conductor(s), grounded conductor, grounding conductor. The grounded conductor and the grounding conductor shall be interconnected only by the normal operation of the TVSS during a surge.

285.25 Grounding. Grounding conductors shall not be run in metal enclosures unless bonded to both ends of such enclosure.

Substantiation: The UL 1449 3rd edition is combing Surge Arrestors with TVSS into one standard and all devices are Surge Protective Devices (SPDs). A surge arrestor is a Type 1 SPD and a Panel Type Hard Wired TVSS is a type 2 SP. The NEC should be changed also to harmonize with UL.

Panel Meeting Action: Accept in Principle in Part

Panel Statement: Accepting the concept for addition and use of term "SPDs". Rejecting the part to combine Articles 280 and 285 into one article. The panel concludes that the application of surge arresters for systems over 1 kV and the associated products designed and constructed to the ANSI/IEEE standards should be kept separate from the application and SPD listed to UL 1449 for systems 1 kV and under. See panel action and statement Proposal 5-335.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-337 Log #1534 NEC-P05 **Final Action: Accept in Principle**
(280 and 285)

TCC Action: The Technical Correlating Committee directs that the action on this proposal be sent to the Technical Correlating Committee Grounding and Bonding task group for review and comment.

Submitter: Technical Correlating Committee on National Electrical Code

Recommendation: Revise Articles 280 and 285 as described in the following, relative to the terms bonding and grounding.

280.12 Revise the title and this section as follows:

280.12 Routing of Surge Arrester <u>Grounding Conductor</u> ~~Connections~~

The conductor used to connect the surge arrester to line or bus and <u>to a grounding conductor connection point as provided in 280.21 or 280.22</u> shall not be any longer than necessary and shall avoid unnecessary bends.

280.21 Revise this section as follows:

Revise this section as follows:

280.21 Installed at Services of Less Than 1000 Volts. Line and ground <u>ing</u> ~~connecting~~ conductors shall not be smaller than 14 AWG copper or 12 AWG aluminum. The arrester grounding conductor shall be connected to one of the following:

280.22 Revise 280.22 as follows:

280.22 Installed on the Load Side Services of Less Than 1000 Volts. Line and ground <u>ing</u> ~~connecting~~ conductors shall not be smaller than 14 AWG copper or 12 AWG aluminum. A surge arrester shall be permitted to be connected between any two conductors — ungrounded conductor(s), grounded conductor, grounding conductor. The grounded conductor and the grounding conductor shall be interconnected only by the normal operation of the surge arrester during a surge.

280.25 Revise this section as follows:

280.25 Grounding <u>Conductor Connections and Enclosures.</u> Except as indicated in this article, surge arrester grounding <u>conductor</u> connections shall be made as specified in Article 250. Grounding conductors shall not be run in metal enclosures unless bonded to both ends of such enclosure.

285.21(B) Revise this section as follows:

(B) Conductor Size. Line and ground <u>ing</u> ~~connecting~~ conductors shall not be smaller than 14 AWG copper or 12 AWG aluminum.

285.25 Revise the title of 285.25 as follows:

285.25 Grounding <u>Conductor Enclosures.</u> Grounding conductors shall not be run in metal enclosures unless bonded to both ends of such enclosure.

Substantiation: 280.12: The proposed revision title and section is intended to clarify what is specifically covered in this section. This section covers both the surge arrester grounding conductor connection and its routing.

280.21: The proposed revision in this section is intended to clarify what is specifically covered in this section. This section covers both the surge arrester line conductor and the surge arrester grounding conductor.

280.22: The proposed revision in this section is intended to clarify what is specifically covered in this section. This section covers both the surge arrester line conductor and the surge arrester grounding conductor.

280.25: The proposed revision title and section is intended to clarify what is specifically covered in this section. This section covers both the surge arrester grounding conductor connections and installations in metal enclosures.

285.21(B): The proposed revision in this section is intended to clarify what is specifically covered in this section. This section covers both the surge arrester line conductor and the surge arrester grounding conductor.

285.25: The word grounding in the title of this section is too broad in coverage in its current form. This section provides the rules for surge arrester grounding conductor enclosures.

This is the result of the TCC Task Group on Grounding and Bonding in resolve of the 2005 NEC cycle actions related to Proposal 5-1 and Comment 5-1 as directed by the Technical Correlating Committee. This is a companion proposal to the proposed revision to the terms "bonded", "grounded", and "equipment grounding conductor" in Article 100 relative to this Task Group's recommendations. These changes clarify the present requirement in more prescriptive language.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement Proposal 5-335 and 5-349.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

Comment on Affirmative:

BRENDER, D.: This proposal references two different code Articles, a violation of the instructions for submitting proposals and Section 4.3.3 of the Regulations Governing Committee Projects.

5-338 Log #508 NEC-P05 **Final Action: Reject**
(280.1, FPN (New))

Submitter: Technical Committee on Lightning Protection,

Recommendation: Add the following FPN following the text of 280.1:

FPN: NFPA 780-2004, Standard for the Installation of Lightning Protection Systems, requires surge protective devices to be installed at all power service entrances and at entrances of signal, data, CATV, and communication lines at facility entrances.

Substantiation: Premises wiring systems are often designed and installed without consideration of the possibility that a lightning protection system could be installed. NFPA 780 provides design requirements for surge protection installed as a part of a lightning protection system. The proposed change would alert architects and engineers, electrical system designers, electrical inspectors and other authorities having jurisdiction to what will be required should lightning protection system installation be considered. The design and installation of the surge protection system is most efficiently and economically accomplished as a part of the electrical system design and installation effort.

Panel Meeting Action: Reject

Panel Statement: Adding this fine print note is confusing and is not necessary to clarify the scope of Article 280.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-339 Log #509 NEC-P05 **Final Action: Reject**
(280.2)

Submitter: Technical Committee on Lightning Protection,

Recommendation: Add Section 280.2 as follows:

In buildings provided with a lightning protection system, surge protection shall comply with the design requirements provided in NFPA 780-2004, Standard for the Installation of Lightning Protection Systems. Renumber remaining sections.

Substantiation: NFPA 780 provides design levels for surge protection devices that are to be installed, in accordance with Article 280, for the purpose of providing protection from the direct and indirect effects of lightning. The design and installation of the surge protection system is most efficiently and economically accomplished as a part of the electrical system design and installation effort. This change would ensure that the necessary surge protective levels have been designed and installed as a part of the initial installation and save any costly retrofits to the electrical system during the lightning protection system installation. Such a change would also go a long way in resolving jurisdictional issues associated with the installation of surge protection hardware for the purpose of lightning protection.

Panel Meeting Action: Reject

Panel Statement: The NEC Style Manual prohibits having references to other standards in prescriptive text.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

5-340 Log #2601 NEC-P05 **Final Action: Accept in Principle**
(280.2.Surge Arrester, Surge Protective Devices (SPDs))

Submitter: Joseph P. DeGregoria, Underwriters Laboratories Inc.
Recommendation: Add new definitions to Article 100 to read:
Surge Arrester. A protective device for limiting surge voltages by discharging or bypassing surge current, and it also prevents continued flow of follow current while remaining capable of repeating these functions.
Surge Protective Devices (SPDs). A protective device for limiting transient voltages by diverting or limiting surge current; it also prevents continued flow of follow current while remaining capable of repeating these functions and designated as follows:
Type 1. Permanently connected SPDs intended for installation between the secondary of the service transformer and the line side of the service disconnect overcurrent device, including watt-hour meter socket enclosures.
Type 2. Permanently connected SPDs intended for installation on the load side of the service disconnect overcurrent device; including SPDs located at the branch panel.
FPN No. 1: For further information on Type 1 and Type 2 SPDs, see UL 1449, Standard for Surge Protective Devices.
Delete the following section:
~~280.2 Definition. Surge Arrester. A protective device for limiting surge voltages by discharging or bypassing surge current, and it also prevents continued flow of follow current while remaining capable of repeating these functions.~~
Substantiation: Move Surge Arrester definition, referenced in several articles, from 280.2 to Article 100.
Add definition for surge protective device (replacing the term transient voltage surge suppressor in 285.2), referenced in several articles, to Article 100.
This is one of several related proposals affecting Articles 100, 230, 250, 280, 285, 501, and 502 based on the following:
1) UL intends to combine the categories of Surge Arresters (Article 280) and Transient Voltage Surge Suppressors (Article 285) into one category and Standard, UL 1449, renamed Surge Protective Devices(SPDs).
UL 1449 will include SPD designations Type 1 and Type 2 for permanently connected devices for use on circuits not exceeding 600 V.
The technology of both low voltage Surge Arresters and TVSSs are now basically the same, thereby justifying coverage under one Standard, UL 1449, and one test program with consideration given to the installation location on the line side (Type 1) or load side (Type 2) of the service disconnect overcurrent protection.
2) The Surge Arrester designation will only be retained for devices used in circuits of 1 kV and over and evaluated to IEEE C62.11-1999.
Panel Meeting Action: Accept in Principle
Add the following definitions to Article 100
Surge Arrester. A protective device for limiting surge voltages by discharging or bypassing surge current, and it also prevents continued flow of follow current while remaining capable of repeating these functions.
Surge Protective Devices (SPDs) A protective device for limiting transient voltages by diverting or limiting surge current; it also prevents continued flow of follow current while remaining capable of repeating these functions and designated as follows:
Type 1- Permanently connected SPDs intended for installation between the secondary of the service transformer and the line side of the service disconnect overcurrent device.
Type 2- Permanently connected SPDs intended for installation on the load side of the service disconnect overcurrent device; including SPDs located at the branch panel.
Type 3 – Point of utilization SPDs.
Type 4 – Component SPDs, including descrete components, as well as assemblies.
FPN No. 1 For further information on Type 1, Type 2, Type 3, and Type 4 SPDs, see UL 1449, Standard for Surge Protective Devices.
Move Surge Arrester definition, referenced in several articles, from Section 280.2 to Article 100.

Panel Statement: Add definition for surge protective device (replacing the term transient voltage surge suppressor in article 285.2), referenced in several articles, to Article 100.
This is one of several related proposals affecting Articles 100, 230, 250, 280, 285, 501 and 502.
See panel action and statement proposal 5-335 and 5-349.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-341 Log #1258 NEC-P05 **Final Action: Reject**
(280.4)

Submitter: Kenneth J. Brown, Leviton Mfg. Co. Inc.
Recommendation: Revise as follows:
280.4 Surge Arrestor Selection.
(A) Circuits of Less than 1000 Volts. Surge arrestor installed on a circuit less than 1000 volts shall comply with all of the following:
(5) Surge Arrestors shall not be contained within an enclosure containing overcurrent protective devices.
Substantiation: Surge arrestors contain combustible materials (metal oxide varistors) that produce conductive smoke (carbon residue) in an overvoltage failure mode that could increase the risk of an arc flash. UL permits the release of conductive residue following the results of the surge arrestors tests and this conductive residue can lead to arc flash within an energized enclosure containing overcurrent protective devices. The section was numbered for ease of use.
Panel Meeting Action: Reject
Panel Statement: No technical substantiation was provided to document the conditions identified by the submitter have actually occurred in the field or from documented testing, such as through a fact finding report. SPDs have been tested within panels containing overcurrent devices as part of the listing process and no evidence of the type failure identified has occurred during this process.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-342 Log #1665 NEC-P05 **Final Action: Reject**
(280.4(A)(4) and 285.3(2))

Submitter: Kenneth J. Brown, Leviton Mfg. Co. Inc.
Recommendation: Revise text to read as follows:
280.4(A)(4) Surge Arrestors shall not be installed on ungrounded systems or impedance grounded systems unless listed specifically for use on these systems. SPDs intended for use on an ungrounded system and provided with a L-G mode of protection, shall have the mode rated at the L-L voltage minimum.
285.3(2) On ungrounded systems or impedance grounded systems unless listed specifically for use on these systems. SPDs intended for use on an ungrounded system and provided with a L-G mode of protection, shall have the mode rated at the L-L voltage minimum.
Substantiation: This section was numbered for ease of use.
Panel Meeting Action: Reject
Panel Statement: The proposal does not meet the requirements set forth in Section 4-3.3 of the NFPA Regulations Governing Committee Projects. There is no substantiation to make these technical changes.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-343 Log #3475 NEC-P05 **Final Action: Accept in Principle**
(280.21)

Submitter: Richard F. Van Wert, Middle Department Inspection Agency / Rep. Benjamin Franklin Chapter IAEI
Recommendation: Revise text to read:
280.21 ~~Installed at Services of Less Than 1000 Volts~~ Connection
(A) Location.
(1) Service Supplied Building or Structure. The surge arrester is allowed to be connected on the line side of the service disconnect overcurernt device or on the load side of services of less than 1000 volts. Line and ground, etc.
Substantiation: This article needs rewording in order to stay consistent with wording in Article 285.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement Proposals 5-335 and 5-349.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

5-344 Log #1586 NEC-P05 **Final Action: Accept in Principle**
(280.24(A)(1))

TCC Action: The Technical Correlating Committee directs that the action on this proposal be sent to the Technical Correlating Committee Task Group on the definition of "Neutral Conductor" for review and comment.
Submitter: Technical Correlating Committee on National Electrical Code
Recommendation: Make the following change in 280.24(A)(1):
Change "neutral" to "neutral conductor."
The revised text would appear as follows:
(1) The grounded conductor of the secondary has elsewhere a grounding connection to a continuous metal underground water piping system. However, in urban water-pipe areas where there are at least four water-pipe connections on the neutral conductor and not fewer than four such connections in each mile of neutral conductor , the metallic interconnection shall be permitted to be made to the secondary neutral conductor , with omission of the direct grounding connection at the surge arrester.
Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).

The Task Group has proposed the following definitions to be added to Article 100:

● **Neutral conductor.** A circuit conductor connected to the neutral point of a system.

● **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.

This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals

● The use of the word ”neutral” as a noun should be avoided. The terms “neutral conductor” or “neutral point” should be used wherever grammatically possible.

● The phrase “grounded circuit conductor (neutral)” should be avoided. The phrases “grounded circuit conductor” or “grounded circuit conductor or neutral conductor” should be used as appropriate.

Additional information is available in the Task Group report.

Note: Supporting material is available for review at NFPA Headquarters.

(280.24(A)(2))

TCC Action: The Technical Correlating Committee directs that the action on this proposal be sent to the Technical Correlating Committee Task Group on the definition of “Neutral Conductor” for review and comment.
Submitter: Technical Correlating Committee on National Electrical Code
Recommendation: Make the following change in 280.24(A)(2):

Change “neutral” to “neutral conductor.”

The revised text would appear as follows:

(2) The grounded conductor of the secondary system is a part of a multiground neutral system or static wire of which the primary neutral <u>conductor</u> or static wire has at least four ground connections in each mile of line in addition to a ground at each service.

Substantiation: This proposal was developed by the TCC Task Group on the definition of “Neutral Conductor.” Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).

The Task Group has proposed the following definitions to be added to Article 100:

● **Neutral conductor.** A circuit conductor connected to the neutral point of a system.

● **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.

This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals

● The use of the word ”neutral” as a noun should be avoided. The terms “neutral conductor” or “neutral point” should be used wherever grammatically possible.

● The phrase “grounded circuit conductor (neutral)” should be avoided. The phrases “grounded circuit conductor” or “grounded circuit conductor or neutral conductor” should be used as appropriate.

Additional information is available in the Task Group report.

5-346 Log #1588 NEC-P05 **Final Action: Accept in Principle**
(280.24(C))

TCC Action: The Technical Correlating Committee directs that the action on this proposal be sent to the Technical Correlating Committee Task Group on the definition of “Neutral Conductor” for review and comment.
Submitter: Technical Correlating Committee on National Electrical Code
Recommendation: Make the following change in 280.24(C):

Change “neutral” to “neutral conductor.”

The revised text would appear as follows:

(C) By Special Permission. An interconnection of the surge arrester ground and the secondary neutral <u>conductor</u> , other than as provided in 280.24(A) or (B), shall be permitted to be made only by special permission.

Substantiation: This proposal was developed by the TCC Task Group on the definition of “Neutral Conductor.” Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).

The Task Group has proposed the following definitions to be added to Article 100:

● **Neutral conductor.** A circuit conductor connected to the neutral point of a system.

● **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.

This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals

● The use of the word ”neutral” as a noun should be avoided. The terms “neutral conductor” or “neutral point” should be used wherever grammatically possible.

● The phrase “grounded circuit conductor (neutral)” should be avoided. The phrases “grounded circuit conductor” or “grounded circuit conductor or neutral conductor” should be used as appropriate.

Ballot Results: Affirmative: 15

5-347 Log #802 NEC-P05 **Final Action: Accept in Principle**
(280.25)

Submitter: Joe Tedesco, Boston, MA
Recommendation: Delete the last sentence in 280.25:

“Grounding conductors shall not be run in metal enclosures unless bonded to both ends of such enclosure.” and replace with the following:

“Ferrous metal enclosures for grounding electrode conductors shall be electrically continuous from the point of attachment to cabinets or equipment to the grounding electrode and shall be securely fastened to the ground clamp or fitting. Nonferrous metal enclosures shall not be required to be electrically continuous. Ferrous metal enclosures that are not physically continuous from cabinets or equipment to the grounding electrode shall be made electrically continuous by bonding each end of the raceway or enclosure to the grounding electrode conductor.

Bonding shall apply at each end and to all intervening ferrous raceways, boxes, and enclosures between the service equipment and the grounding electrode. The bonding jumper for a grounding electrode conductor raceway or cable armor shall be the same size as, or larger than, the required enclosed grounding electrode conductor. Where a raceway is used as protection for a grounding electrode conductor, the installation shall comply with the requirements of the appropriate raceway article.”

Substantiation: Because it is a better rule, and includes the important new changes made in Article 250 in the last edition.

A FPN could do the same, but I feel that adding the words will be easily understood by Code Scholars and users of the NEC.

Panel Meeting Action: Accept in Principle

ARTICLE 285 — TRANSIENT VOLTAGE SURGE SUPPRESSORS: TYSSs

5-349 Log #2604 NEC-P05 **Final Action: Accept in Principle**
(285)

TCC Action: The Technical Correlating Committee advises that Article Scope statements and Titles are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.
Submitter: Joseph P. DeGregoria, Underwriters Laboratories Inc.
Recommendation: Revise text to read:

ARTICLE 285 Surge Protective Devices (SPDs) ~~Transient Voltage Surge Suppressors: TVSSs~~

I. General.

285.1 Scope. This article covers general requirements, installation requirements, and connection requirements for SPDs ~~transient voltage surge suppressors (TVSSs)~~ permanently installed on premises wiring systems.

~~285.2 Definition. Transient Voltage Surge Suppressor (TVSS). A protective device for limiting transient voltages by diverting or limiting surge current; it also prevents continued flow of follow current while remaining capable of repeating these functions.~~

285.3 Uses Not Permitted. A SPD ~~TVSS~~ device shall not be installed in the following:

(1) Circuits exceeding 600 volts

(2) On ungrounded systems, impedance grounded systems, or corner grounded delta systems unless listed specifically for use on these systems

(3) Where the rating of the SPD ~~TVSS~~ is less than the maximum continuous phase-to-ground power frequency voltage available at the point of application

FPN: For further information on SPDs ~~TVSSs~~ , see NEMA LS 1-1992, Standard for Low Voltage Surge Suppression Devices. The selection of a properly rated SPD ~~TVSS~~ is based on criteria such as maximum continuous operating voltage, the magnitude and duration of overvoltages at the suppressor location as affected by phase-to-ground faults, system grounding techniques, and switching surges.

285.4 Number Required. Where used at a point on a circuit, the SPD ~~TVSS~~ shall be connected to each ungrounded conductor.

285.5 Listing. A SPD ~~TVSS~~ shall be a listed device.

285.6 Short Circuit Current Rating. The SPD ~~TVSS~~ shall be marked with a short circuit current rating and shall not be installed at a point on the system where the available fault current is in excess of that rating. This marking requirement shall not apply to receptacles.

II. Installation.

285.11 Location. SPDs ~~TVSSs~~ shall be permitted to be located indoors or outdoors and shall be made inaccessible to unqualified persons, unless listed for installation in accessible locations.

285.12 Routing of Connections. The conductors used to connect the SPD ~~TVSS~~ to the line of bus and to ground shall not be any longer than necessary and shall avoid unnecessary bends.

III. Connecting SPDs ~~Transient Voltage Surge Suppressors~~

285.21 Connection. Where a SPD ~~TVSS~~ is installed, it shall comply with 285.23 through 285.27. ~~285.21(A) through (C).~~

285.23 Type 1 SPDs

(A) Type 1 SPDs shall be connected to the supply side of the service disconnect as permitted in 230.82(4). Type 1 SPDs shall be permitted to be connected as specified in 285.24.

(B) When installed at services, the grounding conductor of a Type 1 SPD shall be connected to one of the following:

(1) Grounded service conductor

(2) Grounding electrode conductor

(3) Grounding electrode for the service

(4) Equipment grounding terminal in the service equipment

285.24 Type 2 SPDs

~~(A) Location.~~

(~~1~~ A) Service Supplied Building or Structure. Type 2 SPDs ~~The transient voltage surge suppressor~~ shall be connected on the load side of a service disconnect overcurrent device required in 230.91, unless installed in accordance with 230.82(8).

(~~2~~ B) Feeder Supplied Building or Structure. Type 2 SPDs ~~The transient voltage surge suppressor~~ shall be connected at the building or structure in accordance with (1) or (2)

(1) On the load side of the first overcurrent device where the main disconnect for the building or structure consists of a circuit breaker or fused disconnect switch.

(2) On the load side of a branch circuit overcurrent protective device in the first panel where the building or structure main disconnect does not contain an overcurrent protective device. ~~on the load side of the first overcurrent device at the building or structure.~~

~~Exception to (1) and (2): Where the TVSS is also listed as a surge arrester, the connection shall be as permitted by Article 280.~~

(~~3~~ C) Separately Derived System. The SPD ~~TVSS~~ shall be connected on the load side of the first overcurrent device in a separately derived system.

~~(B)~~ 285.25 Conductor Size. Line and ground connecting conductors shall not be smaller than 14 AWG copper or 12 AWG aluminum.

~~(C)~~ 285.26 Connection Between Conductors. A SPD ~~TVSS~~ shall be permitted to be connected between any two conductors — ungrounded conductor(s), grounded conductor, grounding conductor. The grounded conductor and the grounding conductor shall be interconnected only the normal operation of the SPD ~~TVSS~~ during a surge.

285.2 ~~5~~ 7 Grounding. Grounding conductors shall not be run in metal enclosures unless bonded to both ends of such enclosure.

Substantiation: This is one of several related proposals affecting Articles 100, 230, 250, 280, 285, 501, and 502 based on the following:

1) UL intends to combine the categories of Surge Arresters (Article 280) and Transient Voltage Surge Suppressors (Article 285) into one category and Standard, UL 1449, renamed Surge Protective Devices(SPDs).

UL 1449 will include SPD designations Type 1 and Type 2 for permanently connected devices for use on circuits not exceeding 600 V.

The technology of both low voltage Surge Arresters and TVSSs are now basically the same, thereby justifying coverage under one Standard, UL 1449, and one test program with consideration given to the installation location on the line side (Type 1) or load side (Type 2) of the service disconnect overcurrent protection.

2) The Surge Arrester designation will only be retained for devices used in circuits of 1 kV and over and evaluated to IEEE C62.11-1999.

Panel Meeting Action: Accept in Principle

ARTICLE 285 Surge Protective Devices (SPDs) 1kV or less ~~Transient Voltage Surge Suppressors: TVSSs~~

I. General

285.1 Scope. This article covers general requirements, installation requirements, and connection requirements for SPDs ~~transient voltage surge suppressors (TVSSs)~~ permanently installed on premises wiring systems 1 kV or less .

FPN: Transient Voltage Surge Suppressors (TVSSs) are also known as SPDs.

~~285.2 Definition. Transient Voltage Surge Suppressor (TVSS). A protective device for limiting transient voltages by diverting or limiting surge current; it also prevents continued flow of follow current while remaining capable of repeating these functions.~~

285.3 Uses Not Permitted. A SPD ~~TVSS~~ device shall not be installed in the following:

(1) Circuits exceeding ~~600~~ 1 kV ~~volts~~

(2) On ungrounded systems, impedance grounded systems, or corner grounded delta systems unless listed specifically for use on these systems.

(3) Where the rating of the SPD ~~TVSS~~ is less than the maximum continuous phase-to-ground power frequency voltage available at the point of application

FPN: For further information on SPDs ~~TVSSs~~ , see NEMA LS 1-1992, Standard for Low Voltage Surge Suppression Devices. The selection of a properly rated SPD ~~TVSS~~ is based on criteria such as maximum continuous operating voltage, the magnitude and duration of overvoltages at the suppressor location as affected by phase-to-ground faults, system grounding techniques, and switching surges.

285.4 Number Required.
Where used at a point on a circuit, the SPD ~~TVSS~~ shall be connected to each ungrounded conductor.

285.5 Listing. A SPD ~~TVSS~~ shall be a listed device.

285.6 Short Circuit Current Rating. The SPD ~~TVSS~~ shall be marked with a short circuit current rating and shall not be installed at a point on the system where the available fault current is in excess of that rating. This marking requirement shall not apply to receptacles.

II. Installation

285.11 Location. SPDs ~~TVSSs~~ shall be permitted to be located indoors or outdoors and shall be made inaccessible to unqualified persons, unless listed for installation in accessible locations.

285.12 Routing of Connections. The conductors used to connect the SPD ~~TVSS~~ to the line or bus and to ground shall not be any longer than necessary and shall avoid unnecessary bends.

III. Connecting SPDs ~~Transient Voltage Surge Suppressors~~

285.21 Connection. Where a SPD ~~TVSS~~ device is installed, it shall comply with 285.23 through 285.28. ~~285.21(A) through (C)~~ .

285.23 Type 1 SPDs. Type 1 SPDs shall be installed in accordance with 285.23(A) and 285.23(B)

(A) Installation. Type 1 SPDs shall installed as follows:

(1) Type 1 SPDs shall be permitted to be connected to the supply side of the service disconnect as permitted in 230.82(4) or
(2) Type 1 SPDs shall be permitted to be connected as specified in 285.24.

(B) At the Service. When installed at services, the grounding conductor of a Type 1 SPD shall be connected to one of the following:

(1) Grounded service conductor

(2) Grounding electrode conductor

(3) Grounding electrode for the service

(4) Equipment grounding terminal in the service equipment

285.24 Type 2 SPDs. Type 2 SPDs shall be installed in accordance with 285.24(A) through 285.24(C).

~~(A) Location~~ .
(~~1~~ A) Service Supplied Building or Structure. Type 2 SPDs ~~The transient voltage surge suppressor~~ shall be connected anywhere on the load side of a service disconnect overcurrent device required in 230.91, unless installed in accordance with 230.82(8).

(~~2~~ B) Feeder Supplied Building or Structure. Type 2 SPDs ~~The transient voltage surge suppressor~~ shall be connected at the building or structure in accordance with (1) or (2)
(1) Anywhere on the load side of the first overcurrent device where the main disconnect for the building or structure consists of a circuit breaker or fused disconnect switch.
(2) Anywhere on the load side of a branch circuit overcurrent protective device in the first panel where the building or structure main disconnect does not contain an overcurrent protective device . ~~on the load side of the first overcurrent device at the building or structure.~~
~~Exception to (1) and (2): Where the TVSS is also listed as a surge arrester, the connection shall be as permitted by Article 280.~~

(~~3~~ C) Separately Derived System. The SPD ~~TVSS~~ shall be connected on the load side of the first overcurrent device in a separately derived system.

285.25 Type 3 SPDs Type 3 SPDs shall be permitted to be installed anywhere on the load side of branch circuit overcurrent protection up to the equipment served, provided the connection is a minimum 10 m (30 ft.) of conductor distance from the service panel or separately derived system.

~~(B)~~ 285.26 Conductor Size. Line and ground ing ~~connecting~~ conductors shall not be smaller than 14 AWG copper or 12 AWG aluminum.

~~(C)~~ 285.27 Connection Between Conductors. A SPD ~~TVSS~~ shall be permitted to be connected between any two conductors — ungrounded conductor(s), grounded conductor, grounding conductor. The grounded conductor and the grounding conductor shall be interconnected only by the normal operation of the SPD ~~TVSS~~ during a surge.

285.2 ~~5~~ 8 Grounding Conductor Connections and Enclosures . ~~Grounding conductors shall not be run in metal enclosures unless bonded to both ends of such enclosure.~~
Except as indicated in this article, SPD grounding connections shall be made as specified in Article 250, Part III. Grounding conductors installed in metal enclosures shall comply with 250.64(E).
Panel Statement: The p roposed revised text incorporating proposals 5-337, 5-343, 5-351, 5-352 and added text covering type 3 SPDs. Set the voltage level to segregate surge arresters in Article 280 to SPDs in Article 285. Revised text for clarity and to correlate with revisions from other proposals. The panel understands that the article title and scope statement in this revised article is under the purview of the Technical Correlating Committee.

ARTICLE 300 — WIRING METHODS

3-5 Log #1532 NEC-P03 **Final Action: Accept in Principle in Part**
(300, 590, 720)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to the Technical Correlating Committee Grounding and Bonding Task Group for comment.
Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Revise Articles 300, 590, and 720 as described in the following, relative to the terms bonding and grounding.
300.5(I) Exception No. 1: Exception No. 1: Conductors in parallel in raceways or cables shall be permitted, but each raceway or cable shall contain all conductors of the same circuit including equipment grounding conductors.
300.5(J) Revise the title of the section as follows:
(J) Earth ~~Ground~~ Movement. Where direct-buried conductors, raceways, or cables are subject to movement by settlement or frost, direct-buried conductors, raceways, or cables shall be arranged so as to prevent damage to the enclosed conductors or to equipment connected to the raceways.
300.40 Revise 300.40 as follows:
300.40 Insulation Shielding. Metallic and semiconducting insulation shielding components of shielded cables shall be removed for a distance dependent on the circuit voltage and insulation. Stress reduction means shall be provided at

all terminations of factory-applied shielding.
Metallic shielding components such as tapes, wires, or braids, or combinations thereof, and their associated conducting or semiconducting components shall be connected to an equipment grounding conductor ~~grounded~~ .

590.4(D): Revise 590.4(D) as follows:

(D) Receptacles. All receptacles shall be of the grounding type. Unless installed in a continuous grounded metal raceway or metal-covered cable that qualifies as an equipment grounding conductor in accordance with 250.118, all branch circuits shall include contain a separate equipment grounding conductor, and all receptacles shall be electrically connected to the equipment grounding conductors. Receptacles on construction sites shall not be installed on branch circuits that supply temporary lighting. Receptacles shall not be connected to the same ungrounded conductor of multiwire circuits that supply temporary lighting.

590.6(B)(2)(a): Revise Section 590.6(B)(2)(a) as follows:

(2) Assured Equipment Grounding Conductor Program. A written assured equipment grounding conductor program continuously enforced at the site by one or more designated persons to ensure that equipment grounding conductors for all cord sets, receptacles that are not a part of the permanent wiring of the building or structure, and equipment connected by cord and plug are installed and maintained in accordance with the applicable requirements of 250.114, 250.138, 406.3(C), and 590.4(D).

(a) The following tests shall be performed on all cord sets, receptacles that are not part of the permanent wiring of the building or structure, and cord-and-plug-connected equipment required to be connected to an equipment grounding conductor ~~grounded~~ : …

720.10: Revise Section 720.10 as follows:

720.10 Grounding and Bonding. Grounding and bonding shall be as provided in Article 250.

Substantiation: 300.5(I) Exception No. 1: This proposed revision clarifies the specific conductor referred to in this section. Grounding conductor is defined in Article 100. The specific conductor being referenced in this rule is the equipment grounding conductor.

300.5(J): The definition of ground has been revised. The more appropriate word to use in the title of this section is "earth" since this section deals with movement of the earth or grade levels.

300.40: The proposed revision is intended to be more specific to where the connection of the shielding is to be made. As previously worded, connected to ground could mean just connected to the earth through an electrode. The equipment grounding conductor, by definition establishes the connection to ground.

590.4(D): The proposed revisions to this section are intended to be more prescriptive and specific to require the metal raceway or metal-covered cable referred to in this section to qualify as an equipment grounding conductor rather than just indicate that the raceway or metal-covered cable could just be grounded.

590.6(B)(2)(a): Contain is changed to include which is more appropriate since the equipment grounding conductor is generally included with the branch circuit and is not contained within it. (Editorial revision proposed)

590.62(B)(2)(a): This proposed revision clarifies the specific conductor referred to in this section. The specific grounding conductor referenced in this rule is the equipment grounding conductor which accomplishes the grounding and provides an effective ground-fault current path.

720.10: Both grounding and bonding functions are necessary for these installations. The title and section have been revised to include both.

This is the result of the TCC Task Group on Grounding and Bonding in resolve of the 2005 NEC cycle actions related to Proposal 5-1 and Comment 5-1 as directed by the Technical Correlating Committee. This is a companion proposal to the proposed revision to the terms "bonded", "grounded", and "equipment grounding conductor" in Article 100 relative to this Task Group's recommendations. These changes clarify the present requirement in more prescriptive language.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle in Part

Revise 590.4(D) as follows:

(D) Receptacles. All receptacles shall be of the grounding type. Unless installed in a continuous grounded metal raceway or metal-covered cable that qualifies as an equipment grounding conductor in accordance with 250.118, all branch circuits shall include ~~contain~~ a separate equipment grounding conductor, and all receptacles shall be electrically connected to the equipment grounding conductor (s) . Receptacles on construction sites shall not be installed on branch circuits that supply temporary lighting. Receptacles shall not be connected to the same ungrounded conductor of multiwire circuits that supply temporary lighting.

Panel Statement: The panel accepts the recommendation made for 300.5(I) Exception No. 1 to add the word "equipment".

The panel accepts the recommendation made for 300.5(J) to change the word "Ground" to the word "Earth".

The panel accepts in principle the recommendation made for 590.4(D) with the editorial changes shown in the panel action text. The "(s)" was added to indicate that the receptacles could be connected through an equipment bonding jumper to an equipment grounding conductor or multiple equipment grounding conductors.

The panel rejects the recommendation made for 300.40 since the present text adequately covers the intent to connect metallic shielding components to a grounded point in the system.

The panel rejects the recommendation made for 590.6(B)(2)(a) since this directly relates to text used by OSHA in their acceptance of this alternative method of protection.

The panel rejects the recommendation made for 720.10. Refer to the panel action and statement on Proposal 3-136 which deleted this section.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-6 Log #556 NEC-P03 **Final Action: Reject**

(300.1(D) (New))

Submitter: R. K. Varma, State of PA, DCED

Recommendation: Add new text to read:

All staples under Article 300 - Wiring Methods shall be insulated and listed by an approved listing agency. Number of different size cables under a staple shall be a part of listing.

Substantiation: Currently, there is no requirement for staples to be insulated or listed under Article 300 - Wiring Methods. Only prudence is called upon to safeguard against damage to the jacket of the cable and prudence cannot be quantified.

Panel Meeting Action: Reject

Panel Statement: The need for insulated staples for various wiring methods should be determined in the individual articles for that particular wiring method. Often the difference in lumber, kiln-dried versus non-kiln-dried lumber, will affect the ability to install a staple in the wood without potentially damaging the cable and may be an issue in some areas of the country but not others.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-7 Log #1000 NEC-P03 **Final Action: Reject**

(300.2(A) Exception (New))

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Add:

Exception: Individual conductors shall be permitted, where installed in accordance with 225.6.

Substantiation: Edit. Wiring method of 225.6 is permitted but not covered in Chapter 3.

Panel Meeting Action: Reject

Panel Statement: The intended section referenced in the proposal is understood as 300.3(A) rather than 300.2(A). The proposed text already exists in 300.3(A). There is no need to provide a duplicate of this text.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-8 Log #3588 NEC-P03 **Final Action: Reject**

(300.3)

Submitter: Jeff Jonas, Generac Power Systems, Inc.

Recommendation: Change to 300.3(B):

(B) Conductors of the Same Circuit. All conductors of the same circuit and, where used, the grounded conductor and all equipment grounding conductors and bonding conductors shall be contained within the same raceway, auxiliary gutter, cable tray, cablebus assembly, trench, cable, or cord, unless otherwise permitted in accordance with 300.3(B)(1) through (B)(~~4~~)(5).

Add 300.3(B)(5):

300.3(B)(5) Listed Assemblies. Where a listed device is mounted adjacent to the panelboard, the neutral conductors shall be permitted to originate in the panelboard.

Note: We feel this is the best place to make this change but would be open to other suggestions.

Substantiation: Typically all conductors of a circuit are to be in the same raceway, conduit, etc. This general rule is to reman consistent with electrical theory, that is, to reduce inductive heating and to avoid increases in overall circuit impedance, all circuit conductors of an individual circuit must be grouped. This also is to help in the identification of same circuit conductors.

These devices vary from the above statement. However, we feel that the variance is occurring in a controlled environment. The control aspect comes from the fact that the TSS is a Listed Device and a pre-wired conduit is provided for field installation.

When a device is listed, such as this TSS, the system has been investigated by an independent third party, in many cases Underwriters Laboratories, Inc. during the listing process a prototype is built. Normal operation of the device is tested by energizing all circuits to their maximum rating. Temperatures are measured, verified to be within the limits of the materials involved, and certified to be safe. This temperature test verified that there are no adverse affects from inductive heating. The assembly is documented and Follow Up Service inspections are routinely conducted to verify that it continues to be manufactured as it was at the time of submittal.

The pre-wired conduit limits the length of the conduit that the 2 circuit conductors are not run together. With 2 ft. conduit length, everything is in sight and there should be no confusion as to which circuits are which. We feel the short length of conduit is like the alternate installation called out in 300.3(b)(4).

With this information in mind we feel that it is an acceptable design that meets good engineering practice and the intent of the NEC would hope the code-making panel give it serious consideration.

The inspection in the field should be to determine if the device is installed tot he manufacturers specifications and being used as the manufacturer's 3rd party listing specifies. However, in some cases the NEC is being used as the basis to review listed product, and the interpretation of NEC as it relates to the device and its installed intent is a point of subjective interpretation at times, as has been the case with a small portion of installations.

Note: Supporting material available upon request for review at NFPA headquarters.

Panel Meeting Action: Reject

Panel Statement: (1) There is a conflict with existing 210.4(A). Section 210.4(A), last sentence states in a multiwire branch circuit, all conductors shall originate from the same panelboard or similar distribution equipment. (2) Section 300.3(B) really deals with conductors of the same circuit within the wiring method and not the requirements in Article 210 for branch circuits.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 12 Negative: 1

Explanation of Negative:

GUIDA, T.: Section 300.3(B) requires all conductors of the same circuit, including any grounded conductors, where used, and any equipment grounding conductors to be installed together to ensure that lines of flux for the entire circuit will cancel. This is accomplished by routing all of the conductors in close proximity to each other within the same raceway, auxiliary gutter, cable tray, cablebus assembly, cable or cord, or, where installed in a trench, in the earth in close proximity to each other.

In the case presented in the proposal, a new panelboard was established within the transfer switch. This new panelboard was supplied with normal power from a new feeder circuit breaker in the existing panel and with backup power from the generator. The feeder conductors consisted of both ungrounded conductors from a new breaker and a neutral conductor in the existing panel connected to the new panel in the transfer switch.

Ungrounded branch circuit conductors from the existing panel were removed from the branch circuit breakers in the existing panel and reconnected to new circuit breakers in the new panel within the transfer switch but the neutrals in the existing panel were left connected to the existing panelboard neutral block. The feeder neutral for the new panelboard was sized large enough for any maximum unbalanced load from the ungrounded branch circuit conductors so there is no issue of induced current between the two panels and thus no safety problem from induction. Furthermore, the entire assembly is a listed assembly, as substantiated in the proposal, with third party testing to indicate there was no inductive current to either the raceway or the enclosures for either panelboards during either normal power or generator power operation.

The Panel 3 Statement for reject alludes to a possible violation of Section 210.4(A), which covers multiwire branch circuits. Section 210.4(A) only applies where multiwire branch circuits are being reconnected with the ungrounded conductors being relocated into the transfer switch panelboard but the multiwire branch circuit neutrals left in the old panelboard. There would not be a Code violation if individual branch circuits were installed in this manner.

The last sentence of this section states that all conductors shall originate from the same panelboard or similar distribution equipment. This was inserted into 210.4(A) in the 1981 NEC to ensure that multiwire branch circuits supplying more than one device or equipment on the same yoke have circuit breakers either with internal trip or have identified tie bars so both circuits can be simultaneously disconnected. This section would not apply to a panelboard where all of the branch circuits were individual branch circuits, not multiwire branch circuits. There is no technical or safety reason to restrict the use of these listed transfer switches due to 210.4(A) last sentence because the neutrals for the branch circuits are in the existing panelboard, less than two feet away from the new panelboard/transfer switch. This proposal should be accepted and inserted as a new 300.3(B)(5).

3-9 Log #2748 NEC-P03 **Final Action: Reject**
(300.3(5))

Submitter: Daniel Baker, URS Corporation, Inc.

Recommendation: Revise text to read:

(5) Airfield Lighting Circuits. Conductors of series circuits used for airfield lighting and that are powered by regulators which limit current to 20 amperes, or less may be separated.

Substantiation: 300.3(B) Conductors of the Same Circuit. Reads: "All conductors of the same circuit and, where used, the grounded conductor and all equipment grounding conductors and bonding conductors shall be contained within the same raceway, auxiliary gutter, cable tray, cablebus assembly, trench, cable, or cord, unless otherwise permitted in accordance 300.(B)(1) through (4)."

It is common practice in airfield lighting series circuits which are powered by regulators to separate the conductors and run single conductors along the edge of a taxiway or runway. This saves on wiring costs which can be significant because of the long runs involved, runways are usually over 5,000 feet long. The practices and methods used in airfield lighting are based on Federal Aviation Administration (FAA) Advisory Circulars (ACs). An example of separated single conductor series circuit is shown on the left in **Figure 23** of Appendix 1 of Advisory Circular AC 150/5340-30A "Design and Installation Details for Airport Visual Aids", issued April 11, 2005. The ACs stipulate that the series circuits be connected to "Constant Current Regulators" (CCRs). There are two classes of CCRs, one with a maximum rating of 6.6 amperes and the other with a rating of 20 ampleres, maximum.

Although many airfield installations are not inspected by local inspectors, there are times where this occurs and these installations are cited for lack of compliance with this provision of the NEC. This proposal adds a fifth condition to the list at the end of the above NEC provision.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: Section 300.3(B)(3) already permits individual conductors of series circuits to be separated if installed in non-ferrous-type raceways or conduits. Runway series circuits are typically installed in direct buried applications or in non-metallic PVC conduit, both of which satisfy 300.3(B)(3). Series circuits installed in ferrous raceways are not permitted since they will experience induction heating that would violate the intent of The Code and be a cause for concern. To add an exception to permit something that is already presently allowed is not necessary.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-10 Log #1275 NEC-P03 **Final Action: Reject**
(300.3(B), FPN (New))

Submitter: W. Brian Poykko, Poykko Engineering

Recommendation: Add:

FPN: Use 4 pole transfer switches or 3 pole transfer switches with overlapping contacts to eliminate multiple neutral current return paths in systems with emergency or standby power supplies and more than one transfer switch.

Substantiation: If there is more than one transfer switch, the use of 3 pole switches creates more than one neutral current return path. This would not meet the requirements of "Conductors of the Same Circuit" requirements of 300.3(B).

Panel Meeting Action: Reject

Panel Statement: Section 3.1.3 of the NEC Style Manual does not permit requirements or mandatory text in a fine print note. Section 90.5(C) states that finepPrint notes are for informational purposes only and are not enforceable. Four pole transfer switches with overlapping contacts do not eliminate multiple neutral paths but ensure that the neutral is not opened while the normal phase conductors are still in the circuit, leaving a series circuit connection through the ungrounded phase conductors. The substantiation is also not correct since a truly balanced load without a grounded or neutral conductor can use multiple three-pole transfer switches without creating more than one neutral path.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-11 Log #2229 NEC-P03 **Final Action: Reject**
(300.3(B)(1) Exception)

Submitter: Donald A. Ganiere, Ottawa, IL

Recommendation: Delete the following:

<u>Exception: Conductors installed in nonmetallic raceways run underground shall be permitted to be arranged as isolated phase installations. The raceways shall be installed in close proximity, and the conductors shall comply with the provisions of 300.20(B).</u>

Substantiation: The exception is not required. Such installations are permitted by 300.3(B)(3) in all locations, not just underground locations.

Panel Meeting Action: Reject

Panel Statement: This exception is necessary to permit installations where nonmetallic raceways are installed in close proximity with all of Phase A in one raceway, all of Phase B in another raceway, all of Phase C in another, and all the grounded conductors in another raceway. Where this is useful is between underground manholes so the phase conductors can exit the raceways and be easily racked within the manhole, taking up less space, and making it easier to do testing and maintenance on the installation. This would not be permissible without this exception.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-12 Log #1142 NEC-P03 **Final Action: Accept in Principle**
(300.3(C))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise first sentence:
Conductors of AC and DC circuits rated 600 volts, nominal, or less, ~~ac and dc circuits~~ shall be permitted to occupy the same wiring enclosure, cable, or raceway.
Substantiation: Edit. The commas in the present sentence structure, construed as "and" separates the ac and dc circuits from the 600 volt limitation.
Panel Meeting Action: Accept in Principle
In the proposed text, use the lower case on both the "ac" and "dc" circuits and add a comma after "circuits". With these changes the first sentence of 300.3(C)(1) is revised to read as follows:
Conductors of ac and dc circuits, rated 600 volts, nominal, or less, shall be permitted to occupy the same equipment wiring enclosure, cable, or raceway.
Panel Statement: The change to the proposed text is editorial in nature. The substantiation is not correct in stating that the commas are construed as "and" in the present Code text. A comma is a punctuation mark that provides separation within a sentence or causes the reader to pause at a specific location within a sentence.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-13 Log #3352 NEC-P03 **Final Action: Reject**
(300.3(D) (New))

Submitter: Paul Dobrowsky, Holley, NY
Recommendation: Add new Subdivision (D) to Section 300.3 as follows:
(D) Listing. Cables and insulated conductors installed in enclosures or raceways shall be listed for use in wet locations where the enclosures or raceways are in wet locations.
Substantiation: Enclosures and raceways that are in locations that are exposed to rain or other liquids typically have liquid or at least moisture in the enclosure or raceway. Conductors need to be suitable for this location.
Panel Meeting Action: Reject
Panel Statement: The requirement for cables to be suitable for the location in which they are to be installed is presently addressed in 310.8 and Table 310.13 applicable locations. Article 310 covers the general requirements for conductors such as insulation types, designations, and uses. To add the proposed text to Article 300 would be inappropriate, since 300 deals with wiring methods in general. Repeating this requirement in Article 300 does not add clarity to the Code.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
CASPARRO, P.: Neither 310.8 nor Table 310.13 specifically address the fact that conductors installed in raceways are required to be suitable for wet locations.
It is sometimes interpreted that the interior of raceways are a dry location, even when the raceway is located outdoors.
Due to condensation and the eventual entrance of moisture into the raceway; stating that the interior of the raceway is considered a wet location if the exterior is in a wet location will add clarity.
CMP 3 may believe that this requirement should be in another section, but the proposed text should be added to provide clarity.

3-14 Log #3044 NEC-P03 **Final Action: Reject**
(300.4)

Submitter: Melvin K. Sanders, TECo Inc.
Recommendation: Delete the following text as indicated.
300.4 Protection Against Physical Damage
Where subject to physical damage, conductors shall be protected.
~~**(A) Cables and Raceways Through Wood Members.**~~
~~**(1) Bored Holes.** In both exposed and concealed locations, where a cable- or raceway-type wiring method is installed through bored holes in joists, rafters, or wood members, holes shall be bored so that the edge of the hole is not less than 32 mm (1 1/ 4 in.) from the nearest edge of the wood member. Where this distance cannot be maintained, the cable or raceway shall be protected from penetration by screws or nails by a steel plate or bushing, at least 1.6 mm (1/ 16 in.) thick, and of appropriate length and width installed to cover the area of the wiring.~~
~~*Exception No. 1: Steel plates shall not be required to protect rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, or electrical metallic tubing.*~~
~~*Exception No. 2: A listed and marked steel plate less than 1.6 mm (1/ 16 in.) thick that provides equal or better protection against nail or screw penetration shall be permitted.*~~
~~**(2) Notches in Wood.** Where there is no objection because of weakening the building structure, in both exposed and concealed locations, cables or raceways shall be permitted to be laid in notches in wood studs, joists, rafters, or other wood members where the cable or raceway at those points is protected against nails or screws by a steel plate at least 1.6 mm (1/ 16 in.) thick, and of appropriate length and width, installed to cover the area of the wiring. The steel plate shall be installed before the building finish is applied.~~
~~*Exception No. 1: Steel plates shall not be required to protect rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, or electrical metallic tubing.*~~
~~*Exception No. 2: A listed and marked steel plate less than 1.6 mm (1/ 16 in.) thick that provides equal or better protection against nail or screw penetration shall be permitted.*~~
~~**(B) Nonmetallic-Sheathed Cables and Electrical Nonmetallic Tubing Through Metal Framing Members.**~~
~~**(1) Nonmetallic-Sheathed Cable** . In both exposed and concealed locations where nonmetallic-sheathed cables pass through either factory or field punched, cut, or drilled slots or holes in metal members, the cable shall be protected by listed bushings or listed grommets covering all metal edges that are securely fastened in the opening prior to installation of the cable.~~
~~**(2) Nonmetallic-Sheathed Cable and Electrical Nonmetallic Tubing.** Where nails or screws are likely to penetrate nonmetallic-sheathed cable or electrical nonmetallic tubing, a steel sleeve, steel plate, or steel clip not less than 1.6 mm (1/ 16 in.) in thickness shall be used to protect the cable or tubing.~~
~~*Exception: A listed and marked steel plate less than 1.6 mm (1/ 16 in.) thick that provides equal or better protection against nail or screw penetration shall be permitted.*~~
(C) Cables Through Spaces Behind Panels Designed to Allow Access. Cables or raceway-type wiring methods, installed behind panels designed to allow access, shall be supported according to their applicable articles.
~~**(D) Cables and Raceways Parallel to Framing Members and Furring Strips.** In both exposed and concealed locations, where a cable- or raceway-type wiring method is installed parallel to framing members, such as joists, rafters, or studs, or is installed parallel to furring strips, the cable or raceway shall be installed and supported so that the nearest outside surface of the cable or raceway is not less than 32 mm (1-1/ 4 in.) from the nearest edge of the framing member or furring strips where nails or screws are likely to penetrate. Where this distance cannot be maintained, the cable or raceway shall be protected from penetration by nails or screws by a steel plate, sleeve, or equivalent at least 1.6 mm (1/ 16 in.) thick.~~
~~*Exception No. 1: Steel plates, sleeves, or the equivalent shall not be required to protect rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, or electrical metallic tubing.*~~
~~*Exception No. 2: For concealed work in finished buildings, or finished panels for prefabricated buildings where such supporting is impracticable, it shall be permissible to fish the cables between access points.*~~
~~*Exception No. 3: A listed and marked steel plate less than 1.6 mm (1/ 16 in.) thick that provides equal or better protection against nail or screw penetration shall be permitted.*~~
~~**(E) Cables and Raceways Installed in Shallow Grooves.** Cable- or raceway-type wiring methods installed in a groove, to be covered by wallboard, siding, paneling, carpeting, or similar finish, shall be protected by 1.6 mm (1/ 16 in.) thick steel plate, sleeve, or equivalent or by not less than 32-mm (1-1/ 4-in.) free space for the full length of the groove in which the cable or raceway is installed.~~
~~*Exception No. 1: Steel plates, sleeves, or the equivalent shall not be required to protect rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, or electrical metallic tubing.*~~
~~*Exception No. 2: A listed and marked steel plate less than 1.6 mm (1/ 16 in.) thick that provides equal or better protection against nail or screw penetration shall be permitted.*~~
(F) Insulated Fittings. Where raceways containing ungrounded conductors 4 AWG or larger enter a cabinet, box enclosure, or raceway, the conductors shall be protected by a substantial fitting providing a smoothly rounded insulating surface, unless the conductors are separated from the fitting or raceway by substantial insulating material that is securely fastened in place.
Exception: Where threaded hubs or bosses that are an integral part of a cabinet, box enclosure, or raceway provide a smoothly rounded or flared entry for conductors.
Conduit bushings constructed wholly of insulating material shall not be used to secure a fitting or raceway. The insulating fitting or insulating material shall have a temperature rating not less than the insulation temperature rating of the installed conductors.
Substantiation: The wiring methods typically installed in wooded frame structures are Article 320 (Type AC), Article 330 (Type MC), Article 334 (Types NM, NMC, and NMS), and Article 362 (ENC). Insofar as Article 340 (Type UF) is installed in lieu of Article 334 wiring methods, its installation must meet the requirements of Article 334 Parts II and III, and also subject to the same installation restrictions.
Since the 1975 Edition of the NEC, there has been a requirement in Section 300.4 that steel plates or bushings be installed to provide protection of certain wiring method against damage from ordinary nails or screw-nails when they pass through wooden members or laid in notches or grooves and the distance from the nail direction could not be the required 1-1/4 inch (32 mm).
This restriction placed in Article 300 has prevented those CMP's most knowledgeable in application of these products from using any other protection schemes or technology for this purpose. During the 2005 ROP/ROC stage, fact-finding reports were presented to CMP 3 highlighting the steel plates called for provide little or no protection against nails or screw-nails larger than #8 or equivalent trade designation. Since Section 300.4 first paragraph was changed

in 2005 ROP to emphasize conductors are to be protected against physical damage, it is obvious that such protection is to be provided by the wiring method in which they are contained, as spelled out in Section 300.3(A). Because the Scopes of Section 320.1, 330.1, 334.1, 340.1 and 362.1 state they govern the installation of those wiring methods which, by Section 300.3(A), contain the conductors that are to be protected, as stated in Section 300.4 first paragraph.

Sections 320.12(1), 330.12(1), 340(10), and 362.12(10) state those wiring methods are not to be exposed to physical damage, therefore the contained conductors are inherently protected against damage which meets the intent of Section 300.4 first paragraph, and Section 300.3(A) is satisfied.

The proposed deletions would leave 300.4 first paragraph, 300.4(D), and 300.4(F) and need to be re-identified. This would allow Article 300 to set the general guidelines and allow CMP 7 and CMP 8 to set rules deemed necessary to protect appropriate wiring methods.

Separate proposals are being made to CMP 7 and CMP 8 to address this text proposed to be deleted from here and moved into their jurisdiction. Coordination between all affected CMP's will be essential in order for this to be accomplished in one ROP/ROC cycle.

Panel Meeting Action: Reject

Panel Statement: The purpose of Article 300 is to provide an introduction to Chapter 3 for wiring methods and to provide general rules that can be easily accessed by the user of the Code, rather than having to look for these general rules in each article. Following this line of thinking by the submitter, all of Article 300 could be inserted into the various articles in Chapter 3, depending on the type of wiring method to be employed, but it would not be as user-friendly as it is now.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-15 Log #108 NEC-P03 **Final Action: Reject**

(300.4(A)(1))

Submitter: Michael Meyers, St. Charles, MI

Recommendation: Revise the section to require holes bored through horizontal framing members to be not closer than 50 mm (2 in.) from the edge. The revised section will then read as follows:

"(1) Bored Holes. In both exposed and concealed locations, where a cable- or raceway-type wiring method is installed through bored holes in <u>wood studs and vertical framing members</u> ~~joists, rafters, or wood members,~~ holes shall be bored so that the edge of the hole is not less than 32 mm (1 1/4 in.) from the nearest edge of the wood member, <u>and for joists, rafters, beams and other horizontal framing holes shall be bored so that the edge of the hole is not less than 50 mm (2 in.) from the nearest edge of the wood member.</u> Where this distance cannot be...

Substantiation: There are two issues, potential damage to the cable by screws, and weakening of the horizontal member. Screws are frequently used to attach ceiling materials to the underside of horizontal framing members and frequently long screws are used. The incidences of damage to cable by fasteners are on the rise. This increased spacing from the edge of joists and rafters will help reduce the damage to cables. As another issue, framing members especially when they support loads are sometimes severely weakened when holes are bored as close as 1 1/4 in. from the bottom surface of the joist. Stresses near the hole will be much less when the spacing is 2 in. from the edge of the wood member.

Panel Meeting Action: Reject

Panel Statement: Steel plates and other methods of protection can be used to provide protection for cables or raceway type wiring methods installed through wood framing members, joists, and similar framing where construction methods dictate a longer screw or fastener. Inserting structural damage requirements in the NEC would not be feasible since the size of the structural member would determine where the hole should be drilled to prevent weakening of the structure.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

Comment on Affirmative:

GUIDA, T.: The International Residential Code (IRC) has this 2-inch requirement for bored holes in joists, rafters, beams, and other horizontal structural framing members in Table E3702.1 but this makes a bored hole through the top plate (horizontal run of two 2 X 4 framing members) of a 2 X 4 support wall a Code violation. In many installations, there may be no other way for the electrician to access the attic with NM cable in a one or two family dwelling than to drill through the top plate of a wall. Assuming he is using a one-inch drill bit, there are no structural problems with this bored hole where the hole is drilled in the center of the studs. There was no technical substantiation submitted to justify increasing from a 1 and 1/4 inch distance as required by the NEC to a 2-inch distance as covered in the IRC.

3-16 Log #422 NEC-P03 **Final Action: Reject**

(300.4(A)(1))

Submitter: Timothy Bosman, City of Riverview

Recommendation: Revise text to read as follows:

300.4 Protection Against Physical Damage. Where subject to physical damage, conductors shall be adequately protected.

(A) Cables and Raceways Through Wood Members.

(1) Bored Holes. In both exposed and concealed locations, where a cable- or raceway-type wiring methods is installed through bored holes in joists, rafters, or wood members, ~~holes shall be bored so that the edge of the hole is not less than 32 mm (1 1/4 in.) from the nearest edge of the wood member. Where this distance cannot be maintained, the cable or raceway shall be protected from penetration by screws or nails by a steel plate or bushing, at least 1.6 mm (1/16 in.) thick, and of appropriate length and width installed to cover the area of the wiring.~~ <u>shall have a steel plate or bushing, at least 1.6 mm (1/16 in.) thick or a harden steel plate at least 1.32 mm (1/32 in.) thick and of appropriate length and width installed to cover the area of the writing. The holes shall be bored so that the edge of the hole is not less than 32 mm (1 1/4 in.) from the nearest edge of the wood member.</u>

Substantiation: The problem is that a nail or screw will penetrate the wiring, raceway cable running in the joists, rafters or wood members, and can cause an electrical short or electrical fire.

The other problem is that the inspector does not examine all the joists, rafters and wood members to see if they are to code, which means that houses, apartments, condominiums and buildings go uninspected. It would be thousands and thousands of wood members not being checked for code; however, the visibility of a steel plate would indicate it is protected.

However, it is not always the inspector's fault, sometimes it is the contractor's who use power tools and also use too long of a nail or screw, but a steel plate would stop the nails and screws and consequently save lives.

Panel Meeting Action: Reject

Panel Statement: Steel plates and other methods of protection are already permitted to be used to provide protection for cables or raceway-type wiring methods installed through wood framing members, joists, and similar framing where construction methods dictate a longer screw or fastener. Requiring a steel plate or bushing for all wiring penetrations through a wood structure would be overly restrictive, since there are many applications where drilling the hole not less than 1 ¼ inch from the nearest edge of the wood member provides sufficient clearance for protection of the raceways and cables from nail and screw penetration. This proposed change would also require a steel plate over EMT, rigid metal conduit, IMC, and other raceways where damage by screws or nails is not an issue.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-18 Log #482 NEC-P03 **Final Action: Reject**

(300.4(A)(1))

Submitter: Ronald Wendel, Bren Products

Recommendation: Revise text to read:

300.4 Protection Against Physical Damage. Where subject to physical damage, conductors shall be adequately protected.

(A) Cables and Raceways Through Wood Members.

(1) Bored Holes. In both exposed and concealed locations, where a cable- or raceway-type wiring method is installed through bored holes in joists, rafters,

or wood members, ~~holes shall be bored so that the edge of the hole is not less than 32 mm (1 1/4 in.) from the nearest edge of the wood member. Where this distance cannot be maintained, the cable or raceway shall be protected from penetration by screws or nails by a steel plate or bushing, at least 1.6 mm (1/16 in.) thick, and of appropriate length and width installed to cover the area of the wiring.~~ shall have a steel plate or bushing, at least 1.6 mm (1/16 in.) thick or a hardened steel plate at least 1.32 mm (1/32 in.) thick and of appropriate length and width installed to cover the area of the wiring. The holes shall be bored so that the edge of the hole is not less than 32 mm (1 1/4 in.) from the nearest edge of the wood member.

Exception: Steel plates shall not be required to protect rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, or electrical metallic tubing.

Substantiation: The problem is that a nail or screw will penetrate the wiring, raceway or cable running in the joists, rafters or wood members, and can cause an electrical short or electrical fire.

The average house has between 600 and 2400 wood members; therefore, the city inspector would not have adequate time to inspect all wood members to ensure they are up to code.

According to the electrical survey of house fires, when wires are penetrated, the likelihood of an electrical short goes up 63 percent and electrical house fires go up 38 percent.

Panel Meeting Action: Reject

Panel Statement: Steel plates and other methods of protection are already permitted to be used to provide protection for cables or raceway-type wiring methods installed through wood framing members, joists, and similar framing where construction methods dictate a longer screw or fastener. Requiring a steel plate or bushing for all wiring penetrations through a wood structure would be overly restrictive, since there are many applications where drilling the hole not less than 1 ¼ inch from the nearest edge of the wood member provides sufficient clearance for protection of the raceways and cables from nail and screw penetration.

(300.4(A)(1))

Submitter: Dennis Ness, Guardian Inspection Services Inc.

Recommendation: Revise as follows:

300.4 (A)(1) Bored holes. In both exposed and concealed locations, where a cable or raceway type method installed through bored holes in joists, rafters, or wood members, holes shall be bored so that the edge of the hole is not less than 32 mm (1 1/4 in.) from the nearest edge of the wood member. Where this distance cannot be maintained, the cable or raceway shall be protected from penetration by screws or nails by a steel plate or bushing, at least 1.6 mm (1/16 in.) thick, and of appropriate length and width installed to cover the area of the wiring.

300.4(A)(1) Revised text:

Bored holes. In both exposed and concealed locations, where a cable or raceway-type method s installed through bored holes in joists, rafters, or wood members, holes shall be bored so that the edge of the hole is not less than <u>50 mm (2 in.)</u> from the nearest edge of the wood member. <u>In both exposed and concealed locations, where a cable or raceway-type method is installed through bored holes in studs, holes, shall be bored so that the edge of the hole is not less than 32 mm (1 1/4 in.) from the nearest edge of the wood member.</u> Where this distance cannot be maintained, the cable or raceway shall be protected from penetration by screws or nails by a steel plate or bushing, at least 1.6 mm (1/16 in.) thick, and of appropriate length and width installed to cover the area of the wiring.

Substantiation: An an inspector it has come to my attention there is difference in location for bored holes between the International Residential Code (IRC) and the National Electrical Code (NEC). The present language in the NEC [300.4(A)(1)] states "joists, rafters, or wood members" and does not specify studs. The IRC (E3302 electrical) does not have this section and it simply states wood-framed structural members shall not be drilled, notched or altered in any manner except as provided for in this code, which generally refers to the building sections.

I have inspected homes where the electrician has bored holes 1 1/2 in. from the edge of the floor joists, passing the electrical inspection and the building inspector has rejected the work as not being within the 2 in. from the edge required in the IRC. Some inspectors are requiring an engineering evaluation on the location of the holes and an engineered fix of the problem which is expensive.

I believe this proposed change in language will solve this problem.

Panel Meeting Action: Reject

Panel Statement: The proposed action has two different requirements for the depth of the hole, 1 and ¼ inches from the edge of wood members and 2 inches from the edge of wood members. The two-inch dimension in the IRC is dealing with bored holes in joists, rafters, beams, and other horizontal framing members. The proposed text is applying this 2-inch measurement to joists, rafters, or wood members, which is even more restrictive than the IRC with absolutely no technical substantiation for the increase from 1 and ¼ inch to 2 inches.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

Comment on Affirmative:

GUIDA, T.: Same Affirmative Comment as Proposal 3-15.

3-20 Log #2284 NEC-P03 **Final Action: Reject**
(300.4(A)(1))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education

Recommendation: Add new text as shown:

"...or <u>other</u> wood members,...nearest edge of the wood member. <u>Where the wood member sits against another wood member or members, they may be treated as a single member for the purpose of measuring this distance.</u> ... <u>Exception No. 3: This requirement shall not apply to an edge of the wood member that is against masonry</u> ."

Substantiation: Adding "other" is merely a grammatical correction. As for the other lines whose addition I propose, technically cable in bored holes in such locations is in violation, even though the cable patently is protected as well as in the presently-legal uses. A hole bored near the edge of a stud that's against another, being part of a double stud assembly, is quite safe. Masonry protects as well as a nail plate.

Panel Meeting Action: Reject

Panel Statement: The added text does not provide any additional clarity to this section and, in fact, may cause some confusion since studs can be installed against each other from the 1 and ½ inch side and not back to back with each other from the 3 and ½ inch side. The proposed exception can also be misapplied since the 2 X 4 could be installed with the 3 and ½ inch side flat against the masonry wall so that there is still a problem with possible penetration where the hole is bored through the 2 X 4 from side to side.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-21 Log #3045 NEC-P03 **Final Action: Accept in Principle**
(300.4(A)(1))

Submitter: Melvin K. Sanders, TECo Inc.

Recommendation: Add to the end of the paragraph the following.

<u>"The steel plates shall be permitted to be single or ganged."</u>

Substantiation: Some jurisdictions are interpreting the phase of the present last sentence to mean only single strips or plates are permitted when providing the "appropriate length and width." There was no information provided to CMP 03 during the 2005 ROP or ROC that ganging was a problem. The interpretation represents a restriction beyond that intended by CMP 3 or required by the NEC.

Panel Meeting Action: Accept in Principle

Add a "(s)" to "plate" and "bushing" in the last sentence of the existing text in 300.4(A)(1) to read as follows:

Where this distance cannot be maintained, the cable or raceway shall be protected from penetration by screws or nails by a steel plate(s) or bushing(s), at least 1.6 mm (1/ 16 in.) thick, and of appropriate length and width installed to cover the area of the wiring.

Panel Statement: Adding the "(s)" at the end of both "plate" and "bushing" provides clarity that one or more plates or bushings can be used to ensure the protection of these cables and raceways.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-22 Log #3220 NEC-P03 **Final Action: Reject**
(300.4(A)(1))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education

Recommendation: Revise text to read as follows:

"...or <u>other</u> wood members,...nearest edge of the wood member. <u>Where the wood member sits against another wood member or members, that may be treated as a single member for the purpose of measuring this distance</u> ... <u>Exception No. 3: This requirement shall not apply to an edge of the wood member that is against masonry."</u>

Substantiation: Adding "other" is merely a grammatical correction. As for the other lines whose addition I propose, technically cable in bored holes in such locations is in violation, even though the cable patently is protected as well as in the presently-legal uses. A hole bored near the edge of a stud that's against another, being part of a double stud assembly, is quite safe. Masonry protects as well as a nail plate.

Ballot Results: Affirmative: 13

3-23 Log #3663 NEC-P03 **Final Action: Reject**
(300.4(A)(1))

Submitter: Wayne Clevenger, Durham City/ County Inspections
Recommendation: Revise text to read as follows:
In both exposed and concealed locations, where a cable or raceway type wiring method is installed through bored or cut holes in joist rafters wood members or metal studs holes shall be bored or cut so the edge of hole is not less than 1 1/4 in. from the nearest edge of wood member or metal stud.
Substantiation: Contractors argue code does not read so to require protection of MC or AC cable when installed in a metal stud application.
Panel Meeting Action: Reject
Panel Statement: Section 300.4(A)(1) is titled to apply only to bored holes in wood members. Metal framing is covered by 300.4(B) and applies only to nonmetallic-sheathed cables and electrical nonmetallic tubing and does not cover MC or AC cable in metal studs. AC, MC, or flex installed in a metal stud wall can easily be installed in the center of the steel stud and well away from any tech screw penetration hazards.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-24 Log #2760 NEC-P03 **Final Action: Reject**
(300.4(A)(1), FPN (New))

Submitter: Truman C. Surbrook, Michigan State University
Recommendation: After the main paragraph and before the exceptions add a new fine print note as follows:
FPN: Distances greater than 32 mm (1 1/4 in.) may be required by other codes, standards, or manufacturer's specifications.
Substantiation: This section implies that a spacing of 32 mm (1 1/4 in.) is acceptable while a greater spacing may be required. An example is the requirement of a 50 mm (2 in.) spacing for bored holes in horizontal members. This requirement originates in the building code and is, therefore, stated in Table E3702.1 of the International Residential Code. It needs to be called to the attention of the installing electrician that other codes may override the spacings in the NEC.
Panel Meeting Action: Reject
Panel Statement: There is no reason to provide a fine print note, such as the one proposed, that may cause more confusion in the industry than clarity. An electrician who is wiring a residence in an area under the jurisdiction of the IRC should also be familiar with any differences in the NEC and the IRC, or at least he will very quickly find out after his first inspection.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13
Comment on Affirmative:
GUIDA, T.: Same Affirmative Comment as Proposal 3-15.

3-25 Log #2951 NEC-P03 **Final Action: Reject**
(300.4(A)(1) Exception No. 1)

Submitter: Philip Simmons, Simmons Electrical Services
Recommendation: Revise existing 300.4(A)(1) Exception No. 1 as follows:
Exception No 1: Steel plates shall not be required to protect rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, ~~or~~ electrical metallic tubing or Type AC and MC cables of the interlocked armor type .
Substantiation: The Fact Finding Study by Underwriters Laboratories on "Nail Penetration of Types AC and MC Cable Installed Parallel to Framing Members" proves conclusively that interlocked armor Type AC and MC cables perform better than EMT and PVC conduits in providing protection from physical damage from nails and screws during and after construction. A copy of this Fact Finding Study is enclosed for your information and review.
A summary of the Fact Finding Study follows. Note that the corrugated aluminum armored cable product is excluded as it is not proposed to be included in the Exception.

Wiring Method	Penetrations and Damage		
	Nails	Screws	Total
Type AC AL Interlocked Armor	4	12	16
Type AC Steel Interlocked Armor	0	3	3
Type MC Steel Interlocked Armor	0	7	7
Electrical Metallic Tubing	0	26	26
Rigid Nonmetallic Conduit	85	44	102

Metal-clad cables with corrugated armor were the only type of cable that performed worse than EMT and RNC. This Comment proposes to exclude metal-clad cables having corrugated armors and thus correlate directly with the Fact Finding Study.
Since EMT and RNC are exempted from nail plate requirements, this Proposal should be accepted so the appropriate Type AC and MC cables have equal and fair treatment.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: While the report does suggest that AC and MC interlocked cable may provide better protection from nail or screw penetration than other wiring methods, this does not in itself permit the removal of this cabling method from this section of the Code. Installations of AC, MC, or other assembled cables should be protected within the 1-1/4 in. dimension to reduce the possibility of reworking the installation after the building finish materials are complete. Raceways and conduits systems provide a way to remove damaged wiring and cable assemblies do not. Added protection should be required for assembled cables for this purpose.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-26 Log #1438 NEC-P03 **Final Action: Reject**
(300.4(A)(1) Exception No. 3 (New))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Add new text as follows:
Exception No. 3: Steel plates shall not be required to protect steel-clad cables where the diameter of the cable(s) and hole are such that the cable(s) can be moved freely to where the part of the cable closest to the nearest edge of the wood member is no less than 32 mm (1 1/4 in.).
Substantiation: As presently worded, 300.4(A)(1) has an unfortunate implication. Given the same size cable, and the same hole location, the larger the hole, the more likely the section will require protection, even though the cable is less likely to be trapped in place to be pierced by a nail or screw. One could argue that the larger the hole, the more likely additional cables will be pulled through. However, the NEC tradition is not one of adding requirements to protect against the hazards that might be created by someone coming by after rough inspection, but before actual concealment. One could argue that even a loose cable could be nicked and harmed by a screw. Hence, the restriction of this exception to tough cable that is most unlikely to be nicked, as opposed to accepting the nudge and moving out of the way.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 3-25.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-27 Log #1439 NEC-P03 **Final Action: Reject**
(300.4(A)(1) Exception No. 4 (New))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Add new text as follows:
Exception No. 4: In a wall that has previously-applied finish material on one side, steel plates shall not be required to protect cables where the required distance is maintained to the outer surface of the existing wall finish material.
Substantiation: The present measurement is considered reasonably adequate to prevent cable penetration when finish material is applied to structural members. Once such finish material is in place, the concern is for cable penetration when items are attached to the surface of that finish material. One might argue that with this wording the cable is at risk if the finish material is removed and replaced, but that is a stretch. And when cables are run by boring through fully-closed walls with the extra-long drills that now are available, no one enforced 300.4(A)(1). Moreover, the NEC tradition is not one of adding requirements to protect against the remote hazards. I use the wording, "the required distance," to coordinate with my proposed Exception No. 3.
Panel Meeting Action: Reject
Panel Statement: There is still a cable penetration hazard once the finish is applied to the wall or ceiling where items such as pictures, mirrors, and other fairly heavy items are hung on the wall. Where these items are installed on a finished wall, a stud finder is often used to locate the structural stud and a screw is then inserted through the finish and into the stud where, without the cable or raceway protection, penetration into the cable or raceway could occur, creating a safety hazard.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-28 Log #2953 NEC-P03 **Final Action: Reject**
(300.4(A)(2) Exception No. 1)

Submitter: Philip Simmons, Simmons Electrical Services
Recommendation: Revise existing 300.4(A)(2) Exception No 1 as follows:
Exception No. 1: Steel plates shall not be required to protect rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, ~~or~~ electrical metallic tubing or Type AC and MC cables of the interlocked armor type .
Substantiation: The Fact Finding Study by Underwriters Laboratories on "Nail Penetration of Types AC and MC Cable Installed Parallel to Framing Members" proves conclusively that interlocked armor Type AC and MC cables perform better than EMT and PVC conduits in providing protection from physical damage from nails and screws during and after construction. This Fact Finding Study was furnished with the Proposal and is attached to this Comment for your convenience.

A summary of the Fact Finding Study follows. Note that the corrugated aluminum armored cable product is excluded as it is not proposed to be included in the Exception.

Wiring Method	Penetrations and Damage		
	Nails	Screws	Total
Type AC AL Interlocked Armor	4	12	16
Type AC Steel Interlocked Armor	0	3	3
Type MC Steel Interlocked Armor	0	7	7
Electrical Metallic Tubing	0	26	26
Rigid Nonmetallic Conduit	85	44	102

Metal-clad cables with corrugated armor were the only type of cable that performed worse than EMT and RNC. This Comment proposes to exclude metal-clad cables having corrugated armors and thus correlate directly with the Fact Finding Study.

Since EMT and RNC are exempted from nail plate requirements, this Proposal should be accepted so the appropriate Type AC and MC cables have equal and fair treatment.

Note: Supporting material is available for review at NFPA Headquarters.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-29 Log #3470 NEC-P03 **Final Action: Reject**

(300.4(B)(2))

Submitter: Richard F. Van Wert, Middle Department Inspection Agency / Rep. Benjamin Franklin Chapter IAEI

Recommendation: Revise text to read:

300.4(B)(2 Nonmetallic-Sheathed Cable and Electrical Nonmetallic Tubing. Where nails or screws are likely to penetrate nonmetallic-sheathed cable ~~or~~ electrical nonmetallic tubing, type MC or type AC cable, a steel sleeve, steel plate, etc.

Substantiation: Wiring installers take 300.4(B)(2) as gospel and never think to look at Articles 320 or 330. 300.4(B)(2) as it stands now is actually misleading the reader by not mentioning types MC and AC cables as cables that definitely need protection.

Panel Meeting Action: Reject

Panel Statement: Metal framing is covered by 300.4(B) and applies only to nonmetallic-sheathed cables and electrical nonmetallic tubing and does not cover MC or AC cable in metal studs. AC, MC, or flex installed in a metal stud wall can easily be installed in the center of the steel stud and well away from any tech screw penetration hazards. With a 2 X 4 metal stud wall, unlike a wood stud wall, the dimensions are true dimensions so the flex, AC, and MC cable can be located in the middle with a 2 inch clearance from either edge. There was no technical substantiation provided in the proposal to require AC or MC cable to comply with the same requirements for NM and ENT in a metal stud wall.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-30 Log #3340 NEC-P03 **Final Action: Reject**

(300.4(D))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc. / Rep. Massachusetts Electrical Code Advisory Committee

Recommendation: Delete this subsection.

Substantiation: This is a companion proposal to one made for Section 334.17 to include this provision for nonmetallic sheathed cables. Taken together, both proposals transfer this restriction to the type of cable for which it is appropriate. There have been many studies done that well demonstrate that armored cables roll out of the way of a penetrating nail or screw. In fact, it is much more difficult to damage an armored cable assembly than it is a rigid steel raceway, whether EMT or even rigid or intermediate steel conduit, and certainly more difficult than rigid nonmetallic conduit. The difficulty of making inadvertent penetrations of metal sheathed cables has been conclusively established in a UL fact-finding study done in a prior code cycle.

Panel Meeting Action: Reject

Panel Statement: The purpose of Article 300 is to provide an introduction to Chapter 3 for wiring methods and to provide general rules that can be easily accessed by the user of the Code, rather than having to look for these general rules in each article. Following this line of thinking by the submitter, all of Article 300 could be inserted into the various articles in Chapter 3, depending on the type of wiring method to be employed, but it would not be as user-friendly as it is now.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-31 Log #3310 NEC-P03 **Final Action: Reject**

(300.4(E))

Submitter: William Benard, State of New Hampshire,

Recommendation: Revise text to read as follows:

(E) Cables and Raceways installed under metal roof decking. Exposed and concealed locations, where a cable- or raceway-type wiring method is installed under metal roof decking, such as metal corrugated sheeting, the cable or raceway shall be installed and supported so that the nearest outside surface of the cable or raceway is not less than 32 mm (1 1/4 in.) from the nearest surface of the sheet metal decking where screws are likely to penetrate when roofing repairs or replacement occurs after the initial raceway installation. Where this distance is not maintained, the cable or raceway shall be protected from penetration by screws by a steel plate, sleeve, or equivalent at least 6.4 mm (1/4 in.) thick.

~~(E)~~ (F) Cables and Raceways Installed in Shallow Grooves

(Remaining text unchanged)

~~(F)~~ (G) Insulated Fittings

(Remaining text unchanged)

Substantiation: The proposed subsection is intended to address the "real world" problem of physical damage to cables and raceway methods installed below roof decks with insulating and waterproofing material secured above using screws intended to penetrate the decking by at least 1 in. to meet minimum manufacturer windsheer specifications. This method of fastening the roofing material is fairly new to the industry replacing the old "ballast hold down" method typically utilized until the later '80s. The new method of screwing the roofing material down is causing substantial damage to all wiring methods secured to the underside or located within 1.25 in. of the lowest point of the decking material. Generally, roofing materials are replaced within 15 years of the original installation according to roofing manufacturers. The probability of damage to the existing wiring methods increases substantially during the re-roof process as longer screws are utilized to secure the new roofing material.

The.25 in. protection allowance where the space is not maintained was selected because it will provide sufficient protection to a cable or raceway method installed in the suspect area. It is standard practice of a roofing installation to not push the screw through the steel flange of the junior beam supporting the decking from the underside of the deck. The flange of the junior beam is typically at least.25 in. thick and, therefore, this would allow a cable or raceway method to be run parallel to the underside of the supporting flange of the junior beam.

Documentation exists to substantiate costly repairs required to replace damaged raceways and cables in buildings where the wiring methods were installed within the identified area subject to physical damage. The incidents of damage are not limited to economic impact only, but can be linked to injury to unqualified individuals attempting to reenergize the circuits while unaware of the cause of the original failure.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The installation covered in the proposal already seems to be covered by the existing subsections in 300.4, so additional text in this section would not seem to accomplish anything constructive. Roofers are faced with exposed and concealed electrical raceways installed in existing buildings, and they must be able to install the new roof without damage to the electrical system. This proposal deals with repair or replacement of a metal roof, but raceway and cable protection during a remodel would require a similar change or a change would then be required where trusses or joists are removed during structural damage repair. The individual building trades must take responsibility for all work during repair or replacement of a roof or whatever part of structure or building is under repair.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 12 Negative: 1

Explanation of Negative:

CASPARRO, P.: I disagree with the panel statement that this particular installation is covered in the existing subsections of 300.4. I do agree with the submitter's statement that a 1/4 in. spacing from the nearest surface of the sheet metal roofing may not be enough. The presentation made during the panel meeting showed decking screws as long as 6 in. with 3 in. to 4 in. protruding below the sheet metal roof surface. The 1/4 in. protection plate could also be penetrated by these screws since they are designed to penetrate the roof decking. The answer is to not allow the conduits of any system; power, communications, or life safety; to be that close to the roof decking.

3-32 Log #147 NEC-P03 **Final Action: Reject**

(300.4(F))

Submitter: John Smith, Wire Guard, Inc.

Recommendation: Add new text to read as follows:

Conductors, inside electrical boxes, subject to physical damage (such as router bits, sheetrock saws or knives) or nonconductive coatings (such as drywall mud, paint, lacquer or enamel) must be temporarily protected by means of a rigid metal coverplate, not less than.047 inches thick (the required thickness to prevent the router from penetrating the metal plate).

Exception No. 1: Listed covers to have equivalent strength and characteristics shall be permitted.

Substantiation: Conductors inside electrical boxes during the construction phase are physically damaged by sheet rock routers, sheet rock saws and knives, etc. When the conductors are cut into by the aforementioned objects, the amperage rating of the conductor is compromised or lessened. This can result in overheating which often leads to fires (refer to the NFPA's Fire Analysis Report and the US Home Products Report which I have provided). The leading cause of fires in electrical boxes is short circuit or ground fault. The form of material first ignited is electrical wire or cable insulation, which is mostly caused by damaged wires undetected during construction. Nonconductive coatings such as drywall mud, paint, lacquer and enamel will compromise the identification markings or colors of the conductors and cause noncompliance with NEC 2005 310.12 Conductor Identification. This will cause the electrician to cut, scrape or remove coatings, which could damage the insulation on the conductor, thus resulting in noncompliance with NEC 2005 Table 310.13 Conductor Application and Insulation referring to thickness of insulation. NEC 2005 250.12 Clean Surfaces can be compromised by drywall mud, paint, lacquer and enamel causing poor grounding to device or fixture.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: Section 110.12(C) already adequately covers the integrity of electrical equipment, including conductors with insulation, by stating there shall be no damaged parts that may adversely affect safe operation or mechanical strength of the equipment. Paint, plaster, or other foreign materials are not permitted to contaminate wiring terminals, wire, and other electrical components. This protection can be provided in many different and varied ways, one of which could be with a metal or plastic cover placed over the box during the rough-in stages of construction. Shorter router blades can be used on drywall that will not penetrate into the electrical boxes; however, the electrician must ensure the drywall installer understands the potential damage that can occur within a box where using longer blades.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 9 Negative: 4

Explanation of Negative:

CASPARRO, P.: Although the panel statement refers to 110.12(C) Integrity of Electrical Equipment and Connections which states that... There shall be no damaged parts that may adversely affect safe operation or mechanical strength of the equipment such as parts that are broken; bent; cut; or deteriorated by corrosion, chemical action, or overheating.

The fact of the matter is that wires are being cut by routers and paint, speackling and other substances used in the construction process are contaminating the wires in outlet boxes. This problem has been going on for years and will continue until addressed by the NEC. For the sake of safety, let's fix the problem now.

EGESDAL, S.: It makes sense to protect electrical conductors from construction debris, until final electrical installation. The fire alarm industry manufacturers ship smoke detectors with a protective covering, which is removed after there is no longer potential damage from the various construction trades. Some fire alarm control panels are shipped with a protective device (often a piece of cardboard) to place over the fire alarm system wiring and terminals in a rough-in-box for protection from paint, plaster, and general construction site grime. While it may not be necessary to require a listed product, it makes sense to require installers to protect the wiring against typical construction debris.

KEDEN, R.: I disagree with the panel meeting action (reject) and the panel statement.

Even though Section 110-12(C) covers the subject, reality is that the people who cause physical damage and contamination (drywall installers, plaster workers, and painters) do not read the NEC and the electrician ends up replacing wires and cleaning out boxes. Without endorsing specific products and materials, the code needs to give some specific guidance. I would have preferred an accept in principle.

OWEN, R.: See my Explanation of Negative Vote on Proposal 3-35.

3-33 Log #1338 NEC-P03 **Final Action: Accept in Principle**
(300.4(F))

Submitter: Mike Holt, Mike Holt Enterprises

Recommendation: Delete the word "ungrounded" so that the requirement will apply to the grounded conductor as well.

(F) Insulated Fittings. Where raceways containing ~~ungrounded~~ conductors 4 AWG or larger enter a cabinet, box enclosure, or raceway, the conductors shall be protected by a substantial fitting providing a smoothly rounded insulating surface, unless the conductors are separated from the fitting or raceway by substantial insulating material that is securely fastened in place.

Substantiation: As written, this important protection requirement does not apply to grounded conductors. The grounded conductor, in many cases, is every bit as dangerous as the ungrounded conductor. This is especially true when multi-wire circuits are employed. Isolated phase installations permitted by 300.3(B)(1) are an example of where this would apply.

Panel Meeting Action: Accept in Principle

In the first sentence of 300.4(F) change the word "ungrounded" to the words "insulated circuit".

Panel Statement: Grounding electrode conductors are not part of a circuit, and are intended to be excluded.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-34 Log #2230 NEC-P03 **Final Action: Reject**
(300.4(F))

Submitter: Donald A. Ganiere, Ottawa, IL

Recommendation: Revise as follows:

(F) Insulated Fittings. Where raceways <u>or metal fittings</u> containing ungrounded conductors 4 AWG or larger enter a cabinet, box enclosure, or raceway, the conductors shall be protected by a substantial fitting providing a smoothly rounded insulating surface, unless the conductors are separated from the fitting or raceway by substantial insulating material that is securely fastened in place.

Substantiation: Under the current code rule only RMC and IMC containing ungrounded conductors require protection for those conductors, they are the only raceways that enter the enclosure. In the case of cables, ETM, or other raceways only the connector enters the enclosure. Potential for conductor damage also exists where the connectors enter the raceway and protection should be provided.

Panel Meeting Action: Reject

Panel Statement: The present text "…the conductors shall be protected by a substantial fitting providing a smoothly rounded insulating surface,.." adequately addresses the submitter's concern. In addition the substantiation is incorrect that this subsection only covers rigid metal conduit and intermediate metal conduit. It covers all raceways where 4 AWG and larger conductors enter a cabinet, box, enclosure, or raceway.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-35 Log #633 NEC-P03 **Final Action: Reject**
(300.4(G))

Submitter: Carlo Compagnone, Compa Covers, Inc.

Recommendation: Add the following wording to 300.4(G):

"Protection of Outlet Boxes During Construction. The open front of both metal and nonmetallic electrical outlet boxes shall be temporarily covered to protect insulated electrical conductors from physical damage or deterioration due to power routers, plaster spray, spray foam insulation, and other potential damage during construction. The covers shall be constructed of a nonmetallic material and shall be clearly marked "Not for Permanent Installation"."

Substantiation: Leaving the front end of an electrical box open during the preliminary stages of construction results in exposed wires. This allows electrical wiring vulnerable to be cut or damaged during construction with power routers along with plaster filled boxes and overspray from paint guns and spray foam insulation guns, which in the end will leave a poor and unsafe working environment. Having a temporary cover on an electrical box is most of all a safety factor. The covers prevent build up of debris and puts a stop to unauthorized personnel tampering with wiring during the time of construction.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 3-32.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 10 Negative: 3

Explanation of Negative:

CASPARRO, P.: See my explanation of negative vote on Proposal 3-32.

KEDEN, R.: I disagree with the panel meeting action (reject) and the panel statement

Even though Section 110-12(C) covers the subject, reality is that the people who cause physical damage and contamination (drywall installers, plaster workers, and painters) do not read the NEC and the electrician ends up replacing wires and cleaning out boxes. Without endorsing specific products and materials, the code needs to give some specific guidance. I would have preferred an accept in principle.

OWEN, R.: While I agree with the Panel statement that 110.12(C) does cover damage to some extent, it does not go far enough. As an AHJ, over the years I have inspected many installations where sheetrockers and other trades damage conductors while trying to do their own work as quickly as possible. I am sure that not all this damage has been found by inspectors or electricians, and, thus, are still in operation in a possibly unsafe condition.

I believe it is time for the Code to require a specific method of protection, rather than just a concept that equipment and conductors should be protected. This is not new to the NEC: Article 300 already requires a very specific method of protecting cables, etc. that are subject to screw and nail penetration by requiring a nail plate be installed under 300.4(D). Article 300 also requires a minimum burial depth for underground installations, plus recognizes mechanical protection reducing that depth by using concrete. I urge the panel to reconsider this decision, and while not endorsing any particular product, I think it is time to become more specific in the protection methods for conductors in electrical boxes during construction.

3-36 Log #3370 NEC-P03 **Final Action: Reject**
(300.4(G))

Submitter: Jody Cook, Plugs & Switches, Inc.
Recommendation: Add new text to read:
Conductors inside junction boxes shall be protected by an acceptable means.
Substantiation: Eliminates routered wires too short to pigtail, damage to circuit integrity, exposure to live parts, and junction boxes being filled with mud making it harder to dentify cut and nicked wires.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 3-32.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
CASPARRO, P.: See my explanation of negative vote on Proposal 3-32.

3-37 Log #415 NEC-P03 **Final Action: Reject**
(Table 300.5)

Submitter: Ronald Deering, City of Portage
Recommendation: Revise as follows:
Under a building: Col 1 Col 2 Col 3 Col 4 Col 5
mm in. mm in. mm in. mm in. mm in.
300 12 300 12 300 12 300 12 300 12
(in raceway only) (in raceway only) (in raceway only)
Substantiation: By adding a depth requirement to the table, for raceways under a building slab, in the saw cuts would have no affect on the raceways below. Money could be saved throughout the construction industry, when cuts need to be made, for plumbing installations, etc.
Panel Meeting Action: Reject
Panel Statement: The submitter did not provide any technical substantiation documenting the number of incidents where raceways were damaged by saw cutting a slab with a conduit installed at or near the top of the sub-base under the concrete. In many cases, the electrician installs the conduit in the sub-base to prevent the concrete from cracking anyway. Requiring a specific depth for these raceways to be imbedded below the sub-base would be difficult on many construction sites since final depth of the sub-base is often established after the inspection and right before the concrete is poured.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-38 Log #678 NEC-P03 **Final Action: Reject**
(300.5)

Submitter: Jamie McNamara, Hastings, MN
Recommendation: Revise as follows:
300.5 Underground Installations. ……..
(D) Protection from Damage. Direct-buried conductors and cables shall be protected from damage in accordance with 300.5 (D)(1) through(D) (3) ~~(4)~~ .
(1)…..
~~(3) Service Conductors. Underground service conductors that are not encased in concrete and that are buried 450 mm (18 in.) or more below grade shall have their location identified by a warning ribbon that is placed in the trench at least 300 mm (12 in.) above the underground installation.~~
(3) ~~(4)~~ Enclosure or Raceway Damage. …….. (E) …….
(G) Service Conductors. Underground service conductors that are not encased in concrete or in metal conduit and that are buried 450 mm (18 in.) or more below grade shall have their location identified by a warning ribbon that is placed in the trench at least 300 mm (12 in.) above the underground installation.
Substantiation: To require direct-buried conductors and nonmetallic conduits (PVC) containing service conductors to have identification ribbon. When excavating around nonmetallic conduits buried 450 mm or deeper, the conduits and the conductors inside are often damaged and striped, exposing the excavator to hazards, before being recognized as conduit and conductors.
Panel Meeting Action: Reject
Panel Statement: Direct buried service conductors are much more easily damaged, even when the operator is scratching the surface of the trench to locate the conductors, than when the conductors are installed in a raceway. A backhoe operator can damage any raceway system if the operator is not paying attention and has no idea that anything is buried below.
All utility companies have a service that will mark the ground directly above the service conductors, whether the conductors are directly buried or not, so anyone digging in that area will be less likely to damage their conductors. Cable locators should be used before any trenching or backhoe work is started in an area where service conductors may be buried. The primary concern for service conductors is providing an indicator, such as a warning ribbon, for direct burial cables, especially where those cables have no other form of protection.
Schedule 80 PVC could certainly be used as a protection method for underground service conductors or cables. Restricting the protection to metal conduit would not recognize this alternative protection method. A backhoe operator could damage cables or conductors in any wiring method installed but a raceway will provide some level of protection for these service conductors. Direct burial cables are not protected, so a warning ribbon is a method to help identify the location for these conductors and provide some warning that service cables are located below.
In addition, the result of this proposal would be to delete the present 300.5(D)(2) because it has not been shown as retained, and the reason for doing so has not been provided.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
CASPARRO, P.: As the panel statement indicated, a backhoe operator can damage any raceway system if the operator is not paying attention and has no idea that anything is buried below, therefore, a warning ribbon placed 12 in. above the underground installation would alleviate this problem, thus saving unnecessary damage and possible bodily harm.

3-39 Log #2014 NEC-P03 **Final Action: Reject**
(Table 300.5)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 17 for information.
Submitter: Dennis Baker, Springs & Sons Electrical Contractors, Inc. / Rep. IEC
Recommendation: I propose adding another row so that PVC could be used on residential construction at a depth of 6 in.
One and Two Column 1 Column 2 Column 3 Column 4 Column 5
Family Dwellings 450 18 150 6 150 6 300 12 150 6
Substantiation: If PVC is buried 6 in. deep on residential construction, it should be deep enough. If you dig with a shovel and hit PVC, chances are you will do no damage. If you use a machine such as a Ditch Witch or power trencher, you will tear up the PVC but you would also tear up rigid or intermediate metal conduit. We wire lots of swimming pools and spas and I believe that PVC is a better conduit system due to chemicals and all but where I live (Arizona) the ground prohibits burying PVC 18 in. deep. Please consider this change.
Panel Meeting Action: Reject
Panel Statement: The minimum depth requirement for PVC has been consistently 18 inches for most applications, unless some specific condition exists where heavy vehicular traffic may cause flexing and breakage of the raceway system. Circuits that are damaged during trenching, either by hand or machine, are just as dangerous in a residential installation, as those in a commercial and an industrial installation. Maintaining an 18-inch depth requirement for PVC, with some exceptions, seems to have stood the test of time as being a reasonable depth to keep most PVC raceway damage to a minimum.
The submitter has proposed changing the depth of other wiring methods without any substantiation.
Refer this action to CMP 17 for their information. The substantiation indicates the problem is with swimming pool wiring methods. The submitter is encouraged to review Table 680.10 and its notes.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-40 Log #2185 NEC-P03 **Final Action: Reject**
(Table 300.5)

Submitter: Dann Strube, Strube Consulting
Recommendation: On Column 2 last line change ~~450~~ 150 mm (~~18~~) (6) in .
Substantiation: Table 300.5 allows underground cable to rise from 24 in. to 18 in. on the air port at 600 volts. Table 300.50 allows underground cable to rise from 30 in. to 18 in. at 40 KV. However, rigid metal conduit is pushed down from 6 in. to 18 in. on Table 300.5 at 600 volts while the same product remains at 6 in. at 40 KV. It does not make sense to require 600 volt conduit to be deeper than 40 KV conduit. You have had proposals on this for at least four code cycles and it should not be that hard to figure out that there is something wrong here. I don't care if you make everything 3 in. or 18 in. or 10 ft. Just fix it.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided technical substantiation for this change in Table 300.5. While the panel understands that there is a difference between Table 300.5 and Table 300.50, the submitter has not provided a technical basis for making this change.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
GUIDA, T.: This proposal should have been accepted since the submitter is correct in his statement that requiring rigid metal conduit and intermediate metal conduit to be installed at a depth of 18 inches in or under airport runways for 600 volt and less circuits but permitting these same raceways to be buried at 6 inches in or under an airport runway for installations over 600 volts does not make sense. Prior to the 1990 NEC, both the under 600 volt installations and the over 600-volt installations had the same requirement of 6 inches of burial depth for rigid metal and intermediate metal conduit. Cables in runways

or in adjacent areas of airports were required to be not less than 18 inches for under 600 volt circuits and for those circuits over 600 volts, and it wasn't until the rewrite of Table 300.5 in the 1990 NEC that all wiring methods for wiring in or under airport runways were required to be at a depth of 18 inches or more for circuits at 600 volts or less. There was no technical reason given by Panel 3 during the 1990 rewrite of Table 300.5 to increase the burial depth of GRC and IMC to 18 inches for those circuits of 600 volts or less and there is no technical reason not to change the depth back to 6 inches or less.

3-41 Log #2874 NEC-P03 **Final Action: Reject**
(Table 300.5)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 17 for information.
Submitter: Dennis Baker, Springs & Sons Electrical Contractors, Inc. / Rep. IEC
Recommendation: Revise text to read as follows:
I would like to change the heading of column 5 in Table 300.5, which now reads:
"Circuits for Control of Irrigation and Landscape Lighting Limited to Not More than 30 Volts and Installed with Type UF or in Other Identified Cable or Raceway ~~to one of the following:~~
1. Circuits for Control of Irrigation, Landscape Lighting and Pool/Spa Control Panels Limited to Not More than 30 Volts and Installed with Type UF or in Other Identified Cables or Raceway.
2. Control Circuits Limited to Not More than 30 Volts and Installed with Type UF or in Other Identified Cable or Raceway.
Substantiation: We now have Pool/Spa Control Panels that are controlled by a 9 volt DC circuit and when they are installed in PVC conduit, they should be permitted to be at a depth of 6 in. Currently, this type of circuit is not addressed under Article 680, nor is it defined properly in Article 725. This would be the best place to address this type of circuit for burial depth.
Panel Meeting Action: Reject
Panel Statement: Section 90.3 states that Chapters 1 through 4 apply generally and Chapters 5, 6, and 7 can supplement or modify the requirements in Chapters 1 through 4. Section 680.10 provides minimum burial depths for under the pool or within 5 feet horizontally of the inside wall of the pool, unless this wiring is required to supply equipment permitted by Article 680. The recommended text in this proposal would be more appropriate for 680.10; otherwise, this proposed change in Table 300.5 would still be modified by the requirements in 680.10.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-42 Log #1206 NEC-P03 **Final Action: Reject**
(300.5(B))

Submitter: Dennis Downer, Morrisville, VT
Recommendation: Change the wording of 300.5(B) to the language following:
300.5 Underground Installations.
(B) Listing Cables <u>.</u> ~~and~~ insulated conductors <u>and any splices or terminations</u> installed in enclosures or raceways in underground installations shall be listed for use in wet locations.
Substantiation: 300.5(B) should include the wording splices or terminations to be consistent with 314.30(C). In any underground installation all splices and terminations shall be listed as suitable for wet locations, not just in handhole enclosures without bottoms. There are numerous other applications such as PVC boxes installed underground where flooding of the box could happen.
314.30 Handhole Enclosures.
(C) Handhole Enclosures Without Bottoms. Where handhole enclosures without bottoms are installed, all enclosed conductors and any splices or terminations, if present, shall be listed as suitable for wet locations.
Panel Meeting Action: Reject
Panel Statement: Cables and insulated conductors installed in enclosures or raceways in underground locations are required to be listed for use in a wet location. If the cable or conductor has that insulation stripped for a splice or a connection, Section 110.14(B) requires "all splices and joints, and the free ends of conductors" to be covered with an insulation equivalent to that of the conductors or with an insulating device identified for the purpose. There is no reason to have this text in this section when Section 110.14(B) already covers it.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-43 Log #2231 NEC-P03 **Final Action: Reject**
(300.5(B))

Submitter: Donald A. Ganiere, Ottawa, IL
Recommendation: Delete the following text:
~~(B) Listing, Cables, and insulated conductors installed in enclosures or raceways in underground installations shall be listed for use in wet locations.~~
Delete this part and re-letter remaining parts of this section.
Substantiation: I have submitted a proposal to add similar wording in a new Section 300.9.
Panel Meeting Action: Reject
Panel Statement: In the past, there has been a misconception with certain installers and designers that conductors in raceways installed in an underground location were not subject to wet conditions. This subsection was inserted into this section to ensure compliance with wet location installations, including compliance with Section 310.8(C) requirements for wet location conductors and to clarify that an underground installation is a wet location.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-44 Log #2992 NEC-P03 **Final Action: Reject**
(300.5(B), FPN (New))

Submitter: Robert Konnik, Rockbestos-Suprenant
Recommendation: Add a fine print note to clarify the requirement for wet rated conductors in 300.5(B).
<u>FPN: Underground installations include installations below grade and in tunnels.</u>
Substantiation: This clarifies the requirements for wet rated conductors in these installations.
Panel Meeting Action: Reject
Panel Statement: The text very clearly states that underground installations are a wet location so a fine print note explaining that point is not necessary. There may be applications in tunnels where raceways are not in a wet location. Certainly, raceways buried in the ground anywhere surrounding a tunnel are in a wet location, but there are many tunnel installations where the tunnel itself is not considered a wet location.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-45 Log #3333 NEC-P03 **Final Action: Reject**
(300.5(C))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Add "or structures" after "building".
Substantiation: Edit. Structures which are not deemed buildings should be included.
Panel Meeting Action: Reject
Panel Statement: This section deals specifically with buildings, not structures. A structure could be two 4 X 4 posts installed in the ground with plywood fastened between the poles to provide a mounting structure for a service or panelboards. There would be no reason to require direct burial conductors to be installed in a raceway under that structure.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-46 Log #2710 NEC-P03 **Final Action: Accept**
(300.5(D)(1))

Submitter: Steven D. Holmes, Underwriters Laboratories Inc.
Recommendation: Revise as follows:
300.5 Underground Installations.
[No change to (A), (B), or (C)]
(D) Protection from Damage. Direct-buried conductors and cables shall be protected from damage in accordance with 300.5(D)(1) through (D)(4)
(1) Emerging from Grade. Direct-buried conductors and <u>cables</u> ~~enclosures~~ emerging from grade <u>and specified in columns 1 and 4 of Table 300.5</u> shall be protected by enclosures or raceways extending from the minimum cover distance below grade required by 300.5(A) to a point at least 2.5 m (8 ft) above finished grade. In no case shall the protection be required to exceed 450 mm (18 in.) below finished grade.
[Remainder of 300.5 not changed]
Substantiation: Problem/Substantiation 1 - The term "enclosures" is incorrect - The submitter proposes that the first occurrence of the term "enclosures" in the first sentence of 300.5(D)(1) should be, instead, the term "cables". As it is now written, 300.5(D)(1) requires an enclosure emerging from grade to be protected by an additional enclosure or raceway. This does not make sense. The submitter proposes that it is "Direct Buried conductors and cables" that is the subject of 300.5(D)(1), matching the subject of 300.5(D).
Problem 2 - Irrigation and Landscape Lighting Circuits - 300.5(D)(1) requires conductors and cables of circuits rated maximum 30 volts and for the control or irrigation or landscape lighting to be protected by enclosures or raceways extending from the minimum cover distance below grade to a point at least 2.5 m (8 ft) above finished grade. This is not done to the knowledge of the submitter. Requiring 8 ft tall raceways at every sprinkler valve, low voltage landscape luminaire, and other places where these conductors emerge from below grade is not necessary, is defeated by the conductors extending back down from the top to the valve or luminaire, presents an undesired expense, and is not usually esthetically pleasing.
Substantiation for Changes to Problem 2 - The 30 volt or less circuits for irrigation control and landscape lighting exhibit limited risk of electric shock in the event the conductors or cables are damaged. The low voltage also subjects the insulation of the conductors and cable to less voltage stress than branch

circuit voltage conductors and cables. These risks are limited enough for the column 5 conductors and cables to not require the extent of a 2.5 m (8 ft) raceway rising above finished grade to protect these conductors or cables from damage.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-47 Log #1339 NEC-P03 **Final Action: Reject**
(300.5(D)(3))

Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Revise as follows:
(D) Protection from Damage. Direct-buried conductors and cables shall be protected from damage in accordance with 300.5(D)(1) through (D)(4).
(1) Remain unchanged
(2) Remain unchanged
(3) Service Conductors. Underground <u>direct buried</u> service conductors <u>or cables</u> that are not encased in concrete <u>or in a raceway</u> and that are buried 450 mm (18 in.) or more below grade shall have their location identified by a warning ribbon that is placed in the trench at least 300 mm (12 in.) above the underground installation.
(4) Remain unchanged.
Substantiation: Although many would argue that this change is not necessary due to the fact that subsection (D) applies only to direct buried conductors, it is interpreted differently by many, including expert users of the Code. I believe the reason for this is due to the fact that parenthetical 4 contains provisions for raceways, making the user think that parenthetical 3 also applies to raceways. Because cables are permitted to be installed in raceways (in accordance with the respective cable/raceway Articles), this should be made more clear. This change also adds the term “cables” to the subsection, in an effort to provide consistency between the changing language of subsection (D) and (D)(3).
Panel Meeting Action: Reject
Panel Statement: There are many applications where sleeves or raceways are installed as additional protection for direct burial cable and conductors. Section 300.5(D)(1) and (D)(4) both provide information on direct buried conductors enclosed in conduits as a means of providing protection from physical damage. In spite of this additional protection, these conductors or cables are still listed for direct burial. The introductory text in 300.5(D) makes this very clear.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 11 Negative: 2
Explanation of Negative:
AYER, L.: I would have to agree with the submitter’s substantiation. Numerous proposals have been submitted for recent code cycles which misinterpret this section. 300.5(D)(3) is clearly found under the heading for direct-buried cables, but still creates confusion among users of the code. The proposed wording would add clarity.
CASPARRO, P.: See my explanation of negative vote on Proposal 3-38.

3-48 Log #2193 NEC-P03 **Final Action: Reject**
(300.5(D)(3))

Submitter: David Williams, Lansing, MI
Recommendation: Revise as follows:
(3) Service Conductors. Underground service conductors <u>and raceways</u> that are not encased in concrete and that are buried 450 mm (18 in.) or more below grade shall have their location identified by a warning ribbon that is placed in the trench at least 300 mm (12 in.) above the underground installation.
Substantiation: The wording of the code section did not include raceways and I feel some could interpret this to only require this requirement when the conductors are direct burial.
Panel Meeting Action: Reject
Panel Statement: The introductory text in 300.5(D) requires direct buried conductors and cables to be protected from physical damage in (1) through (4). An installation may warrant more than one of these requirements be used. For example, direct buried service conductors may require protection where emerging from grade as provided in 300.5(D)(1) or where there is a potential for damage as provided in 300.5(D)(4). Where service conductors are not direct buried and are instead installed entirely in a raceway, this warning ribbon is not required. The warning ribbon is only required where direct buried conductors or cables are installed, even where a raceway or sleeve may be installed as extra protection.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
CASPARRO, P.: See my explanation of negative vote on Proposal 3-38.

3-49 Log #2232 NEC-P03 **Final Action: Reject**
(300.5(D)(3))

Submitter: Donald A. Ganiere, Ottawa, IL
Recommendation: Revise as follows:
(3) Service Conductors. Underground service conductors that are not encased in concrete and that are buried 450 mm (18 in.) or more below grade shall have their location identified by a warning ribbon that is placed ~~in the trench~~ at least 300 mm (12 in.) above the underground installation.
Substantiation: The potential hazard from a “dig-in” accident is not changed by the method used to install the conductors. If service conductors installed in a trench present a hazard, then so do service conductors installed by directional boring or other “trenchless” methods. The warning ribbon requirement should apply to all underground service conductors or to none of the underground service conductors. The panel should not consider the additional costs required to install the warning ribbon when “trenchless” installation methods are used. The only consideration should be the safety of the system, and if trenched in service conductors require a warning ribbon for safety reasons, then so do service conductors installed using other methods of installation.
Panel Meeting Action: Reject
Panel Statement: The only way to install a warning ribbon 12-inches above a bored hole containing service conductors would be to drill an additional hole with the ribbon inserted in the hole and pulled through from one location to another or to dig a trench to a depth 12-inches above the cable. In addition, since the ribbon would be installed in a drilled hole, the inspector would not be able to verify the depth of the ribbon as being 12-inches above the service conductors.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
CASPARRO, P.: See my explanation of negative vote on Proposal 3-38.

3-50 Log #3161 NEC-P03 **Final Action: Reject**
(300.5(D)(3))

Submitter: Wally Harris, Atlantic Inland Inspections
Recommendation: Add text as indicated in underline type:
(3) Service <u>, Branch Circuit and Feeder Conductors</u> . Underground <u>branch circuit, feeder and</u> service conductors that are not encased in concrete and that are buried 450 mm (18 in.) or more below grade shall have their location identified by a warning ribbon that is placed in the trench at least 300 mm (12 in.) above the underground installation.
Substantiation: The commentary presented by the NEC Handbook in the 2002 Edition states the following, “Providing a warning ribbon reduces the risk of an accident or electrocution during excavation near underground service conductors that are not encased in concrete. This provision requiring a warning ribbon does not extend to feeders and branch circuits because these circuits contain short-circuit and overload protection.”
Although feeders and branch circuits do contain short-circuit and overload protection, there would still seem to be the possibility of bodily injury or worse if an underground conductor was accidentally contacted by a person digging by hand with a metal digging bar or other metal implement.
As stated in 90.1(A) of this Code; “Practical Safeguarding. The purpose of this Code is the practical safeguarding of persons and property from hazards arising from the use of electricity.”
This would seem to be an additional “practical safeguard” of persons that should be added to the Code.
Panel Meeting Action: Reject
Panel Statement: Service conductors are not protected by overcurrent protection devices and constitute a much greater hazard where these service conductors are damaged during excavation. Anyone digging in a location where directly buried service conductors have a ribbon installed 12-inches above the cable should be warned that there is a cable below that location. Expanding this warning ribbon requirement to all service, feeder, and branch circuit underground direct burial applications would tend to desensitize the effect of the warning ribbon. Human nature tends to disregard safety items where that person is constantly exposed too often to that safety item.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
CASPARRO, P.: The panel is correct in saying that service conductors are not protected by overcurrent protection and therefore constitute a much greater hazard when these conductors are damaged during excavation. But, I disagree with the panel statement that says “Expanding this warning ribbon requirement to all applications would tend to desensitize the effect of the warning ribbon.” Any type of warning device that eliminates a hazard, extra work, and the expense of a repair would be valid in its use. Can we really ever be TOO safe?

3-51 Log #270 NEC-P03 **Final Action: Reject**
(300.5(D)(4))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
Enclosure or Raceway Damage. Where the enclosure or raceway is subject to ~~physical~~ damage, the conductors shall be installed in rigid metal conduit, intermediate metal conduit, Schedule 80 rigid nonmetallic conduit, or equivalent.
Substantiation: Use of the word “physical” is superfluous. In some instances, one could argue for the use of “mechanical” to differentiate that from e.g., “thermal” damage, but context makes the intended sense quite clear, rendering anything like this completely unnecessary.
Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the use of “physical” is not only poor writing–look at William Zinsser’s classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to “physical damage,” in 1959, from “mechanical injury” (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, “Is anyone claiming electrical equipment needs protection from non-physical injury?” (Substitute the snide adjective of your choice.) Let’s take care of that for good: for our purposes, “damage” means “physical damage.”
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 3-177.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-52 Log #1912 NEC-P03 **Final Action: Reject**
(300.5(D)(4))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action taken on Proposal 8-53. This action will be considered by the Panel as a Public Comment.
See the Technical Correlating Committee action on Proposal 8-53.
It was also the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 8 for comment.
Submitter: William Wagner, Certification Solutions
Recommendation: Revise 300.5(D)(4) as follows:
300.5(D)(4) Enclosure or Raceway Damage. Where the enclosure or raceway is subject to physical damage, the conductors shall be installed in rigid metal conduit, intermediate metal conduit, Schedule 80 rigid ~~nonmetallic~~ <u>PVC</u> conduit, or equivalent.
Substantiation: This is a companion proposal for the definition of Rigid Nonmetallic Conduit in Article 100 and the revised Article 352 for Type PVC Conduit. It clarifies that rigid polyvinyl chloride conduit is designed as Type PVC, rather than the broader designation of rigid nonmetallic conduit (Type RNC) which includes PVC, HDPE and RTRC.
Panel Meeting Action: Reject
Panel Statement: Since Panel 8 has jurisdiction over Article 352, this change must first occur with Panel 8 in Article 352. Article 352 covers rigid nonmetallic conduit, which includes Schedule 80 PVC conduit. The use of “Schedule 80 nonmetallic conduit” in 300.5(D)(4) provides the user of the NEC with the ability to find the raceway requirements in Article 352. PVC is not in the index but rigid nonmetallic conduit is in the index.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-53 Log #272 NEC-P03 **Final Action: Reject**
(300.5(F))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
Where necessary to prevent ~~physical~~ damage to the raceway or cable, protection shall be provided in the form of granular or selected material, suitable running boards, suitable sleeves, or other approved means.
Substantiation: Use of the word “physical” is superfluous. In some instances, one could argue for the use of “mechanical” to differentiate that from e.g., “thermal” damage, but context makes the intended sense quite clear, rendering anything like this completely unnecessary.
Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the use of “physical” is not only poor writing–look at William Zinsser’s classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to “physical damage,” in 1959, from “mechanical injury” (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, “Is anyone claiming electrical equipment needs protection from non-physical injury?” (Substitute the snide adjective of your choice.) Let’s take care of that for good: for our purposes, “damage” means “physical damage.”

Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-54 Log #3160 NEC-P03 **Final Action: Reject**
(300.5(F))

Submitter: Wally Harris, Atlantic Inland Inspections
Recommendation: Reformat Section as follows adding text as indicated in underline type, and deleting text as indicated in strikethrough type, as shown:
(F) Backfill. Backfill that contains large rocks, paving materials, cinders, large or sharply angular substances, or corrosive material shall not be placed in an excavation where materials may damage raceways, cables, or other substructures or prevent adequate compaction of fill or contribute to corrosion of raceways, cables, or other substructures.
(1) ~~Where necessary to~~ <u>Where the authority having jurisdiction deems it</u> necessary to prevent physical damage to the raceway or cable, protection shall be provided in the form of granular or selected material, suitable running boards, suitable sleeves, or other approved means.
Substantiation: By deleting and adding the text as proposed, this proposal would give the Authority Having Jurisdiction more clear power to assure that the intent of this section is followed. The present use of the phrase “Where necessary to...” leaves only the imagination to judge just as to just who would, or would not find it necessary to install the intended protection.
Panel Meeting Action: Reject
Panel Statement: Section 110.2 states that “conductors and equipment required or permitted by this Code shall be acceptable only if approved” and “approved” is defined in Article 100 as being acceptable to the authority having jurisdiction. Inserting this text into 300.5(F) is not necessary, since 110.2 already provides the AHJ’s with that power.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-55 Log #537 NEC-P03 **Final Action: Reject**
(300.5(G))

Submitter: Joel A. Rencsok, Electrical Designs Inc.
Recommendation: Revise text to read:
Where a raceway enters from an underground system, the end within the building shall be sealed so as to prevent the entrance of moisture or gases. The sealing device shall be identified and listed for the purpose.
Substantiation: I have submitted three photos where the underground feeder generated enough Hydrogen gas to blow apart the control building. Fortunate no one was killed. See also 300.50(E).
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: Seal-off devices can minimize the migration of gases or vapors but not prevent this migration based on the laws of physics. Since seal-off devices cannot prevent the migration of gases, the first sentence of the proposal is not possible and would be totally unenforceable. The submitter did not provide all of the pertinent information involved in this incident, so the panel could analyze the cause and effects of the incident. Making a change and a requirement of this magnitude in the Code requires more technical substantiation than was provided in the proposal.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-56 Log #2233 NEC-P03 **Final Action: Reject**
(300.5(I))

Submitter: Donald A. Ganiere, Ottawa, IL
Recommendation: Revise as follows:
(I) Conductors of the Same Circuit. All conductors of the same circuit and, where used, the grounded conductor and all equipment grounding conductors shall be installed in the same raceway or cable <u>or where individual conductors are used, they</u> shall be installed in close proximity in the same trench.
Substantiation: It appears that the current wording would permit the use of a three conductor cable containing the three phase conductors and individual conductors for the grounded and grounding conductors installed in close proximity in the same trench. This proposal would require that all circuit conductors be in the same raceway, or if individual conductors are used that these individual conductors be installed in close proximity in the trench.
Panel Meeting Action: Reject
Panel Statement: The requirement is already provided in the existing text in 300.5(I) for underground raceways or cables. This section works in conjunction with the requirements in 300.3(B)(2), where permission is given for a cable assembly installed in accordance with Section 250.134(B), Exception No. 2, for

dc circuits. Making this proposed change would make this dc application a code violation in this section and a conflict with the permission in 250.134(B), Exception No. 2.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-57 Log #1234 NEC-P03 **Final Action: Reject**
(300.5(I) Exception No. 2)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Change "nonmetallic raceways" to "nonmagnetic raceways".
Substantiation: Edit. Isolated conductors are permitted for cables with a nonmagnetic sheath: nonmagnetic raceways such as aluminum, brass, or copper should be included.
Panel Meeting Action: Reject
Panel Statement: This Exception No. 2 is targeting parallel conductor installations in PVC or other nonmetallic conduit.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-58 Log #1641 NEC-P03 **Final Action: Reject**
(300.6(A))

Submitter: Gregory J. Steinman, Thomas & Betts Corporation
Recommendation: Add the word "listed" and delete the word "approved" to describe electrically conductive corrosion resistant compound.
Where corrosion protection is necessary and the conduit is threaded in the field, the threads shall be coated with a listed ~~approved~~ electrically conductive corrosion resistant compound.
Substantiation: There are numerous compounds on the market that may not be appropriate for this use. An AHJ has no tools to use to confirm whether a compound may or may not be suitable for long-term corrosion protection. Underwriters Laboratories Inc. created a product category for this specific application, (FOIZ) Electrically Conductive Corrosion Resistant Compounds. There have been corrosion issues with field-threaded conduit, which was the reason for this requirement being introduced in 2002. Don't rely on an AHJ taking an educated guess on the long-term performance of corrosion protection. This electrical connection is the safety path for effective grounding. Any corrosion at these connections depreciates the safety level.
Panel Meeting Action: Reject
Panel Statement: No substantiation has been provided by the submitter to show there is a problem with using non-listed products. "Listed" products may be approved, but there is no justification to require "listed" only.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 10 Negative: 3
Explanation of Negative:
CASPARRO, P.: Although I agree that no substantiation has been provided by the submitter to prove the need for a listed product, I do believe that the submitter has valid concerns that need to be addressed. Listing would remove the guesswork for the Authority Having Jurisdiction when trying to determine if a compound is adequate for the task.
The panel also had discussion about whether these compounds are listed for use in hazardous locations. This is a very valid concern since the grounding path in a hazardous location is an even greater concern. But, the fact that a product is not listed for a particular application is no reason to reject a proposal, Arc Fault devices didn't exist at the time they were introduced into the NEC.
EGESDAL, S.: Considering that electrically conductive corrosion resistant compound applied in the field will be expected to function for decades, it is reasonable to require a listed product, where independent evaluation and listing will provide long-term confidence in the product.
GUIDA, T.: This proposal should have been accepted requiring listed corrosion protection for field threaded rigid and IMC conduit. Listed corrosion resistant compounds have been tested for both their corrosion resistivity and an electrical conductivity test. Electrical inspectors should not be required to determine in the field whether a material installed on the threads of a raceway are electrically conductive when there is a listed material that is available that will ensure conductivity of the conduit path. If a material is applied to the field threads of a metal raceway and conductivity is impaired, the grounding and bonding path of the metal raceway may no longer be an assured path and a ground fault in a circuit may not have a path back to the source to facilitate the operation of the overcurrent protective, as required by 250.4(A)(5).
Comment on Affirmative:
PACE, D.: The ACC supports the panel statement that no substantiation was provided to indicate that "non-listed" compounds are a problem. "Listed" products may be approved for use, but there is no justification to require "listed" products only.

3-59 Log #3396 NEC-P03 **Final Action: Accept**
(300.6(B))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: In both the title and text, change "non-ferrous" to "aluminum".
Substantiation: This proposal corrects a serious error in the 2005 NEC that was based on faulty substantiation when the proposal that created this rule was presented. Not all non-ferrous metal raceways are aluminum, but the proposal substantiation presented UL Guide Card restrictions that only apply to aluminum. These requirements do not apply to brass conduit, and complicate swimming pool wiring projects that use metallic raceways. Brass conduit has been recognized for these uses for forty years.
Panel Meeting Action: Accept
Panel Statement: The panel does not agree with the submitter's claim in the substantiation that there is a "serious" error in the 2005 edition of the Code.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-60 Log #639 NEC-P03 **Final Action: Accept in Principle**
(300.6(B) Exception (New))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Add a new exception as follows:
Exception: Red Brass shall not be required to have protective coatings.
Substantiation: This change is necessary to correct a problem which has developed since this section was rewritten for the 2002 edition. The text in 300.6(B) "Non-Ferrous Metal equipment" is applicable to non-ferrous products, including aluminum and red brass. Aluminum and red brass rigid conduit are listed to UL 6A. The UL Electrical Construction Equipment Directory includes limitations and special conditions of use for listed products. Under the product category "Conduit, Rigid Nonferrous Metallic (DYWV), aluminum conduit is required to have supplementary corrosion protection when installed in concrete or in soil. UL does not require supplementary protection for Red Brass conduit. Red Brass conduit has been used for many years as the preferred method for wiring swimming pool lighting and has held up in these harsh corrosive environments without problems.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action and statement for Proposal 3-59. The submitter is correct. One type of nonferrous raceway, brass conduit, does not require extra corrosion protection. This requirement only applies to aluminum raceways, enclosures, etc, that are in direct contact with the earth or embedded or encased in concrete. By changing "nonferrous" in both the title and the text to "aluminum," this subsection will now only apply to aluminum equipment. The proposed exception would no longer apply.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-61 Log #640 NEC-P03 **Final Action: Accept in Principle**
(300.7(B), FPN)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Revise Fine Print Note to read as follows:
FPN: Table 352.44(A) provides the expansion information for polyvinyl chloride (PVC). A nominal number for steel conduit can be determined by multiplying the expansion length in this table by 0.20. The coefficient of expansion for steel electrical metallic tubing, intermediate metal conduit, and rigid conduit is ~~11.70 x 10-6~~ 1.170 x 10 -5 (0.0000117 mm per mm-of conduit for each °C in temperature change) [~~6.50 x 10-6~~ (0.650 x 10 -5) (0.00000 65 in. per inch of conduit for each °F in temperature change)].
A nominal number for aluminum conduit can be determined by multiplying the expansion length in Table 352.44(A) by 0.40. The coefficient of expansion for aluminum electrical metallic tubing and rigid metal conduit is 2.34 x 10 -5 (0.0000234 mm per mm of conduit for each °C in temperature change) [1.30 x 10 -5 (0.000013 in. per inch of conduit for each °F in temperature change)].
Substantiation: This is a change in the exponential value of the coefficient of expansion associated with steel raceways. It does not change the resultant calculations associated with determining the length of expansion or contraction change per unit of temperature change. It is being changed to reflect the same exponential value as shown in Table 352.44(A) for Rigid Nonmetallic Conduit (RNC) which this FPN references. It allows for a direct, general comparison of the linear expansion characteristics of these commonly used raceways. Aluminum was added to complete the family of metals commonly used.
Panel Meeting Action: Accept in Principle
Revise the existing FPN to read as follows:
FPN: Table 352.44(A) provides the expansion information for polyvinyl chloride (PVC). A nominal number for steel conduit can be determined by multiplying the expansion length in this table by 0.20. The coefficient of

expansion for steel electrical metallic tubing, intermediate metal conduit, and rigid conduit is ~~11.70 x 10-6~~ 1.170 x 10 -5 (0.0000117 mm per mm of conduit for each °C in temperature change) [~~6.50 x 10-6~~ 0.650 x 10 -5 (0.00000 65 in. per inch of conduit for each °F in temperature change)].

In the proposed second paragraph, add "and aluminum electrical metallic tubing" after "aluminum conduit" in the first sentence. Add "aluminum" before "rigid metal conduit" in the second sentence. The changes to read as follows:

A nominal number for aluminum conduit and aluminum electrical metallic tubing can be determined by multiplying the expansion length in Table 352.44(A) by 0.40. The coefficient of expansion for aluminum electrical metallic tubing and aluminum rigid metal conduit is 2.34 x 10 - 5 (0.0000234 mm per mm of conduit for each o C in temperature change) [1.30 x 10 -5 (0.000013) in. per inch of conduit for each o F in temperature change].

Panel Statement: The text was added to the recommended text to clarify the types of raceways included in the expansion calculation.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

Comment on Affirmative:

CASPARRO, P.: I understand that PVC, HDPE, and RTRC conduits all have coefficient of expansion tables in their respective articles. The FPN in 300.7(B) contains a multiplier for steel. The multiplier is to be used with the table in 352 (for PVC conduit) to find expansion charactristics for steel conduit. There is currently no multiplier for aluminum in the NEC. Consequently nonmetallic conduit products and steel products are covered, but aluminum is not. This change to the FPN corrects the oversight.

3-62 Log #1914 NEC-P03 **Final Action: Reject**
(300.7(B), FPN)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 8-53. See Technical Correlating Committee action on Proposal 8-53. This action will be considered by the Panel as a Public Comment.

It was also the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 8 for comment.

Submitter: William Wagner, Certification Solutions

Recommendation: Revise the first sentence of the FPN to 300.7(B) as follows:

FPN: Table 352.44 ~~(A~~) provides the expansion information for polyvinyl chloride (PVC).

Substantiation: This is a companion proposal for the revised Article 352 for Type PVC Conduit. Article 352 will now apply only to rigid polyvinyl chloride conduit (Type PVC), rather than for rigid nonmetallic conduit (Type RNC) which includes PVC, HDPE and RTRC. Therefore, there will only be one Table 352.44 and the reference should be revised accordingly.

Panel Meeting Action: Reject

Panel Statement: Since Panel 8 has jurisdiction over Article 352, this change must first occur with Panel 8 in Article 352.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-63 Log #2234 NEC-P03 **Final Action: Reject**
(300.9 (New))

Submitter: Donald A. Ganiere, Ottawa, IL

Recommendation: Add new text to read as follows:

300.9 Raceways in Wet Locations. Cables and conductors installed in underground raceways or raceways that are located in wet locations shall be listed for use in wet locations.

Substantiation: The interior of raceways installed in wet locations is a wet location and the cables and conductors installed in such raceways should be listed for that purpose. I have submitted a proposal to delete the similar requirement for underground installations that is in 300.5(B). This new requirement will cover all raceways installed in wet locations.

Panel Meeting Action: Reject

Panel Statement: The requirement for cables to be suitable for the location in which they are to be installed is presently addressed in Section 310.8, and Table 310.13 applicable locations. Article 310 covers the general requirements for conductors such as insulation types, designations, and uses. To add the proposed text to Article 300 would be inappropriate since 300 deals with wiring methods in general. Repeating this requirement in Article 300 does not add clarity to The Code. See panel action and statement for Proposal 3-43.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-64 Log #158 NEC-P03 **Final Action: Reject**
(300.10)

Submitter: Steven Stelly, Louisiana Dept. of Transportation and Development

Recommendation: My proposal is to require an equipment grounding conductor of appropriate size preventing the use of conduit as an equipment grounding conductor.

Substantiation: Because of some uncontrollable situations due to changing environmental conditions such as air pollution, resulting in rusted out or broken threads, couplings or connectors pulled apart that are not apparent because of hidden locations, the integrity of the conduit being used as an equipment grounding conductor is lost. Because of a short circuit or ground fault occurring in equipment down stream of the break, an unsuspecting person could receive a severe shock or be electrocuted.

The added cost of installing an equipment grounding conductor in the conduit instead of using the conduit is minimal in comparison to saving a life.

Panel Meeting Action: Reject

Panel Statement: This proposal does not comply with Section 4.3.3 of the NFPA Rules and Regulations to provide specific text in the recommendation for change. A suggested change of this magnitude requiring a separate equipment grounding conductor, rather than permitting the raceway to act as the equipment grounding conductor, must be submitted to Panel 5 for grounding and bonding and to Panel 8 covering raceways for their action.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-65 Log #2228 NEC-P03 **Final Action: Accept in Principle**
(300.10 Exception No. 3 (New))

Submitter: Donald A. Ganiere, Ottawa, IL

Recommendation: Add an exception to read as follows:

Exception No. 3: Where conduits are installed into the bottom of open bottom equipment, the conduits shall not be required to be mechanically secured to the equipment.

Substantiation: Large equipment such as switchboards, MCCs and pad mount transformers are often supplied with open bottoms for the conduit to be stubbed into. There is no way to secure these conduits to the equipment. The rule in this section says that the conduits must be mechanically secured to the enclosure, "unless specifically permitted elsewhere in this Code." There is no specific provision in this code to permit this, yet this type of installation is very common.

Panel Meeting Action: Accept in Principle

Reword the recommended text to read as follows:

Exception No. 3: Conduit installed into the bottom of open bottom equipment, such as switchboards, motor control centers, and transformers, shall not be required to be mechanically secured to the equipment.

Panel Statement: The text was changed to provide clarity and some examples of open bottom type equipment where this exception could apply.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-66 Log #2942 NEC-P03 **Final Action: Reject**
(300.11)

Submitter: Philip Simmons, Simmons Electrical Services

Recommendation: Revise existing 300.11 as follows and renumber the following subsections:

300.11 Securing and Supporting.

(A) Secured in Place. Raceways, cable assemblies, boxes, cabinets, and fittings shall be securely fastened in place.

(B) Support wires. Support wires that do not provide secure support shall not be permitted as the sole support. Support wires and associated fittings that provide secure support and that are installed in addition to the ceiling grid support wires shall be permitted as the sole support. Where independent support wires are used, they shall be secured at both ends. Cables and raceways shall not be supported by ceiling grids.

Substantiation: The existing section needs to be broken up with appropriate titles to add clarity to the NEC. Adding an additional section with a title for the sentences on support wires will improve the organization of the Code. Presently, the requirements for using support wires, which are specific, are included in the section that provides a general requirement for raceways, cable assemblies, boxes, cabinets, and fittings.

Panel Meeting Action: Reject

Panel Statement: There are some organizational problems with the submitter's recommendation. The existing (A) applies to both securely fastening and supporting the various raceways, cable assemblies, etc., and must remain as a single subsection.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

9-7d Log #3519a NEC-P09 **Final Action: Reject**
(300.11(A))

TCC Action: The Technical Correlating Committee directs that the panel reconsider this Proposal since boxes for power-limited fire alarms are not excluded from Article 314 by any rules from Article 760. This action will be considered by the panel as a public comment.

The Technical Correlating Committee further directs that this proposal be forwarded to Code-Making Panel 3 for information.

Submitter: Thomas F. Norton, Norel Service Co. Inc.

Recommendation: Add a new sentence at the end of 300.11(A) as follows:

Boxes installed for smoke detectors, heat detectors or a combination of both in suspended ceilings using "T" bar supports shall not be required to install additional support to the building structure.

Substantiation: This sentence should be added for clarity. It is not the intention to require each smoke/heat detector box to be tied to the building structure.

Panel Meeting Action: Reject

Panel Statement: Section 314.23 adequately covers surface mounted, structurally mounted, finished surface, suspended ceiling mounted and similar box support. The rules in 314.23(D) are appropriate for non-power-limited applications. The proposal is unclear as to the intended application. Modifications of 314.23(D) for power-limited applications in Article 760 are under the jurisdiction of CMP-3

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10

Ballot Not Returned: 1 de Vega, H.

3-67 Log #3519 NEC-P03 **Final Action: Reject**
(300.11(A))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 9 for action in Article 314. This action will be considered by Code-Making Panel 9 as a public comment.

Submitter: Thomas F. Norton, Norel Service Co. Inc.

Recommendation: Add a new sentence at the end of 300.11(A) as follows:

Boxes installed for smoke detectors, heat detectors or a combination of both in suspended ceilings using "T" bar supports shall not be required to install additional support to the building structure.

Substantiation: This sentence should be added for clarity. It is not the intention to require each smoke/heat detector box to be tied to the building structure.

Panel Meeting Action: Reject

Panel Statement: Section 314.23 adequately covers surface-mounted, structurally mounted, finished surface, suspended ceiling mounted and similar box support and is under the jurisdiction of Panel 9, not Panel 3. Very specifically, 314.23(D) applies to box support from a framing member in (1) and to support wires in (2). Any suggested changes for support of boxes in a suspended ceiling should be submitted to 314.23(D) rather than 300.11.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-67a Log #CP300 NEC-P03 **Final Action: Accept**
(300.11(A)(2))

Submitter: Code-Making Panel 3,

Recommendation: Revise the last sentence of 300.11(A)(2) to read as follows:

An independent means of secure support shall be provided <u>and shall be permitted to be attached to the assembly</u> .

Substantiation: Adding this text in the last sentence in (2) provides clarity and direction to the installer and the inspector that connecting the lower end of the independent support for the raceway to the ceiling assembly is acceptable in a non-fire-rated assembly.

Panel Meeting Action: Accept

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-68 Log #3299 NEC-P03 **Final Action: Reject**
(300.11(A)(2))

Submitter: Jerry Feagans, City of St. Louis

Recommendation: Revise text to read as follows:

Wiring located within the cavity of a non-fire rated floor-ceiling or roof-ceiling assembly shall ~~not~~ <u>be permitted to</u> be secured to, or supported by the ceiling assembly support wires. <u>This wiring shall be for equipment located within or supported by the ceiling assembly.</u>

Substantiation: The problem is the confusion about which wires can or cannot be used. Your ceiling support wires are already carrying the weight of your lay-in fixtures. Adding the weight of the whips for these fixtures does not appear to add that much additional weight to the ceiling system. I have tried to get the manufacturers instructions to see how they recommend how to install and I have not been successful in doing so. It appears that the manufacturers are reluctant in issuing those instructions. With this change the contractors and the AHJ will still be able to insure a safe and secure wiring system without all the unnecessary confusion.

Panel Meeting Action: Reject

Panel Statement: Many non-fire rated ceiling assemblies are not even rated to carry the weight load of lay-in luminaires and certainly are not rated to carry the load of the branch circuit wiring system. Where the ceiling assembly is designed to carry the load of the luminaires, the manufacturer has absolutely no idea of the type of wiring method that will be used to connect to these luminaires and the approximate weight of that wiring method. One of the major problems in the past in permitting wiring methods to be supported by the ceiling grid assembly was the number of raceways supported by one ceiling wire. Many installations had three or more ½ or ¾ inch EMTs attached to each grid wire. The attachment means had a tendency to shorten the support wire a small amount and thus make the finished ceiling not level. To fix the problem, the ceiling grid installer would just pop the EMT support devices off the support wire, leaving the EMT unsupported above the ceiling.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-69 Log #3298 NEC-P03 **Final Action: Reject**
(300.11(A)(2) Exception)

Submitter: John Stacey, City of St. Louis, Elect. Insp. Dept.

Recommendation: Revise text to read as follows:

The ceiling support system shall be permitted to support new ceiling branch - circuit wiring and associated ceiling equipment where installed in accordance with ~~Ceiling System Manufacturer's Instructions~~ the AHJ.

Substantiation: After calling several ceiling manufacturers, they had no instructions and did not want anything on their support wires. The weight of the luminaire exits are on the ceiling already. Some of the slabs above may be 20+ ft. A 1/2 - pound whip should not overload these ceilings. Please reconsider.

Panel Meeting Action: Reject

Panel Statement: See the panel action and statement for Proposal 3-68.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-70 Log #3189 NEC-P03 **Final Action: Reject**
(300.11(B))

Submitter: Donald Cook, Shelby County Development Services

Recommendation: Revise text to read:

300.11(B) Raceways used as Means of Support. Raceways shall be used only as a means of support for other raceways, cables, ~~or~~ <u>electric or</u> nonelectric equipment under any of the following conditions:

Substantiation: Current text permits the support of raceways, cables, or nonelectric equipment by other raceways. The items included in 300.11(B)(3) which are permitted to be supportted by raceways (boxes, conduit bodies, and luminaires) are neither raceways, cables nor nonelectric equipment.

Adding "electric or" will cover those items. Electric equipment is defined in Article 100 and includes the items listed in 300.11(B)(3).

Panel Meeting Action: Reject

Panel Statement: Section 300.11(B) clearly lays out the conditions whereby raceway can be used to support other items and delineate them in 300.11(B)(1),(2), and (3). Raceways are neither tested nor listed for external mechanical load carrying capabilities.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 12 Negative: 1

Explanation of Negative:

AYER, L.: I would agree with the submitter's substantiation. Other than raceways and cables, 300.11(B) allows only nonelectric equipment to be supported by raceways under certain conditions. 300.11(B)(3) under this section allows for boxes, conduit bodies, and luminaries to be supported by raceways. These items are clearly electric items and the wording of the present text needs to be revised for clarity.

3-71 Log #638 NEC-P03 **Final Action: Reject**
(300.11(B)(4) (New))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Recommendation: Add a new (4) to 300.11(B) to read as follows:

<u>(4) Support for cable installed in raceway shall be provided by the raceway, installed in accordance with the applicable raceway article.</u>

Substantiation: To many it may be obvious that the conduit is the support for cables inside the conduit, just as it is for conductors. 300.11(B) does not permit cable to be supported by raceway. Therefore, questions often arise in the field regarding support whenever cable is installed in conduit. The proposed text is a clarification of what is required, including the fact that it is the conduit support requirements that apply. This new text would only be applicable where the cable is not prohibited from being installed in conduit. Chapter 3 is the appropriate place for this rule as it could apply to several articles, dependent upon what Panel 7 permits or prohibits relevant to cables in raceway, both currently and in the future. Panel 3 may recall that Panel 8 revised raceway

articles in the 2005 NEC to permit cables in raceways unless the individual cable articles prohibit it, thus those decisions have been passed from Panel 8 to Panel 7. At the current time the cables most likely to be installed in conduit are not prohibited.
Panel Meeting Action: Reject
Panel Statement: The support of conductors and cables by the raceway when the cables and conductors are pulled into the raceway would seem to be very obvious, but this is certainly covered by 300.11(B)(1) since raceways are listed to contain conductors and permission is granted in a number of the raceway articles to also contain cables. Certainly if the raceway is identified for the internal support of conductors and permission is given in the cable article to install the cable in a raceway, then it follows that the cable is also supported. This would be contrary to the extra support requirements that are provided in 300.19 for vertical raceways.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-72 Log #1109 NEC-P03 **Final Action: Reject**
(300.11(C))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise as follows:
Cable wiring methods shall not be used as a means of support for other cables, raceways, or ~~nonelectrical~~ equipment.
Substantiation: Edit. The word "nonelectrical" implies that this section does not prohibit of electrical equpment such as a receptacle or switch box.
Panel Meeting Action: Reject
Panel Statement: The word "equipment," as defined in Article 100, is a very general definition and includes electrical materials, fittings, devices, appliances, luminaires, apparatus, and anything similar used in connection with or as a part of an electrical installation. The intent of this section was to limit cable wiring methods from supporting other cables, raceways, and non-electrical equipment. There may be listed cable assemblies and fittings that are adequately supporting electrical sensing equipment in certain installations, so this application should still be permitted.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-73 Log #1009 NEC-P03 **Final Action: Reject**
(300.11(C) Exception (New))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Add:
Exception: A single listed Class 2 or Class 3 cable that is soley for the connection to the control circuit(s) of a single utilization equipment shall be permitted to be supported from Type AC, Type MC, or Type MI cable used as the power supply for the equipment.
Substantiation: A limit of a single Class 2 or 3 cable and a single utilization equipment would make such support reasonable, since flexible metal and nonmetallic raceways are permitted for support in 300.11(B). This type of installation is commonly installed and accepted.
Panel Meeting Action: Reject
Panel Statement: There was no restriction provided in the recommended text as to the size of Class 2 or Class 3 cable that could be installed, the number of conductors within the Class 2 or Class 3 cables attached to AC, MC or MI cable, or any restriction for the length of the Class 2 or 3 cable. Finally there was no size provided for the Type AC, MC, or MI cable that could be used for supporting other cables. All of these items mentioned must be quantified to ensure that the control cable does not overburden the power cable. This is consistent with 300.11(B)(2).
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-74 Log #1011 NEC-P03 **Final Action: Reject**
(300.11(C) Exception (New))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Add:
Exception: A single listed Class 2 or Class 3 cable that is solely for the connection to the control circuit(s) of a single utilization equipment shall be permitted to be supported from Type AC, Type MC, or Type MI cable used s the power supply to the equipment.
Substantiation: Specifying a single listed cable and a single equipment will exclude multiple cables and other type cables. Raceways, including flexible metal and nonmetallic types are permitted in 300.11(B). This type installation is not uncommonly installed and accepted.
Panel Meeting Action: Reject
Panel Statement: See the panel Statement in Proposal 3-73.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-75 Log #273 NEC-P03 **Final Action: Reject**
(300.12 Exception No. 1)

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
Exception No. 1: Short sections of raceway used to provide support or protection of cable assemblies from ~~physical~~ damage shall not be required to be made electrically continuous.
Substantiation: Use of the word "physical" is superfluous. In some instances, one could argue for the use of "mechanical" to differentiate that from e.g., "thermal" damage, but context makes the intended sense quite clear, rendering anything like this completely unnecessary.
Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 3-177.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-76 Log #1340 NEC-P03 **Final Action: Reject**
(300.14)

Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Add the word "unspliced"
300.14 Length of Free Conductors at Outlets, Junctions, and Switch Points. At least 150 mm (6 in.) of free <u>, unspliced,</u> conductor, measured from the point in the box where it emerges from its raceway or cable sheath, shall be left at each outlet, junction, and switch point for splices or the connection of luminaires (fixtures) or devices. Where the opening to an outlet, junction, or switch point is less than 200 mm (8 in.) in any dimension, each conductor shall be long enough to extend at least 75 mm (3 in.) outside the opening.
Substantiation: This change is to clarify that the free length of conductor is required to be unspliced. As written, the code is vague as to whether or not the conductor is permitted to contain a splice in the free length aforementioned.
Panel Meeting Action: Reject
Panel Statement: The purpose of Section 300.14 is to permit access to the end of the conductor. Whether this conductor is spliced or un-spliced does not affect the length of this free end of the conductor. Many conductors originate inside the box and are spliced to other conductors within the box but extend out of the box for connection to a device of some kind. Making this change would not permit this very common application. Even the exception to this section states that unspliced or unterminated conductors do not have to comply with 300.14.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-77 Log #262 NEC-P03 **Final Action: Reject**
(300.15(C))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
Protection. A box or conduit body shall not be required where cables enter or exit from conduit or tubing that is used to provide cable support or protection against ~~physical~~ damage.
Substantiation: Use of the word "physical" is superfluous. In some instances, one could argue for the use of "mechanical" to differentiate that from e.g., "thermal" damage, but context makes the intended sense quite clear, rendering anything like this completely unnecessary.
Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. Panel Statement: See panel action and statement on Proposal 3-177.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-78 Log #1406 NEC-P03 **Final Action: Reject**
(300.15(C), Exceptions No. 1 and 2 (New))

Submitter: George Stolz, II, Pierce, CO
Recommendation: Add the following Exceptions to 300.15(C):
Exception No. 1: A fitting shall not be required for type LFNC used for protection between a box and entrance into concealed spaces where the conduit is secured within 1 ft of the penetration into the concealed space.
Exception No. 2: A fitting shall not be required where short lengths of LFNC are used for separation of cables from masonry.
Substantiation: For Exception No. 1: It is highly difficult to abrade cable assemblies with type LFNC conduit. This would ease installations from outdoor boxes to interior spaces. An instance where this exception would be utilized is retrofitting existing structures for air conditioning.
For Exception No. 2: Anything unrecognized by the NEC that safely separates the cable from masonry can be used for this purpose, where as of now if LFNC is used a fitting must be installed, despite the fact that it is not really serving as conduit so much as a nonabrasive seperative device.
Panel Meeting Action: Reject
Panel Statement: Where cable is installed as a wiring method, and then conversion to conduit or tubing occurs, protection of the cable is imperative to prevent abrasion from sharp edges. Since this is a general section that deals with cables being converted to conduit or tubing, a specific change can be inserted into any article dealing with cables, conduit, or tubing. Depending on the robustness of the cable, such as three conductor UF cable installed in place of NM cable, abrasion of the cable may not be an issue but it would be better dealt with in either the specific cable article or the raceway article.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-79 Log #3397 NEC-P03 **Final Action: Reject**
(300.15(L))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Revise as follows:
(L) Manholes and Handhole Enclosures. ~~Where accessible only to qualified persons,~~ A box or conduit body shall not be required for conductors in manholes or handhole enclosures, except where connecting to electrical equipment. The installation shall comply with Part V of Article 100 for manholes, and 314.30 for handhole enclosures.
Substantiation: The deleted wording is apparently intended to apply to the inside of these enclosures. However, the literal text applies to the outside of the enclosure, and inadvertently prohibits their use in public areas where they have been routinely used since they were first developed. The access rule can be simply deleted, because access to the inside is limited by the requirements to attach the cover with a method that requires a tool to open (or with a cover that weighs over 100 lb). See 314.30(D) and 110.75(D). In addition, jurisdiction over access to the interior of these enclosures should rest with CMP 1 and CMP 9 respectively.
Panel Meeting Action: Reject
Panel Statement: A manhole or a handhole enclosure may still be accessed by someone who is not a qualified person and that person may not understand the safety issue of these conductors being spliced inside the manhole or enclosure without a box or fitting. If the manhole is accessed by other than qualified people, installing a box or an enclosure for splices or terminations may still be necessary, so deleting this phrase would decrease safety in these applications.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-80 Log #1144 NEC-P03 **Final Action: Reject**
(300.16(A) and FPN (New))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Add "conduit body" after "box."
Add FPN:
FPN: See 300.20(B) where metal boxes or conduit bodies are used.
Substantiation: Edit. Conduit bodies with three or more hubs should be suitable. (see 590.4(G). The FPN clarifies that this section does not conflict with 300.20(B) due to lack of reference to metal.
Panel Meeting Action: Reject
Panel Statement: This applies only where open wiring or concealed knob and tube wiring is converted to conduit, tubing, NM cable, AC cable, MC cable, MI cable, or surface raceways. Where this conversion occurs, a box or fitting is required. While there can be no splices or taps in a fitting, taps or splices could occur within a box. It would take permission from 314.16(C)(2) for those splices or taps within a conduit body. There was no technical substantiation provided to add conduit bodies to this section. In addition, Section 300.20 would apply to these applications where single conductors enter into a ferrous metal enclosure, so a fine print note added to 300.16(A) is unnecessary.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-81 Log #3341 NEC-P03 **Final Action: Reject**
(300.17)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc. / Rep. Massachusetts Electrical Code Advisory Committee
Recommendation: Add a second paragraph as follows:
Where different raceway wiring methods are joined together without a pull point at the transition, there shall not be more than the equivalent of four quarter bends (360 degrees total) between pull points, e.g., conduit bodies and boxes.
Substantiation: Although the 360° rule is adequately covered in the various tubular raceway articles, none of those limitations apply beyond the scope of their article. There are a variety of listed fittings that enable seamless transitions between wiring methods, and nothing in 300.15 requires enclosures at such points unless the conductors actually terminate or splice. The result is no literal NEC requirement to observe the 360° bend rule on a continuous pull if the run crosses wiring methods, provided no particular wiring method exceeds the bend limit. A fish tape does not know that it has crossed a wiring method transition. This proposal provides an important tool for the inspection community to control abuses of what CMP 8 clearly intends as the upper limit elsewhere in Chapter 3.
Panel Meeting Action: Reject
Panel Statement: There are raceways in Chapter 3 that do not have the 360-degree bend requirements. For example, this added sentence would make it a requirement that strut-type channel raceways in Article 384, surface metal raceways in Article 386, and surface nonmetallic raceways in Article 388 would all have to comply with the 360-degree rule even though all have removable covers.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-82 Log #1467 NEC-P03 **Final Action: Reject**
(300.17, FPN)

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Rename the term "fixture wires" to "luminaire wires" in 300.17 FPN.
Substantiation: With the changing of the term "fixture" to "luminaire" it only makes sense that the term "fixture wires" be changed to "luminaire wires".
For the purposes of correlation, this proposal is also being submitted to the following Articles/Sections/Tables/Annexes: 200.6; 210.19; 210.20; 210.24; 240.4; 240.5; 300.17; 310.1; 314.16; Article 402; 517.74; 660.9; Table 1; Table 5; Annex C.
Panel Meeting Action: Reject
Panel Statement: While the term "fixture," as relating to "lighting fixtures" has been changed to "luminaires", the term "fixture wires" applies to conductors that serve appliances or other devices and not just "luminaires." The change in terminology does not provide greater clarity or usability.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-83 Log #1915 NEC-P03 **Final Action: Accept in Part**
(300.17, FPN)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposals 8-53 and 8-78. This action will be considered by the Panel as a Public Comment.
See Technical Correlating Committee action on Proposals 8-53 and 8-78.
It was also the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 8 for comment.
Submitter: William Wagner, Certification Solutions
Recommendation: Revise the FPN to 300.17 as follows:
FPN: See the following sections of this Code: intermediate metal conduit, 342.22; rigid metal conduit, 344.22; flexible metal conduit, 348.22; liquidtight flexible metal conduit, 350.22; rigid ~~nonmetallic~~ PVC conduit, 352.22; HDPE conduit, 353.22; RTRC, 355.22 ; liquidtight nonmetallic flexible conduit, 356.22; electrical metallic tubing, 358.22; flexible metallic tubing, 360.22; electrical nonmetallic tubing, 362.22; cellular concrete floor raceways, 372.11; cellular metal floor raceways, 374.5; metal wireways, 376.22; nonmetallic wireways, 378.22; surface metal raceways, 386.22; surface nonmetallic raceways, 388.22; underfloor raceways, 390.5; fixture wire, 402.7; theaters, 520.6; signs, 600.31(C); elevators, 620.33; audio signal processing, amplification and reproduction equipment, 640.23(A) and 640.24; Class 1, Class 2, and Class 3 circuits, Article 725; fire alarm circuits, Article 760; and optical fiber cables and raceways, Article 770.

Substantiation: This is a companion proposal for the definition of Rigid Nonmetallic Conduit in Article 100, the revised Article 352 for Type PVC Conduit and the proposed new Article 355 for RTRC. The products formerly designated collectively as rigid nonmetallic conduit (Type RNC) will be expanded to include separate Articles for PVC, HDPE and RTRC.
Panel Meeting Action: Accept in Part
Accept the addition of HDPE conduit, 353.22, and reject the remainder of the proposal.
Panel Statement: HDPE conduit was accepted since Article 353 was a new article in the 2005 NEC. The remainder of the proposal was not accepted, since Panel 8 has jurisdiction over raceway articles and the NEC TCC has jurisdiction over the acceptance of new articles in the NEC.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-84 Log #3272 NEC-P03 **Final Action: Reject**
(300.18(C) (New))

Submitter: Leonard F. Devine, Jr., Palm Beach County Plan Review
Recommendation: Add text to read as follows:
300.18(C) Raceway Diameter. Raceways shall be of the same diameter from one end of a run to the other end unless the diameter of the raceway is changed at a junction/pull box, or when the raceway diameter is changed anywhere in the run, it is visible where the change is made.
Substantiation: The problem is that all to often, especially in remodel work a designer will go to a site to be remodeled and observe a larger raceway than may have been required thinking that there will be available space for them to increase the wire size, especially when schedule 80 PVC is involved because many times a larger raceway was installed above grade for physical protection. Even if the conductors can be installed in a raceway smaller than would be allowed because the designer cannot determine the size. Many times the conductors are damaged and there are no indications of this until they become a problem sometime in the future.
Panel Meeting Action: Reject
Panel Statement: The reason Table 4 and Annex C were changed in the 1990s was that different types of raceways and tubing have a slightly different inside diameter, even for the same trade size. These different diameters would make this proposed rule unenforceable. There are even different internal diameters for the same type of raceway within a product group, as was mentioned in the substantiation, such as Schedule 80 versus Schedule 40 PVC conduits.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-85 Log #3016 NEC-P03 **Final Action: Reject**
(300.19 Exception (New))

Submitter: James Conrad, Tyco Thermal Control
Recommendation: Add exception to 300.19 as follows:
<u>Exception: Conductors in vertical racewarys that are part of an Electrical Circuit Protective System shall be supported in accordance with the distances given in the system write-up but not to exceed the values in Table 300.19(A).</u>
Substantiation: Testing has shown that conductors in a vertical raceway weakened when exposed to fire conditions. This is currently being addressed by the STP for UL 2196 and each manufacturer will be required to test their systems to determine the maximum distance for their cable support distance.
Panel Meeting Action: Reject
Panel Statement: This is already covered in Section 110.3(B), where listed and labeled equipment shall be installed and used in accordance with any instructions included in the listing or labeling, so inserting this text into 300.19 as an exception is unnecessary.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-85a Log #CP301 NEC-P03 **Final Action: Accept**
(300.20(A))

Submitter: Code-Making Panel 3,
Recommendation: Add the word "ferrous" in the title in two places and in (A) in three places to read as follows:
300.20 Induced Currents in Ferrous Metal Enclosures or Ferrous Metal Raceways.
(A) Conductors Grouped Together. Where conductors carrying alternating current are installed in ferrous metal enclosures or ferrous metal raceways, they shall be arranged so as to avoid heating the surrounding ferrous metal by induction. To accomplish this, all phase conductors and, where used, the grounded conductor and all equipment grounding conductors shall be grouped together.
[The exceptions are not changed.]
Substantiation: Section 300.20 is addressing induction from the ac conductors into ferrous (magnetic) metal enclosures and ferrous raceways. The word "ferrous" was added to more accurately describe the type of metal enclosures and raceways where induction would be an issue. This change will provide correlation for terminology with Section 300.3(B) and 300.5(I),
Exception No. 2.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-86 Log #1235 NEC-P03 **Final Action: Accept in Principle**
(300.20(A))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Insert "with magnetic properties" after "metal raceways".
Substantiation: Edit. Literal wording does not permit single conductor Type MI or Type MC cable for ac circuits. Subsection (B) qualifies metal as "with magnetic properties".
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Log CP301, which would seem to satisfy the submitter's intent.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-87 Log #2747 NEC-P03 **Final Action: Reject**
(300.20(A) Exception No. 3 (New))

Submitter: Daniel Baker, URS Corporation, Inc.
Recommendation: Revise text to read:
<u>Exception No. 3: Conductors of series circuits powered by regulators which limit current to 20 amperes, may be run without being grouped.</u>
Substantiation: Existing article reads:
300.20(A) Conductors Grouped Together. Where conductors carrying alternating current are installed in metal enclosures or metal raceways, they shall be arranged so as to avoid heating the surrounding metal by induction. To accomplish this, all phase conductors and, where used, the grounded conductor and all equipment grounding conductors shall be grouped together.
It is common practice in airfield lighting series circuits which are powered by regulators to separate the conductors and run single conductors along the edge of a taxiway or runway. This saves on wiring costs which can be significant because of the long runs involved, runways are usually over 5,000 feet long. As a result of this, conductors often enter enclosures singly. The practices and methods used in airfield lighting are based on Federal Aviation Administration (FAA) Advisory Circulars (ACs). An example of ungrouped entering a metal enclosure is shown on the left in **Figure 23** of Appendix 1 of Advisory Circular AC 150/5340-30A "Design and Installation Details for Airport Visual Aids", issued April 11, 2005. The ACs stipulate that the series circuits be connected to "Constant Current Regulators" (CCRs). There are two classes of CCRs, one with a maximum rating of 6.6 amperes and the other with a rating of 20 ampleres, maximum. Considering the limitation to 20 amperes, maximum there will be negligible heating caused by this separation.
Although many airfield installations are not inspected by local inspectors, there are times where this occurs and these installations are cited for lack of compliance with this provision of the NEC. This proposal adds a third exception to the list at the end of the above NEC provision.
Note: Supporting material is available for review at NFPA Headquarters.

3-88 Log #2746 NEC-P03 **Final Action: Reject**
(300.20(B) Exception No. 2 (New))

Submitter: Daniel Baker, URS Corporation, Inc.
Recommendation: Revise text to read:
<u>Exception No. 2: In the case of series circuits powered by regulators which limit current to 20 amperes or less the inductive heating effect can be ignored where these conductors are placed in metal enclosures or pass through metal.</u>
Substantiation: Existing article reads:
(B) Individual Conductors. Where a single conductor carrying alternating current passes through metal with magnetic properties, the inductive effect shall be minimized by (1) cutting slots in the metal between the individual holes through which the individual conductors pass or (2) passing all conductors in the circuit through an insulating wall sufficiently large for all of the conductors of the circuit.
It is common practice in airfield lighting series circuits which are powered by regulators to separate the conductors and run single conductors along the edge of a taxiway or runway. This saves on wiring costs which can be significant because of the long runs involved, runways are usually over 5,000 feet long. As a result of this, conductors often enter enclosures singly. The practices and methods used in airfield lighting are based on Federal Aviation Administration (FAA) Advisory Circulars (ACs). An example of an individual conductor passing through a metal enclosure is shown on the left in **Figure 23** of Appendix 1 of Advisory Circular AC 150/5340-30A "Design and Installation Details for Airport Visual Aids", issued April 11, 2005. The ACs stipulate that the series circuits be connected to "Constant Current Regulators" (CCRs). There are two classes of CCRs, one with a maximum rating of 6.6 amperes and the other with a rating of 20 amperes, maximum. Considering the limitation to 20 amperes, maximum there will be negligible heating caused by this separation.

Cutting slots in the underground enclosure to minimize the inductive effects is not practical because this would destroy the watertightness of the enclosure.

Although many airfield installations are not inspected by local inspectors, there are times where this occurs and these installations are cited for lack of compliance with this provision of the NEC. This proposal adds a second exception to the list at the end of the above NEC provision.

Note: Supporting material is available for review at NFPA Headquarters.

3-89 Log #2773 NEC-P03 **Final Action: Reject**
(300.21)

Submitter: Allen C. Weidman, The Society of the Plastics Industry, Inc.

Recommendation: Revise as follows:

300.21 Spread of Fire or Products of Combustion.

Electrical installations in hollow spaces, concealed spaces, vertical shafts, and ventilation or air-handling ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around electrical penetrations through fire-resistant–rated walls, partitions, floors, or ceilings shall be firestopped using approved methods to maintain the fire resistance rating.

FPN No.1 : Directories of electrical construction materials published by qualified testing laboratories contain many listing installation restrictions necessary to maintain the fire-resistive rating of assemblies where penetrations or openings are made. Building codes also contain restrictions on membrane penetrations on opposite sides of a fire-resistance–rated wall assembly. An example is the 600-mm (24-in.) minimum horizontal separation that usually applies between boxes installed on opposite sides of the wall. Assistance in complying with 300.21 can be found in building codes, fire resistance directories, and product listings.

FPN No.2: See 8.14.1 of NFPA 13-2002, Installation of Sprinkler Systems, for requirements for sprinklers in concealed spaces containing exposed combustibles.

Substantiation: The addition of "concealed spaces" helps the NEC correlate with other NFPA Standards and building codes. Most NFPA standards use the term "hollow" to describe the void in a metal door, concrete blocks, and masonry. Most other NFPA standards do not consider "concealed" to mean the space is inaccessible, as defined by the NEC [See definition of "Concealed" below.]

Article 100 Definition

"Concealed. Rendered inaccessible by the structure or finish of the building. Wires in concealed raceways are considered concealed, even though they may become accessible by withdrawing them."

If wiring installed in a building is concealed, the definition of "concealed" is descriptive. However, when the term "concealed" is used in the term "concealed space," as in 604.4, the space is accessible.

NFPA 70-2005

"604.4 Uses Permitted.

Manufactured wiring systems shall be permitted in accessible and dry locations and in ducts, plenums, and other air-handling spaces where listed for this application and installed in accordance with 300.22.

Exception No. 1: In concealed spaces, one end of tapped cable shall be permitted to extend into hollow walls for direct termination at switch and outlet points.

Exception No. 2: Manufactured wiring system assemblies installed outdoors shall be listed for use in outdoor locations."

The proposed fine print note will alert NEC users to review NFPA 13 should there be a concern about possible combustible loading in a concealed space. The proposed fine print note is identical to the one in 800.154(A).

There is a separate proposal to add the definition of "concealed space" to Article 100 Definitions, which reads as follows:

"Concealed Space. That portion(s) of a building behind walls, over suspended ceilings, in pipe chases, attics, and in whose size might normally range from 44.45mm (1 3/4 in.) stud spaces to 2.44 m (8ft) interstital truss spaces and that might contain combustible materials such as building structural members, thermal and/or electrical insulation, and ducting. [NFPA 96:3.3.42.1]"

Panel Meeting Action: Reject

Panel Statement: The definition for "concealed" in Article 100 in the 2005 NEC does not apply to the proposed text or to the proposed fine print note. There was no technical substantiation provided to add concealed spaces to 300.21. The reference to NFPA 13 does not seem appropriate in 300.21 at this time, since putting a sprinkler head in an inaccessible location inside the wall or above a drywall ceiling would not permit access for servicing. The area above a suspended ceiling is not considered by the NEC to be a concealed space.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 12 Negative: 1

Explanation of Negative:

EGESDAL, S.: The Panel Statement points out a conflict between the NEC and NFPA 13. The use of the term "concealed" in the NEC and NFPA 13 covers different sets of spaces. Also, the Panel Statement is in error, as NFPA 13 does require sprinklers in inaccessible spaces. See below:

The following is from NFPA 13-2002, Standard for the Installation of Sprinkler Systems.

8.14 Special Situations.

8.14.1 Concealed Spaces.

8.14.1.1 Concealed Spaces Requiring Sprinkler Protection. All concealed spaces enclosed wholly or partly by exposed combustible construction shall be protected by sprinklers except in concealed spaces where sprinklers are not required to be installed by 8.14.1.2.1 through 8.14.1.2.15.

8.14.1.2* Concealed Spaces Not Requiring Sprinkler Protection.

8.14.1.2.1 Noncombustible and limited combustible concealed spaces with no combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.

8.14.1.2.2 Noncombustible and limited combustible concealed spaces with limited access and not permitting occupancy or storage of combustibles shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.

8.14.1.2.3 Concealed spaces formed by studs or joists with less than 6 in. (152 mm) between the inside or near edges of the studs or joists shall not require sprinkler protection. (See Figure 8.6.4.1.5.1.)

8.14.1.2.4 Concealed spaces formed by bar joists with less than 6 in. (152 mm) between the roof or floor deck and ceiling shall not require sprinkler protection.

8.14.1.2.5 Concealed spaces formed by ceilings attached directly to or within 6 in. (152 mm) of wood joist construction shall not require sprinkler protection.

Additionally, Mr. Koffel in his substantiation on Proposal 3-91 points out that "hollow spaces" in other NFPA standards and building codes typically refers to the void in metal doors, concrete blocks, and masonry.

The users of the NEC would benefit if the term "concealed" space in buildings had a consistent meaning across all NFPA standards.

3-90 Log #2827 NEC-P03 **Final Action: Reject**
(300.21)

Submitter: John Kacpenski, Western Telecommunications Consutling (WTC)

Recommendation: Revise text to read as follows:

300.21 Spread of Fire or Products of Combustion.

Electrical installations in hollow spaces, vertical shafts, and ventilation or air-handling ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around electrical penetrations through fire-resistant-rated walls, partitions, floors, or ceilings shall be firestopped using approved methods to maintain the fire resistance rating.

FPN: Directories of electrical construction materials published by qualified testing laboratories contain many listing installation restrictions necessary to maintain the fire-resistive rating of assemblies where penetrations or openings are made. Building codes also contain restrictions on membrane penetrations on opposite sides of a fire-resistance-rated wall assembly. An example is the 600-mm (24-in.) minimum horizontal separation that usually applies between boxes installed on opposite sides of the wall. Assistance in complying with 300.21 can be found in building codes, fire resistance directories, and product listings.

(A) Fire Resistance Rating of Through-Penetration:

Through-Penetration Firestop assemblies shall meet all criteria set forth in ANSI/UL 1479 (ASTM E 814-02). The following ratings shall apply:

(1) "F" Rating - "F" rating criteria prohibits the passage through a firestop assembly.

(2) "T" Rating - "T" rating criteria restricts the maximum temperature rise on the unexposed surface of the wall or deck caused by the firestop assembly.

(3) "L" Rating - "L" rating determines the amount of air leakage through a firestop assembly.

(4) "F & T" Ratings - Also are required to achieve acceptable hose stream performance.

(B) Firestop Assemblies.

(1) Hourly Rating. The hourly rating given to a firestop assembly is for the complete assembly and not the individual components that make up the assemblies.

(2) Specifications listing the assembly for an application by a registered testing lab shall be provided to the AHJ along with proof of successful completion of training from the assembly manufacturer.

(C) Firestop Inspection. At a minimum the proposed firestop assembly contractor shall be prepared for all criteria referenced in ASTM E2174 and E2393.

(D) Long-Term Maintenance. Firestop assemblies shall be included on the facility passive fire protection maintenance schedule approved by the AHJ for the type of building.

Substantiation: The additional text will assist the AHJ in interpreting the code that is defined in the NEC Handbook. This additional information will also set parameters as to what is required of firestop installers, specifiers, and other responsible parties. This will also inform them of the potential criteria the AHJ will use to inspect firestop assembly installations.

Panel Meeting Action: Reject

Panel Statement: Enough information has been provided in the fine print note to 300.21 to permit the user of the NEC to access the information necessary for compliance with 300.21. Adding this recommended text does not clarify the

issue of fire resistance or fire penetration requirements. Without accessing the UL Fire Resistance Directories and studying the general and specific requirements for though-penetration fire stop systems, someone may actually misapply a fire stop application. This information is best left in its entirety in the UL Fire Resistance Directory.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-91 Log #3311 NEC-P03 **Final Action: Reject**
(300.21)

Submitter: William E. Koffel, Koffel Assoc., Inc. / Rep. Society of the Plastics Industry
Recommendation: 300.21 Spread of Fire or Products of Combustion.
Electrical installations in hollow spaces, concealed spaces, vertical shafts, and ventilation or air-handling ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around electrical penetrations through fire-resistant–rated walls, partitions, floors, or ceilings shall be firestopped using approved methods to maintain the fire resistance rating.
FPN No.1 : Directories of electrical construction materials published by qualified testing laboratories contain many listing installation restrictions necessary to maintain the fire-resistive rating of assemblies where penetrations or openings are made. Building codes also contain restrictions on membrane penetrations on opposite sides of a fire-resistance–rated wall assembly. An example is the 600-mm (24-in.) minimum horizontal separation that usually applies between boxes installed on opposite sides of the wall. Assistance in complying with 300.21 can be found in building codes, fire resistance directories, and product listings.
FPN No.2: See 8.14.1 of NFPA 13, Installation of Sprinkler Systems, for requirements for sprinklers in concealed spaces containing exposed combustibles.
Substantiation: The addition of “concealed spaces” helps the NEC correlate with other NFPA Standards and building codes. Most NFPA standards use the term “hollow” to describe the void in a metal door, concrete blocks, and masonry. Most other NFPA standards do not consider “concealed” to mean the space is inaccessible, as defined by the NEC [See definition of “Concealed” below.]
Article 100 Definition
“Concealed. Rendered inaccessible by the structure or finish of the building. Wires in concealed raceways are considered concealed, even though they may become accessible by withdrawing them.”
If wiring installed in a building is concealed, the definition of “concealed” is descriptive. However, when the term “concealed” is used in the term “concealed space,” as in 604.4, the space is accessible.
NFPA 70-2005
“604.4 Uses Permitted. Manufactured wiring systems shall be permitted in accessible and dry locations and in ducts, plenums, and other air-handling spaces where listed for this application and installed in accordance with 300.22.
Exception No. 1: In concealed spaces, one end of tapped cable shall be permitted to extend into hollow walls for direct termination at switch and outlet points.
Exception No. 2: Manufactured wiring system assemblies installed outdoors shall be listed for use in outdoor locations.”
The proposed fine print note will alert NEC users to review NFPA 13 should there be a concern about possible combustible loading in a concealed space. The proposed fine print note is identical to the one in 800.154(A). It should be noted that the section number may need to be changed once the 2006 Edition of NFPA 13 is published.
There is a separate proposal to add the definition of “concealed space” to Article 100 Definitions, which reads as follows:
“ **Concealed Space.** That portion(s) of a building behind walls, over suspended ceilings, in pipe chases, attics, and in whose size might normally range from 44.45 mm (1 3/4 in.) stud spaces to 2.44 m (8 ft) interstitial truss spaces and that might contain combustible materials such as building structural members, thermal and/or electrical insulation, and ducting. [NFPA 96:3.3.42.1]”

Explanation of Negative:
EGESDAL, S.: See my Explanation of Negative for Proposal 3-89.

3-92 Log #1916 NEC-P03 **Final Action: Reject**
(300.22)

Submitter: William Wagner, Certification Solutions
Recommendation: Revise 300.22 as follows:
300.22 Wiring in Ducts, Plenums, and Other Air-Handling Spaces. The provisions of this section apply to the installation and uses of electric wiring and equipment in ducts, plenums, and other air-handling spaces.
FPN: See Article 424, Part VI, for duct heaters.
(A) Ducts for Dust, Loose Stock, or Vapor Removal. No wiring systems of any type shall be installed in ducts used to transport dust, loose stock, or flammable vapors. No wiring system of any type shall be installed in any duct, or shaft, containing only such ducts, used for vapor removal or for ventilation of commercial-type coking equipment.
(B) Ducts or Plenums Used for Environmental Air. Only wiring methods consisting of Type MI cable, Type MC cable employing a smooth or corrugated impervious metal sheath without an overall nonmetallic covering, electrical metallic tubing, flexible metallic tubing, intermediate metal conduit, ~~or~~ rigid metal conduit without an overall nonmetallic covering , or Type RTRC rigid nonmetallic conduit listed as having adequate fire-resistant and low smoke-producing characteristics, shall be installed in ducts or plenums specifically fabricated to transport environmental air. Flexible metal conduit shall be permitted, in lengths not to exceed 1.2 m (4 ft), to connect physically adjustable equipment and devices permitted to be in these ducts and plenums chambers. The connectors used with flexible metal conduit shall effectively close any openings in the connection. Equipment and device shall be permitted within such ducts or plenum chambers only if necessary for their direct action upon, or sensing of the contained air. Where equipment or devices are installed and illumination is necessary to facilitate maintenance and repair, enclosed gasketed-type luminaires (fixtures) shall be permitted.
FPN: One method of defining that a Type RTRC rigid nonmetallic conduit is a fire-resistant and low smoke-producing raceway is that it exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with the plenum test in UL 2024, Standard for Optical Fiber Cable Raceway.
(C) Other Space Used for Environmental Air. This section applies to space used for environmental air-handing purposes other than ducts and plenums as specified in 300.22(A) and (B). It does not include habitable rooms or areas of buildings, the prime purpose of which is not air handling.
FPN: The space over a hung ceiling used for environmental air-handling purposes is an example of the type of other space to which this section applies.
Exception: This section shall not apply to the joist or stud spaces of dwelling units where the wiring passes through such spaces perpendicular to the long dimension of such spaces.
(1) Wiring Methods. The wiring methods for such other space shall be limited to totally enclosed, nonventilated, insulated busway having no provisions for plug-in connections, Type MI cable, Type MC cable without an overall nonmetallic covering, Type AC cable, or other factory-assembled multiconductor control or power cable that is specifically listed for the use, or listed prefabricated cable assemblies of metallic manufactured wring systems without nonmetallic sheath. Other Types of cables and conductors shall be installed in electrical metallic tubing, flexible metallic tubing, intermediate metal conduit, rigid metal conduit without an overall nonmetallic covering, Type RTRC rigid nonmetallic conduit listed as having adequate fire-resistant and low smoke-producing characteristics , flexible metal conduit, or, where accessible, surface metal raceway or metal wireway with metal covers or solid bottom metal cable tray with solid metal covers.
FPN: One method of defining that a Type RTRC rigid nonmetallic conduit is a fire-resistant and low smoke-producing raceway is that it exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with the plenum test in UL 2024, Standard for Optical Fiber Cable Raceway.
(2) Equipment. Electrical equipment with a metal enclosure, or with a nonmetallic enclosure listed for the use and having adequate fire-resistant and low-smoke-producing characteristics, and associated wiring material suitable for the ambient temperature shall be permitted to be installed in such other space unless prohibited elsewhere in this Code.
Exception: Integral fan systems shall be permitted where specifically identified for such use.
(D) Information Technology Equipment. Electric wiring in air-handling areas beneath raised floors for information technology equipment shall be permitted in accordance with Article 645.
Substantiation: Manufacturers have developed Type RTRC rigid nonmetallic conduit products that they believe are suitable for use as wiring methods in plenum and riser applications. However, in order to have these products evaluated accordingly, certification agencies require that there be at least one potential application for their use in accordance with the National Electrical Code. This proposal would permit these products to be employed in these applications providing that they have been specifically evaluated and listed for such use. Additionally, the Fine Print Notes provide a suggested methodology for evaluating the fire and smoke producing aspects of these products, which is based upon other nonmetallic raceways that have perviously been listed for use in these environments.
Panel Meeting Action: Reject
Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:
“[S]o as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to

plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."
This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-93 Log #3101 NEC-P03 **Final Action: Reject**
(300.22)

Submitter: Donald Hall, Corning Cable Systems
Recommendation: This proposal may be considered as an alternate to my proposal to revise 392.4 or it may be considered in addition to acceptance of my proposal to revise 392.4.
Add new text under 300.22(C):
<u>(3) Cable Trays. Metallic cable tray systems with or without solid bottoms and solid metal covers may be used within other air-handling spaces to support wiring methods permitted in 300.22(C)(1) and other raceways or cables permitted for such use elsewhere in this Code.</u>
Substantiation: 392.4 references 300.22 as the only permitted uses of trays within other air-handling spaces. If 300.22 is to exist as the sole source of information regarding pemitted use of trays as support structures in other air-handling spaces, then it is inadequate in its treatment of the subject.
The existing languate of 300.22 and the reference of 392.4 is confusing some users of the Code. Some users are concluding that metallic tray systems can only be used in ducts, plenum, and other air handling spaces if they have solid bottoms and solid metal covers. This is not the intent of 392.4 or 300.22. The commentary to 392.4 in the NEC handbook correctly identifies the intent of 300.22 by stating,
"Section 300.22 specifically limits the types for wiring methods that may be used within other spaces used for environmental air. Metallic cable trays may be used within these spaces to support only the recognized wiring methods permitted in these spaces. The cable tray types may be ladder, ventilated trough, ventilated channel, or solid bottom. Metal cable trays are not the limiting factor; rather the cable or wiring method is the limiting factor."
300.22(C)(1) refers to <u>wiring methods</u>. It allows "other types of cables and conductors", meaning those which 300.22 does not specifically mention by name, to be placed in various types of raceway, in metal wireway with metal covers, or in metallic trays having solid bottoms and solid metal covers. It does not require metal trays to have solid bottoms or solid metal covers unless the trays contain "other types of cables or conductors" which are not expressly permitted for use in that space by 300.22. Furthermore, although "other cables and conductors" is inclusive of the various types of low voltage cable described in Articles 725, 760, 800, 820, and 830, these articles all contain sufficiently clear language explaining that plenum rated cables may be installed within other air-handling spaces without compliance to 300.22. Therefore, if a metal tray used in "other air-handling spaces" is used to support only wiring methods permitted in that space, there is no requirement or reason for them to have solid bottoms or solid metal covers.
Other proposals may be submitted which would propose to address this issue by adding text to Articles 725, 760, 800, 820, and 830 explicitly permitting the use of metal trays without solid bottom and solid metal covers. Since these other articles are not the source of the confusion and since these trays are already permitted to be used, it is more desirable to change 300.22 and/or 392.4 which are the source of confusion.
Panel Meeting Action: Reject
Panel Statement: The Panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:
"[S]o as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

3-95 Log #2610 NEC-P03 **Final Action: Reject**
(300.22(C)(1))

Submitter: David H. Kendall, Carlon
Recommendation: Revise as follows:
300.22(C) Other Spaces Used for Environmental Air.
(1) Wiring Methods. The wiring methods for such other space shall be limited to totally enclosed, nonventilated, insulated busway having no provisions for plug-in connections, Type MI cable, Type MC cable without an overall nonmetallic covering, Type AC cable, or other factory-assembled multiconductor control or power cable that is specifically listed for the use, or listed prefabricated cable assemblies of metallic manufactured wiring systems without nonmetallic sheath. Other types of cables <u>,</u> ~~and~~ conductors <u>and raceways</u> shall be <u>permitted to be</u> installed in electrical metallic tubing, flexible metallic tubing, intermediate metal conduit, rigid metal conduit without an overall nonmetallic covering, flexible metal conduit, or where accessible, surface metal raceway or metal wireway with metal covers or solid bottom metal cable tray with solid metal covers.
Substantiation: Raceways such as ENT, Article 352, and Optical Fiber/ Communications raceways found in Articles 725, 770, 800 and 820 are pulled into metal conduits in areas for environmental air. This common practice allows cable to be removed and replaced without interrupting other services.
Panel Meeting Action: Reject
Panel Statement: The Panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

300.22 Wiring in Ducts, Plenums, and Other Air-Handling Spaces.
The provisions of this section apply to the installation and uses of electric wiring and equipment in ducts, plenums, and other air-handling spaces.
FPN: See Article 424, Part VI, for duct heaters.
(C) Other Space Used for Environmental Air. This section applies to space used for environmental air-handling purposes other than ducts and plenums as specified in 300.22(A) and (B). It does not include habitable rooms or areas of buildings, the prime purpose of which is not air handling.
FPN: The space over a hung ceiling used for environmental air-handling purposes is an example of the type of other space to which this section applies.
Exception: This section shall not apply to the joist or stud spaces of dwelling units where the wiring passes through such spaces perpendicular to the long dimension of such spaces.
(1) Wiring Methods. The wiring methods for such other space shall be limited to <u>the following:</u>

(a) Totally enclosed, nonventilated, insulated busway having no provisions for plug-in connections
(b) Type MI cable
(c) Type MC cable without an overall nonmetallic covering
(d) Type AC cable
(e) Factory-assembled multiconductor control or power cable that is specifically listed for the use
(f) Listed prefabricated cable assemblies of metallic manufactured wiring systems without nonmetallic sheath
(g) Cables and conductors installed in electrical metallic tubing, flexible metallic tubing, intermediate metal conduit, rigid metal conduit without an overall nonmetallic covering, flexible metal conduit, or, where accessible, surface metal raceway or metal wireway with metal covers or solid bottom metal cable tray with solid metal covers
(h) Cables listed as low smoke-producing cable and fire-resistant cable, because the cable exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with NFPA 262-2002, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces.
FPN: This covers the following types of cables: CL2P, CL3P, NPLFP, FPLP, OFNP, OFCP, CMP, CATVP, BLP.
~~totally enclosed, nonventilated, insulated busway having no provisions for plug-in connections, Type MI cable, Type MC cable without an overall nonmetallic covering, Type AC cable, or other factory-assembled multiconductor control or power cable that is specifically listed for the use, or listed prefabricated cable assemblies of metallic manufactured wiring systems without nonmetallic sheath. Other types of cables and conductors shall be installed in electrical metallic tubing, flexible metallic tubing, intermediate metal conduit, rigid metal conduit without an overall nonmetallic covering, flexible metal conduit, or, where accessible, surface metal raceway or metal wireway with metal covers or solid bottom metal cable tray with solid metal covers~~ .

(2) Equipment. Electrical equipment with a metal enclosure, or with a nonmetallic enclosure listed for the use and having adequate fire-resistant and low-smoke-producing characteristics, and associated wiring material suitable for the ambient temperature shall be permitted to be installed in such other space unless prohibited elsewhere in this Code.

Exception: Integral fan systems shall be permitted where specifically identified for such use.

(D) Information Technology Equipment. Electric wiring in air-handling areas beneath raised floors for information technology equipment shall be permitted in accordance with Article 645.

Substantiation: This proposal does not alter any of the requirements presently found in the NEC for wiring methods. However, this proposal does help the NEC user by explicitly placing all the appropriate wiring methods into article 300.22, instead of having them appear spread out throughout the code, in articles 725, 760, 770, 800, 820 and 830, where they appear somewhat haphazardly. This refers to the wiring methods in (h) which are now permitted by the following sections of the NEC, in articles 725, 760, 770, 800, 820 and 830. The wording in each section is different but the end result is that cables "listed as being suitable for use in ducts, plenums, and other space used for environmental air" and also "listed as having adequate fire resistant and low smoke producing characteristics" by exhibiting "a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with NFPA 262" are permitted for use as wiring methods in "other spaces used for environmental air". The present NEC wording follows:

725.3 Other Articles.
Circuits and equipment shall comply with the articles or sections listed in 725.3(A) through 725.3(G). Only those sections of Article 300 referenced in this article shall apply to Class 1, Class 2, and Class 3 circuits.
(A) Number and Size of Conductors in Raceway. Section 300.17.
(B) Spread of Fire or Products of Combustion. Section 300.21. The accessible portion of abandoned Class 2, Class 3, and PLTC cables shall be removed.
(C) Ducts, Plenums, and Other Air-Handling Spaces. Class 1, Class 2, and Class 3 circuits installed in ducts, plenums, or other space used for environmental air shall comply with 300.22. Type CL2P or CL3P cables and plenum signaling raceways shall be permitted for Class 2 and Class 3 circuits installed in other spaces used for environmental air.
760.3 Other Articles.
Circuits and equipment shall comply with 760.3(A) through 760.3(F). Only those sections of Article 300 referenced in this article shall apply to fire alarm systems.
(A) Spread of Fire or Products of Combustion. Section 300.21. The accessible portion of abandoned fire alarm cables shall be removed.
(B) Ducts, Plenums, and Other Air-Handling Spaces. Section 300.22, where installed in ducts or plenums or other spaces used for environmental air.
Exception: As permitted in 760.30(B)(1) and (B)(2) and 760.61(A).
760.30 Multiconductor NPLFA Cables.
Multiconductor non–power-limited fire alarm cables that meet the requirements of 760.81 shall be permitted to be used on fire alarm circuits operating at 150 volts or less and shall be installed in accordance with 760.30(A) and 760.30(B).
(B) Applications of Listed NPLFA Cables. The use of non–power-limited fire alarm circuit cables shall comply with 760.30(B)(1) through (B)(4).
(1) Ducts and Plenums. Multiconductor non–power-limited fire alarm circuit cables, Types NPLFP, NPLFR, and NPLF, shall not be installed exposed in ducts or plenums.
FPN: See 300.22(B).
(2) Other Spaces Used for Environmental Air. Cables installed in other spaces used for environmental air shall be Type NPLFP.
Exception No. 1: Types NPLFR and NPLF cables installed in compliance with 300.22(C).
Exception No. 2: Other wiring methods in accordance with 300.22(C) and conductors in compliance with 760.27(C).
Exception No. 3: Type NPLFP-CI cable shall be permitted to be installed to provide a 2-hour circuit integrity rated cable.
760.61 Applications of Listed PLFA Cables.
PLFA cables shall comply with the requirements described in either 760.61(A), (B), or (C) or where cable substitutions are made as shown in 760.61(D).
(A) Plenum. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type FPLP. Types FPLP, FPLR, and FPL cables installed in compliance with 300.22 shall be permitted. Type FPLP-CI cable shall be permitted to be installed to provide a 2-hour circuit integrity rated cable.
770.3 Other Articles.
Circuits and equipment shall comply with 770.3(A) and 770.3(B). Only those sections of Article 300 referenced in this article shall apply to optical fiber cables and raceways.
(A) Spread of Fire or Products of Combustion. The requirements of 300.21 for electrical installations shall also apply to installations of optical fiber cables and raceways. The accessible portion of abandoned optical fiber cables shall be removed.
(B) Ducts, Plenums, and Other Air-Handling Spaces. The requirements of 300.22 for electric wiring shall also apply to installations of optical fiber cables and raceways where they are installed in ducts or plenums or other space used for environmental air.
Exception: As permitted in 770.154(A).
770.154 Applications of Listed Optical Fiber Cables and Raceways.
Nonconductive and conductive optical fiber cables shall comply with any of the requirements given in 770.154(A) through 770.154(E) or where cable substitutions are made as shown in 770.154(F).
(A) Plenums. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type OFNP or OFCP. Abandoned cables shall not be permitted to remain. Types OFNR, OFCR, OFNG, OFN, OFCG, and OFC cables installed in compliance with 300.22 shall be permitted. Listed plenum optical fiber raceways shall be permitted to be installed in ducts and plenums as described in 300.22(B) and in other spaces used for environmental air as described in 300.22(C). Only type OFNP and OFCP cables shall be permitted to be installed in these raceways.
FPN: See 8.14.1 of NFPA 13 (2002), Installation of Sprinkler Systems, for requirements for sprinklers in concealed spaces containing exposed combustibles.
800.3 Other Articles.
(A) Hybrid Power and Communications Cables. The provisions of 780.6 shall apply for listed hybrid power and communications cables in closed-loop and programmed power distribution.
FPN: See 800.179(J) for hybrid power and communications cable in other applications.
(B) Hazardous (Classified) Locations. Communications circuits and equipment installed in a location that is classified in accordance with Article 500 shall comply with the applicable requirements of Chapter 5.
(C) Spread of Fire or Products of Combustion. Section 300.21 shall apply. The accessible portion of abandoned communications cables shall not be permitted to remain.
(D) Equipment in Other Space Used for Environmental Air. Section 300.22(C) shall apply.
800.154 Applications of Listed Communications Wires and Cables and Communications Raceways.
Communications wires and cables shall comply with the requirements of 800.154(A) through 800.154(F) or where cable substitutions are made in accordance with 800.154(G)
(A) Plenum. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type CMP. Abandoned cables shall not be permitted to remain. Types CMP, CMR, CMG, CM, and CMX and communications wire installed in compliance with 300.22 shall be permitted. Listed plenum communications raceways shall be permitted to be installed in ducts and plenums as described in 300.22(B) and in other spaces used for environmental air as described in 300.22(C). Only Type CMP cable shall be permitted to be installed in raceways.
820.3 Other Articles.
Circuits and equipment shall comply with 820.3(A) through 820.3(G).
(A) Spread of Fire or Products of Combustion. Section 300.21 shall apply. The accessible portion of abandoned coaxial cables shall be removed.
(B) Ducts, Plenums, and Other Air-Handling Spaces. Section 300.22, where installed in ducts, plenums, or other spaces used for environmental air, shall apply.
Exception: As permitted in 820.154(A).

820.154 Applications of Listed CATV Cables and CATV Raceways.
CATV cables shall comply with the requirements of 820.154(A) through 820.154(D) or where cable substitutions are made as shown in Table 820.154.
(A) Plenums. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type CATVP. Abandoned cables shall not be permitted to remain. Types CATVP, CATVR, CATV, and CATVX cables installed in compliance with 300.22 shall be permitted. Listed plenum CATV raceways shall be permitted to be installed in ducts and plenums as described in 300.22(B) and in other spaces used for environmental air as described in 300.22(C). Only Type CATVP cable shall be permitted to be installed in these raceways.
FPN: See 8.14.1 of NFPA 13-2002, Installation of Sprinkler Systems, for requirements for sprinklers in concealed spaces containing exposed combustibles.
830.3 Other Articles.
Circuits and equipment shall comply with 830.3(A) through 830.3(E).
(A) Spread of Fire or Products of Combustion. Section 300.21 shall apply. The accessible portion of abandoned network-powered broadband communications cables shall be removed.
(B) Ducts, Plenums, and Other Air-Handling Spaces. Section 300.22 shall apply where installed in ducts, plenums, or other spaces used for environmental air.
Exception: As permitted in 830.154(B).
830.154 Low-Power Network-Powered Broadband Communications System Wiring Methods.
Low-power network-powered broadband communications systems shall comply with any of the requirements of 830.154(A) through 830.154(D).
(A) In Buildings. Low-power network-powered broadband communications systems shall be installed within buildings using listed Type BLX, Type BL, Type BLR, or Type BLP network-powered broadband communications low-power cables.
(B) Ducts, Plenums, and Other Air-Handling Spaces. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type BLP. Type BLX cable installed in compliance with 300.22 shall be permitted.

In fact, this is also consistent with a proposal to make a change to 90.3 so that chapter 8 is no longer independent of Chapters 1 through 7, which is no longer reasonable, in view of the similarity between wiring for communications systems and for other systems, since there are communications systems that are not always low voltage wiring.

This proposal does not change any requirements; it simply makes the code more user friendly.

Panel Meeting Action: Reject
Panel Statement: The Panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:
"[S]o as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."
This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal."
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-97 Log #480 NEC-P03 **Final Action: Reject**
(300.22(C)(2))

Submitter: Jeffrey A. Fecteau, City of Peoria, Arizona
Recommendation: Revise text to read:
(2) Equipment. Electrical equipment with a metal enclosure <u>without any openings, or where listed equipment is specifically identified for such use,</u> or with a nonmetallic enclosure listed for the use and having adequate fire-resistant and low smoke producing characteristics, and associated wiring material suitable for the ambient temperature shall be permitted to be installed in such other space unless prohibited elsewhere in this Code.
Substantiation: This will clarify that electrical equipment that has ventilation openings such as motors, transformers, dimmer banks, sign power supplies, etc. that have plastics and other components that may produce smoke and toxic vapors that could escape through the openings and contaminate this space used for environmental air shall not be installed in this space unless listed for such installation.

See the Exception to 300.22(C)(2) that will only allow an integral fan "where specifically identified for such use."

This will also mirror the requirements in 300.22(C)(1) "...for totally enclosed, nonventilated, insulated busway..., surface metal raceway or metal wireway with metal covers or solid bottom metal cable tray with solid metal covers."

Note: Supporting material is available for review at NFPA headquarters.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 12 Negative: 1

Explanation of Negative:

GUIDA, T.: This proposal should have been accepted. With reference to the Panel Statement, this proposal is not about a plenum cable issue and does not change the "status quo" with regard to cables or equipment. The proposed FPN directs the user of the Code to an appropriate test standard for "equipment with a nonmetallic enclosure listed for use and having adequate fire-resistant and low-smoke producing characteristics" [300.22(C)(2)].

3-100 Log #805 NEC-P03 **Final Action: Reject**
(300.24)

Submitter: Joe Tedesco, Boston, MA

Recommendation: 300.24 Access to Electrical Equipment Behind Panels Designed to Allow Access. Access to electrical equipment shall not be denied by an accumulation of low energy wires and cables that prevents removal of panels, including suspended ceiling panels.

Substantiation: Added words: "low energy" to existing text already found in Chapters 6, 7, and 8. This is an important rule and will be easier to find in Article 300.

Panel Meeting Action: Reject

Panel Statement: As stated in the submitter's substantiation, similar text is already located in various articles in Chapters 6, 7, and 8. Inserting this text into a new section within Article 300 would then necessitate inserting this additional reference section number into other Articles, such as 725 and 760. For example, Section 725.3 states that only those sections of Article 300 referenced in article 725 shall apply to Class 1, Class 2, or Class 3 circuits. Section 725.7 already provides this same information on access to equipment behind these panels for Article 725. Other articles have similar provisions.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 12 Negative: 1

Explanation of Negative:

CASPARRO, P.: I disagree with the panel statement that this doesn't belong in Article 300. We continue to support keeping wires and cables of any energy level off of ceiling tiles.

3-101 Log #271 NEC-P03 **Final Action: Reject**
(300.31)

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education

Recommendation: Revise as follows:

Covers Required. Suitable covers shall be installed on all boxes, fittings, and similar enclosures to prevent accidental contact with energized parts or ~~physical~~ damage to parts or insulation.

Substantiation: Use of the word "physical" is superfluous. In some instances, one could argue for the use of "mechanical" to differentiate that from e.g., "thermal" damage, but context makes the intended sense quite clear, rendering anything like this completely unnecessary.

Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.

Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 3-177.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-102 Log #3342 NEC-P03 **Final Action: Reject**
(300.37)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc. / Rep. Massachusetts Electrical Code Advisory Committee

Recommendation: Insert the following sentence following the first sentence:

Where rigid nonmetallic conduit is used, it shall be Schedule 80 or it shall be suitably encased in not less than 50 mm (2 in.) of concrete.

Substantiation: If rigid nonmetallic conduit is used for above grade use above 600V, the Code should require a small safety margin beyond what it requires for similar use for 600V and below. This proposal allows rigid nonmetallic conduit for this purpose, but asks for Schedule 80 (or concrete encasement otherwise) when so employed.

Medium voltage applications warrant an increased level of protection as compared with circuits running at 600V and below. Remember, this part of the section applies to installations that are accessible to the general public. Only the last sentence of the section carries with it restrictions on public accessibility. Generally speaking, an increased magnitude of potential hazard warrants enhanced protection methods to mitigate the hazard.

Panel Meeting Action: Reject

Panel Statement: Where the rigid nonmetallic conduit is not exposed to physical damage, there is no technical reason for requiring this raceway to be Schedule 80 PVC. There are many different installations where Schedule 40 PVC is an acceptable wiring method. There are other wiring methods in Section 300.37, where installed in a location subject to physical damage, would also be a concern but are as acceptable as Schedule 40 PVC in a location not subject to physical damage.

Number Eligible to Vote: 13

3-104 Log #3343 NEC-P03 **Final Action: Accept in Principle**
(Table 300.50)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc. / Rep. Massachusetts Electrical Code Advisory Committee

Recommendation: In Table 300.50, add a superscript "4" to the first and second column titles, and a fourth footnote as follows:

4 Depth reduction of 150 mm (6 in.) permitted for each 50 mm (2 in.) of concrete or equivalent protection placed in the trench over the underground installation.

Substantiation: The 2005 NEC deleted the long-standing permission to use a 2-in. thick concrete cover for each 6 in. of depth reduction from Table 300.50 initial burial depths for direct-burial cables and for rigid nonmetallic conduit. The panel substantiated its action by pointing to the discrepancy between this allowance and the fact that Table 300.5 only allows a single 2-in. reduction. Burial depths for medium voltage applications are greater for these wiring methods than for utilization voltages, so it makes common sense that with more robust physical protection the burial depth might be further decreased. Further, the NEC now contains a greater discrepancy because medium voltage wiring has no in-the-trench concrete allowance, whereas Table 300.5 will allow a 6-in. cover reduction within its scope.

It is inappropriate to use text no longer necessary for 600V or less wiring methods as a reason for removing similar language from over 600 volt wiring methods, when the only effect is to make them (Tables 300.5 and 300.50) look similar. This allowance has been relied on by Code users for decades, and should remain available. CMP 3 should review the elaborate negative comment in the voting on this issue during the ROC stage in the 2005 NEC.

Panel Meeting Action: Accept in Principle

Panel Statement: During Panel discussions in the last Code cycle, there was a consensus that reducing the burial depth by 6 inches for each 2 inches of concrete poured in a trench for all wiring methods, except rigid metal conduit and intermediate metal conduit for over 600 volt installations was a possible hazard for anyone with a pick and shovel. For many years, it was permissible to reduce the depth 6 inches for each two inches of concrete for any voltage system over 600 volts but one could only reduce the depth of the raceway or direct burial cable by one 6 inch depth for two inches or more of concrete for cables 600 volts and under. In the 2002 and previous Codes, if a trench was dug just wide enough for a 22kV cable and 6 inches of concrete was poured on top, the 22 kV cable only had to be 12 inches deep. The concrete did not have to encase the cable so anyone digging a hole for a tree, for example, could very easily drive a pick from the side of the hole into the 22 kV cable. This is directly buried and unprotected cable at 22 kV.

By permitting this depth reduction only under controlled locations in industrial facilities with trained personnel who should first provide an underground locator for locating high voltage lines, the general public should be assured of greater safety. The industrial facilities can still use this depth reduction where obstacles or permafrost to do not permit greater depths. See the Panel Action and Statement in 3-105 which seems to satisfy the submitter's intent.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-105 Log #3038 NEC-P03 **Final Action: Accept in Principle**
(300.50 Note 3 (New))

Submitter: Melvin K. Sanders, TECo Inc.

Recommendation: Add text to read as follows:

Note 3. In industrial establishments, where conditions of maintenance and supervision ensure that written procedures have been adopted and qualified persons who are authorized will service the installation, the minimum cover requirements for other than rigid metal conduit and intermediate metal conduit shall be permitted to be reduced 6-inches (150 mm) for each 2-inches (50 mm) of concrete or equivalent placed entirely within the trench over the underground installation.

Substantiation: During the re-write of Table 300.50 for the 2005 cycle for the ROP and ROC stages, Table 300.50 Exception No. 2 of the 2002 Edition of the NEC was deleted during the Comment stage, based upon comments that lack of restrictions would expose general construction unqualified personnel to electrical shock or electrocution hazards during "dig-ins." No technical documentation was provided to substantiate the supposed degree of hazard. Due to time constraints, the research necessary to track the text in question was not possible, and in order to err on the side of caution, the wording was stricken even though it was acknowledged at that time there had been no proposals made this had been experienced as a problem.

The proposed Note 3 is adapted from 2002 NEC Table 300.50 Exception No. 2 and revised to address the concerns expressed at the ROC stage of the 2005 cycle. The dreaded phase " In industrial establishments, where conditions of maintenance and supervision ensure that written procedures have been adopted and qualified persons who are authorized will service the installation, …" was added to preclude its use in general locations and to stipulate that those knowledgeable in the hazards associated with voltages over 600 volts would be assigned.

The added text "… entirely …" will emphasize earlier CMP statements that it was expected the previous wording gave the directive the concrete pad would end up below finished grade and there would be back-fill material between the top of the concrete pad and the final grade for a trenched-in installation. Since there still seems to be some confusion on this point, the word "entirely" was added to clarify this issue.

The SI units were modified to follow the directive from the TCC from the 2002 cycle, to indicate they are not measured dimensions.

This proposed Note 3 is necessary within industrial plants because it is impossible to go under some piping that may be several layers deep with the uppermost layer not permitting the 2005 minimum burial depth from the surface and the lowermost layer several tens of feet deep. Also, since the NEC is supposed to be National in coverage, another problem with the 2005 edition wording, it would not permit installations subject to permafrost as found in the north slope oil fields of Alaska.

Panel Meeting Action: Accept in Principle

In the recommended text, delete the phrase "written procedures have been adopted and", and the phrase "who are authorized" in the sentence. Move the metrication from within the parenthesis to outside and replace with the inch measurement to read as follows:

Table 300.50 Note 3. In industrial establishments, where conditions of maintenance and supervision ensure that qualified persons will service the installation, the minimum cover requirements, for other than rigid metal conduit and intermediate metal conduit, shall be permitted to be reduced 150 mm (6 inches) for each 50 mm (2 inches) of concrete or equivalent placed entirely within the trench over the underground installation.

Panel Statement: The two phrases dealing with written procedures and authorization were removed since these two issues would be almost impossible to enforce. The metrication was fixed to be consistent with 90.9(B).

The panel clarifies that the added note is an addition to the general notes, not the footnotes shown in superscript. The Panel would encourage NFPA Staff to use letters for footnotes instead of numbers to distinguish the difference between "notes" and "footnote."

Number Eligible to Vote: 13

Ballot Results: Affirmative: 12 Negative: 1

Explanation of Negative:

CASPARRO, P.: In the last sentence of the panel action, this part should be deleted - "or Equivalent placed entirely within the trench over the underground installation." What is equivalent to concrete?

3-106 Log #1917 NEC-P03 **Final Action: Reject**
(300.50(B))

Submitter: William Wagner, Certification Solutions

Recommendation: Revise the second sentence of 300.50(B) as follows:

300.50(B) Protection from Damage. Raceways installed on poles shall be of rigid metal conduit, intermediate metal conduit, ~~PVC~~ Schedule 80 rigid PVC conduit , or equivalent, extending from the minimum cover depth specified in Table 300.50 to a point 2.5 m (8 ft) above finished grade.

Substantiation: This is a companion proposal for the definition of Rigid Nonmetallic Conduit in Article 100 and the revised Article 352 for type PVC Conduit and results in the use of consistent terminology for this product throughout the Code.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 3-52.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-107 Log #263 NEC-P03 **Final Action: Reject**
(300.50(D))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education

Recommendation: Revise as follows:

"Protection in the form of granular or selected material or suitable sleeves shall be provided to prevent ~~physical~~ damage to the raceway or cable."

Substantiation: Use of the word "physical" is superfluous. In some instances, one could argue for the use of "mechanical" to differentiate that from e.g., "thermal" damage, but context makes the intended sense quite clear, rendering anything like this completely unnecessary.

Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.

Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 3-177.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-108 Log #679 NEC-P03 **Final Action: Accept in Principle**
(300.50(F) (New))

Submitter: Jamie McNamara, Hastings, MN

Recommendation: Revise as follows:

300.50 Underground Installations.

New (F) I underlined added text.

(F) Underground Conductors. Underground conductors that are not encased in concrete or in metal conduit and that are buried 450 mm (18 in.) or more below grade shall have their location identified by a warning ribbon that is placed in the trench at least 300 mm (12 in.) above the underground installation.

Substantiation: To require conductor over 600 volts to have an identification ribbon would enhance safety to people. When excavating conductors can be damaged exposing the excavator to an electrocution hazard. This warning ribbon will help identify the hazard before the damage is done.

Panel Meeting Action: Accept in Principle

Add a superscript 4 to the first column after "Direct-Buried Cables" in Table 300.50 and a fourth superscript footnote below the table to read as follows:

4 Underground direct-buried cables that are not encased or protected by concrete and are buried 750 mm (30 inches) or more below grade shall have their location identified by a warning ribbon that is placed in the trench at least 300 mm (12 inches) above the cables.

Panel Statement: Direct-buried cables at over 600 volts are the most likely to be damaged where excavation is being done to existing installations and where people are most subject to injury, not those high voltage cables in rigid nonmetallic conduit or raceways installed under concrete slabs at least 4 inches thick. Placing a warning ribbon over direct buried cables does make sense but the proposed text was too restrictive.

Refer to the panel statement on Proposal 3-105 regarding the recommendation to NFPA Staff on the numbering of notes versus footnotes.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

ARTICLE 310 — CONDUCTORS FOR GENERAL WIRING

6-4 Log #1535 NEC-P06 **Final Action: Accept in Part**
(310, 400, and 402)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to the Technical Correlating Committee Task Group on Grounding & Bonding for Comment.
Submitter: Technical Correlating Committee on National Electrical Code,
Recommendation: Revise Articles 310, 400, and 402 as described in the following, relative to the terms bonding and grounding.
310.6 Revise 310.6 as follows:
Solid dielectric insulated conductors operated above 2000 volts in permanent installations shall have ozone-resistant insulation and shall be shielded. All metallic insulation shields shall be connected to an equipment grounding conductor ~~be grounded~~ t ~~hrough an effective grounding path meeting the requirements of 250.4(A)(5) or 250.4(B)(4)~~ . Shielding shall be for the purpose of confining the voltage stresses to the insulation.
310.7 Exception Revise 310.7 Exception as follows:
The metallic shield, sheath, or armor shall be connected to an equipment grounding conducto r ~~grounded through an effective grounding path meeting the requirements of 250.4(A)(5) or (B)(4)~~ .
400.4, Table 400.4, Note 6, Revise Note 6 to Table 400.4 as follows:
6. The third conductor in these cables shall be used ~~for~~ as an equipment grounding ~~purpose~~ conductor only. The insulation of the equipment grounding conductor for Types SPE-1, SPE-2, SPE-3, SPT-1, SPT-2, SPT-3, NISPT-1, NISPT-2, NISPE-1, and NISPE-2 shall be permitted to be thermoset polymer.
Revise 400.23 as follows:
400.23 Equipment Grounding Conductor Identification . A conductor intended to be used as an equipment grounding conductor shall have a continuous identifying marker readily distinguishing it from the other conductor or conductors. Conductors having a continuous green color or a continuous green color with one or more yellow stripes shall not be used for other than equipment grounding conductors ~~purposes.~~ The identifying marker shall consist of one of the methods in 400.23(A) or 400.23(B).
400.32 Revise 400.32 as follows:
All shields shall be connected to an equipment grounding conductor ~~grounded~~ .
400.33 Revise 400.33 as follows:
400.33 Equipment Grounding Conductors. Equipment grounding conductors shall be connected in accordance with Part V I and VII of Article 250.
Substantiation: 310.6: The language of 250.4(A)(5) and 250.4(B)(4) is referring to an equipment grounding conductor. Thus, a more direct language is proposed.
310.7 Exception: The language of 250.4(A)(5) and 250.4(B)(4) is referring to an equipment grounding conductor. Thus, a more direct language is proposed.
400.4 Table 4004., Note 6: The term "Equipment Grounding Conductor" instead of "Equipment Grounding" is proposed in order to use defined terms.
400.23: The term "Equipment Grounding Conductor" instead of "Equipment Grounding" is proposed in order to use defined terms.
400.32: The proposed text is more prescriptive. The existing rule requires a connection to an equipment grounding conductor.
400.33: The term "Equipment Grounding Conductor" instead of "Grounding Conductor" is proposed since this text applies specifically to the equipment grounding conductor.
This is the result of the TCC Task Group on Grounding and Bonding in resolve of the 2005 NEC cycle actions related to Proposal 5-1 and Comment 5-1 as directed by the Technical Correlating Committee. This is a companion proposal to the proposed revision to the terms "bonded", "grounded", and "equipment grounding conductor" in Article 100 relative to this Task Group's recommendations. These changes clarify the present requirement in more prescriptive language.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Part
Accept the following parts of the proposal and reject the balance of the proposal:
Revise 400.4 Note 6 to Table 400.4 as follows:
6. The third conductor in these cables shall be used ~~for~~ as an equipment grounding ~~purpose~~ conductor only. The insulation of the equipment grounding conductor for Types SPE-1, SPE-2, SPE-3, SPT-1, SPT-2, SPT-3, NISPT-1, NISPT-2, NISPE-1, and NISPE-2 shall be permitted to be thermoset polymer.
Revise 400.23 as follows:
400.23 Equipment Grounding Conductor Identification . A conductor intended to be used as an equipment grounding conductor shall have a continuous identifying marker readily distinguishing it from the other conductor or conductors. Conductors having a continuous green color or a continuous green color with one or more yellow stripes shall not be used for other than equipment grounding conductors ~~purposes.~~ The identifying marker shall consist of one of the methods in 400.23(A) or 400.23(B).
400.32 Revise 400.32 as follows:
All shields shall be connected to an equipment grounding conductor ~~grounded~~ .
400.33 Revise 400.33 as follows:
400.33 Equipment Grounding Conductors. Equipment grounding conductors shall be connected in accordance with Parts V I and VII of Article 250.
Panel Statement: The present language requires the metallic insulation shields to be grounded through an effective grounding path, thus meeting the requirements of 250.4(A)(5) or (B)(4). This requirement takes into consideration the different purposes for which these conductors may be used rather than limiting their use as the proposed language may do. The primary grounding point may not be to the equipment grounding conductor. The panel also considered the concerns expressed in the TCC voting regarding the changes in Article 310.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Abstain: 1
Explanation of Abstention:
MCCLUNG, L.: Fails to address 5000V non shielded cable restoration issue.

6-5 Log #1468 NEC-P06 **Final Action: Reject**
(310.1, FPN)

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Rename the term "fixture wires" to "luminaire wires" in 310.1 FPN.
Substantiation: With the changing of the term "fixture" to "luminaire" it only makes sense that the term "fixture wires" be changed to "luminaire wires".
For the purposes of correlation, this proposal is also being submitted to the following Articles/Sections/Tables/Annexes: 200.6; 210.19; 210.20; 210.24; 240.4; 240.5; 300.17; 310.1; 314.16; Article 402; 517.74; 660.9; Table 1; Table 5; Annex C.
Panel Meeting Action: Reject
Panel Statement: The use of fixture wire is not limited to luminaires or lighting fixtures; they are also used within equipment. The action on this proposal should also be forwarded for information to CMPs 2, 3, 5, 8, 9, 10, 12, and 15.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 9 Negative: 2
Explanation of Negative:
CLINE, S.: If "fixture" was the word which gave rise to "fixture wires" in the past, then it seems that the term should now be "luminaire wires." It is possible that a different word more inclusive of current applications for these conductors could be better than "luminaire," but "luminaire" is the defined word the Code now uses in place of "fixture." A new word could be done as a Comment should someone have one to suggest. I believe in struggling for uniformity and simplicity in the Code as much as is practically possible.
KENT, G.: To be consistent, this proposal should have been accepted. The term 'fixture' was changed to 'luminaire' wire.

6-6 Log #420a NEC-P06 **Final Action: Reject**
(310.2(B), 310.14, & Tables 310.16 and 310.21)

Submitter: John Brouzakis, John's Electric
Recommendation: Discontinue use of all aluminum and copper clad wire in homes, business, and industry. Discontinue using aluminum bus bars in breaker panels and MCC panels. Aluminum and copper clad wire and bus bars are still being used in homes, business and industry.
Substantiation: I've seen aluminum or copper clad wire connections to 240 volt a.c. circuits such as on ranges, dryers and other circuits become loose or corroded and start arcing and burn the wire.
Some breaker panels in basements with aluminum bus bars corrode and start arcing where the breaker plugs into the bus bar. On one job, I had to remove all the breakers, clean the bus bar and replace some of the breakers.
These are just a couple of problems that I experienced with people using AL or copper clad wire and panels with AL bus bars. These situations could have turned into electrical fires with loss of life and property. I believe only copper wire and bus bars should be used in homes, buildings and industry.
When I see AL or copper clad wiring inside a home, I tell the owner it should be replaced with copper. I would appreciate it if you discontinue the usage of aluminum and copper clad wire inside homes, business and industry in your next code.
Panel Meeting Action: Reject
Panel Statement: No technical substantiation has been provided to discontinue the use of all aluminum or copper-clad aluminum conductors or aluminum bus bars. Also, the proposal does not comply with 4-3.3(c) of the NFPA Regulations Governing Committee Projects, which states that the proposal shall include "Proposed text of the Proposal, including the wording to be added, revised (and how revised), or deleted."
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-7 Log #1674 NEC-P06 **Final Action: Accept in Principle in Part**
(310.4)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 5 for Comment.

Submitter: Paul E. Guidry, Fluor Enterprises, Inc.

Recommendation: Add text to read as follows:

310.4, Exception No. 5: Equipment grounding conductors in sizes smaller than 1/0 AWG shall be permitted to be run in parallel to supply motor loads from variable frequency drives where listed multiconductor cable is utilized.

Substantiation: It is a common practice and a common VFD manufacturer's recommendation to parallel three equipment grounding conductors where multiconductor power supply cables are utilized with a variable frequency drive. Many times these equipment grounding conductors are of sizes less than 1/0 AWG. Even though 110.3(A)(1) and 110.3(B) allows listed cable such as this to be used in this manner, there seems to be a conflict with NEC 310.4. Adding the exception above would clarify that this practice is acceptable.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle in Part

Insert as a new paragraph to 310.13 after the fine print note and change the proposed text to read as follows:

Equipment grounding conductors shall be permitted to be sectioned within a listed multi-conductor cable provided the combined circular mil area complies with 250.122.

Panel Statement: The panel agrees that the equipment grounding conductor in listed multi-conductor cable shall be permitted to be sectioned. The use of a sectioned EGC is not limited to variable frequency drives and therefore this has been moved to conductor construction.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

6-7a Log #CP601 NEC-P06 **Final Action: Accept**
(310.4)

Submitter: Code-Making Panel 6

Recommendation: Delete section 310.4 in its entirety and replace with the following:

310.4 Conductors in Parallel.

Aluminum, copper-clad aluminum, or copper conductors of size 1/0 AWG and larger, comprising each phase, polarity, neutral, grounded circuit conductor, or equipment grounding conductor shall be permitted to be connected in parallel (electrically joined at both ends). Where parallel equipment grounding conductors are used they shall be sized in accordance with 250.122.

Exception No. 1: Conductors, other than equipment grounding conductors, in sizes smaller than 1/0 AWG shall be permitted to be run in parallel to supply control power to indicating instruments, contactors, relays, solenoids, and similar control devices, provided all of the following apply:

(a) They are contained within the same raceway or cable.

(b) The ampacity of each individual conductor is sufficient to carry the entire load current shared by the parallel conductors.

(c) The overcurrent protection is such that the ampacity of each individual conductor will not be exceeded if one or more of the parallel conductors become inadvertently disconnected.

Exception No. 2: Conductors, other than equipment grounding conductors, in sizes smaller than 1/0 AWG shall be permitted to be run in parallel for frequencies of 360 Hz and higher where conditions (a), (b), and (c) of Exception No. 1 are met.

Exception No. 3: Under engineering supervision, grounded neutral conductors in sizes 2 AWG and larger shall be permitted to be run in parallel for existing installations.

FPN: Section 310.4 Exception No. 3 can be used to alleviate overheating of neutral conductors in existing installations due to high content of triplen harmonic currents.

Exception No. 4: As permitted in 620.12(A)(1).

The paralleled conductors in each phase, polarity, neutral, grounded circuit conductor, or equipment grounding conductor shall comply with all of the following:

(1) Be the same length
(2) Have the same conductor material
(3) Be the same size in circular mil area
(4) Have the same insulation type
(5) Be terminated in the same manner

Where run in separate cables or raceways, the cables or raceways with conductors shall have the same number of conductors, and shall have the same electrical characteristics. Conductors of one phase, polarity, neutral, grounded circuit conductor, or equipment grounding conductor shall not be required to have the same physical characteristics as those of another phase, polarity, neutral, grounded circuit conductor, or equipment grounding conductor to achieve balance.

Conductors installed in parallel shall comply with the provisions of 310.15(B)(2)(a).

FPN: For sectioned equipment grounding conductors in listed multi-conductor cables, see 310.13

Substantiation: The panel has reorganized this section in response to a number of public proposals indicating the need to reorganize the section to make it more usable without changing the intent of the section. A FPN was added to identify the use of sectioned Equipment grounding conductors and the existing 2nd FPN was removed.

Panel Meeting Action: Accept

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

6-8 Log #2235 NEC-P06 **Final Action: Reject**
(310.4)

Submitter: Donald A. Ganiere, Ottawa, IL

Recommendation: Revise as follows:

310.4 Conductors in Parallel. Aluminum, coper-clad aluminum, or copper conductors of ~~size 1/0 AWG and larger~~ size #1 AWG and smaller , comprising each phase, polarity, neutral, or grounded circuit conductor, shall ~~be permitted to~~ not be connected in parallel (electrically joined at both ends).

Substantiation: There is no code rule that prevents the installation of conductors smaller than 1/0 AWG in parallel in the current code. The existing rule just specifically permits the use of conductors 1/0 and larger in parallel, but does not prohibit smaller conductors from being paralleled.

Panel Meeting Action: Reject

Panel Statement: The present language meets the requirements of Section 3.1.3 of the NEC Style Manual. Article 310.4 permits conductors 1/0 or larger to be installed in parallel. The general rule is that conductors sized smaller than 1/0 are not permitted to be run in parallel.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

6-9 Log #3174 NEC-P06 **Final Action: Accept in Principle**
(310.4)

Submitter: Brian P. Johnson, Minnesota State Community & Technical College

Recommendation: I propose that 310.4 be reorganized. Paragraph one and its five subdivisions after FPN of Exception No. 4 should be placed after the first paragraph of 310.4 instead of after the list of exceptions. The reason why it should be placed there instead of after the exceptions is because both paragraphs talk about the same things. They both talk about the phase, polarity, neutral, or grounded circuit conductors of conductors in parallel and how they should be used.

Substantiation: One solution that you will get by excepting my proposal is that 310.4 will be more organized. Another solution that you will get by excepting my proposal is that it will be understood better because those two paragraphs will be next to each other. As written. it is difficult to understand for a new student of electricity, as I am.

Panel Meeting Action: Accept in Principle

The panel has addressed the submitter's issues in its action on Committee Proposal 6-7a.

Panel Statement: See Committee Proposal 6-7a.

6-10 Log #1172 NEC-P06 **Final Action: Reject**
(310.4 Exception No. 1)

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Delete.

Substantiation: Edit. 90.3 indicates Chapter 6 may modify Chapter 3. This exception is already covered.

Panel Meeting Action: Reject

Panel Statement: While it may be redundant, removing this section will not enhance the usability of the Code.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

6-11 Log #1117 NEC-P06 **Final Action: Accept in Principle in Part**
(310.4 Exception No. 4)

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Revise as follows:

Exception No. 4: Under engineering supervision, grounded ~~neutral~~ conductors in sizes 2 AWG and 1 AWG ~~larger~~ shall be permitted to be run in parallel for existing installations.

Substantiation: I believe this exception was established to allow increases in neutral capacities where conditions in the FPN occurred. However, the panel statement for Proposal 6-7 Log 731 in the 2004 ROP, stated this is not the purpose. Therefore, the exception should not be limited to neutrals, which excludes the grounded conductor of a 4-wire delta-connected system. The phrase "and larger' includes conductors 1/0 AWG which should not require engineering supervision as the first paragraph permits paralleling of 1/0 conductors without regard to engineering supervision or existing installations.

Panel Meeting Action: Accept in Principle in Part
Revise as follows:
Exception No. 4: Under engineering supervision, grounded ~~neutral~~ conductors in sizes 2 AWG ~~and~~ or 1 AWG ~~larger~~ shall be permitted to be run in parallel for existing installations.
Panel Statement: The panel accepts the deletion of the word "neutral" and changes the wording of "and larger" to read "or 1 AWG". The word "grounded" already exists in the Code.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-12 Log #1137 NEC-P06 **Final Action: Accept in Principle**
(310.4 Exception No. 4)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise as follows:
Under engineering supervision grounded neutrals in sizes 2 AWG and 1 AWG ~~and larger~~ shall be permitted to be run in parallel for existing installations.
Substantiation: I believe this rule was established for neutrals for conditions noted in the FPN. The phrase "and larger" includes conductors 1/0 and larger which should not require engineering supervision, as the first paragraph permits paralleling of 1/0 and larger conductors without engineering supervision or regard to new or existing installations.
Panel Meeting Action: Accept in Principle
The panel has addressed the submitter's issues in its action on Proposal 6-11
Panel Statement: See panel action and statement on Proposal 6-11.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-13 Log #2556 NEC-P06 **Final Action: Reject**
(310.6)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.
Submitter: Bruce McClung, McSquared Electrical Consulting LLC
Recommendation: Revise text as follows:
Renumber present Exception as Exception No. 1: and add Exception No. 2: Nonshielded multiconductor cables rated 2001-5000 volts listed by a qualified testing laboratory shall be permitted for use up to 5000 volts if the cable has an overall metallic sheath or armor:
The metallic, sheath, or armor shall be grounded through an effective grounding path meeting the requirements of 250.4(A)(5) or 250.4(B)(4).
FPN: See 300.3(C)(2) for installation requirements for conductors rated over 600 volts.
Substantiation: The use of nonshielded multiconductor cables rated 2001-5000 volts having an overall metallic sheath or armor is just as reliable and safe when installed and grounded properly above ground as it is when installed as direct burial. See continued use of this construction permitted in 310.7 Direct Burial Conductors.
Panel Meeting Action: Reject
Panel Statement: The submitter has provided no technical substantiation to prove that nonshielded multiconductor cables with an overall metallic sheath or armor used on systems rated up to 5000 volts for aboveground installations would be safe.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 7 Negative: 4
Explanation of Negative:
HUDDLESTON, JR., R.: This proposal should have been accepted. Insufficient evidence exists to ban the use of nonshielded cable for 4160 volt applications, especially when installed as armored cable as this proposal specified. The panel refuses to acknowledge that nonshielded cable has been used for many years safely for 4160 volt applications, as long as it is installed properly and maintained correctly. The panel alluded to safety concerns, and when it was pointed out that armored cable, with the metal armor grounded, is virtually a shield in terms of corona, the panel absolutely ignored the lack of evidence for safety problems.
KOMASSA, D.: See my explanation of negative vote on Proposal 6-19.
MCCLUNG, L.: Starting with 310.6 Exception make modification as follows:
1. Revise to read: Exception: Nonshielded insulated conductors listed by a qualified testing laboratory shall be permitted for use up to 2400V dry "locations" and 5000V "dry or wet locations" under the following conditions.
a. Conductors shall have insulation resistant to electric discharge and surface tracking, or the insulated conductor(s) shall be covered with a material resistant to ozone, electric discharge, and surface tracking.
b. Where used at 5000V, the insulated conductor(s) shall be enclosed in an armor of interlocking metal tape or a smooth or corrugated metallic sheath.
c. Insulation and jacket thicknesses shall be in accordance with Table 310.63.
5000V nonshielded multi-conductor cable rated 2001-5000V having an overall metallic sheath or armor is reliable and safe when installed and properly grounded above ground or installed as direct burial.

WETHERELL, A.: I agree with the submitter that no evidence, anecdotal or otherwise, has been provided that indicates that 5 kV rated, nonshielded cable has presented a safety problem when it is enclosed in metal conduit or metallic armor.
Comment on Affirmative:
CLINE, S.: I understand that this is a difficult subject with two widely separated camps. It seems to have overall people-resistant safety on one side and practical risk-management on the other. The danger when there is a failure is high and, in some cases, literally explosive.
As currently worded , I believe that 310.7 applies to the construction requirements for cables, not applications of voltage operation. It says "rated above," not "operated above" as 310.6 does. It appears that 310.6 still limits the operational voltage of non-shielded cables to below 2000 in the general rule, and 2400 volts under the exception's allowances.
Evidentiary Substantiation of the equivalent safety performance of an overall metallic sheath or armor compared to shielded construction needs to be presented for me to agree to this expansion of applied use.

LAIDLER, W.: I'm voting to reject this proposal because unshielded cables operating at voltages above 2400 volts present a safety hazard whether or not they are enclosed in a raceway or a metallic sheath. This is due to the fact that the discharging problems mainly occur at the point where the cables terminate. The only way to ensure safety when cables are operating above 2400 volts is to shield them.
ZIMNOCH, J.: This proposal addresses a serious safety issue that exists in the field. When non-shielded cables are operated at 4160 volts, a standing voltage potential exists on the surface of the cable regardless of how much insulation or what non-metallic material covers that surface; this is the reason for applying a shield to a cable. The shield contains the potential and drains any leakage to ground. The NEC initially did not allow this type of cable construction to operate at 4160 volts; it was added as an exception, which means originally it was thought to be unsafe.
Current ICEA standards includes the following, "Cables without insulation shields have electric fields that extend partially within the insulation and whatever exists between the insulation and ground. If the field is sufficiently intense, it will cause the air near the insulation to ionize and form corona which can damage the cable insulation or cause the insulation itself to breakdown". This same corona also creates a serious safety issue for personnel.

6-14 Log #1736 NEC-P06 **Final Action: Reject**
(310.6 Exception)

Submitter: Thomas F. Mueller, Southern Company Services
Recommendation: Change "2400" to "5000" in the exception.
The exception will then read, "Non-shielded insulated conductors listed by a qualified testing laboratory shall be permitted for use up to 5000 volts under the following conditions." The conditions folowing (a, b, and c) will remain the same.
Substantiation: In the previous code cycle, the panel was duped by copper salesmen. The panel was fed a disingenuous argument that 5 kV shielded cables would correct perceived safety problems associated with 5 kV non-shielded cable installations.
No one disputes the fact that voltages in the 5 kV range produce corona - a phenomenon damaging to cable insulation - in moist and/or dirty conditions. The 5 kV shielding proponents produced evidence - also not in dispute - of corona damage at 5 kV terminations. What the proponents did not divulge is that corona at terminations can be present and just as damaging for both shielded and non-shielded designs.
To intimate that 5 kV non-shielded cable cannot be installed safely is patently false. Even the anecdotal examples of non-shield problems focused on terminations, not cable installation. It was pointed out to panel members that some cable vendors did not manufacture non-shielded cables in the 5 kV range and they were then at a competitive disadvantage. Let's all shed a tear for cable companies that don't make non-shielded 5 kV cable. Perhaps those same companies don't make other types of cable either.
Shielded cable is more expensive and more expensive to install, has less ampacity, takes more room at terminations, and requires a greater degree of precision by electricians installing it than non-shielded cable.
To shield or not shield at 5 kV is just as much a design decision as whether to use THHN or THWN conductors. The elimination of 5 kV non-shielded cable from the ingredient list of a designer's cook book serves no purpose but to sell more copper. The panel should be suspicious of those code changes that tend to economically benefit the submitter and proponents. Changes that increase cost without improving safety hurt us all.
Note: When this proposal is adopted, a corresponding change must be made in Table 310.63.
Panel Meeting Action: Reject
Panel Statement: The panel agreed with the substantiation submitted for the 2005 Code that the use of nonshielded conductors and cables above 2400 volts provides an increased safety hazard for personnel in close proximity to energized nonshielded conductors or cables and should be eliminated.

Number Eligible to Vote: 11
Ballot Results: Affirmative: 8 Negative: 3
Explanation of Negative:
HUDDLESTON, JR., R.: This proposal should have been accepted. The substantiation by the submitter, unfortunately, appears to be correct. There are literally hundreds of documented examples of safe nonshielded cable installations that have been in place for many years, with no problems whatsoever. The panel refused to acknowledge the hardships that banning nonshielded cable for 4160 volt applications imposed on users, such as retrofitting larger junction boxes on motors and switchgear in order to allow adequate room to install stress cones (and voiding UL listing by modifying the equipment).
KOMASSA, D.: See my explanation of negative vote on Proposal 6-19.
MCCLUNG, L.: 5000V nonshielded conductors or cables are just as safe and reliable at terminations as is shielded 5000V.
Comment on Affirmative:
CLINE, S.: I understand that this is a difficult subject with two widely separated camps. It seems to have overall people-resistant safety on one side and practical risk-management on the other. The danger when there is a failure is high and, in some cases, literally explosive.
As currently worded , I believe that 310.7 applies to the construction requirements for cables, not applications of voltage operation. It says "rated above," not "operated above" as 310.6 does. It appears that 310.6 still limits the operational voltage of non-shielded cables to below 2000 in the general rule, and 2400 volts under the exception's allowances.
Evidentiary Substantiation of the equivalent safety performance of an overall metallic sheath or armor compared to shielded construction needs to be presented for me to agree to this expansion of applied use.
LAIDLER, W.: The physical laws that are imposed on conductors carrying voltages higher than 2000 volts make those conductors inherently dangerous. The NEC has always recognized this potential safety issue and requires that the conductors be shielded. It is only by exception that unshielded conductors are permitted to be used with voltages exceeding 2000 volts. During the last cycle, the panel chose to reduce the voltage limit from 8000 to 2400 volts based on the substantiation provided by the submitter of the proposal. Several panel members also related instances where people were seriously injured or killed as the result of working around unshielded cables operating at 4160 volts. No substantiation has been provided to warrant the panel to reverse the action taken during the last Code cycle.
ZIMNOCH, J.: See my explanation of affirmative vote on Proposal 6-13.

6-15 Log #1989 NEC-P06 **Final Action: Reject**
(310.6 Exception)

Submitter: Neil F. LaBrake, Jr., Niagara Mohawk, a National Grid Company / Rep. Edison Electric Institute-Electric Light & Power Group
Recommendation: In the Exception, change '2400' to '5000'. The exception will now read as follows:
Exception: Non shielded insulated conductors listed by a qualified testing laboratory shall be permitted for use up to ~~2000~~ 5000 volts under the following conditions:
Exception clauses a, b & c to remain the same.
Substantiation: The purpose of this change is to allow unshielded cable to be used for typical 5 kV type circuits that are commonly installed in the industry. For almost a century, 4160 volt circuits have been run safety & effectively on non shielded 5 kV cables. Over that time frame, cable insulation materials and constructions have seen vast improvements. Thus the design life of such cables even though continuously energized has been extended so that it does not routinely require replacement.
The 2005 NEC disallowed this practice with a few advocates saying it was unsafe. Those advocates were unable to document a single injury that would have been prevented had shielded 5 kV cable been used instead of properly installed unshielded 5 kV cable. The panel was convinced by these arguments and now the code requires a cable that is more expensive & has its own set of safety problems.
To suggest that an unshielded 5 kV cable, installed in a grounded cable tray is unsafe, without technical documentation is incorrect. In fact, the installation of shielded 5 kV cable in an area where it would otherwise be appropriate to install a non-shielded cable is not as safe. The shielded cable has less current carrying capacity and its installation is more complicated and exacting and therefore susceptible to improper installation practice.
The original proposal to establish the new rule stated that installations "…have experienced arcing problems…where the cable conductors are separated outside of the outer sheath." What the submitter failed to state was that such problems exist for shielded and non shielded constructions. Indeed, evidence would suggest that these problems would exist to a greater degree with shielded 5 kV cables. Non shielded cables can be terminated without the use of special tools, or termination devices, by skilled electricians. Shielded cables must be precisely prepared and terminated using stress relieving attachments by electricians who have received specialized training. Poorly prepared shielded cable and improperly grounded shielding can present more hazards than unshielded cable.
4160 volts is a potential high enough to cause corona, an electrostatic discharge that is damaging to electrical insulating materials. There is no industry evidence of deteriorating cable insulation for properly designed and installed 5 kV non shielded cables. It can be deduced then that corona is not a problem with the cables and therefore not a safety issue.
If the intent of the rule change was to protect employees from improperly designed and/or installed cables, the argument is untenable. Such cables would quickly deteriorate, while the rule change increases the likelihood of improper installation and subsequent additional hazard.
4160 volts is a dangerous voltage. Corona and arcing are a concern at the terminations, not along properly designed and installed cable. Since both shielded and non shielded cables terminate, nothing is gained by requiring 5 kV shields under all circumstances. This proposed code change is economically sound while in addition it enhances safety.
Panel Meeting Action: Reject
Panel Statement: The panel agreed with the substantiation submitted for the 2005 Code that the use of nonshielded conductors and cables above 2400 volts provides an increased safety hazard for personnel in close proximity to energized nonshielded conductors or cables and should be eliminated.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 8 Negative: 3
Explanation of Negative:
HUDDLESTON, JR., R.: This proposal should have been accepted. See comment for Proposal 6-14.
KOMASSA, D.: See my explanation of negative vote on Proposal 6-19.
MCCLUNG, L.: 5000V nonshielded conductors or cables when properly installed are just as safe and reliable as is shielded 5000V cables.
Comment on Affirmative:
CLINE, S.: I understand that this is a difficult subject with two widely separated camps. It seems to have overall people-resistant safety on one side and practical risk-management on the other. The danger when there is a failure is high and, in some cases, literally explosive.
Mr. LaBrake's arguments in his Substantiation seem to be well thought out and presented. One of the biggest difficulties I heard regarding taking this point of view had to do with the "properly designed and installed cable" requirement for safety he mentions, and with ongoing maintenance requirements. Anecdotal statements regarding safety issues were presented; the Panel seemed to need a higher level of evidence. The point of the relative mechanical difficulty of making up the termination might be a good point, if this is a non-self-clearing (by failure) operational danger. One of the concerns appeared to be that the non-shielded cable could experience modes of insulation failure which did not self-clear by failure, but instead laid traps of future personal risk. Evidentiary Substantiation needs to be presented for me to agree to this expansion of applied use.
LAIDLER, W.: See my affirmative comment on Proposal 6-13.
ZIMNOCH, J.: See my explanation of affirmative vote on Proposal 6-13.

6-16 Log #2991 NEC-P06 **Final Action: Reject**
(310.6 Exception)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 11 for Information.
Submitter: Robert Konnik, Rockbestos-Suprenant
Recommendation: Revise text to read as follows:
Add allowance for 5 kv nonshielded cables used as motor leads or parts of assemblies in 301.6 exception as shown below:
Exception: Nonshield insulated conductors listed by a qualified testing laboratory shall be permitted for use up to 2400 volts <u>or up to 5000 volts for motor leads or as part of an assembly</u> under the following conditions:
Substantiation: It is not always practical to use a 5 kv shielded cable, with stress cone type terminations for motor leads or assemblies. These cables are of limited length and have been used in even greater voltages for many years.
Panel Meeting Action: Reject
Panel Statement: The proposed modification to the exception should not be included in Chapter 3 since Article 310 addresses conductors for general wiring, not wiring within assemblies. Use of nonshielded cable within an assembly should be addressed in the product standard or Listing. This proposal should be referred to CMP 11 for information.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 9 Negative: 2
Explanation of Negative:
KOMASSA, D.: See my explanation of negative vote on Proposal 6-19.
MCCLUNG, L.: 5000V nonshielded conductors or cables installed since 1960 exceed 400 circuits with more than 2400 termination in safe and reliable installations.
Comment on Affirmative:
ZIMNOCH, J.: See my explanation of affirmative vote on Proposal 6-13.

6-17 Log #3516 NEC-P06 **Final Action: Reject**
(310.6 Exception)

Submitter: Mark Goodman, Jacobs Engineering Group / Rep. American Petroleum Institute
Recommendation: Revise wording to delete 2400 volts and replace with 5000 volts.

Section to read:...shall be permitted for use up to ~~2400~~ 5000 volts under the following conditions.

Substantiation: Non-shielded cable at 5000 volts has been utilized in the petrochemical industry since the 1940's. In some refineries, the number of circuits at 5 kV, without shielding exceeds 500 and our survey shows that there have not been any failures attributed to the lack of shielding at this voltage level.

The non shielded cables provide more insulation than the shielded cables. The thicker insulation makes the use of non-shielded cables more reliable especially where subjected to more corrosive environments. The 2002 change had no technical merit and the non-shielded cables should be allowed in installations up to 5 kV.

Panel Meeting Action: Reject

Panel Statement: The panel agreed with the substantiation submitted for the 2005 Code that the use of nonshielded conductors and cables above 2400 volts provides an increased safety hazard for personnel in close proximity to energized nonshielded conductors or cables and should be eliminated.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 8 Negative: 3

Explanation of Negative:

HUDDLESTON, JR., R.: This proposal should have been accepted. See comment for Proposal 6-14.

KOMASSA, D.: See my explanation of negative vote on Proposal 6-19.

MCCLUNG, L.: 5000V nonshielded conductors or cables in one company since mid 1940's exceeding 500 circuits with more than 3000 terminations have provided safe and reliable service.

Comment on Affirmative:

CLINE, S.: I understand that this is a difficult subject with two widely separated camps. It seems to have overall people-resistant safety on one side and practical risk-management on the other. The danger when there is a failure is high and, in some cases, literally explosive.

Anecdotal statements regarding safety issues were presented; the Panel seemed to need a higher level of evidence. Where is the survey? Who did it and what were its parameters?

One of the Panel's concerns appeared to be that the non-shielded cable could experience modes of insulation failure which did not self-clear by failure, but instead laid traps of future personal risk. Evidentiary Substantiation needs to be presented for me to agree to this expansion of applied use.

LAIDLER, W.: See my affirmative comment on Proposal 6-13.

ZIMNOCH, J.: See my explanation of affirmative vote on Proposal 6-13.

6-18 Log #2292 NEC-P06 **Final Action: Reject**

(310.6 Exception No. 2 (New))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.

Submitter: Bruce McClung, McSquared Electrical Consulting LLC

Recommendation: Revise text as follows:

Renumber present Exception as Exception No.1: and add Exception No. 2: Nonshielded multiconductor cables rated 2001-5000 volts shall be permitted if the cable has an overall metallic sheath or armor:

The metallic shield, sheath, or armor shall be grounded through an effective grounding path meeting the requirements of 250.4(A)(5) or (B)(4).

FPN: See 300.50 for installation requirements for conductors rated over 600 volts.

Substantiation: The use of nonshielded multiconductor cables rated 2001-5000 volts having an overall metallic sheath or armor is just as reliable and safe when installed and grounded properly above ground as it is when installed as direct burial. See continued use of this construction permitted in 310.7 Direct Burial Conductors.

Panel Meeting Action: Reject

Panel Statement: The panel agreed with the substantiation submitted for the 2005 Code that the use of nonshielded conductors and cables above 2400 volts provides an increased safety hazard for personnel in close proximity to energized nonshielded conductors or cables and should be eliminated.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 7 Negative: 4

Explanation of Negative:

HUDDLESTON, JR., R.: This proposal should have been accepted. See comment for Proposal 6-13.

KOMASSA, D.: See my explanation of negative vote on Proposal 6-19.

MCCLUNG, L.: 5000V nonshielded multi-conductor cable rated 2001-5000V having an overall metallic sheath or armor is reliable and safe when installed and properly grounded above ground or installed as direct burial.

WETHERELL, A.: See my explanation of negative vote on Proposal 6-13.

Comment on Affirmative:

CLINE, S.: I understand that this is a difficult subject with two widely separated camps. It seems to have overall people-resistant safety on one side and practical risk-management on the other. The danger when there is a failure is high and, in some cases, literally explosive.

As currently worded , I believe that 310.7 applies to the construction requirements for cables, not applications of voltage operation. It says "rated above," not "operated above" as 310.6 does. It appears that 310.6 still limits the operational voltage of non-shielded cables to below 2000 in the general rule, and 2400 volts under the exception's allowances.

Evidentiary Substantiation of the equivalent safety performance of an overall metallic sheath or armor compared to shielded construction needs to be presented for me to agree to this expansion of applied use.

LAIDLER, W.: See my affirmative comment on Proposal 6-14.

ZIMNOCH, J.: See my explanation of affirmative vote on Proposal 6-13.

6-19 Log #2700 NEC-P06 **Final Action: Reject**

(310.6 Exception No. 2 (New))

Submitter: Dorothy Kellogg, American Chemistry Council

Recommendation: Make existing exception "Exception No. 1".

Add new exception:

Exception No. 2: In industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons service the installation, nonshielded insulated conductors shall be permitted for use up to 8000 volts when installed in a metal raceway such as rigid metal conduit.

Substantiation: For many years, large industrial installations have used nonshielded insulated conductors for medium voltage distribution systems within their facilities. Virtually all problems that have occurred have been due to improper installation techniques, such as allowing conductors to cross at skew angles in junction boxes where corona between cables becomes an issue. If nonshielded cables are installed and maintained properly in metal raceways, there is no reason to disallow their use up to 8KV.

Often, older electrical gear and equipment does not allow enough room for terminations requiring stress cones, and modifications would need to be made in order to terminate shielded cable in these cabinets and terminal boxes. Listed equipment should not be modified or the listing may become voided, which could necessitate replacing the equipment at greater cost.

The National Electrical Code is written to provide for "the practical safeguarding of person and property from hazards arising from the use of electricity." (90.1(A)). Nonshielded medium voltage cable, when properly installed and maintained in supervised industrial installations, does not violate this purpose.

Panel Meeting Action: Reject

Panel Statement: The panel agreed with the substantiation submitted for the 2005 Code that the use of nonshielded conductors and cables above 2400 volts provides an increased safety hazard for personnel in close proximity to energized nonshielded conductors or cables and should be eliminated.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 8 Negative: 3

Explanation of Negative:

HUDDLESTON, JR., R.: This proposal should have been accepted. The proposal was amended so that the wording was changed from 8000 volts to 5000 volts, which would have been to "accept in principle". This would have been fine; however, to reject this proposal on a safety basis ignores the fact that conduit installations are undoubtedly a safe way to install nonshielded cable. The panel did not submit any reasons why this would not be a safe installation, but remained adamant about rejecting any inclusion of the use of nonshielded cable for 4160 volt use, period. It would appear that the panel members voting against this proposal in principle had made their minds up, and would not allow the facts to change their opinion.

KOMASSA, D.: This proposal should have been accepted in principle by changing the "8000 volts" to "5000 volts". By permitting the use of nonshielded cables up to 5000 volts where "conditions of maintenance and supervision ensure that only qualified persons" work on these cables addresses the concerns of adequately trained workers and supervised facilities which can keep an installation in good repair. The NECA representative at the meeting cited the New York Times as a location which has a well maintained facility. We should not penalize those facilities which keep in good repair from continuing to use nonshielded cable up to 5000 volts.

MCCLUNG, L.: 5000V nonshielded conductors or cables utilized in industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons service the installation should be permitted since such facilities have thousands of circuits with 6 times as many terminations in safe and reliable operation.

Comment on Affirmative:

CLINE, S.: I understand that this is a difficult subject with two widely separated camps. It seems to have overall people-resistant safety on one side and practical risk-management on the other. The danger when there is a failure is high and, in some cases, literally explosive.

This sort of installation requirement seems to be a suggestion close to an alternative to shielding which might be acceptable. The part of the substantiation related to existing installations seems to have an even higher probability of acceptance. What installation instructions or safety reports can be presented as real evidence of the operational safety of such applications?

Evidentiary Substantiation of the equivalent safety performance of an in-conduit installation compared to shielded construction needs to be presented for me to agree to this expansion of applied use. Alternatively, risk management having to do with existing installations might be acceptable.

LAIDLER, W.: I am voting to reject this proposal because the inherent danger of using unshielded cables on voltages exceeding 2400 volts is the same in all locations. To permit the use of unshielded cables in any location is a step backward in regards to safety of personnel and equipment.

ZIMNOCH, J.: See my explanation of affirmative vote on Proposal 6-13.

6-20 Log #3072 NEC-P06 **Final Action: Reject**
(310.6 Exception No. 2)

Submitter: Michael Martin, Lyondell Chemical Company
Recommendation: Add text to read as follows:

Exception No. 2: In industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons service the installations, nonshielded insulated conductors listed by a qualified testing laboratory shall be permitted for use up to 5000 volts under the following conditions:

(a) Conductors shall have insulation resistant to electric discharge and surface tracking, or the insulated conductor(s) shall be covered with a material resistant to ozone, electric discharge, and surface tracking.

(b) Where used in wet locations, the insulated conductor(s) shall have an overall nonmetallic jacket or a continuous metallic sheath.

(c) Insulation and jacket thicknesses shall be in accordance with Table 310.63.

Substantiation: The use of non shielded cable up to 5000V has a long history of safe and effective use in industrial establishments.
Panel Meeting Action: Reject
Panel Statement: The panel agreed with the substantiation submitted for the 2005 Code that the use of nonshielded conductors and cables above 2400 volts provides an increased safety hazard for personnel in close proximity to energized nonshielded conductors or cables and should be eliminated.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 9 Negative: 2
Explanation of Negative:

KOMASSA, D.: See my explanation of negative vote on Proposal 6-19.

MCCLUNG, L.: 5000V nonshielded conductors or cables utilized in industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons service the installation should be permitted since such facilities have thousands of circuits with 6 times as many termnations in safe and reliable operation.

Comment on Affirmative:

CLINE, S.: I understand that this is a difficult subject with two widely separated camps. It seems to have overall people-resistant safety on one side and practical risk-management on the other. The danger when there is a failure is high and, in some cases, literally explosive.

This sort of installation requirement seems to be a suggestion close to an alternative to shielding which might be acceptable. What installation instructions or safety reports can be presented as real evidence of the operational safety of such applications?

Evidentiary Substantiation of the equivalent safety performance of an “industrial establishment” installation compared to shielded construction needs to be presented for me to agree to this expansion of applied use.

LAIDLER, W.: See my affirmative comment on Proposal 6-19.

ZIMNOCH, J.: See my explanation of affirmative vote on Proposal 6-13.

6-21 Log #2745 NEC-P06 **Final Action: Reject**
(310.6 Exception No. 3 (New))

TCC Action: The Technical Correlating Committee directs that the panel reconsider the proposal and act on its merits since the application discussed is not exempt under 90.2(B). This action will be considered by the panel as a public comment.
Submitter: Daniel Baker, URS Corporation, Inc.
Recommendation: Revise text to read:

Exception No. 3: Nonshielded insulated listed by the Federal Aviation Administration as certified to meet the requirements for L-824 5,000 volts, shall be permitted for use on series lighting circuits up to 5,000 volts under the conditions specified above under Exception No. 1.

Substantiation: This proposal returns an exception that permitted use of unshielded wiring to be used for underground airfield lighting circuits, due to the 2005 change to this item.

It is common practice in airfield lighting series circuits which are powered by regulators to run unshielded wiring underground for powering the lights. These circuits are ungrounded, and feature many connections, typically for runways every 50 feet, and for taxiways as close together as 20 feet. On a typical circuit, there are often over 100 lights, each of which is connected to the series circuit twice. Requiring use of shielded wire will greatly complicate the splicing, and thus increase the cost of the lighting installations. The practices and methods used in airfield lighting are based on Federal Aviation Administration (FAA) Advisory Circulars (ACs). An example of the connection at typical airfield lighting fixture is shown on the left in **Figure 23** of Appendix 1 of Advisory Circular AC 150/5340-30A “Design and Installation Details for Airport Visual Aids”, issued April 11, 2005. The ACs stipulate that the two “L-823” Connectors be provided for each light.

Because of the importance of these systems to the safe operations of aircraft, it provides higher levels of operability to have an ungrounded system. If a ground occurs on the circuit, no fault current flows so operations can continue.

These practices have been in use for many years with ungrounded, unshielded cable at almost all major airports throughout the United States.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject
Panel Statement: While airfield lighting circuits are not specifically exempted from the Code in 90.2(B), the cable and application is not within the scope of Article 310, which addresses conductors for general wiring.
The panel recommends that CMP 1 review the panel action and proposal for information.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:

MCCLUNG, L.: 5000V nonshielded conductors or cables whether used for series lighting circuits or 3-phase power circuits have proven to be safe and reliable when properly installed and maintained.

Comment on Affirmative:

CLINE, S.: I understand that this is a difficult subject with two widely separated camps. It seems to have overall people-resistant safety on one side and practical risk-management on the other. The danger when there is a failure is high and, in some cases, literally explosive.

This sort of installation requirement seems to be a form which might be acceptable. What installation instructions or safety reports can be presented as real evidence of the operational safety of such applications?

Evidentiary Substantiation of the equivalent safety performance compared to shielded construction needs to be presented for me to agree to this expansion of applied use.

LAIDLER, W.: I’m voting to reject this proposal because an exception in the NEC permitting the use of unshielded cable for runway lighting systems is not appropriate. The same inherent danger exists in all applications when using unshielded cable on systems operating above 2400 volts. The FAA may choose not to use the NEC if it deems it necessary to use unshielded cables for runway lighting systems.

ZIMNOCH, J.: See my explanation of affirmative vote on Proposal 6-13.

6-22 Log #2558 NEC-P06 **Final Action: Reject**
(310.7)

Submitter: Bruce McClung, McSquared Electrical Consulting LLC
Recommendation: Revise text as follows:

Add words “listed by a qualified testing laboratory” so it reads Exception: Nonshielded multiconductor cables rated 2001-5000 volts listed by a qualified testing laboratory shall be permitted for use up to 5000 volts if the cable has an overall metallic sheath or armor:

The metallic shield, sheath, or armor shall be grounded through an effective grounding path meeting the requirements of 250.4(A)(5) or 250.4(B)(4).

Delete FPN No. 1 and continue FPN No. 2 as FPN: See 300.50 for installation requirements for conductors rated over 600 volts.

Substantiation: The use of nonshielded multiconductor cables rated 2001-5000 volts having an overall metallic sheath or armor should be listed by a qualified testing laboratory, but does not have to comply with installation requirements for conductors rated 600 volts or less.
Panel Meeting Action: Reject
Panel Statement: The addition of the phrase “listed by a qualified testing laboratory” violates the NEC Style Manual and the addition of “for use up to 5000 volts” is not necessary since the existing wording implies that such cable is approved for such use.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 9 Negative: 2
Explanation of Negative:

KOMASSA, D.: See my explanation of negative vote on Proposal 6-19.

MCCLUNG, L.: 5000V nonshielded multi-conductor cable rated 2001-5000V having an overall metallic sheath or armor is reliable and safe when installed and properly grounded above ground or installed as direct burial.

Comment on Affirmative:

CLINE, S.: I understand that this is a difficult subject with two widely separated camps. It seems to have overall people-resistant safety on one side and practical risk-management on the other. The danger when there is a failure is high and, in some cases, literally explosive.

As currently worded , I believe that 310.7 applies to the construction requirements for cables, not applications of voltage operation. It says “rated above,“ not “operated above“ as 310.6 does. It appears that 310.6 still limits the operational voltage of non-shielded cables to below 2000 in the general rule, and 2400 volts under the exception’s allowances.

Evidentiary Substantiation of the equivalent safety performance of an overall metallic sheath or armor compared to shielded construction needs to be presented for me to agree to this expansion of applied use.

LAIDLER, W.: See my affirmative comment on Proposal 6-23.

6-23 Log #2637 NEC-P06 **Final Action: Reject**
(310.7 Exception)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative. It was the additional action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting concerning a conflict within Chapter 3. This action will be considered by the Panel as a public comment.
Submitter: James M. Daly, General Cable
Recommendation: Change 5000 to 2400.
Substantiation: Article 310 was revised in the 2005 NEC to limit nonshielded conductors and cables to 2400 volts. This reference was overlooked and needs to be corrected.
Panel Meeting Action: Accept
Panel Statement: Section 310.13 refers to Table 310.63, which no longer recognizes nonshielded cables rated above 2400 volts.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 7 Negative: 4
Explanation of Negative:
HUDDLESTON, JR., R.: This proposal should have been rejected, as there is no sound evidence that proper installations using nonshielded cable for 4160 volt applications are a concern.
KOMASSA, D.: See my explanation of negative vote on Proposal 6-19.
MCCLUNG, L.: Fails to address 5000V nonshielded cable restoration issue.
WETHERELL, A.: See my explanation of negative vote on Proposal 6-13.
Comment on Affirmative:
CLINE, S.: These are detail corrections to Panel action(s) in a previous cycle. I think they are correct as they stand, and their acceptance does not interfere with the other arguments related to allowance of cable application at higher voltages. I think it should be a high priority for Panel members to assure that the Code is correct and clear.
LAIDLER, W.: I'm voting to accept this proposal because the submitter is correct. When the panel voted to limit the voltage of unshielded cables to 2400 volts during the 2005 cycle, the editing to this exception was overlooked.
ZIMNOCH, J.: Acceptance of the proposal will correct an oversight that occurred during the 2005 Code cycle. The Panel never discussed either leaving the direct burial Exception in 310.7 nor specifically modifying the Exception. All of the Panel discussion was directed towards limiting the use of non-shielded conductors or cables to 2400 V in all applications and installations. See the Panel Statement "It is the panel's decision that cables rated above 2400 volts be shielded." on Comments 6-9, 6-13, 6-14, and 6-17 through 6-22 to the 2005 Code.
Not accepting the proposal will continue to perpetuate a conflict within Chapter 3. Table 310.63 no longer authorizes 5 kV non-shielded conductors or cables but the Exception in 310.7 permits its use for direct burial applications if the cable has an overall metallic sheath or armor, a clear conflict of Code requirements.
The revisions to Table 310.63 in the 2005 Code cycle removed the insulation and jacket thicknesses for 5 kV non-shielded constructions so the Code no longer includes any construction requirements for non-shielded conductors or cables rated above 2400 V. Therefore, no conductors or cables rated over 2400 V can be provided in compliance with the Code. Failure to accept the proposal could result in non-shielded products rated 5 kV being direct buried with the onus being placed on the AHJ to accept the product and permit the installation even though that is contrary to the Panel action during the 2005 Code cycle.

6-24 Log #3448 NEC-P06 **Final Action: Accept**
(310.7 Exception)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative. It was the additional action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting concerning a conflict within Chapter 3. This action will be considered by the Panel as a public comment.
Submitter: Joseph S. Zimnoch, The Okonite Company
Recommendation: Change the following exception:
Exception: Nonshielded multiconductor cables rated 2001 - ~~5000~~ 2400 volts shall be permitted if the cable has an overall metallic sheath or armor.
Substantiation: This is a housekeeping item in accordance with the 5 kV to 2.4 kV non-shielded cable change in the 2005 cycle.
Panel Meeting Action: Accept
Panel Statement: Section 310.13 refers to Table 310.63, which no longer recognizes nonshielded cables rated above 2400 volts.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 7 Negative: 4
Explanation of Negative:
HUDDLESTON, JR., R.: This proposal should have been rejected. See comment 6-23.
KOMASSA, D.: See my explanation of negative vote on Proposal 6-19.
MCCLUNG, L.: Fails to address 5000V nonshielded cable restoration issue.
WETHERELL, A.: See my explanation of negative vote on Proposal 6-13.
Comment on Affirmative:
CLINE, S.: These are detail corrections to Panel action(s) in a previous cycle. I think they are correct as they stand, and their acceptance does not interfere with the other arguments related to allowance of cable application at higher voltages. I think it should be a high priority for Panel members to assure that the Code is correct and clear. LAIDLER, W.: See my affirmative comment on Proposal 6-23.
ZIMNOCH, J.: See my explanation of affirmative vote on Proposal 6-23.

6-25 Log #2744 NEC-P06 **Final Action: Reject**
(310.7 Exception No. 2 (New))

TCC Action: The Technical Correlating Committee directs that the panel reconsider the proposal and act on its merits since the application discussed is not exempt under 90.2(B). This action will be considered by the panel as a public comment.
Submitter: Daniel Baker, URS Corporation, Inc.
Recommendation: Revise text to read:
Exception No 2: Ungrounded airfield lighting series circuits rated up to 5000 volts and powered by regulators may be unshielded.
Substantiation: The practices and methods used in airfield lighting are based on Federal Aviation Administration (FAA) Advisory Circulars (ACs). An example of direct burial cable installation at typical airfield lighting fixtures is shown on the right in **Figure 23** taken from Appendix 1 of Advisory Circular AC 150/5340-30A "Design and Installation Details for Airport Visual Aids", issued April 11, 2005. The figure clearly shows FAA Type L-824, 1/C, #8 AWG, 5 kV Cable. This type of cable is unshielded, and the circuits are not intentionally grounded. One of the advantages cited by the FAA in the above referenced AC in Section 2.1.4, "System Design" b. 4 reads "unintentional grounding will not shut the system down."
Requiring use of shielded wire will greatly complicate the splicing, and thus increase the cost of the lighting installations. These circuits are ungrounded, and feature many connections, typically for runways every 50 feet, and for taxiways as close together as 20 feet. On a typical circuit, there are often over 100 lights, each of which is connected to the series circuit twice.
The practice of using unshielded 5kV direct burial cable with ungrounded circuits has been implemented for many years at various airports in the United States.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: While airfield lighting circuits are not specifically exempted from the Code in 90.2(B), the cable and application is not within the scope of Article 310, which addresses conductors for general wiring.
The panel recommends that CMP 1 review the panel action and proposal for information.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:
MCCLUNG, L.: 5000V nonshielded conductors or cables whether used for series lighting circuits or 3-phase power circuits have proven to be safe and reliable when properly installed and maintained.
Comment on Affirmative:
LAIDLER, W.: See my affirmative comment on Proposal 6-21.
ZIMNOCH, J.: See my explanation of affirmative vote on Proposal 6-13.

6-26 Log #812 NEC-P06 **Final Action: Accept**
(310.8(B) and 310.8(C)(2))

Submitter: Austin D. Wetherell, Underwriters Laboratories, Inc.
Recommendation: Delete "THHW-2" from the list of types in both sections.
Substantiation: Type THHW-2 does not exist in the Table 310.13. A 90° C wet or dry rated wire of this construction is covered by Type THW-2.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-27 Log #2236 NEC-P06 **Final Action: Reject**
(310.8(D))

Submitter: Donald A. Ganiere, Ottawa, IL
Recommendation: Revise as follows:
(D) Locations Exposed to Direct Sunlight. Insulated conductors or cables used where exposed to direct rays of the sun shall comply with one of the following:
(1) Cables listed ~~, or listed and marked,~~ as being sunlight resistant
(2) Conductors listed ~~, or listed and marked~~ , as being sunlight resistant
(3) Covered with insulting material, such as tape or sleeving, that is listed ~~, or listed and marked,~~ as being sunlight resistant.
Substantiation: The words "or listed and marked" add nothing to the understanding of the question. There is no requirement that the conductors be

"marked", only that they be listed. The fact, that they listed for the use is the rule, the "marking" is optional. The listing neither requires nor precludes the marking of the cable.

Panel Meeting Action: Reject

Panel Statement: The phrase "listed and marked" was added in the 2005 Code cycle to provide greater clarity for inspectors. Some standards require products to be marked "sunlight resistant" while others do not.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10 Negative: 1

Explanation of Negative:

HUDDLESTON, JR., R.: This proposal should have been accepted. The wording in the proposal does away with useless, redundant words, without negating the meaning intended. Any words that are currently in the NEC that can be removed without changing the meaning should be removed.

6-28 Log #3344 NEC-P06 **Final Action: Reject**
(310.8(D) Exception (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc. / Rep. Massachusetts Electrical Code Advisory Committee

Recommendation: Add an exception as follows:

Exception: For drip loops installed to comply with 230.54(F), or for similar drip loops formed in branch-circuit or feeder conductors, conductors extending not more than 900 mm (3 ft) from a cable sheath or from a raceway shall not be required to be sunlight resistant.

Substantiation: The blanket prohibition against nonsunlight-resistant conductors is not appropriate for short lengths of conductors emerging from separate holes in a weatherhead. Although sunlight resistant wire is somewhat more available than when the rule first changed, it still is a special order item in many sizes. Although UL has revised its guide card restrictions on SE cable to give relief where that is the wiring method, they cannot provide relief for building wire generally. This is particularly true for small conductors that usually are not uniformly black with colored tape applied afterwards.

For example, a 60A service might well have a No. 6 grounded circuit conductor (neutral or otherwise), and that conductor would need to be entirely white. Although white wires can be made sunlight resistant, it is much more difficult and expensive than black wire, and therefore we are not likely to see much of it. Relief is needed for installers. The general rule is appropriate, however, for long lengths of conductors exposed to sunlight, such as outdoor installations of single conductors in cable tray or open wiring on insulators.

Panel Meeting Action: Reject

Panel Statement: All conductors and cables exposed to direct sunlight must be sunlight resistant. A failure could occur in a short length of a conductor or cable exposed to direct sunlight just as it could occur in a longer length.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10 Negative: 1

Explanation of Negative:

HUDDLESTON, JR., R.: This proposal should have been accepted. The submitter makes a good argument for allowing non-sunlight-resistant conductors for drip loops.

6-29 Log #927 NEC-P06 **Final Action: Accept**
(310.10, FPN 2)

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Delete.

Substantiation: Edit. A reference to a study involving conduit without specifying whether it was metal, nonmetallic, or flexible types, has limited or no use.

Panel Meeting Action: Accept

Panel Statement: This is to corrolate with the action on Proposals 6-30 & 6-51. The panel disagrees with the submitters substantiation.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10 Negative: 1

Explanation of Negative:

HUDDLESTON, JR., R.: This proposal should have been rejected. A FPN referencing the possibility that conduits installed on rooftops may heat up the conductors is appropriate.

6-30 Log #3151 NEC-P06 **Final Action: Accept**
(310.10, FPN 2)

Submitter: Travis Lindsey, Travis Lindsey Consulting Services

Recommendation: Delete 310.10 FPN No. 2.

Substantiation: This is a companion Proposal to a Proposal to add section 310.15 (B)(2)(c) and should be accepted only if that proposal is accepted.

Panel Meeting Action: Accept

Panel Statement: This is to corrolate with the action on Proposal 6-51.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10 Negative: 1

Explanation of Negative:

HUDDLESTON, JR., R.: This proposal should have been rejected. A FPN is appropriate to alert designers that there is a possibility that conduits on rooftops may cause conductors to become warmer than ambient temperatures.

6-31 Log #2930 NEC-P06 **Final Action: Reject**
(310.11(A)(6), 310.11(B)(1) and 310.11(B)(4))

Submitter: Leif O. Pihl, IBEW LU 292

Recommendation: Revise as follows:

310.11 Marking

(A) Required Information *. All conductors and cables shall… (This text to remain unchanged)*

(1) thru (5) (This text to remain unchanged.)

<u>(6)Color of the insulation, as a full word or as an abbreviation. Tracer color(s) shall follow the primary color, separated by a slash ('/') or an equivalent separation.</u>

<u>Exception No. 1:The color is not required to be marked on the outer jacket of multiconductor cables.</u>

<u>Exception No. 2:A conductor's tracer's color label is not required if the primary color is green and the tracer color is yellow.</u>

<u>Exception No. 3:A conductor's tracer's color label is not required if the tracer color is only black or only white.</u>

<u>FPN: Below are some examples of possible color labels, including the full name, a possible abbreviation, and an example primary color with a tracer color.</u>

<u>BLACK, [BLK.], <BLK/ORG>,</u>
<u>WHITE, [WHT], <WHT/ORG>,</u>
<u>RED, [RED], <RED/ORG>,</u>
<u>BLUE, [BLU], <BLU/ORG>,</u>
<u>GREEN, [GRN], <GRN/ORG>,</u>
<u>YELLOW, [YEL], <YEL/ORG>,</u>
<u>ORANGE, [ORG], <ORG/PRP>,</u>
<u>BROWN, [BRN], <BRN/ORG>,</u>
<u>PURPLE, [PRP], <PRP/ORG>,</u>
<u>PINK, [PNK], <PNK/ORG>,</u>
<u>GRAY, [GRY], <GRY/ORG>,</u>
<u>TAN, [TAN], <TAN/ORG>.</u>

310.11 (B) Method of Marking

Surface Marking *The following conductors and calves shall be durably marked on the surface. The AWG size or circular mil area* <u>and color</u> *shall be repeated at intervals not exceeding 610mm (24 in.). All other markings shall be repeated at intervals not exceeding 1.0m (40 in.).*

310.11 (B)(4) Optional Marking of Wire Size **<u>and Color</u>** *The information required in 310.11(A)(4)* <u>and 310.11(A)(6)</u> *shall be permitted to be marked on the surface of the individual insulated conductors for the following multiconductor cables:*

(remainder unchanged)

Substantiation: This change is being recommended to cut down on the number of hazards that have been introduced in the field do to misidentification of the color imbedded into conductors' insulation.

It has been stated that as few as 8-10%, and as many as one-in-six men have some form of color blindness. (Because the condition is hereditary by way of the X-chromosome, only 0.4-1.0% of women have the condition.) Within these groups of people, total color blindness is very rare, partial color blindness is much more common. People with partial color blindness are in "all walks of life", including Electricians.

It does not take a color blindness condition in order to misidentify a conductor's insulation color. Numerous manufacturers have made colors that are not easy for even the most visually acute people to easily identify. Over time the colors in some conductor's insulation has been known to fade or discolor. Add into these situations problems with poor lighting, dust, and any other number of conditions, and one can see that color misidentification can cause serious safety problems. (Try identifying a green, gray and brown conductor, in a dusty, shady environment, when the manufacturer has not added sufficient pigment to the insulation.)

The ideal solution would be to dictate various ranges of color via existing RGB (red-green-blue), CMYK (Cyan-Magenta-Yellow-Black), frequency, or other identification methods. However, this is not an ideal world. Additional research would be needed in order to find out the exact colors that are less likely to be misidentified by the partially colorblind community. Further, manufacturers would object to additional manufacturing processes for cost and nuisance reasons.

There is a less expensive and arguably better alternative: Add to the already existing labeling requirements to include the color. This code change *does not dictate what the exact color must be* ; the manufacturer gets to decide what color they choose to sell it as. With this code change they must label the conductor so that the end user has a better chance to know *what the color is intended to be* .

Exception No. 1 is a response to criticism this proposal has received.

Exception No. 2's reason is to ease the financial burden upon manufacturers and businesses that specialize in adding tracer colors and/or re-spooling conductors onto spools with a smaller quantity that the OEM made. This exception does not significantly reduce safety, as it is relatively rare for colors other than yellow to be placed on a green conductor.

Exception No. 3's reason is similar to Exception No. 2 as described above. So long as there is only one tracer color, and that color is either white or black, the chances of misidentification are very minimal.

The reason for the Fine Print Note is to give manufacturers and users an example of what to expect the color labels *could* look like. The selection of example color choices are already in the market place, derived from several manufacturers catalogs. Showing an example of what users should look for would improve proper identification, and thus safety.

Panel Meeting Action: Reject

Panel Statement: As indicated in the 2004 ROP, there are times that conductors cannot be marked and, if marked, cannot easily be read. This may occur when the conductors are small or not round. The Code does not prohibit the conductors from being marked, so if desired, the customer may request such marking. There are recognized color standards. One such standard is Munsell, which is often referenced in wire and cable standards.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

6-32 Log #2150 NEC-P06 **Final Action: Reject**
(310.12)

Submitter: Roger Hewitt, Puget Sound Electrical Apprenticeship / Rep. IBEW LU #46

Recommendation: Delete existing text from 310.12 and replace with:

310.12(A) Deleted text of 200.6 (ALL).
310.12(B) Deleted text of 250.119 (ALL).
310.12(C) Deleted text of 210.5 (C).
310.12(D) Deleted text of 215.12 (C).

Substantiation: Multiple sections of the NEC must now be consulted to ensure proper conductor identification. Combining all conductor identification requirements in one section in Article 310 is logical.

Panel Meeting Action: Reject

Panel Statement: There are very specific requirements in 200.6 for grounded conductors and in 250.119 for equipment grounding conductors. Section 200.7 also applies to the marking of grounded conductors. 310.12 applies to conductors for general wiring, whereas 200.7 also applies to conductors used in applications other than general wiring. Combining all the marking requirements into 310.12 would not improve clarity over the present text, which directs the user to the appropriate sections that provide the marking requirements applicable to the particular use of the conductors -- grounded conductors, equipment grounding conductors, branch circuits, and feeders.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

6-33 Log #676 NEC-P06 **Final Action: Reject**
(310.12, FPN (New))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 2 for Action. This action will be considered by Code-Making Panel 2 as a public comment.

Submitter: Jamie McNamara, Hastings, MN

Recommendation: Add a FPN to the end of current 310.12 Conductor Identification to read

<u>FPN: Were two nominal voltage systems exist in a building the systems are often identified by colors as follows, for the lower voltage, A phase is Black, B is Red, C is Blue and the grounded conductor is White. The system with the higher voltage is A phase is Brown, B is Orange or Purple, C is Yellow and the grounded conductor is Gray.</u>

Substantiation: This fine print note would help users of the NEC identify a long time industry practice of a common way the conductors are identified. It helps people recognize the deferent systems and identify the hazards.

Panel Meeting Action: Reject

Panel Statement: The panel believes that this proposal is properly within the purview of CMP 2 for consideration in Chapter 2.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

Comment on Affirmative:

LAIDLER, W.: I agree with the panel that this proposal would be more appropriate under the purview of Panel 2. I also agree with the submitter that a FPN recommending that where different nominal voltage systems are present in a building, a color coding identifying each system is needed. This recommendation would provide an additional means to identify different systems from each other as well as providing an additional safety factor.

6-34 Log #2943 NEC-P06 **Final Action: Reject**
(310.12 Exception)

Submitter: Philip Simmons, Simmons Electrical Services

Recommendation: Move the existing exception that follows 310.12(C) to follow (A).

Substantiation: The existing exception modifies the rule on identification of grounded conductors and should follow (A). The NEC Style Manual requires an exception to directly follow the rule it modifies.

Panel Meeting Action: Reject

Panel Statement: The exception correctly applies only to (C).

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

6-35 Log #193 NEC-P06 **Final Action: Reject**
(310.12(C))

NOTE: The following proposal consists of Comment 6-29 on Proposal 6-20 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 6-20 was:

Revise text as follows:

(C) Ungrounded Conductors. Conductors that are intended for use as ungrounded conductors, whether used as a single conductor or in multiconductor cables, shall be finished to be clearly distinguishable from grounded and grounding conductors. Distinguishing markings shall not conflict in any manner with the surface markings required by 310.11(B)(1). <u>Branch-circuit ungrounded conductors shall be in accordance with 210.5(C). Feeders shall be in accordance with 215.12.</u>

Exception: Conductor identification shall be permitted in accordance with 200.7.

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education

Recommendation: Delete " ~~in any manner~~ " and add <u>"Exception: Where all conductors in an enclosure are the same size and insulation type, a white conductor shall be permitted to be reidentified as a non-grounded conductor without regard to 310.11(B)(1)."</u>

Substantiation: In this circumstance, loss of the markings will produce no hazard. Contrariwise, if the section of wire that happens to be available in the enclosure happens to be the portion containing the markings, it could be unnecessarily burdensome on installers to have to re-pull in order to avoid an apparent conflict between the two NEC sections (presuming small-gage conductors).

Panel Meeting Action: Reject

Panel Statement: The rules for re-identification are covered in Chapter 2.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

6-36 Log #813 NEC-P06 **Final Action: Accept**
(Table 310.13)

Submitter: Austin D. Wetherell, Underwriters Laboratories, Inc.

Recommendation: For Type THHW, extend the size range by adding the following entries at the bottom of the 6th, 7th, and 8th columns: 1001-2000 3.18 125

Substantiation: The size ranges for Type TW (rated 60°C wet or dry), THW (75°C wet or dry), THW-2 (90°C wet or dry) go up to 2000 kcmil. Type THHW has the same construction as the three previously named conductors and is rated 90°C dry, 75°C wet. There is no technical reason to restrict the size of Type THHW to 1000 kcmil. UL 83, the ANSI approved Standard for Thermoplastic-Insulated Wires, covers Type THHW in sizes up to and including 2000 kcmil.

Panel Meeting Action: Accept

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

6-37 Log #814 NEC-P06 **Final Action: Accept in Principle**
(Table 310.13)

Submitter: Austin D. Wetherell, Underwriters Laboratories, Inc.

Recommendation: Delete Types RHW-2 and XHHW-2 from Table 310.13, and revise footnote 4 to Table 310.13 to read "-2" instead of "2".

Substantiation: Types RHW-2 and XHHW-2 are covered by footnote 4 which applies to Types RHW and XHHW. Regarding the footnote, the suffix always has a "-2". If the Panel believes that all the types should appear in the table, an alternative proposal (for consistency), would be to delete footnote 4 from Types THW, THWN, USE, and ZW, and add Types THW-2, THWN-2, USE-2, and ZW-2. Footnote 4 would then need to be removed from the end of the table. Doing so would involve renumbering of the footnotes.

Panel Meeting Action: Accept in Principle

Panel Statement: The panel has satisfied the submitter's intent to have consistency by including the "-2" types within the table.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

[1] Some insulations do not require an outer covering.
[2] Where design conditions require maximum conductor operating temperatures above 90°C (194°F).
[3] For signaling circuits permitting 300-volt insulation.
[4] footnote 4 deleted~~Listed wire types designated with the suffix "2," such as RHW-2, shall be permitted to be used at a continuous 90°C (194°F) operating temperature, wet or dry.~~
[5] Some rubber insulations do not require an outer covering.
[6] Includes integral jacket.
[7] For ampacity limitation, see 340.80.
[8] Insulation thickness shall be permitted to be 2.03 mm (80 mils) for listed Type USE conductors that have been subjected to special investigations. The nonmetallic covering over individual rubber-covered conductors of aluminum-sheathed cable and of lead-sheathed or multiconductor cable shall not be required to be flame retardant. For Type MC cable, see 330.104. For nonmetallic-sheathed cable, see Article 334, Part III. For Type UF cable, see Article 340, Part III.

6-38 Log #2960 NEC-P06 **Final Action: Reject**
(Table 310.13)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panels 7 and 14 for Information.
Submitter: Robert L. Seitz, Artech Engineering
Recommendation: Add text to read as follows:
Marine Shipboard Cable X110 90°C Dry and Wet Location Cross Linked Polyolefin Insulation Thermosetting compound outer cover.
Note 9 - See 505.15(B)(1)(g) for application provisions
Substantiation: A proposal has been submitted for 505.15(B)(1) to allow the installation of Marine Shipboard cable to be installed in Zone 1 classified areas.

I proposed to add marine shipboard to Table 310.13 to permit the installation of this cable with guidance provided in the reference paragraph, and further reference to Article 336.

It is intended that Power cables, control cables and instrument cable configurations all be allowed.

Marine Shipboard cable listed and marked under UL 1309 compliant with IEEE 45 and IEEE 1580.

The purpose is to provide a cable other than MC-HL to be installed in Zone 1 Classified areas to allow proper installation of listed and marked Zone 1 devices. Marine Shipboard cable provides the crush and impact resistance required for MC-HL cable with resistance to abrasion, chemicals and sunlight, durability for a harsh environment while providing necessary flexibility for installation of Zone 1 devices.
Panel Meeting Action: Reject
Panel Statement: Article 310 is for general wiring, and this is for a specific application. Table 310.13 contains information on single conductors, not multiconductor cables. Addition of the proposed text would require a new article to address the power, control, and instrumentation cables mentioned in the substantiation and would, for example, require all of the information contained in Articles 330 or 336. This proposal and panel action should be referred to CMP7 & CMP14 for information.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-39 Log #2990 NEC-P06 **Final Action: Accept in Principle**
(Table 310.13)

Submitter: Robert Konnik, Rockbestos-Suprenant
Recommendation: Revise text to read as follows:
Change wall thickness of Type SIS in Table 310.13 for 1-4/0 AWG from 95 mils to 55 mils.
Substantiation: This appears to be a typographical error, since Table 14 of UL 44 states 55 mils for 1-4/0 AWG which would make SIS cable the same thickness at XHHW.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
Change wall thickness of Type SIS in Table 310.13 for 1-4/0 AWG from “2.41mm” to “1.40 mm” and “95 mils” to “ 55 mils” .
Panel Statement: The panel added the SI equivalent for the corrected value.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-40 Log #3304 NEC-P06 **Final Action: Reject**
(Table 310.13)

Submitter: Redwood Kardon, Code Check Institute
Recommendation: Add text to read as follows:
1. Some insulations do not require an outer covering.
2. Where design conditions require maximum conductor operating temperatures above 90°C (194°F).
3. For signaling circuits permitting 300-volt insulation.
4. Listed wire types designated with the suffix “2” such as RHW-2, shall be permitted to be used as a continuous 90°C (194°F) operating temperature, wet or dry
5. Some rubber insulations do not require an outer covering.
6. Includes integral jacket.
7. For ampacity limitation, see 340.80.
8. Insulation thickness shall be permitted to be 2.03 mm (80 mils) for listed Type USE conductors that have.
9. For the purpose of calculating ampacity of natural rubber insulated conductors it shall be permitted to use TW wire values.

Substantiation: There are many existing structures wired with natural rubber covered conductors. When adding circuit extensions as permitted by code for concealed knob and tube there is no recognized values associated with natural rubber insulated conductors. The current “R” value in the code now represents Thermoset plastic and is not equivalent to the “R” for rubber in earlier editions of the code.
Panel Meeting Action: Reject
Panel Statement: The proposed text is not necessary and may even cause some confusion. When rubber-type insulation was in the NEC it had a 60 degree C temperature value. If rubber-type insulation on conductors is being used as part of an existing wiring method, it would still have a 60 degree C value.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-40a Log #CP600 NEC-P06 **Final Action: Accept**
(310.13,310.6 Exception, 310.10, 310.15, Tables 310.16-310.20, Tables 310.67 through 310.86)

Submitter: Code-Making Panel 6,
Recommendation: Revise 310.13 as follows:
“…the applicable provisions of ~~one or more of the following: Table 310.13, Table 310.61, Table 310.62, Table 310.63, and Table 310.64~~ Tables 310.13(A) through 310.13(E).”
Renumber Table 310.13 as Table 310.13(A)
Renumber Table 310.61 as Table 310.13(B)
Renumber Table 310.62 as Table 310.13(C)
Renumber Table 310.63 as Table 310.13(D)
Renumber Table 310.64 as Table 310.13(E)
310.6 Exception (c) – Revise “310.63” to “310.13(D)”
310.10, FPN No. 1 – revise “Table 310.13 and Table 310.61” to “Table 310.13(A) and Table 310.13(B)”
Revise title – “Table 310.13(A) Conductor Applications and Insulations Rated 0-600 V” Delete phrase “For 601-2000, see Table 310.62” under Thickness of Insulation for Types RHH, RHW, and RHW-2.
Revise title – “Table 310.13(B) Conductor Application and Insulation Rated 2001 V and Higher”. Delete phrase “rated 2001 volts and higher” under Application Provision.
310.15(B)(1) – Revise “310.13” to “310.13(A) and 310.13(C)”
Table 310.16 – In the first line of the Table, revise “310.13” to “310.13(A)”
Table 310.17 – In the first line of the Table, revise “310.13” to “310.13(A)”
Table 310.18– In the first line of the Table, revise “310.13” to “310.13(A)”
Table 310.19 – In the first line of the Table, revise “310.13” to “310.13(A)”
Table 310.20 – In the first line of the Table, revise “310.13” to “310.13(A)”
Tables 310.67 through 310.86 – In the first line of each Table, revise “Table 310.61” to “Table 310.13(B)”
Substantiation: 2.3.1 of the NEC Style Manual stipulates “Tables and figures shall be referenced in the text and shall be designated by the number of the NEC rule in which they are referenced.”

These tables are referenced in 310.13 and, therefore, should be identified as 310.13 tables.

The other revisions correlate references in other Sections with the revisions to the Table numbers.

The titles of Tables 310.13(A) and 310.13(B) were revised for clarity and consistency with other tables in the Article.

The Panel Action on this Proposal should be referred to the following Panels for action on the indicated Sections within their scope.
CMP 5 – 300.3(A)
CMP 7 – 320.104, 322.112, 328.100, 330.112(A), 334.112, 336.104, 340.112, and 396.10(B)
CMP 12 – 610.13, Note to Table 610.14(A)
CMP 15 – 520.42, FPN
CMP 19 – 552.10(B)(2), 675.4(A)
Panel Meeting Action: Accept
Panel Statement: The panel action on this proposal should be referred to the following panels for action on the indicated sections within their scope.
CMP 5 – 300.3(A)
CMP 7 – 320.104, 322.112, 328.100, 330.112(A), 334.112, 336.104, 340.112, and 396.10(B)
CMP 12 – 610.13, Note to Table 610.14(A)

CMP 19 – 552.10(B)(2), 675.4(A)
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-41 Log #399 NEC-P06 **Final Action: Reject**
(310.13, Table 8)

Submitter: Michael Owen, My Trade Training, LLC
Recommendation: Revise existing Table 310.13 to “Table 310.13(A)”. Relocate Table 8, Chapter 9, to Article 310 and reidentify as “Table 310.13(B) Conductor Properties”.
Substantiation: Article 310 is titled “Conductors” and the information contained in existing Table 8 is physical data about conductors where such information may be used for many differing purposes, such as determination of resistance, voltage drop considerations, conversion of AWG to circular mils, etc.
Panel Meeting Action: Reject
Panel Statement: The information provided by Table 8 is widely applied throughout the Code to make various types of conductor calculations, and the information should remain in Table 8.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-42 Log #3517 NEC-P06 **Final Action: Reject**
(Table 310.14(A) (New))

Submitter: Joseph S. Zimnoch, The Okonite Company
Recommendation: Add a new table to read:

Thickness of Composite Insulation for 0- to – 600 Volts Nonshielded Types RHH and RHW-2

Conductor Size (AWG or kcmil)	Inner Layer mm	Inner Layer mils	Outer Layer mm	Outer Layer Mils
14-10	0.76	30	0.38	15
8	1.14	45	0.38	15
6-2	1.14	45	0.76	30
1-4/0	1.40	55	1.14	45
213-500	1.65	65	1.65	65
501-1000	2.03	80	1.65	65
1001-2000	2.54	100	2.41	95

Substantiation: This adds composite wall thicknesses as currently allowed by UL 44, Table 15 and manufactured by many cable companies. The addition of this table allows designers, users and installers to relate manufacturer's literature to the Code. This is a companion proposal to a similar one for 601-2000 v Composite Insulations.
Panel Meeting Action: Reject
Panel Statement: There is not enough technical data and information to support complete correlation of this conductor type in the code.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-43 Log #3518 NEC-P06 **Final Action: Reject**
(Table 310.14(B))

Submitter: Joseph S. Zimnoch, The Okonite Company
Recommendation: Add a new table to read:

Thickness of Composite Insulation for 601- to – 2000 Volts Nonshielded Types RHH and RHW-2

Conductor Size (AWG or kcmil)	Inner Layer mm	Inner Layer mils	Outer Layer mm	Outer Layer Mils
14-10	1.14	45	0.38	15
8	1.40	55	0.76	30
6-2	1.40	55	0.76	30
1-4/0	1.65	65	1.14	45
213-500	1.90	75	1.65	65
501-1000	2.29	90	1.65	65
1001-2000	2.92	115	2.41	95

Substantiation: This adds composite wall thicknesses as currently allowed by UL 44, Table 17 and manufactured by many cable companies. The addition of this table allows designers, users and installers to relate manufacturer's literature to the Code. This is a companion proposal to a similar one for 0-600 v Composite Insulations.
Panel Meeting Action: Reject
Panel Statement: There is not enough technical data and information to support complete correlation of this conductor type in the code
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-44 Log #898 NEC-P06 **Final Action: Reject**
(310.15(4)(a))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
A neutral conductor that carries only the unbalanced current from other conductors of the same circuit <u>or a common neutral in accord with the provisions of 310.15(B)(2)(a)</u> shall not be required to be counted.
Substantiation: Edit. The common neutral of 215.4 should be included.
Panel Meeting Action: Reject
Panel Statement: The panel disagrees that the common neutral won't be a current carrying conductor.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-45 Log #3558 NEC-P06 **Final Action: Reject**
(310.15(A)(2))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 1 for information.
Submitter: Robert Alexander, Laguna Hills, CA
Recommendation: Revise as follows:
310.5(A)(2) Selection of Ampacity. Where more than one calculated or tabulated ampacity including those determined by 110.14(C), could apply for a given circuit ~~length~~ , the lowest value shall be used.
Exception: Where two different ampacities apply to adjacent portions of a circuit, the higher ampacity shall be permitted to be used beyond the point of transition, a distance equal to 3.0 m (10 ft) or 10 percent of the circuit length figures at the higher ampacity, whichever is less. Where an ampacity determined by 110.14(C) is the lowest value this exception shall not apply.
~~FPN: See 110.14(C) for conductor temperature limitations due to termination provisions.~~
Substantiation: This is a coordinating proposal to 110.14(C)(1). It recognizes that if the lowest ampacity value is determined by connections it is the overall limiting value. The FPN is made redundant by the direct reference.
Panel Meeting Action: Reject
Panel Statement: The FPN should remain since it is possible to splice a larger conductor onto the end of a conductor to address the connector temperature limitations.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-46 Log #3135 NEC-P06 **Final Action: Reject**
(310.15(B), FPN)

Submitter: Eric Stromberg, Stromberg Engineering, Inc.
Recommendation: Add new text as follows:
(5) Limitations due to terminations, as per 110.14(c)
Substantiation: It seems as though one of the most misunderstood sections of the *Code* is the sizing of conductors. The requirements of 110.14(c) are, many times, either not known; or are applied incorrectly. Calling out 110.14(c) in 310.15 will point users of the *Code* to this section.
Panel Meeting Action: Reject
Panel Statement: Section 310.15(A)(2) Exception already includes a reference to 110.14(C) and that Section addresses the selection of ampacity whereas 310.15(B) applies to the Tables.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-47 Log #1054 NEC-P06 **Final Action: Reject**
(310.15(B)(2))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise second sentence as follows:
"...or where single conductors or multiconductor cables are stacked or bundled longer than <u>a continuous length</u> of 600 mm (24 in.).
Substantiation: Edit. To clarify that aggregate lengths of close proximity at supports or fastenings are not intended.
Panel Meeting Action: Reject
Panel Statement: This restriction applies to single conductors and multiconductor cables that are bundled or stacked for 600 mm (24 in.) in a continuous length. It does not apply to applications where the conductors or cables are stacked or bundled numerous times in the run. Once a conductor or cable is no longer bundled or stacked, the air around each conductor will lower the conductor operating temperature before it gets to the next bundle and there is no need to reduce the ampacity.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-48 Log #1771 NEC-P06 **Final Action: Reject**
(310.15(B)(2)(a))

Submitter: Danny Thomas, Durham City-County Inspections
Recommendation: Create a second paragraph to 310.15(B)(2)(a) and provide a definition for the word "bundled". Perhaps this could be accomplished by modifying the definition found in 320.2 and adding the following.
"As used in this section, bundled is defined as follows.
Bundled. Cables or conductors that are periodically bound together by being physically tied, wrapped, taped, or installed in a raceway."
Substantiation: What is the meaning of the word "bundled" in this specific code section? Do we go the dictionary and use a definition found in it, which might match what the NEC is trying to accomplish?
For example as found in Webster's Dictionary!
"a group of things fastened together", "to hustle or hurry", "a considerable number of things".

Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any evidence that the lack of a definition of the term "bundled" is creating a problem in the industry. Bundling of conductors or cables does not require that they be physically tied, wrapped, taped or installed in a raceway; they could simply be installed in close proximity in the same hole in the structure framing.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-49 Log #484 NEC-P06 **Final Action: Reject**
(Table 310.15(B)(2)(a), Exception No. 6 (New))

Submitter: Stanley J. Folz, Morse Electric Company
Recommendation: Add an exception to read:
Exception No. 6: The derating factors shown in Table 310.15(B)(2)(a) do not apply to branch circuits supplying an individual dwelling unit.
Substantiation: Although other applications certainly require derating because of the continuous currents encountered. Dwelling units essentially have one continuous load, the HVAC equipment. All other loads are either small or cycling. It was a common occurrence to have ten to fifteen cables in the same set of bored holes "home run" to the panel. Fifteen 12/2 NM cables would result in 30 conductors that would be derated 45 percent per Table 310.15(B)(2)(a). This would result in 13.5 amperes allowed per 12/2 NM cable. 13.5 ampere times fifteen 12/2 NM cables results in a 110 ampere load @ 220 volts on a typical 100 ampere panel. This type of loading is never encountered in an individual dwelling. This rule does not contribute any additional safety when applied to individual dwelling units.
Panel Meeting Action: Reject
Panel Statement: Testing data has shown that the submitters substantiation is not accurate.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-50 Log #1405 NEC-P06 **Final Action: Reject**
(310.15(B)(2)(a), Exception No. 6 (New))

Submitter: George Stolz, II, Pierce, CO
Recommendation: Add an Exception to read:
<u>Exception No. 6: Of those conductors that are switched cable or raceway installations, only the maximum number of conductors capable of being simultaneously energized need to be derated.</u>
Substantiation: In most threeway and fourway switching methods, the load is alternated between travelers, eliminating the need to include both travelers in derating.
Panel Meeting Action: Reject
Panel Statement: The proposed exception is not necessary. The present language of 310.15(B)(2) already permits what the submitter is proposing.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-51 Log #3150 NEC-P06 **Final Action: Accept in Principle**
(310.15(B)(2)(c))

TCC Action: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the panel as a public comment.
Submitter: Travis Lindsey, Travis Lindsey Consulting Services
Recommendation: Add 310.15(B)(2)(c) to read:
(c) Conduits Exposed to Sunlight on Rooftops. Where conductors or cables are installed in conduits exposed to direct sunlight on or above rooftops, the adjustments shown in Table 310-15(B)(2)(c) shall be added to the outdoor temperature to determine the applicable ambient temperature for application of the correction factors in Tables 310.16 and 310.18.

Table 310.15(B)(2)(c) Ambient Temperature Adjustment for Conduits Exposed to Sunlight On or Above Rooftops

<u>Distance Above Roof</u>	<u>Temperature Adjustment</u>
On roof, up to and including 13 mm (½ in.) above roof	33 °C (60 ºF)
Above 13 mm (½ in.), up to and including 90 mm (3-½ in.) above roof	22 °C (40 ºF)
Above 90 mm (3-½ in.), up to and including 300 mm (12 in.) above roof	17 °C (30 ºF)
Above 300 mm (12 in.), up to and including 900 mm (36 in.) above roof	14 °C (25 ºF)

Substantiation: 310.10 stipulates that no conductor shall be used in such a manner that its operating temperature exceeds that designated for the type of insulated conductor involved. The air inside conduits in direct sunlight is significantly hotter than the surrounding air, and appropriate ampacity corrections must be made to comply with 310.10. Addition of this new Section and Table will provide the necessary ampacity derating requirements for conduits containing conductors installed on rooftops where they are exposed to the sun.
Full details are contained in the test report entitled *Effect of Rooftop Exposure on Ambient Temperatures Inside Conduits, November 2005.*
This is a companion proposal to a proposal to delete 310.10 FPN No. 2.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
Add 310.15(B)(2)(c) to read:
(c) Conduits Exposed to Sunlight on Rooftops. Where conductors or cables are installed in conduits exposed to direct sunlight on or above rooftops, the adjustments shown in Table 310-15(B)(2)(c) shall be added to the outdoor temperature to determine the applicable ambient temperature for application of the correction factors in Tables 310.16 and 310.18.

Table 310.15(B)(2)(c) Ambient Temperature Adjustment for Conduits Exposed to Sunlight On or Above Rooftops

Distance Above Roof to <u>**Bottom of Conduit**</u>	<u>**Temperature Adder**</u>	
	C°	F°
0 thru 13 mm (½ in.)	33	60
Above 13 mm (½ in.), thru 90 mm (3-½ in.)	22	40
Above 90 mm (3-½ in.), thru 300 mm (12 in.)	17	30
Above 300 mm (12 in.), thru 900 mm (36 in.)	14	25

Panel Statement: The revisions to the Table improve clarity since the values shown are temperature adders for each set of numeric units and not direct conversions from ºC to ºF.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 9 Negative: 2
Explanation of Negative:
HUDDLESTON, JR., R.: This proposal should have been rejected. The panel did not really examine the implications of this proposal; rather, they blindly accepted that there is merit to de-rating ampacity in conduits on rooftops due to one elaborate and "scholarly" study. The real implications are onerous - a derating to 33 percent of Table 310.16 ampacity for conductors run across the roof (the example presented by this panel member to the panel) is completely unwarranted. What is the problem that we are trying to fix? Is there any documented evidence of failures of conductors installed on rooftops? None was presented to the Code Panel.
Industrial users of the NEC will be affected in their installation and wiring of rooftop blowers and HVAC units, as well as other rooftop electrical devices. Benefits to the copper industry are obvious. Benefits to users of conductors are much less so. The bottom line is that this proposal stands to make it much more expensive to install equipment on rooftops without any documented safety benefit.
MCCLUNG, L.: Personal experience with conductors installed in metallic conduits across rooftops during 41 years of continuous service at facilities ranging from Edmonton, Alberta to Ponce, Puerto Rico, without a failure of such 600V conductors leads to the conclusion that normal industrial installations using the allowable ampacities with existing derating already in the NEC are safe and reliable.
Comment on Affirmative:
KENT, G.: I agree with this proposal, but feel it necessary to point out averaging was used for the ambient temperature in the study. The Code should reference this averaging to keep inspectors/local jurisdictions from using the hottest day on record as the temperature to begin a de-rating factor from.
LAIDLER, W.: I agree with the panel's action to accept this proposal in part based on the technical substantiation provided by the submitter. The panel should have added language that would give guidance to how the maximum outside ambient temperature should be determined. An AHJ could take the maximum temperature of the hottest day of the year for that location and require that 30°F be added to that temperature to arrive at the temperature in which the correction factors in Tables 310.16 and 310.18 would be applied. I do not believe that the submitter intended that a maximum instantaneous value be used when applying this new section. It was stated in the submitter's substantiation that an average or median temperature value was used in experiments to avoid using extreme temperatures. A FPN could be added along with this new section making reference to several different ways that could be used in determining the maximum average temperature for a specific location.
ZIMNOCH, J.: The submitter should submit a listing of temperatures for various cities.

6-52 Log #2237 NEC-P06 **Final Action: Accept**
(310.15(B)(2)(a), FPN 2)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 8 for Comment.
Submitter: Donald A. Ganiere, Ottawa, IL
Recommendation: Revise as follows:
FPN No. 2: See 366.23(A) for ~~correction~~ <u>adjustment</u> factors for conductors in sheet metal auxiliary gutters and 376.22 for correction factors for conductors in metal wireways.

Substantiation: The term "adjustment factors" is used for adjusting the conductor ampacity where there are more than three current carrying conductors in a raceway or cable. The term "correction factor" is used to correct the conductor ampacity for ambient temperature. I have submitted a proposal to make the same wording change in 366.23(A).
Panel Meeting Action: Accept
Panel Statement: This Panel Action should be sent to CMP 8 for correlation.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-53 Log #483 NEC-P06 **Final Action: Reject**
(310.15(B)(2) Exception No. 3)

Submitter: Stanley J. Folz, Morse Electric Company
Recommendation: Revise text to read:
Exception No. 3: Derating cables shall ~~not~~ apply to conductors in nipples having a length ~~not exceeding~~ greater than 600 mm (24 in.).
Substantiation: Creates positive language.
Panel Meeting Action: Reject
Panel Statement: The present language of the exception meets the requirements of section 3.1.4 of the NEC Style Manual by modifying the mandatory language. The Panel understands that this Proposal addresses 310.15(B)(2)(a) Exception No. 3.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-54 Log #264 NEC-P06 **Final Action: Reject**
(310.15(B)(2) Exception No. 4)

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
Derating factors shall not apply to underground conductors entering or leaving an outdoor trench if those conductors have ~~physical~~ protection in the form of rigid metal conduit, intermediate metal conduit, or rigid nonmetallic conduit having a length not exceeding 3.05 m (10 ft) and the number of conductors does not exceed four.
Substantiation: Use of the word "physical" is superfluous - the purpose is obvious. In some instances, one could argue for the use of "mechanical" to differentiate that from e.g., "thermal" damage, but context makes the intended sense quite clear, rendering anything like this completely unnecessary.
Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "protection" means "physical protection."
Panel Meeting Action: Reject
Panel Statement: The word "physical" emphasizes the importance of protection of underground conductors entering or leaving an outdoor trench and should remain in the text. The word "physical" is appropriate since it specifically defines the type of protection being provided and complies with 3.2.5.5 of the NEC Style Manual. There are other types of protection that may be provided, such as protection from EMF interference, overheating, voltage and overcurrent.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-55 Log #2777 NEC-P06 **Final Action: Reject**
(310.15(B)(2) Exception No. 6 (New))

Submitter: Wayne Foster, Lynn Electric Inc.
Recommendation: Add new text to read as follows:
Exception No. 6: derating factors shall not apply to cables run in bored holes, or cut notches in joists or interior walls in dwellings under the following conditions:
(1) Where these cables are run in bored holes in a wall, floor, or ceiling space, and where the ambient temperature will not exceed 30°C in normal use and,
(2) Where the ambient temperature will not exceed 30°C in normal use and
(3) Where these cables are not larger than No. 12 Cu or No. 10 AL
(4) This exception shall not apply where more than two NM cables containing two or more current carrying conductors are bundled together and pass through wood framing that is to be fire- or draft stopped using thermal insulation or sealing foam, a required in 334.80.
Substantiation: Where there are cables run in bored holes in joists with spacing between each joist, the maximum load on these cables, will most likely never be used because of the load profiles in dwelling units. The temperature rise of these cables is minimal, under these conditions. By limiting this exception to 15 and 20 ampere circuits, the range, dryer, electric furnace, etc. are excluded and the likelihood of more than one or two heavily load circuits are eliminated.
The code now requires multiple holes to be bored in floor joists to accommodate the runs and building regulations limit the amount of these holes that can be safely bored into floor joist. This places an undue burden on the electrician to find exit routing from panelboads. This proposal will provide some relief from the stringent requirements.
And that the dwelling unit load is so diverse and that those circuits are almost totally for convenience: therefore the need for derating is not required as circuits will be used minimally and in small groups. The heaviest loaded circuits would likely be one or two small appliance branch circuits, a bathroom receptacle circuit, and a laundry circuit. Those circuits, mixed in with the other circuits would not require derating.
Panel Meeting Action: Reject
Panel Statement: Testing data has shown that the submitters substantiation is not accurate.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-56 Log #3345 NEC-P06 **Final Action: Reject**
(310.15(B)(2)a. Exception No. 6 (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc. / Rep. Massachusetts Electrical Code Advisory Committee
Recommendation: Insert the following as a new Exception No. 6 :
Exception No. 6: Derating factors shall not apply where 30 or fewer current-carrying conductors occupy no more than 20 percent of the interior cross sectional area of Cellular Concrete Floor Raceways, Article 372; Cellular Metal Floor Raceways, Article 374; and Underfloor Raceways, Article 390.
Substantiation: For good reason, these raceway articles forbid the reinsulation of conductors at abandoned outlets. However, the present Code builds in a powerful economic incentive to violate these rules. This is because the current text of this section and its table complicate the simple solution to the problem. If this proposal is accepted, it will be a simple matter to use one pair of conductors for each outlet, spliced in a header duct of some kind. Then if an outlet is to be abandoned, the pair of wires can be simply withdrawn with a pull wire left in place for the future. Although this can be done now, the literal effect of the current code is to require oversized conductors on many runs, which needlessly discourages the practice. In fact, with generally small loads split up over many pairs of wires, or even a large load using only one pair of wires in a group, there is no problem. These raceways are large in area and well embedded in an excellent "heat sink" medium.
This wording adds restrictions comparable to metal wireways. This will provide a more technically correct basis for the existing rule in terms of preventing overheating. If these installations overheat, then the wireways would also. One of these metal raceways embedded in a concrete floor would be very unlikely to cause a problem for the enclosed conductors based on standard usage patterns and similarities with other raceways of comparable cross section.
Panel Meeting Action: Reject
Panel Statement: The submitter has provided no technical data or calculations in his substantiation to support this new exception.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-57 Log #1065 NEC-P06 **Final Action: Accept in Principle in Part**
(310.15(B)(3))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Where bare or covered conductors are ~~used~~ installed with insulated conductors in a raceway, auxiliary gutter, cable tray, or supported on a messenger , ~~their allowable ampacities shall be limited to those permitted for the adjacent conductors~~ they shall be considered to have an insulation temperature rating equal to the lowest insulation temperature rating of the insulated conductors, for the purpose of determining ampacity.
Substantiation: Edit. Present wording requires a bare neutral service conductor which is sized larger than the insulated conductors, to compensate for harmonic currents, to have an ampacity limited to that of the ungrounded conductors, which in effect requires an increased ampacity for those conductors even if unaffected by harmonic currents. "Adjacent" is not defined and is to be avoided per Style manual. A bare individual neutral installed as an open conductor in overhead spans per 225.6 and 225.14 is "adjacent" to ungrounded conductors and limited to their ampacity even though Table 310.21 indicates higher ampacity than insulated conductors of the same size in Table 310.17.
Panel Meeting Action: Accept in Principle in Part
The panel accepts the change of "used" to "installed". The Panel does not accept the phrase "in a raceway, auxiliary gutter, cable tray, or supported on a

messenger". The Panel accepts the last phrase in Principle. The Section shall read: "Where bare or covered conductors are installed with insulated conductors, the temperature rating of the bare or covered conductor shall be equal to the lowest temperature rating of the insulated conductors for the purpose of determining ampacity."

Panel Statement: The panel did not accept the phrase "in a raceway…" since the rule applies regardless of the installation and by listing some installations, others may be inadvertently omitted. The panel revised the last phrase for clarity.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

6-58 Log #3657 NEC-P06 **Final Action: Reject**

(310.15(B)(4)(a))

Submitter: George Rohanna, Local Union #98 IBEW

Recommendation: New wording - A neutral conductor that carries only the unbalanced current (of a dedicated circuit).

Delete - From other conductors of the same circuit.

Substantiation: Delete (From other conductors of the same circuit) is more confusing than - "of a dedicated circuit".

Panel Meeting Action: Reject

Panel Statement: The proposed wording does not improve the clarity of the section.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

6-59 Log #1589 NEC-P06 **Final Action: Accept**

(310.15(B)(4)(b))

Submitter: Technical Correlating Committee on National Electrical Code®,

Recommendation: Make the following change in 310.15(B)(4)(b):

Change "neutral" to "neutral conductor." Also change "wire" to "conductor."

The revised text would appear as follows:

(b) In a 3-wire circuit consisting of two phase ~~wires~~ conductors and the neutral conductor of a 4-wire, 3-phase, wye-connected system, a common conductor carries approximately the same current as the line-to-neutral load currents of the other conductors and shall be counted when applying the provisions of 310.15(B)(2)(a).

Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).

The Task Group has proposed the following definitions to be added to Article 100:

● **Neutral conductor.** A circuit conductor connected to the neutral point of a system.

● **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.

This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals

● The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.

● The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.

Also, the word "wire" should be replaced by "conductor" for consistency.

Additional information is available in the Task Group report.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10 Negative: 1

Explanation of Negative:

LAIDLER, W.: I am voting against this proposal. I was a member of the TCC Task Group that developed the definition of "Neutral Conductor". After reviewing the explanation of negative votes from some members of the TCC, I'm now of the opinion that the Task Group did not come up with a clear definitive definition of what constitutes a neutral conductor. The definition proposed makes no reference to whether or not the neutral conductor needs to be grounded. Any new definition of a neutral conductor should make reference to how it relates to the long used Code terminology of a grounded conductor. Until this is done, the language should remain unchanged.

Comment on Affirmative:

CLINE, S.: While I agree that the use of the word "neutral" itself demands change, that is a separate argument for another Panel. This section itself has what seems to me to be a syntax flaw where it apparently refers to the same conductor as both a "neutral" and as a "common" (a good word to use!). But still, this is not a part of this Proposal's subject.

I can agree that changing "wire" to "conductor" in either "3-wire" or "4-wire" is a different subject with different impacts in the trade, and should not be done here.

Changing "wire" after "phase" to "conductor" is desirable. "Conductor" is an accurate and more inclusive term, and gives more consistency to the Code.

The addition of the word "conductor" after "neutral" will help to focus that the item being discussed is part of the circuit construction, not a point of connection in a piece of equipment.

6-60 Log #1590 NEC-P06 **Final Action: Accept**

(310.15(B)(4)(c))

Submitter: Technical Correlating Committee on National Electrical Code®,

Recommendation: Make the following change in 310.15(B)(4)(c):

Change "neutral" to "neutral conductor."

The revised text would appear as follows:

(c) On a 4-wire, 3-phase wye circuit where the major portion of the load consists of nonlinear loads, harmonic currents are present in the neutral conductor; the neutral conductor shall therefore be considered a current-carrying conductor.

Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).

The Task Group has proposed the following definitions to be added to Article 100:

Ballot Results: Affirmative: 10

Ballot Not Returned: 1 de Vega, H.

6-61 Log #194 NEC-P06 **Final Action: Accept in Principle**
(310.15(B)(6))

NOTE: The following proposal consists of Comment 6-40 on Proposal 6-41 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 6-41 was:

Revise as follows:

(6) 120/240-Volt, 3-Wire, Single-Phase Dwelling Services and Feeders. For individual units of one family, two-family and Multifamily dwelling units, conductors, as listed in Table 310.15(B)(6), shall be permitted as 120/240-volt, 3-wire, single-phase service-entrance conductors, service lateral conductors, and feeder conductors that serve as the main power feeder to ~~a~~ each ~~dwelling~~ unit and are installed in raceway or cable with or without an equipment grounding conductor. For application of this section, the main power feeder shall be the feeder(s) between the main disconnect and the lighting and appliance branch-circuit panelboards(s). The feeder conductor to ~~a dwelling~~ each unit shall not be required to be larger than their service-entrance conductors. The grounded conductor shall be permitted to be smaller than the ungrounded conductors, provided the requirements of 215.2, 220.22, and 230.42 are met.

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Recommendation: Accept the panel action in principle. Clarify the permissible application of the multiple feeder allowances as one of the following four options:

1) "… the main power feeder shall include the feeder(s) serving only loads associated with a single dwelling unit and running to but not originating in the lighting and appliance branch-circuit panelboard(s) serving the dwelling unit." OR

2) "… the main power feeder shall include the feeder(s) serving only loads associated with a single dwelling unit and running to the lighting and appliance branch-circuit panelboard(s) serving the dwelling unit." OR

3) "… the main power feeder shall include the feeder(s) serving only dwelling loads and running between the main disconnect and the lighting and appliance branch-circuit panelboard(s) serving the dwelling unit." OR

4) "… the main power feeder shall include the feeder(s) serving only dwelling loads and running to but not originating in the lighting and appliance branch-circuit panelboard(s) serving a particular dwelling unit."

Substantiation: By clarifying that this note applies to dwelling units within multifamily housing, which is well advised, the proposal raises important questions as to exactly which panelboard feeders are within the scope of this allowance. Options 1 and 2 exclude feeders that are comprised of dwelling loads, but that serve multiple dwelling units. Options 3 and 4 allow such a feeder. Options 1 and 2 as a group and options 3 and 4 as a group sort out whether this allowance applies to subpanel feeders within a dwelling unit. Dwelling unit subpanel loads do not present the same diversity as dwelling unit panels serving the entire dwelling unit, and thereby undercut one of the traditional supporting assumptions underlying these allowances. However, all of these interpretations are possible given the ambiguous "(s)" endings on the word "feeder" and "panelboard." CMP 6 needs to clarify exactly which feeders qualify for this allowance.

Panel Meeting Action: Accept in Principle

Remove the 2 sets of parentheses and the duplicate "s" on panelboards so that the section reads:

(6) 120/240-Volt, 3-Wire, Single-Phase Dwelling Services and Feeders. For individual dwelling units of one family, two-family, and multifamily dwellings, conductors, as listed in Table 310.15(B)(6), shall be permitted as 120/240-volt, 3-wire, single-phase service-entrance conductors, service lateral conductors, and feeder conductors that serve as the main power feeder to each dwelling unit and are installed in raceway or cable with or without an equipment grounding conductor. For application of this section, the main power feeder shall be the feeder between the main disconnect and the lighting and appliance branch-circuit panelboard. The feeder conductors to a dwelling unit shall not be required to have an allowable ampacity rating greater than their service-entrance conductors. The grounded conductor shall be permitted to be smaller than the ungrounded conductors, provided the requirements of 215.2, 220.61, and 230.42 are met.

Panel Statement: The panel agrees that the present wording is ambiguous. It is the panel's intent that this allowance apply only to conductors carrying 100% of the dwelling unit's diversified load.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

6-62 Log #1138 NEC-P06 **Final Action: Reject**
(310.15(B)(6))

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Add:

"120/208 volt and" ahead of "120/240 volt" in two places.

Substantiation: Edit. Present wording excluded application where the service supply is 120/208 volt 3 phase 4-wire, for example serving an apartment building.

Panel Meeting Action: Reject

Panel Statement: The neutral conductor of a 120/208 volt, 3 wire system does carry significant load. In a 120/240 volt system the load on the neutral conductor is reduced. No substantiation was provided to justify applying the Table to 120/208-volt service conductors.

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Add:

"or 120/208-volt" after "120/240-volt".

Substantiation: Edit. This section should be applicable where dwelling units in apartment buildings are supplied with 120/208-volt systems.

Panel Meeting Action: Reject

Panel Statement: The neutral conductor of a 120/208 volt, 3 wire system does carry significant load. In a 120/240 volt system the load on the neutral conductor is reduced. No substantiation was provided to justify applying the Table to 120/208-volt service conductors.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

6-64 Log #1341 NEC-P06 **Final Action: Reject**
(Table 310.15(B)(6))

Submitter: Mike Holt, Mike Holt Enterprises

Recommendation: Add reference to table 310.15(B)(6)

(6) 120/240-Volt, 3-Wire, Single-Phase Dwelling Services and Feeders. For individual dwelling units of one family, two-family, and multifamily dwellings conductors as listed in Table 310.15(B)(6), shall be permitted as 120/240-volt, 3-wire, single-phase service-entrance conductors, service lateral conductors, and feeder conductors that serve as the main power feeder to each dwelling unit and are installed in raceway or cable with or without an equipment grounding conductor. For application of this section, the main power feeder shall be the feeder(s) between the main disconnect and the lighting and appliance branch-circuit panelboards(s). The feeder conductors to a dwelling unit shall not be required to have an allowable ampacity rating greater than their service-entrance conductors. The grounded conductor shall be permitted to be smaller than the ungrounded conductors <u>and sized in accordance with Table 310.15(B)(6)</u> provided the requirements of 215.2, 220.61, and 230.42 are met.

Substantiation: This section should be re-written to clarify how the grounded conductor is to be sized.

Panel Meeting Action: Reject

Panel Statement: The grounded conductor is sized in accordance with 230.42(C), not Table 310.15(B)(6). 230.42(C) is presently referenced in 310.15(B)(6). The panel assumes that the submitter's proposal relates to 310.15(B)(6) rather than the Table.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

6-65 Log #1410 NEC-P06 **Final Action: Reject**
(310.15(B)(6))

Submitter: George Stolz, II, Pierce, CO

Recommendation: Revise the text to read as follows:

<u>Conductors shall be permitted to be connected to equipment rated according to Table 310.15(B)(6) under the following conditions:</u>

<u>(a) The supply is a single phase, 120/240 Volt, 3 wire system.</u>

<u>(b) The conductors are installed for one-family, two-family, and multifamily dwellings.</u>

<u>(c) The conductors are service laterals, service entrance conductors, and/or feeders that serve only one individual dwelling unit.</u>

<u>(d) These conductors shall serve as the main power feeder to each dwelling unit.</u>

<u>(e) These conductors shall serve lighting and appliance branch-circuit panelboards.</u>

<u>For the purposes of this section, the main power feeder shall be the feeder(s) between the main disconnect and the panelboard(s). The grounded conductor shall be permitted to be smaller than the ungrounded conductors, provided the requirements of 215.2, 220.61, 230.42 are met.</u>

Substantiation: As the text currently stands, the first sentence of this section is very difficult to read, containing 56 words separated by no less than nine commas. This section is packed with various requirements. It would be much clearer to understand and more readily and accurately applied in a list format. It is very easy to misapply this section as it currently stands.

In addition, given the smaller size of conductors and the general hierarchy of overcurrent protection and conductor installation, the sentence that allows feeders to not be larger than the service conductors is unnecessary. If such an improbable installation were to occur, then it's reasonable to require the conductor ampacities given in subsequent tables to apply.

Panel Meeting Action: Reject
Panel Statement: The proposed text does not require compliance with all the list items and omits some existing requirements (“and are installed in raceway or cable with or without an equipment grounding conductor”). The panel appreciates the submitter’s efforts to improve the readability and clarity of the Section but any revised text must require that the installation comply all of the existing requirements.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-66 Log #1483 NEC-P06 **Final Action: Accept**
(Table 310.15(B)(6))

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise Table 310.15(B)(6) so the service or feeder rating is on the left of the table, and the conductor sizes are on the right as displayed here:

	Conductor (AWG or kcmil)	
Service or Feeder Rating (Amperes)	**Copper**	**Aluminum or Copper-Clad Aluminum**
100	4	2
110	3	1
125	2	1/0
150	1	2/0
175	1/0	3/0
200	2/0	4/0
225	3/0	250
250	4/0	300
300	250	350
350	350	500
400	400	600

Substantiation: When using Table 310.15(B)(6), the code user is trying to determine what size of conductor is required for a particular service or feeder. The existing layout of the table is geared for the user who knows the size of conductor and is trying to determine the size of overcurrent device. This is not the way this table is most commonly used. The table should be changed so that it is more user-friendly.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-67 Log #3615 NEC-P06 **Final Action: Reject**
(310.15(B)(6))

Submitter: Joseph A. Hertel, State of Wisconsin
Recommendation: Add an Exception No. 6 to the requirements of NEC 310.15 (B)(6).
Exception No. 6: The derating factors shown in Table 310.15 (B)(2)(a) do not apply to branch cicuits supplying an individual dwelling unit.
Substantiation: The circuit diversity in an individual dwelling unit is very high. The State of Wisconsin has allowed this exception for more than 20 years with no adverse effects. This exception would allow the use of the exception in NEC 312.5(C) for a dwelling without having to additionally derate the conductor ampacity.
Panel Meeting Action: Reject
Panel Statement: The submitter did not provide any data to support his proposal and testing data has shown that the submitters substantiation is not accurate. In addition, the section referenced is inappropriate for branch circuits.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:
KOMASSA, D.: I believe this proposal should have been accepted. Twenty years of successful experience in the entire state of Wisconsin is indeed adequate technical support to justify this change.

6-68 Log #2557 NEC-P06 **Final Action: Reject**
(Table 310.63)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reported as “Reject” because less than two-thirds of the members eligible to vote have voted in the affirmative.
Submitter: Bruce McClung, McSquared Electrical Consulting LLC
Recommendation: Revise text/table as follows:
New Title: “Table 310.63 Thickness of Insulation and Jacket for Nonshielded Solid Dielectric Insulated Conductors Rated 2001 to 5000 Volts” and restore contents of Table 310.63 to include all that portion of Table 310.63 under the 2001 - 5000 Volts subheading from the NEC 2002 Edition.
Substantiation: Support continued/revised permitted use of nonshielded multiconductor cables rated 2001-5000 volts listed by a qualified testing laboratory if the cable has an overall metallic sheath or armor as covered under Section 310.7 Direct Burial Conductors. Exception; and support new permitted use of nonshielded multiconductor cables rated 2001-5000 volts listed by a qualified testing laboratory if the cable has an overall metallic sheath or armor as covered under new 310.6 Shielding. Exception:
Panel Meeting Action: Reject
Panel Statement: The panel agreed with the substantiation submitted for the 2005 Code that the use of nonshielded conductors and cables above 2400 volts provides an increased safety hazard for personnel in close proximity to energized nonshielded conductors or cables and should be eliminated.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 7 Negative: 4
Explanation of Negative:
HUDDLESTON, JR., R.: This proposal should have been accepted. See comments on Proposals 6-13 through 6-19.
KOMASSA, D.: See my explanation of negative vote on Proposal 6-19.
MCCLUNG, L.: Starting with Table 310.63 in the existing 2005 NEC make modifications as follows:
1. Change heading to state: “Thickness of insulation in jacket for nonshielded solid dielectric insulated conductors rated 2400V and 5000V.”
2. Change “dry locations, single conductor” column’s title to state: “dry locations single conductor - 2400V.”
3. Change “wet or dry locations” column’s title to state: “wet or dry locations-2400V and 5000V Type AC or Type MC.”
4. Delete the “jacket” column under “single conductors” - “wet or dry locations.”
WETHERELL, A.: See my explanation of negative vote on Proposal 6-13.
Comment on Affirmative:
CLINE, S.: I understand that this is a difficult subject with two widely separated camps. It seems to have overall people-resistant safety on one side and practical risk-management on the other. The danger when there is a failure is high and, in some cases, literally explosive.
As currently worded , I believe that 310.7 applies to the construction requirements for cables, not applications of voltage operation. It says “rated above,“ not “operated above“ as 310.6 does. It appears that 310.6 still limits the operational voltage of non-shielded cables to below 2000 in the general rule, and 2400 volts under the exception’s allowances.
Evidentiary Substantiation of the equivalent safety performance of an overall metallic sheath or armor compared to shielded construction needs to be presented for me to agree to this expansion of applied use.
LAIDLER, W.: See my affirmative comment on Proposal 6-13.
ZIMNOCH, J.: See my explanation of affirmative vote on Proposal 6-13.

6-69 Log #3303 NEC-P06 **Final Action: Accept in Principle**
(Table 310.63)

Submitter: Joe Zimmoch, The Okonite Company
Recommendation: Add the following to:
Table 310.63 Thickness of Insulated Conductors Rated 2400 Volts and Jacket for Nonshielded Solid Dielectric Insultion (as shown below)

[Proposal 6-69 (Log #3303)]

1001-1250	3.56	140	2.92	115	1.65	65	4.32	170	3.56	140	2.29	115
1251-1500	3.56	140	2.92	115	2.03	80	4.32	170	3.56	140	2.29	115
1501-2000	3.56	140	2.92	115	2.03	80	4.32	170	3.94	155	3.56	140

Substantiation: This extends the conductor range to 2000 kcmil for Table 310.63. Other tables such as 310.13, 310.62, and 310.64 list insulation and jacket thickness to 2000 kcmil. Cables rated 2.4 kV (formerly 5 kV) with conductor sizes from 1001 to 2000 kcmil have been manufactured and used for many years but without a UL label because these sizes are not listed in the Code. These thickness are in accordance with ICEA S-96-659 "Standard for Non-Shielded Cables".

Panel Meeting Action: Accept in Principle

Revise the 1st two entries in the next to last column of the Table from "2.29" to "2.92" to corrolate with the last columns values of "115".

Panel Statement: The panel accepts the proposal with the correction of the two conversion errors.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10 Abstain: 1

Explanation of Abstention:

MCCLUNG, L.: Fails to address 5000V nonshielded cable restoration issue.

6-70 Log #195 NEC-P06 **Final Action: Accept in Principle**
(Table 310.64)

NOTE: The following proposal consists of Comment 6-57 on Proposal 6-50 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 6-50 was:

Revise Table 310.64 to include 173 Percent Insulation Levels.

Add an additional column with the heading "173 Percent Insulation Level3" after each of the five "133 Percent Insulation Level 2" columns.

The insulation thicknesses to be entered into the new columns is as follows:

	5001-8000 Volts		**8001-15,000 Volts**		**15,001-25,000 Volts**	
	mm	**mils**	**mm**	**mils**	**mm**	**mils**
8	—	—	—	—	—	—
6-4	4.45	175	—	—	—	—
2	4.45	175	6.60	260	—	—
1	4.45	175	6.60	260	10.67	420
1/0-2000	4.45	175	6.60	260	10.67	420

	25,001-28,000 Volts		**28,001-35,000 Volts**	
	mm	**mils**	**mm**	**mils**
8	—	—	—	—
6-4	—	—	—	—
2	—	—	—	—
1	11.30	445	—	—
1/0-2000	11.30	445	14.73	580

Add an additional note to the table as follows:

3 173 Percent Insulation Level. Cables in this category shall be permitted to be applied under the following conditions.

(1) in industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons service the installation

(2) where the fault clearing time requirements of the 133 percent level category cannot be met

(3) where an orderly shutdown is essential to protect equipment and personnel, and

(4) there is adequate assurance that the faulted section will be de-energized in an orderly shutdown

Also, cables with this insulation thickness shall be permitted to be used in 100 or 133 percent insulation level applications where additional insulation strength is desirable.

Submitter: H. R. Stewart, HRS Consulting

Recommendation: In second column over 2001-5000 volts, add "100 percent insulation".

Substantiation: This appears to have been left off. This corresponds with the revision Note 2 as made in Proposal 6-51. This makes it much clearer that 5KV shielded cables with 90 mils of insulation is a 100 percent insulation level.

Added note: I support the inclusion of the 173 percent insulation level in Table 310.64.

Panel Meeting Action: Accept in Principle

In second column over 2001-5000 volts, add "100 Percent Insulation Level 1 ".

Panel Statement: The addition of "level" provides consistency with the other columns. The addition of the 173% insulation level columns and the other proposed text, as modified, was included in the 2005 Code.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

6-71 Log #196 NEC-P06 **Final Action: Reject**
(Table 310.64)

NOTE: The following proposal consists of Comment 6-59 on Proposal 6-51 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 6-51 was:

In Note 2, revise the last sentence as follows:

"Also, they shall be permitted to be used in <u>100 percent insulation level applications</u> where additional insulation strength ~~over the 100 percent level category~~ is desirable."

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Recommendation: Accept the proposal in principle. Reformat the note in a list format similar to that accepted under Proposal 6-50, as follows:

100 Percent Insulation Level. Cables in this category shall be permitted to be installed where (1) or (2) apply:

(1) on grounded systems, where relay protection is arranged to clear ground faults as rapidly as possible and in not less than 1 minute

(2) on ungrounded systems where the faulted section will be completely de-energized as rapidly as possible and in not less than one minute.

FPN: These cables are applicable to the great majority of installations on grounded systems.

133 Percent Insulation Level. Cables in this category shall be permitted to be installed where (1) and (2) or where (3) apply:

(1) where the fault clearing time requirements of the 100 percent level cannot be met

(2) where the faulted section will be de-energized in an orderly shutdown that protects the integrity of the cable.

(3) As a component of and under the requirements governing 100 percent insulation level applications where additional insulation strength is desirable.

FPN: This insulation level corresponds to that formerly designated for ungrounded systems.

Substantiation: This wording uses parallel language to that accepted for the 173 percent category, allowing a consistent presentation. It avoids imprecise language and transfers explanatory information to fine print notes where it belongs.

Panel Meeting Action: Reject

Panel Statement: While the panel agrees that the tabular format is clearer, the current proposal changes the wording and intent without providing any technical substantiation.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

ARTICLE 312 — CABINETS, CUTOUT BOXES, AND METER SOCKET ENCLOSURES

9-8 Log #926 NEC-P09 **Final Action: Accept**
(312.2)

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Delete "or Hazardous (Classified) (Locations)" in the heading and delete (B).

Substantiation: Edit. Section 90.3 indicates Chapter 5 applies and may modify this section. The style manual indicates references should not be made to entire articles.

Panel Meeting Action: Accept

Delete "or Hazardous (Classified) (Locations)" in the heading and delete (B).

Panel Statement: Delete "or Hazardous (Classified) (Locations)" in the heading and delete (B).

CMP-9 intends to delete (B) and only have a paragraph without the (A).

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10

Ballot Not Returned: 1 de Vega, H.

9-9 Log #1434 NEC-P09 **Final Action: Reject**
(312.2)

Submitter: Greg Chontow, Hopatcong, NJ

Recommendation: Delete the following text:

~~Above the level of uninsulated live parts.~~

Substantiation: Water damage from accumulation can corrode enclosure which is vital to prevent contact to live parts.

Panel Meeting Action: Reject

Panel Statement: The present text was added in the 2005 Code to address the matter of wiring methods that enter an enclosure in a wet location above live parts. Section 312.10(A) requires metal cabinets and cutout boxes to be protected both inside and outside against corrosion.

NEMA 3R enclosures have been constructed to meet the provisions of this section for many years prior the action in the previous code cycle to put the text in the Code. CMP-9 is unaware of any loss experience associated with undue corrosion on these enclosures that has not been adequately addressed through revisions to the product standards.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-10 Log #1342 NEC-P09 **Final Action: Reject**
(312.4)

Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Apply this section to all surfaces, change title
312.4 Repairing ~~Plaster and Drywall or Plasterboard~~ Surfaces.
~~Plaster, drywall, or plasterboard~~ Surfaces that are broken or incomplete shall be repaired so there will be no gaps or open spaces greater than 3 mm (1/8 in.) at the edge of the cabinet or cutout box employing a flush-type cover.
Substantiation: The repair of surfaces, in order to provide a complete and workmanlike installation, should not be limited to just plaster, drywall, or plasterboard.
Panel Meeting Action: Reject
Panel Statement: The proposal as written would have electricians troweling plastic wood around the perimeter of flush boxes in wood-paneled walls. This would go beyond the requirements necessary for safety. This rule addresses a condition where building construction is, in effect, used to complete an electrical enclosure, and there are limitations to the extent that that can be considered safe practice. Since the boxes must come all the way to the surface of a combustible wall, the necessity for repair vanishes. If there is an unusual degree of shoddy workmanship, then 110.12 can still be cited.
These problems would also be true for a cement wall installation.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-11 Log #3091 NEC-P09 **Final Action: Reject**
(312.5)

Submitter: Joseph A. Hertel, Safety and Buildings
Recommendation: Revise as follows:
Cabinets, cutout boxes, and meter socket enclosures [NEC 312.5]. (1) Cables [NEC 312.5(C)] Substitute the following wording for 312.5(C) Exception (intro):
Exception: Cables with entirely nonmetallic sheaths shall be permitted to enter an enclosure through one or more nonflexible raceways of not less than a fitting and not more than 10 ft in length, provided all of the following conditions are met:
Delete 312.5(C) Exception paragraph (b).
Substitute the following wording for 312.5(C) Exception paragraph (c):
A fitting is provided on each end of the raceway to protect the cable(s) from abrasion.
Substantiation: The required 18 in. length prevents use of this wiring method in many instances. Reducing the length to that of a fitting would not create a hazard. This method is becoming quite common where panels are placed in an exterior location.
(b) A fitting or raceway used in this manner would have the same characteristics if it was attached to the sides or bottom of the enclosure.
(c) The current language requires that the fittings remain accessible after installation. This method is used in multifamily dwellings to bring the branch circuits into a cabinet and the end of the raceway is not accessible after the gypsum wall covering is installed. There is no real need for the accessibility since modifications to the branch circuitry of multifamily dwellings are rarely encountered.
Panel Meeting Action: Reject
Panel Statement: With respect to the three modifications proposed by the submitter, the panel provides the following response:
1)The 18 inch minimum raceway length was chosen as a distance long enough to provide reasonable containment of the enclosed cables without specifying a length so long as to require mandatory derating of the cables. Removal of this length requirement would create the possibility that the enclosure will no longer perform its intended containment function (A95 ROP – 9-66a).
2)The exception was written to allow such installations only at the top of the enclosure as the panel noted this limitation would assure that the outer raceway termination wouldn’t be readily accessible (A98 ROC – 9-44).
3)The current language not only requires the fitting to remain accessible, but also requires that the enclosure be surface-mounted.
Adequate closure of the enclosure is dependent upon adequate closure of the raceway. No fittings are designed and evaluated to close openings around multiple cables as anticipated by the proposal. The lack of suitable fittings presents the possibility that excess dust, debris, rodents or other pests could enter the enclosure and create a potential hazardous condition. The existing requirements are intended to mitigate this concern and the level of safety afforded by those requirements should not be lessened.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-12 Log #1199 NEC-P09 **Final Action: Reject**
(312.5 Exception (New))

Submitter: Lanny G. McMahill, Phoenix, AZ
Recommendation: Add new Exception.
Exception: Cables with entirely nonmetallic sheaths shall be permitted to enter the back of a surface-mounted enclosure through one or more nonflexible raceways not more than 75 mm (3 in.) in diameter, and not less than 75 mm (3 in.) and not more than 600 mm (24 in.) in length, provided all of the following conditions are met:
(a) Each cable is fastened within 200 mm (8 in.), measured along the sheath, of the outer end of the raceway.
(b) The raceway extends directly into an enclosed wall space.
(c) A fitting is provided on each end of the raceway to protect the cable(s) from abrasion.
(d) The raceway is sealed or plugged at the inner end using approved means so as to prevent access to the enclosure through the raceway.
(e) The cable sheath is continuous through the raceway and extends into the enclosure beyond the fitting not less than 50 mm (2 in.).
(f) The raceway is fastened at its outer end in accordance with the applicable article.
(g) The conductor size is maximum 10 AWG.
(h) The raceway shall be permitted to be filled to 60 percent of its total cross-sectional area, and 310.15(B)(2)(a) adjustment factors need not apply to this condition.
Substantiation: This is a standard wiring practice allowed in many jurisdictions for the past 30 years. This is a safe and reasonable wiring practice for surface mounted enclosures. This proposal is intended to modify the practice. The proposed language is intended to mirror the current exception; yet, it incorporates more restrictions and clarification. The current exception allows Type NM cables to enter a raceway in the top of a surface mounted enclosure. This exception allows Type NM cables to enter a raceway in the back of a surface mounted enclosure. Additional restrictions include:
1) The raceway is limited to a maximum 3 inches in diameter, and restricted to between 3 inches and 24 inches in length. The 3 inches in diameter is to restrict the size of the opening in the back of the enclosure. The minimum length is to ensure that the raceway extends into the wall space. The maximum length is to allow for greater depth of wall and additional flexibility in installation.
2) The cable must be fastened within 8 inches of the raceway end. This mirrors the requirement noted in 314.17(C)1 Exception. It also allows for better securing of the cables.
3) The raceway must extend into an enclosed wall space. This is intended to prevent access to the cables and provide a degree of protction from access to the enclosure.
4) The raceway must be sealed or pluged at the inner end to prevent access.
5) The cable sheath must extend at least 2 inches into the enclosure. The current exception only requires 1/4 inch.
6) The conductor size is restricted to 10 AWG. This is to prevent larger cables from entering the opening.
7) The raceway is restricted to 60 percent fill and adjustment factors need not apply.
Panel Meeting Action: Reject
Panel Statement: The use of short fittings as described is a potential hazard, because an arc in the panel may no longer be contained by the enclosure. CMP-9 has discussed this approach repeatedly over many cycles, and does not agree that it should be allowed. The literal text of this proposal would allow a 3 trade size connector anywhere in the back of a panel, even close to the busbars and even if only a handful of small cables pass through it.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-13 Log #2367 NEC-P09 **Final Action: Reject**
(312.5 Exception (New))

Submitter: Thomas Wandrie, Phoenix, AZ
Recommendation: Add a new Exception to Section 312.5
Exception: Cables with entirely nonmetallic sheaths shall be permitted to enter the back of a surface-mounted enclosure through one or more nonflexible raceways not more than 75 mm (3 in.) in diameter, and not less than 75 mm (3 in.) and not more than 600 mm (24 in.) in length, provided all of the following conditions are met:
(a) Each cable is fastened within 200 mm (8 in.), measured along the sheath, of the outer end of the raceway.
(b) The raceway extends directly into an enclosed wall space.
(c) A fitting is provided on each end of the raceway to protect the cable(s) from abrasion.

(d) The raceway is sealed or plugged at the inner end using approved means so as to prevent access to the enclosure through the raceway.

(e) The cable sheath is continuous through the raceway and extends into the enclosure beyond the fitting not less than 50 mm (2 in.).

(f) The raceway, if greater than 305 mm (12 in.), is fastened at its outer end in accordance with the applicable article.

(g) The raceway shall be permitted to be filled to 60 percent of its total cross-sectional area, and 310.15(B)(2)(a) adjustment factors need not apply to this condition.

Substantiation: This is a standard wiring practice allowed in many jurisdictions for the past 30 years. This is a safe and reasonable wiring practice for surface mounted enclosures. This proposal is intended to codify the practice. The proposed language is intended to mirror the current exception; yet, it incorporates more restrictions and clarification. The current exception allows Type NM cables to enter a raceway in the top of a surface mounted enclosure. This exception allows Type NM cables to enter a raceway in the back of a surface mounted enclosure. Additional restrictions include:

1) The raceway is limited to a maximum 3 inches in diameter, and restricted to between 3 inches and 24 inches in length. The 3 inches in diameter is to restrict the size of the opening in the back of the enclosure. The minimum length is to ensure that the raceway extends into the wall space. The maximum length is to allow for greater depth of wall and additional flexibility in installation.

2) The cable must be fastened within 8 inches of the raceway end. This mirrors the requirement noted in Section 314.17(C), Exception. It also allows for better securing of the cables.

3) The raceway must extend into an enclosed wall space. This is intended to prevent access to the cables and provide a degree of protection from access to the enclosure.

4) The raceway must be sealed or plug at the inner end to prevent access.

5) The cable sheath must extend at least 2 inches into the enclosure. The current exception only requires ¼ inch.

6) The raceway is restricted to 60 percent fill and adjustment factors need not apply.

Panel Meeting Action: Reject

Panel Statement: The use of short fittings as described is a potential hazard, because an arc in the panel may no longer be contained by the enclosure. CMP-9 has discussed this approach repeatedly over many cycles, and does not agree that it should be allowed. The literal text of this proposal would allow a 3 trade size connector anywhere in the back of a panel, even close to the busbars and even if only a handful of small cables pass through it.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10

Ballot Not Returned: 1 de Vega, H.

9-14 Log #2417 NEC-P09 **Final Action: Reject**

(312.5(C)(b))

Submitter: Dan Frohberg, Northeast Community College

Recommendation: Revise text to read as follows:

The raceway may extend directly above or below the enclosure and penetrate to the attic or crawl space for the purpose of adding circuits at a later time.

Substantiation: We need to build in expansion or growth in our installations. A conduit that extends into an attic space or crawl space would facilitate adding circuits later after the initial project was finished. Raceways would need to be sealed at those levels yet to prevent air flow and fire. We are seeing Habitat housing built slab on grade with no way to add circuiting at a later date. These projects are built to minimum specs with donated funds.

Panel Meeting Action: Reject

Panel Statement: The concept of extending a raceway into an accessible location is good design but does not address a safety issue. See 90.1(B) and 90.8(A). The use of an empty conventional raceway terminating in a box is always permitted and where used, can be of any length. This provision is limited to cable sleeves, which are a special case.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10

Ballot Not Returned: 1 de Vega, H.

9-15 Log #608 NEC-P09 **Final Action: Reject**

(312.5(C) Exception (New))

Submitter: Michael J. Johnston, Plano, TX

Recommendation: Revise text to read:

(C) Cables. Where cable is used, each cable shall be secured to the cabinet, cutout box, or meter socket enclosure.

Exception No. 1: Fittings listed for securing multiple cables to cabinets, cutout boxes, or meter socket enclosures while maintaining the integrity of the electrical enclosure shall be permitted.

Exception No. 2 : Cables with entirely nonmetallic sheaths shall be permitted to enter the top of a surface-mounted enclosure through one or more nonflexible raceways not less than 450 mm (18 in.) and not more than 3.0 m (10 ft) in length, provided all of the following conditions are met:

(a) Each cable is fastened within 300 mm (12 in.) measured along the sheath, of the outer end of the raceway.

(b) The raceway extends directly above the enclosure and does not penetrate a structural ceiling.

(c) A fitting is provided on each end of the raceway to protect the cable(s) from abrasion and the fittings remain accessible after installation.

(d) The raceway is sealed or plugged at the outer end using approved means so as to prevent access to the enclosure through the raceway.

(e) The cable sheath is continuous through the raceway and extends into the enclosure beyond the fitting not less than 6 mm (1/4 in.).

(f) The raceway is fastened at its outer end and at other points in accordance with the applicable article.

(g) Where installed as conduit or tubing, the allowable cable fill does not exceed that permitted for complete conduit or tubing systems by Table 1 of Chapter 9 of this Code and all applicable notes thereto.

FPN: See Table 1 in Chapter 9, including Note 9, for allowable cable fill in circular raceways. See 310.15(B)(2)(a) for required ampacity reductions for multiple cables installed in a common raceway.

Substantiation: Issues have been raised about common installation practices for nonmetallic sheathed cables that are not recognized by any Code rule as acceptable. These practices have to do with the method of securing each cable to the enclosure as required in the general requirement of this section. The identified practices that are currently not permitted by the NEC involve attaching a PVC male adaptor or other chase nipple or bushing to the enclosure and routing multiple cables through that opening. The integrity of the electrical enclosure in this type of installation is compromised.

This proposed new Exception No. 1 provides an alternative method that could be recognized by an exception to this requirement as long as the fitting used for this type of installation was evaluated and listed for this use. Otherwise this method is not permitted by the NEC. It appears that there are currently some fittings (two-screw, clamp-type) that are available and have been recognized for attachment of more than one cable to the enclosure. However, these fittings have a pretty restrictive limitation on the number and sizes of cables permitted to be installed when using the fitting to attach more than one cable to the enclosure. Adding this new exception will provide users with an alternative recognized by the NEC for such installations and also provide enforcement officials with more language in this section to clarify what is required and what is not permitted regarding these types of installations. It also would allow manufacturers the ability to develop a fitting for this use that can be listed and evaluated for multiple cable attachment to enclosures while still maintaining the integrity of the electrical enclosure. Openings in electrical enclosures are required to be effectively closed (110.12). This common practice that is not recognized by Code rules as acceptable appears to be a regional issue primarily found used in the south and southwestern part of the country but may even be a more widespread problem.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The base rule requires each cable to be secured to an enclosure. If a fitting were developed that accomplished this for multiple cables passing through a single opening, then such a fitting could be used under the existing wording without requiring a new exception. The proposal is not necessary.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10

Ballot Not Returned: 1 de Vega, H.

9-16 Log #2250 NEC-P09 **Final Action: Reject**

(312.5(C) Exception)

Submitter: Jeffrey A. Fecteau, City of Peoria, Arizona

Recommendation: Revise as follows:

Exception: Cables with entirely nonmetallic sheaths shall be permitted to enter the top, back or side of a surface mounted enclosure through one or more nonflexible raceways or fittings not ~~less than 450 mm (18 in.) or~~ more than 3.0 m (10 ft) in length, provided all of the following conditions are met:

(a) Each cable is fastened within ~~300~~ 200 mm (~~12~~ 8 in.) measured along the sheath of the outer end of the raceway.

(b) The raceway or fitting extends into a wall or ceiling space directly above or behind the enclosure and does not penetrate a structural ceiling.

(c) A fitting is provided on each end of the raceway to protect the cable(s) from abrasion when a raceway is used ~~and the fittings remain accessible after installation.~~

(d) The raceway or fitting is sealed or plugged at the outer end using approved means so as to prevent access to the enclosure through the raceway.

(e) The cable sheath is continuous through the raceway or fitting and extends into the enclosure beyond the fitting not less than 6 mm (1/4 in.)

(f) The raceway or fitting is fastened at its outer end and at other points in accordance with the applicable article.

(g) Where installed as conduit or tubing, the allowable cable fill does not exceed that permitted for complete conduit or tubing systems by Table 1 of Chapter 9 of this code and all applicable notes thereto.

Substantiation: This will allow a code compliant installation that has been allowed for an unknown amount of time. This installation is currently a code violation however the Phoenix and Tucson Metro areas have amended the NEC to locally allow this installation. I have provided a draft of the resolution allowing this installation, and the amended text.

DRAFT

WHEREAS The Maricopa Association of Governments Building Codes Committee (heretofore referred to as the "Committee") approved the amendments to the 2002 edition of the National Electrical Code (heretofore referred to as the "NEC") with the intent to promote and present a uniform set of electrical codes and amendments for jurisdictions within Maricopa County AND;

WHEREAS Sections 312.5, and 314.17 of the 2002 NEC (E3807.7 and E3806.1.1 of the 2003 International Residential Code), that addresses cables and conductors entering cabinets, cutout boxes and meter socket enclosures, requires the closure of openings through which cables enter a cabinet, cutout box or meter socket enclosures, and further requires that nonmetallic cables be permitted to only enter the top of a surface mounted enclosure if not secured to the cabinet, cutout box or meter socket enclosure and that the nonmetallic cable be protected at points of entry into a cabinet, cutout box, or meter socket enclosure from damage and abrasion, AND;

WHEREAS electricians in Maricopa County and elsewhere in the state and nation have been installing the above referenced meter socket enclosures commonly referred to as "all-in-ones" for decades in tens of thousands of homes in a manner consistent with the methods described in Exhibit "A" with no documented record of fires or life safety hazards attributable to this practice AND;

WHEREAS the Association of Governments Building Codes Committee resolved to enforce these provisions of the Code as written and adopted unless a viable and approved alternative method was presented and approved prior to December 1, 2005 AND;

WHEREAS the Maricopa Association of Governments Building Codes Committee, the MAG/RPR Building Inspectors/Plan Review Forum, the Arizona Building Officials Code Development and Review Committee, the Southern Arizona Chapter of the International Code Council, and the Grand Canyon Chapter of the International Code Council have all worked together to develop an alternate method to validate the practice as meeting the intent of the Code AND;

WHEREAS the alternate method as described in Exhibit "A" was approved by the Development Advisory board Technical Subcommittee of the City of Phoenix and addresses the major areas of concern as identified by the previous referenced organizations.

BE IT SO RESOLVED by the Committee that the alternate method described in Exhibit "A": meets the intent of the NEC and is acceptable to the Committee for use in MAG jurisdictions and that the method of enforcement whether by adopted ordinance or written policy be the decision of the local jurisdiction.

Reference the 2002 National Electrical Code and replace the first paragraph with the flowing (the remainder of Section 312.5 to remain the same)

312.5 Cabinets, Cutout Boxes, and Meter Socket Enclosures. Conductors entering enclosures within the scope of this article shall be protected from abrasion and shall comply with 312.5(A) through (C).

Exception: For one- and two-family dwellings, cables with entirely nonmetallic sheaths shall be permitted to enter the back of a surface-mounted enclosure through one or more nonflexible raceways not more than 75 mm (3 in.) in diameter, and not less than 75 mm (3 in.) and not more than 600 mm (24 in.) in length, provided all of the following conditions are met:

a. Each cable is fastened within 200 mm (8 in.) measured along the sheath of the outer end of the raceway.

b. The raceway extends directly into an enclosed wall space.

c. A fitting is provided on each end of the raceway to protect the cable(s) from abrasion.

d. The raceway is sealed or plugged using approved means so as to prevent access to the enclosure through the raceway.

e. The cable sheath is continuous through the raceway and extends into the enclosure beyond the fitting not less than 50 mm (2 in.)

f. The raceway, if greater than 305 mm (12 in.) is fastened at its outer end in accordance with the applicable article.

g. The raceway shall be permitted to be filled to 60 percent of its total cross sectional area, and 310.15(B)(2)(a) adjustment factors need not apply to this condition.

Panel Meeting Action: Reject

Panel Statement: The installation procedure described in the proposal is one that CMP-9 voted to prohibit during previous code making cycles (1993, 1996, 1999, and 2005). Connectors or fittings as presented in the proposal are not designed for this purpose. A connector, bushing or other fitting without a length of raceway creates the possibility that the enclosure will no longer perform its intended containment function.

See panel actions and statements on Proposals 9-11, 9-12 and 9-15.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10

Ballot Not Returned: 1 de Vega, H.

9-17 Log #2489 NEC-P09 **Final Action: Reject**
(312.11(A)(2))

Submitter: Sukanta Sengupta, North Brunswick, NJ

Recommendation: 312.11(A)(2) Doors. Exception

Substantiation: For shock protection, the Prohibited Approach Boundary for 301V to 750V is 25.4 mm (0 ft 1 in.). NFPA 70E Table 130.2(C).

Distance between a door and any live metal part should be more than the Prohibited Approach Boundary recommended in NFPA 70E.

Panel Meeting Action: Reject

Panel Statement: The long accepted practice of supplementing air space with an insulation material provides safe installations and continues to be acceptable.

Section 312.11(A)(2) is not germane to the Prohibited Approach Boundary of NFPA 70E.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10

Ballot Not Returned: 1 de Vega, H.

ARTICLE 314 — OUTLET, DEVICE, PULL, AND JUNCTION BOXES, CONDUIT BODIES; FITTINGS; AND MANHOLES

9-18 Log #1538 NEC-P09 **Final Action: Accept in Principle in Part**
(314, 404, 408, 450, and 490)

TCC Action: The Technical Correlating Committee directs that the action on this proposal be sent to the Technical Correlating Committee Grounding and Bonding task group for review and comment.

Submitter: Technical Correlating Committee on National Electrical Code®,

Recommendation: Revise Articles 314, 404, 408, 450, and 490 as described in the following, relative to the terms bonding and grounding.

314.4 Revise 314.4 as follows:

Metal Boxes. Unless otherwise permitted or required in Article 250, all metal boxes shall be connected to an equipment grounding conductor ~~grounded~~ in accordance with the provisions of Part VI of Article 250.

314.30(D) Revise 314.30(D) as follows:

Covers. (Last sentence) Metal covers and other exposed conductive surfaces shall be connected to an equipment grounding conductor ~~bonded~~ in accordance with Part VI of Article 250. ~~250.96(A).~~

404.9(B) Revise 404.9(B) as follows:

(B) Grounding. Snap switches, including dimmer and similar control switches, shall be connected to an equipment grounding conductor ~~effectively grounded~~ and shall provide a means to connect ~~ground~~ metal faceplates to a metal yoke , whether or not a metal faceplate is installed. Snap switches shall be considered as providing an effective ground fault current path ~~effectively grounded~~ if either of the following conditions is met.

(1) The switch is mounted with metal screws to a metal box that is connected to an equipment grounding conductor or to a nonmetallic box with integral means for connecting to an equipment grounding conductor ~~grounding devices~~ . (2) An equipment grounding conductor or equipment bonding jumper is connected to an equipment grounding termination of the snap switch.

Exception to (B): Where no ~~grounding~~ means exists within the snap-switch enclosure for connecting to the equipment grounding conductor or where the wiring method does not include or provide an equipment ground ing conductor , a snap switch without a ~~grounding~~ connection to an equipment grounding conductor shall be permitted for replacement purposes only. A snap switch wired under the provisions of this exception and located within reach of earth, grade conducting floors, or other conducting surfaces shall be provided with a faceplate of nonconducting, noncombustible material or shall be protected by a ground fault circuit interrupter.

404.12 Revise 404.12 as follows:

Grounding of Enclosures. Metal enclosures for switches or circuit breakers shall be connected to an equipment grounding conductor ~~grounded~~ as specified in Part IV of Article 250. Metal enclosures for switches or circuit breakers used as service equipment shall comply with the provisions of Part V of Article 250. Where nonmetallic enclosures are used with metal raceways or metal-armored cables, provision shall be made for connecting the equipment grounding conductor(s) ~~grounding continuity~~ .

Except as covered in 404.9(B), Exception, nonmetallic boxes for switches shall be installed with a wiring method that provides or includes an equipment grounding conductor ~~ground~~ .

408.3(D) Revise 408.3(D) as follows:

(D) Terminals. In switchboards and panelboards, load terminals for field wiring, including grounded circuit conductor load terminals and connections to the equipment-grounding-conductor ~~ground~~ bus for load equipment grounding conductors, shall be located so that it is not necessary to reach across or beyond an uninsulated ungrounded line bus in order to make connections.

408.40 Revise 408.40 as follows:

Grounding of Panelboards. Panelboard cabinets and panelboard frames, if of metal, shall be in physical contact with each other and shall be connected to an equipment grounding conductor ~~grounded~~ . Where the panelboard is used with nonmetallic raceway or cable or where separate equipment grounding conductors are provided, a terminal bar for the equipment grounding conductors shall be secured inside the cabinet. The terminal bar shall be bonded to the cabinet and panelboard frame, if of metal; otherwise it shall be connected to the equipment grounding conductor that is run with the conductors feeding the panelboard.

Exception: Where an isolated equipment grounding conductor is provided as permitted by 250.146(D), the insulated equipment grounding conductor that is run with the circuit conductors shall be permitted to pass through the panelboard without being connected to the panelboard's equipment grounding terminal bar.

Equipment g rounding conductors shall not be connected to a terminal bar provided for grounded conductors (may be a neutral) unless the bar is identified for the purpose and is located where interconnection between equipment grounding conductors and grounded circuit conductors is permitted or required by Article 250.

450.5(B) and (C) Revise 450.5(B) and (C) as follows:

Ground Reference for Fault Protection Devices. A n ~~grounding~~ autotransformer used to make available a specified magnitude of ground-fault current for operation of a ground- fault responsive protective device on a 3-phase, 3-wire ungrounded system shall conform to 450.5(B)(1) and (2).

(1) Rating. The autotransformer shall have a continuous neutral-current rating sufficient for the specified ground-fault current.

(2) Overcurrent Protection. An overcurrent protective device of adequate short-circuit rating that will open simultaneously all ungrounded conductors when it operates shall be applied in the ~~grounding~~ autotransformer branch circuit and shall be rated or set at a current not exceeding 125 percent of the autotransformer continuous per-phase current rating or 42 percent of the continuous-current rating of any series connected devices in the autotransformer neutral connection. Delayed tripping for temporary overcurrents to permit the proper operation of ground- fault responsive tripping devices on the main system shall be permitted but shall not exceed values that would be more than the short-time current rating of the ~~grounding~~ autotransformer or any series connected devices in the neutral connection thereto.

(C) Ground Reference for Damping Transitory Overvoltages. A n ~~grounding~~ autotransformer used to limit transitory overvoltages shall be of suitable rating and connected in accordance with 450.5(A)(1).

490.21(B)(1) Revise 490.21(B)(1) as follows:

(B) Power Fuses and Fuseholders.

(1) Use. Where fuses are used to protect conductors and equipment, a fuse shall be placed in each ungrounded conductor. Two power fuses shall be permitted to be used in parallel to protect the same load if both fuses have identical ratings and both fuses are installed in an identified common mounting with electrical connections that will divide the current equally. Power fuses of the vented type shall not be used indoors, underground ~~under ground~~ , or in metal enclosures unless identified for the use.

490.36 Revise 490.36 as follows:

Grounding. Frames of switchgear and control assemblies shall be connected to an equipment grounding conductor or, where permitted, the grounded conductor ~~grounded~~ .

490.37 Revise 490.37 as follows:

Grounding of Devices. The ~~Devices with~~ metal cases or frames, or both, such as instruments, relays, meters, and instrument and control transformers, located in or on switchgear or control, shall be connected to an equipment grounding conductor ~~have the frame or case grounded~~ .

490.55 Revise 490.55 as follows:

Power Cable Connections to Mobile Machines. A metallic enclosure shall be provided on the mobile machine for enclosing the terminals of the power cable. The enclosure shall include terminal bar connections to the machine frame ~~provisions for a solid connection~~ for the equipment grounding conductor ~~ground wire(s) terminal to effectively ground the machine frame~~ . Ungrounded conductors shall be attached to insulators or be terminated in approved high-voltage cable couplers (which include equipment grounding conductor ~~ground wire~~ connectors) of proper voltage and ampere rating. The method of cable termination used shall prevent any strain or pull on the cable from stressing the electrical connections. The enclosure shall have provision for locking so only authorized and qualified persons may open it and shall be marked

DANGER — HIGH VOLTAGE — KEEP OUT.

490.72 Revise 490.72 as follows:

(D) Ground Current Detection. Means shall be provided for detection of the sum of the neutral and equipment grounding conductor ~~ground~~ currents and shall trip the circuit-interrupting device if the sum of those currents exceeds the greater of 5 amperes or 7½ percent of the boiler full-load current for 10 seconds or exceeds an instantaneous value of 25 percent of the boiler full-load current.

490.74 Revise 490.74 as follows:

Grounding. All exposed non–current-carrying metal parts of the boiler and associated exposed metal ~~grounded~~ structures or equipment shall be bonded to the pressure vessel or to the neutral conductor to which the vessel is connected in accordance with 250.102, except the ampacity of the bonding jumper shall not be less than the ampacity of the neutral conductor.

Substantiation: 314.4: Changes are proposed to correct the terms to the definition proposed for Article 100. The proposed changes also are intended to make the requirements more prescriptive in nature. The proposal recognizes that in some cases, boxes are permitted to be grounded by connection the grounded service conductor.

314.30(D): The proposed changes are intended to make the requirements more prescriptive in nature.

404.9(B): Changes are proposed to correct the terms to the definitions proposed for Article 100 and to the terms defined in 250.2. The proposed changes also are intended to make the requirements more prescriptive in nature.

404.12: The proposed changes are intended to make the requirements more prescriptive in nature and to include a reference to where the requirements are found in Article 250.

408.3(D): The proposal intends to use a defined term for the bus used to connect equipment grounding conductors.

408.40: Changes are proposed to use terms as defined in Article 100. The proposed changes also are intended to make the requirements more prescriptive in nature.

450.50(B) and (C): The word "grounding" is proposed to be deleted as in essence these are not "grounding autotransformers" but are autotransformers that are used for the purpose indicated. Other changes are editorial in nature.

490.21(B)(1): Editorial revision.

490.36: The proposed changes are intended to make the requirements more prescriptive in nature and to comply with the defined terms.

490.37: The changes proposed are for clarity as well as to be more prescriptive in nature.

490.55: Changes are proposed to use terms as defined in Article 100. The proposed changes also are intended to make the requirements more prescriptive in nature.

490.72: Changes are proposed to use terms as defined in Article 100. The proposed changes also are intended to make the requirements more prescriptive in nature.

490.74: Changes are proposed to use terms as defined in Article 100. The proposed changes also are intended to make the requirements more prescriptive in nature.

This is the result of the TCC Task Group on Grounding and Bonding in resolve of the 2005 NEC cycle actions related to Proposal 5-1 and Comment 5-1 as directed by the Technical Correlating Committee. This is a companion proposal to the proposed revision to the terms "bonded", "grounded", and "equipment grounding conductor" in Article 100 relative to this Task Group's recommendations. These changes clarify the present requirement in more prescriptive language.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle in Part

For clarity, CMP-9 numbered the statement items to correspond with the action items.

1. Accept in principle the revision of 314.4. Revise the opening clause to read as follows:" Except as permitted in 250.112(I)... ". Accept the remainder of 314.4 as proposed.
2. Reject the revision of 314.30(D)
3. Accept in principle the revision to 404.9(B); accept the wording of all changes except those to the first two sentences, which are revised as follows instead of that in the proposal:

Snap switches, including dimmer and similar control switches, shall be connected to an equipment grounding conductor ~~effectively grounded~~ and shall provide a means to connnect ~~ground~~ metal faceplates to the equipment grounding conductor whether or not a metal faceplate is installed. Snap switches shall be considered ~~effectively grounded~~ to be part of an effective ground-fault current path if either of the following conditions is met:

4. Accept the revision of 404.12.
5. Accept the revision to 408.3(D).
6. Accept the revision to 408.40.
7. Reject the changes to 450.5(B) and (C).
8. Accept the changes to 490.21(B)(1).
9. Accept the changes to 490.36
10. Accept the changes to 490.37 in principle. Add the phrase ", or, where permitted, the grounded conductor" at the end.
11. Accept the changes to 490.55 in principle. Delete the word "bar" after the word "terminal".
12. Accept in principle the change to 490.72(D) as follows:... the neutral conductor and equipment grounding conductor ~~ground~~ currents...
13. Accept the changes to 490.74.

Panel Statement: CMP-9 addressed the concerns of the Technical Correlating Committee.

For clarity, CMP-9 numbered the statement items to correspond with the action items.

1. The revision incorporates the concept of Proposal 9-21. CMP-9 continues to believe that the reference to 250.112(I) is correct and adequately inclusive for the intent of this action.
2. Handhole enclosure covers may be used to enclose a portion of a service lateral, and as such, Part IV of Article 250 would not apply. The bonding language in the existing code is appropriate.
3. There have been fairly recently, and may be again, listed snap switches with nonmetallic yokes that included ground-screw equipped brass inserts to

receive the faceplate screws. The literal text of the proposal would make these designs noncompliant for no observable reason. The second sentence is revised because a switch cannot be a ground-fault current path, it can only be a small part of the entire grounding circuit.

7. In this case the word "grounding" is simply a useful adjective that calls out the fact that these transformers have a different function than autotransformers generally. The panel considered substituting the appellation "ground-reference" and decided that it would be only change for the sake of change. The terminology does not need to change, and there is no evidence that the usage in this section has ever confused anyone.

10. Here again this equipment, especially under medium voltage applications, may be connected to a grounded circuit conductor.

11. This equipment is often provided with a single grounding terminal.

12. CMP-9 added the word "conductor" to correlate with Proposal 9-163.

Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.
Comment on Affirmative:

HARTWELL, F.: Note that item 3 of the panel action on this proposal was subsequently modified by the action on Proposal 9-93. As clearly stated in the panel action text on that proposal, the action thereon modifies the wording in 404.9(B)(1) accepted in this action.

9-19 Log #2486 NEC-P09 **Final Action: Reject**
(314.3)

Submitter: Sukanta Sengupta, North Brunswick, NJ
Recommendation: Revise text to read as follows:

314.3 Nonmetallic Boxes. Nonmetallic boxes shall be permitted with the following wiring methods.

Open wiring on insulators
Concealed knob-and-tube wiring
Cabled wiring methods with entirely nonmetallic sheaths
Flexible cords
Nonmetallic raceways
Metal raceways or metal-armored cables in nonmetallic boxes with internal bonding means between all entries
Metal raceways or metal-armored cables in listed nonmetallic boxes with integral bonding means and provisions for attaching equipment bonding jumpers between all threaded entries

Substantiation: Wiring practice utilizing metallic raceways or metal-armored cable and nonmetallic boxes are very common. Code should recognize this practice as a standard one and not an exception.
Panel Meeting Action: Reject
Panel Statement: CMP-9 concludes that such applications are comparatively unusual and deserving of coverage in an exception that carefully sets out the conditions, instead of being folded into the main rule.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-20 Log #2490 NEC-P09 **Final Action: Reject**
(314.3)

Submitter: Sukanta Sengupta, North Brunswick, NJ
Recommendation: None Provided.
Substantiation: Wiring practice utilizing metallic raceways or metal-armored cable and nonmetallic boxes are very common. Code should recognize this practice as standard one and not an exception.
Panel Meeting Action: Reject
Panel Statement: CMP-9 notes that this proposal contains no recommendation and therefore does not conform to the Regulations Governing Committee Projects. However, an inference can be made as to the intent based on Proposal 9-19, and CMP-9 rejects this proposal for the same reason.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-21 Log #197 NEC-P09 **Final Action: Accept in Principle**
(314.4)

NOTE: The following proposal consists of Comment 9-38 on Proposal 9-21 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 9-21 was:

Revise as follows:

All metal boxes shall be grounded ~~in accordance with the provisions of Article 250.~~

The Technical Correlating Committee directs that Proposal 9-21 and Comment 9-38 be reported as "Hold". The Technical Correlating Committee has concerns that the reference to the 250.112(i) requirement may not adequately address all of the relevant Article 250 grounding issues.

Submitter: Noel Williams, Herriman, UT
Recommendation: This proposal should have been rejected or accepted in principal by deleting the entire section.
Substantiation: Article 250 does not require all metal boxes to be grounded. In particular, metal boxes used for Class 2, Class 3, Power-limited fire alarm, and boxes used for communications are usually not required to be grounded (See 250.112(I)). This proposal would override those rules and require grounding even where there is no shock hazard and there is no grounding means available in the wiring method. Since the apparent intent of the proposal is to comply with the NEC Style Manual, the entire section should be deleted as nothing is added by this section that is not covered by Article 250. Otherwise, the specific applicable sections would have to be listed and this would be unnecessarily cumbersome.
Panel Meeting Action: Accept in Principle
Panel Statement: See action and statement in Proposal 9-18, item 1
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-22 Log #941 NEC-P09 **Final Action: Accept in Principle**
(314.4)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise:

METAL BOXES and CONDUIT BODIES . All metal boxes conduit bodies, and fittings shall be grounded ~~in accordance with the provisions of Article 250~~ except as otherwise permitted or required elsewhere in this code.

Substantiation: Edit. Reference should not be made to an entire article. Since Article 250 already applies. The latter part of the proposal may alert code users to other parts which may modify this section such as 668.30(B), 668.32(B(3) and 675.12, Exception.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel has addressed the concerns in this proposal through its action on Proposal 9-18, item 1.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-23 Log #1098 NEC-P09 **Final Action: Reject**
(314.15(A))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Insert "exposed" before "boxes" in two places.
Substantiation: Edit. "Exposed" indicates on or attached to the surface per Article 100. Recessed (flush) boxes in a wet location with a weatherproof cover appears to comply with 404.4and 406.8 and "weatherproof" as defined in Article 100.
Panel Meeting Action: Reject
Panel Statement: A "wet location" is one that is "…in unprotected locations exposed to the weather". Recessed boxes with weatherproof covers are in locations protected by the building structure and the weatherproof cover.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-24 Log #942 NEC-P09 **Final Action: Accept in Principle**
(314.15(B))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise text:

Installations in hazardous (classified) locations shall conform to applicable provisions of other articles in this code. ~~Article 500 through 517~~ .

Alternatively, delete this section.

Substantiation: Edit. To comply with Style Manual requirements. Already covered by 90.3.
Panel Meeting Action: Accept in Principle

Delete 314.15(B).
314.15(A) becomes 314.15.

Panel Statement: The panel action addresses the submitter's concerns and is consistent with the action and statement on Proposal 9-8.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-25 Log #2730 NEC-P09 **Final Action: Reject**
(314.16)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 17 for information.
Submitter: Doug Boggus, City of Grand Prairie
Recommendation: Add additional text and Fine Print Note as follows:

314.16 Number of Conductors in Outlet, Device, and Junction Boxes, and Conduit Bodies. Boxes and conduit bodies shall be of sufficient size to provide free space for all enclosed conductors. In no case shall the volume of the box, as calculated in 314.16(A), be less than the fill calculation as calculated in 314.16(B). The minimum volume for conduit bodies shall be calculated in 314.16(C).

The provisions of this section shall not apply to terminal housing supplied with motors, and boxes or wiring compartments for appliances .

FPN No. 1 : For volume requirements of motor terminal housings, see 430.12.

FPN No. 2: For volume requirements for appliance terminal connections, see 422.19.

Boxes and conduit bodies enclosing conductors 4 AWG or larger shall also comply with the provision of 314.28.

Substantiation: This is a companion proposal to a proposal to add requirements to Article 422 (proposed Section 422.19) for specific requirements for boxes and wiring compartments utilized in the connection of appliances to a power supply. The added wording and FPN No. 2 are needed to correlate the proposed requirement to Article 422 with the requirements of 314.16(A). The proposal for inclusion into Article 422 is as follows:

422.19 Boxes and Wiring Compartments for Appliances. Boxes or wiring compartments used for a point of junction to an electrical power source, whether separate or furnished as a part of the appliance, shall comply with (1) through (5) where applicable:

(1) Where wire leads are provided by an appliance manufacturer for connection to an electrical power source, at least 150 mm (6 in.) of free conductor, measured from the wall of the box or wiring compartment opposite where the conductors emerge for termination to an electrical power source, shall be provided for splices to either a permanent wiring method or a cord connection.

(2) For either permanent wiring methods or cord connections used to supply the appliance, at least 150 mm (6 in.) of free conductor, measured from the point in the box or wiring compartment where the conductors emerges from its raceway or cable sheath shall be left for splices or for connection to terminals provided as a part of the appliance.

(3) Where the provided opening in a box or wiring compartment is less than 200 mm (8 in.) in any dimension and where wire leads are provided by the appliance manufacturer for connection to an electrical power source, each conductor shall be long enough to extend at least 75 mm (3 in.) outside the opening.

(4) Boxes and wiring compartments shall be of sufficient size to provide free space for all enclosed conductors. In no case shall the volume of the box or wiring compartment be less than the fill calculation as calculated in Table 422.19(A). Volumes of standard boxes that are not marked with their volume shall be as given in Table 314.16(A). Other boxes shall be durably and legibly marked with their volume by the box manufacturer, and appliance wiring compartments shall be durably and legibly marked with their volume by the appliance manufacturer.

(5) Conductors shall not be deflected within a box or wiring compartment unless a minimum wire-bending space per Table 422.19(B) is provided.

Table 422.19(A) Volume Allowance Required per Conductor

Size of Conductor (AWG)	mm²	Free Space Within Box for Each Conductor cm³	in.³
14 or smaller	2.1	32.8	2.00
12	3.3	36.9	2.25
10	5.3	41.0	2.50
8	8.4	49.2	3.00
6	13.3	81.9	5.00

Table 422.19(B) Minimum Wire-Bending Space within Box or Wiring Compartment

Size of Conductor (AWG)	Wire Bending Space mm	in.
14-10	Not Specified	
8-6	38.1	1 1/2
4-3	50.8	2
2	63.5	2 1/2
1	76.2	3

Panel Meeting Action: Reject

Panel Statement: CMP-9 will revisit this proposal in the event that CMP-17 takes favorable action on the companion Proposal, 17-21.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10

Ballot Not Returned: 1 de Vega, H.

9-26 Log #2923 NEC-P09 **Final Action: Accept**
(314.16)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 13 for information.

Submitter: Peter D. Noval, Jr., Philadelphia, PA

Recommendation: Revise text to read as follows:

314.16 Number of conductors in outlet, device, and junction boxes, and conduit bodies. Boxes and conduit bodies, shall be of sufficient size to provide free space for all enclosed conductors. In no case shall the volume of the box, as calculated in 314.16(A), be less than the fill calculation as calculated in 314.16(B).

The minimum volume for conduit bodies shall be as calculated in 314.16(C).

The provisions of this section shall not apply to terminal housings supplied with motors or generators .

FPN: For volume requirements of motor ~~terminal housings~~ or generator terminal housings , see 430.12.

Substantiation: As presently written, this section is not consistent with the requirements of 445.17, which refers to Section 430.12 for generator terminal housing volume requirements.

The revisions to text adding generator terminal housings serve to clarify the intent of the code, facilitating design, installation, and inspection of such housings.

Panel Meeting Action: Accept

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10

Ballot Not Returned: 1 de Vega, H.

9-27 Log #2135 NEC-P09 **Final Action: Accept in Principle**
(Table 314.16(A))

Submitter: Russell LeBlanc, Peterson School of Engineering

Recommendation: In top portion of table add:

AWG after each wire size:

18 (AWG) 16 (AWG) 14 (AWG) 12 (AWG) 10 (AWG) 8 (AWG) 6 (AWG)

Substantiation: The heading for that portion of the table says “maximum number of conductors” so when you read the next line it seems that those numbers are amounts, and not wire sizes.

Panel Meeting Action: Accept in Principle

Instead of the proposal recommendation, change the table heading by adding a second line, centered under the first line that will remain “Maximum Number of Conductors”, as follows: “(arranged by AWG size)”

Panel Statement: CMP-9 agrees with the submitter, but prefers not to repeat the term “AWG” seven times.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10

Ballot Not Returned: 1 de Vega, H.

9-28 Log #588 NEC-P09 **Final Action: Reject**
(Table 314.16(A) Note)

Submitter: Larry T. Smith, National Electrical Seminars

Recommendation: Revise text to read as follows:

*Where no volume allowances are required by 314.16(B)(2) through (B) ~~(5)~~ (4) .

Substantiation: Table 314.16(A) applies to metal boxes that are being used as pull or junction boxes. As the note at the bottom of Table 314.16(A) indicates, the rules of Box Fill Calculations in 314.16(B) apply whenever the box contains any of the items listed in 314.16(B)(2) through (B)(5) - (B)(5) is Equipment Grounding Conductor Fill.

If a 120-volt circuit with two-12 AWG conductors, without a separate equipment grounding conductor, is being pulled through a 4-in. square metal box, Table 314.16(A) applies - total number of conductors is two.

If a three-phase multi-wire circuit with four-12 AWG conductors, without a separate equipment grounding conductor, is being pulled through a 4-in. square metal box, Table 314.16(A) applies - total number of conductors is four.

But, if a 120-volt circuit with three-12 AWG conductors, including a separate equipment grounding conductor, is being pulled through a 4-in. square metal box, 314.16(B) applies - total number of conductors is three.

It doesn’t make much sense; especially since 250.148 permits equipment grounding conductors to be pulled through metal boxes without being attached to the box as long as they aren’t spliced. The inclusion of an equipment grounding conductor shouldn’t automatically require the use of 314.16(B) to calculate box fill.

Panel Meeting Action: Reject

Panel Statement: The presence of the equipment grounding conductor, terminated or not in the box, occupies a portion of the box volume. The allowance calculation accounts for the reduction in box volume.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10

Ballot Not Returned: 1 de Vega, H.

9-29 Log #2488 NEC-P09 **Final Action: Accept in Part**
(314.16(B)(1))

Submitter: Sukanta Sengupta, North Brunswick, NJ
Recommendation: Revise text to read as follows:
314.16(B)(1) Conductor Fill. Each conductor that originates outside the box and terminates or spliced within the box shall be counted once, and each conductor that passes through the box without splice or termination shall be counted once. Each loop or coil ~~A looped,~~ of unbroken conductor ~~not less than twice the minimum length~~ required for free conductor in 300.14 shall be counted twice. The conductor fill shall be calculated using Table 314.16(B). A conductor, no part of which leaves the box, shall ~~not~~ be counted once .
Substantiation: Second sentence:
Loop or coil occupies space. Present code dictates that the space taken by a conductor in the form of “a single loop” or “a coil” or “multiple loops” is the same. It does not follow rules of simple solid geometry.
Last sentence:
A conductor, no part of which leaves a box, still occupies space.
Present code calculation does not recognize these facts. For a box with electronic items, where free space is essential for heat dissipation, this calculation may be critical.
Panel Meeting Action: Accept in Part
Revise proposed text to read as follows:
314.16(B)(1) Conductor Fill. Each conductor that originates outside the box and terminates or spliced within the box shall be counted once, and each conductor that passes through the box without splice or termination shall be counted once. Each loop or coil of unbroken conductor not less than twice the minimum length required for free conductor in 300.14 shall be counted twice. The conductor fill shall be calculated using Table 314.16(B). A conductor, no part of which leaves the box, shall not be counted.
Panel Statement: CMP-9 accepts the addition of the substitution of the text “Each loop or coil” for “A loop” since it clarifies the need to account for all loops in the box. The Panel rejects the elimination of the length requirement used to define amount of unbroken conductor for a double deduction. Without a definition, the point at which a double deduction is required would by subjective. The Panel also rejects the change in the allowance requirement for conductors that do not leave the box. The submitter did not provide technical substantiation to support a change.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-30 Log #1469 NEC-P09 **Final Action: Reject**
(314.16(B)(1) Exception)

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Rename the term “fixture wires” to “luminaire wires” in 314.16(B)(1) exception.
Substantiation: With the changing of the term “fixture” to “luminaire” it only makes sense that the term “fixture wires” be changed to “luminaire wires”.
For the purposes of correlation, this proposal is also being submitted to the following Articles/Sections/Tables/Annexes: 200.6; 210.19; 210.20; 210.24; 240.4; 240.5; 300.17; 310.1; 314.16; Article 402; 517.74; 660.9; Table 1; Table 5; Annex C.
Panel Meeting Action: Reject
Panel Statement: Fixture wires are not only used for luminaires, and the term may stand on its own for that reason. If CMP-6 changes the terminology in Article 402 and other correlating locations, then CMP-9 will revisit this issue.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-31 Log #3398 NEC-P09 **Final Action: Accept**
(314.16(B)(4))

TCC Action: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal by replacing text that is vague and unclear, such as “precludes” and “judges”. This action will be considered by the Panel as a Public Comment.
Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Add the following sentence at the end:
“A device or utilization equipment of a width that precludes mounting in a single 50 mm (2 in.) device box as described in Table 314.16(A) shall be judged on the basis of the minimum number of gangs required for this purpose.”
Substantiation: A large device that cannot be mounted in a conventional single-gang box, and must be installed in a box with multiple gangs, should carry the conductor allowances that multiple devices in adjacent gangs already carry. This is simple common sense and the submitter has applied the concept as an inspector as a matter of interpretation for almost twenty years without difficulty. The proposal is carefully drafted so it will not reach a 3-pole 3-wire nongrounding dryer receptacle, for example (first installed prior to the 1996 NEC), installed in a two-gang box. This is because it could be mounted in a single-gang box and the decision to use a two-gang box was a design choice on the part of the installer. However, the current version of this receptacle, which would be 3-pole 4-wire grounding, will not mount in a single gang box, and would be subject to the rule.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 9 Negative: 1
Ballot Not Returned: 1 de Vega, H.
Explanation of Negative:
RUPP, B.: This proposal should be rejected for the following reasons:
1) The present allowance requirements adequately cover the size of these products and their installations. This can be determined by looking at the basis for the present language and comparing the products. During the 1990 code cycle CMP 9 changed the allowances for the device strap and yoke from one (1) to two (2). The driving factor for this change was the physical size of the GFCI receptacles on the market. These receptacles were larger than the current 50 amp receptacles.
2) This proposal did not provide one shred of technical substantiation, i.e., pictures, samples, problems from inspectors and/or electricians, for justifying the change. Products have been designed specifically for this application and have been successfully utilized in the market for as many as 7 years. This proposal will force a redesign of these products if they are to be used in the same applications.
Comment on Affirmative:
HARTWELL, F.: At first glance, this may seem more complicated than necessary. The reason for the specific reference to a device box as described in Table 314.16(A) is because some single-gang nonmetallic device boxes are either slightly larger or just flexible enough to allow 3-pole 4-wire receptacles to be forced into them. If such an application were used to justify being judged as a single gang application, it would completely evade the intent of the change.

9-32 Log #3595 NEC-P09 **Final Action: Reject**
(314.16(B)(4))

Submitter: Robert Hagarty, RANDL Industries, Inc.
Recommendation: Revise as follows:
For each yoke or strap containing one or more devices or equipment, ~~a double volume allowance in accordance with Table 314.16(B)(shall be made for each yoke or strap based on the largest conductor connected to a device(s) or equipment supported by that yoke or strap~~ , the volume of the device(s) or equipment shall be deducted from the box volume. The box shall not be filled with device(s) or equipment greater than 35 percent of the box volume .
Substantiation: Observation
The proposed code changes are necessary to meet the intent of NEC 314.16 where it states:
Boxes shall be of sufficient size to provide free space for all enclosed conductors.
It has been observed repeatedly during 12 years tracking projects that for many modern devices the required free space is not available for conductors in the device box.
Goal
Demonstrate mathematically that a code change is necessary and essential to meet the intent of the code for box fill when using modern devices and equipment.
Problem and Solution
The volume allowance for device(s) and equipment in electrical boxes that is based upon the largest size of conductor terminated to the device(s) or equipment does not achieve the conductor free space required in Table 314.16(B) when modern devices and equipment that are larger than traditional receptacles and switches are installed.
The proposed method is based upon the actual device and equipment volume. Research indicates 35 percent of box fill for devices and equipment provides adequate free space for conductors.
To calculate box fill using this proposed method:
1. Check the volume of the device or equipment and deduct that volume from the box volume and verify it is no more than 35 percent of the box volume.
2. The remaining volume is then used to determine the maximum number of conductors allowable per Table 314.16(B).
Mathematical Demonstration
The representative few examples below are actual and commonly used in industry today.
Example A – Sensor, Timer and Dimmer Devices
1. Current Code: When a 9 in. 3 device is installed in a 16 in. 3 box it fills 56 percent of the box volume and leaves 7 in. 3 of free space for conductors. Per existing code 8 #14 AWG conductors may be installed in this box less 2 conductors for a double volume allowance terminated on the device per 314.16(B)(4). Thus, 6 conductors in 7 in. 3 of free space yields a ratio of 1.17 in. 3 of free space per conductor. This is only 59 percent of the free space required by Table 314.16(B).
2. Proposed Code. A 9 in. 3 device would require a minimum of 26 in. 3 at 35 percent fill. 26 less 9 equals 17 in. 3 free space available for up to 8 #14 AWG conductors with 2.125 in. 3 of free space for each conductor, thus meeting the 2.0 in. 3 requirement of Table 314.16(B).
Example B – Fire Alarm Device

1. Current Code: When a 13 in. 3 device is installed in a 21 in. 3 box as specified by the manufacturer the device fills 62 percent of the box volume and leaves only 8 in. 3 of free space for conductors. Per existing code 10 #14 AWG conductors may be installed in this box less 2 conductors for a double volume allowance terminated on the device per 314.16(B)(4). Thus 8 conductors (required by the device) in 8 in. 3 of free space yields a ratio of 1.0 in. 3 of free space per conductor. This is only 50 percent of the free space required by Table 314.16(B).

2. Proposed Code: A 13 in. 3 device would require a minimum of 37 in. 3 at 35 percent fill. 37 less 13 equals 24 in. 3 free space available for up to 12 #14 AWG conductors with 2.0 in. 3 free space for each conductor, thus meeting the 2.0 in. 3 requirements of Table 314.16(B).

Example C – Fire Alarm Device

1. Current Code: When a 27 in. 3 device is installed in a 51 in. 3 box it consumes 53 percent of the box volume and leaves 24 in. 3 of space for conductors. Per existing Code 25 #14 AWG conductors may be installed in this box less 2 conductors for a double volume allowance terminated on the device per 314.16(B)(4). Thus, 23 conductors in 24 in. 3 of free space yields a ratio of 1.04 in. 3 of free space per conductor. This is only 52 percent of the free space required by Table 314.16(B).

2. Proposed Code: A 27 in. 3 device would require a minimum of 78 in. 3 at 35 percent fill. 78 less 27 equals 51 in. 3 free space available for up to 25 #14 AWG conductors with 2.04 in. 3 free space for each conductor, thus meeting the 2.0 in. 3 requirement of Table 314.16(B).

Response to Alternatives

1. If a box has conductors only and the maximum fill by actual volume of those conductors does not exceed 5 percent, why would we then allow a device to fill 65 percent the box volume and yet only reduce the number of conductors by two? Why not fill a conductor only box up to 65 percent? The hazards become very obvious and so should the hazards of allowing devices and equipment with this same level of fill.

2. Some suggest a quadruple conductor allowance to resolve this problem. If we install a 27 in. 3 device in a 51 in. 3 box existing code allows 25 #14 AWG conductors less 4 conductors, still leaving 21 conductors. The device only requires 8 conductors; therefore a quadruple deduction has no real impact. The only thing that does alleviate these problems is limiting the volume that a device or equipment may consume in a box.

Impact of Proposed Code Change

The previous cycle of the code making panel expressed concern that manufacturers may be forced to stop making some products and be forced out of business. Our research indicates that this is unlikely because a larger box size is all that will be required for a product to meet the revised code. More importantly, these products will be installed more safely and with fewer wiring problems. As a result, even with the marginal cost increase for larger boxes, the overall costs will be less due to reduced installation and troubleshooting time.

It is our contention that if implemented the industry will see a marked decrease in the number of box related fires and fire related injuries and equipment damage.

Conclusion

The mathematical calculations using actual modern device volumes and the existing code fill allowances demonstrate unequivocally that the proposed code change is necessary to meet the spirit and safety intent of the code.

Panel Meeting Action: Reject

Panel Statement: CMP-9 prefers to address the problem through separately stated rules on box depths. See action on Proposal 9-52.

CMP-9 concludes this approach will address the concerns expressed in the proposal.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10

Ballot Not Returned: 1 de Vega, H.

9-33 Log #2487 NEC-P09 **Final Action: Reject**

(314.16(B)(5))

Submitter: Sukanta Sengupta, North Brunswick, NJ

Recommendation: Revise text to read as follows:

314.16(B)(5) When one or more equipment grounding conductors or equipment bonding jumpers enter a box, a single volume allowance in accordance with 314.16(B)(1) ~~table 314.16(B)~~ shall be made. ~~based on the largest equipment grounding conductor or equipment bonding jumper present in the box.~~ Where an additional set of equipment grounding conductors, as permitted by 250.146(D), is present in the box, an additional volume allowance shall be made for each equipment grounding conductor of the set based on 314.16(B)(1) ~~the largest equipment grounding conductor in the additional set.~~

Substantiation: Equipment grounding conductors are not invisible or ghost conductors and occupy space. The core issue of this section is free space of a box after the installation of conductors and all calculations following Tables 314.16(A) and 314.16(B) should produce one free space volume not the multiple free space volumes reflecting grounding conductors.

Panel Meeting Action: Reject

Panel Statement: As written the proposal would require a substantial increase in box volumes; the panel is unaware of any practical loss experience that would justify this step.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10

Ballot Not Returned: 1 de Vega, H.

9-34 Log #990 NEC-P09 **Final Action: Reject**

(314.16(C)(1))

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Revise text to read as follows:

Conduit bodies enclosing 6 AWG conductors, or smaller, other than short radius conduit bodies described in 314.5, shall have a cross sectional area not less than twice the hub of the conduit body ~~largest conduit or tubing to which it is attached.~~ The maximum number of conductors shall be the maximum number permitted by Table 1 of Chapter 9 for a conduit or tubing of the same size as the conduit hub . ~~To which is attached.~~

Substantiation: Edit. All conduit bodies are not attached to conduit or tubing. There is no prohibition for use with cables or cords.

Panel Meeting Action: Reject

Panel Statement: As a practical matter, the cross-section of a conduit body is determined at the time of manufacture, and not in the field. In turn, that area is based on the largest hub on the conduit body. If the conduit body is used with some cable assembly, the hub size is still a reasonable basis for evaluation. See 314.28(A)(2) (final paragraph) for an example.

Support requirements for conduit bodies rely on a conduit system as a means of support, and therefore conduit size is an appropriate criteria.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10

Ballot Not Returned: 1 de Vega, H.

9-35 Log #3093 NEC-P09 **Final Action: Reject**

(314.17 Exception (New))

Submitter: Joseph A. Hertel, Safety and Buildings

Recommendation: This is an exception in addition to the requirements of 314.17(B) and (C):

Exception: Nonmetallic sheathed cable shall not be required to be secured to the box or conduit body where it is installed in accordance with the wiring method specified in 312.5(C).

Substantiation: 312.5(C) has provisions for cables entering cabinets, cutout boxes or meter socket enclosures. These electrical enclosures are really no different than the outlet, device, pull and junction boxes, conduit bodies, fittings and handlholes of Article 314.

Panel Meeting Action: Reject

Panel Statement: The wiring methods permitted in 312.5(C) are not suitable for boxes, conduit fittings or fittings. The main rule of 312.5(C) prohibits the installation of several cables bunched together and run through a knockout or chase nipple. Individual cable clamps or connectors are required to be used with only one cable per clamp or connector, unless the clamp or connector is identified for more than a single cable.

The requirement of cable securement to the box provides assurance that the wire is not pushed out of the box when the device is pushed into position after wiring. The wiring in cabinets, cutout boxes and meter socket enclosures do not have same forces placed on them during the installation process.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10

Ballot Not Returned: 1 de Vega, H.

9-36 Log #940 NEC-P09 **Final Action: Reject**

(314.17(B) and (C))

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Revise text of (B):

Where metal boxes or conduit bodies are installed with messenger supported wiring, open wiring on insulators, or concealed knob-an -tube wiring, single individual conductors shall enter through an insulating bushing ~~s~~ for each conductor, or in dry locations shall be permitted in flexible nonmetallic tubing or loom extending from the last ~~insulating~~ support, but not greater than 1.4 mm (4-1/2 ft) , to not less than 6 mm (1/4 in.) inside the box or conduit body and beyond any cable clamps or connectors ~~bushings~~ . Except as provided in 300.15(C) the wiring shall be firmly secured to the box or conduit body. Where flexible nonmetallic tubing or loom , or raceway s, or multiconductor cable is installed with metal boxes or conduit bodies, the flexible nonmetallic tubing or loom , raceway, or cable shall be secured to such boxes or conduit bodies.

FPN: See 300.2(B) where single alternating current conductors pass through metal.

(C) Nonmetallic boxes and conduit bodies shall be suitable for the lowest temperature rated conductor entering the box or conduit body. Where nonmetallic boxes or conduit bodies are used with messenger supported wiring, open wiring on insulators, or concealed knob-and-tube wiring, single (individual) conductors shall enter the box or conduit body through individual holes. ~~Where~~ Nonmetallic flexible tubing or loom shall be permitted as in (B) ~~is used~~ to enclose the conductors. The nonmetallic tubing or loom shall extend from the last ~~insulating~~ support to not less than 6 mm (1/4 in.) inside the box or conduit body and beyond any cable clamp or connector . Where nonmetallic-sheathed cable, multiconductor Type UF cable, multiconductor service-entrance cable, and other multiconductor cables with an overall nonmetallic covering or sheath is used, the covering or sheath shall extend not less than 6 MM (1/4 in.) inside the box or conduit body and beyond any cable clamp or connecto r. In all instances except where single conductors with flexible nonmetallic tubing or loom enter the box or conduit body through an insulating bushing, all permitted wiring methods shall be secured to the box or conduit body .

Substantiation: Edit. This proposal is intended for clarification. Flexible nonmetallic loom should be permitted which may not be perceived as tubing; tubing should be specified as nonmetallic; all supports for messenger supported wiring may not be insulating type per 396.2; all wiring methods (open single conductors) may not be safely secured to a box or conduit body. Other multicondutor covered or sheathed cables should be included with NMSC and Type UF cable as other types are permitted in 396.10.

Panel Meeting Action: Reject

Panel Statement: As proposed, the added language does not add clarity. The term "loom" is not used in the Code. See 394.19(B) for the correct terminology.

CMP-9 concludes that the installation requirements in Article 394 are sufficient.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10

Ballot Not Returned: 1 de Vega, H.

9-37 Log #2575 NEC-P09 **Final Action: Reject**

(314.17(C))

Submitter: Richard F. Van Wert, Middle Department Inspection Agency / Rep. Benjamin Franklin Chapter IAEI

Recommendation: Revise text to read as follows:

314.17(C) Exception.

Substantiation: The information in 314.17(C) belongs in 334.30 to be useful and relevant.

Panel Meeting Action: Reject

Panel Statement: CMP-9 does not have jurisdiction in Article 334. Furthermore, Type NM cable is not the only wiring method to which these rules apply.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10

Ballot Not Returned: 1 de Vega, H.

9-38 Log #634 NEC-P09 **Final Action: Reject**

(314.17(E))

Submitter: Carlo Compagnone, Compa Covers, Inc.

Recommendation: Add the following wording to 314.17(E) or 314.26:

"Protection of Outlet Boxes During Construction. The open front of both metal and nonmetallic electrical outlet boxes shall be temporarily covered to protect insulated electrical conductors from physical damage or deterioration due to power routers, plaster spray, spray foam insulation, and other potential damage during construction. The covers shall be constructed of a nonmetallic material and shall be clearly marked "Not for Permanent Installation"."

Substantiation: Leaving the front end of an electrical box open during the preliminary stages of construction results in exposed wires. This allows electrical wiring vulnerable to be cut or damaged during construction with power routers along with plaster filled boxes and overspray from paint guns and spray foam insulation guns, which in the end will leave a poor and unsafe working environment. Having a temporary cover on an electrical box is most of all a safety factor. The covers prevent build up of debris and puts a stop to unauthorized personnel tampering with wiring during the time of construction.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: Protection of all electrical equipment enclosures is important during construction. The panel agrees that electrical equipment of all types (i.e., including cabinets and cutout boxes as covered by Article 312) are vulnerable as noted in the substantiation. The concerns presented are addressed in 110.12(C), "Integrity of Electrical Equipment and Connections". This existing requirement addresses the damage or contamination by foreign materials to the internal parts of electrical equipment. As Article 100 defines "equipment" as a general term, the concern presented is already addressed and additional requirements in Article 314 are not deemed necessary.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 9 Negative: 1

Ballot Not Returned: 1 de Vega, H.

Explanation of Negative:

BELISLE, R.: We believe the submitter's request is intended to protect conductors enclosed in boxes during the construction phase, not equipment. My notes indicate that there was a general consensus that routers and other tools used by other crafts can do substantial damage to conductors. CMP-9 states that 110.12 satisfies the submitters request. The definition of "equipment" found in Article 100 does not mention,nor elude to include conductors. We believe that action should be taken to stop the damage and potential hazards that are currently being created due to other trades not concerning themselves with enclosed wiring of boxes. Panel 9 should have accepted this proposal in principle editing the proposal as follows:

314.26: "Protection of Outlet Boxes During Construction. The open front of ~~both~~ metal and nonmetallic electrical outlet boxes shall be temporarily covered to protect insulated ~~electrical~~ conductors from physical damage or deterioration ~~due to power routers, plaster spray, spray foam insulation, and other potential damage~~ during construction. The covers shall be constructed of a ~~nonmetallic~~ suitable material and shall be clearly marked "Not for Permanent Installation"."

9-39 Log #136 NEC-P09 **Final Action: Reject**

(314.19)

Submitter: Jerry Ibey, Creative Technical Services

Recommendation: Revise as follows:

Boxes used to enclosure flush devices shall be of such design that the device will be completely enclosed on back and sides and *substantial support for the device will be provided.

~~Screws for supporting the box shall not be used in the attachment of the device contained therein.~~

(Add Explanation) *Substantial support for the device is intended to mean that devices should be firmly secured to the box or plaster ring mounting tabs and not soley to the finished surface so that unwanted movement of the device is eliminated. Where a 1/4 in. gap exists due to box setback and where the finished surface is noncombustible, it is recommended to place electrical grade PVC spacers between the device yoke and the box or ring mounting tabs in such a manner that the spacers cannot come off during tightening of the device screws and thereby provide a substantial support of the device to its box.

(New Wording) Screws for supporting the box and/or ring shall be independent of the supporting means for the devise such that the device may be removed without any degradation to the support utilized by the box and/or ring.

Substantiation: With several years of field installation experience, I have encountered these types of problems many times: broken faceplates where the installer tries to "pull" the device flush and support it primarily by the faceplate where the act of inserting a plug causes the device to "sink-in" and where removal of the plug causes the device to "pull-out" thus cracking the faceplate. Excessive movement of the device also "works" the metal yoke to a point of failure or causes the bonding action of the device screws to be momentarily interrupted during the plugging or unplugging.

The internal wiring may also work loose or break, leading to arcing problems and potential fires. Additionally, lateral movement (from side-to-side) can also cause arcing. Some installers also rely on only a tiny portion of the device yoke "ears" to support to the finished surface. These device ears are inherently weak as most have crop-points etched into the metal for easy removal of said ears. Being so weakened by design, a substantial support is not provided when there exists gap a between the device yoke and the box or ring mounting tabs and without placing spacers there between.

As for the change to the wording regarding the screws...it was simply unclear as to the intent which I interpreted to mean that one should not try to use an excessively long screw to mount through the device and then through the ring and then through the box to finally support all pieces to some framing member and where the removal of such could cause the whole assembly to fall off or apart.

Panel Meeting Action: Reject

Panel Statement: The issues covered in the substantiation are real, particularly in the case of receptacles. However, no change in this section is required, because the issue is addressed in 406.4(A).

Ballot Results: Affirmative: 10

Ballot Not Returned: 1 de Vega, H.

9-40 Log #491 NEC-P09 **Final Action: Reject**

(314.19)

Submitter: Jerry Ibey, Creative Technical Services

Recommendation: Section 314.19 currently reads as follows:

"Boxes used to enclose flush devices shall be of such design that the device will be completely enclosed on back and sides and a substantial support for the device will be provided. Screws for supporting the box shall not be used in the attachment of the device therein."

Proposed wording:

Boxes and/or their attached rings used to enclose flush devices shall be of such design that the device attached thereto shall be completely enclosed on back and sides. The box shall be substantially supported to the wall, ceiling or some framing member such that the facia of the box lies flush with the finished surface. The device attached thereto shall be substantially supported to the box and/or ring by means of screws which are independent of any screws or means used to attach the box. Where allowable box setbacks exist, and where the finished surface is noncombustible, electrical-grade PVC spacers shall be placed between the device yoke(s) and the box mounting tabs with the device screws passing there-through thus restoring a rigid, surface-to-surface connection of the device to its box.

Delete the phrase "screws for supporting the box shall not be used in the attachment of the device therein."

Substantiation: Problem: The wording of this article is vague and only addresses the need for a substantially supported device and ignores the extreme need for a substantially supported box as well. There is a need to remove devices occasionally for servicing and the box support should not be compromised if the device screws are removed, the proposed wording clarifies that much better.

The article does not address the correct solution for accommodating box setbacks although a thorough description of allowable setbacks with a detailed definition of combustible materials is set forth. The other problems posed by improperly supported devices are electrical and fire safety issues that do indeed exist if gaps between devices and their boxes are left without proper spacers to substantially support the device to its box.

Substantiation: In my 16 years of installation experience, I encounter these problems constantly; installers rely on the tiny pre-scored “ears” of the device yoke to support solely to the finished surface where often times only a fraction of these ears actually touch the finished surface. Because these ears are inherently weak due to the scoring they can break off leaving a device unsupported and able to flop around within the space. Similarly, installers rely on an often singular center faceplate screw to “pull” the device flush with the finished surface and thus the fragile faceplate bears all of the forces exerted by “plugging-in” and “unplugging” apparatus thus ultimately causing a cracked or broken faceplate with perhaps exposed live parts, and again, an unsupported device. Perhaps the most significant of the problems is unwanted movement of the device which can cause internal wiring to fatigue and break, cause termination points to become loose and may interrupt the bonding action of the device screws if not firmly anchored to its grounded box.

All of which may present potential fire hazards and electrical safety concerns. Nearly every installer recognizes the need for spacers and have devised all sorts of undesirable methods such as pieces of wood, cardboard, metal washers (sometimes the very “ears” previously mentioned are purposely broken off to become these washers), loops of wire wrapped around the device screws, cut off pieces of wiring nuts and other improper spacer means have been encountered. Most all of these will compress with time and eventually work lose leaving the device able to flop around with minimal lateral stability which may allow arcing against adjacent live parts. PVC is the preferred self-extinguishing material for nonmetallic electrical boxes and should be the preferred material for spacers needed to substantially support devices to their boxes.

As for the deleted phrase above, it is simply unlikely that one would have screws long enough to go through the device and then through the entire box and/or ring to then mount to some framing members that would support all of these components, thus the wording is vague and thus merits further elaboration.

Panel Meeting Action: Reject

Panel Statement: The issue primarily concerns receptacles, and there is already a sufficient rule in 406.4(A).

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10

Ballot Not Returned: 1 de Vega, H.

9-41 Log #3594 NEC-P09 **Final Action: Reject**

(314.19)

Submitter: Robert Hagarty, RANDL Industries, Inc.

Recommendation: Revise as follows:

Boxes used to enclose flush devices and equipment shall be of such design and size that the devices or equipment will be completely enclosed on back and sides and no fill greater than 35 percent of the box volume and substantial support for the devices or equipment will be provided. Screws for supporting the box shall not be used in attachment of the device or equipment contained therein.

Substantiation: Observation

The proposed code changes are necessary to meet the intent of NEC 314.16 where it states:

Boxes shall be of sufficient size to provide free space for all enclosed conductors.

It has been observed repeatedly during 12 years tracking projects that for many modern devices the required free space is not available for conductors in the device box.

Goal

Demonstrate mathematically that a code change is necessary and essential to meet the intent of the code for box fill when using modern devices and equipment.

Problem and Solution

The volume allowance for device(s) and equipment in electrical boxes that is based upon the largest size of conductor terminated to the device(s) or equipment does not achieve the conductor free space required in Table 314.16(B) when modern devices and equipment that are larger than traditional receptacles and switches are installed.

The proposed method is based upon the actual device and equipment volume. Research indicates 35 percent of box fill for devices and equipment provides adequate free space for conductors.

To calculate box fill using this proposed method:

1. Check the volume of the device or equipment and deduct that volume from the box volume and verify it is no more than 35 percent of the box volume.

2. The remaining volume is then used to determine the maximum number of conductors allowable per Table 314.16(B).

Mathematical Demonstration

The representative few examples below are actual and commonly used in industry today.

Example A – Sensor, Timer and Dimmer Devices

1. Current Code: When a 9 in.^{3} device is installed in a 16 in.^{3} box it fills 56 percent of the box volume and leaves 7 in.^{3} of free space for conductors. Per existing code 8 #14 AWG conductors may be installed in this box less 2 conductors for a double volume allowance terminated on the device per 314.16(B)(4). Thus, 6 conductors in 7 in.^{3} of free space yields a ratio of 1.17 in.^{3} of free space per conductor. This is only 59 percent of the free space required by Table 314.16(B).

2. Proposed Code. A 9 in.^{3} device would require a minimum of 26 in.^{3} at 35 percent fill. 26 less 9 equals 17 in.^{3} free space available for up to 8 #14 AWG conductors with 2.125 in.^{3} of free space for each conductor, thus meeting the 2.0 in.^{3} requirement of Table 314.16(B).

Example B – Fire Alarm Device

1. Current Code: When a 13 in.^{3} device is installed in a 21 in.^{3} box as specified by the manufacturer the device fills 62 percent of the box volume and leaves only 8 in.^{3} of free space for conductors. Per existing code 10 #14 AWG conductors may be installed in this box less 2 conductors for a double volume allowance terminated on the device per 314.16(B)(4). Thus 8 conductors (required by the device) in 8 in.^{3} of free space yields a ratio of 1.0 in.^{3} of free space per conductor. This is only 50 percent of the free space required by Table 314.16(B).

2. Proposed Code: A 13 in.^{3} device would require a minimum of 37 in.^{3} at 35 percent fill. 37 less 13 equals 24 in.^{3} free space available for up to 12 #14 AWG conductors with 2.0 in.^{3} free space for each conductor, thus meeting the 2.0 in.^{3} requirements of Table 314.16(B).

Example C – Fire Alarm Device

1. Current Code: When a 27 in.^{3} device is installed in a 51 in.^{3} box it consumes 53 percent of the box volume and leaves 24 in.^{3} of space for conductors. Per existing Code 25 #14 AWG conductors may be installed in this box less 2 conductors for a double volume allowance terminated on the device per 314.16(B)(4). Thus, 23 conductors in 24 in.^{3} of free space yields a ratio of 1.04 in.^{3} of free space per conductor. This is only 52 percent of the free space required by Table 314.16(B).

2. Proposed Code: A 27 in.^{3} device would require a minimum of 78 in.^{3} at 35 percent fill. 78 less 27 equals 51 in.^{3} free space available for up to 25 #14 AWG conductors with 2.04 in.^{3} free space for each conductor, thus meeting the 2.0 in.^{3} requirement of Table 314.16(B).

Response to Alternatives

1. If a box has conductors only and the maximum fill by actual volume of those conductors does not exceed 5 percent, why would we then allow a device to fill 65 percent the box volume and yet only reduce the number of conductors by two? Why not fill a conductor only box up to 65 percent? The hazards become very obvious and so should the hazards of allowing devices and equipment with this same level of fill.

2. Some suggest a quadruple conductor allowance to resolve this problem. If we install a 27 in.^{3} device in a 51 in.^{3} box existing code allows 25 #14 AWG conductors less 4 conductors, still leaving 21 conductors. The device only requires 8 conductors; therefore a quadruple deduction has no real impact. The only thing that does alleviate these problems is limiting the volume that a device or equipment may consume in a box.

Impact of Proposed Code Change

The previous cycle of the code making panel expressed concern that manufacturers may be forced to stop making some products and be forced out of business. Our research indicates that this is unlikely because a larger box size is all that will be required for a product to meet the revised code. More importantly, these products will be installed more safely and with fewer wiring problems. As a result, even with the marginal cost increase for larger boxes, the overall costs will be less due to reduced installation and troubleshooting time.

It is our contention that if implemented the industry will see a marked decrease in the number of box related fires and fire related injuries and equipment damage.

Conclusion

The mathematical calculations using actual modern device volumes and the existing code fill allowances demonstrate unequivocally that the proposed code change is necessary to meet the spirit and safety intent of the code.

Panel Meeting Action: Reject

Panel Statement: CMP-9 prefers to address the problem through separately stated rules on box depths. See action on Proposal 9-52.

CMP-9 concludes this approach will address the concerns expressed in the proposal.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10

Ballot Not Returned: 1 de Vega, H.

9-42 Log #139 NEC-P09 **Final Action: Reject**
(314.20)

Submitter: Roderic Tosetti, Tosetti Electrical Consultants
Recommendation: Add text to read as follows:

In walls or ceilings of concrete, tile or other noncombustible material, boxes, fittings and cabinets shall be so installed that the front edge of the box or fitting will not set back of the finished surface more than 1/4 in. In walls and ceilings constructed of wood or other combustible material, outlet boxes, fittings and cabinets shall be flush with the finished surface or project therefrom.

Substantiation: The 2002 NEC section 314.20 was revised in response to a singular recommendation by Mr. Joseph A. Hertel. Mr. Hertel states in his recommendation, "Most electricians and inspectors will treat a wall of this construction as noncombustible...".

The above stated treatment by "Most electricians and inspectors..." cannot be justified. By definition: The term combustible refers to material "that catches fire and burns". By definition: The term "non" preceding the work "combustible" refers to "the opposite of, negative, used to give perforative force". (Webster's New World Dictionary, third College Edition, Simon & Schuster, Inc.)

In essence, you cannot refer to a material or assembly that burns as "noncombustible".

We all know the purpose of the NEC is the practical safeguarding of persons and property from hazards arising from the use of electricity. 314.20 specifically refers to fire hazards and has remained almost the same since the 1937 NEC. In short, we should work toward reinforcing the code rather than diluting its purpose.

1937 NEC

3711. Position in Wall. In walls or ceilings of concrete, tile or other noncombustible material, boxes, fittings and cabinets shall be so installed that the front edge of the box or fitting will not set back of the finished surface more than 1/4 inch. In walls and ceilings <u>constructed of</u> wood or other combustible material, outlet boxes, fittings and cabinets shall be flush with the finished surface or project therefrom.

1999 NEC

370.20. In Wall or Ceiling. In walls or ceilings of concrete, tile or other noncombustible material, boxes, shall be so installed that the front edge of the box or fitting will not set back of the finished surface more than 1/4 inch (6.35 mm). In walls and ceilings <u>constructed of</u> wood or other combustible material, outlet boxes, shall be flush with the finished surface or project therefrom.

2002 NEC

314.20 In Wall or Ceiling. In walls or ceilings with a surface of concrete, tile, gypsum, plaster, or other noncombustible material, boxes shall be installed so that the front edge of the box will not be set back of the finished surface more than 6 mm (1/4 in.)

In walls and ceilings constructed of wood or other combustible surface material, boxes shall be flush with the finished surface or project there from.

Sometime between 1937 and 1947 the term "cabinet" was removed. The 1996 NEC removed the term "fitting".

"In walls and ceilings <u>constructed of</u> wood or other combustible material", speaks to the construction of the wall or ceiling. Wood stud walls covered with sheetrock burn. Furthermore, sheetrock (gypsum) has a flame spread rating and is combustible.

The 2002 NEC 314.20 drastically diminished the code section making it reference only to the construction of the "surface material".

Therefore, to eliminate disagreements and assist the interpretations of 314.20, we need to go back to the 1937 wording and insert the definition of "combustible" in Article 100.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject
Panel Statement: Dry wall has a fire resistance rating and has been used for these purposes for generations. CMP-9 has no basis to impose this type of restriction.
Number Eligible to Vote: 11

Ballot Not Returned: 1 de Vega, H.

9-43 Log #3219 NEC-P09 **Final Action: Reject**
(314.20)

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise text to read as follows:

"In Wall ~~or Ceiling.~~ <u>,Ceiling, or Floor.</u> In walls or ~~ceilings~~ <u>ceilings, or floors...".</u>

Substantiation: Penetrations for installations of floor boxes appear to compromise a fire barrier just as do penetrations for wall boxes.
Panel Meeting Action: Reject
Panel Statement: The rules in 314.20 have to do with limiting the use of building construction to complete an electrical enclosure, and not fire separation. Floor boxes are self contained entities, with the tops in secure contact with the sides, and need not be subject to the setback limitations of this section.

The manufacturers of the floor boxes provide set-back instructions to insure the proper alignment of the box, cover and finished floor surface.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-44 Log #1343 NEC-P09 **Final Action: Reject**
(314.21)

Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Apply this section to all surfaces, change title

314.21 Repairing ~~Plaster and Drywall or Plasterboard~~ <u>Surfaces.</u> ~~Plaster, drywall, or plasterboard~~ Surfaces that are broken or incomplete around boxes employing a flush-type cover or faceplate shall be repaired so there will be no gaps or open spaces greater than 3 mm (1/8 in.) at the edge of the box.

Substantiation: The repair of surfaces, in order to provide a complete and workmanlike installation, should not be limited to just plaster, drywall, or plasterboard.
Panel Meeting Action: Reject
Panel Statement: The proposal as written would have electricians troweling plastic wood around the perimeter of flush boxes in wood-paneled walls. This would go beyond the requirements necessary for safety. This rule addresses a condition where building construction is, in effect, used to complete an electrical enclosure, and there are limitations to the extent that that can be considered safe practice. Since the boxes must come all the way to the surface of a combustible wall, the necessity for repair vanishes. If there is an unusual degree of shoddy workmanship, then 110.12 can still be cited.

These problems would also be true for a cement wall installation.

Ballot Not Returned: 1 de Vega, H.

9-46 Log #2015 NEC-P09 **Final Action: Reject**
(314.23(E))

Submitter: Dennis Baker, Springs & Sons Electrical Contractors, Inc. / Rep. IEC
Recommendation: Add text to read as follows:

(E) Raceway Supported Enclosure, Without Devices, Luminaires (Fixtures), or Lampholders. An enclosure that does not contain a device(s) other than splicing devices or support a luminaire(s) [fixture(s)], lampholder, or other equipment and is supported by entering raceways shall not exceed 1650 cm 3 (100 in. 3) in size. It shall have threaded entries or have hubs identified for the purpose. It shall be supported by two or more conduits threaded wrenchtight into the enclosure or hubs. When conduit is run underground one conduit connection can be made using a listed threadless connector. Each conduit shall be secured within 900 mm (3 ft) of the enclosure, or within 450 mm (18 in.) of the enclosure if all conduit entries are on the same side.

Substantiation: When running rigid metal or intermediate metal conduit underground between several boxes such as for receptacles in the back yard of a residential occupancy, a threadless connector would be plenty adequate to support the box when the two conduits are turned up and one conduit threaded into the box and the other fastened with a threadless fitting.

Panel Meeting Action: Reject
Panel Statement: The conduits need to be threaded in, and there is no basis for making this rule more lenient just because one or more of the raceway entries are running underground. Often a conduit supported by soil has more give than one supported through conventional anchors. If a conduit cannot be turned in, the code permits the use of a threaded union to solve this problem.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-47 Log #1102 NEC-P09 **Final Action: Reject**
(314.23(E) Exception No. 2, (F), and Exception No. 3)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise text of (E): An enclosure that does not contain a device(s), other than splicing devices, or support a luminaire (fixture), lampholder, or other equipment and is supported solely by ~~entering~~ connected raceways... (remainder unchanged).
Add:
Exception No. 2: Where it is impractical to thread more than one conduit into one side of the enclosure a threadless connector shall be permitted for the additional conduits.
Revise text of (F:) An enclosure that contains a device(s) other than splicing devices or supports a luminaire (fixture), lampholder, or other equipment and is supported solely by ~~entering~~ connected raceways. (remainder unchanged).
Add:
Exception No. 3: Where it is impractical to thread more than one conduit into one side of the enclosure a threadless connector shall be permitted for the additional conduits.
Substantiation: This rule is only justified where the conduits are the sole support. It is virtually impossible in some instances to comply with (E) and (F) where conduit bends are stubbed up from earth or concrete for future connection to boxes with threaded entries, without the use of threadless fittings or unions. Two or more short nipples threaded into a box and connected to conduit stub ups with threadless couplings comply with the rule, but is essentially no different than using threadless connectors. The proposed exceptions are commonly accepted installations per 90.4 by AHJs who have been electricians. The exception for (E) permits EMT support of conduit bodies for practical reasons, including a single hub type (one support) Exception No. 2 for (F) is practical but has less stringent restrictions where a conduit body supports a luminaire (fixture). For example, one conduit may be used for support and support may be 3 feet from the luminaire box and the weight supported may be 20 pounds. 680.5(B)(2) appears to permit enclosure support by only one conduit. It appears a steel FS box would be just as suitable as an (aluminum) conduit body for support.
Panel Meeting Action: Reject
Panel Statement: The conduits need to be threaded in, and there is no basis for making this rule more lenient just because one or more of the raceway entries are running underground. Often a conduit supported by soil has more give than one supported through conventional anchors. If a conduit cannot be turned in, the code allows the use of a threaded union to solve this problem.
CMP-9 was unable to find 680.5(B), however, the panel calls the submitter's attention to Table 680.3, which specifically invokes the support rules in 314.23 in cases such as this.
Number Eligible to Vote: 11

(314.23(F))

Submitter: Dennis Baker, Springs & Sons Electrical Contractors, Inc. / Rep. IEC
Recommendation: Add text to read as follows:
(F) Raceway Supported Enclosure, With Devices, Luminaires (Fixtures), or Lampholders. An enclosure that does not contain a device(s) other than splicing devices or support a luminaire(s) [fixture(s)], lampholder, or other equipment and is supported by entering raceways shall not exceed 1650 cm 3 (100 in. 3) in size. It shall have threaded entries or have hubs identified for the purpose. It shall be supported by two or more conduits threaded wrenchtight into the enclosure or hubs. When conduit is run underground one conduit connection can be made using a threadless connector. Each conduit shall be secured within 450 mm (18 in.) of the enclosure.
Substantiation: When running rigid metal or intermediate metal conduit underground between several boxes such as for receptacles in the back yard of a residential occupancy, a threadless connector would be plenty adequate to support the box when the two conduits are turned up and one conduit threaded into the box and the other fastened with a threadless fitting.
Panel Meeting Action: Reject
Panel Statement: The conduits need to be threaded in, and there is no basis for making this rule more lenient just because one or more of the raceway entries are running underground. Often a conduit supported by soil has more give than one supported through conventional anchors. If a conduit cannot be turned in, the code permits the use of a threaded union to solve this problem.

(314.24)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc. / Rep. CMP 9 Task Group on Allowable Box Depth
Recommendation: Revise 314.24 to read as follows:
314.24 Depth of Boxes. Outlet and device boxes shall have sufficient depth to allow equipment installed within them to be mounted properly and without likelihood of damage to conductors within the box.
(A) Outlet and Device Boxes With Enclosed Devices or Utilization Equipment. Outlet and device boxes that enclose devices or utilization equipment shall have a minimum internal depth that accommodates the

rearward projection of the equipment and the size of the conductors that supply the equipment. The internal depth shall include, where used, that of any extension boxes, plaster rings, or raised covers. The internal depth shall comply with all applicable provisions of (1) through (5).

(1) Large Equipment. Boxes that enclose devices or utilization equipment that projects more than 48 mm (1 7/8 in.) rearward from the mounting plane of the box shall have a depth that is not less than the depth of the equipment plus 6 mm (1/4 in.).

(2) Conductors Larger Than 4 AWG. Boxes that enclose devices or utilization equipment supplied by conductors larger than 4 AWG shall be identified for their specific function.

(3) Conductors 8, 6, or 4 AWG. Boxes that enclose equipment supplied by 8, 6, or 4 AWG conductors shall have an internal depth that is not less than 52.4 mm (2 1/16 in.).

(4) Conductors 12 or 10 AWG. Boxes that enclose equipment supplied by 12 or 10 AWG conductors shall have an internal depth that is not less than 30.2 mm (1 3/16 in.). Where the equipment projects rearward from the mounting plane of the box by more than 25 mm (1 in.), the box shall have a depth not less than that of the equipment plus 6 mm (¼ in.).

(5) Conductors 14 AWG and Smaller. Boxes that enclose equipment supplied by 14 AWG or smaller conductors shall have a depth that is not less than 23.8 mm (15/16 in.).

Exception to (1) through (5): Equipment that is listed to be installed with specified boxes shall be permitted.

(B) Outlet Boxes Without Enclosed Devices or Utilization Equipment. Outlet boxes that do not enclose devices or utilization equipment shall have a minimum internal depth of 12.7 mm (½ in.).

Substantiation: This proposal is the result of a task group created as part of the CMP 9 discussion of Public Comment 9-62 on Proposal 9-34 in the 2005 NEC cycle. The members were Frederic Hartwell (CMP 9, Chair), William Hopple (CMP 16) Robert Osborne (CMP 9) Brian Rock (CMP 17) and Bradford Rupp (CMP 9). Proposal 9-34 raised issues regarding inadequate box sizing requirements in prior editions of the NEC, and suggested modifications to the volume allowance provisions in 314.16 accordingly. CMP 9 believed that the issue needed attention, but that changes to volume provisions would not adequately address the concerns, because it was easily possible for box-mounted equipment to have a very deep profile and yet take up a comparatively small volume. The task group was therefore charged with reviewing both the volume rules in 314.16 and the box depth coverage in 314.24. The latter section had only seen one substantial change in the previous 70 years, so it probably needed very careful review.

The task group concluded that the work should be done in 314.24, and this proposal completely rewrites the section. This section took its present form in the 1975 NEC. Prior to that time, and extending back into the 1930s or before, the requirement was for boxes for concealed work to have a minimum depth of 1½ inches unless such a depth would damage the building structure or was otherwise impracticable, in which case a box of minimum depth of ½ inch could be used. The rule in the 1975 NEC and thereafter was designed to accommodate a box design that would allow a device to be installed on a wall made with 3/4-in. furring strips and 3/16-in. paneling.

At the time, only a single conductor allowance needed to be made for a device. Since a typical 1 inch deep (15/16 inch internal depth) box configured for this purpose has a volume of 6.5 in 3 , if armored cable or metal raceway entered the box with no additional grounding conductors, the box had a practical application at the time. These boxes are still available (reference RACO #404 or equal). However, for the past fifteen years two allowances have been and continue to be required for devices, so a single gang 15/16 inch internal depth box has little practical application unless augmented by a surface extension of some sort, such as are readily available from manufacturers of various types of surface raceways. Another marginal application of a box this shallow would involve the two-gang versions of the same boxes, which have volumes running over 14 in 3 . Note that only the two-gang versions are currently listed, (although the NEC does not require these metal device boxes to be listed).

The task group was also aware that introducing additional marking requirements on electrical equipment is frequently problematic and not to be done lightly. Over the years some of the most intense discussions within the panel have grown out of suggestions that may have, often inadvertently, forced changes in product markings. These changes are extremely expensive for the industry to accommodate, they are genuine, and should never be imposed if there is some other way. This proposal carefully avoids any mandatory change in marking requirements, although the option is there for a manufacturer to pursue a special listing if it chooses.

As part of its discussions, the task group gave considerable thought to at what point a rearward projection becomes problematic. Clearly this is in part related to the wire sizes involved in a given installation. The task group considered incorporating by reference the Table 312.6(A) bending radii to this end, but rejected that approach because Table 312.6(A) distances assume an installer bringing a wire to a fixed terminal; this is not appropriate for a device wired outside a box and then mounted into the box. The other part of the discussion involved an informal survey of current device designs in an effort to write a rule that could be easily applied and that would readily comport with likely applications. Although the 2005 proposal that resulted in the task group creation addressed fire alarm equipment, it became quickly apparent that any rule in this area had to work easily with power devices.

As a result of the device survey, the task group settled on 1 7/8 inches as good number to set as a limit beyond which field measurements or manufacturers' specifications would need to be consulted. 314.24(A)(1) of the proposal language describes equipment with a deeper profile as "large equipment" and requires the box to be at least 1/4-inch deeper than such equipment. The term "box" as used here means [and the parent language in (A) makes clear] the underlying box together with any extension boxes, plaster rings, or raised covers employed. The same principle has been used in 314.16(A) for many generations. Virtually all common devices with mounting yokes do not exceed this limit, and therefore do not fall into the "large equipment" category. This "large equipment" category does, however, directly address the concerns in 2005 NEC Proposal 9-34.

The next step was to set a logical sequence of workable rules for more conventional devices. The task group believes it is important that there be enough space behind these devices so if one of their supply conductors falls behind the device, it will not be damaged by being compressed against the rear wall of the box. Since the largest devices in the category of power devices rated 60 amperes and below run about 1 3/4 inches, the 2 1/16-inch internal depth requirement in (A)(3) allows for clearance of the largest conductors likely to be used on such devices, based on wire diameters in Table 5 of Chapter 9. It also corresponds to the actual overall depth of a standard 2 1/8-inch deep outlet box.

Although there are some insulated conductors that are large enough in diameter to be pinned against some device brands, the task group is recommending a simple requirement that works well in the overwhelming majority of cases. If the AHJ wants an enforcement tool in the event of a significant problem, the parent language in 314.24 of this proposal ("accommodates the rearward projection of the equipment and the size of the conductors that supply the equipment") provides an answer. This is an exact and intended parallel to the parent language in 314.16 (that there be "sufficient size to provide free space for all enclosed conductors"). For over 70 years, this language has allowed and continues to allow the AHJ to insist on a larger box in those rare cases where all the volume calculations work out but the box is still overcrowded.

If the wires are even larger, such as for 100-ampere pin-and-sleeve devices, device boxes would generally be inappropriate, and the (A)(2) rule requires boxes "identified for their specific function." Generally, these are cast boxes with mating covers (frequently angled) that contain the receptacle body, all to be assembled with 1/4-inch or larger bolts at all four corners. Note that the word "identified" rather than "listed" was chosen because some manufacturer's back boxes are designed to be interchangeable with other manufacturer's receptacle housings, but they are not specifically listed for this purpose.

The task group then turned to more modest applications, including conventional 15-, 20-, and 30-ampere circuits and associated devices. In this context, the task group considered locking receptacle configurations and yoked manual motor-controllers. As covered in (A)(4), the minimum internal depth is 1 3/16 inch, with a requirement to make sure there is a 1/4-inch space behind the device for devices deeper than 1 inch. Since most flush applications involve spacings of at least 1 3/4 inches (1 1/4-inch deep box plus a mud ring or raised cover of some sort with a rise in the ½-inch range), and since devices in this amperage range (including 30-ampere locking, TVSS, and GFCI receptacles) don't much exceed 1 1/4 inches deep, this will not require much in the way of field measurements. Some dimmer and occupancy sensor switches, however, do approach 1 3/4 inches in depth, and will require field consideration. Note that even in this case, however, if the underlying box is 1 1/2 inches deep (very common) with the same plaster ring or raised cover, even these devices meet the rule easily.

With that settled, the task group finished the work in this section by addressing the current provisions of 314.24, which allow for a 1-inch device box for flush work. This is a 15/16-inch deep box measured internally, because 314.40(B) requires steel boxes to be of 1/16-inch thick steel as a minimum. Although the volume requirements have largely driven these applications off the market, the task group did not want to abandon the allowance all together. Some residential grade devices project less than 3/4 inch into a box, so the solution was to reserve these boxes for 14 AWG wire connections. The other piece of the current rule concerns outlet boxes that do not contain flush equipment. This minimum depth rule becomes the (B) subsection, the requirement remaining unchanged in over 70 years.

A note on the metrication process in this proposal. CMP 9 decided to use soft conversions in both Table 314.16(A) and in 314.24 (see Proposals 9-6 and 9-14 for the 2002 NEC) because hard conversions could have the effect of forcing the redesign of products built to current standards. Therefore, the dimensions in this proposal that describe the minimum depth of a box use soft conversions. Dimensions that describe the rearward projection of mounted equipment, and that would likely be field-measured, are hard conversions.

Panel Meeting Action: Accept

Ballot Results: Affirmative: 10

Ballot Not Returned: 1 de Vega, H.

9-53 Log #3593 NEC-P09 **Final Action: Reject**
(314.24)

Submitter: Robert Hagarty, RANDL Industries, Inc.
Recommendation: Revise as follows:
No box shall have an internal depth of less than 12.7 mm (1/2 in.). Boxes intended to enclose flush devices or equipment shall have an internal depth of not less than 23.8 mm (15/16 in.) and shall not be filled to greater than 35 percent of the box volume by devices or equipment.
Substantiation: Observation
The proposed code changes are necessary to meet the intent of NEC 314.16 where it states:
Boxes shall be of sufficient size to provide free space for all enclosed conductors.
It has been observed repeatedly during 12 years tracking projects that for many modern devices the required free space is not available for conductors in the device box.
Goal
Demonstrate mathematically that a code change is necessary and essential to meet the intent of the code for box fill when using modern devices and equipment.
Problem and Solution
The volume allowance for device(s) and equipment in electrical boxes that is based upon the largest size of conductor terminated to the device(s) or equipment does not achieve the conductor free space required in Table 314.16(B) when modern devices and equipment that are larger than traditional receptacles and switches are installed.
The proposed method is based upon the actual device and equipment volume. Research indicates 35 percent of box fill for devices and equipment provides adequate free space for conductors.
To calculate box fill using this proposed method:
1. Check the volume of the device or equipment and deduct that volume from the box volume and verify it is no more than 35 percent of the box volume.
2. The remaining volume is then used to determine the maximum number of conductors allowable per Table 314.16(B).
Mathematical Demonstration
The representative few examples below are actual and commonly used in industry today.
Example A – Sensor, Timer and Dimmer Devices
1. Current Code: When a 9 in. 3 device is installed in a 16 in. 3 box it fills 56 percent of the box volume and leaves 7 in. 3 of free space for conductors. Per existing code 8 #14 AWG conductors may be installed in this box less 2 conductors for a double volume allowance terminated on the device per 314.16(B)(4). Thus, 6 conductors in 7 in. 3 of free space yields a ratio of 1.17 in. 3 of free space per conductor. This is only 59 percent of the free space required by Table 314.16(B).
2. Proposed Code. A 9 in. 3 device would require a minimum of 26 in. 3 at 35 percent fill. 26 less 9 equals 17 in. 3 free space available for up to 8 #14 AWG conductors with 2.125 in. 3 of free space for each conductor, thus meeting the 2.0 in. 3 requirement of Table 314.16(B).
Example B – Fire Alarm Device
1. Current Code: When a 13 in. 3 device is installed in a 21 in. 3 box as specified by the manufacturer the device fills 62 percent of the box volume and leaves only 8 in. 3 of free space for conductors. Per existing code 10 #14 AWG conductors may be installed in this box less 2 conductors for a double volume allowance terminated on the device per 314.16(B)(4). Thus 8 conductors (required by the device) in 8 in. 3 of free space yields a ratio of 1.0 in. 3 of free space per conductor. This is only 50 percent of the free space required by Table 314.16(B).
2. Proposed Code: A 13 in. 3 device would require a minimum of 37 in. 3 at 35 percent fill. 37 less 13 equals 24 in. 3 free space available for up to 12 #14 AWG conductors with 2.0 in. 3 free space for each conductor, thus meeting the 2.0 in. 3 requirements of Table 314.16(B).
Example C – Fire Alarm Device
1. Current Code: When a 27 in. 3 device is installed in a 51 in. 3 box it consumes 53 percent of the box volume and leaves 24 in. 3 of space for conductors. Per existing Code 25 #14 AWG conductors may be installed in this box less 2 conductors for a double volume allowance terminated on the device per 314.16(B)(4). Thus, 23 conductors in 24 in. 3 of free space yields a ratio of 1.04 in. 3 of free space per conductor. This is only 52 percent of the free space required by Table 314.16(B).
2. Proposed Code: A 27 in. 3 device would require a minimum of 78 in. 3 at 35 percent fill. 78 less 27 equals 51 in. 3 free space available for up to 25 #14 AWG conductors with 2.04 in. 3 free space for each conductor, thus meeting the 2.0 in. 3 requirement of Table 314.16(B).
Response to Alternatives
1. If a box has conductors only and the maximum fill by actual volume of those conductors does not exceed 5 percent, why would we then allow a device to fill 65 percent the box volume and yet only reduce the number of conductors by two? Why not fill a conductor only box up to 65 percent? The hazards become very obvious and so should the hazards of allowing devices and equipment with this same level of fill.
2. Some suggest a quadruple conductor allowance to resolve this problem. If we install a 27 in. 3 device in a 51 in. 3 box existing code allows 25 #14 AWG conductors less 4 conductors, still leaving 21 conductors. The device only requires 8 conductors; therefore a quadruple deduction has no real impact. The only thing that does alleviate these problems is limiting the volume that a device or equipment may consume in a box.
Impact of Proposed Code Change
The previous cycle of the code making panel expressed concern that manufacturers may be forced to stop making some products and be forced out of business. Our research indicates that this is unlikely because a larger box size is all that will be required for a product to meet the revised code. More importantly, these products will be installed more safely and with fewer wiring problems. As a result, even with the marginal cost increase for larger boxes, the overall costs will be less due to reduced installation and troubleshooting time.
It is our contention that if implemented the industry will see a marked decrease in the number of box related fires and fire related injuries and equipment damage.
Conclusion
The mathematical calculations using actual modern device volumes and the existing code fill allowances demonstrate unequivocally that the proposed code change is necessary to meet the spirit and safety intent of the code.
Panel Meeting Action: Reject
Panel Statement: CMP-9 prefers the approach taken in Proposal 9-52, that focuses on actual rearward projection distances.

9-56 Log #2611 NEC-P09 **Final Action: Accept in Principle**
(314.27(A) & (B))

Submitter: David H. Kendall, Carlon
Recommendation: Revise as follows:
(A) Boxes at Luminaire (Lighting Fixture) Outlets. Boxes used at luminaire (lighting fixture) or lampholder outlets in a ceiling shall be designed for the purpose and shall be required to support a luminaire (light fixture) weighing a minimum of 23 kg (50 lb.). Boxes used at luminaire (lighting fixture) or lampholder outlets in a wall shall be designed for the purpose and shall be marked to indicate the maximum weight of the luminaire (light fixture) that is permitted to be supported by the box in the wall . At every outlet used exclusively for lighting, the box shall be designed or installed so that a luminaire (lighting fixture) may be attached.
Exception: A wall-mounted luminaire (fixture) weighing not more than 3 kg (6 lb.) shall be permitted to be supported on other boxes or plaster rings that are secured to other boxes, provided the luminaire (fixture) or its supporting yoke is secured to the box with no fewer than two No. 6 or larger screws.

(B) Maximum Luminaire (Fixture) Weight. Outlet boxes or fittings designed for the support of luminaires (lighting fixture) and installed as required by 314.23 shall be permitted to support a luminaires (lighting fixtures) weighing 23 kg (50 Lb) or less. A luminaire (lighting fixture) that weighs more than 23 kg (50 lb) shall be supported independently of the outlet box unless the outlet box is listed and marked for the maximum weight to be supported.

Substantiation: This proposal clarifies the requirements for listed boxes used for luminaire support. Currently, there are outlet boxes on the market that are listed and marked for luminaires weighing between 3 kg (6 lb) and 23 kg (50 lb) for ceiling applications. I believe that Panel 9 always intend that a ceiling box for luminaire support shall be required to support a minimum of 23 kg (50 lbs) or less.

Markings for boxes between 3 kg (6 lb) and 23 kg (50 lb) was initially permitted for wall mounted luminaires only and was not intended for ceiling mounted luminaires. Homeowners may unknowingly change a ceiling luminaire to a heavy weight than the box is listed for.

314.27(B) was revised to indicate that boxes listed for luminaires weighing more than 23 kg (50 lb) are required to be marked with the maximum weight.

Panel Meeting Action: Accept in Principle

Revise the proposed wording to read as follows:

"(A) Boxes at Luminaire (Lighting Fixture) Outlets. Boxes used at luminaire (lighting fixture) or lampholder outlets in a ceiling shall be designed for the purpose and shall be required to support a luminaire (light fixture) weighing a minimum of 23 kg (50 lb.). Boxes used at luminaire (lighting fixture) or lampholder outlets in a wall shall be designed for the purpose and shall be marked on the interior of the box to indicate the maximum weight of the luminaire (light fixture) that is permitted to be supported by the box in the wall, if other than 23 kg (50 lb) . At every outlet used exclusively for lighting, the box shall be designed or installed so that a luminaire (lighting fixture) may be attached.

Exception: A wall-mounted luminaire (fixture) weighing not more than 3 kg (6 lb.) shall be permitted to be supported on other boxes or plaster rings that are secured to other boxes, provided the luminaire (fixture) or its supporting yoke is secured to the box with no fewer than two No. 6 or larger screws.

(B) Maximum Luminaire (Fixture) Weight. Outlet boxes or fittings designed for the support of luminaires (lighting fixture) and installed as required by 314.23 shall be permitted to support a luminaires (lighting fixtures) weighing 23 kg (50 Lb) or less. A luminaire (lighting fixture) that weighs more than 23 kg (50 lb) shall be supported independently of the outlet box unless the outlet box is listed and marked for the maximum weight to be supported."

Panel Statement: Code-Making Panel 9 agrees with the submitter to change 314.27(A) & (B).

Code-Making Panel 9 made two changes to the submitter's text. The first change assures that no additional marking requirements will apply to a conventional outlet box suitable for a 50 lb load. The second change assures that the capacity of the box can be reviewed at the time of a finish inspection.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10

Ballot Not Returned: 1 de Vega, H.

Comment on Affirmative:

HARTWELL, F.: Obviously it would be preferable to pick up a weight problem at the time of the rough inspection, and an interior marking can and should be read and applied at that time. However, the final luminaire decision may not be in place at that time, and the panel revision allows for review on the final inspection as well.

9-57 Log #597 NEC-P09 **Final Action: Reject**
(314.27(B))

Submitter: Jerry Spadaro, Middletown, NJ

Recommendation: Add text to read as follows:

Outlet boxes installed for lighting purposes on ceilings over 10 ft with attic access should be listed type box which independently supports fixture from building structure.

Substantiation: By having a listed type box for ceilings over 10 ft would solve a major problem. At this time, boxes are installed according to fixture weight. Example, having a new home with a 22 ft ceiling, a contractor installs a plastic box or nail-on box in hall because the fixture they are installing weighs about a pound (contractor fixture). This is not the fixture that would be permanently installed in that location. The correct practice would be to change the box to accommodate the weight of the fixture. This does not happen. They are installing fixtures weighing hundreds of pounds on boxes which are only designed to hold 50 pounds which causes fixtures to fall and create a major safety hazard. By sizing a box according to ceiling height makes more sense because if the ceiling height is over 10 ft you know that the fixture eventually installed on the ceiling will most likely weigh over 50 pounds. The box that should be installed in a new home should be a listed type box where the weight of the fixture is not on the box but independently supported by the building frame.

I am a licensed electrician in the states of New Jersey and New York with 25 years of experience. I have developed such a support box. It is patented and UL listed and able to support fixtures r anging from 0 to 800 pounds. The box is licensed to Westinghouse and is sold as (Hercules Heavy-Duty Chandelier & Fixture Brace - Westinghouse Model Number 01800).

Panel Meeting Action: Reject

Panel Statement: There has been no fact-finding work to support the broad assertion that most homeowners will install very heavy (over 50 lb) fixtures in high ceilings. The NEC cannot be written to anticipate every attempt to violate its terms.

(314.27(C) Exception)

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education

Recommendation: Revise as follows:

"Where the Authority Having Jurisdiction judges them free from likely exposure to ~~physical damage~~ blows or abrasion...".

Substantiation: Use of the word "physical" is superfluous– the purpose is obvious. In some instances, one could argue for the use of "mechanical" to differentiate that from e.g., "thermal" damage, but context makes the intended sense quite clear, rendering anything like this completely unnecessary.

The proposed rewording is an attempt at precision. Furthermore, if you reject the full rewording I would then have to fall back to arguing that in that case the term "physical" should be eliminated.

Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.

Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.)

Panel Meeting Action: Reject

Panel Statement: The use in CMP-9's articles is consistent with the rest of the Code. CMP-9 understands that this is a global proposal and if this terminology changes, it must be evaluated by the Technical Correlating Committee and guidance provided to code making panels so the results will be consistent.

Ballot Not Returned: 1 de Vega, H.

9-59 Log #930 NEC-P09 **Final Action: Reject**
(314.27(C) Exception)

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Delete "Receptacles and covers shall be listed as an assembly for this type of location."

Substantiation: The requirement is vague; is there a specific listing for this location? Where the location is free from exposure to damage, moisture, and dirt there does not seem to be a substantial reason not to permit standard type receptacles, plates, or weatherproof covers.

Panel Meeting Action: Reject

Panel Statement: Removal of this requirement would be incorrect, as products listed under the category for "Receptacles for Plugs and Attachment Plugs" may additionally be evaluated and listed as an assembly for this type of application. As noted on the UL guide card for this category: "Display receptacles are provided with a flush device cover plate or outlet box cover and closure plug or plugs. They are intended for use in show window floors and similar locations where the device is not likely to be subjected to scrub water. They are not intended to be used as substitutes for floor boxes, which are covered under Metallic Outlet Boxes (QCIT) and Nonmetallic Outlet Boxes (QCMZ)."

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10

Ballot Not Returned: 1 de Vega, H.

9-60 Log #1961 NEC-P09 **Final Action: Accept**
(314.27(D))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Recommendation: Add text to read as follows:

(D) Boxes at Ceiling-Suspended (Paddle) Fan Outlets. Outlet boxes or outlet box systems used as the sole support of a ceiling-suspended (paddle) fan shall be listed, shall be marked by their manufacturer as suitable for this purpose, and shall not support ceiling-suspended (paddle) fans that weigh more than 32 kg (70 lb). For outlet boxes or outlet box systems designed to support ceiling-suspended (paddle) fans that weigh more than 16 kg (35 lb), the required marking shall include the maximum weight to be supported.

Where two or more separately switched, ungrounded conductors are provided to a ceiling mounted outlet box, the outlet box or outlet box system shall be listed for sole support of a ceiling-suspended (paddle) fan.

Substantiation: Many new homes are built where they have multiple wired switches for future fans with luminaire kits. Standard boxes are installed with standard luminaires. The homeowner will replace the luminaire with a fan unaware that the ceiling box is not rated for the support of a fan and lumnaire kit.

Panel Meeting Action: Accept

Number Eligible to Vote: 11

Ballot Results: Affirmative: 7 Negative: 3

Ballot Not Returned: 1 de Vega, H.

Explanation of Negative:

HARTWELL, F.: The action on this proposal should have been to reject, using a similar statement to the one that appears on Proposal 9-57. How many homes are wired like this? There is no fact-finding work to support this proposal, only an assertion. I have been and remain, not always full time but always in some capacity, an electrical inspector for about 25 years and I have never seen a single instance of the wiring described in this proposal that resulted in a paddle fan. Fan boxes go in on the ceilings in selected locations, and then the fans go in as part of the final inspection process.

The scenario presented in the proposal is either a fraud or a conspiracy. If the new owners are aware that they will be installing paddle fans on substandard boxes, then it is a conspiracy and the NEC cannot be written in such a way as to preclude the effects of such conspiracies. If the new owners are not aware of the rules, and if the builders tell them that a fan with conventional mounting arrangements is an option, then such owners are the victims of a fraud. Listed fan boxes present little marginal cost in comparison to the significant risk to those who would perpetrate such a practice. There are far better ways to address this problem, if it really is a widespread problem, which do not violate the most sacred principles of NEC philosophy as expressed in 90.1.

For example, we could require actual notice, perhaps on the panel, that the ceiling outlet boxes wired as suggested in the proposal and located in rooms (specify) must not be used as the direct support of a paddle fan. This notice could be easily verified on inspection, and the existence of such a notice would immediately end the fraudulent practice where it exists. No builder is going to try and save the small amount of money involved in fan boxes and end up having to explain such a notice to a buyer or to a Realtor. The notice would also allow such an application when the multiple switched conductors were installed for legitimate purposes.

Examples abound. Many chandeliers are wired with one set of lamps controlled independently from the remaining lamps. Many ceilings are wired with multi-circuit lighting track for which such switching arrangements are required. In addition, the panel must never forget that fan boxes are not and never have been the only acceptable method of hanging a paddle fan. They are only required when the box is the sole support of the fan. I recently wired a group of paddle fans in a school cafeteria using surface metal raceway. After carefully special ordering surface raceway boxes listed for paddle fan support (yes, they exist), I discovered that the fans that came in later actually mounted to hooks that had to be structurally mounted. The outlet box classification turned out to be irrelevant, because the fans hang from 3/8-inch threaded eyehooks set in concrete anchors. The boxes still serve an aesthetic purpose, of course, because they rise to meet the fan canopies.

Remember, nothing in this proposal restricts its application to housing. I also once wired a paddle fan to an outlet box that was placed in a home run involving many circuits running through ¾-in. EMT. The outlet box consisted of a 4 11/16-in. sq. by 2 1/8-inch deep steel box, with a similar size extension box, and a 4 11/16-in. sq. by 4-inch round by 5/8-in. rise plaster ring. Does anyone seriously believe such a box is or ever will be available as a fan box? Did it matter? No, because the framing supporting the box was specifically intended to receive the pair of lag bolts used to hold the fan bracket. This installation met all NEC requirements, but it would fail the requirements in this proposal. Why should we send the inspection community into the uncertain realm of 90.4 for all these legitimate applications, both residential and nonresidential?

We must never forget that a ceiling outlet box wired as described in the proposal is entirely safe until and unless a paddle fan is mounted in such a way that the box is the sole support of the fan. And 90.1(B) clearly tells us that NEC compliant installations today may not be suitable for future uses tomorrow. What stands between today and tomorrow is qualified, disinterested third-party inspection. If some jurisdictions are seeing the instances described in the proposal substantiation, it can only be because these jurisdictions have failed to create a regulatory environment that supports such inspections. This was the importance of the “Inspection Initiative” in the 1990s. Without inspection (and also without product standards) the NEC becomes invalid on its face, and our electrical safety system unravels. The logo of IAEI depicts the inspector as the keystone of the industry. That logo is exactly correct, and rules that presume the absence of inspection create a completely misleading sense of security.

LEMAY, T.: There are multiple reasons for installing two or more separately switched ungrounded conductors to a ceiling mounted outlet box. A few examples are independent control of a paddle fan-light kit assembly, dual level switching of multiple lamp or multiple ballasted luminaries, control of an outlet “down stream” from the referenced lighting outlet or having a spare controlled ungrounded circuit conductor in a light outlet for extension to a load in another part of the room at a later time, i.e. the addition of recessed light(s) to illuminate a special piece of furniture that has not yet been purchased.

There are multiple reasons that would require an installer to use a ceiling fan rated outlet box in lieu of a standard Lighting Outlet Box. A few examples would be if the room or area or volume of an area in an occupancy provided for an obvious use of a paddle fan or if the builder, and user or designer specified a paddle fan at a specific outlet location, or perhaps it is known that a luminaire with excessive weight would be installed at the outlet location.

The premise that having two or more separately switched ungrounded conductors present in ceiling mounted outlet box as being “the” reason to require this box to be a ceiling fan rated box does not, in itself, provide substantiation for an additional code requirement.

MCCULLOUGH, R.: The submitter has not provided any data to support the claim that the homeowner will replace the luminaire with a fan unaware that the ceiling box is not rated for the support of a fan and luminaire kit. Changes to UL 507 in recent years require clearly visible markings on the outside of the carton for ceiling-suspended (paddle) fans as well as statements in the installation instructions regarding proper support for these fans. The substantiation only talks about homes but the proposed language would require fan support boxes in any type of occupancy and at many locations where two switch legs are provided yet fans could never be installed. An example of this could be a commercial showroom where two separately switched ungrounded conductors may be provided to allow for the future installation of two-circuit track lighting or perhaps separately switched night lighting. In many cases, a ceiling outlet box for such track lighting is located 18 in. off the wall and paddle fans would not be installed there, but this proposal would require a fan box. This change would also require a fan rated box at a location where provisions may have already been made to support the fan independently of the box.

I do not feel that we should be trying to write Code rules to cover every possible misuse of products or people ignoring clearly stated installation rules or all possible scenarios of future installations.

9-61 Log #3172 NEC-P09 **Final Action: Reject**
(314.27(D))

Submitter: Wally Harris, Atlantic Inland Inspections

Recommendation: Revise this section to read as follows:

(D) Boxes at Ceiling-Suspended (Paddle) Fan Outlets

Outlet boxes or outlet box systems used as the sole support of a ceiling-suspended (paddle) fan shall comply with the following:

(1) Boxes shall be listed

(2) Shall be marked by their manufacturer as suitable for this purpose.

(3) Shall not support ceiling-suspended (paddle) fans that weigh more than 32kg (70 lb).

(4) Outlet box systems designed to support ceiling-suspended (paddle) fans that weigh more than 16kg (35 lb), shall have the required marking state the maximum weight to be supported.

Substantiation: Will clarify and make section easier to understand.

Panel Meeting Action: Reject

Panel Statement: The proposed wording is no clearer than the present text, and violates the NEC Manual of Style for list items because parallel construction is not used.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10

Ballot Not Returned: 1 de Vega, H.

9-62 Log #2612 NEC-P09 **Final Action: Accept in Principle**
(314.27(E) (New))

Submitter: David H. Kendall, Carlon

Recommendation: Add a new section 314.27 to read as follows:

(E) Outlet Boxes in a Ceiling. Single gang outlet boxes not larger than 57 mm x 100 m (2 1/4 in. x 4 in.) and round or octagonal outlet boxes not larger than 100 mm (4 in.) in diameter are permitted to be installed in a ceiling for receptacles, smoke detectors or any device not defined as a luminaire (fixture) or lampholder and that weighs 3 kg (6 lbs) or less.

Substantiation: This proposal is for clarification and to make the code more user friendly. Outlet boxes are installed in ceilings as a common practice. The most common use for outlet boxes in a ceiling is for garage door openers where a receptacle is required. The only reference in the NEC that indicates that single gang boxes may be permitted to be installed in a ceiling is 314.17(C) Exception. This new text makes it clear to the user of the Code that these types of boxes are permitted in the ceiling. Round or octagonal boxes listed as outlet boxes and are not marked for luminaire support and should not be excluded from this rule.

Panel 9, during the 2005 ROP, confirmed that there is confusion in the Code by Stating “CMP 9 recognizes confusion with regard to this issue and recommends coverage in the NECHB.” The confusion and rule can be addressed by accepting the proposed language. The NECHB is not an enforceable code book and not all contractors and inspectors carries the NECHB with them. The new text makes it clear and user friendly that these types of boxes are permitted in the ceiling.

Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 9-63.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-63 Log #3399 NEC-P09 **Final Action: Accept in Principle**
(314.27(E) (New))

TCC Action: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal by replacing text that is vague and unclear, such as "comparable size and weight". This action will be considered by the Panel as a Public Comment.
Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Add a new 314.27(E) as follows:
E. Utilization Equipment. Boxes used for the support of utilization equipment other than ceiling-suspended (paddle) fans shall meet the requirements of 314.27(A) and (B) for the support of a luminaire (fixture) of comparable size and weight.
Exception: Utilization equipment weighing no more than 3 kg (6 lb) shall be permitted to be ceiling mounted.
Substantiation: During the preceding NEC cycle, CMP 9 spent considerable time reviewing whether smoke detectors and the like were covered by this section, and therefore whether they needed to be mounted on outlet boxes (as opposed to device boxes). CMP 9 concluded, correctly, that no language in this part of the code restricted such placements. However, that result opened the question as to whether there were any enforceable limitations on utilization equipment so mounted, and whether there should be. This proposal provides the framework to place definitive limitations in the NEC. Note that the exception is necessary because the device box exception in 314.27(A) only applies to wall-mounted applications.
Panel Meeting Action: Accept in Principle
Revise the submitter's Exception text to read as follows:
Exception: Utilization equipment weighing not more than 3 kg (6 lb) shall be permitted to be supported on other boxes or plaster rings that are secured to other boxes, provided the equipment or its supporting yoke is secured to the box with no fewer than two No. 6 or larger screws.
Panel Statement: The Panel concludes that the revised text clarifies the intent of the submitter.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-64 Log #1461 NEC-P09 **Final Action: Reject**
(314.28)

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise as follows:
314.28 Pull and Junction Boxes and Conduit Bodies.
Boxes and conduit bodies used as pull or junction boxes shall comply with 314.28(A) through (D).
Exception: Terminal housing supplied with motors shall comply with the provisions of 430.12.
(A) Minimum Size. For raceways containing conductors of 4 AWG or larger, and for cables containing conductors of 4 AWG or larger, the minimum dimensions of pull or junction boxes installed in a raceway or cable run shall comply with (A)(1) through (A)(3). Where an enclosure dimension is to be calculated based on the diameter of entering raceways, the diameter shall be the metric designator (trade size) expressed in the units of measurement employed.
(1) Straight Pulls. ~~In straight pulls~~ . <u>In pulls where conductors are deflected 30 degrees or less,</u> the length of the box shall not be less than eight times the metric designator (trade size) of the largest raceway.
(2) Angle or U Pulls. Where splices <u>are made</u> or <u>in pulls where conductors are deflected greater than 30 degrees,</u> ~~angle or U pulls are made~~ , the distance between each raceway entry inside the box and the opposite wall of the box shall not be less than six times the metric designator (trade size) of the largest raceway in a row. This distance shall be increased for additional entries by the amount of the sum of the diameters of all other raceway entries in the same row on the same wall of the box. Each row shall be calculated individually, and the single row that provides the maximum distance shall be used.
Exception: Where a raceway or cable entry is in the wall of a box or conduit body opposite a removable cover, the distance from that wall to the cover shall be permitted to comply with the distance required for one wire per terminal in Table 312.6(A).
The distance between raceway entries enclosing the same conductor shall not be less than six times the metric designator (trade size) of the larger raceway.
When transposing cable size into raceway size in 314.28(A)(1) and (A)(2), the minimum metric designator (trade size) raceway required for the number and size of conductors in the cable shall be used.
Substantiation: This proposal is intended to clarify what the difference between an angle pull and a U pull is. As currently written, it is subject to much interpretation. This language uses the 30 degree deflection parameter already set forth in many code sections, such as 366.58, 376.23 and 378.23.
Panel Meeting Action: Reject
Panel Statement: The Code is quite clear. Except in an infinitesimal number of custom-made pull box applications, the boxes all have four sides, one at right angles to the next. When conduits arrive at the box, the enclosed conductors do one of three things: They turn back on themselves and exit the side they came in on ("U" pull); they turn a right angle and leave an adjacent side (angle pull), or they leave the opposite side in something approximating a straight line (straight pull). They could also leave the back of the box, which would be an angle pull as well.
In the event that there is an actual enforcement issue, the submitter is encouraged to submit documentation in the future.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-65 Log #2731 NEC-P09 **Final Action: Reject**
(314.28, Exceptions No. 1 & No. 2)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 17 for information.
Submitter: Doug Boggus, City of Grand Prairie
Recommendation: Revise text to read:
314.28 Pull and Junction Boxes and Conduit Bodies. Boxes and conduit bodies used as pull or junction boxes shall comply with 314.28(A) through (D).
Exception <u>No. 1</u> : Terminal housing supplied with motors shall comply with the provisions of 430.12.
<u>Exception No. 2: Boxes and wiring compartments utilized for the connection of appliances to supply conductors shall comply with 422.19.</u>
Substantiation: This is a companion proposal to a proposal to add requirements to Article 422 (proposed Section 422.19) for specific requirements for boxes and wiring compartments utilized in the connection of appliances to a power supply. The added Exception No. 2 is needed to correlate the proposed requirement to Article 422 with the requirements of 314.28. The proposal for inclusion into Article 422 is as follows:
422.19 Boxes and Wiring Compartments for Appliances. Boxes or wiring compartments used for a point of junction to an electrical power source, whether separate or furnished as a part of the appliance, shall comply with (1) through (5) where applicable:
(1) Where wire leads are provided by an appliance manufacturer for connection to an electrical power source, at least 150 mm (6 in.) of free conductor, measured from the wall of the box or wiring compartment opposite where the conductors emerge for termination to an electrical power source, shall be provided for splices to either a permanent wiring method or a cord connection.
(2) For either permanent wiring methods or cord connections used to supply the appliance, at least 150 mm (6 in.) of free conductor, measured from the point in the box or wiring compartment where the conductors emerges from its raceway or cable sheath shall be left for splices or for connection to terminals provided as a part of the appliance.
(3) Where the provided opening in a box or wiring compartment is less than 200 mm (8 in.) in any dimension and where wire leads are provided by the appliance manufacturer for connection to an electrical power source, each conductor shall be long enough to extend at least 75 mm (3 in.) outside the opening.
(4) Boxes and wiring compartments shall be of sufficient size to provide free space for all enclosed conductors. In no case shall the volume of the box or wiring compartment be less than the fill calculation as calculated in Table 422.19(A). Volumes of standard boxes that are not marked with their volume shall be as given in Table 314.16(A). Other boxes shall be durably and legibly marked with their volume by the box manufacturer, and appliance wiring compartments shall be durably and legibly marked with their volume by the appliance manufacturer.
(5) Conductors shall not be deflected within a box or wiring compartment unless a minimum wire-bending space per Table 422.19(B) is provided.

Table 422.19(A) Volume Allowance Required per Conductor

Size of Conductor (AWG)		Free Space Within Box for Each Conductor	
	mm^2	cm^3	in.^{3}
14 or smaller	2.1	32.8	2.00
12	3.3	36.9	2.25
10	5.3	41.0	2.50
8	8.4	49.2	3.00
6	13.3	81.9	5.00

Table 422.19(B) Minimum Wire-Bending Space within Box or Wiring Compartment

Size of Conductor (AWG)	Wire Bending Space mm	Wire Bending Space in.
14-10	Not Specified	
8-6	38.1	$1^1/_2$
4-3	50.8	2
2	63.5	$2^1/_2$
1	76.2	3

Panel Meeting Action: Reject
Panel Statement: CMP-9 will revisit this proposal in the event that CMP-17 takes favorable action on the companion Proposal, 17-21.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-66 Log #3400 NEC-P09 **Final Action: Accept**
(314.28(A))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Revise the first sentence by inserting the word "that are required to be insulated" after the first instance of the words "4 AWG or larger" as follows:
For raceways containing conductors of 4 AWG or larger that are required to be insulated , and for cables containing conductors of 4 AWG or larger, the minimum dimensions of pull or junction boxes installed in a raceway or cable run shall comply with (A)(1) through (A)(3).
Substantiation: Raceways are commonly used to route grounding electrode conductors, which are not required to be insulated and are often run bare. Such conduit runs often use conduit bodies to make changes of direction. The rules in 314.28 are related to the safety objective of making sure that conductor insulation is not degraded through excessively cramped bend radii in pull boxes and conduit bodies, whether through installation difficulty or through continuing stress after installation. These objectives are irrelevant to conductors that need not be insulated in the first place, whether or not insulated conductors are used. It is plainly excessive, for example, to require a mogul LB on a ½ trade size conduit body enclosing a 2 AWG grounding electrode conductor. Although this section is seldom applied this way, the literal text makes no allowance for these cases, and should. The concern raised in this proposal does not apply to cable assemblies, and therefore the other part of the sentence does not require a comparable modification.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-67 Log #2289 NEC-P09 **Final Action: Accept in Principle**
(314.28(A)(2))

Submitter: D. Williams, Lansing, MI
Recommendation: Revise text to read as follows:
(2) Splice and Angle or U Pulls. Where splices or where angle or U pulls are made, the distance between each raceway entry inside the box and the opposite wall of the box shall not be less than six times the metric designator (trade size) of the largest raceway in a row. This distance shall be increased for additional entries by the amount of the sum of the diameters of all other raceway entries in the same row on the same wall of the box. Each row shall be calculated individually, and the single row that provides the maximum distance shall be used.
Substantiation: Sizing of junction boxes for splices wasn't very clear that for a straight pull that is being spliced you would use 314.28(A)(2) instead of (A)(1). This will clear this up.
Panel Meeting Action: Accept in Principle
Reword the title as follows:
"Angle or U Pulls, or Splices."
Panel Statement: CMP 9 prefers to keep the more customary application first.
Number Eligible to Vote: 11

9-69 Log #2917 NEC-P09 **Final Action: Reject**
(314.29)

Submitter: Marcus Sampson, Lysistrata Electric
Recommendation: Revise as follows:
Boxes, Conduit Bodes, and Handhole Enclosures to Be Accessible. Boxes, conduit bodies, and handhole enclosures shall be installed so that the wiring contained in them can be rendered accessible without removing any part of the building or building mechanical systems . In underground circuits, enclosures shall be accessible without excavating sidewalks, paving, earth, or other substance that is to be used to establish the finished grade.
Substantiation: Plumbing pipes and heating ducts that are installed and used as building mechanical systems may not be considered "part of the building?" Unfortunately, some installers and enforcement authorities allow these items to impede access to electrical enclosures. This change would clarify the requirement that these items remain accessible.
Panel Meeting Action: Reject
Panel Statement: The Code is quite clear. CMP-9 refers the submitter to Article 100 for the definition of Accessible (as applied to wiring methods).
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-70 Log #2130 NEC-P09 **Final Action: Reject**
(314.29 Exception No. 2 (New))

Submitter: Russell LeBlanc, Peterson School of Engineering
Recommendation: Add exception no. 2 to read:
Boxes connected to de-energized and abandoned wiring or wiring methods shall be permitted to be concealed.
Substantiation: There should be no safety concerns for a concealed box if wiring has been abandoned and de-energized.
Panel Meeting Action: Reject
Panel Statement: CMP-9 concludes that safety concerns still exist for concealed wiring that has been abandoned that may become energized.
The status of this wiring must be decided by the AHJ because the NEC is an installation code.
Number Eligible to Vote: 11

Ballot Not Returned: 1 de Vega, H.

9-71 Log #440 NEC-P09 **Final Action: Accept**
(314.30)

Submitter: John D. Minick, National Electrical Manufacturers Association
Recommendation: Revise text to read as follows:
Handhole Enclosures. Handhole enclosures shall be identified for use in underground systems and shall be designed and installed to withstand all loads likely to be imposed.
Substantiation: The NEC TCC requested that NEC Panel 1 submit a proposal for the 2008 Code cycle to correct the wording in the definition of "handhole enclosure" so that the definition complies with the NEC Style Manual. A joint effort was undertaken by CMP-1 members John Troglia and John Minick to resolve the issue. This effort resulted in a proposal to delete the word "identified", which is a word that is in violation of NEC Style Manual Section 2.2.2. This proposal is a companion proposal to revise Section 314.30 by adding the word "identified" plus additional wording for clarification so that the section is not affected by the loss of the word "identified" in Article 100, definition of "Handhole Enclosure". The proposed revised definition of "Handhole Enclosure" to Article 100 will allow the 2008 NEC definition to read, "Handhole Enclosure. An enclosure ~~identified~~ for use in underground systems, provided with an open or closed bottom, and sized to allow personnel to reach into, but not enter, for the purpose of installing, operating, or maintaining equipment or wiring or both." These revisions should not affect the current intended requirements or uses permitted for such enclosures and retains the requirement that handhole enclosures be identified as well as being designed and installed to withstand all loads likely to be imposed.
Panel Meeting Action: Accept

Ballot Not Returned: 1 de Vega, H.

9-75 Log #3296 NEC-P09 **Final Action: Reject**
(314.30(C))

Submitter: David Mercier, Southwire Co.
Recommendation: Add text to read as follows:
314.30 Handhole Enclosures
(C) Handhole Enclosures Without Bottoms - Where handhole enclosures without bottoms are installed, all enclosed conductors shall be listed for direct burial and any splices or terminations, if present, shall be listed as suitable for wet locations.
Substantiation: Handhole enclosures without bottoms often use rock fill to drain water that may collect in the enclosure due to rain. The rock and possible debris found in the bottom of handhole enclosures can easily damage conductors rated for wet locations due to the thinner insulations used on these conductors. Conductors listed for direct burial have a robust construction that is designed for installations in contact with earth.
Panel Meeting Action: Reject
Panel Statement: CMP-9 discussed the possibility of including a direct burial parameter at length during the comment meetings for the 2005 NEC, and decided against it. The only difference in the test protocol for a direct-burial rating and a wet location rating for conductors is that the direct-burial conductors get an additional impact test to simulate backfill being shoveled over the wiring. Although handholes are frequently flooded, and subject to dirt infills, those infills take place over very long time periods such that the conditions that prompted an impact test would never be seen on the inside of the handhole. Therefore a direct burial requirement in these cases is excessive.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-76 Log #3401 NEC-P09 **Final Action: Accept in Principle**
(314.30(C))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Revise as follows:
Handhole enclosures shall be identified for the use. They shall be designed and installed to withstand all loads likely to be imposed.
Substantiation: This is a companion proposal to one that removes the identification requirement from Article 100. All rules that apply to handhole applications should be located here. In addition, inserting a requirement into a definition violates 2.2.2 of the NEC Style Manual. This proposal and its companion taken together do not change any requirements in the NEC.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 9-71.
The change meets the submitter's intent.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-77 Log #3402 NEC-P09 **Final Action: Accept**
(314.30(C))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Revise to read as follows:
(C) Enclosed Wiring. All enclosed conductors and any splices or terminations, if present, shall be listed as suitable for wet locations.
Substantiation: The current requirement conditions the wet location rule on the handhole having no bottom, in spite of the fact that the enclosure will be located in a wet location. Under the terms of the Article 100 definitions that apply to locations, as well as the 2005 revision to 300.5(B), the interior of a handhole enclosure is classified as a wet location regardless of whether it has a bottom. This paragraph originated as a placeholder for a requirement that wiring in handhole enclosures without bottoms be suitable for direct burial. When CMP 9 decided during its meeting on comments for the 2005 NEC that wet location suitability was sufficient, the present wording was included, but the scope of this paragraph was not changed accordingly. This proposal corrects the oversight.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-78 Log #2238 NEC-P09 **Final Action: Accept in Principle**
(314.30(C))

Submitter: Donald A. Ganiere, Ottawa, IL
Recommendation: Revise as follows:
(C) Handhole Enclosures Without Bottoms. Where handhole enclosures without bottoms are installed ~~, all enclosed conductors and~~ any splices or termination, ~~if~~ present, shall be listed as suitable for wet locations.
Substantiation: This wording is not needed as 300.5(B) already requires that conductors installed in underground enclosures be listed as suitable for use in wet locations.
Panel Meeting Action: Accept in Principle Panel Statement: See panel action and statement on Proposal 9-77.
The change meets the submitter's intent.
Number Eligible to Vote: 11

(314.72)

Submitter: Larry Rogers, Vattertott College-Tulsa / Rep. Vatterott Colleges, NFPR and IAEI Member
Recommendation: Add new text as follows:
Enclosure fronts or faces; All unfinished edges, internally and externally of enclosure faces shall be rounded or de-burred to a smooth finish.
Substantiation: I am using enclosures in a generic form to include panel boards, auxiliary gutters, surface metal raceways, and large junction boxes above 4 11/16. Sharp corners/edges on enclosures have caused thousands of injuries to workmen and also thousands of hours of lost time man hours. Also, damage to the integrity of conductor insulation during installation or inspection is a problem with results of sometimes immediate arc flash or they are found later with a bare hand, which could lead to a fatal shock or serious cut due to jerk reaction. We ask this panel to consider having the manufacturer remove these sharp edges prior to shipment, thus attacking the problem from the start. Sharp edges stay sharp for years.
Panel Meeting Action: Reject
Panel Statement: CMP 9 notes that the proposal is improperly located, in that it would only apply to medium voltage applications.
Regardless of the intended location, CMP-9 agrees with the submitter that there are legitimate concerns in this area.
This proposal is a product standards requirement and does not need to be part of the installation code. It is suggested that the submitter propose revisions to the appropriate product standards through the particular standards revision process.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 9 Negative: 1
Ballot Not Returned: 1 de Vega, H.
Explanation of Negative:
BELISLE, R.: My notes indicate CMP-9 generally agreed that there is a legitimate concern over the issue relating to sharp edges and worker injuries, yet failed to act due to improper section numbering. We believe the submitter has a valid point, which deserves attention. Product standards are responsible for construction of electrical equipment, but will not change until the NEC changes. If the NEC disallows the practice of sharp edges, Standards will be quick to follow with appropriate changes.
We believe the CMP should act to insert the proposed language into new sections <u>312.10(D)</u> and <u>314.40 (E)</u> .
These locations would apply to all boxes and enclosures of concern.

Comment on Affirmative:
LEMAY, T.: The submitte's concerns are valid with regard to numerous electrical equipment parts and enclosures having sharp corners and edges that cause accidental injury.
There are many emergency room visits requiring suturing of open wounds caused by accidental impact with these items that could be avoided if efforts were taken to provide for rounded or deburred edges.
I agree with the panel in that this is a product standards issue.

ARTICLE 320 — ARMORED CABLE: TYPE AC

7-1 Log #1536 NEC-P07 **Final Action: Accept**
(320, 330, 332, 334 and 340)

Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Revise Articles 320, 330, 332, 334, and 340 as described in the following, relative to the terms bonding and grounding.
320.108 Revise 320.108 as follows:
320.108 Equipment Grounding <u>Conductor</u> . Type AC cable shall provide an adequate path <u>for fault current as required by 250.4(A)(5) or 250.4(B)(4) to act as an</u> equipment grounding <u>conductor</u> ~~as required by 250.4(A)(5) or 250.4(B)(4)~~ .
330.108 Revise 330.108 as follows:
330.108 Equipment Grounding <u>Conductor</u> . Where Type MC cable is used ~~for~~ <u>to provide</u> an equipment grounding <u>conductor,</u> it shall comply with 250.118(10) and 250.122.
332.108 Revise 332.108 as follows:
332.108 Equipment Grounding <u>Conductor</u> <u>.</u> Where the outer sheath is made of copper, it shall provide an adequate path <u>to serve as an equipment grounding conductor</u> ~~for equipment grounding purposes~~ . Where <u>the outer sheath is</u> made of steel, ~~an~~ <u>a separate</u> equipment grounding conductor shall be provided.
334.15(C) Revise 334.15(C) as follows:
(C) In Unfinished Basements. Where cable is run at angles with joists in unfinished basements, it shall be permissible to secure cables not smaller than two 6 AWG or three 8 AWG conductors directly to the lower edges of the joists. Smaller cables shall be run either through bored holes in joists or on running boards. NM cable used on a wall of an unfinished basement shall be permitted to be installed in a listed conduit or tubing. Conduit or tubing shall utilize a nonmetallic bushing or adapter at the point the cable enters the raceway. Metal conduit and tubings and metal outlet boxes shall be connected to an <u>equipment grounding conductor</u> ~~grounded.~~
334.108 Revise 334.108 as follows:
334.108 Equipment Grounding <u>Conductor</u> . In addition to the insulated conductors, the cable shall have an insulated or bare <u>equipment grounding</u> conductor ~~for equipment grounding purposes only~~ .
340.108 Revise 340.108 as follows:
340.108 Equipment Grounding <u>Conductor</u> <u>.</u> In addition to the insulated conductors, the cable shall be permitted to have an insulated or bare <u>equipment grounding</u> conductor ~~for equipment *grounding* purposes only~~ .
Substantiation: 320.108: The term “Equipment Grounding Conductor” instead of “Equipment Grounding” is proposed in order to use defined terms.
330.108: The term “Equipment Grounding Conductor” instead of “Equipment Grounding” is proposed in order to use defined terms.
332.108: The term “Equipment Grounding Conductor” instead of “Equipment Grounding” is proposed in order to use defined terms.
334.15(C): The proposed text is more prescriptive. The existing rule requires a connection to an equipment grounding conductor.
334.108: The proposed text is more prescriptive. The existing rule requires a connection to an equipment grounding conductor.
340.108: The proposed text is more prescriptive. The existing rule requires a connection to an equipment grounding conductor.
This is the result of the TCC Task Group on Grounding and Bonding in resolve of the 2005 NEC cycle actions related to Proposal 5-1 and Comment 5-1 as directed by the Technical Correlating Committee. This is a companion proposal to the proposed revision to the terms “bonded”, “grounded”, and “equipment grounding conductor” in Article 100 relative to this Task Group’s recommendations. These changes clarify the present requirement in more prescriptive language.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
BROWN, H.: We recommend that this proposal be rejected.
While it is apparent that an enormous amount of work went into this project by the task group, the participation level reported, including the 50.0% and 61.1% involved in the final decision-making teleconferences, makes us question how it was determined that consensus was achieved. Section 4.1 reports “all TG members who participated in the review of the purpose and the intent of the existing Grounding and Bonding terms in the 2005 NEC achieved consensus with the results as shown in the table in Attachment 4 titled ‘Table of NEC article 100 Summary of Proposed Terms and Substantiation.

It is not clear to us whether the consensus noted in Section 4.1 is consensus of the 52.8% participation rate for all eight meetings as indicated in Section 1.2, or the 50.0% and 61.1% involved in the final decision-making teleconferences. Either way, we are not confident that the results of this Task Group represent consensus and justification for the TCC to offer those findings as a TCC Proposals for the 2008 NEC.

7-2 Log #1495 NEC-P07 **Final Action: Accept**
(320.10(1))

Submitter: Chris MacCreery, Battle Creek Electrical JATC
Recommendation: Revise text to read as follows:
320.10 Uses Permitted.
Type AC cable shall be permitted as follows:
(1) For feeders and branch circuits in both exposed and concealed work.
Substantiation: Some cable articles (MI cable, MC cable, IGS cable, FCC, etc.) stipulate that the cable can be used for feeders, branch circuits and sometimes service entrance. AC cable is not so stipulated. What type of circuits can it be used on? Shouldn't all the articles be similar in uses and permitted and uses not permitted?

Ballot Results: Affirmative: 14

7-3 Log #331 NEC-P07 **Final Action: Reject**
(320.12(1))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
(1) Where subject to ~~physical~~ damage.
Substantiation: Use of the word "physical" is superfluous– the purpose is obvious. In some instances, one could argue for the use of "mechanical" to differentiate that from e.g., "thermal" damage, but context makes the intended sense quite clear, rendering anything like this completely unnecessary.
Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."
Panel Meeting Action: Reject
Panel Statement: The word "physical" is appropriate since it specifically defines the type of protection being provided and complies with 3.2.5.5 of the NEC Style Manual. There are other types of protection that may be provided, such as protection from EMF interference.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-4 Log #3043 NEC-P07 **Final Action: Reject**
(320.13)

Submitter: Melvin K. Sanders, TECo Inc.
Recommendation: Insert in new Section 320.13 the following.
320.13 Protection Against Physical Damage
Where subject to physical damage, wiring methods shall be protected by either, or all, in the following manner.
(A) Cables and Raceways Through Wood Members.
(1) Bored Holes. In both exposed and concealed locations, where a cable- or raceway-type wiring method is installed through bored holes in joists, rafters, or wood members, holes shall be bored so that the edge of the hole is not less than 32 mm (1 1/ 4 in.) from the nearest edge of the wood member. Where this distance cannot be maintained, the cable or raceway shall be protected from penetration by screws or nails by a steel plate or bushing, at least 1.6 mm (1/ 16 in.) thick, and of appropriate length and width installed to cover the area of the wiring.
Exception No. 1: Steel plates shall not be required to protect rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, or electrical metallic tubing.
Exception No. 2: A listed and marked steel plate less than 1.6 mm (1/ 16 in.) thick that provides equal or better protection against nail or screw penetration shall be permitted.
(2) Notches in Wood. Where there is no objection because of weakening the building structure, in both exposed and concealed locations, cables or raceways shall be permitted to be laid in notches in wood studs, joists, rafters, or other wood members where the cable or raceway at those points is protected against nails or screws by a steel plate at least 1.6 mm (1/ 16 in.) thick, and of appropriate length and width, installed to cover the area of the wiring. The steel plate shall be installed before the building finish is applied.
Exception No. 1: Steel plates shall not be required to protect rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, or electrical metallic tubing.
Exception No. 2: A listed and marked steel plate less than 1.6 mm (1/ 16 in.) thick that provides equal or better protection against nail or screw penetration shall be permitted.
(B) Nonmetallic-Sheathed Cables and Electrical Nonmetallic Tubing Through Metal Framing Members.
(1) Nonmetallic-Sheathed Cable . In both exposed and concealed locations where nonmetallic-sheathed cables pass through either factory or field punched, cut, or drilled slots or holes in metal members, the cable shall be protected by listed bushings or listed grommets covering all metal edges that are securely fastened in the opening prior to installation of the cable.
(2) Nonmetallic-Sheathed Cable and Electrical Nonmetallic Tubing. Where nails or screws are likely to penetrate nonmetallic-sheathed cable or electrical nonmetallic tubing, a steel sleeve, steel plate, or steel clip not less than 1.6 mm (1/ 16 in.) in thickness shall be used to protect the cable or tubing.
Exception: A listed and marked steel plate less than 1.6 mm (1/ 16 in.) thick that provides equal or better protection against nail or screw penetration shall be permitted.
(C) Cables and Raceways Parallel to Framing Members and Furring Strips. In both exposed and concealed locations, where a cable- or raceway-type wiring method is installed parallel to framing members, such as joists, rafters, or studs, or is installed parallel to furring strips, the cable or raceway shall be installed and supported so that the nearest outside surface of the cable or raceway is not less than 32 mm (1-1/ 4 in.) from the nearest edge of the framing member or furring strips where nails or screws are likely to penetrate. Where this distance cannot be maintained, the cable or raceway shall be protected from penetration by nails or screws by a steel plate, sleeve, or equivalent at least 1.6 mm (1/ 16 in.) thick.
Exception No. 1: Steel plates, sleeves, or the equivalent shall not be required to protect rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, or electrical metallic tubing.
Exception No. 2: For concealed work in finished buildings, or finished panels for prefabricated buildings where such supporting is impracticable, it shall be permissible to fish the cables between access points.
Exception No. 3: A listed and marked steel plate less than 1.6 mm (1/ 16 in.) thick that provides equal or better protection against nail or screw penetration shall be permitted.
(D) Cables and Raceways Installed in Shallow Grooves. Cable- or raceway-type wiring methods installed in a groove, to be covered by wallboard, siding, paneling, carpeting, or similar finish, shall be protected by 1.6 mm (1/ 16 in.) thick steel plate, sleeve, or equivalent or by not less than 32-mm (1-1/ 4-in.) free space for the full length of the groove in which the cable or raceway is installed.
Exception No. 1: Steel plates, sleeves, or the equivalent shall not be required to protect rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, or electrical metallic tubing.
Exception No. 2: A listed and marked steel plate less than 1.6 mm (1/ 16 in.) thick that provides equal or better protection against nail or screw penetration shall be permitted.
Substantiation: The wiring methods typically installed in wooded frame structures are Article 320 (Type AC), Article 330 (Type MC), Article 334 (Types NM, NMC, and NMS), and Article 362 (ENC). Insofar as Article 340 (Type UF) is installed in lieu of Article 334 wiring methods, its installation must meet the requirements of Article 334 Parts II and III, and also subject to the same installation restrictions.
Since the 1975 Edition of the NEC, there has been a requirement in Section 300.4 that steel plates or bushings be installed to provide protection of certain wiring method against damage from ordinary nails or screw-nails when they pass through wooden members or laid in notches or grooves and the distance from the nail direction could not be the required 1-1/4 inch (32 mm).
This restriction placed in Article 300 has prevented those CMP's most knowledgeable in application of these products from using any other protection schemes or technology for this purpose. During the 2005 ROP/ROC stage, fact-finding reports were presented to CMP 3 highlighting the steel plates called for provide little or no protection against nails or screw-nails larger than #8 or equivalent trade designation. Since Section 300.4 first paragraph was changed in 2005 ROP to emphasize conductors are to be protected against physical damage, it is obvious that such protection is to be provided by the wiring method in which they are contained, as spelled out in Section 300.3(A). Because the Scopes of Section 320.1, 330.1, 334.1, 340.1 and 362.1 state they govern the installation of those wiring methods which, by Section 300.3(A), contain the conductors that are to be protected, as stated in Section 300.4 first paragraph.
Sections 320.12(1), 330.12(1), 340(10), and 362.12(10) state those wiring methods are not to be exposed to physical damage, therefore the contained conductors are inherently protected against damage which meets the intent of Section 300.4 first paragraph, and Section 300.3(A) is satisfied.
This would allow Article 300 to set the general guidelines and allow CMP 7 and CMP 8 to set rules deemed necessary to protect appropriate wiring methods.

Separate proposals are being made to CMP 3 and CMP 8 to address the text to be deleted from Article 300. Coordination between all affected CMP's will be essential in order for this to be accomplished in one ROP/ROC cycle.

Panel Meeting Action: Reject

Panel Statement: Section 300.4 specifies requirements for protection against physical damage. Article 320 references those portions of 300.4 that Code-Making Panel 7 requires to be applicable to type AC cable. Code-Making Panel 7 can, at any time, include additional protection requirements to supplement those in 300.4 or modify the 300.4 requirements. It is not necessary to repeat the 300.4 requirements in multiple cable articles when the appropriate requirements in 300.4 can simply be referenced as appropriate in each cable article. Addition of 320.13 would unnecessarily increase the size of the Code without providing additional clarity.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-5 Log #330 NEC-P07 **Final Action: Reject**

(320.15)

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education

Recommendation: Revise as follows:

"...Exposed runs shall also be permitted to be installed on the underside of joists where supported at each joist and located so as not to be subject to ~~physical~~ damage.

Substantiation: Use of the word "physical" is superfluous– the purpose is obvious. In some instances, one could argue for the use of "mechanical" to differentiate that from e.g., "thermal" damage, but context makes the intended sense quite clear, rendering anything like this completely unnecessary.

Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.

Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."

7-6 Log #1403 NEC-P07 **Final Action: Reject**

(320.23, 320.23(A))

Submitter: George Stolz, II, Pierce, CO

Recommendation: Revise text to read:

320.23 In Accessible Attics. ~~Type AC cables~~ Cables in accessible attics or roof spaces that are suitable for storage shall be installed as specified in 320.23(A) and (B). Spaces that have no floor installed shall be considered unsuitable for storage in applying the requirements of this section.

(A) Where Run Across the Top of Floor Joists. Where run across the top of floor joists, or within 2.1 m (7 ft) vertically of floors installed across the top of rafters or studding ~~of floor or floor joists across the face of rafters or studding, in attics and roof spaces that are accessible, the~~ cable shall be protected by substantial guard strips that are at least as high as the cable. Where this space is not accessible by permanent stairs or ladders, protection shall only be required within 1.8 m (6 ft) of the nearest edge of the scuttle hole or attic entrance.

Substantiation: Under the 2005 NEC, cables in attic spaces that are unusable for storage spaces are being needlessly protected against damage that will not likely occur. Revising this text to apply only to attic spaces with flooring installed will be as effective, while relieving installers from the requirement to protect cables where no such protection is necessary. In addition, the removal of the reference to AC cable in 320.23 will provide clarity in relation to other articles that reference this code, such as 334.23. The term "AC cable" is unnecessary in this context, as it is located in the article by the same name.

Panel Meeting Action: Reject

Panel Statement: Section 320.23 is specific to type AC cable and that wording should remain. Section 334.23 refers to 320.23 as an additional requirement for that application and eliminates the need to repeat the text in 320.23. The panel does not accept the revisions proposed for 320.23, since occupants can place storage items (Christmas decorations, summer outdoor furniture, boxes of clothing or housewares, etc.) on top of the floor joists when the attic or roof space is accessible by any means. Section 320.23 provides relief when the space is not accessible by permanent stairs or ladders.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-7 Log #2252 NEC-P07 **Final Action: Reject**

(320.23(A))

Submitter: Bryan P. Holland, Holland Electric

Recommendation: Relocate all the text in 320.23(A) to 300.4 - Between "where" and "run", add the terms Type AC, MC, and NM - Change 320.23, 330.23, and 334.23 to reference the new section in 300.4.

Substantiation: This requirement is in a poor location as currently placed. This rule applies to more than one cable type and, therefore, should be relocated to the general requirements of 300.4 and not be placed in one of the three cable articles. Each cable method that must comply with this rule can reference this section in their respective articles instead of referring them to another cable article.

Panel Meeting Action: Reject

Panel Statement: Article 300 applies to all cable types, and relocation of the proposed rules to 300.4 would then make the requirements applicable to all cable types with no substantiation for such a broad change. The present Code includes the additional requirements for attics and roof spaces in only those articles where the requirement is applicable.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-8 Log #2944 NEC-P07 **Final Action: Reject**

(320.23(A))

Submitter: Philip Simmons, Simmons Electrical Services

Recommendation: Revise the existing 320.23(A) as follows:

320.23 In Accessible Attics. Type AC cables in accessible attics or roof spaces shall be installed as specified in 320.23(A) and (B).

(A) Where Run Across the Top of Framing Members ~~Floor Joists~~ . In attics and roof spaces that are accessible, cables that are installed within 2.1 m (7 ft) above the framing members such as ceiling or floor joists shall be protected by substantial guard strips that are at least as high as the cable where the cable is: ~~Where~~

(1) run across the top of framing members ~~floor joists, or within 2.1 m (7 ft) of floor or floor joists~~

(2) across the face of rafters or studding, ~~in attics and roof spaces that are accessible, the cable shall be protected by substantial guard strips that are at least as high as the cable.~~

Where this space is not accessible by permanent stairs or ladders, protection shall only be required within 1.8 m (6 ft) of the nearest edge of the scuttle hole or attic entrance.

(B) Cable Installed Parallel to Framing Members. Where the cable is installed parallel to the sides of rafters, studs, or framing members such as ceiling or floor joists, neither guard strips nor running boards shall be required, and the installation shall also comply with 300.4(D).

Substantiation: This proposal intends editorial improvements rather than substantive changes. The term "framing members" is being used in some locations as often, the joists that serve as the lower level of the attic are referred to as ceiling joists and not floor joists.

In addition, the sentence is proposed to be restructured for ease of reading and understanding.

Panel Meeting Action: Reject

Panel Statement: The existing wording is specific and adequate.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

SCHUMACHER, D.: This should have been accepted, it clears up any misunderstanding as to the definition of floor joists, and ceiling joists, by calling them framing members.

7-9 Log #3603 NEC-P07 **Final Action: Reject**

(320.23(A))

Submitter: Douglas Hansen, Code Check

Recommendation: Add the following text: For purposes of this section, a folding or pull down ladder is not considered permanent.

Substantiation: Homeowners often replace attic hatches with pull-down ladders to eliminate the need for a portable ladder. The installation of these pull-down ladders does not change the functional use of the accessible unfinished attic space, and the electrical wiring requirements should not change because of the presence of such a ladder.

Panel Meeting Action: Reject

Panel Statement: Addition of a pull-down ladder provides almost the same convenience as a permanent ladder and the occupant is more likely to utilize the space for storage. In fact, installation of a pull-down ladder would indicate that the space is intended to be used for storage.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-10 Log #2203 NEC-P07 **Final Action: Reject**
(321 (New))

Submitter: Kyle Cope, Prysmian Cables and Systems
Recommendation: Add a new article to read as follows:
ARTICLE 3XX Polymeric Armor Cable: Type PA
I. General
3XX.1 Scope. This article covers the use, installation, and construction specification of polymeric armor cable, Type PA.
3XX.2 Definition.
Polymeric Armor Cable, Type PA. A factory assembly of one or more insulated circuit conductors with a ground conductor, with or without optical fiber members enclosed in an armor sheath of suitable polymeric materials with an overall flame-retardant jacket.
II. Installation
3XX.10 Uses Permitted.
(A) General Uses. Type PA cables shall be permitted as follows:
(1) For services, feeders, and branch circuits
(2) For power, lighting, control, and signal circuits
(3) Indoors or outdoors
(4) Where exposed or concealed
(5) Direct buried where identified for such use
(6) In cable tray where identified for such use
(7) In any raceway
(8) As aerial cable on a messenger
(9) In dry locations and embedded in plaster finish on brick or other masonry except in damp or wet locations
(10) In wet locations where any of the following conditions are met;
a. A moisture-impervious jacket is provided over the armor sheath.
b. The insulated conductors under the polymeric covering are listed for use in wet locations.
(B) Specific uses. Type PA cable shall be installed in compliance with Parts II and III of Article 725 as applicable and in accordance with 330.10(B)(1) through (B)(4).
(1) Type PA cable shall be installed in cable tray and shall comply with 392.3, 392.4, 392.6 and 392.8 through 392.13.
(2) Direct Buried. Direct-buried cable shall comply with 300.5 or 300.50, as appropriate.
(3) Installed as Service-Entrance Cable. type PA cable installed as service-entrance cable shall be permitted in accordance with 230.43.
(4) Installed Outside of Buildings or as Aerial Cable. Type PA cable installed outside of buildings or as aerial cable shall comply with 225.10, 396.10 and 396.12.
FPN: The "Uses permitted" is not an all-inclusive list.
3XX.12 Uses Not Permitted. Type PA cable shall not be used where exposed to the following destructive corrosive conditions, unless the cable is protected by material suitable for the conditions:
(1) Where subject to physical damage
(2) Direct burial in the earth
(3) In concrete.
FPN to (3): PA Cable that is identified for direct burial applications is suitable for installation in concrete.
3XX.17 Through or Parallel to Framing Members. Type PA cable shall be protected in accordance with 300.4(A), (B), (C) and (D) where installed through or parallel to framing members.
3XX.23 In Accessible Attics. The installation of Type PA cable in accessible attics or roof spaces shall also comply with 320.23.
3XX.24 Bending Radius. Bends in Type PA cable shall be so made that the cable will not be damaged. The radius of the curve of the inner edge of any bend shall not be less than 12 times the external diameter.
3XX.30 Securing and Supporting.
(A) General. Type PA Cable shall be supported and secured by staples, cable ties, straps, hangers, or similar fittings or other approved means designed and installed so as not to damage the cable.
(B) Securing. Unless otherwise provided, cables shall be secured at intervals not exceeding 1.8 m (6 ft). Cables containing four or fewer conductors sized no larger than 10 AWG shall be secured within 300 mm (12 in.) of every box, cabinet, fitting, or other cable termination.
(C) Supporting. Unless otherwise provided, cables shall be supported at intervals not exceeding 1.8 m (6 ft). Horizontal runs of Type PA cable installed in wooden or metal framing members or similar supporting means shall be considered supported and secured where such support does not exceed 1.8 m (6 ft) intervals.
(D) Unsupported Cables. Type PA cables shall be permitted to be unsupported where the cable:
(1) Is fished between access points through concealed spaces in finished buildings or structures and supporting is impractical; or
(2) Is not more than 1.8 m (6 ft) in length from the last point of cable support to the point of connection to a luminaire (lighting fixture) or other piece of electrical equipment and the cable and point of connection are within an accessible ceiling. For the purpose of this section, Type PA cable fittings shall be permitted as a means of cable support.
3XX.40 Boxes and Fitting. Fittings used for connecting Type PA cable to boxes, cabinets, or other equipment shall be listed and identified for such use.
3XX.80 Ampacity. The ampacity of Type PA cable shall be determined in accordance with 310.15 or 310.60 for 14 AWG and larger conductors and in accordance with Table 402.5 for 18 AWG and 16 AWG conductors. The installation shall not exceed the temperature ratings of terminations and equipment.
(A) Type PA Cable Installed in Cable Tray. The ampacities for Type PA cable installed in cable tray shall be determined in accordance with 392.11 and 392.13.
(B) Single Type PA Conductors Grouped Together. Where single Type PA conductors are grouped together in a triangular or square configuration and installed on a messenger or exposed with a free maintained airspace of not less than 2.15 times one conductor diameter (2.15 x O.D.) of the largest conductor contained within the configuration and adjacent conductor configurations or cables, the ampacity of the conductors shall not exceed the allowable ampacities in the following tables:
(1) Table 310.20 for conductors rated 0 through 2000 volts.
(2) Table 310.67 and Table 310.68 for conductors rated over 2000 volts.
III. Construction Specifications.
3XX.104 Conductors. The conductors shall be of copper, aluminum, or copper-clad aluminum, solid or stranded. The minimum conductor size shall be 18 AWG copper and 12 AWG aluminum or copper-clad aluminum.
3XX.108 Equipment Grounding. In addition to the insulated conductor, the cable shall have an insulated or bare conductor for equipment grounding purposes only.
3XX.112 Insulation. Insulated conductors shall comply with 329.112(A) or (B).
(A) 600 Volts. Insulated conductors in sizes 18 AWG and 16 AWG shall be of a type listed in Table 402.3, with a maximum operating temperature of not less than 90°C (194°F) and as permitted by 725.27. Conductors larger than 16 AWG shall be of a type listed in Table 310.13 or of a type identified for use in Type PA cable.
(B) Over 600 Volts. Insulated conductors shall be of a type listed in Table 310.61 thorough Table 310.64.
3XX.116 Sheath. Sheath shall be continuous and polymeric in nature. Polymeric armor components shall be one or more of the following types: polyolefin, PVC or nylon; either formed or unformed. A metallic foil between layers may be permitted. Supplemental protection of an outer covering shall be permitted and shall be required where such protection is necessary.
Substantiation: Statement of Problem: Material technology advancements now allow for cable designs that provide improved mechanical damage protection, i.e., crush and impact, over standard Type MC cable without sacrificing flame performance properties. The characteristics achieved using traditional metallic components can now be realized using polymeric materials. The use of polymeric materials also provides the opportunity for lighter and smaller diameter cables.
Substantiation for Proposal: Type PA cable offers enhanced mechanical protection over Type MC cable. See test data provided. A UL Fact-Finding Study comparing the subject cable to Type MC is ongoing at the time of proposal submittal. This data will be forwarded once the study is complete.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: This cable construction is currently permitted as Type TC-ER and Type MV and, based on the construction details proposed, should comply with the Uses Permitted, Uses Not Permitted, and installation requirements for these existing cable types. Armor, as used in Chapter 3, refers to a metallic interlocking tape armor or a continuous metallic sheath. A non-metallic outer covering is a jacket.
A fact finding report is required before an article can be included in the Code for this new cable type.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 322 — FLAT CABLE ASSEMBLIES: TYPE FC

7-11 Log #319 NEC-P07 **Final Action: Reject**
(322.10(3))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
(3) In Locations where they will not be subjected to ~~physical damage~~ <u>blows or abrasion.</u>
Substantiation: Use of the word "physical" is superfluous– the purpose is obvious. In some instances, one could argue for the use of "mechanical" to differentiate that from e.g., "thermal" damage, but context makes the intended sense quite clear, rendering anything like this unnecessary.
The proposed rewording is an attempt at precision. Furthermore, if you retain "damage," I would then have to fall back to arguing that in that case the term "physical" should be eliminated.
Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two

reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the use of “physical” is not only poor writing–look at William Zinsser’s classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to “physical damage,” in 1959, from “mechanical injury” (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, “Is anyone claiming electrical equipment needs protection from non-physical injury?” (Substitute the snide adjective of your choice.)
Panel Meeting Action: Reject
Panel Statement: The word “physical” is appropriate since it specifically defines the type of protection being provided and complies with 3.2.5.5 of the NEC Style Manual. There are other types of protection that may be provided, such as protection from EMF interference.
Number Eligible to Vote: 14

ARTICLE 324 — FLAT CABLE CONDUCTOR: TYPE FCC

7-13 Log #198 NEC-P07 **Final Action: Reject**
(324 and 382)

NOTE: The following proposal consists of Comment 7-33 on Proposal 7-30 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 7-30 was:
Proposed Article 324, NEC 2005

FLAT CONDUCTOR CABLE

Type: FCC

I. General

1.1 Scope. This article covers a field-installed wiring system for branch circuits incorporating Type FCC cable and associated accessories as defined by the article. The wiring system is designed for installation under carpet squares or for installation on the surface of interior walls and ceilings.

324.2 Definitions.

Active Safety Device System. A comprehensive safety system for Type FCC installations. The Active Safety Device System includes a means for interrupting current flow to the Type FCC cable if a fault is detected in the FCC system. Faults detected by the Active Safety Device System include ground faults in the Type FCC cable or in equipment connected to the FCC system (ground-fault circuit-interrupter), faults between conductors in the Type FCC Cable, improper connection of the Type FCC cable, and improper wiring supplying the FCC system. ~~Active Safety Device SystemSystem. A comprehensive safety systemsystem for Type FCC installations. The Active Safety Device System includes a Ground Fault Circuit Interrupter (GFCI) and a means of disconnecting when a short occurs between FCC conductors.~~

Bottom Shield. A protective layer that is installed between the floor and Type FCC flat conductor cable to protect the cable from physical damage and may or may not be incorporated as an integral part of the cable.

Cable Connector. A connector designed to join Type FCC cables without using a junction box.

FCC System. A complete wiring system for branch circuits that is designed for installation under carpet squares or on the interior surface of walls and ceilings. - The FCC system includes Type FCC cable, Active Safety Device Systems, and ~~an active safety system~~ associated shielding, connectors, terminators, adapters, boxes, and receptacles.

Insulating End. An insulator designed to electrically insulate the end of a Type FCC cable.

Metal Shield Connections. Means of connection designed to electrically and mechanically connect a metal shield to another metal shield, to a receptacle housing or self-contained device, or to a transition assembly.

Top Shield. A grounded metal shield covering under-carpet components of the FCC system for the purposes of providing protection against physical damage.

Transition Assembly. An assembly to facilitate connection of the FCC system to other wiring systems, incorporating (1) a means of electrical interconnection and (2) a suitable box or covering for providing electrical safety and protection against physical damage.

Type FCC Cable. Three or more flat copper conductors placed edge-to-edge and separated and enclosed within an insulating assembly.

II. Installation

324.10 Uses Permitted.

(A) Branch Circuits. Use of FCC systems shall be permitted both for general-purpose and appliance branch circuits and for individual branch circuits.

(B) Branch Circuit Ratings.

(1) Voltage. Voltage between ungrounded conductors shall not exceed 300 volts. Voltage between ungrounded conductors and the grounded conductor shall not exceed 150 volts.

(2) Current. General-purpose and appliance branch circuits shall have ratings not exceeding 20 amperes. Individual branch circuits shall have ratings not exceeding 30 amperes.

(C) Floors. Use of FCC systems shall be permitted on hard, sound, smooth, continuous floor surfaces made of concrete, ceramic, or composition flooring, wood, and similar materials.

(D) Walls and Ceilings. Use of FCC systems shall be permitted on interior wall and ceiling surfaces, on hard, sound, continuous surfaces made of composite, concrete, gypsum, plaster, wood, and similar materials when used with an A~~a~~ctive S~~s~~afety Device S~~s~~ytem or when contained in surface metal raceways.

(E) Damp Locations. Use of FCC systems in damp locations shall be permitted.

(F) Heated Floors. Materials used for floors heated in excess of 30°C (86°F) shall be identified as suitable for use at these temperatures.

(G) System Height. Any portion of an FCC system with a height above floor level exceeding 2.3 mm (0.090 in.) shall be tapered or feathered at the edges to floor level.

(H) Coverings. Floor-mounted Type FCC cable, cable connectors, and insulating ends shall be covered with carpet squares not larger than 914 mm (36 in.) square. Those carpet squares that are adhered to the floor shall be attached with release-type adhesives.

(I) Corrosion Resistance. Metal components of the system shall be corrosion resistant, coated with corrosion-resistant materials, or insulated from contact with corrosive substances.

(J) Metal-Shield Connectors. Metal shields shall be connected to each other and to boxes, receptacle housings, self-contained devices, and transition assemblies using metal-shield connectors.

324.12 Uses Not Permitted. FCC systems shall not be used:

(1) Outdoors or in wet locations
(2) Where subject to corrosive vapors
(3) In any hazardous (classified) location
(4) In residential, school, and hospital buildings, except when used with an active safety ~~system~~ device system.
(5) On suspended or dropped ceilings.

324.18 Crossings of more than two flat cables shall not be permitted at any one point.

30.30 Securing and Supporting. All FCC system components shall be firmly anchored to the floor, ceiling, or wall using an adhesive or mechanical anchoring system identified for this use. Floors shall be prepared to ensure adherence of the FCC system to the floor until the carpet squares are placed.

324.40 Boxes and Fittings.

(A) Cable Connections and Insulating Ends. All Type FCC cable connections shall use connectors identified for their use, installed such that electrical continuity, insulation, and sealing against dampness and liquid spillage are provided. All bare cable ends shall be insulated and sealed against dampness and liquid spillage using listed insulating ends.

(B) Polarization of Connections. All receptacles and connections shall be constructed and installed so as to maintain proper polarization of the system.

(C) Shields.

(1) Top Shield. A metal top shield shall be installed over all floor-mounted Type FCC cable, connectors, and insulating ends. The top shield shall completely cover all cable runs, corners, connectors, and ends.

(2) Bottom Shield. A bottom shield shall be installed beneath all floor-mounted Type FCC cable, connectors, and insulating ends.

(D) Connection to Other Systems. Power feed, grounding connection, and shield system connection between the FCC system and other wiring systems shall be accomplished in a transition assembly identified for this use.

324.42 Devices.

(A) Receptacles. All receptacles, receptacle housings, and self-contained devices used with the FCC system shall be identified for this use and shall be connected to the Type FCC cable and metal shields. Connection from any grounding conductor of the Type FCC cable shall be made to the shield system at each receptacle.

(B) Receptacles and Housings. Receptacle housings and self-contained devices designed either for floor mounting or for in-wall or on-wall mounting shall be permitted for use with the FCC system. Receptacle housings and self-contained devices shall incorporate means for facilitating entry and termination of Type FCC cable and for electrically connecting the housing or device with the metal shield, where used. – Receptacles and self-contained devices shall comply with 406.3. Power and communications outlets installed together in common housing shall be permitted in accordance with 800.52(A)(1)(c), Exception No. 2.

324.56 Splices and Taps.

(A) FCC Systems Alterations. Alterations to FCC systems shall be permitted. New cable connectors shall be used at new connection points to make alterations. It shall be permitted to leave unused cable runs and associated cable connectors in place and energized. All cable ends shall be covered with insulating ends.

(B) Transition Assemblies. All transition assemblies shall be identified for their use. Each assembly shall incorporate means for facilitating entry of the Type FCC cable into the assembly, for connecting the Type FCC cable to grounded conductors, and for electrically connecting the assembly to the metal cable shields and to equipment grounding conductors.

324.60 Grounding. All metal shields, boxes, receptacle housings, and self-contained devices shall be electrically continuous to the equipment-grounding conductor of the supplying branch circuit. All such electrical connections shall be made with connectors identified for this use. The electrical resistivity of such shield system shall not be more than that of one conductor of the Type FCC cable used in the installation.

III. Construction

324.100 Construction

(A) Type FCC Cable. Type FCC cable shall be listed for use with the FCC system and shall consist of three, four, or five flat copper conductors, one of which shall be an equipment grounding conductor.

(B) Shields.

(1) Materials and Dimensions. All top and bottom shields shall be of designs and materials identified for their use. Top shields shall be metal. Both metallic and nonmetallic materials shall be permitted for bottom shields.

(2) Resistivity. Metal shields shall have cross-sectional areas that provide for electrical resistivity of not more than that of one conductor of the Type FCC cable used in the installation.

~~324.112 Insulation.~~324.112 Insulation. The insulating material of the cable shall be moisture resistant and flame retardant. All insulating materials in the FCC system shall be identified for their use.

~~324.120 Markings~~324.120 Markings.

(A) Cable Marking. Type FCC cable shall be clearly and durably marked on both sides at intervals of not more than 610 mm (24 in.) with the information required by 310.11(A) and with the following additional information:

(1) Material of conductors
(2) Maximum temperature rating
(3) Ampacity

(B) Conductor Identification. Conductors shall be clearly and durably identified on both sides throughout their length as specified in 310.12.
Submitter: Robert J. Sexton, De Corp Americas Inc.
Recommendation: DeCorp Americas, Inc., considering Panel 7 comments and in consultation with Underwriters Laboratories, has made dramatic improvements in AC FlatWire design since Proposal 7-30-(324) was submitted. The revised wire design has a layered construction (see Substantiation for additional description). This construction creates an inherently safe wire and wiring method when protected by a standard circuit breaker or other standard circuit protection.

The panel statement on Proposal 7-30-(324) commented that installation on walls and ceilings was not in the intended scope of Article 324. Considering the revised wire design and the panel comments and in consultation with representatives of Underwriters Laboratories, DeCorp believes that FlatWire wiring technology better fits within the scope of Article 382. As a result, DeCorp, as submitter, proposes to transition from Article 234 and modify Article 382 rather than Article 324.

The panel statement also commented that the electronic circuit protection features in the proposal would need to be reviewed by Panel 10. The revised FlatWire wiring technology eliminates the need for an Active Safety Device as originally proposed. Therefore, the Active Safety Device has been removed from the proposal, and a review by Panel 10 will not be necessary.

Proposed revisions to Article 382 are as follows:

Revise 382.1 as follows:

382.1 Definition.

Nonmetallic Extension. An assembly of ~~two~~ insulated conductors within a nonmetallic jacket of ~~an extruded~~ thermoplastic covering. The classification includes surface extensions intended for mounting directly on the surface of walls or ceilings.

Revise 382.10 as follows:

382.10 Uses Permitted. Nonmetallic extensions shall be permitted only where all the conditions in 382.10(A), (B), and (C) are met.

(A) From an Existing Outlet. The extension is from an existing outlet on a 15- or 20-ampere branch circuit.

(B) Exposed and in a Dry Location. The extension is run exposed and in a dry location.

Exception: Extensions with an earthed metal shield or a grounding conductor covering the ungrounded conductor(s) may be blended into the surface by plaster finish, finishing compound, paint, or similar methods.

(C) Residential or Offices. For nonmetallic surface extensions mounted directly on the surface of walls or ceilings, the building is occupied for residential or office purposes and does not exceed three floors above grade.

FPN No. 1: See 310.10 for temperature limitation of conductors.

FPN No. 2: See 362.10 for definition of first floor.

Revise 382.30 as follows:

382.30 Securing and Supporting. Nonmetallic surface extensions shall be secured in place by approved means at intervals not exceeding 200 mm (8 in.), with an allowance for 300 mm (12 in.) to the first fastening where the connection to the supplying outlet is by means of an attachment plug. There shall be at least one fastening between each two adjacent outlets supplied. An extension shall be attached to ~~only~~ woodwork , ~~or~~ plaster finish , gypsum wallboard, masonry, or similar building surfaces and shall not be in contact with any metal work or other conductive materials other than with metal plates on receptacles.

Substantiation: DeCorp Americas, Inc., has made dramatic improvements in AC FlatWire design since Proposal 7-30-(324) was submitted. The revised wire design is inherently safe when protected by a standard circuit breaker. Any puncture of the wire results in the circuit breaker tripping. This eliminates the need for an Active Safety Device (enhanced GFCI) as originally proposed.

The revised wire design is a multi-layer design> the design consists of layers of insulation and flat conductors with the following configuration:

-------------------------Insulation-------------------------
flat grounding conductor (ground)
-------------------------Insulation-------------------------
flat grounded conductor (neutral)
-------------------------Insulation-------------------------
flat ungrounded conductor (hot)
-------------------------Insulation-------------------------
flat grounding conductor (neutral)
-------------------------Insulation-------------------------
flat grounding conductor (ground)
-------------------------Insulation-------------------------

Connector for the FlatWire tie the grounded (neutral) connectors together and tie the grounding (ground) connectors together at each end of a run of wire.

Rationale or Changes to Article 382:

382.1 Definition – The FlatWire design has, when connected, the equivalent of two current carrying conductors meeting the intent of the definition. The word “two” should be removed from the definition to avoid varying interpretations and provide maximum design flexibility under this article. This wording was most likely put in place before grounding conductors were required. The word “extruded” should also be removed to allow maximum design flexibility.

382.10 Uses Permitted – The FlatWire design protects the ungrounded (hot) conductor with both the grounded (neutral) conductor and the grounding (ground) conductor. This enhances the level of inherent safety well beyond conventional two or three wire cables. The protection from electrical shock is comparable to Type MC Cable. This high level of safety should allow constructions of this type to be blended into the surface of walls and ceilings by plaster finish or similar methods.

382.30 Securing and Supporting – The intent of this section appears to be to allow installation on interior non-conducting surfaces. Additional building surface materials should be added to reflect modern construction techniques.

Additional Discussion of FlatWire and the Proposed Changes to Article 382.

FlatWire’s extremely flat profile differentiates it visually from conventional wire and cable; whereas, the layered construction of FlatWire differentiates it in terms of safety from conventional wire and cable. These two aspects, flat profile and enhanced safety, provide opportunities and advantages not available with conventional wire and cable.

FlatWire’s flat profile makes it possible for it to be easily installed using adhesive to the interior surfaces of buildings. This basic installation method meets the requirements of Article 382. The flat profile also creates the opportunity for FlatWire to be painted to match the wall or ceiling. This aesthetic enhancement also remains within the requirements of Article 382. The flat profile further makes it possible to cover the FlatWire with finishing compound prior to painting. This makes FlatWire an appealing method for providing power to devices without destruction of interior surfaces or the use of unsightly and unsafe extension cords. DeCorp proposes that Article 382 be changed to clearly allow the use of finishing compound to blend FlatWire (or similar constructions) into the surface of the wall or ceiling.

The proposed change to Article 382 allows cables to be blended into the wall or ceiling surface if the hot conductor is protected by an earthed metal shield or a grounding conductor. FlatWire is constructed such that the hot conductor is covered by both the neutral conductor and the ground conductor. This construction provides a level of safety far exceeding conventional unshielded cables. In fact, the protection from electrical shock provided by this construction is most comparable to metal-clad cable. It is the FlatWire’s high level of safety that makes it suitable for it to be covered by finishing compound on walls and ceilings.

Covering FlatWire with finishing compound provides several safety related attributes. The finishing compound encloses the FlatWire in nonflammable material. The FlatWire does not propagate flame due to the insulating material and the large heat dissipating copper surfaces. Covering it with finishing compound further enhances the fire safety.

Finishing compound provides additional protection from physical damage to the FlatWire. FlatWire is very resistant to damage other than direct penetration. Although, the outer insulation is relatively thin, the first layer of copper is the safe grounding layer and is very resistant to abrasive type of abuse. Additionally, the flat copper conductors cannot be additionally thinned by impact in the way that round conductors may be. Covering the FlatWire with finishing compound provides an additional safety barrier to physical abuse. This is further enhanced when fiberglass mesh drywall tape is used over the FlatWire prior to applying the finishing compound.

Blending FlatWire into the wall surface with finishing compound removes the visual temptation for children to play with it. Conventional wisdom says that it is better for cables and cords to be visible so that a person will avoid penetrating them with an object such as a nail. However, this logic does not apply to small children or pets, which are attracted to what they can see; including cables and cords. Covering the FlatWire with finishing compound removes the visual attraction for a child or pet making it less likely that they will damage the FlatWire.

FlatWire Application Note.

FlatWire will be provided with connections and terminations Listed to applicable standards. FlatWire will be supplied from an existing outlet on a branch circuit. A FlatWire source connector will plug into an existing receptacle to supply the FlatWire. The FlatWire will be terminated with a connector and receptacles appropriate for the application. Initial FlatWire products will be supplied by a single receptacle and provide a single receptacle at the termination. Later products may allow provide multiple receptacles similar to standard current taps or special purpose terminations for specific device applications.

FlatWire Testing.

DeCorp is working with Underwriters Laboratories to develop a comprehensive test program for FlatWire. The goal of this test program is to demonstrate the safety of the FlatWire and lead to Listing. This test program will address all of the relevant safety issues as they apply to FlatWire and Article 382.

DeCorp believes that FlatWire systems meet the conceptual requirements of Article 382 and may be Listed without changes to Article 382. The proposed changes to Article 382 are for clarification and to clearly allow FlatWire to be blended into the surface of a wall or ceiling using various methods including the use of finishing compound.

DeCorp is continuing internal testing of FlatWire. I have submitted a test report on the initial penetration testing performed on prototype FlatWire.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The proposal does not include adequate protection for load side extensions and devices.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

Comment on Affirmative:

BROWN, H.: We recommend that this proposal continue to be rejected.

Article 324, flat cable conductor, governs the scope, definitions, listing requirements, installation, and construction requirements of a very specific wiring method. Due to the specialized application of this wiring method, Article 324 should remain isolated with no commingling of any other wiring method.

7-14 Log #323 NEC-P07 **Final Action: Reject**
(324.2)

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education

Recommendation: Revise as follows:

Top shield. “...protection against ~~physical~~ damage.”

Substantiation: Use of the word “physical” is superfluous– the purpose is obvious. In some instances, one could argue for the use of “mechanical” to differentiate that from e.g., “thermal” damage, but context makes the intended sense quite clear, rendering anything like this completely unnecessary.

Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.

Second, the use of “physical” is not only poor writing–look at William Zinsser’s classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to “physical damage,” in 1959, from “mechanical injury” (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, “Is anyone claiming electrical equipment needs protection from non-physical injury?” (Substitute the snide adjective of your choice.)

Let’s take care of that for good: for our purposes, “damage” means “physical damage.”

Panel Meeting Action: Reject

Panel Statement: The word “physical” is appropriate, since it specifically defines the type of protection being provided and complies with 3.2.5.5 of the NEC Style Manual. There are other types of protection that may be provided, such as protection from EMF interference.

ARTICLE 328 — MEDIUM VOLTAGE CABLE: TYPE MV

7-20 Log #2588 NEC-P07 **Final Action: Accept in Principle**
(328.10(4))

Submitter: Jebediah Novak, Cedar Rapids Electrical JATC
Recommendation: Revise the following text from the list of uses permitted:
(4) Direct buried <u>when identified for the use and installed</u> in accordance with 300.50.
Substantiation: The text as written in the 2005 NEC is redundant. By adopting this language in the uses permitted, it will help clarify when it is and is not permissible to bury MV cables. This will allow condition 310.12(3) to then be deleted.
Panel Meeting Action: Accept in Principle
The panel accepts the proposal in principle but does not accept the revised wording to 328.10(4).
In addition, delete 328.12(3).
Panel Statement: Section 300.50 requires that "underground conductors shall be identified for the voltage and conditions under which they are installed." So it is not necessary to repeat the requirement in 328.10(4).
The panel agrees to delete 328.12(3) because it is already addressed in 328.10(4).
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-21 Log #2257 NEC-P07 **Final Action: Reject**
(328.11.xx)

Submitter: H. Brooke Stauffer, National Electrical Contractors Assn. (NECA)
Recommendation: Add new text to read:
328.xx Medium voltage cable shall be installed in a neat and workmanlike manner.
FPN: Accepted industry practices are described in ANSI/NECA 600-2003, Recommended Practice for Installing and Maintaining Medium-Voltage Cable, and other ANSI-approved installation standards.
Substantiation: The general workmanship requirement of 110.12 applies to electrical equipment covered by Article 328. However, safety would be improved by offering more detailed installation guidance for medium voltage cable.
Panel Meeting Action: Reject
Panel Statement: This reference should not be included in the NEC since the NEC is not a design, installation, or maintenance manual. It specifically states in 90.1(C): "This Code is not intended as a design specification or an instruction manual for untrained persons." These standards are also covered by a fine print note in 110.12.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-22 Log #199 NEC-P07 **Final Action: Accept in Principle**
(328.12)

NOTE: The following proposal consists of Comment 7-52 on Proposal 7-52 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 7-52 was:

328.12 Uses Not Permitted.

Unless identified for the use , Type MV cable shall not be used as follows:

(1) Where exposed to direct sunlight

(2) In cable trays, unless specified in 392.3(B)(1)

(3) Direct buried, unless in accordance with 300.50

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Accept the proposal in principle. In (2), revise the wording to say: "(2) In cable trays, unless installed in accordance with 392.3(B)" Add a new (4) as follows: "(4) As exposed wiring outside of raceways, or cable trays where permitted by 392.3(B), unless in an area accessible to qualified persons only".
Substantiation: 392.3(B)(2) does not "specify" Type MV cable. The bottom line is that MV cable is only installable in cable trays under the conditions given in 392.3(B) in their entirety. This includes the industrial occupancy and qualified supervision provisions in the parent rule, and then the specific mention of Type MV cable. Even that provision [392.3(B)(2)] sends the reader back to 392.3(B)(1) that has the rest of the requirements. The reference will be misleading unless it points to all of 392.3(B).
The second change correlates the traditional permission for this wiring method [former 328.10(2)] with the rule in 300.37. NEC users should not assume that the outcome of Proposal 7-52 means that now Type MV cable is eligible for unprotected use in areas accessible to the public. This issue was addressed in comparable Proposal 7-172 for tray cable at 336.12(8) and this wiring method should carry a similar restriction.
Panel Meeting Action: Accept in Principle
Revise existing Code text as follows:
"(2) In cable trays, unless specified in 392.3(B)(2)" to read "(2) In cable trays in accordance with 392.3".
Revise proposed (4) to read as follows and add as 328.10(6)
"(6) As exposed wiring in locations accessible to qualified persons only as permitted in 300.37".
Delete 328.10(3).
Renumber 328.10(4), (5), and (6) as (3), (4), and (5).
Panel Statement: The addition of "Unless identified for the use" is not necessary, since that phrase already appears in the Code. The panel agrees with the substantiation that the reference to 392.3(B)(2) is too limited and does not include additional provisions in other parts of 392.3(B) and 392.3 and agrees that the reference should be to 392.3, not just 392.3(B).
328.12 requires "Unless identified for the use...". MV cables are not identified for exposed runs; 300.37 applies. Locating this requirement in 328.10 is more appropriate.
Since installation in cable tray is addressed in 328.12(2), it is not necessary to repeat a similar rule in 328.10(3).
The panel action on Proposal 7-20 will modify the action taken on this proposal.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 330 — METAL-CLAD CABLE: TYPE MC

7-23 Log #3297 NEC-P07 **Final Action: Accept in Principle**
(330.10(A)(11))

Submitter: David Mercier, Southwire Co.
Recommendation: Add text to read as follows:
330.10(A)
(11) In wet locations where any of the following conditions are met:
a. The metallic covering is impervious to moisture.
b. A lead sheath or moisture-impervious jacket is provided under the metal covering.
c. The insulated conductors under the metallic covering are listed for use in wet locations with a corrosion-resistant material over the metallic covering .
Substantiation: MC Cables installed in wet locations can become corrosive such as when installed in contact with concrete. Aluminum and galvanized steel in contact with concrete or mortar can result in corrosion to the uncovered metallic covering. For aluminum, a reaction may occur that forms aluminum hydroxide and hydrogen gas when in contact with wet concrete. For galvanized steel, a reaction may occur with moisture and chlorides in concrete or mortar to produce zinc oxide. The reaction rates increases with the dampness of the concrete. These reactions can deteriorate the metallic sheath or armor over time.
Panel Meeting Action: Accept in Principle
Revise the proposed text to read as follows:
330.10(A)
(11) In wet locations where any of the following conditions are met:
a. The metallic covering is impervious to moisture.
b. A lead sheath or moisture-impervious jacket is provided under the metal covering.
c. The insulated conductors under the metallic covering are listed for use in wet locations and a corrosion-resistant jacket is provided over the metallic sheath.
Panel Statement: The revised wording defines the construction requirements for this cable to be used in wet locations.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-24 Log #2970 NEC-P07 **Final Action: Accept in Principle**
(330.10(A), Item 11c.)

Submitter: Philip Simmons, National Armored Cable Manufacturers Associatin
Recommendation: Revise text as follows:
330.10 Uses Permitted
11. In wet locations where any of the following conditions are met.
a. The metallic covering is impervious to moisture.
b. A lead sheath or moiture-impervious jacket is provided under the metal covering.
c. The insulated conductors under the metallic covering with an overall moisture impervious jacket are listed for use in wet locations.
Substantiation: The requirements of (11)(a) and (11)(b) of 330.10 keep water from entering the cable core of MC Cable. The requirement of (12)(c) permits water to enter the cable core of the interlocked armor type MC cable. This section should be revised to require an overall moisture impervious jacket over the metal covering to prevent water from entering the cable core where it could migrate to conductor terminations.
Jacket MC Cable is readily available and is recommended by manufacturers where MC Cable is installed in wet locations.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 7-23.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-25 Log #3295 NEC-P07 **Final Action: Reject**
(330.10(A)(7))

Submitter: Donald Cook, Shelby County Development Services
Recommendation: Add text to read as follows:
(7) In any raceway installation where the cable can be terminated in a fitting that provides grounding of the metal sheath.
Substantiation: Without the additional text, MC cable could be installed through a metal or nonmetallic conduit that terminated to a box or enclosure. When the conduit is terminated to the box or enclosure, the cable sheath would extend through the conduit termination into the box or enclosure with no fitting available to ground the sheath of the cable.
Panel Meeting Action: Reject
Panel Statement: Sections 300.10 and 300.15 define the requirements for grounding the metallic armor or sheath.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
BROWN, H.: We disagree with the panel action to reject this proposal.
This proposal addresses a grounding issue. Although 300.10 and 300.15 address this issue, infractions continue to occur in the field. The "free end" of MC cable is often left "dangling" within an enclosure as it exits a raceway, and the grounding continuity is lost.
The added provision to 330.10(A)(7) is essential to these types of installations. The additional language providing that, (when installing MC cable within a raceway, the MC cable must be terminated in a fitting that provides grounding of the metal sheath), will resolve the issue.

7-26 Log #3094 NEC-P07 **Final Action: Accept**
(330.10(B))

Submitter: Donald Hall, Corning Cable Systems
Recommendation: Revise text as follows:
(B) Specific Uses. Type MC cable shall be permitted to be installed in compliance with Part II and III of Article 725 and ~~770.52~~ 770.133 as applicable and in accordance with 330.10(B)(1) through (B)(4).
Substantiation: 770.113 is the correct reference.
Panel Meeting Action: Accept
Panel Statement: Although the proposal is accepted, the panel notes that the correct reference in the submitter's substantiation should have been 770.133.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-27 Log #928 NEC-P07 **Final Action: Accept**
(330.10(B)(4))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise (4):
"installed outside buildings or structures ..." Remainder unchanged.
Substantiation: Edit. Structures which are not "buildings" should be included.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-28 Log #2974 NEC-P07 **Final Action: Accept**
(330.12)

Submitter: Philip Simmons, National Armored Cable Manufacturers Associatin
Recommendation: Revise text as follows:
330.12 Uses Not Permitted
Type MC Cable shall not be used where subject to physical damage or where exposed to the following destructive corrosive conditions, unless the metallic sheath is suitable for the conditions or is protected by material suitable for the conditions:
~~(1) Where subject to physical damage~~
~~(2)~~ (1) Direct burial in the earth
~~(3)~~ (2) In concrete
FPN to ~~(3)~~ (2): MC cable that is identified for direct burial applications is suitable for installation in concrete.
~~(4)~~ (3) Where subject to cinder fills, strong chlorides, caustic alkalis, or vapors of chlorine or of hydrochloric acids.
Substantiation: It appears that when Uses Permitted/Not Permitted was worked on by the Code Panel last cycle (part of the user friendly activity), the provision for not subject to physical damage was moved from Uses permitted where it was misplaced but clear, to uses not permitted where it seems to be linked to a physical damage only in a corrosive environment or where direct buried. It appears that the panel went too far in trying to present the uses not permitted in a list format. Where not subject to physical damage should be moved from the list to the text of 330.12.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 2
Explanation of Negative:
BROWN, H.: We disagree with the panel action to accept this proposal.
This proposal is editorial in nature. The acceptance of this proposal will remove the provision that Type MC cable not be permitted to be used where exposed to physical danger from 330.12(1), and placed as part of the general text of 330.12.
This text, (the new language change), is not consistent with the same requirements as they appear in 320.12(1) and 336.12(1).
Consistency should remain throughout the code. The text, as it is currently written, is consistent with other cable articles, and there is no technical substantiation to warrant this change.
STEWART, H.: The proposed change does not increase safety. The present code already states that MC Cable shall be used where subject to physical damage. The MC Cable sheath must already be suitable for the conditions it is being installed in. This change only allows the opportunity to confuse the user.

7-29 Log #329 NEC-P07 **Final Action: Reject**
(330.12(1))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
(1) Where subject to ~~physical~~ damage.

7-30 Log #3042 NEC-P07 **Final Action: Reject**
(330.13)

Submitter: Melvin K. Sanders, TECo Inc.
Recommendation: Insert in new Section 330.13 the following.
330.13 Protection Against Physical Damage
Where subject to physical damage, wiring methods shall be protected by either, or all, in the following manner.
(A) Cables and Raceways Through Wood Members.
(1) Bored Holes. In both exposed and concealed locations, where a cable- or raceway-type wiring method is installed through bored holes in joists, rafters, or wood members, holes shall be bored so that the edge of the hole is not less than 32 mm (1 1/ 4 in.) from the nearest edge of the wood member. Where this distance cannot be maintained, the cable or raceway shall be protected from penetration by screws or nails by a steel plate or bushing, at least 1.6 mm (1/ 16 in.) thick, and of appropriate length and width installed to cover the area of the wiring.
Exception No. 1: Steel plates shall not be required to protect rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, or electrical metallic tubing.
Exception No. 2: A listed and marked steel plate less than 1.6 mm (1/ 16 in.) thick that provides equal or better protection against nail or screw penetration shall be permitted.
(2) Notches in Wood. Where there is no objection because of weakening the building structure, in both exposed and concealed locations, cables or raceways shall be permitted to be laid in notches in wood studs, joists, rafters, or other wood members where the cable or raceway at those points is protected against nails or screws by a steel plate at least 1.6 mm (1/ 16 in.) thick, and of appropriate length and width, installed to cover the area of the wiring. The steel plate shall be installed before the building finish is applied.
Exception No. 1: Steel plates shall not be required to protect rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, or electrical metallic tubing.
Exception No. 2: A listed and marked steel plate less than 1.6 mm (1/ 16 in.) thick that provides equal or better protection against nail or screw penetration shall be permitted.
(B) Nonmetallic-Sheathed Cables and Electrical Nonmetallic Tubing Through Metal Framing Members.
(1) Nonmetallic-Sheathed Cable . In both exposed and concealed locations where nonmetallic-sheathed cables pass through either factory or field punched, cut, or drilled slots or holes in metal members, the cable shall be protected by listed bushings or listed grommets covering all metal edges that are securely fastened in the opening prior to installation of the cable.
(2) Nonmetallic-Sheathed Cable and Electrical Nonmetallic Tubing. Where nails or screws are likely to penetrate nonmetallic-sheathed cable or electrical nonmetallic tubing, a steel sleeve, steel plate, or steel clip not less than 1.6 mm (1/ 16 in.) in thickness shall be used to protect the cable or tubing.
Exception: A listed and marked steel plate less than 1.6 mm (1/ 16 in.) thick that provides equal or better protection against nail or screw penetration shall be permitted.
(C) Cables and Raceways Parallel to Framing Members and Furring Strips. In both exposed and concealed locations, where a cable- or raceway-type wiring method is installed parallel to framing members, such as joists, rafters, or studs, or is installed parallel to furring strips, the cable or raceway shall be installed and supported so that the nearest outside surface of the cable or raceway is not less than 32 mm (1-1/ 4 in.) from the nearest edge of the framing member or furring strips where nails or screws are likely to penetrate. Where this distance cannot be maintained, the cable or raceway shall be protected from penetration by nails or screws by a steel plate, sleeve, or equivalent at least 1.6 mm (1/ 16 in.) thick.
Exception No. 1: Steel plates, sleeves, or the equivalent shall not be required to protect rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, or electrical metallic tubing.
Exception No. 2: For concealed work in finished buildings, or finished panels for prefabricated buildings where such supporting is impracticable, it shall be permissible to fish the cables between access points.
Exception No. 3: A listed and marked steel plate less than 1.6 mm (1/ 16 in.) thick that provides equal or better protection against nail or screw penetration shall be permitted.
(D) Cables and Raceways Installed in Shallow Grooves. Cable- or raceway-type wiring methods installed in a groove, to be covered by wallboard, siding, paneling, carpeting, or similar finish, shall be protected by 1.6 mm (1/ 16 in.) thick steel plate, sleeve, or equivalent or by not less than 32-mm (1-1/ 4-in.) free space for the full length of the groove in which the cable or raceway is installed.

Exception No. 1: Steel plates, sleeves, or the equivalent shall not be required to protect rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, or electrical metallic tubing.

Exception No. 2: A listed and marked steel plate less than 1.6 mm (1/ 16 in.) thick that provides equal or better protection against nail or screw penetration shall be permitted.

Substantiation: The wiring methods typically installed in wooded frame structures are Article 320 (Type AC), Article 330 (Type MC), Article 334 (Types NM, NMC, and NMS), and Article 362 (ENC). Insofar as Article 340 (Type UF) is installed in lieu of Article 334 wiring methods, its installation must meet the requirements of Article 334 Parts II and III, and also subject to the same installation restrictions.

Since the 1975 Edition of the NEC, there has been a requirement in Section 300.4 that steel plates or bushings be installed to provide protection of certain wiring method against damage from ordinary nails or screw-nails when they pass through wooden members or laid in notches or grooves and the distance from the nail direction could not be the required 1-1/4 inch (32 mm).

This restriction placed in Article 300 has prevented those CMP's most knowledgeable in application of these products from using any other protection schemes or technology for this purpose. During the 2005 ROP/ROC stage, fact-finding reports were presented to CMP 3 highlighting the steel plates called for provide little or no protection against nails or screw-nails larger than #8 or equivalent trade designation. Since Section 300.4 first paragraph was changed in 2005 ROP to emphasize conductors are to be protected against physical damage, it is obvious that such protection is to be provided by the wiring method in which they are contained, as spelled out in Section 300.3(A). Because the Scopes of Section 320.1, 330.1, 334.1, 340.1 and 362.1 state they govern the installation of those wiring methods which, by Section 300.3(A), contain the conductors that are to be protected, as stated in Section 300.4 first paragraph.

Sections 320.12(1), 330.12(1), 340(10), and 362.12(10) state those wiring methods are not to be exposed to physical damage, therefore the contained conductors are inherently protected against damage which meets the intent of Section 300.4 first paragraph, and Section 300.3(A) is satisfied.

This would allow Article 300 to set the general guidelines and allow CMP 7 and CMP 8 to set rules deemed necessary to protect appropriate wiring methods.

Separate proposals are being made to CMP 3 and CMP 8 to address the text to be deleted from Article 300. Coordination between all affected CMP's will be essential in order for this to be accomplished in one ROP/ROC cycle.

Panel Meeting Action: Reject

Panel Statement: Section 300.4 specifies requirements for protection against physical damage. Article 320 references those portions of 300.4 that Code-Making Panel 7 requires to be applicable to Type AC cable. Code-Making Panel 7 can, at any time, include additional protection requirements to supplement those in 300.4 or modify the 300.4 requirements. It is not necessary to repeat the 300.4 requirements in multiple cable articles when the appropriate requirements in 300.4 can simply be referenced as appropriate in each cable article. Addition of 330.13 would unnecessarily increase the size of the Code without providing additional clarity.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-31 Log #2955 NEC-P07 **Final Action: Accept in Part**
(330.30)

Submitter: Philip Simmons, Simmons Electrical Services

Recommendation: Revise existing 330.30 as follows:

330.30 Securing and Supporting.

(A) General. Type MC cable shall be supported and secured by staples, cable ties, straps, hangers, or similar fittings or other approved means, designed and installed so as not to damage the cable.

(B) Securing. Unless otherwise provided, cables shall be secured at intervals not exceeding 1.8 m (6 ft) where installed on or across framing members . Cables containing four or fewer conductors sized no larger than 10 AWG shall be secured within 300 mm (12 in.) of every box, cabinet, fitting, or other cable termination.

(C) Supporting. Unless otherwise provided, cables shall be supported at intervals not exceeding 1.8 m (6 ft).

Horizontal runs of Type MC Cable installed in wooden or metal framing members or similar supporting means shall be considered supported ~~and secured~~ where such support does not exceed 1.8 m (6 ft) intervals.

(D) Unsupported Cables. Type MC cable shall be permitted to be unsupported where the cable complies with any of the following :

(1) It i s fished between access points through concealed spaces in finished buildings or structures and supporting is impracticable ~~; or~~

(2) It is not more than 600 mm (2 ft) in length at terminals where flexibility is necessary

(3) It i s not more than 1.8 m (6 ft) in length from the last point of cable support to the point of connection to a luminaire (s) [lighting fixture (s)] or other ~~piece of~~ electrical equipment and the cable and point of connection are within an accessible ceiling. For the purpose of this section, Type MC cable fittings shall be permitted as a means of cable support.

Substantiation: Changes are proposed to this section that are editorial in nature. The changes proposed are primarily to bring this section on securing and supporting Type MC cable into harmony with that for Type AC cables in 320.30.

Changes were made to both 320.30 and 330.30 for the 2005 NEC. It was intended that identical rules apply to installation of the cables other than the 4 1/2 ft. rule for securing Type AC cables.

Panel Meeting Action: Accept in Part

The panel accepts proposed 330.30(D)(3) renumbered as (2) and revised to read as follows:

" (2) Is not more than 1.8 m (6 ft) in length from the last point of cable support to the point of connection to luminaires (lighting fixtures) or other electrical equipment and the cable and point of connection are within an accessible ceiling. For the purpose of this section, Type MC cable fittings shall be permitted as a means of cable support."

The panel rejects the remainder of the proposal.

Panel Statement: MC cables must be secured at intervals not exceeding 1.8 m (6 ft) in all applications, not just when installed "on or across framing members."

330.30(A) requires MC cable to be "supported and secured". The second paragraph of 330.30(C) provides one method of compliance.

Except for the deletion of the words "piece of" in 330.30(D), the proposed revisions do not enhance clarity. No technical substantiation has been provided to support the addition of the new (2).

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-32 Log #3116 NEC-P07 **Final Action: Reject**
(330.30)

Submitter: James M. Imlah, City of Hillsboro Building Department

Recommendation: Revise text as follows:

330.30 Securing and Supporting

(A) General. Type MC cable shall be supported and secured by staples, cable ties, straps, hangers, or similar fittings or other approved means designed and installed so as not to damage the cable.

Type MC cable that runs horizontally through or on framing members or racks (spaced less than 6 ft apart) without additional securing is considered supported. Cable ties are not required as the cable passes through or on these members. However, the MC cable must be secured (fastened in place) within 12 in. of the outlet box.

330.30(A) contains the general support requirements for Type MC cable, that is, supported and secured at least every 6 ft.

(B) Securing Unless otherwise provided, cables shall be secured at intervals not exceeding 1.8 m (6 ft). Cables containing four or fewer conductors sized no larger than 10 AWG shall be secured within 300 mm (12 in.) of every box, cabinet, fitting, or other cable termination.

According to 330.30(B), MC cable containing four of fewer conductors of size 10 AWG or less is required to be secured within 12 in. from every box, cabinet, or fitting. Both requirements are illustrated in Exhibit 330.2.

(C) Supporting. Unless otherwise provided, cables shall be supported at intervals not exceeding 1.8 m (6 ft).

(1) Horizontal runs of Type MC cable installed in wooden or metal framing members or similar supporting means shall be considered supported and secured where such support does not exceed 1.8 m (6 ft) intervals.

(2) At terminals where installed for flexibility, support of M/C shall not exceed the following:

(A) 900 mm (3 ft) for #14 AWG to #4 AWG stranded conductors

(B) 1200 mm (4 ft) for #3 AWG to 4/0 AWG conductors

(C) 1500 mm (5 ft) for 250 kcmil and larger conductors

(D) Unsupported Cables Type MC cable shall be permitted to be unsupported where the cable:

(1) Is fished between access points through concealed spaces in finished buildings or structures and supporting is impractical; or

(2) Is not more than 1.8 m (6 ft) in length from the last point of cable support to the point of connection to a luminaire (lighting fixture) or other piece of electrical equipment and the cable and point of connection are within an accessible ceiling. For the purpose of this section, Type MC cable fittings shall be permitted as a means of cable support. Section 330.30(D) permits Type MC cable to be fished, as shown in Exhibit 330.3.

Substantiation: The use of M/C cable use has expanded dramatically and is not restricted for connection to most electrical equipment, motors, transformers and panels. Because of the expanded use of M/C and the larger sizes of conductors it becomes increasingly difficult to meet the minimum support requirements of within 12 inches of a termination (#10 conductors and smaller) and for larger cables allowing up to six feet (if not subject to physical damage). Where cable installation requires flexibility, only stranded conductors shall be installed. The graduated table allows the bends required for larger conductor M/C cables to meet the minimum wire bending radius of 330.24.

Panel Meeting Action: Reject

Panel Statement: Type MC is a general-purpose wiring method in accordance with 330.10 and 330.12 and is not limited to installations where flexibility is required. Section 330.30 currently defines the rules for securing and supporting

Type MC cable, and no technical justification has been provided to support any change in those requirements.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-33 Log #396 NEC-P07 **Final Action: Reject**
(330.30(C))

Submitter: Lawrence Long, DCCC
Recommendation: Revise text to read as follows:
(C) Supporting. Unless otherwise provided, cables shall be supported at intervals not exceeding 1.8 m (6 ft). Horizontal runs of Type MC cable installed in wooden or metal framing members or similar supporting means shall be considered supported and ~~secured~~ where such support does not exceed 1.8 m (6 ft) intervals.
Substantiation: As outlined in 320.30, type AC cable is not required to be secured when installed in horizontal runs through framing members. (i.e., (C) Supporting. Unless otherwise provided, Type AC cable shall be supported at intervals not exceeding 1.4 m (4 1/2 ft)). Horizontal runs of Type AC cable installed in wooden or metal framing members or similar supporting means shall be considered supported where such support does not exceed 1.4 m (4 1/2 ft) intervals.
Panel Meeting Action: Reject
Panel Statement: Section 330.30(A) requires that "Type MC cable shall be supported and secured...". Section 330.30(C) provides one method of compliance.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-34 Log #437 NEC-P07 **Final Action: Reject**
(330.40)

Submitter: Joseph Lopez, Ludvik Electric
Recommendation: Revise text to read as follows:
~~Fittings used for connecting type M.C. cable to boxes, cabinets or other equipment shall be listed and identified for use.~~ At all points where the armor of MC cable terminates, a fitting shall be provided to protect wires from abrasion, unless the design of the outlet boxes or fittings is such as to afford equivalent protection and, in addition an insulating bushing or its equivalent protection shall be provided between the conductors and the armor. The connector or clamp by which the type MC cable is fastened to boxes or cabinets shall be of such design that the insulating bushing or its equivalent will be visible for inspection. Where change is made from type MC cable to other cable or raceway wiring methods, a box, fitting, or conduit body shall be installed at junction points as required in 300.15.
Substantiation: AC cable and MC cable are identical types of cable, except for the bare internal wire enclosed in the AC cables sheath. Per code, 320.40 AC cable requires an additional insulating bushing therefore MC cable should require the same.
Panel Meeting Action: Reject
Panel Statement: Fittings approved for use with Type MC cable are designed so that the fitting provides the protection to the emerging conductors. An insulating bushing is not required in Type MC cable fittings. Section 300.15 already is applicable to Type MC cable.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-35 Log #523 NEC-P07 **Final Action: Accept**
(330.40)

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read:
330.40 Boxes and Fitting s . Fittings used for connecting Type MC cables to boxes, cabinets, or other equipment shall be listed and identified for such use.
Substantiation: The proposal is an editorial correction to revise the word "fitting" to the word "fittings" for consistency between the other wiring method articles.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-36 Log #2988 NEC-P07 **Final Action: Reject**
(330.80(B)(1))

Submitter: Robert Konnik, Rockbestos-Suprenant
Recommendation: Change section 330.80(B)(1) from Table 310.20 to 310.17 as shown below.
(B) Single Type MC Conductors Grouped Together.
Where single Type MC conductors are grouped together in a triangular or square configuration and installed on a messenger or exposed with a maintained free air space of not less than 2.15 times one conductor diameter (2.15 X OD) of the largest conductor contained within the configuration and adjacent conductor configurations or cables, the ampacity of the conductors shall not exceed the allowable ampacities in the following tables;
(1) Table 310. ~~30~~ 17 for conductors rated 0 to 2000 volts
(2) Table 310.67 and 310.68 for conductors rated over 2000 volts.
Substantiation: This would make 330.80(B)(1) the same as 332.80(B) for MI cables. If the ampacity in Table 310.17 is acceptable for MI cable, it should be acceptable for MC cable.
Panel Meeting Action: Reject
Panel Statement: The insulation on the conductors in Type MC cable is normally rated 90ºC, whereas the mineral oxide insulation used in Type MI cable can withstand significantly higher temperatures.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-37 Log #2989 NEC-P07 **Final Action: Accept**
(330.104)

Submitter: Robert Konnik, Rockbestos-Suprenant
Recommendation: Add allowance for nickel and nickel-coated copper conductors to 330.104 as shown below:
330.104 Conductors shall be of copper, aluminum, copper-clad aluminum, nickel, or nickel-coated copper, solid or stranded. The minimum conductor size shall be 18 AWG copper, nickel or nickel coated copper and 12 AWG aluminum or copper-clad aluminum.
Substantiation: MC singles can be from Table 310.13, which could use nickel or nickel-coated copper. Some fire rated MC cables require nickel or nickel coated copper conductors. This harmonizes with the allowance of nickel and nickel coated copper in 332.104 for MI cable.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-38 Log #2332 NEC-P07 **Final Action: Reject**
(330.108)

Submitter: Lee Perry, Service Wire Company
Recommendation: Add a second sentence to read:
Equipment grounding conductor included in a listed multiconductor interlocked metal tape-type MC cable shall be permitted to be either a single conductor, or multi-part segmented conductors, with a minimum cross section area as required under 250.122.
Substantiation: UL standard 1569 allows equipment grounding conductors to be segmented to facilitate a round construction but it is not specifically mentioned in the Code or Article 250 (segmented conductors are mentioned in NEC Handbook). Adding this second sentence in the construction will clarify that listed MC cables with segmented grounding conductors are permissible in compliance with the Code.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: UL 1569, Metal-clad Cable, stipulates that the equipment grounding conductor may be sectioned so the Listing already permits the use of cables as addressed in the proposal. It is not necessary to add the proposed text into the Code.
Sectioned equipment grounding conductors are not considered paralleled in a multiconductor cable.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 332 — MINERAL-INSULATED, METAL-SHEATHED CABLE

7-39 Log #325 NEC-P07 **Final Action: Reject**
(332.10(10))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
(10) In underground runs where suitably protected against ~~physical~~ mechanical threats and corrosive conditions.
Substantiation: Use of the word "physical" is superfluous– the purpose is obvious. In some instances, one could argue for the use of "mechanical" to differentiate that from e.g., "thermal" damage, but context makes the intended sense quite clear, rendering anything like this completely unnecessary. Here, on the other hand, the objection is a bit different. Corrosion is itself a type of physical damage.
Panel Meeting Action: Reject
Panel Statement: The word "physical" is appropriate, since it specifically defines the type of protection being provided and complies with 3.2.5.5 of the NEC Style Manual. There are other types of protection that may be provided, such as protection from EMF interference. The term "mechanical threats" is vague.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 334 — NONMETALLIC-SHEATHED CABLE: TYPE NM, NMC, AND NMS

7-40 Log #2538 NEC-P07 **Final Action: Reject**
(334)

Submitter: Timothy D. Curry, Curry Electric, Inc.
Recommendation: Delete all references throughout the article to ~~NM-C~~ .
Substantiation: I do not believe that NM-C is made anymore.
Panel Meeting Action: Reject
Panel Statement: NMC is still listed in the 2005 UL Electrical Construction Equipment Directory.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-41 Log #2539 NEC-P07 **Final Action: Reject**
(334.2)

Submitter: Timothy D. Curry, Curry Electric, Inc.
Recommendation: Revise text to read:
Type NM -B Insulated conductors...
Substantiation: Due to changes in UL requirements and code changes, NM cable has been upgraded to become NM-B. We should be using the nomenclature of the industry.
Panel Meeting Action: Reject

Panel Statement: Article 334 recognizes NM cable as a wiring method. NM cable with the suffix "-B" is identified as having 90 degree C insulated conductors. See 334.112, FPN.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-42 Log #109 NEC-P07 **Final Action: Reject**
(334.10)

Submitter: Jeffrey Hudecek, Owosso, MI
Recommendation: Add the reference to three floors above grade to the beginning of the second sentence of 334.10(3) to read as follows:
" In any building exceeding three floors above grade, cables shall be concealed within walls, floors, or ceilings...".
Also, add a new fine print note to call attention to the definition of the first floor in 362.10 to read as follows:
"FPN: See 362.10 for definition of first floor of a building. "
Substantiation: There are thousands of nondwelling buildings where nonmetallic sheathed cable is an acceptable wiring method where it is not concealed within 15-minute fire rated construction. There are thousands of commercial and farm buildings where there are no concealed spaces for wiring, and surface installed cable is perfectly acceptable. In agricultural buildings for example, Type UF, which is installed using the rules in Article 334, is the preferred wiring method. It certainly seems as though 334.10(3) is saying that Type UF cable is not permitted to be installed in an agricultural building unless concealed within a fire rated wall, ceiling or floor. concealing cables in agricultural and some commercial buildings is not recommended because of potential rodent damage, yet surface installed cable is preferred.
Panel Meeting Action: Reject
Panel Statement: The substantiation provides only a description of installations where there are no concealed spaces and agriculture installations where Type UF cable is preferred. No substantiation has been submitted to address why the 15 minute finish rating for these and other commercial and non-residential installations in buildings lower than three stories should not be required.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-42a Log #CP700 NEC-P07 **Final Action: Accept**
(334.10)

TCC Action: It was the action of the Technical Correlating Committee that further consideration be given to the Affirmative Comment relative to conformance to the NEC Style Manual, as expressed in the voting. This action will be considered by the Panel as a Public Comment.
Submitter: Code-Making Panel 7,
Recommendation: Add a new Fine Print Note to the end of 334.10 to read as follows:
"FPN No. 2 to (2), (3), and (4): NM Cable shall be permitted in any Type of construction in buildings if the building code permits the building to be Type III, IV, or V construction."
The existing unnumbered Fine Print Note is to become FPN No. 1 to (1), (2), (3), and (4).
Substantiation: To provide clarity regarding the types of construction where NM cable is permitted.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
BROWN, H.: We disagree with the panel action to Accept this Proposal. The Fine Print Note is not necessary. It is already permissible to make the installation in Type I or Type II constructed buildings that are permitted by the building code to be Type III, IV or V construction.
Comment on Affirmative:
DALY, J.: The Proposal should be accepted, however, the text should be modified to comply with 3.1.3 of the NEC Style Manual which states "Fine print notes contain explanatory information. They shall not contain requirements and shall not be written in mandatory language."
The phrase "shall be permitted" should be changed to "may be installed" so the new FPN added to the end of 334.10 reads as follows:
"FPN No. 2 to (2), (3), and (4): NM cable may be installed in any Type of construction in buildings if the building code permits the building to be Type III, IV, or V construction."
The remainder of the Panel Action remains unchanged.

7-43 Log #1496 NEC-P07 **Final Action: Reject**
(334.10(1))

Submitter: Chris MacCreery, Battle Creek Electrical JATC
Recommendation: Revise text to read as follows:
II. Installation
334.10 Uses Permitted.
Type NM, Type NMC, and Type NMS cables shall be permitted to be used in the following:
(1) For feeders and branch circuits in one- and two-family dwellings.
Substantiation: Some cable articles (MI cable, MC cable, IGS cable, FCC, etc.) stipulate that the cable can be used for feeders, branch circuits and sometimes service entrance. NM cable is not so stipulated. What type of circuits can it be used on? Shouldn't all the articles be similar in uses permitted and uses not permitted? All the cable articles should be reviewed for uniformity.
Panel Meeting Action: Reject
Panel Statement: Addition of this proposed text would limit the use to feeders and branch circuits in one- and two-family dwellings only.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-44 Log #3163 NEC-P07 **Final Action: Reject**
(334.10(2))

Submitter: Wally Harris, Atlantic Inland Inspections
Recommendation: Deleted text as indicated by strikethrough type as follows;
(2) Multifamily dwellings ~~permitted to be~~ of Types III, IV, and V construction except as prohibited in 334.12.
Substantiation: These dwellings will already be "permitted" by other Codes to be of the types indicated. The present wording may lead to confusion as to just whom dictates the construction Type.
Panel Meeting Action: Reject
Panel Statement: The provision is intended to allow NM cable in all types of construction with the option that the building be limited to the criteria permitted for Types III, IV, and V construction.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-45 Log #3087 NEC-P07 **Final Action: Reject**
(334.10(3))

Submitter: Joseph A. Hertel, Safety and Buildings
Recommendation: Substitute the following wording for 334.10 (intro)(3):
Other structures permitted to be of Types III, IV and V construction except as prohibited in 334.12.
Substantiation: The language requiring that "cables shall be concealed within walls, floors, or ceilings that provide a thermal barrier of material that has at least a 15-minute finish rating" is not complied with and largely ignored in practice. Compliance would require that all installations in detached garages (Type V structures) where NM cables are installed, dairy and horse facilities (Type V structures) where UF cable is used and many other stand alone structures of Types III, IV or V construction would require gypsum wallboard to provide the 15-minute finish rating.
Panel Meeting Action: Reject
Panel Statement: Violations of the NEC requirements are not reason for changing requirements of the Code. The present text is inclusive of all "Other Structures". The substantiation addresses only unfinished garages and agriculture installations where Type UF cable is preferred. No substantiation has been submitted to address why the 15- minute finish rating for these and other commercial and non-residential installations should not be required. The panel advises the submitter that these installations might be more appropriately addressed under the Type UF Cable Article.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

DALY, J.: The Proposal should have been Accepted in Principle with the following additional text added into the existing 334.10(3):

Add an Exception immediately following 334.10(3) to read: "Exception: A thermal barrier of material that has at least a 15-minute finish rating shall not be required when Type UF cable is installed as nonmetallic- sheathed cable in animal housing facilities classified as storage occupancies."

Add a Fine Print Note after FPN No. 2 to read: "FPN No. 3 to Exception: Classification of animal housing facilities as storage occupancies is defined in NFPA 1-2006, Uniform Fire Code, NFPA 101-2006, Life Safety Code, and NFPA 5000-2006, Building Construction and Safety Code."

Revise existing "FPN No. 1" to "FPN No. 1 to (3)" and "FPN No. 2" to "FPN No. 2 to (3)".

The three NFPA Codes classify any type of animal housing facility as a storage occupancy, defined as an "occupancy used for the storage or sheltering of goods, merchandise, products, vehicles, or animals." A storage occupancy is typically characterized by the presence of few people, usually only owners and employees. If members of the public enter the building, the building can no longer be considered simply a storage occupancy. Additional information is contained in the NFPA Journal, November/December 2004 issue, page 22.

At its July 2004 meeting, the NFPA Standards Council approved an expansion of NFPA 150, Racetrack Stables, to include life and fire safety requirements for both humans and animals in all types of animal housing facilities and it changed the name of the committee to the Technical Committee on Animal Housing Facilities.

7-46 Log #2906 NEC-P07 **Final Action: Reject**
(334.10(4))

Submitter: Julian R. Burns, Quality Power Solutions, Inc./Burns Electrical Contractors
Recommendation: Add new text to read as follows:

<u>(4) Exposed runs in single story warehouses or similar types of buildings where run above 9', except as prohibited in 334.12.</u>

Renumber section to reflect change of deleted text.
Substantiation: The utilization of NM cable for branch circuit wiring of lights, receptacles and similar loads in an open warehouse, poses no hazard. The installation of exposed NM cable in combination office/warehouse buildings was a common practice for many years without any substantiated problems.
Panel Meeting Action: Reject
Panel Statement: The panel accepted the decision of the NFPA Standards Council, in accepting Proposal 7-137 of the NEC 2001 Report on Proposals, which was subsequently upheld by the NFPA Board of Directors.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-47 Log #552 NEC-P07 **Final Action: Reject**
(334.10(5) (New))

Submitter: Neal Dorenkott, City of Eastlake Ohio Building Department / Rep. B.O.C.O.N.E.O
Recommendation: Add new text to read:

(5) In residential air returns, where cables pass through the joists or studs perpendicular to the long dimension, cables shall be fire rated by a metallic raceway, such as rigid metal conduit, electrical metal conduit or flexible metal conduit. The connectors used with such material shall effectively close any openings in the connection.
Substantiation: Although 300.21 address the issue of not increasing the spread of fire or products of combustion, it is not addressed in 334.10 Uses Permitted. To further define 300.21, with the addition of this wording, the proposal will specify in Article 334 of the Code that applies to NM, NMC, and NMS.
Panel Meeting Action: Reject
Panel Statement: The exception to 300.22(C) applies in general and it is unnecessary to repeat the requirement in 334.10.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:

BROWN, H.: We disagree with the panel action to reject this proposal.

This is a very important safety issue that needs to be addressed within the confines of Article 334. Every possible preventable measure to stop the spread of fire is essential to good code.

Article 334 addresses the installation requirements of a wiring method primarily used in dwelling units.

Throughout the event of a fire, residential air returns contribute to the fueling and spreading of the fire. The submitter of this proposal is recognizing a need to provide prescriptive language within334.10(New) that states: "In residential air returns, where cables pass through the joists or studs perpendicular to the long dimension, cables shall be protected by a metallic raceway, such as rigid metal conduit, electrical metallic conduit, or flexible metal conduit. The connectors used with such material shall effectively close any openings in the connection.

Although 300.21 addresses the spread of fire or products of combustion, the additional language appearing in Article 334 that clarifies the intent of the code will give guidance for a proper installation that may save a life.

7-48 Log #424 NEC-P07 **Final Action: Reject**
(334.10(A))

Submitter: Mario Mumfrey, Inspection Bureau Inc.
Recommendation: Revise text to read as follows:

Type NM cable shall be permitted as follows:

(1) For exposed normally dry locations <u>except as not permitted elsewhere in this code.</u>

(2) For concealed normally dry locations <u>of areas in habitable spaces</u> except as prohibited by 334.10(3)

<u>(3) Formally number 2 (unchanged)</u>

<u>FPN: Habitable spaces is defined for this purpose as designed or able to be lived in.</u>
Substantiation: Type NM cable commonly referred to as "Romex" is the wiring method preferred by professionals to use in dwellings units. Respectively, it is also the wiring method of choice used by untrained and unskilled individuals who also work in dwelling units that undergo changes. Such changes include room additions and/or basement finishes. NM cable "Romex" is a fragile wiring method that often requires some form of protection surrounding it even under normal conditions where it is deemed the wiring is subjected to physical damage. Oftentimes either by design or by unforeseen financial circumstances the wiring in areas known to be habitable spaces (lived in) are not concealed. Article 334 is vague in this matter permitting the installation of its wiring method to be installed in both exposed and concealed locations only saying that structures that are not dwellings and of types III, IV, and V construction must be concealed. Compliance to conceal the wiring as well as complete the project is often accomplished through local building ordinances. This simple definition and change will ensure that NM cable, as installed and inspected, will safely be protected and last as the wiring manufacturer intended.

NOTE: It is not the intent for NM cable to be concealed in usual unfinished areas.
Panel Meeting Action: Reject
Panel Statement: Section 334.10(1) and (2) permit NM cable to be installed exposed or concealed in one- and two-family dwellings and multifamily dwellings permitted to be of Types III, IV, and V construction. Section 334.10(3) requires NM cable installed in other structures to be concealed. No technical substantiation has been provided to support the requirement that the cable be concealed in dwellings. NM cable can be protected from physical damage without concealing the cable.
Number Eligible to Vote: 14

7-49 Log #200 NEC-P07 **Final Action: Accept in Principle**
(334.12)

NOTE: The following proposal consists of Comment 7-102 on Proposal 7-115 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 7-115 was:
Change the existing text to the following:

334.12 Uses Not Permitted. Type NM, NMC, and NMS cables shall not be used <u>under the following conditions or in the following locations:</u>

<u>(1) For multifamily dwellings of other than Types III, IV, and V construction.</u>

<u>(2) For non-dwelling structures of other than Types III, IV, and V construction, and where</u>
<u>the cables are not concealed within walls, floors, and ceilings that provide a thermal</u>
<u>barrier of material that has at least a 15-minute finish rating as identified in listings of</u>
<u>fire-rated assemblies.</u>

<u>FPN No. 1: Building constructions are defined in NFPA 220-1999, *Standard on Type of Building Construction* , or the applicable building code, or both.</u>

<u>FPN No. 2: See Annex E for determination of building types [NFPA 220, Table 3.11.</u>

<u>(3) For cable tray installations unless the cable is identified for the use.</u>

(4) For open run installations in dropped or suspended ceilings in other than one- and two
-family and multifamily dwellings.

(5) <u>For installation</u> as service entrance-cable.

(6) <u>For use</u> in commercial garages having hazardous (classified) locations, except in accordance with 511.3(B).

(7) <u>For use</u> in theaters and similar locations, except where permitted in 518.4.

(8) <u>For use</u> in motion picture studios.

(9) <u>For use</u> in storage battery rooms.

(10) <u>For use</u> in hoistways, or on elevators or escalators.

(11) For installations embedded in poured cement, concrete, or aggregate.
(12) For use in hazardous (classified) locations, except where permitted in the following:
Submitter: David H. Kendall, Carlon
Recommendation: The Panel's revised wording should be revised further under Part B to state the following:
(4) Where exposed or subject to ~~excessive~~ moisture or dampness.

Substantiation: NM and NMS Cable is only permitted to be used in normally dry locations per 334.10(A)(1) and 334.10(C)(1). The 1999 NEC (336-4(a) and (b)) permitted NM and NMS Cable to be fished in voids of masonry block or tile walls where such walls were not subject to excessive moisture or dampness. The proposed language expands the use of NM and NMS cable into areas of dampness that could include under roofed open porches. See Locations in Article 100 for Damp.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel contends that "not subject to excessive moisture" conflicts with the definitions of Dry and Damp Locations.
See panel action on Proposal 7-50.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-50 Log #201 NEC-P07 **Final Action: Accept**
(334.12)

TCC Action: The Technical Correlating Committee directs the panel to clairfy the action on this proposal. This action will be considered by the panel as a public comment.
NOTE: The following proposal consists of Comment 7-104 on Proposal 7-115 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. [Refer to Proposal 7-49 (Log#200)]
Submitter: Noel Williams, Noel Williams Consulting
Recommendation: This proposal should be rejected or accepted in principle with the additional change:
Revise 334.12(B)(4) to read "In wet or damp locations."
Substantiation: This proposal will create more problems than it will solve. The comments on Negative by Mr. Brown, Mr. Schumacher, and Mr. Stewart should be more carefully considered. The explanation of negative by Gotham (ROP 7-8) is also applicable here. The idea could work, but it must first be coordinated with UL listing information, which currently refers to Article 334. In particular, the language about "normally dry locations" has been completely lost, and the remaining language "where exposed to excessive moisture or dampness" is too vague to be useful in enforcement. Wet and damp locations are well defined.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-51 Log #202 NEC-P07 **Final Action: Accept in Principle**
(334.12 Exception (New))

NOTE: The following proposal consists of Comment 7-105 on Proposal 7-115 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. [Refer to Proposal 7-49 (Log#200)]
Submitter: Robert C. Duncan, Duncan Consulting, Inc.
Recommendation: Add Exception under 334-12.
Exception: Type NM cable installed in a raceway system are permitted in Type I or II construction.
Substantiation: There is presently a listed NM Hybrid Cable on the market consisting of power, communications and signaling conductors under a common jacket. Without the Code permitting the use of this new type cable to be installed in raceways, the provisions of 780.6, 725.55 and 800.52 cannot be utilized.
Panel Meeting Action: Accept in Principle
Add an Exception following 334.12(A)(1) to read as follows:
"Exception: Type NM, NMC, and NMS cable shall be permitted in Types I and II construction when installed within raceways permitted to be installed in Types I and II construction."
Panel Statement: The addition of the exception will permit the installation of NM, NMC, and hybrid NMS cables in Type I and II construction when installed in a raceway. The panel notes that 725.55 addresses conductor separation between conductors and does not mention hybrid cables.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
BROWN, H.: We feel that this proposal should be rejected.
Type NM cable is not designed to be routinely installed within a conventional raceway system.
Raceways are designed to contain building wire. Raceway systems are allowed to contain as much as 360 degrees of total bend between pull points. Damage to the outer sheath of NM cable will occur when installed within the confines of the raceway articles.
Technical Substantiation should be closely reviewed by CMP 6 as this very important issue is not entirely under the purview of CMP 7. We have reasonable concerns relating to the "safe dissipation" of heat of conductors contained within a cable sheath that are further subjected to the confinement of a raceway. This heat would contribute to conductor insulation degradation that could ultimately lead to ground faults and short circuits.... CLEARLY SOMETHING THAT THE CODE REQUIRES THAT WE AVOID.
Raceway fill is another concern. Cables that are elliptical in shape are not typically designed to be installed within a raceway. They are required, on occasion, to be protected using short sections of raceway. For example: Table 1, Chapter 9, barely makes reference to cables that are elliptical in shape. Why? Because Type NM cables should not be routinely installed in raceway systems.
There are other safe and affordable wiring methods in the market place that meet industry needs, without sacrificing the integrity of the code.

7-57 Log #3041 NEC-P07 **Final Action: Reject**
(334.12(11))

Submitter: Melvin K. Sanders, TECo Inc.
Recommendation: Insert new Section 334.12(11) as follows.
" (11) Where subject to physical damage. "
Substantiation: Article 334 wiring methods are not inherently self protecting against physical damage, and this is in line with other typical wring methods installed in wooden structure as stated in 320.12(1), 330.12(1), and 362.12(10) and subject to the same concerns.

Panel Meeting Action: Reject
Panel Statement: Section 300.4 addresses protection against physical damage for all wiring methods, and it is not necessary to repeat the requirements in 334.12.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
BROWN, H.: We disagree with the panel action to reject this proposal.
The submitter's substantiation states that the wiring methods in 320.12(1), 330.12(1), and 362.12(10) have the requirement that: The wiring method not be permitted where exposed to physical damage.
We agree with the submitter of this proposal. Should consistency remain throughout the code?
In addition to accepting the language that the submitter is requesting, we suggest the addition of a (FPN) to refer code users back to (300.4). This will further the endeavors of making the code more user friendly, and insure that the requirements of 300.4 are followed.

7-52 Log #3090 NEC-P07 **Final Action: Reject**
(334.12(2))

Submitter: Joseph A. Hertel, Safety and Buildings
Recommendation: Revise to read:
"Unsupported in dropped or suspended ceilings in other than one- and two-family and multifamily dwellings."
Substantiation: The current language prohibits the installation of NM cable above a suspended ceiling where the cable is fastened to the structural ceiling or installed through bored holes in joists because removal of the ceiling tile will expose it. "Exposed" is defined in Article 100. The prohibition it would seem was intended to prohibit the use of NM cable where it would be used in an unsupported manner such as fixture whip.
Panel Meeting Action: Reject
Panel Statement: The expectation is that NM would be subject to damage any where it is exposed, with the exception provided for residential wiring. Issues of concern are retrofit wiring, other services, and remodeling in commercial applications. Section 300.11 already addresses securing and supporting in dropped or suspended ceilings.
Section 334.12 is worded correctly. It is not limited to fixture whips.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-53 Log #2903 NEC-P07 **Final Action: Reject**
(334.12(A)(2))

Submitter: Julian R. Burns, Quality Power Solutions, Inc./Burns Electrical Contractors
Recommendation: Delete the following text:
~~(2) Exposed in dropped or suspended ceilings in other than one and two family and multifamily dwellings.~~
Substantiation: There are many types of buildings constructed with the same type of construction as single and multifamily dwellings, which NM cable should be allowed. These types consist of, but not limited to; office condos, retail spaces, medical offices etc. If NM cable is a hazard above a lay-in or suspended ceiling, then it should not be used in dwellings where suspended ceilings are used.

Panel Meeting Action: Reject
Panel Statement: The number of cables, and as a result the fuel load, is significantly greater in the occupancies listed in the proposal than in the occupancies permitted in 334.12(A)(2). Also, see the panel statement on Proposal 7-52.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-54 Log #553 NEC-P07 **Final Action: Reject**
(334.12(A)(11) (New))

Submitter: Neal Dorenkott, City of Eastlake Ohio Building Department / Rep. B.O.C.O.N.E.O
Recommendation: Add new text to read:
(11) In residential air returns without approved fire rated protection.
Substantiation: Although 300.21 address the issue of not increasing the spread of fire or products of combustion, it is not addressed in 334.12(A) Uses Not Permitted. To further define 300.21, with the addition of this wording, this proposal will specify in the Article 334 of the Code that applies to NM, NMC, and NMS.
Panel Meeting Action: Reject
Panel Statement: Section 300.22 addresses wiring in ducts, plenums, and other air-handling spaces and, therefore, applies to all wiring methods. The reference in 334 is not needed.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
BROWN, H.: We disagree with the panel action to Reject this proposal. Every attempt should be made to stop the spread of fire. Although 300.21 addresses the issue of not increasing the spread of fire or products of combustion, there is a need for prescriptive text within the confines of Article 334 to address this very important safety issue.
The issue could be resolved with the addition of a Fine Print Note, however, the prescriptive text suggested in Proposal 7-47 would be preferable.
Please see our comments on Proposal 7-47.

7-55 Log #203 NEC-P07 **Final Action: Accept in Principle**
(334.12(B)(4))

NOTE: The following proposal consists of Comment 7-114 on Proposal 7-115 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. [Refer to Proposal 7-49 (Log#200)]
Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Revise 334.12(B)(4) as revised by the Panel to read:
(4) In other than normally dry locations.
Substantiation: Because the text in the 2002 NEC in Uses Permitted has been deleted, 334.10(A) and (C) that permit NM and NMS to be used in normally dry locations, has been inadvertently changed. The Panel text in proposed (334.12(B)(4)) is insufficient.
In the 2002 NEC only NMC is permitted to be used in dry, damp, or moist locations (334.10(B)(1).
The specific use permitted for NM and NMS by the 2002 NEC, as well as previous codes, is "exposed or concealed in normally dry locations". In uses not permitted of the 2002 NEC, 334.12(a)(10)(d) does state "Where exposed or subject to excessive moisture or dampness," but that was used in conjunction with the normally dry permitted use, and actually emphasizes that NM and NMS are not to be used in other than dry installations.
NM has always been a dry location wiring method. The text accepted by the Panel changes that meaning without substantiation for doing so. The proposed text above corrects this oversight.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 7-49.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-56 Log #3040 NEC-P07 **Final Action: Reject**
(334.13)

Submitter: Melvin K. Sanders, TECo Inc.
Recommendation: Insert in new Section 334.13 the following.
334.13 Protection Against Physical Damage
Where subject to physical damage, wiring methods shall be protected by either, or all, in the following manner.
(A) Cables and Raceways Through Wood Members.
(1) Bored Holes. In both exposed and concealed locations, where a cable- or raceway-type wiring method is installed through bored holes in joists, rafters, or wood members, holes shall be bored so that the edge of the hole is not less than 32 mm (1 1/ 4 in.) from the nearest edge of the wood member. Where this distance cannot be maintained, the cable or raceway shall be protected from penetration by screws or nails by a steel plate or bushing, at least 1.6 mm (1/ 16 in.) thick, and of appropriate length and width installed to cover the area of the wiring.
Exception No. 1: Steel plates shall not be required to protect rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, or electrical metallic tubing.
Exception No. 2: A listed and marked steel plate less than 1.6 mm (1/ 16 in.) thick that provides equal or better protection against nail or screw penetration shall be permitted.
(2) Notches in Wood. Where there is no objection because of weakening the building structure, in both exposed and concealed locations, cables or raceways shall be permitted to be laid in notches in wood studs, joists, rafters, or other wood members where the cable or raceway at those points is protected against nails or screws by a steel plate at least 1.6 mm (1/ 16 in.) thick, and of appropriate length and width, installed to cover the area of the wiring. The steel plate shall be installed before the building finish is applied.
Exception No. 1: Steel plates shall not be required to protect rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, or electrical metallic tubing.
Exception No. 2: A listed and marked steel plate less than 1.6 mm (1/ 16 in.) thick that provides equal or better protection against nail or screw penetration shall be permitted.
(B) Nonmetallic-Sheathed Cables and Electrical Nonmetallic Tubing Through Metal Framing Members.
(1) Nonmetallic-Sheathed Cable . In both exposed and concealed locations where nonmetallic-sheathed cables pass through either factory or field punched, cut, or drilled slots or holes in metal members, the cable shall be protected by listed bushings or listed grommets covering all metal edges that are securely fastened in the opening prior to installation of the cable.
(2) Nonmetallic-Sheathed Cable and Electrical Nonmetallic Tubing. Where nails or screws are likely to penetrate nonmetallic-sheathed cable or electrical nonmetallic tubing, a steel sleeve, steel plate, or steel clip not less than 1.6 mm (1/ 16 in.) in thickness shall be used to protect the cable or tubing.
Exception: A listed and marked steel plate less than 1.6 mm (1/ 16 in.) thick that provides equal or better protection against nail or screw penetration shall be permitted.
(C) Cables and Raceways Parallel to Framing Members and Furring Strips. In both exposed and concealed locations, where a cable- or raceway-type wiring method is installed parallel to framing members, such as joists, rafters, or studs, or is installed parallel to furring strips, the cable or raceway shall be installed and supported so that the nearest outside surface of the cable or raceway is not less than 32 mm (1-1/ 4 in.) from the nearest edge of the framing member or furring strips where nails or screws are likely to penetrate. Where this distance cannot be maintained, the cable or raceway shall be protected from penetration by nails or screws by a steel plate, sleeve, or equivalent at least 1.6 mm (1/ 16 in.) thick.
Exception No. 1: Steel plates, sleeves, or the equivalent shall not be required to protect rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, or electrical metallic tubing.
Exception No. 2: For concealed work in finished buildings, or finished panels for prefabricated buildings where such supporting is impracticable, it shall be permissible to fish the cables between access points.
Exception No. 3: A listed and marked steel plate less than 1.6 mm (1/ 16 in.) thick that provides equal or better protection against nail or screw penetration shall be permitted.
(D) Cables and Raceways Installed in Shallow Grooves. Cable- or raceway-type wiring methods installed in a groove, to be covered by wallboard, siding, paneling, carpeting, or similar finish, shall be protected by 1.6 mm (1/ 16 in.) thick steel plate, sleeve, or equivalent or by not less than 32-mm (1-1/ 4-in.) free space for the full length of the groove in which the cable or raceway is installed.
Exception No. 1: Steel plates, sleeves, or the equivalent shall not be required to protect rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, or electrical metallic tubing.
Exception No. 2: A listed and marked steel plate less than 1.6 mm (1/ 16 in.) thick that provides equal or better protection against nail or screw penetration shall be permitted.
Substantiation: The wiring methods typically installed in wooded frame structures are Article 320 (Type AC), Article 330 (Type MC), Article 334 (Types NM, NMC, and NMS), and Article 362 (ENC). Insofar as Article 340 (Type UF) is installed in lieu of Article 334 wiring methods, its installation must meet the requirements of Article 334 Parts II and III, and also subject to the same installation restrictions.
Since the 1975 Edition of the NEC, there has been a requirement in Section 300.4 that steel plates or bushings be installed to provide protection of certain wiring method against damage from ordinary nails or screw-nails when they pass through wooden members or laid in notches or grooves and the distance from the nail direction could not be the required 1-1/4 inch (32 mm).
This restriction placed in Article 300 has prevented those CMP's most knowledgeable in application of these products from using any other protection schemes or technology for this purpose. During the 2005 ROP/ROC stage, fact-finding reports were presented to CMP 3 highlighting the steel plates called for provide little or no protection against nails or screw-nails larger than #8 or equivalent trade designation. Since Section 300.4 first paragraph was changed in 2005 ROP to emphasize conductors are to be protected against physical damage, it is obvious that such protection is to be provided by the wiring method in which they are contained, as spelled out in Section 300.3(A).

Because the Scopes of Section 320.1, 330.1, 334.1, 340.1 and 362.1 state they govern the installation of those wiring methods which, by Section 300.3(A), contain the conductors that are to be protected, as stated in Section 300.4 first paragraph.

Sections 320.12(1), 330.12(1), 340(10), and 362.12(10) state those wiring methods are not to be exposed to physical damage, therefore the contained conductors are inherently protected against damage which meets the intent of Section 300.4 first paragraph, and Section 300.3(A) is satisfied.

This would allow Article 300 to set the general guidelines and allow CMP 7 and CMP 8 to set rules deemed necessary to protect appropriate wiring methods.

Separate proposals are being made to CMP 3 and CMP 8 to address the text to be deleted from Article 300. Coordination between all affected CMP's will be essential in order for this to be accomplished in one ROP/ROC cycle

Panel Meeting Action: Reject

Panel Statement: Section 300.4 specifies requirements for protection against physical damage. Article 320 references those portions of 300.4 that Code-Making Panel 7 requires to be applicable to Type AC cable. Code-Making Panel 7 can, at any time, include additional protection requirements to supplement those in 300.4 or modify the 300.4 requirements. It is not necessary to repeat the 300.4 requirements in multiple cable articles when the appropriate requirements in 300.4 can simply be referenced as appropriate in each cable article. The addition of 334.13 would unnecessarily increase the size of the Code without providing additional clarity.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-58 Log #2399 NEC-P07 **Final Action: Accept**

(334.15)

Submitter: Mike Holt, Mike Holt Enterprises

Recommendation: Revise text to read:

334.15 Exposed Work. In exposed work, except as provided in 300.11(A), cable shall be installed as specified in 334.15(A) through (C).

(A) Remain unchanged.

(B) Remain unchanged.

(C) In Unfinished Basements <u>and Crawl Spaces</u> . Where cable is run at angels with joists in unfinished basements <u>and crawl spaces</u> , it shall be permissible to secure cables not smaller than two 6 AWG or three 8 AWG conductors directly to the lower edges of the joists. Smaller cables shall be run either through bored holes in joists or on running boards. NM cable used on a wall of an unfinished basement shall be permitted to be installed in a listed conduit or tubing. Conduit or tubing shall utilize a nonmetallic bushing or adapter at the point the cable enters the raceway. Metal conduit and tubings and metal outlet boxes shall be grounded.

Substantiation: The code differentiates between an unfinished basement in different areas of the code, such as in 210.8(A). This code section, however, does not give any direction as to the requirements for a crawl space. Because the same dangers exist in both unfinished basements and crawl spaces, this subsection should be changed to include both locations.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

BROWN, H.: We disagree with the panel action to accept this proposal.

This proposal will allow for cables not smaller than two 6 AWG or three 8 AWG conductors to become fastened directly to the lower edges of joists (in a crawl space).

A "crawl space" is not defined in the code. Without placing "height restrictions" or defining a "crawl space" this provision will quickly become a safety issue.

For example: A crawl space may exist beneath a building on a conventional foundation. An individual would have to navigate under surface mounted wiring, (possibly in a "tight" space), while attempting to move around under the building. The individual could "snag" the wiring, and pull it away from its fastening. "Tight spaces" are already an impediment to performing work. Surface mounted cables should not be located in these types of spaces.

Without defining "crawl space", there are no guidelines or restrictions for allowing a lessening of the current rules. The existing installation requirements provide that the cables must pass through bored holes. This has been an accepted practice for many years, as it provides for a safe installation of the product. Are we becoming too lazy to bore holes to protect our wiring method? Let's continue to give the consumer, the service technicians, and everyone else (pest control, etc.) a safe and efficient electrical installation.

7-59 Log #2467 NEC-P07 **Final Action: Reject**

(334.15(A) Exception (New))

Submitter: David Zinck, Newburyport Wiring Inspector

Recommendation: Add:

Exception: Stacker devices designed for the purpose shall be allowed to secure the cable where installed in accordance with (a) and (b) below:

(a) the stacker devices are installed at intervals no greater than 600 mm (2 ft) and,

(b) the wire enters the stacker device from the top or the side.

Substantiation: Stacker devices provide a very handy, safe, and neat way to do home runs in a house. With the cable supported at a maximum of 2 ft the support is equivalent to running through holes in studs. The purpose of (b) is to ensure that the wire snaps down into the device. If the devices were installed with the openings to the bottom, not much cable would have to fall out before the weight of the cable would pull the wire out of the others. Also, there is at least one manufacturer that has a device that the wires snap into on both sides. On such a device only the top half could be used on horizontal runs. I submitted this proposal in 2002 (see ROP 7-131 Log #1827 NEC-P07). The panel action was that the use of the stackers was allowed by 334.30.

The outer section that holds the cables is 1 1/2 in. or greater off of the surface that the cable is parallel to. The question becomes how far off of the joist can you be and still qualify as "closely follows the surface..." as required by 334.15(A). If a contractor cut 2 in. blocks and nailed them on 4 1/2 ft centers and then ran his Romex across them like giant guitar strings over frets would they pass inspection? The answer has to be YES if the Stackers are to qualify. How about 3 in. blocks? How about 4 in. blocks? I am resubmitting my previous proposal as food for thought.

Panel Meeting Action: Reject

Panel Statement: "Stacker device" is covered in 334.30 by the words "…or similar fittings designed and installed so as not to damage the cable." It is not necessary to list in the Code every possible means of securing and supporting Type NM cable.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-60 Log #328 NEC-P07 **Final Action: Reject**

(334.15(B))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education

Recommendation: Revise as follows:

"(B) Protection from ~~Physical~~ Damage. The cable shall be protected from ~~physical~~ damage...".

Substantiation: Use of the word "physical" is superfluous– the purpose is obvious. In some instances, one could argue for the use of "mechanical" to differentiate that from e.g., "thermal" damage, but context makes the intended sense quite clear, rendering anything like this completely unnecessary.

Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.

Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."

Panel Meeting Action: Reject

Panel Statement: The word "physical" is appropriate since it specifically defines the type of protection being provided and complies with 3.2.5.5 of the NEC Style Manual. There are other types of protection that may be provided, such as protection from EMF interference.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-61 Log #1905 NEC-P07 **Final Action: Accept in Principle**

(334.15(B))

Submitter: James W. Carpenter, International Association of Electrical Inspectors

Recommendation: In the second paragraph of 334.15(B), delete the word "Where" as the first word, delete "is" as the fifth word, the phrases "the cable" and "against nails or screws by a steel plate at least 1.59 mm (1/16 in.) thick and covered with plaster, adobe, or similar finish". Insert the phrase "in accordance with the requirements in 300.4(E) and covered with plaster, adobe, or similar finish". To read as follows:

~~Where~~ Type NMC cable ~~is~~ installed in shallow chases in masonry, concrete, or adobe, ~~the cable~~ shall be protected ~~against nails or screws by a steel plate at least 1.59 mm (in.) thick and covered with plaster, adobe, or similar finish;~~ <u>in accordance with the requirements in 300.4(E) and covered with plaster, adobe, or similar finish.</u>

Substantiation: Shallow is not defined anywhere in the NEC so complying with the requirements in 300.4(E) is certainly permissible. For example, if the one and a quarter in. spacing is maintained, then installing nail plates are not required. If the spacing is not maintained, then one of the other protection means in 334.15(B), paragraph one would be permissible but nail plates would not be necessary as stated in 300.4(E), Exception No. 1. Since 300.4(E), Exception No. 2 now permits plates less than a sixteenth of an in. that are listed and case hardened so by rewording this text would recognize this new method of protection where dealing with NM cable.

Panel Meeting Action: Accept in Principle

The panel accepts the proposal, but changes "in shallow chases" to "in shallow chases or grooves".

Panel Statement: The change in the wording to "in shallow chases or grooves" provides correlation with the wording in 300.4(E).

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-62 Log #1918 NEC-P07 **Final Action: Accept in Part**
(334.15(B))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 8 for Comment.

Submitter: William Wagner, Certification Solutions

Recommendation: Revise 334.15(B) as follows:

334.15(B) Protection from Physical Damage. Cable shall be protected from physical damage where necessary by rigid metal conduit, intermediate metal conduit, electrical metallic tubing, Schedule 80 <u>rigid</u> PVC ~~rigid nonmetallic~~ conduit, or other approved means. Where passing through a floor, the cable shall be enclosed in rigid metal conduit, intermediate metal conduit, electrical metallic tubing, Schedule 80 <u>rigid</u> PVC ~~rigid nonmetallic~~ conduit, or other approved means extending at least 150 mm (6 In.) above the floor.
Where Type NMC cable is installed in shallow chases in masonry, concrete, or adobe, the cable shall be protected against nails or screws by a steel plate at least 1.59 mm (1/16 in.) thick and covered with plaster, adobe, or similar finish.

Substantiation: This is a companion proposal for the definition of Rigid Nonmetallic Conduit in Article 100 and the revised Article 352 for Type PVC Conduit and results in the use of consistent terminology for these products throughout the Code.

Panel Meeting Action: Accept in Part

The panel does not accept the inclusion of the word "rigid" in two places in the recommendation of the proposal, and accepts the remainder of the proposal.

Panel Statement: This action was taken to correlate with the action taken by Code-Making Panel 8 on Proposal 8-53.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-63 Log #344 NEC-P07 **Final Action: Accept in Principle in Part**
(334.15(C))

TCC Action: The Technical Correlating Committee directs the panel to reconsider this proposal and correlate with action taken on Proposal 7-58. This action will be considered by the panel as a public comment.

Submitter: Michael J. Johnston, Plano, TX

Recommendation: Revise text to read as follows:

(C) In Unfinished Basements. Where the cable is run at angles with joists in unfinished basements, it shall be permissible to secure cables not smaller than two 6 AWG or three 8 AWG conductors directly to the lower edges of the joists. Smaller cables shall be run either through bored holes in joists or on running boards. NM cable installed on the walls of an unfinished basement shall be protected from physical damage. <u>Where</u> NM cable <u>is</u> used on a wall of an unfinished basement <u>it</u> shall be permitted to be installed in a listed conduit <u>or tubing or protected by other approved means.</u> Conduit or tubing shall ~~utilize~~ be provided with a ~~nonmetallic~~ <u>suitable</u> bushing or adapter at the point the cable enters the raceway. <u>The NM cable sheath shall extend through the conduit or tubing and into the outlet or device box not less than 6 mm (1/4 in.). The cable shall be secured within 300 mm (12 in.) of the point where the conduit enters the conduit or tubing.</u> Metal conduit and tubings and metal outlet boxes shall be grounded.

Substantiation: The proposed revisions are intended to provided needed clarification and direction for installers and enforcement officials. The added requirements are consistent with provisions that already exist in the Code (312.5(C) Exception) where NM cable is permitted to be installed in similar fashion. The missing elements in the 2005 NEC were the part about the length of the sheath of the cable and the securing distance from the point where the cable enters the conduit or tubing. The bushing could be metallic or nonmetallic types. The other revisions are editorial in nature.

Panel Meeting Action: Accept in Principle in Part

Revise the proposed text to read as follows:

"(C) In Unfinished Basements. Where the cable is run at angles with joists in unfinished basements, it shall be permissible to secure cables not smaller than two 6 AWG or three 8 AWG conductors directly to the lower edges of the joists. Smaller cables shall be run either through bored holes in joists or on running boards. NM cable installed on the wall of an unfinished basement shall be permitted to be installed in a listed conduit or tubing or protected in accordance with 300.4. Conduit or tubing shall be provided with a suitable insulating bushing or adapter at the point the cable enters the raceway. The NM cable sheath shall extend through the conduit or tubing and into the outlet or device box not less than 6 mm (1/4 in.). The cable shall be secured within 300 mm (12 in.) of the point where the cable enters the conduit or tubing. Metal conduit, tubing, and metal outlet boxes shall be grounded.

Panel Statement: "Installed" is more descriptive than "used". Reference to 300.4 provides several methods of protection that may or may not be approved. The change to "insulated bushing" was made to correlate with 300.16(B). The change from "conduit" to "cable" and the revisions in the last sentence were editorial.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-64 Log #1393 NEC-P07 **Final Action: Reject**
(334.15(C))

Submitter: George Stolz, II, Pierce, CO

Recommendation: NEC-2005 334.15(C) has the following added after the existing 2002 text:

~~NM cable use don a wall of an unfinished basement shall be permitted to be installed in a listed conduit or tubing Conduit or tubing shall utilize a nonmetallic bushing or adapter at the point this cable enters the raceway. Metal conduit and tubings and metal outlet boxes shall be grounded.~~

Substantiation: The statement "NM cable used on a wall of an unfinished basement shall be permitted to be installed in a listed conduit or tubing" is redundant, as it is already stated in 300.18 and 300.15(C).

The statement "Conduit or tubing shall utilize a nonmetallic bushing or adapter at the point this cable enters the raceway" is overly restrictive, as a bushing is already required by 300.15(C). A properly installed metallic connector can be used anywhere except in an unfinished basement? That isn't logical or reasonable.

The statement "Metal conduit and tubings and metal outlet boxes shall be grounded" is in direct contradiction to 250.86 Exception No. 2, which rightly assumes that cables being protected from outward physical damage are going to be intact on the interior of that protection.

Panel Meeting Action: Reject

Panel Statement: The revisions made in Proposal 7-63 define the requirements for the installation of NM cable in unfinished basements.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-65 Log #1646 NEC-P07 **Final Action: Reject**
(334.15(C))

Submitter: Gerald Horn, Spencer Research & Development dba/J-Horn Electric Inc.

Recommendation: Add text to read as follows:

Smaller cables shall be run either through bored holes in joist or on running boards, or <u>installed in a commercially available UL approved plastic block with bored holes and a 1/16 in. metal bottom plate. This block is nailed or screwed to the bottom of the joist and eliminates boring the joist.</u>

Substantiation: This plastic block eliminates bored holes in joist and does not have rough edges to tear the sheath of the NM cable that is predominate with bored holes in wood. Also, it does not compromise the integrity or weaken the wood joist.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: "Stackers" are covered by the words "…or similar fittings designed and installed so as not to damage the cable" in 334.30. It is not necessary to list in the Code every possible means of securing and supporting Type NM cable.

Stackers are permitted to be used within the cavity between joists, installed so that the cables are parallel to the joist, but not below the joist.

Smaller cable sizes are more susceptible to physical damage than the larger sizes. Accordingly, the Code specifies the requirements for additional physical protection required for the smaller cables, and requires that any cables approved by the Code to be run at angles with joists shall be secured directly to the bottom of the joist or to a running board.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-66 Log #2468 NEC-P07 **Final Action: Reject**
(334.15(C))

Submitter: David Zinck, Newburyport Wiring Inspector

Recommendation: Revise text to read as follows:

Where cable is run at angles with joists in unfinished basements, it shall be permissible to secure cables ~~not smaller than two 6 AWG or three 8 AWG conductors~~ directly to the lower edges of the joists. ~~Smaller cables shall be run either through bored holes in joints or on running boards.~~

Substantiation: In 2002 I sent in a proposal to regulate and allow "Stackers" to be used for exposed work in unfinished basements (See ROP 7-131 Log #1827 NEC P07). The panel action was that the Stackers were permitted in 334.30. It really comes down to a definition of what constitutes "closely follows the surface of the building finish or of running boards" found in 334.15(A). How close to the surface does the cable have to maintain to qualify as "closely follows the surface"? The outer "holding section" of many stackers is about 1 1/2 in. or better from the surface. Would the same panel allow Romex to be stapled to a series of blocks holding the cable out the same distance? If the answer is YES, than what is the difference between having up to 4 1/2 ft of unsupported Romex running block to block, hanging in free air in between except for the point where it is stapled, and going joist to joist? And we have all heard the argument that it will be an enticing spot to hangs things off of (such as laundry). But the truth is, anyone who is so inclined to hang things off of the Romex stapled to the bottom of the joist will be equally inclined to do it a mere 3 in. higher if the Romex is run through bored holes which is accepted.

Panel Meeting Action: Reject

Panel Statement: Smaller cable sizes are more susceptible to physical damage than the larger sizes. Accordingly, the Code specifies the requirements for additional physical protection required for the smaller cables.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-67 Log #2916 NEC-P07 **Final Action: Accept in Part**
(334.15(C))

Submitter: Marcus Sampson, Lysistrata Electric

Recommendation: Revise as follows:

(C) In Unfinished Basements, <u>Crawl Spaces and Similar Areas</u> . Where cable is run at angles with joists in unfinished basements, <u>crawl spaces and similar areas</u> , it shall be permissible to secure cables not smaller than two 6 AWG or three 8 AWG conductors directly to the lower edges of the joists. Smaller cables shall be run either through bored holes in joists or on running boards. NM cable used on a wall of an unfinished basement shall be permitted to be installed in a listed conduit or tubing. Conduit or tubing shall utilize a nonmetallic bushing or adapter at the point the cable enters the raceway. Metal conduit and tubings and metal outlet boxes shall be grounded.

Substantiation: Cable sizes 6 AWG and larger are often installed through unfinished areas such as crawl spaces, but the term “unfinished basements” restricts this allowance to basement areas.

Panel Meeting Action: Accept in Part

The proposed wording “and similar areas” is rejected. The remainder of the proposal is accepted.

Panel Statement: The term “in unfinished basements and crawl spaces” adequately addresses the appropriate areas applicable to 334.15(C). See panel action on Proposal 7-58.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

BROWN, H.: We disagree with the panel action to accept this proposal.

This proposal should be rejected, and our negative comments on Proposal 7-58 serve to punctuate our opposition to this proposal.

This proposal, if accepted, will allow cables not smaller than two 6 AWG or three 8 AWG conductors to be fastened directly to the lower edges of joists in “Crawl spaces” and “similar areas.”

The panel accepted the language to include “Crawl spaces” and rejected the language to include “and similar areas”.

The point is: <u>CRAWL SPACES ARE NOT NOT DEFINED</u> . Inspectors, installers, or anyone else must have a clear definition of a “Crawl space”, or a “Crawl space” quickly becomes the (SIMILAR AREA THAT THE CODE MAKING PANEL REJECTED).

We are making an attempt to be objective as it relates to this proposal and Proposal 7-58. “Define (Crawl Space), and then make the determination if less wiring restrictions should apply to the “defined” area.

7-68 Log #2574 NEC-P07 **Final Action: Reject**
(334.30)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 9 for Information.

Submitter: Richard F. Van Wert, Middle Department Inspection Agency / Rep. Benjamin Franklin Chapter IAEI

Recommendation: Revise text to read as follows:

334.30 Securing and Supporting.

Exception: Where nonmetallic-sheathed cable...”.

Substantiation: The information in 314.17(C) Exception belongs in 334.30 to be useful and relevant.

Panel Meeting Action: Reject

Panel Statement: The rules in 314.17(C) Exception are more applicable to the use of the box rather than the cable. This proposal and panel action should be referred to Code-Making Panel 9 for information.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

SCHUMACHER, D.: I believe it would clear up a lot of confusion in the field if this were here instead of 314.17(C), it should be added as text rather than an exception.

7-69 Log #3347 NEC-P07 **Final Action: Reject**
(334.30)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc. / Rep. Massachusetts Electrical Code Advisory Committee

Recommendation: Revise 334.30 as follows [(A), (B), and (C unchanged]:

334.30 Securing and Supporting. Nonmetallic-sheathed cable shall be secured by staples, cable ties, straps, or similar fittings so designed and installed as to not damage the cable. Where staples are used for cable sizes smaller than three 8 AWG conductors, they shall be of the insulated type, or listed noninsulated staples driven by staple guns shall be permitted. Cable shall be secured in place at intervals not exceeding 1.4 m (4½ ft) and within 300 mm (12 in.) from every cabinet, box, or fitting. For other than within 300 mm (12 in.) of a cable termination at a cabinet, box, or fitting, cables passing through successive holes in adjacent framing members no more than 600 mm (24 in.) apart shall be considered to be secured.

Sections of cable protected from physical damage by raceway shall not be required to be secured within the raceway.

Substantiation: This proposal raises anew the insulated staple requirement for smaller sizes of Type NM cable. Where applied locally, the requirement has proved to be inexpensive and forgiving of somewhat overenthusiastic hammer blows, the force of which is difficult to calibrate at times. Remember that the density of wood varies based on the positioning of knots and growth rings that cannot always be seen. Even skilled electricians occasionally overdrive staples, and the damage may not show up for years because plasticized polyvinyl chloride will flow over time under constant pressure.

This proposal is particularly pertinent because changes in the product standard have resulted in NM cables with far less robust construction than those that prevailed in years past. This proposal also includes an allowance for the listed staple gun/staple combinations that are now available for smaller sizes of NM cables.

Panel Meeting Action: Reject

Panel Statement: The present Code does not preclude the use of insulated staples or listed noninsulated staples driven by staple guns. No technical substantiation was submitted to justify mandating insulated staples only.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-70 Log #880 NEC-P07 **Final Action: Accept in Part**
(334.80)

Submitter: Noel Williams, Noel Williams Consulting

Recommendation: Add the following to the end of the second paragraph:

“... shall be adjusted in accordance with 310.15(B)(2)(a) and the provisions of 310.15(A)(2), Exception, shall not apply.”

Substantiation: Since the length of a bundle of cables passing through framing is likely to be short relative to the overall length of the cables, the exception to 310.15(A)(2) would often allow the reduced ampacity determined by this section to be disregarded. If heating is an issue in this case, the adjusted ampacity must be used.

Panel Meeting Action: Accept in Part

The panel accepts the addition of the phrase “and the provisions of 310.15(A)(2), Exception, shall not apply”.

Panel Statement: The first phrase in the proposal already exists in the Code.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-71 Log #1344 NEC-P07 **Final Action: Reject**
(334.80)

Submitter: Mike Holt, Mike Holt Enterprises

Recommendation: Delete adherence requirement to 310.15(B)(2)(a)

334.80 Ampacity.

The ampacity of Types NM, NMC, and NMS cable shall be determined in accordance with 310.15. The ampacity shall be in accordance with the 60°C (140°F) conductor temperature rating. The 90°C (194°F) rating shall be permitted to be used for ampacity derating purposes, provided the final derated ampacity does not exceed that for a 60°C (140°F) rated conductor. The ampacity of Types NM, NMC, and NMS cable installed in cable tray shall be determined in accordance with 392.11.

~~Where more than two NM cables containing two or more current-carrying conductors are bundled together and pass through wood framing that is to be fire- or draft-stopped using thermal insulation or sealing foam, the allowable ampacity of each conductor shall be adjusted in accordance with Table 310.15(B)(2)(a).~~

Substantiation: The exception to section 310.15(A)(2) makes this requirement moot. Generally speaking, the portion of cable that is surrounded by sealing foam will only be 3” in length, assuming conventional 2” x 4” construction. This means that if the total circuit length is greater 30”, this rule is nullified by the aforementioned exception. Considering the fact that 300.14 requires not less than 6 inches of free conductor at each outlet point, that makes for a circuit length not to exceed 18 inches before this rule applies. CMP 7 should recognize the fact that a typical NM installation will not consist of an 18” circuit that is engulfed in sealing foam. Considering the fact that ampacity adjustments for type NM cable only make a difference in ampacity when more than 9 current carrying conductors in bundled, this rule makes even less sense.

To summarize: This rule applies ONLY when the total length of NM cable is less than 18" in length, AND is passed through at least 3" of fire stopping foam, AND has more than nine current carrying conductors.

This code requirement serves no purpose, and therefore should be removed.

Panel Meeting Action: Reject

Panel Statement: Technical substantiation submitted during the 2005 Code cycle supported the addition of the second paragraph in 334.80. While the cable is only bundled for a short distance within the fire- or draft-stopped wood framing, it is long enough that the insulated conductors exceed their allowable temperature rating.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-72 Log #1770 NEC-P07 **Final Action: Accept in Principle**
(334.80)

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reconsidered based on the action taken on Proposal 1-19. This action will be considered by the panel as a public comment.

Submitter: Danny Thomas, Durham City-County Inspections

Recommendation: Revise text to read as follows:

Where more than two NM cables, containing two or more current-carrying ~~conductors are bundled together and~~ pass through wood framing members together that is to be fire or draft-stopped using thermal insulation of sealing foam, the allowable ampacity of each conductor shall be adjusted in accordance with Table 310.15(B)(2)(a).

Substantiation: This alleviates having to have a definition for "bundled" which causes a lot of controversy over this particular code section. Many users want to argue that these cables are not bundled based on any code language or definition.

Panel Meeting Action: Accept in Principle

Revise the proposed wording to read as follows:

"Where more than two NM cables, containing two or more current-carrying conductors, pass through the same opening in wood framing that is to be fire- or draft-stopped using thermal insulation or sealing foam, the…".

Panel Statement: The panel agrees that "bundled" is not defined, and the revised wording more accurately describes the installation.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-73 Log #2737 NEC-P07 **Final Action: Accept in Part**
(334.80)

Submitter: Jim Pauley, Square D Company

Recommendation: Revise 334.80, second paragraph as shown:

Where more than two NM cables containing two or more current-carrying conductors are bundled together and pass through wood framing that is to be fire- or draft-stopped using thermal insulation, caulk, or sealing foam, the allowable ampacity of each conductor shall be adjusted in accordance with Table 310.15(B)(2)(a).

Exception: The ampacity adjustment shall not be required where the wood framing is fire or draft stopped only on the bottom side of the framing member.

Substantiation: Questions have been coming from AHJ's on this new provision in the 2005 NEC. This proposal is an effort to address those questions. The first revision involves adding the word "caulk" in the list of items used to seal around the opening. As written today, the rule would not be applicable if caulk were used because the text is specific to thermal insulation and sealing foam.

The second revision is to add an exception to clarify when the rule applies. It appears that it is not uncommon for caulk or a similar material to be placed on some of these openings only on the underside of the framing member. This is particularly true where cables penetrate the plate above a panelboard. Given that the study presented in the 2005 NEC focused on closing up the penetration completely (either by filling the hole itself or by putting material on both top and bottom of the plate), there would not appear to be justification for requiring the derating when a material is placed only on the bottom side of the framing member. The exception has been limited to the bottom side only because it would seem that putting the material on the top side would trap any heat generated by the cables and the rule should apply. If the panel rejects the exception, the implication would be that the rule would apply when a penetration has material placed around the opening in any manner and not necessarily in the opening or on both sides of the opening.

Panel Meeting Action: Accept in Part

The panel accepts the addition of the word "caulk", and rejects the addition of the exception.

Panel Statement: The exception is rejected, since building codes require that openings be properly filled to a level that matches the fire rating of the material prior to the penetration when fire- or draft-stopped.

The panel action on this proposal will modify the panel action on Proposal 7-72.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-74 Log #3152 NEC-P07 **Final Action: Accept**
(334.80)

Submitter: Travis Lindsey, Travis Lindsey Consulting Services

Recommendation: Add an additional third paragraph to 334.80 to read:

Where more than two NM cables containing two or more current-carrying conductors are installed in contact with thermal insulation without maintaining spacing between cables, the allowable ampacity of each conductor shall be adjusted in accordance with Table 310.15(B)(2)(a).

Substantiation: Recent field experimentation shows that NM cables which are grouped or bundled together for varying lengths and installed in contact with thermal insulation in walls and ceilings can exceed the maximum allowable design temperatures of the insulation. Even when the circuit currents were limited to eight percent or less, temperature exceeded 90°C (194°F).

Full details are contained in the test report entitled *NM Cable Bundles Installed on or In Thermal Insulation, November 2005.*

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

ADAMS, M.: NECA believes this proposal is too restrictive. "In contact with thermal insulation" is not the same concept as in the present second paragraph, which envisions completely surrounding bundled NM cables with thermal insulation or sealing foam. Also, since "bundled" is not a term defined in the NEC, accepting this proposal could preclude use of standoff type cable clamps. While intended to maintain space between adjacent NM cables, multiple cables installed in standoff clamps still touch in places, and might also touch thermal insulation. We do not believe that NM cables should be derated under this installation circumstance.

7-75 Log #3348 NEC-P07 **Final Action: Reject**
(334.80)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc. / Rep. Massachusetts Electrical Code Advisory Committee

Recommendation: Revise the first paragraph to read as follows:

334.80 Ampacity. Type NM, NMC, and NMS cable shall have conductors rated at 90°C (194°F). Where installed in thermal insulation, the ampacity of conductors shall be that of 60°C (140°F) conductors. The ampacity of Types NM, NMC, and NMS cable installed in cable tray shall be determined in accordance with 392.11.

Substantiation: Thermal insulation severely degrades the ampacity of conductors. Mid-length conductor derating, whether as a consequence of the ambient temperature notes to Table 310.16, etc., or mutual conductor heating issues covered in 310.15(B)(2)(a), assumes free dissipation of heat from the raceway or cable assembly involved. If that assumption is invalid, then the calculations are invalid. This is true for all wiring methods.

We recommend that CMP 7 review the NEMA research for the 1987 cycle (Proposal 4-97), which showed the cable jacket of 2/3 AWG SEU cable "completely charred" as well as adjacent "charred wood members" when embedded in thermal insulation (specifically, when covered with 7 inches of cellulose insulation) and subjected to currents corresponding to their Table 310.16 ampacities. Similar cables exceeded their temperature ratings when drawing only two-thirds of their table ampacities. The term "final derated ampacity" in this context is meaningless. Ampacity is the continuous current carrying ability of a wire under conditions of use. It is determined by thermodynamics. If the use impedes free circulation of air, then the ampacity is reduced to whatever it is.

If there are no thermal impediments to air circulation, then it is appropriate to allow the 90°C number for derating purposes. If installed in thermal insulation, start with the 60°C number, just as was the case for armored cable prior to the 2005 NEC.

The data in the 1987 NEMA proposal illustrates this principle nicely, since the experimental parameters allow for a very close inference as to the actual effect of thermal insulation on ampacity, at least for 2 AWG aluminum cable assemblies with nonmetallic sheaths. From that experimental data, it is obvious that the true ampacity of 2 AWG XHHW Aluminum made up as Type SE cable is about 60 amperes when it is embedded in cellulose insulation. In fact, the ampacity is even lower because the test set-up used only two current-carrying conductors and comparable table listings are based on three conductors. The table ampacity of the 90°C (XHHW) individual conductors of the SE cable make-up, starting in the 60°C column is 75 amperes. Even this number is much higher than the actual ampacity as determined by test under the specified conditions of use.

The current NEC does not account for this hazard because it allows code users to start their derating calculations in the 90°C column, and bundle many conductors together or run through high-temperature ambients, all apparently valid according to traditional procedures. Suppose, for example, cables accounting for nine 12 AWG current-carrying conductors are bundled through attic floor joists with an assigned design temperature of 45°C. The resulting ampacity (assuming THHN conductors) would appear to be 30A x 0.7 x 0.87 = 18A. The 60°C ampacity of 12 AWG conductors is 25A. Since the calculation result (18A) does not exceed 25A, it appears to be allowed by the NEC, but is it technically correct?

This conclusion is, in fact, incorrect. This calculation does not take into account the effect of thermal insulation. The more technically correct answer is given by the armored cable rules in the 2002 and prior editions of the NEC: Begin with the 60°C column: 25A x 0.7 x 0.71 = 12A. There is no consistent percent multiplier that can be applied to correct for thermal insulation. Because heat dissipation has to account for I 2 R losses, which are usually much higher for larger cables expected to carry much more current, one can't confidently predict the exact ampacity of a given application. However, one can predict with confidence that the thermal insulation effect will be significant. The 60°C rule provides a prescriptive approximation of how to counteract the effects of thermal insulation. It probably overstates the result in the smallest sizes of conductors, and understates it in the larger sizes, but it is the only readily available option at this time.

Panel Meeting Action: Reject

Panel Statement: The conductors in NM, NMC, and NMS cables are already required to be rated at 90 degrees C per 334.112.

With the actions taken on Proposal 7-74, it is not necessary to begin derating the conductors at the 60 degree C ampacity.

The thermal insulation issue has been addressed by the action on Proposal 7-74.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-76 Log #1725 NEC-P07 **Final Action: Reject**
(334.100)

Submitter: Richard P. Owen, City Of St. Paul Electrical Inspection

Recommendation: Revise as follows:

334.100 Construction. The outer cable sheath of nonmetallic-sheathed cable shall be a nonmetallic material. <u>The outer sheath shall be color-coded to indicate the AWG sizing of the current-carrying conductors in the cable. The colors shall be as follows: size 14 AWG-white, size 12 AWG-yellow, size 10 AWG-orange, size 8 AWG and larger- black.</u>

Substantiation: Even though there is a manufacturer that already color codes their cable sheath, this proposal is not to endorse that particular brand of nonmetallic-sheathed cable, it is to introduce the requirement of color-coding for better identification of NM cables before and after installation. I would invite the panel to accompany an electrical inspector into a building under construction that contains very little, if any, lighting and identify the sometimes poorly stamped identification mark on a piece of NM Cable. To verify the size of each individual run of cable, possibly into the hundreds in a single residence is beyond the time any inspector can spend on a job. If this color-coding requirement was instituted with the standardized colors, the inspector could more easily verify that all the individual runs of NM cable are correctly sized and be able to spend more time on other parts of the installation. Since the electrician installing this cable is working under these same poor conditions, it is easy for them to accidentally use the wrong sized cable, especially when using short, separate pieces rather than out of a marked box. This small change could help eliminate inadvertent installation of an undersized cable causing a potential safety hazard.

This color coding is intended to supplement, not replace, the stamped marking on the cables.

Panel Meeting Action: Reject

Panel Statement: Section 310.11 covers marking requirements for cables and conductors and specifies the location and frequency of the markings to facilitate identification and inspection of the cable. Coloring the cable to assist in identification of conductor size in poorly lit buildings is contradictory, as distinguishing color in dark areas is difficult. Additionally, dependence on the jacket color may preclude thorough inspection of the cable type, number of conductors, and UL listing by not looking at the required cable marking.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-77 Log #881 NEC-P07 **Final Action: Accept**
(334.108)

Submitter: Noel Williams, Noel Williams Consulting

Recommendation: Revise as follows:

"In addition to the insulated conductors, the cable shall have an insulated, <u>covered</u> , or bare conductor for equipment grounding purposes only."

Substantiation: This change is intended to more accurately reflect the actual construction of NM cable, much of which includes a covered equipment grounding conductor that is neither insulated nor bare.

Panel Meeting Action: Accept

Panel Statement: The panel notes that the paper wrap over the bare conductor does not meet the definition of a covered conductor in Article 100.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-78 Log #34 NEC-P07 **Final Action: Accept in Principle in Part (334.116 and 334.117 (New))**

Submitter: Stanley Kaufman, Cable Safe Inc.

Recommendation: Revise as follows:

334.116 Sheath. The outer sheath of nonmetallic-sheathed cable shall comply with 334.116(A), (B), and (C).

(A) Type NM. The overall covering shall be flame retardant and moisture resistant.

(B) Type NMC. The overall covering shall be flame retardant, moisture resistant, fungus resistant, and corrosion resistant.

(C) Type NMS. The overall covering shall be flame retardant and moisture resistant. The sheath shall be applied so as to separate the power conductors from the communications and signaling conductors. The signaling conductors shall be permitted to be shielded. An optional outer jacket shall be permitted.

~~**FPN: For composite optical cable, see 770.9 and 770.133.**~~

<u>**334.117 Optical Fibers. Optical fibers shall be permitted in the construction of Nonmetallic-Sheathed Cables**</u>

Substantiation: Article 770 scope states:

770.1 Scope. The provisions of this article apply to the installation of optical fiber cables and raceways. This article does not cover the construction of optical fiber cables and raceways.

Section 770.9(C) states:

(C) Composite. These cables contain optical fibers and current-carrying electrical conductors, and shall be permitted to contain non-current-carrying conductive members such as metallic strength members and metallic vapor barriers. <u>Composite optical fiber cables shall be classified as electrical cables in accordance with the type of electrical conductors.</u>

Requirements for the construction of electrical cables are outside the scope of Article 770. Article 334 should simply be amended to permit optical fibers in the construction of nonmetallic-sheathed electrical cables. Section 770.133 covers the <u>installation</u> of optical fibers along with electrical conductors. It does not cover the construction of the composite electrical/optical fiber cable.

Panel Meeting Action: Accept in Principle in Part

The panel accepts the deletion of the FPN in 334.116(C), and accepts 334.117 in principle by adding 334.104(C).

Section 334.104 will now read as follows:

"334.104 Conductors. The 600 volt insulated conductors shall be sizes 14 AWG through 2 AWG copper conductors or sizes 12 AWG through 2 AWG aluminum or copper-clad aluminum conductors.

(A) Signaling Conductors. Signaling conductors shall comply with 780.5.

(B) Communications Conductors. Communication conductors shall comply with Part V of Article 800.

(C) Optical Fibers. Optical fibers shall be permitted in Type NMS cable as permitted in 770.9(C) and 770.113."

Panel Statement: The definition of NMS cable in 334.2 permits optical fiber conductors within NMS cable rather than NM cable. The permitted use of fiber optic conductors in NMS cable is more appropriate in 334.104 rather than added as a new section. Section 334.104 was revised to list format in accordance with 3.3.2 of the NEC Style Manual.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

ARTICLE 336 — POWER AND CONTROL TRAY CABLE: TYPE TC

7-79 Log #229 NEC-P07 **Final Action: Reject**
(336.10(7))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education

Recommendation: Revise as follows:

"In ~~industrial establishments~~ <u>premises</u> where <u>the Authorities Having Jurisdiction are satisfied that the</u> conditions of maintenance and supervision ensure that only qualified persons service the installation, and where the cable is continuously supported and protected against ~~physical~~ damage...".

Substantiation: Industrial establishments are not the only ones where AHJs are wont to accept this; warehousing operations are another example. Formal 90.4 documentation is not always provided, and given that there is no substantiation for differentiating the ill-defined "industrial" operation from other establishments that may have well-trained-in-house electricians, why not ease the liability picture for such inspectors? Also, why not use the more-common Code term "premises"?

Next, use of the word "physical" is superfluous–the purpose is obvious. In some instances, one could argue for the use of "mechanical" to differentiate that from e.g., "thermal" damage, but here and elsewhere context makes the intended sense quite clear, rendering it completely unnecessary. Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on. Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.)

Panel Meeting Action: Reject

Panel Statement: The term "industrial establishment" is well understood and used throughout the Code. Not all locations that use the Code have an authority having jurisdiction. The word "physical" is appropriate, since it specifically defines the type of protection being provided and complies with 3.2.5.5 of the NEC Style Manual.

Natural disasters render damage that also negatively impact electrical installations. These types of damage are oftentimes uncontrollable and beyond the scope of the NEC.

Physical damage, however, is controllable to a large degree and is within the scope of the NEC.

The NEC gives guidance to its users and installers to avoid placing electrical installations in areas with materials that could fail due to physical (acted upon forceably under adverse conditions that are likely to be present) damage.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-80 Log #1720 NEC-P07 **Final Action: Accept in Principle**
(336.10(7))

Submitter: Dennis A. Nielsen, Lawrence Berkeley National Laboratory

Recommendation: Revise as follows:

In industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons service the installation and, where the cable is continuously supported and protected against physical damage using mechanical protection, such as struts, angles, or channels, Type TC tray cable that complies with the crush and impact requirements of Type MC cable and is identified for such use with the marking Type TC-ER shall be permitted to transition between cable trays , a cable tray and the utilization equipment or device a distance not to exceed 1.8 m (6 ft). The cable shall be secured at intervals not exceeding 1.8 m (6 ft) and be mechanically supported where exiting the cable tray to assure that the minimum bending radius is not exceeded. Equipment grounding for the utilization equipment shall be provided by an equipment grounding conductor within the cable. In cables containing conductors sized 6 AWG or smaller, the equipment grounding conductor shall be provided within the cable or, at the time of installation, one or more insulated conductors shall be permanently identified as an equipment grounding conductor in accordance with 250.119(B).

Substantiation: This will ensure a proper installation, but will allow for proper exiting of the cable tray to any piece of electrical equipment. It provides for the requirement of mechanical support where exiting the cable tray. It establishes a 6 foot limit on how far you can route the cable. This is plenty of length to get out of the tray to the equipment, but still prevents the TC-ER to be just run anywhere.

Panel Meeting Action: Accept in Principle

Add a new Exception to the end of 336.10(7) to read as follows:

"Exception: Where not subject to physical damage, Type TC-ER shall be permitted to transition between cable trays and between cable trays and utilization equipment or devices for a distance not to exceed 1.8 m (6 ft) without continuous support. The cable shall be mechanically supported where exiting the cable tray to ensure that the minimum bending radius is not exceeded."

Panel Statement: The addition of the exception provides clarification for proper installation.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

STEWART, H.: The new Exception would better read as follows for clarification:

"Exception: Where not subject to physical damage, Type TC-ER shall be permitted to transition from cable trays to utilization equipment or devices for a distance not to exceed 1.8 m (6 ft) without continuous support. The cable shall be mechanically supported from where it leaves the cable tray in order to ensure the minimum bending radius is not exceeded."

7-81 Log #2701 NEC-P07 **Final Action: Reject**
(336.10(7))

Submitter: Dorothy Kellogg, American Chemistry Council

Recommendation: Revise text to read:

In industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons service the installation, and where the cable is ~~continuously supported and protected against~~ not subject to physical damage ~~using mechanical protection, such as struts, angles, or channels~~ , Type TC tray cable that complies with the crush and impact requirements of Type MC cable and is identified for such use with marking Type TC-ER shall be permitted ~~between a cable tray and the utilization equipment or device~~ to be exposed . The cable shall be supported and protected against physical damage using mechanical protection, such as struts, angles, or channels . The cable shall be secured at intervals not exceeding 1.8 m (6 ft). Equipment grounding for the utilization equipment shall be provided by an equipment grounding conductor within the cable. In cables containing conductors sized 6 AWG or smaller, the equipment grounding conductor shall be provided within the cable or, at the time of installation, one or more insulated conductors shall be permanently identified as an equipment grounding conductor in accordance with 250.119(B).

Substantiation: There are three different installation methods for Type TC, Type PLTC and Type ITC. All of these cables are permitted to be installed as Exposed Routing (ER) when the cable is listed as ER. The installation requirements should be similar to reduce confusion in field. A similar proposal is being submitted for Articles 725 and 727 in an effort to align the installation methods.

There are no technical reasons to limit this installation method to only between a cable tray and utilization equipment or device. Cables listed for ER installations are a stronger cable, capable of withstanding more abuse than cables not listed for use in ER installations.

Panel Meeting Action: Reject

Panel Statement: TC cables are designed for installation in cable trays. They have nonmetallic outer jackets to facilitate installation without damage to the cabled insulated conductors within. The cables are not designed for exposed installations. A specific construction of TC was developed with enhanced overall cable mechanical performance to enable the cable to meet the crush and impact requirements of MC cable. The enhanced cable is permitted for specific applications to be installed outside of a cable tray. Expansion of the use of TC beyond those specific applications will expose the cable to damage that it is not designed to withstand. The differences in the physical properties nonmetallic and metallic outer coverings are very different. The tensile strength of steel and aluminum is typically 72,000 and 42,000 psi, respectively. The tensile strength of a nonmetallic covering is typically 2,000 psi. Simply meeting a crush and impact requirement does not encompass the abilities of a metallic outer covering on the cable.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

RUNYON, G.: The panel should have Accepted in Principal this proposal to allow type TC-ER cable to be installed between utilization equipment. Panel 3 recognized that there is no reason not to allow PLTC cable and ITC cable that meets the crush and impact requirements of MC cable to be used as exposed wiring when properly supported and secured, by their Accept in Principal vote on Proposals 3-179 and 3-205.

7-82 Log #228 NEC-P07 **Final Action: Reject**
(336.12(1))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education

Recommendation: Revise as follows:

(1) Where subject to ~~physical damage~~ blows or abrasion.

Substantiation: Use of the word "physical" generally is superfluous - the purpose is obvious. In some instances, one could argue for the use of "mechanical" to differentiate that from, e.g., "thermal" damage, but context makes the intended sense quite clear, rendering anything like this completely unnecessary.

Here, though, at the very least the third item refers to a form of physical damage - deterioration by ultraviolet radiation. The proposed rewording is an attempt at precision. If you don't care to reword (1), theoretically its present form eliminates the need for (3) and possibly the other items as well.

Furthermore, I would then have to fall back to arguing that in that case the term "physical" should be eliminated.

Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.

Second, the use of "physical" is not only poor writing – look at William Zinsser's classic, On Writing Well – but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone rasing an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from nonphysical injury?" (Substitute the snide adjective of your choice.)

Panel Meeting Action: Reject

Panel Statement: The word "physical" is appropriate, since it specifically defines the type of protection being provided and complies with 3.2.5.5 of the NEC Style Manual. There are other types of protection that may be provided, such as protection from EMF interference.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-83 Log #2987 NEC-P07 **Final Action: Reject**
(336.104)

Submitter: Robert Konnik, Rockbestos-Suprenant
Recommendation: Add allowance for nickel and nickel-coated copper conductors to 336.104 as shown below.

336.104 Conductors. The insulation conductors of Type TC cables shall be in sizes 18 AWG to 1000 kcmil copper, nickel , or bucket-coated copper, and sizes 12 AWG through 1000 kcmil insulated conductors of sizes 14 AWG and larger copper, nickel-coated copper and sizes 12 AWG through 1000 kcmil aluminum or copper-clad aluminum shall be one of the types listed in Table 310.13 or Table 310.62 that is suitable for branch circuit and feeder circuits or one that is identified for such use.
Substantiation: TC singles can be from Table 310.13, which could use nickel or nickel-coated copper. Some fire rated TC cables require nickel or nickel coated copper conductors. This harmonizes with the allowance of nickel and nickel-coated copper in 332.104 for MI cable.
Panel Meeting Action: Reject
Panel Statement: The insulation used on the conductors in Type TC cable is normally rated 90ºC whereas the magnesium oxide insulation used on the conductors in Type MI cable can withstand significantly higher temperatures.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 338 — SERVICE-ENTRANCE CABLE: TYPES SE AND USE

7-84 Log #2636 NEC-P07 **Final Action: Accept**
(338.10 and 338.12)

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise 338.10 and add 338.12 as shown below:
338.10 Uses Permitted.
(A) Service-Entrance Conductors. Service-entrance cable shall be permitted to be used as service-entrance conductors and shall be installed in accordance with 230.6, 230.7, and Parts II, III, and IV of Article 230.
~~Type USE used for service laterals shall be permitted to emerge from the ground outside at terminations in meter bases or other enclosures where protected in accordance with 300.5(D).~~
(B) Branch Circuits or Feeders.
(1) Grounded Conductor Insulated. Type SE service-entrance cables shall be permitted in wiring systems where all of the circuit conductors of the cable are of the rubber-covered or thermoplastic type.
(2) Grounded Conductor Not Insulated. Type SE service-entrance cable shall be permitted for use where the insulated conductors are used for circuit wiring and the uninsulated conductor is used only for equipment grounding purposes.
Exception: Uninsulated conductors shall be permitted as a grounded conductor in accordance with 250.32, 250.140, ~~250.140, 250.32,~~ and 225.30 through 225.40.
(3) Temperature Limitations. Type SE service-entrance cable used to supply appliances shall not be subject to conductor temperatures in excess of the temperature specified for the type of insulation involved.
(4) Installation Methods for Branch Circuits and Feeders.
(a) *Interior Installations* . In addition to the provisions of this article, Type SE service-entrance cable used for interior wiring shall comply with the installation requirements of ~~Parts I and~~ Part II of Article 334, excluding 334.80.
FPN: See 310.10 for temperature limitation of conductors.
(b) *Exterior Installations* . In addition to the provisions of this article, service-entrance cable used for feeders or branch circuits, where installed as exterior wiring, shall be installed in accordance with Part I of Article 225. The cable shall be supported in accordance with 334.30 . ~~, unless used as messenger-supported wiring as permitted in Part II of Article 396~~ . Type USE cable installed as underground feeder and branch circuit cable shall comply with Part II of Article 340. ~~Where Type USE cable emerges from the ground at terminations, it shall be protected in accordance with 300.5(D). Multiconductor service-entrance cable shall be permitted to be installed as messenger-supported wiring in accordance with 225.10 and Part II of Article 396.~~
338.12 Uses Not Permitted.
(A) Service-Entrance Cable. Service-Entrance Cable (SE) shall not be used under the following conditions or in the following locations.
(1) Where subject to physical damage unless protected in accordance with 230.50(A)
(2) For underground use unless identified for the purpose
(3) For exterior branch circuits and feeder wiring unless the installation complies with the provisions of Part I of Article 225 and is supported in accordance with 334.30 or is used as messenger supported wiring as permitted in Part II of Article 396
(B) Underground Service-Entrance Cable. Underground Service-Entrance Cable (USE) shall not be used under the following conditions or in the following locations
(1) For interior wiring
(2) For above ground installations except where USE cable emerges from the ground and is terminated in an enclosure at an outdoor location and the cable is protected in accordance with 300.5(D)
(3) As aerial cable unless it is a multiconductor cable identified for use above ground and installed as messenger supported wiring in accordance with 225.10 and Part II of Article 396
Substantiation: This proposal was developed by a Task Group appointed by Gaylen D. Rogers, Chair of CMP-7, to consider adding Section 338.12 into the 2008 NEC. The Task Group consisted of the following CMP-7 members: Jim Daly (Chair), Harry Brown, Chris Fahrenthold, James Hinrichs, and Thomas Wood.
The addition of Section 338.12 was considered necessary to add uniformity to all the Articles for which Panel 7 is responsible.
Section 338.10 was revised to correlate with the new Section 338.12.
334 Part I was deleted in 338.10 (B)(4)(a) since it is not applicable for Type SE and USE cables.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-85 Log #2638 NEC-P07 **Final Action: Accept**
(338.10(B)(1))

Submitter: James M. Daly, General Cable
Recommendation: Change the word "rubber-covered" to "thermoset".
Substantiation: Rubber insulation as such is no longer used. Thermoset is more accurate since it includes XLPE and EPR which are the insulations currently in use.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-86 Log #848 NEC-P07 **Final Action: Reject**
(338.10(B)(2))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reconsidered and correlated with the action on Proposal 5-119. This action will be considered by the panel as a public comment.
Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read as follows:
(2) Grounded Conductor Not Insulated. Type SE service-entrance cable shall be permitted for use where the insulated conductors are used for circuit wiring and the uninsulated conductor is used only for equipment grounding purposes.
Exception: Uninsulated conductors shall be permitted as a grounded conductor in accordance with 250.140, 250.32 where the uninsulated grounded conductor of the cable originates in service equipment, and 225.30 through 225.40.
Substantiation: The additional wording proposed is an effort to clarify that compliance with 250.24(A)(5) must be maintained. The current wording in the exception does not restrict this, and situations involving inappropriate grounding connections that could develop where those using the provisions in 250.32(B)(2) and the SE cable feeding another structure originates from a distribution panelboard or other equipment on the downstream side of the service equipment creating undesired objectionable current over equipment grounding conductors as well as other conductive paths.
Panel Meeting Action: Reject
Panel Statement: The panel will reconsider this proposal if Code-Making Panel 5 accepts the proposal to delete 250.32(B)(2). This proposal and panel action should be forwarded to Code-Making Panel 5 for information and comment.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-87 Log #2400 NEC-P07 **Final Action: Reject**
(338.10(B)(2))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reconsidered and correlated with the action on Proposal 5-119. This action will be considered by the panel as a public comment.
Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Revise text to read:
338.10 Uses Permitted.
(B) Branch Circuits or Feeders.
(2) Grounded Conductor Not Insulated. Type SE service-entrance cable shall be permitted for use where the insulated conductors are used for circuit wiring and the uninsulated conductor is used only for equipment grounding purposes.
Exception: Uninsulated conductors shall be permitted as a grounded conductor in accordance with 250.140, ~~250.32,~~ and 225.30 through 225.40.
Substantiation: This is a companion proposal to my proposal to delete 250.32(B)(2). If 250.32(B)(2) is deleted as I am requesting, this section will need to be revised as well.
Panel Meeting Action: Reject
Panel Statement: The panel will reconsider this proposal if Code-Making Panel 5 accepts the proposal to delete 250.32(B)(2). This proposal and panel action should be forwarded to Code-Making Panel 5 for information and comment.
Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
BROWN, H.: We disagree with the panel action to Reject this proposal. We understand the panel's decision was conditional on what Code-Making Panel 5 ruled on the proposal, however, we also feel that we should support any proposed text that would discontinue the practice of using the grounding conductor as an equipment grounding conductor in an electrical circuit.

7-88 Log #2639 NEC-P07 **Final Action: Accept**
(338.10(B)(4)(a))

Submitter: James M. Daly, General Cable
Recommendation: Delete the phrase "excluding 334.80" and change the comma after "Article 334" to a period.
Substantiation: When Type SE conductors are used for interior wiring, as a replacement for Type NM cable, the ampacity of the conductors should be the same as permitted for NM cable since the insulations used are the same both NM and SE conductors.
Panel Meeting Action: Accept
Panel Statement: This action will modify the action taken on Proposal 7-84.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-89 Log #3124 NEC-P07 **Final Action: Accept**
(338.10(B)(4)(a))

Submitter: Truman C. Surbrook, Michigan State University
Recommendation: Delete the reference to Part 1 of Article 334 with the sentence to read as follows:
(a) Interior Installation. In addition to the provisions of this article, Type SE service-entrance cable used for interior wiring shall comply with the installation requirements of Part ~~s I and~~ II of Article 334, excluding 334.80.
Substantiation: There is nothing in Article 334, Part I that applies to Type SE cable.
Panel Meeting Action: Accept
Panel Statement: The action on this proposal is modified by the panel actions taken on Proposals 7-88 and 7-90 and modifies the panel action on Proposal 7-84.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-90 Log #3349 NEC-P07 **Final Action: Accept**
(338.10(B)(4)a.)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc. / Rep. Massachusetts Electrical Code Advisory Committee
Recommendation: Delete the phrase "excluding 334.80".
Substantiation: This is a companion proposal to one submitted to correct the requirements in 334.80 so the 60°C starting point only applies, but always applies, to cables run embedded in thermal insulation. Ironically, this wiring method is the very one that NEMA selected in the 1987 cycle to study the affects of thermal insulation, and those affects proved a dramatic decrease in ampacity when this wiring ran through insulation. The present NEC wording that eliminates the 60°C column ampacity calculation recreates the very hazard documented in the NEMA testing. The solution is to apply 334.80 to SE cable applications, but first, to correct 334.80 (see companion proposal) so the 60°C start point only applies where the cable runs through thermal insulation.
Panel Meeting Action: Accept
Panel Statement: The action on this proposal modifies the action taken on Proposal 7-84.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-91 Log #1719 NEC-P07 **Final Action: Accept in Principle**
(338.12)

Submitter: Dennis A. Nielsen, Lawrence Berkeley National Laboratory
Recommendation: Revise as follows:
338.12 Uses Not Permitted. Type SE and USE cable shall not be used under the following conditions or in the following locations:
(A) SE Cable
(1) Where subject to physical damage unless protected in accordance with 230.50(A).
(2) For underground use unless identified for the purpose.
(3) Branch Circuits and Feeders.
a. For branch circuit and feeder wiring unless protected in accordance with 230.50(A).
b. For interior branch circuit and feeder wiring unless the installation complies with the requirements of Part II of Article 334, excluding 334.80.
c. For exterior branch circuit and feeder wiring unless the installation complies with the provisions of Part I of Article 225 and is supported in accordance with 334.30, unless used as messenger supported wiring as allowed by Part II of Article 396.
d. Where the uninsulated conductor is used as a grounded conductor except as permitted by 250.140.
(B) USE Cable.
(1) For interior wiring.
(2) For exterior feeders and branch circuits unless the installation complies with the requirements of Part II of Article 340.
(3) For above ground installations except where USE cable terminates in an enclosure at an outdoor location where the cable emerges from the ground.
(4) Above ground unless protected in accordance with 300.5(D).
(5) As aerial cable unless it is a multi-conductor cable installed as messenger supported wiring in accordance with 225.10 and Part II of Article 396.
Substantiation: This will provide Article 338 Section II Installaton with a "338.12 Uses not permitted" for Service-Entrance Cable: Types SE and USE. It is much easier for users, installers, engineers and inspectors to have included both uses Permitted and Uses Not Permitted. The NEC Style Manual condones the use of Uses Not Permitted by reference and it makes the NEC very "user friendly."
Panel Meeting Action: Accept in Principle
The panel accepts 338.12(B)(1) and accepts in Principle the balance of the proposal as rewritten by the action taken on Proposal 7-84.
Panel Statement: See panel action on Proposal 7-84. Proposed 338.12(A)(3)(a) is addressed in existing 338.10(A).
Proposed 338.12(A)(3)(b) is addressed in existing 338.10(B)(4)(a).
Proposed 338.12(A)(3)(c) is addressed in existing 338.10(B)(4)(b), and 338.12(B)(3) in Proposal 7-84.
Proposed 338.12(A)(3)(d) is addressed in existing 338.10(B)(2) Exception.
Proposed 338.12(B)(2) is addressed in existing 338.10(B)(4)(b).
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-92 Log #2537 NEC-P07 **Final Action: Accept in Principle**
(338.12 (New))

Submitter: Timothy D. Curry, Curry Electric, Inc.
Recommendation: I would propose that the following section be created.
Article 338.12 Uses Not Permitted.
(A) Type SE cable shall not be permitted as follows:
(1) In any dwelling or structure not specifically permitted in 334.10(1), (2), and (3). Cables shall not be required to be concealed within walls, floors, or ceilings that provide a thermal barrier of material that has at least a 15 minute finish rating as identified in listings of fire-rated assemblies. Short lengths (for services only) are allowed in building types that do not allow NM cable
(2) In commercial garages having hazardous (classified) locations as defined in 511.3
(3) In theaters and similar locations, except where permitted in 518.4(B)
(4) In motion picture studios
(5) In storage battery rooms
(6) In hoistways or on elevators or escalators
(7) Embedded in poured cement, concrete, or aggregate
(8) In hazardous (classified) locations, except where permitted by the following:
(a) 501.10(B)(3)
(b) 502.10(B)(3)
(c) 504.20
(B) Type SE cable shall not be used under the following conditions or in the following locations:
(1) Where exposed to corrosive fumes or vapors
(2) Where embedded in masonry, concrete, adobe, fill, or plaster
(3) In a shallow chase in masonry, concrete, or adobe and covered with plaster, adobe, or similar
Substantiation: Article 388 includes a listing of areas where it is allowed to be used, with 338.10 defining the areas. However, unlike Article 334, it does not contain a list of prohibited locations.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 7-84.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-93 Log #3486 NEC-P07 **Final Action: Accept in Principle**
(338.12)

Submitter: Richard F. Van Wert, Middle Department Inspection Agency / Rep. Benjamin Franklin Chapter IAEI
Recommendation: Add new text to read:
338.12 Uses Not Permitted. Types SE and SER shall not be used as follows:
(1) Underground with or without a raceway.
Substantiation: This type of installation is often attempted because it is not addressed in the Code. A section 338.12 is sorely needed and this will clear up the issue.
Panel Meeting Action: Accept in Principle
Revise 338.12(A)(2) in the panel action on Proposal 7-84 to read: "(2) Underground with or without a raceway."
Panel Statement: See panel action on Proposal 7-84. Section 338.12(A)(2) in the panel action on Proposal 7-84 specifies the requirements for SE cable in underground installations. The panel does not agree with the designation of Type SER cable.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 340 — UNDERGROUND FEEDER AND BRANCH-CIRCUIT CABLE: TYPE UF

7-94 Log #327 NEC-P07 **Final Action: Reject**
(340.12(10))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
(10) Where subject to ~~physical damage~~ blows or abrasion.
Substantiation: Use of the word "physical" is superfluous– the purpose is obvious. In some instances, one could argue for the use of "mechanical" to differentiate that from e.g., "thermal" damage, but context makes the intended sense quite clear, rendering anything like this completely unnecessary.
Here, though,the immediately preceeding item, (9), refers to a form of physical damage–deterioration by ultraviolet radiation. The proposed rewording is an attempt at precision. If you don't care to reword (10), theoretically its present form eliminates the need for (9) and probably (3) and (5) as well.
Furthermore, I would then have to fall back to arguing that in that case the term "physical" should be eliminated.
Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.)
Panel Meeting Action: Reject
Panel Statement: The word "physical" is appropriate, since it specifically defines the type of protection being provided and complies with 3.2.5.5 of the NEC Style Manual. There are other types of protection that may be provided, such as protection from EMF interference.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-95 Log #1143 NEC-P07 **Final Action: Reject**
(340.12(2) and (7))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise (2):
In commercial garages having hazardous (classified) locations as described in 500.5.
Revise (7):
In hazardous (classified) locations described in 500.5 except where installed for nonincendive field wiring in accordance with 340.10(4), 501.10(B)(3), and 502.10(B)(3).
Substantiation: Type UF cable may also be installed as NMSC per 340.10(4). 501.10(B)(3) and 502.10(B)(3) permit any suitable wiring method for unclassified locations.
Panel Meeting Action: Reject
Panel Statement: The restriction in 340.12(2) applies to all commercial garages, not just those with hazardous locations. Section 90.3 states "Chapters 1, 2, 3, and 4 apply generally; Chapters 5, 6, and 7 apply to special occupancies, special equipment, or other special conditions. These latter chapters supplement or modify the general rules. Chapters 1 through 4 apply except as amended by Chapters 5, 6, and 7 for the particular conditions."
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-96 Log #1171 NEC-P07 **Final Action: Reject**
(340.12(2) and (7))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise as follows:
(2) In commercial garages having hazardous (classified) locations .
(7) In hazardous (classified) locations except as otherwise permitted in this Code.
Substantiation: All garages do not have classified areas. (Section 511.3(A)).
310.10(4) permits multicondutor UF cable installed as NMSC. 501.10(B)(3), 502.10(B)(3) and 503.10(B)(3) permit any wiring method suitable for unclassified locations.
Panel Meeting Action: Reject
Panel Statement: The restriction in 340.12(2) applies to all commercial garages, not just those with hazardous locations. Section 90.3 addresses the Code arrangement; see panel statement on Proposal 7-95.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-97 Log #1019 NEC-P07 **Final Action: Reject**
(340.12(7))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Add:
Except as permitted in 501.10(B)(3); 502.10(B)(3); and 503.10(A)(3).
Substantiation: Type UF cable is permitted to be installed as NMSC by 340.10(4). Nonincendive field wiring is permitted using any wiring method suitable for unclassified locations. The proposal would be helpful to code users, though covered by 90.3.
Panel Meeting Action: Reject
Panel Statement: Section 90.3 addresses the Code arrangement; see panel statement on Proposal 7-95.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 342 — INTERMEDIATE METAL CONDUIT: TYPE IMC

8-3 Log #3454 NEC-P08 **Final Action: Reject**
(342.xx)

Submitter: William A. Wolfe, Steel Tube Institute of North America
Recommendation: Add new text to read:
342.xx IMC shall be installed in a neat and workmanlike manner.
FPN: Accepted industry practices are described in the National Electrical Installation Standards (NEIS) NECA-101, "Standard for Installing Steel Conduit (Rigid, IMC, EMT) and other NEIS installation methods.
Substantiation: NECA 101, *Standard for Installing Steel Conduit (Rigid, IMC, EMT)* has been used for several years. This standard provides best practices for safe steel conduit installations and should be referenced in the conduit and EMT articles, similar to the reference that is now included in the FPN to 110.12.
Panel Meeting Action: Reject
Panel Statement: As 90.1(C) states: This Code is not intended as a design specification or instruction manual for untrained persons.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
LOYD, R.: I believe there is value and precedence for providing a reference to installation methods. CMP-8 has added a FPN referencing a able tray installation manual in Article 392, also CMP-1 added a FPN referencing an installation manual for workmanship in 110.12 in the 2005 NEC.
The need for trained manpower is at an all time high. This reference would provide a tool to assist untrained electricians to make safer and better installations.

8-4 Log #336 NEC-P08 **Final Action: Reject**
(342.2)

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
"342.2 Intermediate Metal Conduit (IMC). A steel threadable raceway of circular cross section designed for the ~~physical~~ protection...".
Substantiation: Use of the word "physical" is superfluous– the purpose is obvious. In some instances, one could argue for the use of "mechanical" to differentiate that from e.g., "thermal" damage, but context makes the intended sense quite clear, rendering anything like this completely unnecessary.
Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."
Panel Meeting Action: Reject
Panel Statement: The word "physical" isn't superfluous and includes, but is not limited to, mechanical and thermal damage. Deleting the word "physical" could lead one to believe that any likelihood of damage in any environment would prohibit the use of this product, which is not the intent of the Code.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-5 Log #2239 NEC-P08 **Final Action: Reject**
(342.6 Exception (New))

Submitter: Donald A. Ganiere, Ottawa, IL
Recommendation: Revise as follows:
342.6 Listing Requirements. IMC, factory elbows, and couplings, and associated fittings shall be listed.
Exception: Raceway support fittings and accessories shall not be required to be listed .
Substantiation: The Article 100 definition of "fitting" seems to include raceway supports. Many of the commonly used raceway support straps, clamps, and other items are not listed.
Panel Meeting Action: Reject
Panel Statement: Conduit support accessories are not considered "Fittings". Sections 300.6 and 300.6(A) require support hardware to be constructed of materials suitable for the environment for which they are to be installed.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

(Note: Sequence 8-6 was not used)

9-81a Log #1677 NEC-P09 **Final Action: Reject**
(342.10(D))

Submitter: Paul E. Guidry, Fluor Enterprises, Inc.
Recommendation: This is a companion proposal to ones for 314.23(E) Exception and (F) Exception, 344.10(E) and 358.10(D).
(D) Support of Conduit Bodies. Imtermediate metal conduit shall be permitted to support metallic and non-metallic conduit bodies not larger than the largest trade size of an entering raceway, including a conduit body constructed with only one conduit entry. Where JMC is used to support metallic conduit bodies, the conduit bodies shall be permitted to support luminaries (fixtures) in accordance with 410.16(F).
Substantiation: The exceptions 314.23(E) and (F) have been a source of confusion for years. 314.23(E) and (F) refers to enclosures while the exception refers to conduit bodies. The proper place for this type of information is in the article for each type of raceway as currently found in 352.10(H).
Panel Meeting Action: Reject
Panel Statement: The companion proposals (9-48 and 9-50) have been rejected as Code-Making Panel 9 concludes the material must remain in Article 314, which contains specific requirements for support of enclosures within the scope of this article. In addition to the panel statements on Proposals 9-48 and 9-50, Code-Making Panel 9 wishes to point out that the reason the Exceptions proposed for deletion refer to conduit bodies and not enclosures is that conduit bodies, a subset of the universe of enclosures, are the only applications for which those Exceptions are appropriate. Without those Exceptions, a conduit body over 100 cu. in. would require independent support because any enclosure beyond that size, including such items as FS boxes, requires independent support under the parent rules. It was never the intent to require independent support, for example, on a trade size 4 LB conduit body (on a trade size 4 raceway system) with its typical size well over 100 cu. in.
Note also that the Exceptions are worded differently, and for good reason. The Exception in 314.23(E) includes EMT and RNC, which is appropriate for a conduit body that simply changes a raceway direction, but the one in 314.23(F) covering instances of device or luminaire support does not include these wiring methods due to their lesser mechanical strength. The information in 352.10(H) resulted from a proposal by a member of Code-Making Panel 9 to reverse an unrealistic and rarely enforced rule requiring independent support of all RNC conduit bodies. It should also be noted that both these Exceptions cover "E" fittings, and without them there would be no practical utility for those conduit bodies. These Exceptions are very tightly integrated with their parent rules and must remain in place.
Finally, Code-Making Panel 9 notes that the allowance in 410.16(F) is generic in nature, correlating in part with 300.15(B), and it does not confer the permissions granted in 314.23.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.
Comment on Affirmative:
HARTWELL, F.: For some reason, the companion proposals to this one, covering rigid metal conduit and electrical metallic tubing, ended up on CMP 8's agenda instead of the CMP 9 agenda. The actions on those proposals, docketed as 8-16 and 8-96, should be carefully reviewed by the TCC and correlated with the action on this proposal. The issues are the same and this panel statement was crafted to apply to all of the companion proposals.

8-7 Log #2258 NEC-P08 **Final Action: Reject**
(342.13.xx)

Submitter: H. Brooke Stauffer, National Electrical Contractors Assn. (NECA)
Recommendation: Add new text to read:
342.xx Intermediate metal conduit shall be installed in a neat and workmanlike manner.
FPN: Accepted industry practices are described in ANSI/NECA 101-2006, Standard for Installing Steel Conduits (Rigid, IMC, EMT), and other ANSI-approved installation standards.
Substantiation: The general workmanship requirement of 110.12 applies to electrical equipment covered by Article 342. However, safety would be improved by offering more detailed installation guidance for steel intermediate metal conduit.
ANSI/NECA 101-2006 is currently under development. It will be published prior to the Public Comment deadline.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-3 (Log 3454).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
LOYD, R.: See my comment on 8-3.

8-8 Log #828 NEC-P08 **Final Action: Reject**
(342.24)

Submitter: Craig Carroll, Las Vegas, NM
Recommendation: Revise text to read as follows:
342.24 Bends - How Made. Bends of IMC shall be so made that the conduit will not be damaged and so that the internal diameter of the conduit will not be ~~effectively~~ reduced to less than 90 percent of its original internal diameter. The radius of the curve of any field bend to the centerline of the conduit shall not be less than indicated in Table 2, Chapter 9.
Substantiation: The excessive flatness of supply house bought conduit 90s is a real problem as the inside diameter of many 90s are reduced by as much as 1/2 of the normal conduit roundness. This problem is also expanded by the fact that most contractors only use the minimum size conduit allowed by the Code for competitive reasons. In talking to our supply house owners, I found that there are no specific standards for roundness of a conduit bend even where an elbow is listed as the sales people tell them in the 90s are only listed for the normal intermediate metal conduit standard. They also state that no type of pull-through rat test or other test for maintaining a standard diameter of an elbow is required for the elbow to be listed. You only have to go to any job site or to any supply house and look at the elbows that are available to see how flat many supply house bought elbows have become. The 90 percent chosen for this proposal is not based on anything other than a best guess of how much of a reduction should be allowed before conductor covering could be damaged and replacement required. This 90-percent does assume that a full 40-percent maximum conductor fill has not been reached in the average installation. Possibly 85-87 percent would be a better allowance but I will leave that decision up the the experience of the NEC panel. This problem needs attention now as it is not getting better and in fact is seemingly getting worse. The additional words - so that - were added so that 342.24 matches the wording in 344.24.
Panel Meeting Action: Reject
Panel Statement: Determining ratios in the field is an impossible task. It would place an undue burden on the inspector to determine the amount of the reduction during the inspection process. The submitter provided no technical substantiation for the proposal.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-9 Log #1345 NEC-P08 **Final Action: Accept**
(342.30(C))

Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Add the following text to 342.30
(C) Unsupported raceways: Type IMC shall be permitted to be unsupported where the raceway is not more than 900 mm (3 ft) in length and remains in unbroken lengths (without coupling). Such raceway shall terminate in an outlet box, junction box, device box, cabinet, or other termination at each end of the raceway.
Substantiation: Unsupported raceways are violations of the *Code* that occur every day. As written, a 3 inch length of conduit between enclosures is required to be supported, despite the fact that it adds little if any structural value to the system. Quite often, particularly with conduit nipples, securing and supporting a raceway shorter than 36 inches is not possible. Furthermore, securing and supporting is of little value on lengths less than 36 inches where the conduit terminates at a box on each end, where the box is installed and supported in compliance with its applicable *Code* section.
This proposal is written with the parallel effect of *Code* sections that have been strived for in chapter 3, and matches the numbering system used in the Cable Articles. It also uses existing text taken from both the Cable Articles and the Raceway Articles.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
DABE, J.: As the submitter has pointed out 3 in. of raceway is extremely difficult to fasten or support. However, without any technical substantiation 3 ft of unsupported or unfastened raceway is unjustified due to the increased

possibility of physical damage. The panel should consider a lesser distance, such as 1 ft which would meet the submitter's intent.

HUMPHREY, D.: This proposal does not address other issues that may have a direct impact on the durability of the electrical installation. The affects of weight and vibration on concentric and eccentric knockouts at each end of a three foot run between pieces of equipment, a scenario that would be frequently encountered in many electrical installations, may compromise the strength of the installation. The raceway having even a single point of support would help to mitigate these deleterious affects. In addition, the IMC installation in question may be used as an equipment grounding conductor and any loosening that could occur would serve to compromise the equipment grounding function of the raceway. 300.11 further requires that raceways be securely fastened in place. I would assert that this proposal would conflict with the requirements of 300.11. In summation, depending on connectors, double locknuts etc. to support and secure this up to 36 in. installation especially where concentric or eccentric knockouts are encountered is dubious at best. 36 in. should provide ample space in which to install normal supporting and securing hardware. A proposal involving a shorter distance and where no concentric or eccentric knockouts are encountered may be more prudent.

8-10 Log #577 NEC-P08 **Final Action: Reject**
(342.46)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 3 for information.
Submitter: Larry T. Smith, National Electrical Seminars
Recommendation: Revise as follows:

Where a conduit enters a box, fitting, or other enclosure, a bushing shall be provided to protect the wire from abrasion unless the design of the box, fitting, or enclosure is such as to afford equivalent protection. <u>Where a conduit contains ungrounded conductors 4 AWG or larger, the installation shall also comply with 300.4(F) for the protection of conductors 4 AWG and larger at bushings.</u>

~~FPN: See 300.4(F) for the protection of conductors 4 AWG and larger at bushings.~~

Substantiation: On the surface, the Fine Print Note referring the reader to 300.4(F) seems to be a good reference, that is, until you talk to a wireman who claims that 300.4(F) takes precedence over 342.46 and bushings of any kind are not required on Intermediate Metal Conduit terminations unless the contained conductors are ungrounded 4 AWG and larger - and the AHJ agrees with them.

There's a large geographical area in one of the Midwestern states where a state electrical inspector is not requiring bushings on Intermediate Metal Conduit or Rigid Metal Conduit unless the contained conductors are 4 AWG or larger.

This simple change will eliminate misinterpretations of this section.

Panel Meeting Action: Reject
Panel Statement: Article 300 is the appropriate location for this reference and does take precedence for all wiring methods. The FPN provides guidance.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 344 — RIGID METAL CONDUIT: TYPE RMC

8-11 Log #3459 NEC-P08 **Final Action: Reject**
(344.xx)

Submitter: William A. Wolfe, Steel Tube Institute of North America
Recommendation: Add new text to read:

344.xx RMC shall be installed in a neat and workmanlike manner.

FPN: Accepted industry practices are described in the National Electrical Installation Standards (NEIS) NECA-101, "Standard for Installing Steel Conduit (Rigid, IMC, EMT) and other NEIS installation methods.

Substantiation: NECA 101, *Standard for Installing Steel Conduit (Rigid, IMC, EMT)* has been used for several years. This standard provides best practices for safe steel conduit installations and should be referenced in the conduit and EMT articles, similar to the reference that is now included in the FPN to 110.12.

(344.2)

Submitter: William A. Wolfe, Steel Tube Institute of North America
Recommendation: Revise text to read:

344.2 Definition.

Rigid Metal Conduit (RMC). A threadable raceway of circular cross section designed for the physical protection and routing of conductors and cables and for use as an equipment grounding conductor when installed with its integral or associated coupling and appropriate fittings. RMC is generally made of steel (ferrous) with protective coatings or aluminum (nonferrous). Special use types are <u>red brass</u> ~~silicon bronze~~ and stainless steel.

Substantiation: The UL 6A Standard for Electrical Rigid Metal Conduit – Aluminum and Stainless Steel" was changed in 2004 to "Electrical Rigid Metal Conduit – Aluminum, Red Brass and Stainless Steel". Silicon bronze conduit is not being produced. Red brass conduit was added to the standard for direct burial and swimming pool applications.

Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-14 Log #3353 NEC-P08 **Final Action: Reject**
(344.6 Exception (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc. / Rep. Massachusetts Electrical Code Advisory Committee
Recommendation: Add an exception as follows:

Exception: Rigid metal conduit made from stainless steel or from nonferrous metals other than aluminum shall be permitted to be approved.

Substantiation: This exception will prove useful for brass conduit installations, since surveys of listees under the DYWV category show that the listed material is no longer available. It will also prove to be useful in specialized industrial occupancies where stainless steel and other special alloys are used, also without listing because such relatively small quantities aren't practical to have listed. Although listing is certainly an option that the AHJ could fall back on, in many jurisdictions this will prove too expensive and cumbersome for the limited cases where this allowance is needed. Listing would be a nice feature if it were practical in all cases, but in these limited instances it does not appear to be so. There is now limited relief on this for swimming pool applications because 680.23(B)(2)(a) requires "approved" conduit, which is an intended Chapter 6 modification of this Chapter 3 rule. However, the principle should be extended to other deserving applications that don't have access to a Chapter 6 specification.

Panel Meeting Action: Reject
Panel Statement: Listed conduit of these types is available, and it is the panel's intention to require all raceways to be listed.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-15 Log #3456 NEC-P08 **Final Action: Accept**
(344.10(A), (B) & (C))

Submitter: William A. Wolfe, Steel Tube Institute of North America
Recommendation: Revise text to read:

(A) ~~All~~ Atmospheric Conditions and Occupancies.

1. ~~Use of~~ Galvanized steel and stainless steel RMC shall be permitted under all atmospheric conditions and occupancies. ~~Ferrous raceways and fittings protected from corrosion solely by enamel shall be permitted only indoors and in occupancies not subject to severe corrosive influences.~~

<u>2. Red brass RMC shall be permitted to be installed for direct burial and swimming pool applications.</u>

3. Aluminum RMC shall be permitted to be installed where judged suitable for the environment. Rigid aluminum conduit encased in concrete or in direct contact with the earth shall be provided with approved supplementary corrosion protection.

4. Ferrous raceways and fittings protected from corrosion solely by enamel shall be permitted only indoors and in occupancies not subject to severe corrosive influences.

(B) Corrosion Environments.

1. Galvanized steel, stainless steel and red brass RMC ~~,~~ elbows, couplings, and fittings shall be permitted to be installed in concrete, in direct contact with the earth, or in areas subject to severe corrosive influences where protected by corrosion protection and judged suitable for the condition.

2. Aluminum RMC shall be provided with approved supplementary corrosion protection where encased in concrete or in direct contact with the earth.

FPN: The galvanizing on steel (ferrous) RMC provides corrosion protection. The AHJ *may* require supplementary corrosion protection for severely corrosive environments. Where aluminum (non-ferrous) RMC is encased in concrete or direct-buried, approved supplementary corrosion protection is required. This protection can be provided in a variety of ways including factory PVC-coating, tape-wrapping, or painting with a zinc-rich paint.

(C) Cinder Fill. Galvanized steel, stainless steel and red brass RMC shall be permitted to be installed in or under cinder fill where subject to permanent moisture where protected on all sides by a layer of noncinder concrete not less than 50 mm (2 in.) thick; where the conduit is not less than 450mm (18 in.) under the fill; or where protected by corrosion protection and judged suitable for the condition.

Substantiation: UL's *Electrical Construction Equipment Directory* states that "galvanized rigid steel conduit installed in concrete does not require supplementary corrosion protection. Galvanized rigid steel conduit installed in contact with soil does not generally require supplementary corrosion protection." It also states that "Aluminum conduit used in concrete or in contact with soil requires supplementary corrosion protection".

Article 344 has not differentiated between the corrosion protection required for ferrous vs. non-ferrous metal conduit, leading to confusion among installers/users. There have also been questions concerning whether or not galvanizing provides corrosion protection. This new text will provide useful guidance and will be in line with the listing requirements.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

8-16 Log #1678 NEC-P08 **Final Action: Reject**

(344.10(E))

Submitter: Paul E. Guidry, Fluor Enterprises, Inc.

Recommendation: This is a companion proposal to ones for 314.23(E) Exception and (F) Exception, 342.10(D) and 358.10(D).

Add text to read as follows:

(E) Support of Conduit Bodies. Rigid metal conduit shall be permitted to support metallic and non-metallic conduit bodies not larger than the largest trade size of an entering raceway, including a conduit body constructed with only one conduit entry. Where RMC is used to support metallic conduit bodies, the conduit bodies shall be permitted to support luminaries (fixtures) in accordance with 410.16(F).

Substantiation: The exceptions to 314.23(E) and (F) have been a source of confusion for years. 314.23(E) and (F) refers to enclosures while the exception refers to conduit bodies. The proper place for this type of information is in the article for each type of raceway as currently found in 352.10(H).

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 8-6.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

8-17 Log #3457 NEC-P08 **Final Action: Reject**

(344.10(E))

Submitter: William A. Wolfe, Steel Tube Institute of North America

Recommendation: Add new text to read:

(E) Where severe physical damage is likely to occur, steel or stainless steel RMC shall be used.

Substantiation: Aluminum rigid metal conduit is more likely to be damaged from impact and should be limited to locations where it is not likely to be hit by heavy moving equipment such as fork lifts which may flatten the raceway and damage the enclosed conductors. The mechanical properties of steel and aluminum RMC are very different. This has never been recognized by the NEC but has direct bearing on the suitability of the product for certain applications. The modulus of elasticity of aluminum is 1/3 that of steel, for example, which means that it would deflect 1/3 more under the same load. The typical mechanical properties of aluminum RMC (6063 alloy, temper T1) vs. steel RMC are

Ultimate Tensile Strength:	Aluminum: 17,000psi
	Steel: 55,000psi
Yield strength:	Aluminum: 9,000psi
	Steel: 35,000psi
Modulus of Elasticity:	Aluminum: 10,000,000 lb/in 2 (psi)

Steel: 30,000,000 lb/in 2 (psi)

Panel Meeting Action: Reject

Panel Statement: Although the submitter did supply technical data, the data do not provide substantiation to restrict aluminum conduit in areas where severe physical damage is likely to occur.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

LOYD, R.: This proposal should have been accepted. There is substantial technical substantiation provided. Field testing reports are not necessary since the data provided shows that in physical damage tests aluminum would flatten and fail at much lower values than steel.

8-18 Log #2259 NEC-P08 **Final Action: Reject**

(344.13 (New))

Submitter: H. Brooke Stauffer, National Electrical Contractors Assn. (NECA)

Recommendation: Add new text to read:

344.xx Rigid metal conduit shall be installed in a neat and workmanlike manner.

FPN: Accepted industry practices are described in ANSI/NECA 101-2006, Standard for Installing Steel Conduits (Rigid, IMC, EMT), and other ANSI-approved installation standards.

Substantiation: The general workmanship requirement of 110.12 applies to electrical equipment covered by Article 344. However, safety would be improved by offering more detailed installation guidance for rigid metal conduit.

ANSI/NECA 101-2006 is currently under development. It will be published prior to the Public Comment deadline.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 8-3 (Log 3454).

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

LOYD, R.: See my comment on 8-3.

8-19 Log #2260 NEC-P08 **Final Action: Reject**

(344.13.xx)

Submitter: H. Brooke Stauffer, National Electrical Contractors Assn. (NECA)

Recommendation: Add new text to read:

344.xx Rigid metal conduit shall be installed in a neat and workmanlike manner.

FPN: Accepted industry practices are described in ANSI/NECA 102-2004, Standard for Installing Aluminum Rigid Metal Conduit, and other ANSI-approved installation standards.

Substantiation: The general workmanship requirement of 110.12 applies to electrical equipment and systems covered by Article 344. However, safety would be improved by offering more detailed installation guidance for aluminum rigid metal conduit.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 8-3 (Log 3454).

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

LOYD, R.: See my comment on 8-3.

8-20 Log #829 NEC-P08 **Final Action: Reject**

(344.24)

Submitter: Craig Carroll, Las Vegas, NM

Recommendation: Revise text to read as follows:

344.24 Bends - How Made. Bends of IMC shall be so made that the conduit will not be damaged and so that the internal diameter of the conduit will not be ~~effectively~~ reduced to less than 90 percent of its original internal diameter. The radius of the curve of any field bend to the centerline of the conduit shall not be less than indicated in Table 2, Chapter 9.

Substantiation: The excessive flatness of supply house bought conduit 90s is a real problem as the inside diameter of many 90s are reduced by as much as 1/2 of the normal conduit roundness. This problem is also expanded by the fact that most contractors only use the minimum size conduit allowed by the Code for competitive reasons. In talking to our supply house owners, I found that there are no specific standards for roundness of a conduit bend even where an elbow is listed as the sales people tell them in the 90s are only listed for the normal intermediate metal conduit standard. They also state that no type of pull-through rat test or other test for maintaining a standard diameter of an elbow is required for the elbow to be listed. You only have to go to any job site or to any supply house and look at the elbows that are available to see how flat many supply house bought elbows have become. The 90 percent chosen for this proposal is not based on anything other than a best guess of how much of a reduction should be allowed before conductor covering could be damaged and replacement required. This 90-percent does assume that a full 40-percent maximum conductor fill has not been reached in the average installation. Possibly 85-87 percent would be a better allowance but I will leave that decision up the the experience of the NEC panel. This problem needs attention now as it is not getting better and in fact is seemingly getting worse.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 8-8.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

8-21 Log #3458 NEC-P08 **Final Action: Reject**

(344.30(B))

Submitter: William A. Wolfe, Steel Tube Institute of North America

Recommendation: Revise text to read:

(B) Supports. RMC shall be supported in accordance with one of the following:

(1) Conduit shall be supported at intervals not exceeding 3 m (10 ft.).

(2) The distance between supports for straight runs <u>of steel and stainless steel RMC</u> ~~conduit~~ shall be permitted in accordance with Table 344.30(B)(2), provided the conduit is made up with threaded couplings, and such supports prevent transmission of stresses to termination where conduit is deflected between supports.

(3) Exposed vertical risers <u>of steel and stainless steel RMC</u> from industrial machinery or fixed equipment shall be permitted to be supported at intervals not exceeding 6 m (20 ft) if the conduit is made up with threaded couplings, the conduit is supported and securely fastened at the top and bottom of the riser, and no other means of intermediate support is readily available.

(4) Horizontal runs of RMC supported by openings through framing members at intervals not exceeding 3 m (10 ft) and securely fastened within 900 mm (3 ft) of termination points shall be permitted.

Substantiation: This section was developed for rigid steel conduit. There have been field complaints concerning sagging of aluminum conduit when support distances are extended beyond 10 feet, as permitted by 344.30(B)(2) and (3). Aluminum does not provide adequate strength to extend the support distances. The mechanical properties of steel and aluminum RMC are very different. This has never been recognized by the NEC but has direct bearing on the suitability of the product for certain applications. The modulus of elasticity of aluminum is 1/3 that of steel, for example, which means that it would deflect 1/3 more under the same load. The typical mechanical properties of aluminum RMC (6063 alloy, temper T1) vs. steel RMC are

Ultimate Tensile Strength: Aluminum: 17,000psi Steel: 55,000psi
Yield strength: Aluminum: 9,000psi Steel: 35,000psi
Modulus of
Elasticity: Aluminum: 10,000,000 lb/in 2 (psi) Steel: 30,000,000 lb/in 2 (psi)

Panel Meeting Action: Reject

Panel Statement: The submitter has supplied technical data, but not the information, testing, or field reports necessary to determine if shorter support lengths are required for aluminum.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

LOYD, R.: This proposal should have been accepted. There is substantial technical substantiation provided. Field testing reports are not necessary since the data provided shows that in tests aluminum conduit would sag at lengths much shorter than RMC especially the smaller sizes.

8-22 Log #3465 NEC-P08 **Final Action: Reject**

(Table 344.30(B)(2))

Submitter: William A. Wolfe, Steel Tube Institute of North America

Recommendation: In Table 344.30(B)(2) Supports for Rigid Metal Conduit

Change the heading to read: “Maximum Distance Between Steel and Stainless Steel RMC Supports”

Substantiation: This section was developed for rigid steel conduit. There have been field complaints concerning sagging of aluminum conduit when support distances are extended beyond 10 feet, as permitted by 344.30(B)(2) and (3). Aluminum does not provide adequate strength to extend the support distances. The mechanical properties of steel and aluminum RMC are very different. This has never been recognized by the NEC but has direct bearing on the suitability of the product for certain applications. The modulus of elasticity of aluminum is 1/3 that of steel, for example, which means that it would deflect 1/3 more under the same load. The typical mechanical properties of aluminum RMC (6063 alloy, temper T1) vs. steel RMC are

Ultimate Tensile Strength: Aluminum: 17,000psi Steel: 55,000psi
Yield strength: Aluminum: 9,000psi Steel: 35,000psi
Modulus of
Elasticity: Aluminum: 10,000,000 lb/in 2 (psi) Steel: 30,000,000 lb/in 2 (psi)

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 8-21.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

LOYD, R.: This proposal should have been accepted. See my negative comment on 8-21.

8-23 Log #1346 NEC-P08 **Final Action: Accept**

(344.30(C))

Submitter: Mike Holt, Mike Holt Enterprises

Recommendation: Add the following text to 344.30

(C) Unsupported raceways: Type RMC shall be permitted to be unsupported where the raceway is not more than 900 mm (3 ft) in length and remains in unbroken lengths (without coupling). Such raceway shall terminate in an outlet box, junction box, device box, cabinet, or other termination at each end of the raceway.

Substantiation: Unsupported raceways are violations of the *Code* that occur everyday. As written, a 3 inch length of conduit between enclosures is required to be supported, despite the fact that it adds little if any structural value to the system. Quite often, particularly with conduit nipples, securing and supporting a raceway shorter than 36 inches is not possible. Furthermore, securing and supporting is of little value on lengths less than 36 inches where the conduit terminates at a box on each end, where the box is installed and supported in compliance with its applicable *Code* section.

This proposal is written with the parallel effect of *Code* sections that have been strived for in chapter 3, and matches the numbering system used in the Cable Articles. It also uses existing text taken from both the Cable Articles and the Raceway Articles.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

DABE, J.: See my comment for 8-9.

HUMPHREY, D.: This proposal does not address other issues that may have a direct impact on the durability of the electrical installation. The affects of weight and vibration on concentric and eccentric knockouts at each end of a three foot run between pieces of equipment, a scenario that would be frequently encountered in many electrical installations, may compromise the strength of the installation. The raceway having even a single point of support would help to mitigate these deleterious affects. In addition, the RMC installation in question may be used as an equipment grounding conductor and any loosening that could occur would serve to compromise the equipment grounding function of the raceway. 300.11 further requires that raceways be securely fastened in place. I would assert that this proposal would conflict with the requirements of 300.11. In summation, depending on connectors, double locknuts etc. to support and secure this up to 36 in. installation especially where concentric or eccentric knockouts are encountered is dubious at best. 36 in. should provide ample space in which to install normal supporting and securing hardware. A proposal involving a shorter distance and where no concentric or eccentric knockouts are encountered may be in order.

8-24 Log #2783 NEC-P08 **Final Action: Reject**

(344.44)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 3 for information.

Submitter: Ted Smith, Ludvik Electric Co. / Rep. International Electrical Instructors & Students Assoc.

Recommendation: Add new text to read:

<u>344.44 Expansion Fittings. Expansion fittings shall be installed where expected length change, due to expansion and contraction due to temperature change and designed building movement is more than 12 mm (.5 in.)</u>

Substantiation: Large structures are often times designed with expansion joints to all for building movement and temperature change expansion and contraction. RMC installed across these expansion joints is subject to movement which will lead to loosened connections at couplings and connectors. The loosened connections will decrease the effectiveness of the ground fault return path and ultimately affect the safety of the electrical installation.

Panel Meeting Action: Reject
Panel Statement: Article 300 applies to all raceways generally and 300.7(B) requires expansion fittings where necessary to compensate for thermal expansion and contraction. To repeat it would be redundant. The submitter provided no technical substantiation to justify the building movement of more than 0.5 inch. Additionally, this committee suggests this issue be submitted to Panel 3, Section 300.7(B) since the subject of other types of expansion (beyond thermal) would be addressed there.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-25 Log #655 NEC-P08 **Final Action: Reject**
(344.46)

Submitter: Larry T. Smith, National Electrical Seminars
Recommendation: Revise text to read as follows:
Where a conduit enters a box, fitting, or other enclosure, a bushing shall be provided to protect the wire from abrasion unless the design of the box, fitting, or enclosure is such as to afford equivalent protection. Where a conduit contains ungrounded conductors 4 AWG or larger, the installation shall also comply with 300.4(F) for the protection of conductors 4 AWG and larger at bushings.
~~FPN: See 300.4(F) for the protection of conductors 4 AWG and larger at bushings.~~
Substantiation: On the surface, the Fine Print Note referring the reader to 300.4(F) seems to be a good reference, that is, until you talk to a wireman who claims that 300.4(F) takes precedence over 344.46 and bushings of any kind are not required on Rigid Metal Conduit terminations unless the contained conductors are ungrounded 4 AWG and larger - and their AHJ agrees with them.
There's a large geographical area in one of the Midwestern states where a state electrical inspector is not requiring bushings on Intermediate Metal Conduit or Rigid Metal Conduit unless the contained conductors are 4 AWG or larger.
This simple change will eliminate misinterpretations of this section.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-10.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 348 — FLEXIBLE METAL CONDUIT: TYPE FMC

8-26 Log #641 NEC-P08 **Final Action: Accept**
(348.12(1))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Revise text to read as follows:
348.12 Uses Not Permitted.
(1) FMC shall not be used in the following:
In wet locations ~~unless the conductors are approved for the specific conditions and the installation is such that liquid is not likely to enter raceways or enclosures to which the conduit is connected.~~
Substantiation: The NEC is clear that liquid shall not enter the raceways or enclosures to which Flexible Metal Conduit is connected. Flexible Metal Conduit does not have a continuous outer surface. It has an interlocking metal construction that along with its listed connectors readily permits the entrance of liquids. The present language that "the installation is such that liquid is not likely to enter raceways or enclosures", does not provide the assurance necessary that the requirement will be met. Both Liquidtight Flexible Metallic Conduit and Liquidtight Flexible Nonmetallic Conduit products and associated liquidtight connectors are common, readily available, and assure compliance with the requirement that the entrance of liquid is not permitted.
The Panel previously considered a similar proposal for the 2005 NEC. The Panel's rejection was on the basis that it was not demonstrated that the current text poses a safety issue. The present text however, is subjective for installers and inspectors and cannot assure that liquid will not enter the electrical system when used in wet locations.
Panel Meeting Action: Accept
Panel Statement: See panel action on Proposal 8-27.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
BURNS, J.: According to the unofficial vote taken at the CMP 8 Panel meeting in Hilton Head, SC the above proposals should have been "Accept in Principle" not "Accept" as indicated on the ballot. For this reason I am voting in the "negative".
DABE, J.: According to the unofficial vote taken at the ROP meeting for the 2008 NEC, Code-Making Panel 8 voted to "Accept in Principle" not "Accept" this proposal as indicated on the ballot. For this reason I am voting in the "negative", so the proper proposal moves forward without conflict with another proposal.
Comment on Affirmative:
DUREN, R.: I agree with the panel action, but believe the panel action at the ROP meeting was to accept in principal rather than accept.
HUMPHREY, D.: This proposal by CMP 8 was "Accept in Principle". 8-27 was the accepted proposal.

8-27 Log #2613 NEC-P08 **Final Action: Accept**
(348.12(1))

Submitter: David H. Kendall, Carlon
Recommendation: Revise as follows:
348.12 Uses Not Permitted. FMC shall not be used in the following:
(1) In wet locations ~~unless the conductors are approved for the specific conditions and the installation is such that liquid is not likely to enter raceways or enclosures to which the conduit is connected.~~
Substantiation: Allowing FMC to be used in Wet Locations is an unsafe practice and may cause personal injuries or fire. LFMC is suitable for use in Wet Locations and is an acceptable raceway in place of the FC. Panel 8 does not allow this exception for any other type of raceway systems that are not approved for a wet location.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-28 Log #3355 NEC-P08 **Final Action: Accept**
(348.12(1))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc. / Rep. Massachusetts Electrical Code Advisory Committee
Recommendation: Revise to read as follows:
(1) In wet locations
Substantiation: This provision has been a problem for a long time. It makes little sense to have rules focused on excluding water from wiring systems, and then allow a raceway that admits water at every convolution if used outdoors, regardless of whether or not is arranged so it will not entrain that water into enclosures. Liquidtight flexible wiring methods are readily available for this purpose. Liquidtight flexible metal conduit arrived in the Code over 50 years ago. There does not appear to be any compelling need to maintain the present allowance for a flexible wiring method in a wet location that provides no protection from water.
Panel Meeting Action: Accept
Panel Statement: See panel action on Proposal 8-27.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
BURNS, J.: According to the unofficial vote taken at the CMP 8 Panel meeting in Hilton Head, SC the above proposals should have been "Accept in Principle" not "Accept" as indicated on the ballot. For this reason I am voting in the "negative".
DABE, J.: According to the unofficial vote taken at the ROP meeting for the 2008 NEC, Code-Making Panel 8 voted to "Accept in Principle" not "Accept" this proposal as indicated on the ballot. For this reason I am voting in the "negative", so the proper proposal moves forward without conflict with another proposal.
Comment on Affirmative:
DUREN, R.: I agree with the panel action, but believe the panel action at the ROP meeting was to accept in principal rather than accept.
HUMPHREY, D.: This proposal by CMP 8 was "Accept in Principle". 8-27 was the accepted proposal.

8-29 Log #1973 NEC-P08 **Final Action: Accept**
(348.12(4))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Change the text of 348.12(4) to read as shown:
348.12(4) In any hazardous (classified) location , except ~~other than~~ as permitted by other Articles in this Code ~~in 501.10(b) and 504.20~~ .
Substantiation: This change is necessary because the current text is too limiting. The areas of usage for FMC within the hazardous (Classified) locations Articles in the Code are broader. The current text may limit the use of FMC, by an AHJ, because the FMC Article itself does not recognize the broader permissions. The proposed text is preferred to a laundry list of section references.
Panel Meeting Action: Accept
Panel Statement: The committee noted that the removal of the specific reference, avoids a "laundry list" of other locations that are also relevant. CMP continues to change the numbering, and by avoiding the citations, we are avoiding the obvious editorial upkeep.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-30 Log #311 NEC-P08 **Final Action: Reject**
(348.12(5))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
(5) Where subject to ~~physical damage~~ blows or abrasion.
Substantiation: Use of the word "physical" is superfluous– the purpose is obvious. In some instances, one could argue for the use of "mechanical" to differentiate that from e.g., "thermal" damage, but context makes the intended sense quite clear, rendering this unnecessary.
The proposed rewording is an attempt at precision. Furthermore, if you retain "damage," I would then have to fall back to arguing that in that case the term "physical" should be eliminated, and in fact (2), (3) and (6) probably are unnecessary as they are there to prevent forms of physical damage.
Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.)
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-4 (Log 336).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-31 Log #1203 NEC-P08 **Final Action: Accept in Principle**
(348.22)

Submitter: James Tente, City of Naperville
Recommendation: Revise as follows:
In addition, one covered, insulated or bare equipment grounding conductor of the same size shall be permitted.
Substantiation: For conductors in the size range of 18-10 as given in Table 348.22, the difference in conductor cross sectional area for insulated as opposed to covered conductors is negligible.
Panel Meeting Action: Accept in Principle
Revise the Footnote to Table 348.22 as follows:
In addition, one insulated, covered, or bare equipment grounding conductor of the same size shall be permitted.
Panel Statement: The panel recognizes that the submitter is actually referencing the footnote to Table 348.22. The order of "insulated" and "covered" was reversed for consistency with other sections. The submitter's intent was met.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-32 Log #1459 NEC-P08 **Final Action: Reject**
(348.30(A))

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise as follows:
348.30 Securing and Supporting. FMC shall be securely fastened in place and supported in accordance with 348.30(A) and (B).
(A) Securely Fastened. FMC shall be securely fastened in place by an approved means within 300 mm (12 in.) of each box, cabinet, conduit body, or other conduit termination and shall be supported and secured at intervals not to exceed 1.4 m (4 1/2 ft).
Exception No. 1: Where FMC is fished.
Exception No. 2: At terminals where flexibility is required, lengths shall not exceed the following:
(1) 900 mm (3 ft) for metric designators 16 through 35 (trade sizes 1/2 through 1 1/4)
(2) 1200 mm (4 ft) for metric designators 41 through 53 (trade sizes 1 1/2 through 2)
(3) 1500 mm (5 ft) for metric designators 63 (trade size 2 1/2) and larger
Exception No. 3: Lengths not exceeding 1.8 m (6 ft) from a luminaire (fixture) terminal connection for tap connections to luminaires (light fixtures) as permitted in 410.67(C).
Exception No. 4: Lengths not exceeding 1.8 m (6 ft) f ~~rom the last point where the raceway is securely fastened~~ for connections within an accessible ceiling to luminaire(s) [lighting fixture(s)] or other equipment.
Substantiation: This proposal is intended to add correlation between the flexible raceway Articles and the cable articles. Panel 7 accepted changes in the 2005 cycle to the cable wiring methods to clarify that the fitting connecting the cable to the box is considered to be a support. Panel 8 should consider the same allowance for its wiring methods.
For the purposes of correlation, similar proposals will be made to Articles 348, 350, and 356.
Panel Meeting Action: Reject
Panel Statement: Flexible metal conduit in lengths of 6 feet or less may be used for equipment grounding and should be secured independent of the enclosure.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
DOLLINS, J.: Flexible Metal Conduit is required by the UL-1 product standard to withstand a 300 pound pull without opening the armor. Additionally, the UL-514B product standard for connectors used with FMC requires that the conduit and connector be subjected to a resistance test followed by a pull of 75 to 150 pounds, based on size, without pulling out of the connector, followed by a repeated resistance test. A 6 ft length of Flexible Metal Conduit within an accessible ceiling that is secured by connectors at each end at the luminaire or equipment does not require additional support to maintain the physical or grounding performance of the conduit.

8-33 Log #3331 NEC-P08 **Final Action: Accept**
(348.30(A) Exception No. 1)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise text to read:
Where FMC is fished between access points through concealed spaces in finished buildings or structures and supporting is impractical .
Substantiation: Edit. To correlate with similar sections where conditions for fishing are specified.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-34 Log #204 NEC-P08 **Final Action: Accept in Principle**
(348.30(A) Exception No. 2)

NOTE: The following proposal consists of Comment 8-35 on Proposal 8-43 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 8-43 was:
Revise text for Exception No. 2 as follows:
348.30 Securing and Supporting. FMC shall be securely fastened in place and supported in accordance with 348.30(A) and (B).
(A) Securely Fastened. FMC shall be securely fastened in place by an approved means within 300 mm (12 in.) of each box, cabinet, conduit body, or other conduit termination and shall be supported and secured at intervals not to exceed 1.4 m (4 1/2 ft).
Exception No. 1: Where FMC is fished.
Exception No. 2: Lengths not exceeding the following:
900 mm (3 ft) for sizes 16 to 35 (1/2 to 1 1/4)
1200 mm (4 ft) for sizes 41 to 53 (1 1/2 to 2)
1500 mm (5 ft) for 63 (2 1/2) and larger
at terminals where flexibility is required.
Submitter: Jerry D. Cain, Lodestar Energy Inc.
Recommendation: Exception No. 2: At terminals where flexibility is required, lengths shall not exceed
(1) 900 mm (3 ft) for metric designators 16 through 35 (trade size 1/2 through 1 1/4)
(2) 1200 mm (4 ft) for metric designators 41 through 53 (trade size 1 1/2 through 2)
(3) 1500 mm (5 ft) for metric designators 63 (trade size 2 1/2) and larger.
Substantiation: Please change Exception No. 2 in 350.30(A) to read the same as 348.30(A). The problem mentioned in Proposal 8-43 applies to both wiring methods. This will also maintain consistency in the NEC. Note all the exhibits listed in ROP 8-43 show liquid tight flexible metal conduit. The intent was to modify Article 350, however, in retrospect both articles should be modified since they have similar uses.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel understands that the comment was held during the last cycle and is now a proposal that was intended for Section 350.30(A), Exception No. 2. The submitter's intent was met. See panel action on Proposal 8-44.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-35 Log #3110 NEC-P08 **Final Action: Reject**
(348.30(A) Exception No. 2)

Submitter: James M. Imlah, City of Hillsboro Building Department
Recommendation: Revise text as follows:
348.30 Securing and Supporting
FMC shall be securely fastened in place and supported in accordance with 348.30(A) and (B).
(A) Securely Fastened FMC shall be securely fastened in place by an approved means within 300 mm (12 in.) of each box, cabinet, conduit body, or

other conduit termination and shall be supported and secured at intervals not to exceed 1.4 m (4 1/2 ft.).

Exception No. 1: Where FMC is fished.

Exception No. 2: At terminals where installed for flexibility ~~is required~~ , lengths shall not exceed the following:

(1) 900 mm (3 ft) for metric designators 16 through 35 (trade sizes 1/2 through 1 1/4)

(2) 1200 mm (4 ft) for metric designators 41 through 53 (trade sizes 1 1/2 through 2)

(3) 1500 mm (5 ft) for metric designators 63 (trade size 2 1/2) and larger

Substantiation: By stating "is required" in exception 2, makes a mandatory requirement that has no substantiation and clarification of what is meant by "required." By definition "required" is a mandatory command that infers compliance by force or demanding as the essential and only method authorized. By changing the charging statement of exception 2 to "where installed" will provide clarification of the allowance for expanding the support requirements based on raceway size installed for flexibility. The use of "required" is too restrictive and by using "where installed for flexibility" provides an equal, user friendly understanding.

Panel Meeting Action: Reject

Panel Statement: The requirement for flexibility is the reason for this exception. This exception is not just an alternative wiring method from the base rule.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

8-36 Log #3125 NEC-P08 **Final Action: Reject**

(348.30(A) Exception No. 2)

Submitter: Truman C. Surbrook, Michigan State University

Recommendation: Revise Exception 2 to eliminate the use of the undefined term flexibility to read as follows:

Exception 2: For connection to equipment where the total ~~At terminals where flexibility is required,~~ lengths ~~shall~~ do not exceed the following: (1), (2), and (3) remain unchanged.

Substantiation: The purpose of using FMC is where flexibility is required. Since the term flexibility is not defined in the Code, there have been differences of opinion as to the meaning of this exception. This revision simply permits lengths as described in (1), (2), and (3) to be installed supported only at the termination and supporting the FMC within 300 mm (12 in.) is not a requirement. That requirement would only apply when the lengths are greater than described in (1), (2), and (3) of Exception 2.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 8-35.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

8-37 Log #3439 NEC-P08 **Final Action: Reject**

(348.30(A) Exception No. 2)

Submitter: Aaron Richter, Saranac, MI

Recommendation: Revise text to read:

At terminal ~~where flexibility is required,~~ lengths shall not exceed the following:

Substantiation: This whole section is referring to Flexible Metal Conduit. So with that being said you are told that flexibility is required and already there.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 8-35.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

8-38 Log #2241 NEC-P08 **Final Action: Reject**

(348.30(A) Exception No. 4)

Submitter: Donald A. Ganiere, Ottawa, IL

Recommendation: Revise as follows:

Exception No. 4: Lengths not exceeding 1.8 m (6 ft) from the last point where the raceway is securely fastened for connections within an accessible ceiling to luminaire(s) [lighting fixture(s)] or other equipment. For the purpose of this exception, FMC fittings shall be permitted as a means of cable support.

Substantiation: This permits the conduit fitting to provide the required support for fixture whips. This is already permitted for AC and MC in their respective articles.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 8-32.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

DOLLINS, J.: See the Aluminum Association Comment on Propsoal 8-32.

8-39 Log #3187 NEC-P08 **Final Action: Reject**

(348.30(A) Exception No. 4)

Submitter: Donald Cook, Shelby County Development Services

Recommendation: Revise text to read:

348.30(A) Exception No. 4 Lengths not exceeding 1.8m (6 ft) from the last point where the raceway is securely fastened for connections ~~within an accessible ceiling~~ to luminaire(s) [lighting fixture(s)] or other equipment.

Substantiation: Currently Exception No. 4 allows a less restrictive securing and supportting requirement to luminaires or other equipment where those items are installed within an accessible ceiling. The securing and supportting requirements in the general rule seem to minimize the chance of damage to the integrity of the wiring method. The likelihood of damage to the wiring method would seem to be greater within an accessible ceiling than it would in a non-accessible ceiling. If the connection to luminaires and other equipment is needed, it will be needed in both accessible and non-accessible ceilings. This change will allow this permission in either place and not compromise the safety of the installation.

Panel Meeting Action: Reject

Panel Statement: A raceway that closely follows the surface upon which it is installed is less likely to become damaged by penetration of screws, nails, etc. See Section 300.4.

(348.60)

Submitter: Noel Williams, Noel Williams Consulting

Recommendation: Revise as follows:

"Where used to connect equipment where flexibility is required after installation , an equipment grounding conductor shall be installed...Where flexibility is not required after installation . FMC shall be permitted to be..." (remainder unchanged).

Substantiation: This change is intended to make this section agree with the requirements referenced in 250.118(5) that describes the installations where FC may (and indirectly, where it may not) be used for grounding.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

GRIFFITH, M.: The IEEE believes language should be added to this code section to clarify whether and to what extent "flexibility" includes "vibration" and/or "continuous movement".

8-41 Log #1482 NEC-P08 **Final Action: Accept**

(348.60)

Submitter: Ryan Jackson, West Valley City, UT

Recommendation: Revise as follows:

348.60 Grounding and Bonding. Where used to connect equipment where flexibility is necessary after installation , an equipment grounding conductor shall be installed.

Where flexibility after installation is not required, FMC shall be permitted to be used as an equipment grounding conductor when installed in accordance with 250.118(5).

Where required or installed, equipment grounding conductors shall be installed in accordance with 250.134(B).

Where required or installed, equipment bonding jumpers shall be installed in accordance with 250.102.

Substantiation: This proposal is intended to provide correlation between this section and the 2005 change to 250.118(5)(d).

Panel Meeting Action: Accept

Panel Statement: See panel action on Proposal 8-40.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

BURNS, J.: According to the unofficial vote taken at the CMP 8 Panel meeting in Hilton Head, SC the above proposals should have been "Accept in Principle" not "Accept" as indicated on the ballot. For this reason I am voting in the "negative".

DABE, J.: According to the unofficial vote taken at the ROP meeting for the 2008 NEC, Code-Making Panel 8 voted to "Accept in Principle" not "Accept" this proposal as indicated on the ballot. For this reason I am voting in the "negative", so the proper proposal moves forward without conflict with another proposal.

Comment on Affirmative:

DUREN, R.: I agree with the panel action, but believe the panel action at the ROP meeting was to accept in principal rather than accept.

GRIFFITH, M.: The IEEE believes language should be added to this code section to clarify whether and to what extent "flexibility" includes "vibration" and/or "continuous movement".

HUMPHREY, D.: This proposal by CMP 8 was "Accept in Principle". 8-40 was the accepted proposal.

8-42 Log #3111 NEC-P08 **Final Action: Reject**
(348.60)

Submitter: James M. Imlah, City of Hillsboro Building Department
Recommendation: Revise text as follows:
348.60 Grounding and Bonding
~~Where~~ LFMC used to connect equipment ~~where~~ installed for flexibility ~~is requried~~ , an equipment grounding conductor shall be installed.
~~Where~~ LFMC not installed for flexibility ~~is not required, LFMC~~ shall be permitted to be used as an equipment grounding conductor when installed in accordance with 250.118(6).
Where ~~required or~~ installed for flexibility , equipment grounding conductors shall be installed in accordance with 250.134(B).
Where ~~required or~~ installed for flexibility , equipment bonding jumpers shall be installed in accordance with 250.102.
Substantiation: By stating "is required", makes a mandatory requirement that has no substantiation and clarification of what is meant by "required." By definition "required" is a mandatory command that infers compliance by force or demanding as an essential and the only method authorized. By changing the charging statement to "where installed" will provide clarification of the allowance for the requirements of installation of an equipment grounding conductor if the LFMC is installed for flexibility. The use of "required" is too restrictive and by using "where installed for flexibility" provides an equal, user friendly understanding. This proposal is similar to proposal 348.60.
Panel Meeting Action: Reject
Panel Statement: The current text is clearer to the intent than the proposed text. Additionally, the proposal should be referencing 350.60, not 348.60.

ARTICLE 350 — lIQUIDTIGHT FLEXIBLE METAL CONDUIT: TYPE LFMC

8-43 Log #310 NEC-P08 **Final Action: Reject**
(350.12(5))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
(5) Where subject to ~~physical damage~~ blows or abrasion.
Substantiation: Use of the word "physical" is superfluous– the purpose is obvious. In some instances, one could argue for the use of "mechanical" to differentiate that from e.g., "thermal" damage, but context makes the intended sense quite clear, rendering this unnecessary.
The proposed rewording is an attempt at precision. Furthermore, if you retain "damage," I would then have to fall back to arguing that in that case the term "physical" should be eliminated, and in fact (2) probably is unnecessary as it is there to prevent a form of physical damage.
Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.)
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-4 (Log 336).

(350.30)

Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Revise as follows:
350.30 Securing and Supporting.
~~Exception No. 2: Lengths not exceeding 900 mm (3 ft) at terminals where flexibility is necessary.~~
Exception No. 2: At terminals where flexibility is required, lengths shall not exceed the following:
(1) 900 mm (3 ft) for metric designators 16 through 35 (trade sizes 1/2 through 1 1/4)
(2) 1200 mm (4 ft) for metric designators 41 through 53 (trade sizes 1 1/2 through 2)
(3) 1500 mm (5 ft) for metric designators 63 (trade size 2 1/2) and larger
Substantiation: This changes correlates the.30 rules between FMC (Art. 348) and LFMC.

Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-45 Log #1460 NEC-P08 **Final Action: Reject**
(350.30(A))

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise as follows:
350.30 Securing and Supporting.
LFMC shall be securely fastened in place and supported in accordance with 350.30(A) and (B).
(A) Securely Fastened. LFMC shall be securely fastened in place by an approved means within 300 mm (12 in.) of each box, cabinet, conduit body, or other conduit termination and shall be supported and secured at intervals not to exceed 1.4 m (4 1/2 ft).
Exception No. 1: Where LFMC is fished.
Exception No. 2: Lengths not exceeding 900 mm (3 ft) at terminals where flexibility is necessary.
Exception No. 3: Lengths not exceeding 1.8 m (6 ft) from a luminaire (fixture) terminal connection for tap conductors to luminaries (lighting fixtures) as permitted in 410.67(C).
Exception No. 4: Lengths not exceeding 1.8 m (6 ft) ~~from the last point where the raceway is securely fastened~~ for connections within an accessible ceiling to luminaire(s) [lighting fixture(s)]or other equipment.
Substantiation: This proposal is intended to add correlation between the flexible raceway Articles and the cable Articles. Panel 7 accepted changes in the 2005 cycle to the cable wiring methods to clarify that the fitting connecting the cable to the box is considered to be a support. Panel 8 should consider the same allowance for its wiring methods.
For the purposes of correlation, similar proposals will be made to Articles 348, 350, and 356.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-32.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
DOLLINS, J.: Liquidtight Flexible Metal Conduit is required by the UL 360 product standard to withstand a 300 pound pull without opening the armor. Additionally, the UL 514B product standard for connectors used with LFMC requires that the conduit and connector be subjected to a resistance test followed by a pull of 75 to 150 pounds, based on size, without pulling out of the connector, followed by a repeated resistance test. A 6 ft length of Liquidtight Flexible Metal Conduit within an accessible ceiling that is secured by connectors at each end at the luminaire or equipment does not require additional support to maintain the physical or grounding performance of the conduit.

8-46 Log #3330 NEC-P08 **Final Action: Accept**
(350.30(A) Exception No. 1)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise text to read:
Where L FMC is fished between access points through concealed spaces in finished buildings or structures and supporting is impractical .

Recommendation: Revise text for Exception No. 2 to read:

350.30 Securing and Supporting. LFMC shall be securely fastened in place and supported in accordance with 350.30(A) and (B).

(A) Securely Fastened. LFMC shall be securely fastened in place by an approved means within 300 mm (12 in.) of each box, cabinet, conduit body, or other conduit termination and shall be supported and secured at intervals not to exceed 1.4 m (4 1/2 ft).

Exception No. 1: Where LFMC is fished.

~~Exception No. 2: Lengths not exceeding 900 mm (3 ft) at terminals where flexibility is required.~~

Exception No. 2: At terminals where flexibility is required, lengths shall not exceed:

(1) 900 mm (3 ft) for metric designators 16 through (trade sizes 1/2 through 1/4)

(2) 1200 mm (4 ft) for metric designators 41 to 53 (trade sizes 1 1/2 through 2)

(3) 1500 mm (5 ft) for metric designators 63 (trade size 2 1/2) and larger.

Substantiation: 1. Motor junction box size and location vary from one manufacture to another. The NEMA or IEC frame sizes only designate the motor footprint for mounting, shaft dimensions and location of shaft in relation to motor footprint. This is also a problem when rewind shops return repaired motors with junction boxs different from the originals. Note most manufactures locate the J-box near the center of the motor, though I have seen some located closer to the end. On several occasions modifications to the conduit and/or liquidtight length have been required when changing motors. This adds costly downtime.

2. V-Belt driven equipment requires movement of the motor to install and adjust the belts while 3 ft is more than adequate on small motors, 3 ft is not sufficient on the larger motors without causing damage to the liquid tight. It also makes it much easier to change a motor when the liquidtight is long enough to allow one to bend it into position without the use of a hoist or other means.

3. Use of longer lengths of liquidtight allows the conduit to be located out of harms way when installing conduit to equipment that requires servicing.

Note: Supporting material is available for review at NFPA Headquarters.

ARTICLE 352 — RIGID NONMETALLIC CONDUIT: TYPE RNC

8-53 Log #1919 NEC-P08 **Final Action: Accept in Principle**
(352)

TCC Action: The Technical Correlating Committee advises that Article Scope statements and Titles are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.
Submitter: William Wagner, Certification Solutions
Recommendation: Revise Article 352 to read as follows:

Article 352
Rigid ~~Nonmetallic~~ Polyvinyl Chloride Conduit: Type PVC ~~RNC~~
I. General

352.1 Scope. This article covers the use, installation, and construction specifications for rigid ~~nonmetallic~~ polyvinyl chloride conduit (PVC ~~RNC~~) and associated fittings.
352.2 Definition.
Rigid ~~Nonmetallic~~ Polyvinyl Chloride Conduit (PVC ~~RNC~~). A nonmetallic raceway of circular cross section, with integral or associated couplings, connectors, and fittings for the installation of electrical conductors and cables.
352.6 Listing Requirements. PVC conduit ~~RNC~~ , factory elbows, and associated fittings shall be listed.
II. Installation
352.10 Uses Permitted. The use of PVC conduit ~~RNC~~ shall be permitted in accordance with 352.10(A) through (H).
FPN: Extreme cold may cause some nonmetallic conduits to become brittle and, therefore, more susceptible to damage from physical contact.
(A) Concealed. PVC conduit ~~RNC~~ shall be permitted in walls, floors, and ceilings.
(B) Corrosive Influences. PVC conduit ~~RNC~~ shall be permitted in locations subject to severe corrosive influences as covered in 300.6 and where subject to chemicasl for which the materials are specifically approved.
(C) Cinders. PVC conduit ~~RNC~~ shall be permitted in cinder fill.
(D) Wet Locations. PVC conduit ~~RNC~~ shall be permitted in portions of dairies, laundries, canneries, or other wet locations and in locations where walls are frequently washed, the entire conduit system including boxes and fittings used therewith shall be installed and equipped so as to prevent water from entering the conduit. All supports, bolts, straps, screws and so forth, shall be of corrosion-resistant materials or be protected against corrosion by approved corrosion-resistant materials.
(E) Dry and Damp Locations. PVC conduit ~~RNC~~ shall be permitted for use in dry and damp locations not prohibited by 352.12.
(F) Exposed. PVC conduit ~~RNC~~ shall be permitted for exposed work where not subject to physical damage if identified for such use.
(G) Underground Installations. For underground installations, see 300.5 and 300.50.
FPN: Refer to Article 353 for High Density Polyethylene Conduit: Type HDPE and Article 3XX for Reinforced Thermosetting Resin Conduit: Type RTRC.
(H) Support of Conduit Bodies. ~~Rigid nonmetallic~~ PVC conduit shall be permitted to support nonmetallic conduit bodies not larger than the largest trade size of an entering raceway. These conduit bodies shall not support luminaires (fixtures) or other equipment and shall not contain devices other than splicing devices as permitted by 110.14(B) and 314.16(C)(2).
352.12 Uses Not Permitted. PVC conduit ~~RNC~~ shall not be used under the following conditions.
(A) Hazardous (Classified) Locations.
(1) In hazardous (classified) locations, except as permitted in 503.10(A), 504.20, 514.8 Exception No. 2, and 515.8
(2) In Class I, Division 2 locations, except as permitted in 501.10(B)(3)
(B) Support of Luminaires (Fixtures). For the support of luminaires (fixtures) or other equipment not described in 352.10(H).
(C) Physical Damage. Where subject to physical damage unless identified for such use.
(D) Ambient Temperatures. Where subject to ambient temperatures in excess of 50°C (122°F) unless listed otherwise.
(E) Insulation Temperature Limitations. For conductors or cables operating at a temperature higher than the PVC conduit ~~RNC~~ listed operating temperature rating.
Exception: Conductors or cables rated at a temperature higher than the ~~RNC~~ PVC conduit listed temperature rating shall be permitted to be installed in ~~RNC~~ PVC conduit, provided they are not operated at a temperature higher than the ~~RNC~~ PVC conduit listed temperature rating.
(F) Theaters and Similar Locations. In theaters and similar locations, except as provided in 518.4 and 520.5.
352.20 Size.
(A) Minimum. PVC Conduit ~~RNC~~ smaller than metric designator 16 (trade size 1/2) shall not be used.
(B) Maximum. PVC Conduit ~~RNC~~ larger than metric designator 155 (trade size 6) shall not be used.
FPN: The trade sizes and metric designators are for identification purposes only and do not relate to actual dimensions. See 300.1(C).
352.22 Number of Conductors. The number of conductors shall not exceed that permitted by the percentage fill specified in Table 1, Chapter 9.
Cables shall be permitted to be installed where such use is not prohibited by the respective cable articles. The number of cables shall not exceed the allowable percentage fill specified in Table 1, Chapter 9.
352.24 Bends - How Made. Bends shall be so made that the conduit will not be damaged and the internal diameter of the conduit will not be effectively reduced. Field bends shall be made only with bending equipment identified for the purposes. The radius of the curve to the centerline of such bends shall not be less than shown in Table 2, Chapter 9.
352.26 Bends - Number in One Run. There shall not be more than the equivalent of four quarter bends (360 degrees total) between pull points, for example, conduit bodies and boxes.
352.28 Trimming. All cut ends shall be trimmed inside and outside to remove rough edges.
352.30 Securing and Supporting. PVC conduit ~~RNC~~ shall be installed as a complete system as provided in 300.18 and shall be fastened so that movement from thermal expansion or contraction is permitted. PVC conduit ~~RNC~~ shall be securely fastened and supported in accordance with 352.30(A) and (B).
(A) Securely Fastened. PVC conduit ~~RNC~~ shall be securely fastened within 900 mm (3 ft) of each outlet box, junction box, device box, conduit body, or other conduit termination. Conduit listed for securing at other than 900 mm (3 ft) shall be permitted to be installed in accordance with the listing.
(B) Supports. PVC conduit ~~RNC~~ shall be supported as required in Table 352.30(B). Conduit listed for support at spacings other than as shown in Table 352.30(B) shall be permitted to be installed in accordance with the listing. Horizontal runs of RNC supported by openings through framing members at intervals not exceeding those in Table 352.30(B) and securely fastened within 900 mm (3 ft) of termination points shall be permitted.

Table 352.30(B) Support of Rigid Polyvinyl Chloride ~~Nonmetallic~~ Condit (PVC)(~~RNC~~)

Conduit Size		Maximum Spacing Between Supports	
Metric Designator	**Trade Size**	**Mm or m**	**Ft**
16 – 27	½ – 1	900 mm	3
35 – 53	1 ¼ – 2	1.5 m	5
63 – 78	2 ½ – 3	1.8 m	6
91 – 129	3 ½ – 5	2.1 m	7
155	6	2.5 m	8

352.44 Expansion Fittings. Expansion fittings for PVC conduit ~~RNC~~ shall be provided to compensate for thermal expansion and contraction where the length change, in accordance with Table 352.44(~~A) or Table 352.44(B)~~ is expected to be 6 mm (1/4 in.) or greater in a straight run between securely mounted items such as boxes, cabinets, elbows, or other conduit terminations.

Table 352.44(A) Expansion Characteristics of ~~PVC~~ Rigid ~~Nonmetallic~~ Polyvinyl Chloride Conduit (PVC) Coefficient of Thermal Expansion = 6.084 x 10^{-5} mm/mm/°C (3.38 x 10^{-5} in./in/°F)

352.46 Bushings. Where a conduit enters a box, fitting, or other enclosure, a bushing or adapter shall be provided to protect the wire from abrasion unless the box, fitting, or enclosure design provides equivalent protection.

FPN: See 300.4(F) for the protection of conductors 4 AWG and larger at bushings.

352.48 Joints. All joints between lengths of conduit, and between conduit and couplings, fittings, and boxes, shall be made by an approved method.

352.56 Splices and Taps. Splices and taps shall be made in accordance with 300.15.

352.60 Grounding. Where equipment grounding is required, a separate equipment grounding conductor shall be installed in the conduit.

Exception No. 1: As permitted in 250.134(B), Exception No. 2, for dc circuits and 250.134(B), Exception No. 1, for separately run equipment grounding conductors.

Exception No. 2: Where the grounded conductor is used to ground equipment as permitted in 250.142.

III. Construction Specifications.

352.100 Construction. PVC conduit ~~RNC~~ and fittings shall be composed of suitable nonmetallic material that is resistant to moisture and chemical atmospheres. For use above ground, it shall also be flame retardant, resistant to impact and crushing, resistant to distortion from heat under conditions likely to be encountered in service, and resistant to low temperature and sunlight effects. For use underground, the material shall be acceptably resistant to moisture and corrosive agents and shall be of sufficient strength to withstand abuse, such as by impact and crushing, in handling and during installation. Where intended for direct burial, without encasement in concrete, the material shall also be capable of withstanding continued loading that is likely to be encountered after installation.

352.120 Marking. Each length of PVC conduit ~~RNC~~ shall be clearly and durably marked at least every 3 m (10 ft) as required in the first sentence of 110.21. The type of material shall also be included in the marking unless it is visually identifiable. for conduit recognized for use above ground, these markings shall be permanent. For conduit limited to underground use only, these markings shall be sufficiently durable to remain legible until the material is installed. Conduit shall be permitted to be surface marked to indicate special characteristics of the material.

FPN: Examples of these markings include but are not limited to “limited smoke” and “sunglight resistant.”

Substantiation: This is a companion proposal for the new definition of Rigid Nonmetallic Condit (RNC) in Article 100 and the new Article 355 for Type RTRC conduit. This proposal revises the current Article 352 to remove all references to reenforced thermosetting resin conduit and limit the allowable materials to PVC.

In the 2002 edition of the National Electrical Code, Article 352; Rigid Nonmetallic Conduit (RNC) included PVC, RTRC, and HDPE products. However, for the 2005 edition of the NEC, HDPE was separated from these other conduit types and located in new Article 353. This left two very dissimilar products grouped together as RNC under Article 352 and technically eliminated HDPE as an acceptable wiring method in all applications where rigid nonmetallic conduit was specified. The separation of the PVC and RTRC products, and the definition of RNC as including rigid PVC, HDPE and RTRC will correct this situation by better defining the installation and construction specifications for each conduit type.

Panel Meeting Action: Accept in Principle

Revise Article 352 to read as follows:

Article 352

Rigid ~~Nonmetallic~~ Polyvinyl Chloride Conduit: Type PVC ~~RNC~~

I. General

352.1 Scope. This article covers the use, installation, and construction specifications for rigid ~~nonmetallic~~ polyvinyl chloride conduit (PVC ~~RNC~~) and associated fittings.

FPN: Refer to Article 353 for High Density Polyethylene Conduit: Type HDPE and Article 355 for Reinforced Thermosetting Resin Conduit: Type RTRC.

352.2 Definition.

Rigid ~~Nonmetallic~~ Polyvinyl Chloride Conduit (PVC ~~RNC~~). A rigid nonmetallic ~~raceway~~ conduit (RNC) of circular cross section, with integral or associated couplings, connectors, and fittings for the installation of electrical conductors and cables.

352.6 Listing Requirements. PVC conduit ~~RNC~~ , factory elbows, and associated fittings shall be listed.

II. Installation

352.10 Uses Permitted. The use of PVC conduit ~~RNC~~ shall be permitted in accordance with 352.10(A) through (H).

FPN: Extreme cold may cause some nonmetallic conduits to become brittle and, therefore, more susceptible to damage from physical contact.

(A) Concealed. PVC conduit ~~RNC~~ shall be permitted in walls, floors, and ceilings.

(B) Corrosive Influences. PVC conduit ~~RNC~~ shall be permitted in locations subject to severe corrosive influences as covered in 300.6 and where subject to chemicals for which the materials are specifically approved.

(C) Cinders. PVC conduit ~~RNC~~ shall be permitted in cinder fill.

(D) Wet Locations. PVC conduit ~~RNC~~ shall be permitted in portions of dairies, laundries, canneries, or other wet locations and in locations where walls are frequently washed, the entire conduit system including boxes and fittings used therewith shall be installed and equipped so as to prevent water from entering the conduit. All supports, bolts, straps, screws and so forth, shall be of corrosion-resistant materials or be protected against corrosion by approved corrosion-resistant materials.

(E) Dry and Damp Locations. PVC conduit ~~RNC~~ shall be permitted for use in dry and damp locations not prohibited by 352.12.

(F) Exposed. PVC conduit ~~RNC~~ shall be permitted for exposed work where not subject to physical damage if identified for such use.

(G) Underground Installations. For underground installations, see 300.5 and 300.50.

~~FPN: Refer to Article 353 for High Density Polyethylene Conduit: Type HDPE.~~

(H) Support of Conduit Bodies. ~~Rigid nonmetallic~~ PVC conduit shall be permitted to support nonmetallic conduit bodies not larger than the largest trade size of an entering raceway. These conduit bodies shall not support luminaires (fixtures) or other equipment and shall not contain devices other than splicing devices as permitted by 110.14(B) and 314.16(C)(2).

352.12 Uses Not Permitted. PVC conduit ~~RNC~~ shall not be used under the following conditions.

(A) Hazardous (Classified) Locations.

(1) In hazardous (classified) locations, except as permitted in 503.10(A), 504.20, 514.8 Exception No. 2, and 515.8

(2) In Class I, Division 2 locations, except as permitted in 501.10(B)(3)

(B) Support of Luminaires (Fixtures). For the support of luminaires (fixtures) or other equipment not described in 352.10(H).

(C) Physical Damage. Where subject to physical damage unless identified for such use.

(D) Ambient Temperatures. Where subject to ambient temperatures in excess of 50°C (122°F) unless listed otherwise.

(E) Insulation Temperature Limitations. For conductors or cables operating at a temperature higher than the PVC conduit ~~RNC~~ listed operating temperature rating.

Exception: Conductors or cables rated at a temperature higher than the ~~RNC~~ PVC conduit listed temperature rating shall be permitted to be installed in ~~RNC~~ PVC conduit, provided they are not operated at a temperature higher than the ~~RNC~~ PVC conduit listed temperature rating.

(F) Theaters and Similar Locations. In theaters and similar locations, except as provided in 518.4 and 520.5.

352.20 Size.

(A) Minimum. PVC Conduit ~~RNC~~ smaller than metric designator 16 (trade size 1/2) shall not be used.

(B) Maximum. PVC Conduit ~~RNC~~ larger than metric designator 155 (trade size 6) shall not be used.

FPN: The trade sizes and metric designators are for identification purposes only and do not relate to actual dimensions. See 300.1(C).

352.22 Number of Conductors. The number of conductors shall not exceed that permitted by the percentage fill specified in Table 1, Chapter 9.

Cables shall be permitted to be installed where such use is not prohibited by the respective cable articles. The number of cables shall not exceed the allowable percentage fill specified in Table 1, Chapter 9.

352.24 Bends - How Made. Bends shall be so made that the conduit will not be damaged and the internal diameter of the conduit will not be effectively reduced. Field bends shall be made only with bending equipment identified for the purposes. The radius of the curve to the centerline of such bends shall not be less than shown in Table 2, Chapter 9.

352.26 Bends - Number in One Run. There shall not be more than the equivalent of four quarter bends (360 degrees total) between pull points, for example, conduit bodies and boxes.

352.28 Trimming. All cut ends shall be trimmed inside and outside to remove rough edges.

352.30 Securing and Supporting. PVC conduit ~~RNC~~ shall be installed as a complete system as provided in 300.18 and shall be fastened so that movement from thermal expansion or contraction is permitted. PVC conduit ~~RNC~~ shall be securely fastened and supported in accordance with 352.30(A) and (B).

(A) Securely Fastened. PVC conduit ~~RNC~~ shall be securely fastened within 900 mm (3 ft) of each outlet box, junction box, device box, conduit body, or other conduit termination. Conduit listed for securing at other than 900 mm (3 ft) shall be permitted to be installed in accordance with the listing.

(B) Supports. PVC conduit ~~RNC~~ shall be supported as required in Table 352.30 ~~(B)~~ . Conduit listed for support at spacings other than as shown in Table 352.30 ~~(B)~~ shall be permitted to be installed in accordance with the listing. Horizontal runs of PVC conduit ~~RNC~~ supported by openings through framing members at intervals not exceeding those in Table 352.30 ~~(B)~~ and securely fastened within 900 mm (3 ft) of termination points shall be permitted.

(EXISTING TABLE 352.30(B) HERE AND RENUMBER AS TABLE 352.30)

352.44 Expansion Fittings. Expansion fittings for PVC conduit ~~RNC~~ shall be provided to compensate for thermal expansion and contraction where the length change, in accordance with Table 352.44(~~A) or Table 352.44(B)~~ is expected to be 6 mm (1/4 in.) or greater in a straight run between securely mounted items such as boxes, cabinets, elbows, or other conduit terminations.

(EXISTING TABLE 352.44(A) HERE AND RENUMBER AS TABLE 352.44)

DELETE EXISTING TABLE 352.44(B)

352.46 Bushings. Where a conduit enters a box, fitting, or other enclosure, a bushing or adapter shall be provided to protect the wire from abrasion unless the box, fitting, or enclosure design provides equivalent protection.

FPN: See 300.4(F) for the protection of conductors 4 AWG and larger at bushings.

352.48 Joints. All joints between lengths of conduit, and between conduit and couplings, fittings, and boxes, shall be made by an approved method.

352.56 Splices and Taps. Splices and taps shall be made in accordance with 300.15.

352.60 Grounding. Where equipment grounding is required, a separate equipment grounding conductor shall be installed in the conduit.

Exception No. 1: As permitted in 250.134(B), Exception No. 2, for dc circuits and 250.134(B), Exception No. 1, for separately run equipment grounding conductors.

Exception No. 2: Where the grounded conductor is used to ground equipment as permitted in 250.142.

III. Construction Specifications.

352.100 Construction. PVC conduit ~~RNC~~ and fittings shall be composed of suitable nonmetallic material that is resistant to moisture and chemical atmospheres. For use above ground, it shall also be flame retardant, resistant to impact and crushing, resistant to distortion from heat under conditions likely to be encountered in service, and resistant to low temperature and sunlight effects. For use underground, the material shall be acceptably resistant to moisture and corrosive agents and shall be of sufficient strength to withstand abuse, such as by impact and crushing, in handling and during installation. Where intended for direct burial, without encasement in concrete, the material shall also be capable of withstanding continued loading that is likely to be encountered after installation.

352.120 Marking. Each length of PVC conduit ~~RNC~~ shall be clearly and durably marked at least every 3 m (10 ft) as required in the first sentence of 110.21. The type of material shall also be included in the marking unless it is visually identifiable. for conduit recognized for use above ground, these markings shall be permanent. For conduit limited to underground use only, these markings shall be sufficiently durable to remain legible until the material is installed. Conduit shall be permitted to be surface marked to indicate special characteristics of the material.

FPN: Examples of these markings include but are not limited to “limited smoke” and “sunlight resistant.”

Panel Statement: Changes are made to the submitter’s recommendation to more closely follow the NEC Style Manual, and to correlate with the structure of other articles. The revised text meets the intent of the submitter.

It is recommended that the TCC consider the article scope as revised.

8-54 Log #2669 NEC-P08 **Final Action: Accept in Principle**
(352)

Submitter: Goran Haag, Champion Fiberglass, Inc.

Recommendation: Separate Article 352 into two separate articles one for rigid PVC conduit and one for rigid fiber glass c onduit. Suggest naming article for rigid PVC conduit 352 (same as today) and moving the rigid fiberglass conduit to Article 351 (new article) Below is the revised text for each respective article:

I. General

352.1 Scope This article covers the use, installation, and construction specifications for PVC rigid nonmetallic conduit and associated fittings.

352.2 Definition PVC rigid nonmetallic conduit. A PVC rigid nonmetallic conduit raceway of circular cross section, with integral or associated couplings, connectors, and fittings for the installation of electrical conductors and cables.

352.6 Listing Requirements PVC rigid nonmetallic conduit, factory elbows, and associated fittings shall be listed.

II. Installation

352.10 Uses Permitted The use of PVC rigid nonmetallic conduit shall be permitted in accordance with 352.10(A) through (H).

FPN: Extreme cold may cause some nonmetallic conduits to become brittle and therefore more susceptible to damage from physical contact.

(A) Concealed. PVC rigid nonmetallic conduit shall be permitted in walls, floors, and ceilings.

(B) Corrosive Influences. PVC rigid nonmetallic conduit shall be permitted in locations subject to severe corrosive influences as covered in 300.6 and where subject to chemicals for which the materials are specifically approved.

(C) Cinders. PVC rigid nonmetallic conduit shall be permitted in cinder fill.

(D) Wet Locations. PVC rigid nonmetallic conduit shall be permitted in portions of dairies, laundries, canneries, or other wet locations and in locations where walls are frequently washed, the entire conduit system including boxes and fittings used therewith shall be installed and equipped so as to prevent water from entering the conduit. All supports, bolts, straps, screws, and so forth, shall be of corrosion-resistant materials or be protected against corrosion by approved corrosion-resistant materials.

(E) Dry and Damp Locations. PVC rigid nonmetallic conduit shall be permitted for use in dry and damp locations not prohibited by 352.12.

(F) Exposed. PVC rigid nonmetallic conduit shall be permitted for exposed work where not subject to physical damage if identified for such use.

(G) Underground Installations. For underground installations, see 300.5 and 300.50.

FPN: Refer to Article 353 for High Density Polyethylene Conduit: Type HDPE.

(H) Support of Conduit Bodies. PVC rigid nonmetallic conduit shall be permitted to support PVC conduit bodies not larger than the largest trade size of an entering raceway. These conduit bodies shall not support luminaires (fixtures) or other equipment and shall not contain devices other than splicing devices as permitted by 110.14(B) and 314.16(C)(2).

352.12 Uses Not Permitted

PVC rigid nonmetallic conduit shall not be used under the following conditions.

(A) Hazardous (Classified) Locations

(1) In hazardous (classified) locations, except as permitted in 503.10(A), 504.20, 514.8 Exception No. 2, and 515.8

(2) In Class I, Division 2 locations, except as permitted in 501.10(B)(3)

(B) Support of Luminaires (Fixtures) For the support of luminaires (fixtures) or other equipment not described in 352.10(H).

(C) Physical Damage. Where subject to physical damage unless identified for such use.

(D) Ambient Temperatures. Where subject to ambient temperatures in excess of 50°C (122°F) unless listed otherwise.

(E) Insulation Temperature Limitations For conductors or cables operating at a temperature higher than the PVC rigid nonmetallic conduit listed operating temperature rating.

Exception: Conductors or cables rated at a temperature higher than the PVC rigid nonmetallic conduit listed temperature rating shall be permitted to be installed in PVC rigid nonmetallic conduit, provided they are not operated at a temperature higher than the PVC rigid nonmetallic conduit listed temperature rating.

(F) Theaters and Similar Locations. In theaters and similar locations, except as provided in 518.4 and 520.5.

352.20 Size

(A) Minimum. PVC rigid nonmetallic conduit smaller than metric designator 16 (trade size 1/ 2) shall not be used.

(B) Maximum. PVC rigid nonmetallic conduit larger than metric designator 155 (trade size 6) shall not be used.

FPN: The trade sizes and metric designators are for identification purposes only and do not relate to actual dimensions. See 300.1(C).

352.22 Number of Conductors

The number of conductors shall not exceed that permitted by the percentage fill specified in Table 1, Chapter 9.

Cables shall be permitted to be installed where such use is not prohibited by the respective cable articles. The number of cables shall not exceed the allowable percentage fill specified in Table 1, Chapter 9.

352.24 Bends — How Made

Bends shall be so made that the conduit will not be damaged and the internal diameter of the conduit will not be effectively reduced. Field bends shall be made only with bending equipment identified for the purpose. The radius of the curve to the centerline of such bends shall not be less than shown in Table 2, Chapter 9.

352.26 Bends — Number in One Run

There shall not be more than the equivalent of four quarter bends (360 degrees total) between pull points, for example, conduit bodies and boxes.

352.28 Trimming

All cut ends shall be trimmed inside and outside to remove rough edges.

352.30 Securing and Supporting

PVC rigid nonmetallic conduit shall be installed as a complete system as provided in 300.18 and shall be fastened so that movement from thermal expansion or contraction is permitted. PVC rigid nonmetallic conduit shall be securely fastened and supported in accordance with 352.30(A) and (B).

(A) Securely Fastened. PVC rigid nonmetallic conduit shall be securely fastened within 900 mm (3 ft) of each outlet box, junction box, device box, conduit body, or other conduit termination. Conduit listed for securing at other than 900 mm (3 ft) shall be permitted to be installed in accordance with the listing.

(B) Supports. PVC rigid nonmetallic conduit shall be supported as required in Table 352.30(B). Horizontal runs of PVC rigid nonmetallic conduit supported by openings through framing members at intervals not exceeding those in Table 352.30(B) and securely fastened within 900 mm (3 ft) of termination points shall be permitted.

Table 352.30(B) Support of PVC rigid nonmetallic conduit

Conduit Size		Maximum Spacing Between Supports	
Metric Designator Trade	Size	mm or m	ft
16–27	1/2–1	900 mm	3
35–53	11/4–2	1.5 m	5
63–78	21/2–3	1.8 m	6
91–129	31/2–5	2.1 m	7
155	6	2.5 m	8

352.44 Expansion Fittings

Expansion fittings for PVC Rigid Nonmetallic Conduit shall be provided to compensate for thermal expansion and contraction where the length change, in accordance with Table 352.44, is expected to be 6 mm (1/ 4 in.) or greater in a straight run between securely mounted items such as boxes, cabinets, elbows, or other conduit terminations.

Table 352.44(A) Expansion Characteristics of PVC Rigid Nonmetallic Conduit Coefficient of Thermal Expansion = 6.084 × 10–5 mm/mm/°C (3.38 × 10–5 in./in./°F)

95	5.78	95	3.85	195	7.91
100	6.08	100	4.06	200	8.11

352.46 Bushings

Where a conduit enters a box, fitting, or other enclosure, a bushing or adapter shall be provided to protect the wire from abrasion unless the box, fitting, or enclosure design provides equivalent protection.

FPN: See 300.4(F) for the protection of conductors 4 AWG and larger at bushings.

352.48 Joints

All joints between lengths of conduit, and between conduit and couplings, fittings, and boxes, shall be made by an approved method.

352.56 Splices and Taps

Splices and taps shall be made in accordance with 300.15.

352.60 Grounding

Where equipment grounding is required, a separate equipment grounding conductor shall be installed in the conduit.

Exception No. 1: As permitted in 250.134(B), Exception No. 2, for dc circuits and 250.134(B), Exception No. 1, for separately run equipment grounding conductors.

Exception No. 2: Where the grounded conductor is used to ground equipment as permitted in 250.142.

III. Construction Specifications

352.100 Construction

PVC rigid nonmetallic conduit and fittings shall be composed of suitable PVC material that is resistant to moisture and chemical atmospheres. For use above ground, it shall also be flame retardant, resistant to impact and crushing, resistant to distortion from heat under conditions likely to be encountered in service, and resistant to low temperature and sunlight effects. For use underground, the material shall be acceptably resistant to moisture and corrosive agents and shall be of sufficient strength to withstand abuse, such as by impact and crushing, in handling and during installation. Where intended for direct burial, without encasement in concrete, the material shall also be capable of withstanding continued loading that is likely to be encountered after installation.

352.120 Marking

Each length of PVC rigid nonmetallic conduit shall be clearly and durably marked at least every 3 m (10 ft) as required in the first sentence of 110.21. The type of material shall also be included in the marking unless it is visually identifiable. For conduit recognized for use above ground, these markings shall be permanent. For conduit limited to underground use only, these markings shall be sufficiently durable to remain legible until the material is installed. Conduit shall be permitted to be surface marked to indicate special characteristics of the material.

FPN: Examples of these markings include but are not limited to ``limited smoke'' and ``sunlight resistant.''

I. General

351.1 Scope

This article covers the use, installation, and construction specifications for rigid fiberglass conduit (RFC) and associated fittings.

351.2 Definition

Rigid fiberglass conduit. A rigid fiberglass conduit raceway of circular cross section, with integral or associated couplings, connectors, and fittings for the installation of electrical conductors and cables.

351.6 Listing Requirements

RFC, factory elbows, and associated fittings shall be listed.

II. Installation

351.10 Uses Permitted

The use of RFC shall be permitted in accordance with 352.10(A) through (H).

(A) Concealed. RFC shall be permitted in walls, floors, and ceilings.

(B) Corrosive Influences. RFC shall be permitted in locations subject to severe corrosive influences as covered in 300.6 and where subject to chemicals for which the materials are specifically approved.

(C) Cinders. RFC shall be permitted in cinder fill.

(D) Wet Locations. RFC shall be permitted in portions of dairies, laundries, canneries, or other wet locations and in locations where walls are frequently washed, the entire conduit system including boxes and fittings used therewith shall be installed and equipped so as to prevent water from entering the conduit. All supports, bolts, straps, screws, and so forth, shall be of corrosion-resistant materials or be protected against corrosion by approved corrosion-resistant materials.

(E) Dry and Damp Locations. RFC shall be permitted for use in dry and damp locations not prohibited by 351.12.

(F) Exposed. RFC shall be permitted for exposed work where not subject to physical damage if identified for such use.

(G) Underground Installations. For underground installations, see 300.5 and 300.50.

FPN: Refer to Article 353 for High Density Polyethylene Conduit: Type HDPE.

(H) Support of Conduit Bodies. RFC shall be permitted to support RFC bodies not larger than the largest trade size of an entering raceway. These conduit bodies shall not support luminaires (fixtures) or other equipment and shall not contain devices other than splicing devices as permitted by 110.14(B) and 314.16(C)(2).

351.12 Uses Not Permitted

RFC shall not be used under the following conditions.

(A) Hazardous (Classified) Locations

(1) In hazardous (classified) locations, except as permitted in 503.10(A), 504.20, 514.8 Exception No. 2, and 515.8

(2) In Class I, Division 2 locations, except as permitted in 501.10(B)(3)

(B) Support of Luminaires (Fixtures) For the support of luminaires (fixtures) or other equipment not described in 352.10(H).

(C) Physical Damage. Where subject to physical damage unless identified for such use.

(D) Ambient Temperatures. Where subject to ambient temperatures in excess of 50°C (122°F) unless listed otherwise.

(E) Insulation Temperature Limitations For conductors or cables operating at a temperature higher than the RFC listed operating temperature rating.

Exception: Conductors or cables rated at a temperature higher than the RFC listed temperature rating shall be permitted to be installed in RFC, provided they are not operated at a temperature higher than the RFC listed temperature rating.

(F) Theaters and Similar Locations. In theaters and similar locations, except as provided in 518.4 and 520.5.

352.20 Size

(A) Minimum. RFC smaller than metric designator 16 (trade size 1/ 2) shall not be used.

(B) Maximum. RFC larger than metric designator 155 (trade size 6) shall not be used.

FPN: The trade sizes and metric designators are for identification purposes only and do not relate to actual dimensions. See 300.1(C).

351.22 Number of Conductors

The number of conductors shall not exceed that permitted by the percentage fill specified in Table 1, Chapter 9.

Cables shall be permitted to be installed where such use is not prohibited by the respective cable articles. The number of cables shall not exceed the allowable percentage fill specified in Table 1, Chapter 9.

351.24 Bends — How Made

Bends shall be so made that the conduit will not be damaged and the internal diameter of the conduit will not be effectively reduced. Field bends shall be made only with bending equipment identified for the purpose. The radius of the curve to the centerline of such bends shall not be less than shown in Table 2, Chapter 9.

351.26 Bends — Number in One Run

There shall not be more than the equivalent of four quarter bends (360 degrees total) between pull points, for example, conduit bodies and boxes.

351.28 Trimming

All cut ends shall be trimmed inside and outside to remove rough edges.

351.30 Securing and Supporting

RFC shall be installed as a complete system as provided in 300.18 and shall be fastened so that movement from thermal expansion or contraction is permitted. RFC shall be securely fastened and supported in accordance with 351.30(A) and (B).

(A) Securely Fastened. RFC shall be securely fastened within 900 mm (3 ft) of each outlet box, junction box, device box, conduit body, or other conduit termination. Conduit listed for securing at other than 900 mm (3 ft) shall be permitted to be installed in accordance with the listing.

(B) Supports. Conduit listed for support at spacings different from Table 352.30 (B), shall be permitted to be installed in accordance with the listing. If there is no listing, RFC shall be supported as required in Table 352.30(B). Horizontal runs of RFC supported by openings through framing members at intervals not exceeding those in Table 352.30(B) and securely fastened within 900 mm (3 ft) of termination points shall be permitted.

351.44 Expansion Fittings

Expansion fittings for RFC shall be provided to compensate for thermal expansion and contraction where the length change, in accordance with Table 351.44, is expected to be 6 mm (1/ 4 in.) or greater in a straight run between securely mounted items such as boxes, cabinets, elbows, or other conduit terminations.

351.46 Bushings

Where a conduit enters a box, fitting, or other enclosure, a bushing or adapter shall be provided to protect the wire from abrasion unless the box, fitting, or enclosure design provides equivalent protection.

FPN: See 300.4(F) for the protection of conductors 4 AWG and larger at bushings.

351.48 Joints

All joints between lengths of conduit, and between conduit and couplings, fittings, and boxes, shall be made by an approved method.

351.56 Splices and Taps

Splices and taps shall be made in accordance with 300.15.

351.60 Grounding

Where equipment grounding is required, a separate equipment grounding conductor shall be installed in the conduit.

Exception No. 1: As permitted in 250.134(B), Exception No. 2, for dc circuits and 250.134(B), Exception No. 1, for separately run equipment grounding conductors.

Exception No. 2: Where the grounded conductor is used to ground equipment as permitted in 250.142.

III. Construction Specifications

351.100 Construction

RFC and fittings shall be composed of suitable material that is resistant to moisture and chemical atmospheres. For use above ground, it shall also be flame retardant, resistant to impact and crushing, resistant to distortion from heat under conditions likely to be encountered in service, and resistant to low temperature and sunlight effects. For use underground, the material shall be acceptably resistant to moisture and corrosive agents and shall be of sufficient strength to withstand abuse, such as by impact and crushing, in handling and during installation. Where intended for direct burial, without encasement in concrete, the material shall also be capable of withstanding continued loading that is likely to be encountered after installation.

351.120 Marking

Each length of RFC shall be clearly and durably marked at least every 3 m (10 ft) as required in the first sentence of 110.21. The type of material shall also be included in the marking unless it is visually identifiable. For conduit recognized for use above ground, these markings shall be permanent. For conduit limited to underground use only, these markings shall be sufficiently durable to remain legible until the material is installed. Conduit shall be permitted to be surface marked to indicate special characteristics of the material.

FPN: Examples of these markings include but are not limited to ``limited smoke'' and ``sunlight resistant.''

I**Substantiation:** For the 2005 NEC, High Density Poly Ethylene (HDPE) was broken out from Article 352 and a new Article 353 was created. It is our opinion that the same should have been done for fiberglass conduit as well, but as there was no formal proposal at that time, it couldn't be done for obvious reasons. Fiberglass conduit has entirely different properties (chemical, electrical, physical) compared to PVC conduit. Furthermore, fiberglass conduit has different dimensions compared to PVC conduit. Rigid fiberglass conduit has been produced for almost 40 years now as an accepted conduti material and it is time that fiberglass conduit is being recognized with its own article.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Proposal 8-53 and 8-78.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

8-55 Log #230 NEC-P08 **Final Action: Reject**
(352.10, FPN)

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
FPN: Extreme cold may cause some nonmetallic conduits to become brittle, and therefore, more susceptible to damage from ~~physical~~ contact.
Substantiation: Use of the word "physical" is superfluous - the purpose is obvious.
Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every unnecessary instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "contact" means "physical contact."
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-4 (Log 336).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-56 Log #316 NEC-P08 **Final Action: Reject**
(352.10(F))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
(F) Exposed. For exposed work where not subject to ~~physical~~ damage if identified for such use.
Substantiation: Use of the word "physical" is superfluous– the purpose is obvious.
Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.)
Let's take care of that for good: for our purposes, "damage" means "physical damage."
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-4 (Log 336).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-57 Log #2614 NEC-P08 **Final Action: Accept in Principle**
(352.10(F))

Submitter: David H. Kendall, Carlon
Recommendation: Revise 352.10(F) to read as follows:
(F) Exposed. RNC shall be permitted for exposed work ~~not subject to physical damage if identified for such use~~ . RNC used exposed in areas of physical damage shall be identified for the use.
<u>FPN: Rigid nonmetallic PVC Conduit, Type Schedule 80, is identified for areas of physical damage.</u>
Substantiation: 352.10(F) was revised for clarification and made the section more user friendly. The FPN was added to help the user to identify known product for areas of physical damage.
Panel Meeting Action: Accept in Principle
Modify 352.10(F) as follows:
(F) Exposed. <u>PVC conduit</u> ~~RNC~~ shall be permitted for exposed work ~~not subject to physical damage if identified for such use~~ . <u>PVC conduit</u> ~~RNC~~ used exposed in areas of physical damage shall be identified for the use.
<u>FPN: Rigid nonmetallic PVC Conduit, Type Schedule 80, is identified for areas of physical damage.</u>
Panel Statement: The submitter's intent was met.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

Comment on Affirmative:
LOYD, R.: While I approve of the rule to be applied I feel the FPN is not necessary and could have been better stated in positive text in the Section, such as: "352.10(F) Exposed. Schedule 40 PVC conduit shall be permitted where not subject to physical damage. Schedule 80 PVC conduit shall be permitted in areas where subject to physical damage."
The testing laboratory representatives and the manufacturer on the panel both stated Schedule 80 is the only nonmetallic conduit presently listed for applications where subject to physical damage.

8-58 Log #3449 NEC-P08 **Final Action: Reject**
(352.12 Exception (New))

Submitter: Joseph S. Zimnoch, The Okonite Company
Recommendation: Add the following Exception:
Exception: Medium voltage cables rated 105°C shall be permitted to be installed in concrete encased or direct buried RNC.
Substantiation: Since the introduction of 105°C rated medium voltage cables in the 1996 NEC, many 105°C rated cables have been installed in concrete encased PVC ducts and direct buried PVC ducts without incident.
Since the thermal mass of the concrete and soil dissipate heat away from the duct and there is a temperature gradient from the conductor to the cables outer surface, the cables outer surface runs cooler than the thermal rating of the rating of the duct.
Panel Meeting Action: Reject
Panel Statement: 352.12(E) Exception permits the use of 105 degree C medium voltage cables to be used in rigid nonmetallic conduit, provided that the medium voltage cables are not operated at a temperature higher than the RNC listed temperature rating. The submitter did not provide technical data to support that the concrete and soil thermal conductivity is adequate to protect the conduit against excessive temperature rise.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-59 Log #1974 NEC-P08 **Final Action: Accept**
(352.12(A))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Change the text of 352.12(A) to read as shown:
352.12(A) Hazardous (Classified) Locations. ~~(1)~~ In <u>any</u> hazardous (classified) locations, except as permitted <u>by other Articles in this Code.</u> ~~in 503.10(A), 504.20, 514.8 Exception No. 2, and 515.8.~~
~~(2) In Class I, Division 2 locations, except as permitted in 501.10(B)(3).~~
Substantiation: This change is necessary because the current text is too limiting. The areas of usage for RNC within the hazardous (Classified) locations Articles in the Code are broader. The current text may limit the use of RNC, by an AHJ, because the RNC Article itself does not recognize the broader permissions. The proposed text is preferred to a laundry list of section references.
Panel Meeting Action: Accept
Panel Statement: See panel action and statement on Proposals 8-53 and 8-78. This accepted change should be inserted into the revised Article 352 and new Article 355 based on Proposals 8-53 and 8-78.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-60 Log #3630 NEC-P08 **Final Action: Accept in Principle**
(352.12(A))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 14 for Comment.
Submitter: Goran Haag, Champion Fiberglass, Inc.
Recommendation: For sub-paragraph (1), insert the words "501.10 (B)(1)(7)" before 503.10(A) and delete the next sentence. "(2)In Class I, Division 2 locations, except as permitted in 501.10(B)(3)".
Substantiation: Addition of rigid nonmetallic conduit to Class I, Division 2 wiring methods. This proposal provides the option of using a conduit system that is corrosion resistant and safe for Class I, Division 2 locations. Chemical plants, refineries, off shore drilling facilities and other similar processes are highly corrosive and also have classified areas. Nonmetallic conduit provides a critical option on these locations. The NEC requirements for rigid nonmetallic conduit are found in Article 352. Rigid nonmetallic conduit is listed in the UL Information Directory, which describes the types of rigid nonmetallic conduit, and also in UL standard 1684. Rigid nonmetallic conduit is permitted in Class III, Division 1 locations; a s buried raceway in Class I location in commercial Garages, Article 511; in Bulk Storage Plants, Article 515, and in Class I, Division 1 locations when enclosed in concrete. This proposal also requires an equipment grounding conductor with the nonmetallic conduit in Class I, Division 2 locations. Rigid nonmetallic conduit, not other cabling or conduit systems, is not permitted where subject to physical damage unless identified for such use.
A second proposal to permit RNC in Class I, Division 2 locations is being submitted to section 501.10(B)(1)(7)

Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 8-59. Only Panel 14, the CMP responsible for Hazardous Locations, can determine the acceptable wiring method for hazardous locations.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-61 Log #315 NEC-P08 **Final Action: Reject**
(352.12(C))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
(C) ~~Physical damage~~ Violence. Where subject to ~~physical damage~~ blows or abrasion unless identified for such use.
Substantiation: Use of the word "physical" is superfluous– the purpose is obvious. In some instances, one could argue for the use of "mechanical" to differentiate that from e.g., "thermal" damage, but context makes the intended sense quite clear, rendering anything like this completely unnecessary.
Here, though, the immediately following item, (D), refers to a form of physical damage–deterioration by overheating. The proposed rewording is an attempt at precision. If you don't care to reword (C), its existing form theoretically eliminates the need for (D).
Furthermore, I would then have to fall back to arguing that in that case the term "physical" should be eliminated. Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.)
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-4 (Log 336).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-62 Log #2615 NEC-P08 **Final Action: Accept in Principle**
(352.12(C))

Submitter: David H. Kendall, Carlon
Recommendation: Revise 352.12(C) to read as follows:
(C) Physical Damage. Where subject to physical damage unless identified for such use.
FPN: Rigid nonmetallic PVC conduit, Type Schedule 80, is identified for areas of physical damage.
Substantiation: The FPN was added to help the user to identify known product for areas of physical damage.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 8-57. The submitter's intent is met.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
LOYD, R.: While I approve of the rule to be applied I feel the FPN is not necessary and could have been better stated in positive text in the section, such as: "352.12(C) Exposed. Schedule PVC conduit shall not be permitted where subject to physical damage.
Exception: Schedule 80 PVC conduit shall be permitted."
The testing laboratory representatives and the manufacturer on the panel both stated Schedule 80 is the only nonmetallic conduit presently listed for applications where subject to physical damage.

8-63 Log #3357 NEC-P08 **Final Action: Reject**
(352.12(G) (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc. / Rep. Massachusetts Electrical Code Advisory Committee
Recommendation: Add a new (G) to read as follows:
(G) High-Rise Buildings. Where used in buildings more than 21 m (70 ft) above mean grade, rigid nonmetallic conduit shall not be used unless the building is protected by an approved fire sprinkler system(s) installed on all floors as a complete system, or the conduit is concealed behind a thermal barrier as described in 362.10(2) or 362.10(5), or the conduit is encased in not less than 50 mm (2 in.) of concrete.
Substantiation: This proposal removes a technical inconsistency in the Code, since rigid nonmetallic conduit constructed of polyvinyl chloride is the identical material as used in Electrical Nonmetallic Tubing (ENT). ENT, with a lower volume of nonmetallic material per comparable unit length, now has a more severe restriction.
Although the existence of a technical inconsistency in and of itself does not necessarily justify changing the NEC, certain conclusions can be legitimately drawn from the field experience with comparable products. That chemical composition and its behavior under fire conditions is what led to the final outcome of allowed uses for ENT. The restriction should not be confined to the wiring method with the largest potential market share.
Panel Meeting Action: Reject
Panel Statement: The proposal does not remove a technical inconsistency in the Code but adds a restriction to the use of RNC without technical substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-64 Log #2261 NEC-P08 **Final Action: Reject**
(352.13)

Submitter: H. Brooke Stauffer, National Electrical Contractors Assn. (NECA)
Recommendation: Add new text to read:
352.xx Rigid nonmetallic conduit shall be installed in a neat and workmanlike manner.
FPN: Accepted industry practices are described in ANSI/NECA 111-2003, Standard for Installing Nonmetallic Raceways (RNC, ENT, LFNC), and other ANSI-approved installation standards.
Substantiation: The general workmanship requirement of 110.12 applies to electrical equipment and systems covered by Article 352. However, safety would be improved by offering more detailed installation guidance for rigid nonmetallic conduit.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-3 (Log 3454).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
LOYD, R.: See my comment on 8-3.

8-65 Log #1348 NEC-P08 **Final Action: Accept in Principle**
(352.30(C))

Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Add the following text to 352.30
(C) Unsupported raceways: Type RNC shall be permitted to be unsupported where the raceway is not more than 900 mm (3 ft) in length and remains in unbroken lengths (without coupling). Such raceway shall terminate in an outlet box, junction box, device box, cabinet, or other termination at each end of the raceway.
Substantiation: Unsupported raceways are violations of the *Code* that occur everyday. As written, a 3 inch length of conduit between enclosures is required to be supported, despite the fact that it adds little if any structural value to the system. Quite often, particularly with conduit nipples, securing and supporting a raceway shorter than 36 inches is not possible. Furthermore, securing and supporting is of little value on lengths less than 36 inches where the conduit terminates at a box on each end, where the box is installed and supported in compliance with its applicable *Code* section.
This proposal is written with the parallel effect of *Code* sections that have been strived for in chapter 3, and matches the numbering system used in the Cable Articles. It also uses existing text taken from both the Cable Articles and the Raceway Articles
Panel Meeting Action: Accept in Principle
Add the following text to 352.30
(C) Unsupported raceways: Type PVC conduit RNC shall be permitted to be unsupported where the raceway is not more than 900 mm (3 ft) in length and remains in unbroken lengths (without coupling). Such raceway shall terminate in an outlet box, junction box, device box, cabinet, or other termination at each end of the raceway.
Panel Statement: The submitter's intent is met. It is the committee intent that this change be folded into 8-53 and 8-78 (in 355.30, change PVC conduit to RTRC).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
DABE, J.: See my comment for 8-9.
HUMPHREY, D.: This proposal does not address other issues that may have a direct impact on the durability of the electrical installation., The affects of weight and vibration on concentric and eccentric knockouts at each end of a three foot run between pieces of equipment, a scenario that would be frequently encountered in many electrical installations may compromise the strength of the installation. The raceway having even a single point of support would help to mitigate these deleterious affects. 300.11 further requires that raceways be

securely fastened in place. I would assert that this proposal would conflict with the requirements of 300.11. In summation, depending on connectors, double locknuts etc. to support and secure this up to 36 in. installation especially where concentric or eccentric knockouts are encountered is dubious at best. 36 in. should provide ample space in which to install normal supporting and securing hardware. A proposal involving a shorter distance and where no concentric or eccentric knockouts are encountered may be in order.

8-66 Log #3359 NEC-P08 **Final Action: Reject**
(352.44)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc. / Rep. Massachusetts Electrical Code Advisory Committee
Recommendation: Revise to read as follows:
352.44 Expansion Fittings. Expansion fittings for rigid nonmetallic conduit shall be provided to compensate for thermal expansion and contraction where the length change will exceed, in accordance with Tables 352.44(A) and (B), 3 mm (1 / 8 in) at securely mounted items such as boxes, cabinets, elbows, or other conduit terminations.
Substantiation: The main problem with the existing wording is that one cannot assume the problem is only between two securely mounted boxes, etc. If that is the case, then the current NEC wording (1/4 inch) is fine because the box at each end only moves 1/8 inch. Suppose, however, the conduit 90's away from a brick inside corner on the left to a box on the right. The left side cannot move, so how much distance is allowed for the box? The full 1/4-inch will break the supports free of the box, as members of the Advisory Committee have verified by test. The current NEC wording does not address this common occurrence. Another related problem in the NEC concerns boxes mounted on either end of reverse 90's or the like. The conduit may expand and contract over its length much more than 1/4 inch and not put very much pressure on the boxes at all.
The point is, how much displacement should any fixed termination tolerate? The rule should be written to prevent, under any circumstances, RNC movement that will tend to displace a securely fastened item more than 1/8-inch due to field temperature fluctuation. If the panel has technical information that demonstrates that typical items in a run of PVC can tolerate more that 1/8-inch, then so be it. However, the Advisory Committee members are aware of instances where even this smaller dimension pushed the envelope on what mounted equipment would tolerate. Remember, the point of this proposal is not to change the allowed tolerance between two items connected with RNC. The 1/4-inch limit works fine until the entire expansion motion occurs at only one end of a run. These circumstances occur frequently.
Panel Meeting Action: Reject
Panel Statement: The current language of this section adequately conveys the requirement. In addition, there is not enough technical substantiation to revise the requirement.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-67 Log #960 NEC-P08 **Final Action: Reject**
(352.60)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise as follows:
Where an equipment grounding conductor is ~~required~~ provided , ~~a separate equipment grounding conductor~~ it shall be installed in the raceway.
Substantiation: Where equipment is not to be grounded, but grounded by choice, present wording does not preclude an EGC installed in any manner, and if not in the raceway is not covered by 250.120(A). Code provisions are not limited to mandatory requirements and 110.12 applies to all wiring. 250.1(1) indicates Article 250 covers installations "permitting" and the proposal would correlate this section.
Panel Meeting Action: Reject
Panel Statement: The submitter's concerns are addressed in Section 300.3(B) for equipment grounding conductors that are provided, but not required.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-68 Log #2616 NEC-P08 **Final Action: Accept in Principle in Part**
(352.100)

Submitter: David H. Kendall, Carlon
Recommendation: Revise 352.100 to read as follows:
352.100 Construction. RNC shall be made of rigid (nonplasticized) polyvinyl chloride (PVC) or reenforced thermosetting resin (RTRC). The material shall be homogenous without the use of foaming agents . RNC and fittings shall be composed of suitable nonmetallic material that is resistant to moisture and chemical atmospheres. For use above ground, it shall also be flame retardant, resistant to impact and crushing, resistant to distortions from heat under conditions likely to be encountered in service and resistant to low temperature and sunlight effects. For use underground, the material shall be acceptably resistant to moisture and corrosive agents and shall be of sufficient strength to withstand abuse, such as by impact and crushing, in handling and during installation. Where intended for direct burial, without encasement in concrete, the material shall also be capable of withstanding continued loading that is likely to be encountered after installation.
Substantiation: 352.100 was revised to narrow the scope of the PVC and RTRC material allowed to be used without Panel 8 review.
UL has recently issued a Listing for a foamed core Schedule 40 Rigid PVC Conduit. Several Panel members had concerns regarding this listing that was not addressed by UL.
This product was evaluated to the requirements contained in the standard for Schedule 40 and 80 Rigid PVC Conduit, UL 651. However, the foam core product utilizes foaming agents within its wall, and is therefore nonhomogeneous in nature. This produces a product that is obviously different from any other conduit previously listed under UL 651. As a result, there are several inherent safety concerns pertaining to this product that would not have been addressed by the Listing evaluation. It should also be noted that this type of product has previously been submitted to UL prior to their restructuring and was rejected for evaluation under the UL 651 standard due to these same concerns. While the foam core product may have its place as a Listable conduit, it should not be considered equivalent to currently Listed PVC conduits. The development of separate requirements to address these products should have taken place through UL's Subject 651 STP, in accordance with UL's own standards development process.
When discussing the technical considerations and concerns related to this product, it is important to bear in mind the uses for which it was developed. Coextruded cellular core PVC pipe originated within the plumbing industry for use in DWV (Drain, Waste, and Vent) applications. Due to its low mechanical strength, it is excluded from pressure applications and is used almost exclusively in nonexposed locations. While some electrical utilities have subsequently used this product in limited applications outside of the scope of the National Electrical Code, it was always subject to strict premise control and never permitted as a general purpose wiring method.
Based on this history and our familiarity with this pipe, industry is greatly concerned over its ability to withstand the physical conditions to which it will be subjected. While the resistance of homogenous rigid PVC conduit to mechanical damage on both a short term and long term basis has been well established, the same cannot be said for the foamed pipe. UL's decision to List coextruded cellular cover PVC pipe as an electrical raceway, without a thorough analysis and understanding of its nature and inherent weaknesses, has established a dangerous precedent which can only serve to damage the reputation of the rigid nonmetallic conduit industry.
The UL 651 Standard requires that the compound used for Schedule 40 and Schedule 80 Rigid PVC Conduit be as described in the Standard Specification for Rigid Poly (Vinyl Chloride) (PVC) Compounds and Chlorinated Poly (Vinyl Chloride) (CPVC) Compounds, ASTM D 1784. However, that standard applies only to homogenous conduit and indicates that the materials used "shall be of uniform composition." This is clearly not the case once the foaming agents have been introduced.
Instead of the ASTM D 1784 standard, the document that is applicable to the cellular pipe is the Standard Specification for Coextruded Poly (Vinyl Chloride) (PVC) Plastic Pipe with a Cellular Core, ASTM F 891. This is acknowledged in the manufacturer's own product literature. However, the F 891 document clearly indicates that this product is intended for use as drain, waste, or vent pipe or as underground communication conduit and that it is "not for underground electrical power distribution usage."
Our concerns over the use of this pipe in power distribution applications center on its nonhomogeneous nature, and the highly questionable performance characteristics of the foamed inner layer. Our principle technical concerns are as follows:
1) Pockets of air, such as those found within the cells of the foam core pipe, provide an excellent insulating layer. While this may be desirable in many applications, electrical conduit is not one of them. Once such an insulating layer has been introduced within the wall of any type of rigid nonmetallic conduit, the conduits ability to dissipate the heat generated by the conductors contained within is severely compromised. As the heat generation effects are one of the two main factors used to determine a raceway's wirefill capacity, in all likelihood this product should have a decreased wirefill. However, this was not addressed by UL's investigation, nor was it envisioned by the wirefill tables contained in the National Electrical Code.
2) As noted above, the manufacturer's own literature for this product states that its performance is in accordance with the ASTM F891 Standard. However, this standard specifies impact values which range from 42 - 55% of those specified in UL 651. Based upon our experience, it would be extremely difficult, if not impossible, for a coextruded cellular pipe to comply with the UL 651 requirements. Impact testing is one of the areas where we have been receiving contradictory information from UL as to whether or not this product was subjected to the UL 651 requirements. As impact resistance is one of the principle parameters that need to be maintained in any type of rigid conduit, it is imperative that this not be compromised in any manner.
3) Homogeneous rigid PVC conduit provides a predictable behavior pattern in that if the outer wall is scratched or the end of the conduit is chambered in the factory or in the field, it will only expose identical material underneath. However, in the case of the foam core product, a new material will be exposed. UL's policy has long been to evaluate products based upon their intended conditions of use and reasonably foreseeable conditions of misuse. As minor nicks or scrapes may occur during transport or installation, a number of the

foam core conduit's performance characteristics should be evaluated both from the standpoint of the performance of the inner and outer walls, as well as the foam core.

4) The blowing agent used to produce the cellular core pipe has a flash point of 320°F and the MSDS sheets for this material indicates that "elevated temperatures and flames" are to be avoided because of this. As almost all cellular core pipe will have residual blowing agent embedded in them after manufacture, this is a significant concern. Should the outer or inner layer of PVC be compromised during installation of the conduit or conductors, a potentially hazardous situation can arise. The effect of the blowing agent on the flammability of this product is of great concern and must be thoroughly investigated.

5) Should the outer PVC layer of these products become compromised, it can also expose the cellular inner core to moisture. Due to the open nature of this inner layer, moisture could then readily penetrate the conduit, resulting in an electrically or mechanically hazardous situation. The cells provide a pathway through the conduit wall whereby moisture can penetrate and potentially contact the electrical conductors. Additionally, the detrimental effect of increased moisture content on PVC conduit's mechanical properties has long been established.

6) The resistance to sunlight of PVC products has always been of great concern to conduit manufacturers, and additives have been developed to address this. However, the effect of sunlight on the foam core pipe, in either the short term or long term, is largely unknown. Even the plumbing and utility applications of this pipe have only involved applications that are shielded from sunlight, so no history can be extrapolated for electrical conduit. Our concerns once again center on the possibility of minor surface damage, which would not have a detrimental effect on a homogenous product, having a serious effect on the cellular core product.

7) The DZYR Guide information states that this product is "inherently resistant to atmosphere containing common industrial corrosive agents and will also withstand vapors or mist of caustic, pickling acids, plating bath and hydrofluoric and chromic acids." While the behavior of the homogenous PVC product has been established for these environments, and therefore does not require an evaluation as part of the Listing investigation, the same cannot be said for the foam core pipe. This situation would be significantly aggravated by the introduction of moisture as a transport mechanism.

8) The thermal expansion characteristics of homogenous PVC conduit are well known, and are defined in Table 352.44(A) of the National Electrical Code. However, the same cannot be said for the foam core pipe. Stresses imposed upon the conduit system by insufficient allowance for thermal expansion would result in a hazardous situation, and this situation must be addressed both by UL and the National Electrical Code.

9) Schedule 40 and 80 rigid PVC conduit is acceptable for both field and factory bending by a variety of methods. however, when the foam core pipe is similarly bent, the PVC layer will stretch and thin, thereby reducing its wall thickness. This thinning can create a number of complications for the foam core pipe that are not present for the homogeneous conduit, such as increasing the possibility of burn through to the foam inner layer when wires or cables are pulled. In addition to the hazards implicit in exposing this foamed material to the environment, the cellular structure of this material will be very susceptible to damage by the wire insulation.

10) Concerns over delamination of rigid conduit products have been addressed through the incorporation of the Extrusion Process Test in UL 651. However, as noted before, if the exterior PVC layer is compromised, it will expose an interior layer which does not have a similar history.

11) Recycled/Regrind materials are currently permitted for use with Schedule 40 and Schedule 80 rigid PVC conduit, due to their homogenous nature However, the introduction of the blowing agents and nonuniform materials may preclude this for the coextruded cellular core pipe. Steps must be taken to quantify the blowing agents and additives that are introduced in the cellular process, as their presence and amount can have a significant impact on the overall behavior of this pipe.

Material Identification for a nonhomogenous PVC pipe will similarly introduce new challenges for these products that will need to be addressed. In addition to the PVC compounds used in the inner and outer layers, the amount and identification of the blowing agent and other additives present in the cellular core will need to be determined and tightly controlled. As noted above, these additional materials and the porosity that results can significantly affect the mechanical characteristics of this pipe.

12) This pipe should be provided with an additional marking in order to distinguish it from the standard homogeneous wall conduit. As the outward physical appearances of the two products are virtually indistinguishable once it has been installed, to not alert the installation and inspection communities of its use will do them a severe disservice.

As noted in earlier communication to UL, this product was clearly not envisioned for coverage under Article 352 of the National Electrical Code. Each of the three conduit types currently or formerly covered by Article 352 (rigid PVC, HDPE, and RTRC) was first introduced to the Code Making Panel (CMP) through the use of a Fact Finding Investigation. To introduce a new and significantly different type of rigid nonmetallic conduit without following this same procedure indicates a willingness on UL's part to unilaterally determine what types of products should be accepted as general purpose wiring methods without receiving input from the CMP or UL's STP.

Due to the extent and nature of our concerns, which are shared by other manufacturers within the rigid PVC industry as well as members of CMP 8, it can be readily seen that insufficient technical consideration was given to the potential hazards implicit with the use of this product.

Panel Meeting Action: Accept in Principle in Part

Revise the proposed text in 352.100 to read as follows:

352.100 Construction. PVC conduit RNC shall be made of rigid (nonplasticized) polyvinyl chloride (PVC) ~~or reenforced thermosetting resin (RTRC).~~ The material shall be homogeneous without the use of foaming agents . RNC and fittings shall be composed of suitable nonmetallic material that is resistant to moisture and chemical atmospheres. For use above ground, it shall also be flame retardant, resistant to impact and crushing, resistant to distortions from heat under conditions likely to be encountered in service and resistant to low temperature and sunlight effects. For use underground, the material shall be acceptably resistant to moisture and corrosive agents and shall be of sufficient strength to withstand abuse, such as by impact and crushing, in handling and during installation. Where intended for direct burial, without encasement in concrete, the material shall also be capable of withstanding continued loading that is likely to be encountered after installation.

Panel Statement: The committee accepts the changes but rejects the change to include reinforced thermosetting resin (RTRC). The panel doesn't believe that RTRC can be constructed using the nonhomogeneous foaming agent. See panel action and statement on Proposal 8-53.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

WALBRECHT, G.: UL is opposed to the proposed revision limiting the material for rigid nonmetallic conduit (RNC) to only homogeneous polyvinyl chloride (PVC) or reinforced thermosetting resin (RTRC) for a number of reasons.

The level of detail associated with defining the materials used in the construction of RNC is better addressed in the relevant product safety standards, in this case the Standard for Schedule 40 and 80 Rigid PVC Conduit and Fittings, ANSI/UL 651. ANSI/UL 651 includes assessments of impact resistance, flammability, water absorption, sunlight resistance, and other relevant safety properties related to RNC. Proposals to revise ANSI/UL 651 may be submitted by any interested party for the action of the Standards Technical Panel. The proposed revision under consideration by Panel 8 related to homogenous material has not been submitted for action by STP 651.

Most importantly, the numerous allegations included within the proposal are not technically substantiated by factual information.

Based on this, UL does not support the proposed revision to Article 352. The proposed revision will modify very detailed material requirements within the NEC, with the practical result of effective suppression of suitable alternative technologies - and repetitive future work in CMP 8 to address product level details better addressed in the applicable product standard forum.

ARTICLE 353 — HIGH DENSITY POLYETHYLENE CONDUIT: TYPE HDPE CONDUIT

8-68a Log #CP801 NEC-P08 **Final Action: Accept**
(353.1)

Submitter: Code-Making Panel 8,

Recommendation: Revise 353.1 to add an FPN as follows:

353.1 Scope. This article covers the use, installation, and construction specification for high density polyethylene (HDPE) conduit and associated fittings.

FPN: Refer to Article 352 for Rigid Polyvinyl Chloride Conduit: Type PVC and Article 355 for Reinforced Thermosetting Resin Conduit: Type RTRC.

Substantiation: The intent of this proposal is to provide consistency with panel actions on Proposals 8-53 and 8-78. It is recommended that the TCC consider the article scope as revised.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

KENDALL, D.: This proposal should be rejected. The scope of Article 353 should state that HDPE Conduit is a rigid nonmetallic conduit as stated for both PVC Conduit (Article 352) and RTRC Conduit (Proposed Article 355). All three conduits were under the scope of Article 352 prior to the 2005 NEC. Article 352 was for rigid nonmetallic conduits.

Comment on Affirmative:

DUREN, R.: Foamed core products should undergo a fact-finding investigation to determine the scope and range of their acceptable use. If the manufacturer wants to sell this product for use as a wiring method, a separate article covering application of the foamed core product should be developed unless the product is found to be comparable in every way to the performance of the homogenous product covered in Article 352.

8-69 Log #2617 NEC-P08 **Final Action: Accept in Principle**
(353.10(5))

Submitter: David H. Kendall, Carlon
Recommendation: Revise as follows:
353.10 Uses Permitted.
(5) Aboveground where encased in not less than 50 mm (2 in.) of concrete.
Substantiation: The proposal clarifies that HDPE conduit is acceptable to be used aboveground where encased in concrete per the listing of the product. HDPE conduit has been listed per UL651A and UL651B for aboveground uses where encased in not less than 50 mm of concrete prior to the adoption of this new article.
Panel Meeting Action: Accept in Principle
Revise as follows:
353.10 Uses Permitted.
(5) Aboveground, except as prohibited in Section 353.12, where encased in not less than 50 mm (2 in.) of concrete.
Panel Statement: The submitter's intent was met. The phrase ", except as prohibited in Section 353.12, " was added to clarify that HDPE is not permitted in buildings.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-70 Log #1967 NEC-P08 **Final Action: Accept**
(353.12(3))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Change the text of 353.12(3) to read as shown:
353.12(3) in any hazardous (classified) locations, except as permitted by other Articles in this Code. ~~in 504.20~~
Substantiation: This change is necessary because the current text is too limiting. The areas of usage for HDPE Conduit within the hazardous (Classified) locations Articles in the Code are broader. The current text may limit the use of HDPE Conduit, by an AHJ, because the HDPE Conduit Article itself does not recognize the broader permissions. The proposed text is preferred to a laundry list of section references.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-71 Log #2262 NEC-P08 **Final Action: Reject**
(353.13)

Submitter: H. Brooke Stauffer, National Electrical Contractors Assn. (NECA)
Recommendation: Add new text to read:
353.xx HDPE conduit shall be installed in a neat and workmanlike manner.
FPN: Accepted industry practices are described in ANSI/NECA/NEMA 605-2005, Recommended Practice for Installing Nonmetallic Underground Utility Duct, and other ANSI-approved installation standards.
Substantiation: The general workmanship requirement of 110.12 applies to electrical equipment covered by Article 353. However, safety would be improved by offering more detailed installation guidance for HDPE conduit.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-3 (Log 3454).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
LOYD, R.: See my comment on 8-3.

8-72 Log #2618 NEC-P08 **Final Action: Accept**
(353.20(B))

Submitter: David H. Kendall, Carlon
Recommendation: Revise as follows:
353.20 Size.
(A) Minimum. HDPE conduit smaller than metric designator 16 (trade size 1/2) shall not be used.
(B) Maximum. HDPE conduit larger than metric designator 155 (trade size 6) ~~103 (trade size 4)~~ shall not be used.
FPN: The trade sized and metric designations are for identification purposes only and do not relate to actual dimensions, see 300.1(C).
Substantiation: The proposal clarifies that metric designator 155 (trade size 6) is the maximum size HDPE conduit listed on the market to date. HDPE conduit, metric designator 155 (trade size 6), has been listed per UL651A and UL651B prior to the adoption of this new article.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-73 Log #2782 NEC-P08 **Final Action: Reject**
(353.44)

Submitter: Ted Smith, Ludvik Electric Co. / Rep. International Electrical Instructors & Students Assoc.
Recommendation: Add new text to read:
353.44 Expansion Fittings. Expansion fittings shall be installed where expected length change, due to expansion and contraction due to temperature change and designed building movement is more than 6 mm (.25 in.)
Substantiation: Large structures are often times designed with expansion joints to all for building movement and temperature change expansion and contraction. HDPE installed across these expansion joints is subject to movement which will lead to loosened connections at couplings and connectors. The loosened connections will decrease the effectiveness of the ground fault return path and ultimately affect the safety of the electrical installation.
Panel Meeting Action: Reject
Panel Statement: HDPE is only for underground use or within 2 inches of concrete above ground if 8-69 is accepted, not for use within buildings. HDPE cannot be used within a building. There are no technical data submitted for temperature coefficents for expansion. Setting the stage for any type of code violation is not the intent of the panel.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-74 Log #2619 NEC-P08 **Final Action: Accept**
(353.48, FPN (New))

Submitter: David H. Kendall, Carlon
Recommendation: Revise as follows:
353.48 Joints. All joints between lengths of conduit and between conduit and couplings, fittings, and boxes, shall be made by an approved method.
FPN: HDPE Conduit can be joined using either heat fusion, electrofusion or mechanical fittings.
Substantiation: The new fine print note indicates several common ways of joining HDPE Conduit together. Unlike PVC Conduit, two pieces of HDPE Conduit can be heat fusion together. This has been a common and safe practice used for years by the Gas Utility Companies for joining two pieces of yellow HDPE natural gas pipe. Electrical and telephone contractors also use this established method to join two pieces of conduit. This type of joining creates a joint that is both air and water tight. The joint is usually stronger than the conduit itself.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 354 — NONMETALLIC UNDERGROUND CONDUIT WITH CONDUCTORS: TYPE NUCC

8-75 Log #2620 NEC-P08 **Final Action: Accept in Principle**
(354.10(5))

Submitter: David H. Kendall, Carlon
Recommendation: Revise as follows:
354.10 Uses Permitted.
(5) Aboveground where encased in not less than 50 mm (2 in.) of concrete.
Substantiation: The proposal clarifies that NUCC is acceptable to be used aboveground where encased in concrete per the listing of the product. NUCC has been listed as an assembly per UL1990 for aboveground uses where encased in not less than 50 mm of concrete. The raceway is listed to UL651B. This has always been an acceptable use of the product in barrier walls.
Panel Meeting Action: Accept in Principle
Revise as follows:
354.10 Uses Permitted.
(5) Aboveground, except as prohibited in Section 354.12, where encased in not less than 50 mm (2 in.) of concrete.
Panel Statement: The submitter's intent was met. The phrase ", except as prohibited in Section 354.12, " was added to clarify that NUCC is not permitted in buildings.
Number Eligible to Vote: 12

(355 (New))

TCC Action: The Technical Correlating Committee advises that Article Scope statements and Titles are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.
Submitter: William Wagner, Certification Solutions
Recommendation: Add Article 355 as follows:
Article 355
Reinforced Thermosetting Resin Conduit: Type RTRC
I. General
355.1 Scope. This article covers the use, installation, and construction specification for reinforced thermosetting resin conduit (RTRC) and associated fittings.
355.2 Definition.
Reinforced Thermosetting Resin Conduit (RTRC). A nonmetallic raceway of circular cross section, with integral or associated couplings, connectors, and fittings for the installation of electrical conductors and cables.
355.6 Listing Requirements. RTRC, factory elbows, and associated fittings shall be listed.
II. Installation.
355.10 Uses Permitted. The use of RTRC shall be permitted in accordance with 355.10(A) through (H)
(A) Concealed. RTRC shall be permitted in walls, floors, and ceilings.
(B) Corrosive Influences. RTRC shall be permitted in locations subject to severe corrosive influences as covered in 300.6 and where subject to chemicals for which the materials are specifically approved.
(C) Cinders. RTRC shall be permitted in cinder fill.
(D) Wet Locations. RTRC shall be permitted in portions of dairies, laundries, canneries, or other wet locations and in locations where walls are frequently washed, the entire conduit system including boxes and fittings used therewith shall be installed and equipped so as to prevent water from entering the conduit. All supports, bolts, straps, screws, and so forth, shall be of corrosion-resistant materials or be protected against corrosion by approved corrosion-resistant materials.
(E) Dry and Damp Locations. RTRC shall be permitted for use in dry and damp locations not prohibited by 355.12.
(F) Exposed. RTRC shall be permitted for exposed work where not subject to physical damage if identified for such use.
(G) Underground Installations. For underground installations, see 300.5 and 300.50.
FPN: Refer to Article 352 for Rigid Polyvinyl Chloride Conduit: Type PVC and Article 353 for High Density Polyethylene Conduit: Type HDPE.
(H) Support of Conduit Bodies. RTRC shall be permitted to support nonmetallic conduit bodies not larger than the largest trade size of an entering raceway. These conduit bodies shall not support luminaires (fixtures) or other equipment and shall not contain devices other than splicing devices as permitted by 110.14(B) and 314.16(C)(2).

355.12. Uses Not Permitted. RTRC shall not be used under the following conditions.
(A) Hazardous (Classified) Locations.
(1) In hazardous (classified) locations, except as permitted in 503.10(A), 504.20, 514.8 Exception No. 2, and 515.8
(2) In Class I, Division 2 locations, except as permitted in 501.10(B)(3).
(B) Support of Luminaires (Fixtures). For the support of luminaires (fixtures) or other equipment not described in 355.10(H).
(C) Physical Damage. Where subject to physical damage unless identified for such use.
(D) Ambient Temperatures. Where subject to ambient temperatures in excess of 110°C (230°F) unless listed otherwise.
(E) Insulation Temperature Limitations. For conductors or cables operating at a temperature higher than the RTRC listed operating temperature rating.
Exception: Conductors or cables rated at a temperature higher than the RTRC listed temperature rating shall be permitted to be installed in RTRC, provided they are not operated at a temperature higher than the RTRC listed temperature rating.
(F) Theaters and Similar Locations. In theaters and similar locations, except as provided in 518.4 and 520.5.
355.20 Size.
(A) Minimum. RTRC smaller than metric designator 16 (trade size 1/2) shall not be used.
(B) Maximum. RTRC larger than metric designator 155 (trade size 6) shall not be used.
FPN: The trade sizes and metric designators are for identification purposes only and do not relate to actual dimensions. See 300.1(C).
355.22 Number of Conductors. The number of conductors shall not exceed that permitted by the percentage fill specified in Table 1, Chapter 9.
Cables shall be permitted to be installed where such use is not prohibited by the respective cable articles. The number of cables shall not exceed the allowable percentage fill specified in Table 1, Chapter 9.
355.24 Bends – How Made. Bends shall be so made that the conduit will not be damaged and the internal diameter of the conduit will not be effectively reduced. Field bends shall be made only with bending equipment identified for the purpose. The radius of the curve to the centerline of such bends shall not be less than shown in Table 2, Chapter 9.
355.26 Bends – Number in One Run. There shall not be more than the equivalent of four quarter bends (360 degrees total) between pull points, for example, conduit bodies and boxes.
355.28 Tripping. All cut ends shall be trimmed inside and outside to remove rough edges.
355.30 Securing and Supporting. RTRC shall be installed as a complete system as provided in 300.18 and shall be fastened so that movement from thermal expansion or contraction is permitted. RTRC shall be securely fastened and supported in accordance with 355.30(A) and (B).
(A) Securely Fastened. RTRC shall be securely fastened within 900 mm (3 ft) of each outlet box, junction box, device box, conduit body, or other conduit termination. Conduit listed for securing at other than 900 mm (3 ft) shall be permitted to be installed in accordance with the listing.
(B) Supports. RTRC shall be supported as required in Table 355.30(B). Conduit listed for support at spacing other than as shown in Table 355.30(B) shall be permitted to be installed in accordance with the listing. Horizontal runs of RTRC supported by openings through framing members at intervals not exceeding those in Table 355.30(B) and securely fastened within 900 mm (3 ft) of termination points shall be permitted.

Table 355.30(B) Support of Reinforced Thermosetting Resin Conduit (RTRC)

Conduit Size		Maximum Spacing Between Supports	
Metric Designator	**Trade Size**	**Mm or m**	**Ft**
16 – 27	½ – 1	900 mm	3
35 – 53	1 ¼ – 2	1.5 m	5
63 – 78	2 ½ – 3	1.8 m	6
91 – 129	3 ½ – 5	2.1 m	7
155	6	2.5 m	8

355.44 Expansion Fittings. Expansion fittings for RTRC shall be provided to compensate for thermal expansion and contraction where the length change, in accordance with Table 355.44 is expected to be 6 mm (1/4 in.) or greater in a straight run between securely mounted items such as boxes, cabinets, elbows, or other conduit terminations.

Table 355.44 Expansion Characteristics of Reinforced Thermosetting Resin Conduit (RTRC) Coefficient of Thermal Expansion = 27.10-5 mm/mm°C (1.5 x 10-5 in./in.°F)

Temperature Change	Length Change of RTC Conduit (mm/m)	Temperature Change (°F)	Length Change of RTC Conduit (in./100 ft)	Temperature Change (°F)	Length Change of RTC Conduit (in./100 ft)
5	0.14	5	0.09	105	1.89
10	0.27	10	0.18	110	1.98
15	0.41	15	0.27	115	2.07

95	2.57	95	1.71	195	3.51
100	2.70	100	1.80	200	3.60

355.46 Bushings. Where a conduit enters a box, fitting, or other enclosure, a bushing or adapter shall be provided to protect the wire from abrasion unless the box, fitting, or enclosure design provides equivalent protection.

FPN: See 300.4(F) for the protection of conductors 4 AWG and larger at bushings.

355.48 Joints. All joints between lengths of conduit, and between conduit and couplings, fitting, and boxes, shall be made by an approved method.

355.56 Splices and Taps. Splices and taps shall be made in accordance with 300.15.

355.60 Grounding. Where equipment grounding is required, a separate equipment grounding conductor shall be installed in the conduit.

Exception No. 1: As permitted in 250.134(B), Exception No. 2, for dc circuits and 250.134(B), Exception No. 1, for separately run equipment grounding conductors.

Exception No. 2: Where the grounded conductor is used to ground equipment as permitted in 250.142.

III. Construction Specifications.

355.100 Construction. RTRC and fittings shall be composed of suitable nonmetallic material that is resistant to moisture and chemical atmospheres. For use above ground, it shall also be flame retardant, resistant to impact and crushing, resistant to distortion from heat under conditions likely to be encountered in service, and resistant to low temperature and sunlight effects. For use underground, the material shall be acceptably resistant to moisture and corrosive agents and shall be of sufficient strength to withstand abuse, such as by impact and crushing, in handling and during installation. Where intended for direct burial, without encasement in concrete, the material shall also be capable of withstanding continued loading that is likely to be encountered after installation.

355.120 Marking. Each length of RTRC shall be clearly and durably marked at least every 3 m (10 ft) as required in the first sentence of 110.21. The type of material shall also be included in the marking unless it is visually identifiable. For conduit recognized for use above ground, these markings shall be permanent. For conduit limited to underground use only, these markings shall be sufficiently durable to remain legible until the material is installed. Conduit shall be permitted to be surface marked to indicate special characteristics of the material.

Substantiation: This is a companion proposal for the new definition of Rigid Nonmetallic Conduit (RNC) in Article 100 and the revised Article 352 for Type PVC Conduit. This is a NEW article for the National Electrical Code.

In the 2002 edition of the National Electrical Code, Article 352; Rigid Nonmetallic Conduit (RNC) included PVC, RTRC, and HDPE products. However, for the 2005 edition of the NEC, HDPE was separated from these other conduit types and located in new Article 353. This left two very dissimilar products grouped together as RNC under Article 352 and technically eliminated HDPE as an acceptable wiring method in all applications where rigid nonmetallic conduit was specified. The separation of the PVC and RTRC products, and the definition of RNC as including rigid PVC, HDPE, and RTRC will correct this situation by better defining the installation and construction specifications for each conduit type.

It is requested that new Article be located as Article 355, which would place it after the PVC and HDPE conduit and Nonmetallic Underground Conduit with Conductors Articles.

Panel Meeting Action: Accept in Principle

Add new Article 355 to read as follows:

Article 355

Reinforced Thermosetting Resin Conduit: Type RTRC

I. General

355.1 Scope. This article covers the use, installation, and construction specification for reinforced thermosetting resin conduit (RTRC) and associated fittings.

FPN: Refer to Article 352 for Rigid Polyvinyl Chloride Conduit: Type PVC and Article 353 for High Density Polyethylene Conduit: Type HDPE.

355.2 Definition.

Reinforced Thermosetting Resin Conduit (RTRC). A rigid nonmetallic conduit (RNC) of circular cross section, with integral or associated couplings, connectors, and fittings for the installation of electrical conductors and cables.

355.6 Listing Requirements. RTRC, factory elbows, and associated fittings shall be listed.

II. Installation.

355.10 Uses Permitted. The use of RTRC shall be permitted in accordance with 355.10(A) through (H)

(A) Concealed. RTRC shall be permitted in walls, floors, and ceilings.

(B) Corrosive Influences. RTRC shall be permitted in locations subject to severe corrosive influences as covered in 300.6 and where subject to chemicals for which the materials are specifically approved.

(C) Cinders. RTRC shall be permitted in cinder fill.

(D) Wet Locations. RTRC shall be permitted in portions of dairies, laundries, canneries, or other wet locations and in locations where walls are frequently washed, the entire conduit system including boxes and fittings used therewith shall be installed and equipped so as to prevent water from entering the conduit. All supports, bolts, straps, screws, and so forth, shall be of corrosion-resistant materials or be protected against corrosion by approved corrosion-resistant materials.

(E) Dry and Damp Locations. RTRC shall be permitted for use in dry and damp locations not prohibited by 355.12.

(F) Exposed. RTRC shall be permitted for exposed work where not subject to physical damage if identified for such use.

(G) Underground Installations. For underground installations, see 300.5 and 300.50.

(H) Support of Conduit Bodies. RTRC shall be permitted to support nonmetallic conduit bodies not larger than the largest trade size of an entering raceway. These conduit bodies shall not support luminaires (fixtures) or other equipment and shall not contain devices other than splicing devices as permitted by 110.14(B) and 314.16(C)(2).

355.12. Uses Not Permitted. RTRC shall not be used under the following conditions.

(A) Hazardous (Classified) Locations.

(1) In hazardous (classified) locations, except as permitted in 503.10(A), 504.20, 514.8 Exception No. 2, and 515.8

(2) In Class I, Division 2 locations, except as permitted in 501.10(B)(3).

(B) Support of Luminaires (Fixtures). For the support of luminaires (fixtures) or other equipment not described in 355.10(H).

(C) Physical Damage. Where subject to physical damage unless identified for such use.

(D) Ambient Temperatures. Where subject to ambient temperatures in excess of 50°C (122°F) unless listed otherwise.
(E) Insulation Temperature Limitations. For conductors or cables operating at a temperature higher than the RTRC listed operating temperature rating.
Exception: Conductors or cables rated at a temperature higher than the RTRC listed temperature rating shall be permitted to be installed in RTRC, provided they are not operated at a temperature higher than the RTRC listed temperature rating.
(F) Theaters and Similar Locations. In theaters and similar locations, except as provided in 518.4 and 520.5.
355.20 Size.
(A) Minimum. RTRC smaller than metric designator 16 (trade size 1/2) shall not be used.
(B) Maximum. RTRC larger than metric designator 155 (trade size 6) shall not be used.
FPN: The trade sizes and metric designators are for identification purposes only and do not relate to actual dimensions. See 300.1(C). 355.22 Number of Conductors. The number of conductors shall not exceed that permitted by the percentage fill specified in Table 1, Chapter 9. Cables shall be permitted to be installed where such use is not prohibited by the respective cable articles. The number of cables shall not exceed the allowable percentage fill specified in Table 1, Chapter 9.
355.24 Bends – How Made. Bends shall be so made that the conduit will not be damaged and the internal diameter of the conduit will not be effectively reduced. Field bends shall be made only with bending equipment identified for the purpose. The radius of the curve to the centerline of such bends shall not be less than shown in Table 2, Chapter 9.
355.26 Bends – Number in One Run. There shall not be more than the equivalent of four quarter bends (360 degrees total) between pull points, for example, conduit bodies and boxes.
355.28 Trimming. All cut ends shall be trimmed inside and outside to remove rough edges.
355.30 Securing and Supporting. RTRC shall be installed as a complete system as provided in 300.18 and shall be fastened so that movement from thermal expansion or contraction is permitted. RTRC shall be securely fastened and supported in accordance with 355.30(A) and (B).
(A) Securely Fastened. RTRC shall be securely fastened within 900 mm (3 ft) of each outlet box, junction box, device box, conduit body, or other conduit termination. Conduit listed for securing at other than 900 mm (3 ft) shall be permitted to be installed in accordance with the listing.
(B) Supports. RTRC shall be supported as required in Table 355.30. Conduit listed for support at spacing other than as shown in Table 355.30 shall be permitted to be installed in accordance with the listing. Horizontal runs of RTRC supported by openings through framing members at intervals not exceeding those in Table 355.30 and securely fastened within 900 mm (3 ft) of termination points shall be permitted.
(EXISTING TABLE 352.30(B) HERE AS TABLE 355.30)
355.44 Expansion Fittings. Expansion fittings for RTRC shall be provided to compensate for thermal expansion and contraction where the length change, in accordance with Table 355.44 is expected to be 6 mm (1/4 in.) or greater in a straight run between securely mounted items such as boxes, cabinets, elbows, or other conduit terminations.
(EXISTING TABLE 352.44(B) HERE AS TABLE 355.44)
355.46 Bushings. Where a conduit enters a box, fitting, or other enclosure, a bushing or adapter shall be provided to protect the wire from abrasion unless the box, fitting, or enclosure design provides equivalent protection.
FPN: See 300.4(F) for the protection of conductors 4 AWG and larger at bushings.
355.48 Joints. All joints between lengths of conduit, and between conduit and couplings, fitting, and boxes, shall be made by an approved method.
355.56 Splices and Taps. Splices and taps shall be made in accordance with 300.15.
355.60 Grounding. Where equipment grounding is required, a separate equipment grounding conductor shall be installed in the conduit.
Exception No. 1: As permitted in 250.134(B), Exception No. 2, for dc circuits and 250.134(B), Exception No. 1, for separately run equipment grounding conductors.
Exception No. 2: Where the grounded conductor is used to ground equipment as permitted in 250.142.

III. Construction Specifications.

355.100 Construction. RTRC and fittings shall be composed of suitable nonmetallic material that is resistant to moisture and chemical atmospheres. For use above ground, it shall also be flame retardant, resistant to impact and crushing, resistant to distortion from heat under conditions likely to be encountered in service, and resistant to low temperature and sunlight effects. For use underground, the material shall be acceptably resistant to moisture and corrosive agents and shall be of sufficient strength to withstand abuse, such as by impact and crushing, in handling and during installation. Where intended for direct burial, without encasement in concrete, the material shall also be capable of withstanding continued loading that is likely to be encountered after installation.
355.120 Marking. Each length of RTRC shall be clearly and durably marked at least every 3 m (10 ft) as required in the first sentence of 110.21. The type of material shall also be included in the marking unless it is visually identifiable. For conduit recognized for use above ground, these markings shall be permanent. For conduit limited to underground use only, these markings shall be sufficiently durable to remain legible until the material is installed. Conduit shall be permitted to be surface marked to indicate special characteristics of the material.
FPN: Examples of these markings include but are not limited to "limited smoke" and "sunlight resistant."
Panel Statement: The submitter's intent is met, and additional editorial changes are made for clarity. This article better clarifies what RTRC is and its use. Changes are made to the submitter's recommendation to more closely follow the NEC Style Manual, and to correlate with the structure of other articles. The revised text meets the intent of the submitter.
It is recommended that the TCC consider the proposed numbering sequence of this article as well as the article scope.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-79 Log #1921 NEC-P08 **Final Action: Reject**
(355.10)

Submitter: William Wagner, Certification Solutions
Recommendation: Revise 355.10 as follows:
355.10 Uses Permitted. The use of RTRC shall be permitted in accordance with 352.10(A) through (~~H~~) (J).
(A) Concealed. RTRC shall be permitted in walls, floors, and ceilings.
(B) Corrosive Influences. RTRC shall be permitted in locations subject to severe corrosive influences as covered in 300.6 and where subject to chemicals for which the materials are specifically approved.
(C) Cinders. RTRC shall be permitted in cinder fill.
(D) Wet Locations. RTRC shall be permitted in portions of dairies, laundries, canneries, or other wet locations and in locations where walls are frequently washed, the entire conduit system including boxes and fittings used therewith shall be installed and equipped so as to prevent water from entering the conduit. All supports, bolts, straps, screws, and so forth, shall be of corrosion-resistant materials or be protected against corrosion by approved corrosion-resistant materials.
(E) Dry and Damp Locations. RTRC shall be permitted for use in dry and damp locations not prohibited by 355.12.
(F) Exposed. RTRC shall be permitted for exposed work where not subject to physical damage if identified for such use.
(G) Underground Installations. For underground installations, see 300.5 and 300.50.
FPN: Refer to Article 352 for Rigid Polyvinyl Chloride Conduit: Type PVC and Article 353 for High Density Polyethylene Conduit: Type HDPE.
(H) Support of Conduit Bodies. RTRC shall be permitted to support nonmetallic conduit bodies not larger than the largest trade size of an entering raceway. These conduit bodies shall not support luminaires (fixtures) or other equipment and shall not contain devices other than splicing devices as permitted by 110.14(B) and 314.16(C)(2).
(I) Ducts, Plenums, and Other Air-Handling Spaces. RTRC shall be permitted for use in ducts, plenums, and other air-handling spaces as covered in 300.22 if listed as having adequate fire-resistant and low smoke-producing characteristics.
FPN: One method of defining that RTRC is a fire-resistant and low smoke-producing raceway is that it exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m(5 ft) or less when tested in accordance with the plenum test in UL 2024, Standard for Optical Fiber Cable Raceway.
(J) Riser, RTRC shall be permitted for use in riser applications if listed as having fire-resistant characteristics capable of preventing the carrying of fire from floor to floor.
FPN: One method of defining that RTRC has fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is that it pass the requirements of the test for Flame Propagation (riser) in UL 2024, Standard for Optical Fiber Cable Raceway.
Substantiation: This is a companion proposal for the revised 300.22 and new Article 355.
Manufacturers have developed Type RTRC rigid nonmetallic conduit products that they believe are suitable for use as wiring methods in plenum and riser applications. However, in order to have these products evaluated accordingly, certification agencies require that there be at least one potential application for their use in accordance with the National Electrical Code. This proposal would permit these products to be employed in these applications providing that they have been specifically evaluated and listed for such use. Additionally, the Fine Pint Notes provide suggested methodologies for evaluating the fire and smoke producing aspects of these products, which are based upon other nonmetallic raceways that have previously been listed for use in these environments.
Panel Meeting Action: Reject
Panel Statement: The submitter has not supplied any technical substantiation to support this proposal. Code Panel 3 will determine which wiring methods are permitted in ducts, plenums, and other air handling spaces (300.22). Individual raceway articles do not need to duplicate acceptable systems. In addition, UL 2024 is used to evaluate nonmetallic raceways for Articles 725,

770, 800, and 825 and is not intended to be used for the evaluation of electrical raceways. Only plenum rated cables are permitted to be used in these raceways in the final application and testing. 300.22 is for electrical conductors, cables, and raceways.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-80 Log #1922 NEC-P08 **Final Action: Reject**
(355.12)

Submitter: William Wagner, Certification Solutions
Recommendation: Revise 355.12 as follows:
355.12 Uses Not Permitted. RTRC shall not be used under the following conditions.
(A) Hazardous (Classified) Locations.
(1) In hazardous (classified) locations, except as permitted in 503.10(A), 504.20, 514.8 Exception No. 2, and 515.8
(2) In Class I, Division 2 locations, except as permitted in 501.10(B)(3).
(B) Support of Luminaires (Fixtures). For the support of luminaires (fixtures) or other equipment not described in 355.10(H).
(C) Physical Damage. Where subject to physical damage unless identified for such use.
(D) Ambient Temperatures. Where subject to ambient temperatures in excess of 110°C (230°F) unless listed otherwise.
(E) Insulation Temperature Limitations. For conductors or cables operating at a temperature higher than the RTRC listed operating temperature rating.
Exception: Conductors or cables rated at a temperature higher than the RTRC listed temperature rating shall be permitted to be installed in RTRC, provided they are not operated at a temperature higher than the RTRC listed temperature rating.
(F) Theaters and Similar Locations. In theaters and similar locations, except as provided in 518.4 and 520.5.
<u>(G) Ducts, Plenums, and Other Air-Handilng Spaces. RTRC shall not be used in ducts, plenums, and other air-handling spaces as covered in 300.22, unless listed as having adequate fire-resistant and low smoke-producing characteristics.</u>
<u>FPN: One method of defining that RTRC is a fire-resistant and low smoke-producing raceway is that it exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with the plenum test in UL 2024, Standard for Optical Fiber Cable Raceway.</u>
<u>(H) Riser. RTRC shall not be used in riser applications unless listed as having fire-resistant characteristics capable of preventing the carrying of fire from floor to floor.</u>
<u>FPN: One method of defining that RTRC has fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is that is pass the requirements of the test for Flame Propagation (riser) in UL 2024, Standard for Optical Fiber Cable Raceway.</u>
Substantiation: Manufactures have developed Type RTRC rigid nonmetallic conduit products that they believe are suitable for use as wiring methods i plenum and riser applications. However, general purpose Type RTRC conduit has not been evaluated for either or these uses. This proposal would prohibit Type RTRC conduit from being employed in these applications unless it has been specifically evaluated and listed for such use. Additionally, the Fine Print Notes provide suggested methodologies for evaluating the fire and smoke producing aspects of these products, which are based upon other nonmetallic raceways that have previously been listed for use in these environments.

ARTICLE 356 — LIQUIDTIGHT FLEXIBLE NONMETALLIC CONDUIT: TYPE LFNC

8-81 Log #309 NEC-P08 **Final Action: Reject**
(356.10, FPN)

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
FPN: Extreme cold may cause some nonmetallic conduits to become brittle and, therefore, more susceptible to damage from ~~physical~~ contact.
Substantiation: Use of the word “physical” is superfluous– the purpose is obvious.
Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the use of “physical” is not only poor writing–look at William Zinsser’s classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to “physical damage,” in 1959, from “mechanical injury” (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, “Is anyone claiming electrical equipment needs protection from non-physical injury?” (Substitute the snide adjective of your choice.)
Let’s take care of that for good: for our purposes, “damage” means “physical damage.”
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-4 (Log 336).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-82 Log #2622 NEC-P08 **Final Action: Accept in Principle**
(356.10(7) (New))

Submitter: David H. Kendall, Carlon
Recommendation: Revise as follows:
356.10 Uses Permitted.
<u>(7) For encasement in concrete when installed in compliance with 356.42.</u>
Substantiation: This proposal adds a clarification to 356.10 Uses Permitted, to make it clear that LFNC can be encased in concrete when straight fittings are used.
Panel Meeting Action: Accept in Principle
Rewrite new 356.10(7) as follows
<u>(7) For encasement in concrete where listed for direct burial and installed in compliance with 356.42</u>
Panel Statement: The text was revised to accurately reflect the listing of the product. Editorial changes for clarity. The submitter’s intent was met.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-83 Log #308 NEC-P08 **Final Action: Reject**
(356.12(1))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
(1) Where subject to ~~physical damage~~ <u>blows or abrasion.</u>
Substantiation: Use of the word “physical” generally is superfluous– the purpose is obvious. In some instances, one could argue for the use of “mechanical” to differentiate that from e.g., “thermal” damage, but context makes the intended sense quite clear, rendering anything like this completely unnecessary.
Here, though, the immediately following item, (2), refers to form of physical damage–deterioration by overheating. The proposed rewording is an attempt at precision. If you don’t care to reword (1), its existing form theoretically eliminates the need for (2).
Furthermore, I would then have to fall back to arguing that in that case the term “physical” should be eliminated. Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the use of “physical” is not only poor writing–look at William Zinsser’s classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to “physical damage,” in 1959, from “mechanical injury” (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, “Is anyone claiming electrical equipment needs protection from non-physical injury?” (Substitute the snide adjective of your choice.)
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-4 (Log 336).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-84 Log #1969 NEC-P08 **Final Action: Accept**
(356.12(5))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Change the text of 356.12(5) to read as shown:
356.12(5) in <u>any</u> hazardous (classified) locations, <u>except</u> ~~other than~~ a s permitted by other Articles in this Code. ~~in 501.10(B), 502.10(A) and (B), 503.10(A), and 504.20~~
Substantiation: This change is necessary because the current text is too limiting. The areas of usage for LFNC within the hazardous (Classified) locations Articles in the Code are broader. The current text may limit the use of LFNC, by an AHJ, because the LFNC Article itself does not recognize the broader permissions. The proposed text is preferred to a laundry list of section references.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-85 Log #2263 NEC-P08 **Final Action: Reject**
(356.13 (New))

Submitter: H. Brooke Stauffer, National Electrical Contractors Assn. (NECA)
Recommendation: Add new text to read:
356.xx Liquidtight flexible nonmetallic conduit shall be installed in a neat and workmanlike manner.
FPN: Accepted industry practices are described in ANSI/NECA 111-2003, Standard for Installing Nonmetallic Raceways (RNC, ENT, LFNC), and other ANSI-approved installation standards.
Substantiation: The general workmanship requirement of 110.12 applies to electrical equipment covered by Article 356. However, safety would be improved by offering more detailed installation guidance for liquidtight flexible nonmetallic conduit.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-3 (Log 3454).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
LOYD, R.: See my comment on 8-3.

8-86 Log #2904 NEC-P08 **Final Action: Accept**
(356.20(A)(3))

Submitter: Julian R. Burns, Quality Power Solutions, Inc./Burns Electrical Contractors
Recommendation: Delete the following text:
~~(3) For electric sign conductors in accordance with 600.32(A).~~
Substantiation: This section of the NEC is in conflict with 600.32(A) which only permits the use of minimum size of 1/2 in. LFNC. Thus this section is misleading.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-87 Log #3060 NEC-P08 **Final Action: Reject**
(356.20(A)(3))

Submitter: Randall K. Wright, RKW Consulting
Recommendation: Revise text to read as follows:
(3) For electric sign conductors 600 volts or less ~~in accordance with 600.32(A).~~
Substantiation: 356.20(A)(3) is in conflict with 600.32(A)(3). 600.32(A)(3) relates to secondary wiring over 1000 volts, using 3/8 conduit for primary wiring is still acceptable.
Panel Meeting Action: Reject
Panel Statement: See panel action and substantiation on Proposal 8-86.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-88 Log #485 NEC-P08 **Final Action: Reject**
(356.30(1))

Submitter: David Perry, IAEI
Recommendation: Revise text to read:
~~Where installed in lengths exceeding 1.8 m (6 ft), the~~ Conduit shall be securely fastened at intervals not exceeding 900 mm (3 ft) and within 300 mm (12 in.) on each side of every outlet box, junction box, cabinet, or fitting.
Substantiation: Problem: Conduit does not have to be securely fastened if less than 1.8 m (6 ft).
Substantiation: Conduit should be securely fastened over 900 mm (3 ft) and within 300 mm (12 in.) on each side of every outlet box, junction box, cabinet, or fitting regardless of lengths.
Panel Meeting Action: Reject
Panel Statement: LFNC is not required to be secured in lengths of 1.8 m (6 ft) or less. LFNC and LFNC fittings have been evaluated for securing the conduit in lengths not exceeding 1.8 m (6 ft).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
DABE, J.: To protect the conductors in the raceway even lengths of LFNC that do not exceed 6 ft, should be strapped and supported where exposed to physical contact.
LOYD, R.: This proposal should have been accepted as the proponent is correct. All raceways except this one does require support when used as a fixed wiring method which is appropriate and adds safety. 356.30 should be revised to read the same as 350.30 since these two wiring methods are used in a similar fashion.

8-89 Log #1458 NEC-P08 **Final Action: Reject**
(356.30(A))

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise as follows:
356.30 Securing and Supporting. Type LFNC-B shall be securely fastened and supported in accordance with one of the following:
(1) Where installed in lengths exceeding 1.8 m (6 ft), the conduit shall be securely fastened at intervals not exceeding 900 mm (3 ft) and within 300 mm (12 in.) on each side of every outlet box, junction box, cabinet, or fitting.
(2) Securing or supporting of the conduit shall not be required where it is fished, installed in lengths not exceeding 900 mm (3 ft) at terminals where flexibility is required, or installed in lengths not exceeding 1.8 m (6 ft) from a luminaire (fixture) terminal connection for tap conductors to luminaries (lighting fixtures) permitted in 410.67(C).
(3) Horizontal runs of LFNC supported by openings through framing members at intervals not exceeding 900 mm (3 ft) and securely fastened within 300 mm (12 in.) of termination points shall be permitted.
(4) Securing or supporting of LFNC-B shall not be required where installed in lengths not exceeding 1.8 m (6 ft) ~~from the last point where the raceway is securely fastened~~ for connections within an accessible ceiling to luminaire(s) [lighting fixture(s)] or other equipment.
Substantiation: This proposal is intended to add correlation between the flexible raceway Articles and the cable Articles. Panel 7 accepted changes in the 2005 cycle to the cable wiring methods to clarify that the fitting connecting the cable to the box is considered to be a support. Panel 8 should consider the same allowance for its wiring methods.
For the purposes of correlation, similar proposals will be made to Articles 348, 350, and 356.
Panel Meeting Action: Reject
Panel Statement: The panel believes that the raceway must be supported independently of the box. If the raceway is pulled free, it could put undue stress on the conductors.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
DOLLINS, J.: Liquidtight Flexible Nonmetallic Conduit is required by the UL 1660 product standard to withstand a 200 pound pull for 3/8 size and a 300 pound pull for all other sizes without opening. Additionally, the UL 514B product standard for connectors used with LFNC requires that the conduit be subjected to a pull of 75 to 150 pounds, based on size, without pulling out of the connector. A 6 ft length of Liquidtight Flexible Nonmetallic Conduit within an accessible ceiling that is secured by connectors at each end at the luminaire or equipment does not require additional support to maintain the physical performance of the conduit or the connector.

ARTICLE 358 — ELECTRICAL METALLIC TUBING: TYPE EMT

8-90 Log #3463 NEC-P08 **Final Action: Reject**
(358.xx)

Submitter: William A. Wolfe, Steel Tube Institute of North America
Recommendation: Add new text to read:
358.xx EMT shall be installed in a neat and workmanlike manner.
FPN: Accepted industry practices are described in the National Electrical Installation Standards (NEIS) NECA-101, "Standard for Installing Steel Conduit (Rigid, IMC, EMT) and other NEIS installation methods.
Substantiation: NECA 101, Standard for Installing Steel Concuit (Rigid, IMC, EMT) has been used for several years. This standard provides best practices for safe steel conduit installations and should be referenced in the conduit and EMT articles, similar to the reference that is now included in the FPN to 110.12.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-3 (Log 3454).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
LOYD, R.: See my comment on 8-3.

8-91 Log #314 NEC-P08 **Final Action: Reject**
(358.2)

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
"358.2 Electrical Metallic Tubing (EMT). An unthreaded thinwall raceway of circular cross section designed for the ~~physical~~ protection...".

Substantiation: Use of the word "physical" is superfluous– the purpose is obvious. In some instances, one could argue for the use of "mechanical" to differentiate that from e.g., "thermal" damage, but context makes the intended sense quite clear, rendering anything like this completely unnecessary. Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.)

Let's take care of that for good: for our present purposes, "protection" means "physical protection".

Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-4 (Log 336).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-92 Log #2240 NEC-P08 **Final Action: Reject**
(358.6 Exception (New))

Submitter: Donald A. Ganiere, Ottawa, IL
Recommendation: Revise as follows:

344.6 Listing Requirements. RMC, factory elbows and couplings, and associated fittings shall be listed.

<u>Exception: Raceway support fittings and accessories shall not be required to be listed.</u>

Substantiation: The Article 100 definition of "fitting" seems to include raceway supports. Many of the commonly and used raceway support straps, clamps, and other items are not listed.
Panel Meeting Action: Reject
Panel Statement: The panel assumes that the submitter intended to add a new exception to 344.6 and not 358.6 per Proposal 8-93. See panel action and statement on Proposal 8-5.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-93 Log #2242 NEC-P08 **Final Action: Reject**
(358.6 Exception (New))

Submitter: Donald A. Ganiere, Ottawa, IL
Recommendation: Revise as follows:

358.6 Listing Requirements. EMT, factory elbows, and associated fittings shall be listed.

<u>Exception: Raceway support fittings and accessories shall not be required to be listed.</u>

Substantiation: The Article 100 definition of "fitting" seems to include raceway supports. Many of the commonly used raceway support straps, clamps and other items are not listed.
Panel Meeting Action: Reject
Panel Statement: Tubing support accessories are not considered "fittings". Sections 300.6 and 300.6(A) require support hardware to be constructed of materials suitable for the environment for which they are to be installed.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-94 Log #3460 NEC-P08 **Final Action: Reject**
(358.10, FPN)

Submitter: William A. Wolfe, Steel Tube Institute of North America
Recommendation: Revise text to read:

FPN: See 300.6 for protection against corrosion. <u>When aluminum (non-ferrous) EMT is in direct contact with the earth or is installed in concrete, supplementary corrosion protection is required. The galvanizing on steel EMT provides corrosion protection. When steel (non-ferrous) EMT is in direct contact with the earth or is installed in concrete, supplementary corrosion protection *may* be required.</u>

Substantiation: UL's *Electrical Construction Equipment Directory* states that "Galvanized steel electrical metallic tubing installed in concrete on grade or above generally requires no supplementary corrosion protection. Galvanized steel electrical metallic tubing in concrete slab below grade level may require supplementary corrosion protection.

"In general, galvanized steel electrical metallic tubing in contact with soil requires supplementary corrosion protection.

"Aluminum electrical metallic tubing used in concrete or in contact with soil requires supplementary corrosion protection."

Article 358 has not differentiated between the corrosion protection required for ferrous vs. non-ferrous EMT leading to confusion among installers/users. This new text will provide useful guidance and will be in line with the listing requirements.

Panel Meeting Action: Reject
Panel Statement: The reference to 300.6 in the fine print note gives the installer the proper location to determine corrosion protection requirements for ferrous and non-ferrous raceways. The committee also notes that "is required" is mandatory text and is not permitted in an FPN.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

LOYD, R.: The panel acted inconsistently in rejecting this proposal. This proposal was submitted as a companion to Proposal 8-15 which was accepted and since both contain information that is accurate and provides information beneficial to the user both should have been accepted.

If this proposal is accepted editorial strike "non" in the 3rd sentence "when steel (~~non-~~ ferrous)" since steel is a ferrous material.

8-95 Log #3084 NEC-P08 **Final Action: Reject**
(358.10(B))

Submitter: Joseph A. Hertel, Safety and Buildings
Recommendation: Delete paragraph (B) Corrosion Protection.
Substantiation: Most jurisdictions delete this paragraph because EMT has been shown to fail in underground environments. An example of language that may be added to restrict the installation would be:

Electrical metallic tubing shall not be used in direct contact with earth, in concrete slabs or floors poured on earth, or in exterior concrete walls below grade.

Panel Meeting Action: Reject
Panel Statement: EMT is suitable for underground installations where corrosion protection is provided in accordance with 358.10(B).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-96 Log #1687 NEC-P08 **Final Action: Reject**
(358.10(D))

Submitter: Paul E. Guidry, Fluor Enterprises, Inc.
Recommendation: This is a companion proposal to ones for 314.23(E) Exception and (F) Exception, 342.10(D), and 344.10(E).

Add text to read as follows:

<u>358.10(D) Support of Conduit Bodies. Electrical metallic tubing shall be permitted to support metallic and non-metallic conduit bodies not larger than the largest trade size of an entering raceway, including a conduit body constructed with only one conduit entry. These conduit bodies shall not support luminaries (fixtures) or other equipment and shall not contain devices other than splicing devices as permitted by 110.14(B) and 314.16(C)(2).</u>

Substantiation: The exceptions to 314.23(E) and (F) have been a source of confusion for years. 314.23(E) and (F) refer to enclosures while the exception refers to conduit bodies. The proper place for this type of information is in the article for each type of raceway as currently found in 352.10(H).
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-6.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-97 Log #313 NEC-P08 **Final Action: Reject**
(358.12(1))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:

(1) Where, during installation or afterward, it will be subject to severe ~~physical damage~~ <u>blows or abrasion.</u>

Substantiation: Use of the word "physical" is superfluous– the purpose is obvious. In some instances, one could argue for the use of "mechanical" to differentiate that from e.g., "thermal" damage, but context makes the intended sense quite clear, rendering this unnecessary.

The proposed rewording is an attempt at precision. Furthermore, if you retain "damage," I would then have to fall back to arguing that in that case the term "physical" should be eliminated.

Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent

opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.)
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-4 (Log 336).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-98 Log #946 NEC-P08 **Final Action: Reject**
(358.12(1))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Delete "severe."
Substantiation: Edit. "Severe" is subjective and argumentative. Similar sections do not use the word "severe".
Panel Meeting Action: Reject
Panel Statement: The current text reflects the panel's understanding of the proper use of EMT. The determination between physical damage and severe physical damage remains with the authority having jurisdiction.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-99 Log #1036 NEC-P08 **Final Action: Reject**
(358.12(1))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Delete "severe".
Substantiation: Edit. "Severe" is subjective and argumentative. Other similar sections do not use the word severe.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-98.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-100 Log #3461 NEC-P08 **Final Action: Reject**
(358.12(1))

Submitter: William A. Wolfe, Steel Tube Institute of North America
Recommendation: Revise text to read:
(1) Where, during installation or afterward, <u>steel EMT</u> will be subject to severe physical damage. <u>Aluminum EMT shall not be used where subject to physical damage.</u>
Substantiation: The mechanical properties of steel and aluminum EMT are very different. This has never been recognized by the NEC but has direct bearing on the suitability of the product for certain applications. The modulus of elasticity of aluminum is 1/3 that of steel, for example, which means that it would deflect 1/3 more under the same load. The typical mechanical properties are shown below (Aluminum EMT is typically produced from a higher strength alloy and different designation from aluminum rigid but is still substantially less impervious to damage than steel EMT. The values shown below reflect the typical properties of a 6005 aluminum alloy of Temper Designation 5. Steel values reflect the typical mechanical properties of mild steel.)

Ultimate Tensile Strength: Aluminum: 38,000psi Steel: 48,000psi
Yield strength: Aluminum: 31,000psi Steel: 45,000psi
Modulus of
Elasticity: Aluminum: 10,000,000 lb/in 2 (psi) Steel: 30,000,000 lb/in 2 (psi)

Panel Meeting Action: Reject
Panel Statement: As a general rule, aluminum EMT is capable of being exposed to physical damage, but not severe physical damage.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
LOYD, R.: This proposal should have been accepted. There is substantial technical substantiation provided. Field testing reports are not necessary since the data provided shows that in physical damage tests aluminum would flatten and fail at much lower values than steel.

8-101 Log #642 NEC-P08 **Final Action: Accept**
(358.12(4))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Change the text of 358.12(4) to read as shown:
358.12(4) In any hazardous (classified) location except as permitted by <u>other Articles in this Code.</u> ~~502.10, 503.10, and 504.20.~~
Substantiation: This change is necessary because the current text is too limiting. The areas of usage for EMT within the hazardous (Classified) locations Articles in the Code are broader. There are installations such as wiring intrinsically safe apparatus, nonincendive field wring, and in specific hazardous (classified) locations where EMT is permitted. The current text may limit the use of EMT, by an AHJ, because the EMT Article itself does not recognize the broader permissions. The proposed text is preferred to a laundry list of section references.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-102 Log #2264 NEC-P08 **Final Action: Reject**
(358.13)

Submitter: H. Brooke Stauffer, National Electrical Contractors Assn. (NECA)
Recommendation: Add new text to read:
358.xx Electrical metallic tubing shall be installed in a neat and workmanlike manner.
FPN: Accepted industry practices are described in ANSI/NECA 101-2006, Standard for Installing Steel Conduits (Rigid, IMC, EMT), and other ANSI-approved installation standards.
Substantiation: The general workmanship requirement of 110.12 applies to electrical equipment covered by Article 358. However, safety would be improved by offering more detailed installation guidance for steel intermediate metal conduit.
ANSI/NECA 101-2006 is currently under development. It will be published prior to the Public Comment deadline.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-3 (Log 3454).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
LOYD, R.: See my comment on 8-3.

8-103 Log #3462 NEC-P08 **Final Action: Reject**
(358.30(A) and 358.30(B))

Submitter: William A. Wolfe, Steel Tube Institute of North America
Recommendation: Revise text to read:
(A) Securely Fastened. <u>Steel</u> EMT shall be securely fastened in place at least every 3 m (10 ft). <u>Aluminum EMT shall be securely fastened in place at least every 1.5 m (5 ft)</u> . In addition, each EMT run between termination points shall be securely fastened within 900 mm (3 ft) of each outlet box, junction box, device box, cabinet, conduit body, or other tubing termination.
(B) Supports. Horizontal runs of <u>steel</u> EMT supported by openings than 3 m (10 ft) and securely fastened within 900 mm (3 ft) termination points shall be permitted. <u>Aluminum EMT shall be supported at intervals not greater than 1.5 m (5 ft).</u>
Substantiation: The mechanical properties of steel and aluminum EMT are very different. This has never been recognized by the NEC but has direct bearing on the suitability of the product for certain applications. The modulus of elasticity of aluminum is 1/3 that of steel, for example, which means that it would deflect 1/3 more under the same load. The typical mechanical properties are shown below (Aluminum EMT is typically produced from a higher strength alloy and different designation from aluminum rigid but is still substantially less impervious to damage than steel EMT. The values shown below reflect the typical properties of a 6005 aluminum alloy of Temper Designation 5. Steel values reflect the typical mechanical properties of mild steel.)

Ultimate Tensile Strength: Aluminum: 38,000psi Steel: 48,000psi
Yield strength: Aluminum: 31,000psi Steel: 45,000psi
Modulus of
Elasticity: Aluminum: 10,000,000 lb/in 2 (psi) Steel: 30,000,000 lb/in 2 (psi)

Panel Meeting Action: Reject
Panel Statement: The submitter has supplied us with technical data, but not the information, testing, or field reports necessary to determine if shorter support lengths are required for aluminum.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
LOYD, R.: This proposal should have been accepted. There is substantial technical substantiation provided. Field testing reports are not necessary since the data provided shows that in tests aluminum EMT would sag at lengths much shorter than galvanized steel EMT especially the smaller sizes.

8-104 Log #1349 NEC-P08 **Final Action: Accept**
(358.30(C))

Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Add the following text to 358.30
(C) Unsupported raceways: Type EMT shall be permitted to be unsupported where the raceway is not more than 900 mm (3 ft) in length and remains in unbroken lengths (without coupling). Such raceway shall terminate in an outlet box, junction box, device box, cabinet, or other termination at each end of the raceway.
Substantiation: Unsupported raceways are violations of the *Code* that occur everyday. As written, a 3 inch length of conduit between enclosures is required to be supported, despite the fact that it adds little if any structural value to the system. Quite often, particularly with conduit nipples, securing and supporting a raceway shorter than 36 inches is not possible. Furthermore, securing and supporting is of little value on lengths less than 36 inches where the conduit terminates at a box on each end, where the box is installed and supported in compliance with its applicable *Code* section.
This proposal is written with the parallel effect of *Code* sections that have been strived for in chapter 3, and matches the numbering system used in the Cable Articles. It also uses existing text taken from both the Cable Articles and the Raceway Articles.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
DABE, J.: See my comment for 8-9.
HUMPHREY, D.: This proposal does not address other issues that may have a direct impact on the durability of the electrical installation. The affects of weight and vibration on concentric and eccentric knockouts at each end of a three foot run between pieces of equipment, a scenario that would be frequently in many electrical installations, may compromise the strength of the installation. The raceway having even a single point of support would help to mitigate these deleterious affects. In addition, the EMT installation in question may be used as an equipment grounding conductor and any loosening that could occur would serve to compromise the equipment grounding function of the raceway. 300.11 further requires that raceways be securely fastened in place. I would assert that this proposal would conflict with the requirements of 300.11. In summation, depending on connectors, double locknuts etc. to support and secure this up to 36 in. installation especially where concentric or eccentric knockouts are encountered is dubious at best. 36 in. should provide ample space in which to install normal supporting and securing hardware. A proposal involving a shorter distance and where no concentric or eccentric knockouts are encountered may be in order.

8-105 Log #2781 NEC-P08 **Final Action: Reject**
(358.44 (New))

Submitter: Ted Smith, Ludvik Electric Co. / Rep. International Electrical Instructors & Students Assoc.
Recommendation: Add new text to read:
358.44 Expansion Fittings. Expansion fittings shall be installed where expected length change, due to expansion and contraction due to temperature change and designed building movement is more than 12 mm (5 in.)
Substantiation: Large structures are often times designed with expansion joints to all for building movement and temperature change expansion and contraction. EMT installed across these expansion joints is subject to movement which will lead to loosened connections at couplings and connectors. The loosened connections will decrease the effectiveness of the ground fault return path and ultimately affect the safety of the electrical installation.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-24.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 360 — FLEXIBLE METALLIC TUBING: TYPE FMT

8-106 Log #312 NEC-P08 **Final Action: Reject**
(360.12(5))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
(5) Where subject to ~~physical damage~~ blows or abrasion.
Substantiation: Use of the word "physical" is superfluous– the purpose is obvious. In some instances, one could argue for the use of "mechanical" to differentiate that from e.g., "thermal" damage, but context makes the intended sense quite clear, rendering this unnecessary.
The proposed rewording is an attempt at precision. Furthermore, if you retain "damage," I would then have to fall back to arguing that in that case the term "physical" should be eliminated, and in fact (1), (2) and (4) probably are unnecessary as they are there to prevent forms of physical damage.
Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.)
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-4 (Log 336).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-107 Log #505 NEC-P08 **Final Action: Accept**
(360.20(A) Exception No. 2)

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise as follows:
360.20 Size
(A) Minimum FMT smaller than metric designator 16 (trade size 1/2) shall not be used.
Exception No. 1: FMT of metric designator 12 (trade size 3/8) shall be permitted to be installed in accordance with 300.22(B) and (C).
Exception No. 2: FMT of metric designator 12 (trade size 3/8) shall be permitted in lengths not in excess of 1.8 m (6 ft) as part of an ~~approved~~ listed assembly or for luminaires (lighting fixtures). See 410.67(C).
Substantiation: Approved is defined as "acceptable to the authority having jurisdiction." It appears as though the assembly that is referred to in this exception should be a listed assembly. It is recognized that the AHJ can base the approval of this assembly if it is listed or not. Manufacturers currently produce these as listed assemblies. This proposal is an effort to enhance consistency with the use of approved, listed, and identified throughout the NEC just as was done in the 2002 cycle in many of the hazardous (classified) locations articles in Chapter 5.
Panel Meeting Action: Accept
Make the changes in the proposal and change the word "an" to "a" in the proposal.
Panel Statement: Minor editorial change; the word "an" was changed to "a" in the proposed text.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 362 — ELECTRICAL NONMETALLIC TUBING: TYPE EMT

8-108 Log #1537 NEC-P08 **Final Action: Accept**
(362, 366, 368, 384 and 392)

Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Revise Articles 362, 366, 368, 384, and 392 as described in the following, relative to the terms bonding and grounding.
362.60 Revise 362.60 as follows:
Grounding. Where equipment grounding is required, a separate equipment grounding conductor shall be installed in the raceway in compliance with Article 250 Part VI .
366.60 Revise 366.60 as follows:
Grounding. Metal auxiliary gutters shall be connected to an equipment grounding conductor(s), to an equipment bonding jumper, or to the grounded conductor where permitted or required by 250.92(B)(1) or 250.142 ~~grounded~~ .
368.60 Revise 368.60 as follows:
Grounding. Busway shall be connected to an equipment grounding conductor(s), to an equipment bonding jumper, or to the grounded conductor where permitted or required by 250.92(B)(1) or 250.142 ~~grounded~~ .
384.16 In 384.16, change "250.118(14)" to "250.118(13)".
392.7 Revise 392.7 as follows:
Grounding.
(A) Metallic Cable Trays. Metallic cable trays that support electrical conductors shall be connected to a grounded ~~as required for conductor~~ enclosure (s) in accordance with 250.96 and Part IV of Article 250 .
(B) Steel or Aluminum Cable Tray Systems. Steel or aluminum cable tray systems shall be permitted to be used as equipment grounding conductors, provided ~~that~~ all the following requirements are met:

(1) The cable tray sections and fittings <u>are</u> ~~shall be~~ identified <u>as an equipment</u> ~~for~~ grounding <u>conductor</u> ~~purposes~~ .

(2) The minimum cross-sectional area of cable trays ~~shall~~ conform to the requirements in Table 392.7(B).

(3) All cable tray sections and fittings <u>are</u> ~~shall be~~ legibly and durably marked to show the cross-sectional area of metal in channel cable trays, or cable trays of one-piece construction, and the total cross-sectional area of both side rails for ladder or trough cable trays.

(4) Cable tray sections, fittings, and connected raceways <u>are</u> ~~shall be~~ bonded in accordance with 250.96 using bolted mechanical connectors or bonding jumpers sized and installed in accordance with 250.102.

Substantiation: 362.60: The proposed changes are intended to make the requirements more prescriptive in nature by making a reference to where the requirements are found in Article 250.

366.60: The proposed changes are intended to make the requirements more prescriptive in nature and to include a reference to where the requirements are found in Article 250.

368.60: The proposed changes are intended to make the requirements more prescriptive in nature by making a reference to where the requirements are found in Article 250.

384.16: To correct the reference.

392.7: Changes are proposed to correct the terms to the definitions proposed for Article 100 and to the terms defined in 250.2. The proposed changes also are intended to make the requirements more prescriptive in nature.

This is the result of the TCC Task Group on Grounding and Bonding in resolve of the 2005 NEC cycle actions related to Proposal 5-1 and Comment 5-1 as directed by the Technical Correlating Committee. This is a companion proposal to the proposed revision to the terms “bonded”, “grounded”, and “equipment grounding conductor” in Article 100 relative to this Task Group’s recommendations. These changes clarify the present requirement in more prescriptive language.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept

Panel Statement: The panel examined not only the TCC Task Group actions and TCC recommendation, but also the technical merits and voted to accept the proposal.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

DABE, J.: Based on the concerns of Michael Callanan, regarding whether this proposal is based on a true consensus, the panel, at this time, should reconsider their action and reject this proposal.

8-109 Log #334 NEC-P08 **Final Action: Reject**
(362.10, FPN)

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education

Recommendation: Revise as follows:

FPN: Extreme cold may cause some types of nonmetallic conduits to become brittle and, therefore, more susceptible to damage from ~~physical~~ contact.

Substantiation: Use of the word “physical” is superfluous– the purpose is obvious. In some instances, one could argue for the use of “mechanical” to differentiate that from e.g., “thermal” damage, but context makes the intended sense quite clear, rendering anything like this completely unnecessary.

Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.

Second, the use of “physical” is not only poor writing–look at William Zinsser’s classic, On Writing Well but silly, and reflects a bit poorly on the Code process. When the references were changed to “physical damage,” in 1959, from “mechanical injury” (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, “Is anyone claiming electrical equipment needs protection from non-physical injury?” (Substitute the snide adjective of your choice.) Let’s take care of that for good: for our purposes, “contact” means “physical contact.”

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 8-4 (Log 336).

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

8-110 Log #635 NEC-P08 **Final Action: Reject**
(362.10(2))

Submitter: Tom Lang, Prescott, WI

Recommendation: 362.10(2) Delete exception to (2) in its entirety.

(2) In any building exceeding three floors above grade, ENT shall be concealed within walls, floors, and ceilings where the walls, floors, and ceilings provide a thermal barrier of material that has at least a 15-minute-finish-rating as identified in listings of fire rated assemblies. The 15-minuite finish-rated thermal barrier shall be permitted to be used for combustible walls, floors, and ceilings.

~~Exception to (2): Where a fire sprinkler system(s) is installed in accordance with NFPA 13, 2002, Standard for the Installation of Sprinkler Systems, on all floors, ENT shall be permitted to be used within walls, floors, and ceilings, exposed or concealed, in buildings exceeding three floors above grade.~~

Substantiation: Pertaining to style manual. Cannot reference an entire standard “NFPA 13-2002, Standard for the Installation of Sprinklers”.

Panel Meeting Action: Reject

Panel Statement: The reference to NFPA 13 was addressed in previous cycles and was brought before the NFPA Standards Council (SC#01-64(t) July 13, 2001) and was upheld. No new substantiation is provided.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

8-111 Log #636 NEC-P08 **Final Action: Reject**
(362.10(5))

Submitter: Tom Lang, Prescott, WI

Recommendation: 362.10(5) Delete exception to (5) in its entirety.

(5) Above suspended ceilings where the suspended ceilings provide a thermal barrier of material that has at least a 15-minute finish rating as identified in listings of fire-rated assemblies, except as permitted in 362.10(1)(a).

~~Exception to (5): ENT shall be permitted to be used above suspended ceilings in buildings exceeding three floors above grade where the building is protected throughout by a fire sprinkler system installed in accordance with NFPA 13 2002, Standard for the Installation of Sprinkler Systems.~~

Substantiation: Pertaining to style manual. Cannot reference an entire standard “NFPA 13-2002, Standard for the Installation of Sprinklers”.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 8-110.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

8-112 Log #2823 NEC-P08 **Final Action: Reject**
(362.12 X.)

Submitter: Lanny G. McMahill, Phoenix, AZ

Recommendation: Add new item number X:

<u>X. Where flexibility is required unless identified or such use.</u>

Substantiation: Generally, ENT is intended as a fixed wiring method. However, at least one ENT manufacturer promotes their product for use and application where flexibility is required. In addition, the listing and labeling laboratory for the ENT allows the use of the word “flex” in the manufacturer’s literature. Therefore, if the product is identified as acceptable for use as a flexible wiring method, it should be recognized as such in the NEC.

Panel Meeting Action: Reject

Panel Statement: Flexibility may be required during the installation. This is an acceptable feature of ENT. Flexible raceways shall be used where flexibility is required for operation or maintenance.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

WALBRECHT, G.: We agree with the action taken by CMP-8 on comment 8-112, but disagree with the panel statement. Electrical Nonmetallic Tubing (ENT) is capable of being bent without the use of tools during installation. However, reference to the term flexibility in the panel statement can be misleading when used to describe ENT. This product is not intended for use where flexibility is required.

8-113 Log #1963 NEC-P08 **Final Action: Accept**
(362.12(1))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Recommendation: Change the text of 362.12(1) to read as shown:

362.12(1) in <u>any</u> hazardous (classified) locations, except as permitted by <u>other Articles in this Code</u> . ~~504.20 and 505.15(A)(1)~~

Substantiation: This change is necessary because the current text is too limiting. The areas of usage for ENT within the hazardous (Classified) locations Articles in the Code are broader. The current text may limit the use of ENT, by an AHJ, because the ENT Article itself does not recognize the broader permissions. The proposed text is preferred to a laundry list of section references.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

8-114 Log #2265 NEC-P08 **Final Action: Reject**
(362.13 (New))

Submitter: H. Brooke Stauffer, National Electrical Contractors Assn. (NECA)
Recommendation: Add new text to read:

362.xx Electrical nonmetallic tubing shall be installed in a neat and workmanlike manner.

FPN: Accepted industry practices are described in ANSI/NECA 111-2003, Standard for Installing Nonmetallic Raceways (RNC, ENT, LFNC), and other ANSI-approved installation standards.

Substantiation: The general workmanship requirement of 110.12 applies to electrical equipment covered by Article 362. However, safety would be improved by offering more detailed installation guidance for electrical nonmetallic tubing.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 8-3 (Log 3454).

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

LOYD, R.: See my comment on 8-3.

8-115 Log #3039 NEC-P08 **Final Action: Reject**
(362.13)

Submitter: Melvin K. Sanders, TECo Inc.
Recommendation: Insert as New Section 362.13 the following text.

362.13 Protection Against Physical Damage

Where subject to physical damage, wiring methods shall be protected by either, or all, in the following manner.

(A) Cables and Raceways Through Wood Members.

(1) Bored Holes. In both exposed and concealed locations, where a cable- or raceway-type wiring method is installed through bored holes in joists, rafters, or wood members, holes shall be bored so that the edge of the hole is not less than 32 mm (1 1/ 4 in.) from the nearest edge of the wood member. Where this distance cannot be maintained, the cable or raceway shall be protected from penetration by screws or nails by a steel plate or bushing, at least 1.6 mm (1/ 16 in.) thick, and of appropriate length and width installed to cover the area of the wiring.

Exception No. 1: Steel plates shall not be required to protect rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, or electrical metallic tubing.

Exception No. 2: A listed and marked steel plate less than 1.6 mm (1/ 16 in.) thick that provides equal or better protection against nail or screw penetration shall be permitted.

(2) Notches in Wood. Where there is no objection because of weakening the building structure, in both exposed and concealed locations, cables or raceways shall be permitted to be laid in notches in wood studs, joists, rafters, or other wood members where the cable or raceway at those points is protected against nails or screws by a steel plate at least 1.6 mm (1/ 16 in.) thick, and of appropriate length and width, installed to cover the area of the wiring. The steel plate shall be installed before the building finish is applied.

Exception No. 1: Steel plates shall not be required to protect rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, or electrical metallic tubing.

Exception No. 2: A listed and marked steel plate less than 1.6 mm (1/ 16 in.) thick that provides equal or better protection against nail or screw penetration shall be permitted.

(B) Nonmetallic-Sheathed Cables and Electrical Nonmetallic Tubing Through Metal Framing Members.

(1) Nonmetallic-Sheathed Cable . In both exposed and concealed locations where nonmetallic-sheathed cables pass through either factory or field punched, cut, or drilled slots or holes in metal members, the cable shall be protected by listed bushings or listed grommets covering all metal edges that are securely fastened in the opening prior to installation of the cable.

(2) Nonmetallic-Sheathed Cable and Electrical Nonmetallic Tubing. Where nails or screws are likely to penetrate nonmetallic-sheathed cable or electrical nonmetallic tubing, a steel sleeve, steel plate, or steel clip not less than 1.6 mm (1/ 16 in.) in thickness shall be used to protect the cable or tubing.

Exception: A listed and marked steel plate less than 1.6 mm (1/ 16 in.) thick that provides equal or better protection against nail or screw penetration shall be permitted.

(C) Cables and Raceways Parallel to Framing Members and Furring Strips. In both exposed and concealed locations, where a cable- or raceway-type wiring method is installed parallel to framing members, such as joists, rafters, or studs, or is installed parallel to furring strips, the cable or raceway shall be installed and supported so that the nearest outside surface of the cable or raceway is not less than 32 mm (1-1/ 4 in.) from the nearest edge of the framing member or furring strips where nails or screws are likely to penetrate. Where this distance cannot be maintained, the cable or raceway shall be protected from penetration by nails or screws by a steel plate, sleeve, or equivalent at least 1.6 mm (1/ 16 in.) thick.

Exception No. 1: Steel plates, sleeves, or the equivalent shall not be required to protect rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, or electrical metallic tubing.

Exception No. 2: For concealed work in finished buildings, or finished panels for prefabricated buildings where such supporting is impracticable, it shall be permissible to fish the cables between access points.

Exception No. 3: A listed and marked steel plate less than 1.6 mm (1/ 16 in.) thick that provides equal or better protection against nail or screw penetration shall be permitted.

(D) Cables and Raceways Installed in Shallow Grooves. Cable- or raceway-type wiring methods installed in a groove, to be covered by wallboard, siding, paneling, carpeting, or similar finish, shall be protected by 1.6 mm (1/ 16 in.) thick steel plate, sleeve, or equivalent or by not less than 32-mm (1-1/ 4-in.) free space for the full length of the groove in which the cable or raceway is installed.

Exception No. 1: Steel plates, sleeves, or the equivalent shall not be required to protect rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, or electrical metallic tubing.

Exception No. 2: A listed and marked steel plate less than 1.6 mm (1/ 16 in.) thick that provides equal or better protection against nail or screw penetration shall be permitted.

Substantiation: The wiring methods typically installed in wooded frame structures are Article 320 (Type AC), Article 330 (Type MC), Article 334 (Types NM, NMC, and NMS), and Article 362 (ENC). Insofar as Article 340 (Type UF) is installed in lieu of Article 334 wiring methods, its installation must meet the requirements of Article 334 Parts II and III, and also subject to the same installation restrictions.

Since the 1975 Edition of the NEC, there has been a requirement in Section 300.4 that steel plates or bushings be installed to provide protection of certain wiring method against damage from ordinary nails or screw-nails when they pass through wooden members or laid in notches or grooves and the distance from the nail direction could not be the required 1-1/4 inch (32 mm).

This restriction placed in Article 300 has prevented those CMP's most knowledgeable in application of these products from using any other protection schemes or technology for this purpose. During the 2005 ROP/ROC stage, fact-finding reports were presented to CMP 3 highlighting the steel plates called for provide little or no protection against nails or screw-nails larger than #8 or equivalent trade designation. Since Section 300.4 first paragraph was changed in 2005 ROP to emphasize conductors are to be protected against physical damage, it is obvious that such protection is to be provided by the wiring method in which they are contained, as spelled out in Section 300.3(A). Because the Scopes of Section 320.1, 330.1, 334.1, 340.1 and 362.1 state they govern the installation of those wiring methods which, by Section 300.3(A), contain the conductors that are to be protected, as stated in Section 300.4 first paragraph.

Sections 320.12(1), 330.12(1), 340(10), and 362.12(10) state those wiring methods are not to be exposed to physical damage, therefore the contained conductors are inherently protected against damage which meets the intent of Section 300.4 first paragraph, and Section 300.3(A) is satisfied.

This would allow Article 300 to set the general guidelines and allow CMP 7 and CMP 8 to set rules deemed necessary to protect appropriate wiring methods.

Separate proposals are being made to CMP 3 and CMP 8 to address the text to be deleted from Article 300. Coordination between all affected CMP's will be essential in order for this to be accomplished in one ROP/ROC cycle.

Panel Meeting Action: Reject

Panel Statement: The requirements for physical protection of conductors for different cables or raceways are adequately covered in Section 300.4.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

8-116 Log #332 NEC-P08 **Final Action: Reject**
(362.19)

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:

Where subject to ~~physical damage~~ blows or abrasion.

Substantiation: Use of the word "physical" is superfluous– the purpose is obvious. In some instances, one could argue for the use of "mechanical" to differentiate that from e.g., "thermal" damage, but context makes the intended sense quite clear, rendering anything like this completely unnecessary.

Here, though, the immediately preceeding item, (9), refers to a form of physical damage–deterioration by ultraviolet radiation. The proposed rewording is an attempt at precision. If you don't care to reword (10), theoretically its present form eliminates the need for (9) and probably (3) and (5) as well.

Furthermore, I would then have to fall back to arguing that in that case the term "physical" should be eliminated.

Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent

opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.)

Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-117 Log #837 NEC-P08 **Final Action: Accept in Principle**
(362.30(A))

Submitter: Stephen W. Drayton, Eastern Idaho Electrical JATC
Recommendation: Add the following sentence to the end of 362.30(A):
Securing or supporting of ENT shall not be required where it is fished.
Substantiation: If it is the intent of the NEC to allow ENT to be fished in existing walls or ceilings, it should be mentioned. i.e., See 356.30(2), or 348.30(A) Exception no. 1.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 8-119.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-118 Log #1156 NEC-P08 **Final Action: Accept in Principle**
(362.30(A) Exception No. 3 (New))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Add:
Exception No. 3: Fastening shall not be required where an unbroken length of ENT is fished between access points in finished buildings or structures and fastening is impractical.
Substantiation: Provision should be made for ENT where fished, as it is for other wiring methods.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 8-119.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-119 Log #2623 NEC-P08 **Final Action: Accept**
(362.30(A) Exception No. 3 (New))

Submitter: David H. Kendall, Carlon
Recommendation: Revise as follows:
362.30 Securing and Supporting.
ENT shall be installed as a complete system in accordance with 300.18 and shall be securely fastened in place and supported in accordance with 362.30(A) and (B).
(A) Securely Fastened ENT shall be securely fastened at intervals not exceeding 900 mm (3 ft). In addition, ENT shall be securely fastened in place within 900 mm (3 ft) of each outlet box, device box, junction box, cabinet, or fitting where it terminates.
Exception No.1: Lengths not exceeding a distance of 1.8 m (6 ft) from a luminaire (fixture) terminal connection for tap connections to lighting luminaires (fixtures) shall be permitted without being secured.
Exception No. 2: Lengths not exceeding 1.8 m (6 ft) from the last point where the raceway is securely fastened for connections within an accessible ceiling to luminaire(s) [lighting fixture(s)] or other equipment.
<u>Exception No. 3: For concealed work in finished buildings or prefinished wall panels where such securing is impracticable, unbroken lengths (without coupling) of ENT shall be permitted to be fished.</u>
Substantiation: Fishing ENT into finished walls in existing buildings is a common practice for the protection of conductors and communication cabling. ENT's flexibility allows it to be easily fished between access points. 300.4(D) Exception 2 permits an inferior wiring method to be fished between access points. The proposed language is identical that is found for EMT in 358.30 with the exception of the reference to ENT.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-120 Log #434 NEC-P08 **Final Action: Reject**
(362.30(B))

Submitter: Michael Lenon, Lenon Electric
Recommendation: Revise text to read as follows:
(B) Supports. Horizontal runs of ENT supported by openings in framing members at intervals not exceeding 900 mm ~~3 ft~~ <u>2 ft</u> and securely fastened within 900 mm ~~(3 ft)~~ <u>2 ft</u> of termination points shall be permitted.
Substantiation: ENT is not strong enough to hang in 3 ft spans as it will sag making the workmanship look bad.
Panel Meeting Action: Reject
Panel Statement: There is a lack of technical substantiation to support the statement that ENT is not strong enough to be supported every three feet. The Code gives a maximum distance for supporting ENT. Reducing the spacing for the appearance of "workmanship" is always acceptable.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-121 Log #1233 NEC-P08 **Final Action: Reject**
(362.60)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise text:
Where equipment grounding is ~~required~~ provided, a separate equipment grounding conductor shall be installed in the raceway.
Substantiation: Where grounding is done by choice, and not required, the rule should apply. 250.1 indicates Article 250 covers installations where grounding is "permitted".
Panel Meeting Action: Reject
Panel Statement: The submitter's concerns are addressed in Section 300.3(B) for equipment grounding conductors that are provided, but not required.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 366 — AUXILIARY GUTTERS

8-122 Log #2569 NEC-P08 **Final Action: Reject**
(366)

Submitter: Larry Rogers, Vattertott College-Tulsa / Rep. Vattertott Colleges, NFPR and IAEI Member
Recommendation: Add new text as follows:
Enclosure fronts or faces; All unfinished edges, internally and externally of enclosure faces shall be rounded or de-burred to a smooth finish.
Substantiation: I am using enclosures in a generic form to include panel boards, auxiliary gutters, surface metal raceways, and large junction boxes above 4 11/16. Sharp corners/edges on enclosures have caused thousands of injuries to workmen and also thousands of hours of lost time man hours. Also, damage to the integrity of conductor insulation during installation or inspection is a problem with results of sometimes immediate arc flash or they are found later with a bare hand, which could lead to a fatal shock or serious cut due to jerk reaction. We ask this panel to consider having the manufacturer remove these sharp edges prior to shipment, thus attacking the problem from the start. Sharp edges stay sharp for years.
Panel Meeting Action: Reject
Panel Statement: 366.100(C) already provides protection for the conductors. Article 366 covers only Auxiliary Gutters and not the other referenced items in the submitter's substantiation. Protection of personnel from these types of hazards is covered in Section 110.3(A)(1) through (8) as well as in other documents.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-123 Log #285 NEC-P08 **Final Action: Reject**
(366.1(B)(1), FPN)

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education

8-124 Log #3403 NEC-P08 **Final Action: Accept**
(366.2)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Revise as follows:

366.2 Definitions

Metallic Auxiliary Gutter. A sheet metal enclosure used to supplement wiring spaces at meter centers, distribution centers, switchboards, and similar points of wiring systems. The enclosure has hinged or removable covers for housing and protecting electric wires, cable and busbars. The enclosure is designed for conductors to be laid or set in place after the enclosures have been installed as a complete system.

Nonmetallic Auxiliary Gutter. A flame retardant, nonmetallic enclosure used to supplement wiring spaces at meter centers, distribution centers, switchboards, and similar points of wiring systems. The enclosure has hinged or removable covers for housing and protecting electric wires, cable and busbars. The enclosure is designed for conductors to be laid or set in place after the enclosures have been installed as a complete system.

Delete the parent text of 366.10, leaving only the title (“Uses Permitted”).

Substantiation: The present NEC text complicates one of the most difficult tasks for NEC trainers within the scope of CMP 8, namely, explaining the difference between auxiliary gutters and wireways. This is especially true given that the equipment used is always listed for both functions, and only the applicable field usage divides the two articles. Since the usage defines the article application, it is essential that the definitions at the beginning of the article focus on on this point.

This proposal includes the usage information now appearing in 366.10 in the definitions for this reason. This proposal also carefully excludes from the definitions any use of the word “wireway” which really confuses one from the other. This proposal does not change any code rules, but presents the information in a far more understandable format. The syntax has also been changed so it works purely as two definitions.
Panel Meeting Action: Accept

Ballot Results: Affirmative: 12

8-125 Log #3611 NEC-P08 **Final Action: Accept in Principle**
(366.2)

Submitter: Noel Williams, Herriman, UT
Recommendation: In the definitions of Metallic and Nonmetallic Auxiliary Gutters (two places) replace the term “wireway” with the term “auxiliary gutter.”
Substantiation: The problem should be obvious. The assembly is either a wireway or an auxiliary gutter. Wireways are separately defined in Articles 376 and 378. This implies that an auxiliary gutter is a wireway used in a different way. In fact both may be the same thing, but they are listed as one or the other.
Panel Meeting Action: Accept in Principle
Panel Statement: The submitter’s intent was met. See panel action and statement on Proposal 8-124.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-126 Log #420b NEC-P08 **Final Action: Reject**
(366.23)

Submitter: John Brouzakis, John’s Electric
Recommendation: Discontinue use of all aluminum and copper clad wire in homes, business, and industry. Discontinue using aluminum bus bars in breaker panels and MCC panels. Aluminum and copper clad wire and bus bars are still being used in homes, business and industry.
Substantiation: I’ve seen aluminum or copper clad wire connections to 240 volt a.c. circuits such as on ranges, dryers and other circuits become loose or corroded and start arcing and burn the wire.

Some breaker panels in basements with aluminum bus bars corrode and start arcing where the breaker plugs into the bus bar. On one job, I had to remove all the breakers, clean the bus bar and replace some of the breakers.

These are just a couple of problems that I experienced with people using AL or copper clad wire and panels with AL bus bars. These situations could have turned into electrical fires with loss of life and property. I believe only copper wire and bus bars should be used in homes, buildings and industry.

When I see AL or copper clad wiring inside a home, I tell the owner it should be replaced with copper. I would appreciate it if you discontinue the usage of aluminum and copper clad wire inside homes, business and industry in your next code.
Panel Meeting Action: Reject
Panel Statement: Panel 8 is not the appropriate panel for this proposal. Article 366 is for Auxiliary Gutters only. Additionally, a specific change is not outlined in the proposal.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-127 Log #2243 NEC-P08 **Final Action: Accept**
(366.23(A))

Submitter: Donald A. Ganiere, Ottawa, IL
Recommendation: Revise as follows:

366.23 Ampacity of Conductors.

(A) Sheet Metal Auxiliary Gutters. Where the number of current-carrying conductors contained in the sheet metal auxiliary gutter is 30 or less, the ~~correction~~ adjustment factors specified in 310.15(B)(2)(a) shall not apply. The current carried continuously in bare copper bars in sheet metal auxiliary gutters shall not exceed 1.55 amperes/mm 2 (1000 amperes in. 2) of cross section of the conductor. For aluminum bars, the current carried continuously shall not exceed 1.09 amperes/ mm 2 (700 amperes/in. 2) of cross section of the conductor.
Substantiation: The term “adjustment factors” is used for adjusting the conductor ampacity for more than three conductors in a raceway or cable. The term “correction factor” is used to correct the conductor ampacity for ambient temperature. 310.15(B)(2)(a) is titled “adjustment factors”, not “correction factors”.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-128 Log #3529 NEC-P08 **Final Action: Reject**
(366.23(A))

Submitter: Timothy McCord, Washington, PA
Recommendation: Revise as follows:

Where the number of current-carrying conductors contained in the sheet metal auxiliary gutter is 30 or less, the correction factors specified in 310.15(B)(2)(a) shall not apply.
The current carried continuously in bare copper bars in sheet metal auxiliary gutters shall not exceed 1.55 amperes ~~/~~ per mm 2 (1000 amperes ~~/~~ per in. 2) of cross section of the conductor. For aluminum bars, the current carried continuously shall not exceed 1.09 amperes ~~/~~ per mm 2 (700 amperes ~~/~~ per in. 2) of cross section of the conductor.
Substantiation: The / symbol used for per is also used in mathematical equations as a division symbol. This change will eliminate any confusion.
Panel Meeting Action: Reject
Panel Statement: The panel believes the existing material is clear.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 368 — BUSWAYS

8-129 Log #455 NEC-P08 **Final Action: Reject**
(368.6 (New))

Submitter: W. Creighton Schwan, Hayward, CA
Recommendation: Add new text to read as follows:

368.6 Listing Requirements. Busways and associated fittings shall be listed.

Substantiation: The AHJ does not have the means to determine the safety of the design and manufacture of busways, particularly with regard to voltage and current ratings, heat rise, enclosure fault current path, support spacings, indoor or outdoor suitability. 230.42(A) refers to LISTED busways for allowable current for services.
Panel Meeting Action: Reject
Panel Statement: Per the 2000 ROC, the panel reaffirms its position that it is not the intent of the panel to require the listing of busways, and the submitter hasn’t provided sufficient substantiation for a listing requirement.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:

DABE, J.: The submitter is correct in stating that the AHJ does not have the means to determine the safety of the design and manufacture of busways. The panel should consider the fact that many panels including this one have required listing for far less hazardous and complex items.

WALBRECHT, G.: The submitter’s substantiation is correct. The Authority Having Jurisdiction will not have the means available to determine the safety of the design, manufacture, and installation of a busway. Busways and their associated fittings, as with any wiring method, should be evaluated and listed by nationally recognized third party certification organization. Field fabrication and modification of factory-produced components can also be hazardous and should be properly examined and evaluated by a nationally recognized testing organization.

8-130 Log #289 NEC-P08 **Final Action: Reject**
(368.10)

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
"... to provide adequate protection from ~~physical damage~~ blows or abrasion."
Substantiation: Use of the word "physical" is superfluous– the purpose is obvious. In some instances, one could argue for the use of "mechanical" to differentiate that from e.g., "thermal" damage, but context makes the intended sense quite clear, rendering anything like this completely unnecessary.
The proposed rewording is an attempt at precision. Furthermore, if you reject the full rewording I would then have to fall back to arguing that in that case the term "physical" should be eliminated.
Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.)
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-4 (Log 336).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-131 Log #3404 NEC-P08 **Final Action: Reject**
(368.10)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Re-title 368.10(A) and 368.10(B) from "Exposed" and "Concealed" to "In View" and "Out of View."
Substantiation: These terms are not used in accordance with Article 100 definitions. "Exposed" includes behind hung ceiling access panels, and "Concealed" essentially means not closed in by structure. This comment provides correct terminology that does not conflict with the applicable provisions. The actual requirements that follow these titles are correct, but when we train journeymen that the area above hung ceilings is still "exposed" (because Article 100 says so), it doesn't help to have erroneous bold print with an opposite meaning.
Panel Meeting Action: Reject
Panel Statement: The terms "Exposed" and "Concealed "more closely represent the terminology used within this article. The terms "In View" and "Out of View "are not used in the NEC and would not add significant clarity. The panel does not believe there is existing confusion.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-131a Log #677 NEC-P08 **Final Action: Reject**
(368.10(A))

Submitter: Jamie McNamara, Hastings, MN
Recommendation: Revise as follows:
368.10 (A) ~~Exposed.~~ In Open.
Substantiation: The definition in article 100 of "Exposed (as applied to wiring methods). On or attached to the surface or behind panels designed to allow access" conflicts with the word exposed as used in 368.10. "368.10 (A) Exposed. Busways shall be permitted to be located in the open where visible, except as permitted i n 368.10(C). "
Panel Meeting Action: Reject
Panel Statement: See panel action on Proposal 8-131. The term "Exposed "more closely represent the terminology used within this article. The term "In Open" is not used in this context in the NEC and would not add significant clarity.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-132 Log #690 NEC-P08 **Final Action: Reject**
(368.10(A) (New))

Submitter: Steve McNamara, Hastings, MN
Recommendation: Add new text to read:
368.10(A) Busways located in the open shall have a minimum of 12 in. working space on one side for maintenance and inspection.
Substantiation: This would provide a very minimal requirement to provide a small amount of working and inspection space on one side of busways. Currently, with no test on what is required, some think the working space in 110.26 is the minimum required while others think no space is needed for inspection or working.
Panel Meeting Action: Reject
Panel Statement: 110.26 already requires sufficient access and working space about all electrical equipment. And if the equipment is to be worked on while energized, the clearance requirements of Table 110.26(A)(1) or Table 110.34(A) are required. The 12 inches in many cases would be too restrictive. Working space is only required around busway joints between sections and fittings.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-133 Log #1046 NEC-P08 **Final Action: Reject**
(368.12(1))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Delete the word "severe".
Substantiation: Edit. "Severe" is subjective and argumentative. Other similar sections do not use the word "severe".
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-98.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-134 Log #914 NEC-P08 **Final Action: Reject**
(368.12(A))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Delete "severe".
Substantiation: Edit. "Severe" is subjective and argumentative. Other similar sections do not use the word severe.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-98.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-135 Log #2266 NEC-P08 **Final Action: Reject**
(368.13 (New))

Submitter: H. Brooke Stauffer, National Electrical Contractors Assn. (NECA)
Recommendation: Add new text to read:
368.xx Busways shall be installed in a neat and workmanlike manner.
FPN: Accepted industry practices are described in ANSI/NECA 408-2002, Recommended Practice for Installing and Maintaining Busways, and other ANSI-approved installation standards.
Substantiation: The general workmanship requirement of 110.12 applies to electrical equipment covered by Article 368. However, safety would be improved by offering more detailed installation guidance for busways.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-3 (Log 3454).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
LOYD, R.: See my comment on 8-3.

8-136 Log #1923 NEC-P08 **Final Action: Reject**
(368.56(A))

Submitter: William Wagner, Certification Solutions
Recommendation: Revise 368.56(A) as follows:
368.56(A) General. Branches from busways shall be permitted to use any of the following wiring methods:
(1) Type AC armored cable
(2) Type MC metal-clad cable
(3) Type MI mineral-insulated, metal-sheathed cable
(4) Type IMC intermediate metal conduit
(5) Type RMC rigid metal conduit
(6) Type FMC flexible metal conduit
(7) type LFMC liquidtight flexible metal conduit
(8) Type PVC ~~RNC~~ rigid-nonmetallic polyvinylchloride conduit
(9) Type HDPE high density polyethylene conduit
(10) Type RTRC reinforced thermosetting resin conduit
(~~9~~) (11) Type LFNC liquidtight flexible nonmetall ic conduit
(~~10~~)(12) Type EMT electrical metallic tubing
(~~11~~)(13) Type ENT electrical nonmetallic tubing
(~~12~~)(14) Busways
(~~13~~)(15) Strut-type channel raceway
(~~14~~)(16) Surface metal raceways
(~~15~~)(17) Surface nonmetallic raceways
Where a separate equipment grounding conductor is used, connection of the equipment grounding conductor to the busway shall comply with 250.8 and 250.12.

Substantiation: This is a companion proposal for the new definition of Rigid Nonmetallic Conduit in Article 100, the revised Article 352 for Type PVC Conduit and the new Article 355 for type RTRC Conduit. It clarifies that the broad designation of rigid nonmetallic conduit (Type RNC) includes PVC, HDPE and RTRC and specifies each acceptable raceway type that is covered by a separate Code Article as a separate line item. Additionally, editorial revisions revise the names of several raceway types for uniformity.
Panel Meeting Action: Reject
Panel Statement: The proposal is rejected since Proposals 8-53 and 8-78 refer to RNC in the definition of PVC conduit and RTRC. Use of HDPE is not permitted to be used as a branch from a busway.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-137 Log #2207 NEC-P08 **Final Action: Reject**
(368.56(A)(16))

Submitter: Kyle Cope, Prysmian Cables and Systems
Recommendation: (16) Type PA Cable
Substantiation: Statement of problem: Material technology advancements now allow for cable designs that provide improved mechanical damage protection. i.e., crush and impact, over standard Type MC cable without sacrificing flame performance properties. The characteristics achieved using traditional metallic components can now be realized using polymeric materials. The use of polymeric materials also provides the opportunity for lighter and smaller diameter cables.

Substantiation for Proposal: Type PA has been proposed as a new type (Article 3XX) and should be included in this list (368.56(A)) as it offers enhanced mechanical benefits as an alternate to Type MC cable. See test data provided. A UL Fact-Finding study comparing the subject cable to type MC is ongoing at the time of proposal submittal. This data will be forwarded once the study is complete.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: Panel 8 cannot accept this product until it has been accepted under the jurisdiction of Panel 7.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-138 Log #1591 NEC-P08 **Final Action: Accept**
(368.258)

Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Make the following change in 368.258:

Change "neutral" to "neutral conductor."

The revised text would appear as follows:

368.258 Neutral <u>Conductor</u> .
Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).
The Task Group has proposed the following definitions to be added to Article 100:

● **Neutral conductor.** A circuit conductor connected to the neutral point of a system.

● **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.

This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals

● The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.

● The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.

Additional information is available in the Task Group report.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept
Panel Statement: The panel agrees with the submitter's change but doesn't agree with the submitter's substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

DABE, J.: Based on the Negative Comment of Mike Callanan which states: "The proposed definitions for "neutral" and "neutral point" do not provide a clear and concise understanding of what actually constitutes a neutral conductor or when a grounded conductor is not a neutral. The fact that the Task Group needed to provide four drawings to help explain the meaning of the definitions is an indication they are not clear." The panel should reconsider the acceptance of this proposal.

ARTICLE 370 — CABLEBUS

8-139 Log #2753 NEC-P08 **Final Action: Reject**
(370.4(B))

Submitter: Jonathan R. Althouse, Michigan State University
Recommendation: Add a new sentence as follows:

<u>The adjustment factors in 310.15(B)(2)(a) shall not be required to apply</u>
Substantiation: Conductors installed in cablebus usually consist of parallel conductors per phase with many conductors within the cablebus. The cables are mounted on spacer blocks to maintain spacing for ventilation. These conductors act as free conductors in air and there is no need for applying the adjustment factors for more than three current-carrying conductors, but this is not stated in this section. There needs to be a clear statement that adjustment factors are not required to be applied in this section
Panel Meeting Action: Reject
Panel Statement: Without a fact-finding report, or listing of cablebus clearly indicating that the adjustment factor should not apply, this determination should be left up to the AHJ.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-140 Log #288 NEC-P08 **Final Action: Reject**
(370.6(B))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:

"... protected against ~~physical damage~~ <u>blows or abrasion</u> , and unventilated."
Substantiation: Use of the word "physical" is superfluous– the purpose is obvious. In some instances, one could argue for the use of "mechanical" to differentiate that from e.g., "thermal" damage, but context makes the intended sense quite clear, rendering anything like this completely unnecessary.

The proposed rewording is an attempt at precision. Furthermore, if you reject the full rewording I would then have to fall back to arguing that in that case the term "physical" should be eliminated.

Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.)
Panel Meeting Action: Reject

Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-141 Log #287 NEC-P08 **Final Action: Reject**
(370.7(4))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:

(4) Additional ~~physical~~ protection where required, such as guards where subject to severe ~~physical damage~~ <u>blows or abrasion.</u>
Substantiation: Use of the word "physical" is superfluous– the purpose is obvious. In some instances, one could argue for the use of "mechanical" to differentiate that from e.g., "thermal" damage, but context makes the intended sense quite clear, rendering anything like this completely unnecessary.

The proposed rewording is an attempt at precision. Furthermore, if you reject the full rewording I would then have to fall back to arguing that in that case the term "physical" should be eliminated.

Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the

Code process. When the references were changed to “physical damage,” in 1959, from “mechanical injury” (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, “Is anyone claiming electrical equipment needs protection from non-physical injury?” (Substitute the snide adjective of your choice.)
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-4 (Log 336).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-142 Log #1151 NEC-P08 **Final Action: Reject**
(370.9)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise text:
A cablebus installation shall be grounded and bonded ~~in accordance with Article 250, excluding 250,86 Exception No. 2.~~
Alternatively, delete this section.
Substantiation: To comply with Style Manual requirements. Proposed wording excludes 250.86, Exception No. 2. Section 90.3 indicates Article 250 already applies.
Panel Meeting Action: Reject
Panel Statement: The current text is clearer than the proposed text. By meeting the requirements of 370.9, which refers to 250.86, the cablebus will both be bonded and grounded. The submitter was unclear in his proposal.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 372 — CELLULAR CONCRETE FLOOR RACEWAYS

8-143 Log #1964 NEC-P08 **Final Action: Accept**
(372.4(2))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Change the text of 372.4(2) to read as shown:
372.4(2) in <u>any</u> hazardous (classified) locations, except as permitted by <u>other Articles in this Code</u> . ~~504.20, and in Class I, Division 2 locations as permitted by 501.10(B)(3)~~
Substantiation: This change is necessary because the current text is too limiting. The areas of usage for Cellular Concrete Floor Raceways within the hazardous (Classified) locations Articles in the Code are broader. The current text may limit the use of Cellular Concrete Floor Raceways, by an AHJ, because the Cellular Concrete Floor Raceways Article itself does not recognize the broader permissions. The proposed text is preferred to a laundry list of section references.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-144 Log #1053 NEC-P08 **Final Action: Reject**
(372.12)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise second sentence as follows:
For the purpose of this section, so-called loop wiring (continuous unbroken conductor connecting the individual outlets) <u>or connection to feed-through terminals</u> shall not be considered a splice or tap.
Substantiation: Where conductors are terminated on terminals designed for feed-through connections but are not unbroken, it seems reasonable not to consider this type connection a splice or tap, also.
Panel Meeting Action: Reject
Panel Statement: The Code is clear as to intent that splices or taps will only be allowed in header access units or junction boxes. Loop wiring is continuous and unbroken, whereas using the terminals on a device to join two wires is a splice. Splices are made in junction boxes not only to have access but also to limit the effects of arcing.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-145 Log #1056 NEC-P08 **Final Action: Reject**
(372.17 Exception (New))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Add a new Exception as follows:
<u>Exception: Where more than one outlet is individually supplied by a set of conductors on the same circuit, it shall be permitted to count only one set of current-carrying conductors of that circuit for derating purposes.</u>
Substantiation: The present derating factors discourages individual sets of conductors to outlets on the same circuit, which results in loop wiring and a tendency to violate 372.13 since inspection is not generally required to remove wiring. The proposal would improve efficiency, reduce voltage drop and heating of conductors.
Panel Meeting Action: Reject
Panel Statement: The current text is clear. It is the intent of the panel to have the adjustment factors of 310.15(B)(2) apply to cellular concrete floor raceways.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 374 — CELLULAR METAL FLOOR RACEWAYS

8-146 Log #1965 NEC-P08 **Final Action: Accept**
(374.3(2))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Change the text of 374.3(2) to read as shown:
374.3(2) in <u>any</u> hazardous (classified) locations, except as permitted <u>by other Articles in this Code</u> . ~~504.20, and in Class I, Division 2 locations as permitted by 501.10(B)(3)~~
Substantiation: This change is necessary because the current text is too limiting. The areas of usage for Cellular Metal Floor Raceways within the hazardous (Classified) locations Articles in the Code are broader. The current text may limit the use of Cellular Metal Floor Raceways, by an AHJ, because the Cellular Metal Floor Raceways Article itself does not recognize the broader permissions. The proposed text is preferred to a laundry list of section references.
Panel Meeting Action: Accept

Ballot Results: Affirmative: 12

8-148 Log #1057 NEC-P08 **Final Action: Reject**
(374.17 Exception (New))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Add a new Exception as follows:
<u>Exception: Where more than one outlet is individually supplied by a set of conductors on the same circuit, it shall be permitted to count only one set of current-carrying conductors of that circuit for derating purposes.</u>
Substantiation: The present derating factors discourages individual sets of conductors to outlets on the same circuit, which results in loop wiring and a tendency to violate 374.7 since inspection is not generally required to remove wiring. The proposal would improve efficiency, reduce voltage drop and heating of conductors.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-145.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 376 — METAL WIREWAYS

8-149 Log #2570 NEC-P08 **Final Action: Reject**
(376.5 (New))

Submitter: Larry Rogers, Vattertott College-Tulsa / Rep. Vatterott Colleges, NFPR and IAEI Member
Recommendation: Add new text as follows:
Enclosure fronts or faces; All unfinished edges, internally and externally of enclosure faces shall be rounded or de-burred to a smooth finish.
Substantiation: I am using enclosures in a generic form to include panel boards, auxiliary gutters, surface metal raceways, and large junction boxes

above 4 11/16. Sharp corners/edges on enclosures have caused thousands of injuries to workmen and also thousands of hours of lost time man hours. Also, damage to the integrity of conductor insulation during installation or inspection is a problem with results of sometimes immediate arc flash or they are found later with a bare hand, which could lead to a fatal shock or serious cut due to jerk reaction. We ask this panel to consider having the manufacturer remove these sharp edges prior to shipment, thus attacking the problem from the start. Sharp edges stay sharp for years.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 8-122.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

8-150 Log #456 NEC-P08 **Final Action: Accept in Principle**
(376.6 (New))

Submitter: W. Creighton Schwan, Hayward, CA

Recommendation: Add new text to read as follows:

<u>Metal wireways and associated fittings shall be listed.</u>

Substantiation: The AHJ does not have the means to determine the safety of the design and manufacture, particularly the ability of the joints to carry large fault currents where power conductors are contained. Panel comment (Proposal 8-208, pg. 964, 2001 ROP) refers to 250.118(14) for use of wireway as an equipment grounding conductor. In the 2005 NEC, see 250.118(13) which refers to LISTED wireways.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action on Proposal 8-151.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 8 Negative: 4

Explanation of Negative:

DAUBERGER, G.: This is the same proposal that CMP 8 rejected in the last cycle, and no new substantiation has been provided. Because of the nature of the product and its application, many fittings are fabricated in the field to fill a specific need. It would be impractical and almost impossible to submit these fittings for listing prior to the installation.

DOLLINS, J.: The submitter’s recommendation is overly restrictive, and the substantiation is insufficient to require the listing of wireway and associated fittings. A similar proposal was submitted for the 2005 NEC and was rejected. No additional substantiation has been submitted to reverse the panel’s position.

KENDALL, D.: This proposal should be rejected. Listed metal raceways and associated fittings are unrealistic in the field. Fittings and elbows are required to be fabricated in the field by the contractor. It is impossible for a manufacturer to produce and list all the possible combination of fittings.

LOYD, R.: I am voting against this proposal which is to require all metal wireways to be listed. Metal wireways have been used based on the installers need for them. Many are used in unique applications and they may be custom made on the job or by local sheet metal shops. The present language is sufficient and the code should not be changed at this time.

8-151 Log #673 NEC-P08 **Final Action: Accept**
(376.6)

TCC Action: It was the action of the Technical Correlating Committee that the panel reconsider the proposal as it is unclear what “one of a kind” means and that further consideration be given to the comments expressed in the voting. This action will be considered by the panel as a public comment.

Submitter: Jamie McNamara, Hastings, MN

Recommendation: Revise as follows:

<u>**376.6 Listing Requirements.** Metal wireways and associated fittings shall be listed.</u>

<u>Exception: One of a kind and custom made wireways and fitting shall not be required to be listed.</u>

Substantiation: To require stand sections of metal raceway to be listed provides for a minimum standard of safety that all standard wireways should meet. It helps the AHJ determine if the raceway suitable for installation and use. The AHJ rarely has the ability in the field to determine the suitability of a raceway as to its condition of use. Virtually all other chapter three wring methods are required to be listed.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 8 Negative: 4

Explanation of Negative:

DAUBERGER, G.: This is the same proposal that CMP 8 rejected in the last cycle. At that time, the panel statement was: “The submitter’s recommendation is overly restrictive and the substantiation is insufficient to require the listing of wireway and associated fittings.” There was absolutely no substantiation provided with the proposal for the 2008 Code either, therefore, the proposal should be rejected.

DOLLINS, J.: The submitter’s recommendation is overly restrictive, and the substantiation is insufficient to require the listing of wireway and associated fittings. A similar proposal was submitted for the 2005 NEC and was rejected. No additional substantiation has been submitted to reverse the panel’s position.

KENDALL, D.: See my Explanation of Negative for Proposal 8-150.

LOYD, R.: I am voting against this proposal which is to require all metal wireways to be listed except for the one-of-a-kind and custom-made wireways.

Metal wireways have been used based on the installers need for them. Many are used in unique applications which is the bases for the exception. However, they may not be custom made. They can be made of manufactured enclosures that are not necessarily listed as “wireways”. They may be manufactured as auxiliary gutters, junction boxes, or cabinets or cutout boxes, then installed as wireways. Therefore, to require listing may be overly restrictive and does not add safety. The present language is sufficient and the code should not be changed at this time.

Comment on Affirmative:

DABE, J.: While we agree with the action taken by the panel, upon review of the recirculation for Code-Making Panel 8, we feel that the language shown below will lead to a greater degree of consensus. And, also better meet the needs of the industry that we represent, by meeting the intent of the proposal and allowing a field manufactured piece when necessary.

“376.6 Listing Requirements. Metal wireways and associated fittings shall be listed.

Exception: One of a kind, custom made, and <u>field-fabricated</u> wireways and fittings shall not be required to be listed.”

WALBRECHT, G.: We agree with the submitter that the Authority Having Jurisdiction will not have the means available to determine the safety of the design, manufacture, and installation of a metal wireway. Wireways and their associated fittings, as with a wiring method, should be evaluated and listed by a nationally recognized third party certification organization. However, we do not agree with the additional exception. Field fabrication and modification of factory-produced components can also be hazardous and should be properly examined and evaluated by a nationally recognized testing organization.

8-152 Log #304 NEC-P08 **Final Action: Reject**
(376.12(1))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education

Recommendation: Revise as follows:

(1) Where subject to severe ~~physical damage~~ <u>blows or abrasion.</u>

Substantiation: Use of the word “physical” is superfluous– the purpose is obvious. In some instances, one could argue for the use of “mechanical” to differentiate that from e.g., “thermal” damage, but context makes the intended sense quite clear, rendering anything like this completely unnecessary.

Here, though, item (2) also refers to a source of physical damage. The proposed rewording is an attempt at precision. If you don’t care to reword (a), its existing form theoretically eliminates the need for (2).

Furthermore, I would then have to fall back to arguing that in that case the term “physical” should be eliminated.

Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the use of “physical” is not only poor writing–look at William Zinsser’s classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to “physical damage,” in 1959, from “mechanical injury” (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, “Is anyone claiming electrical equipment needs protection from non-physical injury?” (Substitute the snide adjective of your choice.)

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 8-4 (Log 336).

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

8-153 Log #1037 NEC-P08 **Final Action: Reject**
(376.12(1))

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Delete “severe”.

Substantiation: Edit. “Severe” is subjective and argumentative. Other similar sections do not use the word severe.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 8-98.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

8-154 Log #1150 NEC-P08 **Final Action: Reject**
(376.12(1) and (2))

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Delete “severe”.

Substantiation: Edit. Severe damage is not defined and is subjective. Other similar requirements do not use the word “severe”.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 8-98.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-156 Log #3127 NEC-P08 **Final Action: Reject**
(376.23(B))

Submitter: Jeremy Enders, East Lansing, MI
Recommendation: Revise the section to make the meaning clear when a raceway must traverse from one side to the other of a wireway. The section will read as follows:
(B) Metallic Wireways Used as Pull Boxes. Where insulated conductors 4 AWG or larger are pulled through a wireway, the distance between raceway and cable entries enclosing the same conductor shall not be less than ~~eight times the diameter of the largest raceway or cable entry. that required by 314.28(A)(1) for straight pulls and 314.28(A)(2) for angle pulls~~ ...
Substantiation: Applying the rules for straight and angle pulls to conductors entering and leaving a wireway for the purpose of passing from one side to the other is not clear. There can be a simple rule that applies in all cases and that is to require a minimum of eight times the diameter of the largest raceway involved as a minimum distance between raceway entries. Then, it does not matter if it is a straight pull or the wires travel down the wireway a short distance before leaving either the top or the bottom. When wires enter a wireway and travel down the wireway a short distance than leave it this an angle pull or do the rules of wire deflection (376.23(A)) apply? This revision makes the answer clear.
Panel Meeting Action: Reject
Panel Statement: The current text is clear as to intent. The rules for determining if two raceways or cables enclosing the same conductors are considered a straight or angle pull is determined by whether the raceways or cables enter and leave on adjacent walls (angle) or opposite walls (straight), and not how far they travel down a wireway before leaving.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-155 Log #3405 NEC-P08 **Final Action: Accept**
(376.56(B)(4))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Revise to read as follows:
(4) Live Parts. Power distribution blocks shall not have uninsulated live parts exposed within a wireway, whether or not the wireway cover is installed.
Substantiation: Although members of the panel have clarified the intent of this new (2005 NEC) requirement, the literal test allows uninsulated power distribution blocks as long as the cover is on the wireway. With the cover in place, (“after installation”) uninsulated power distribution blocks are “in the wireway” but no longer “exposed” and therefore comply with the literal text. Remember that live parts include insulated conductors as long as they are energized. Therefore, the prohibition must address “uninsulated live parts” and must apply with the cover open. This proposal incorporates these concepts.
Panel Meeting Action: Accept
Change the code reference to 376.56(B)(4).
Panel Statement: The panel believes the submitter intended to reference 376.56(B)(4) not 376.15(B)(4). The print line heading should be changed from “376.15” to “376.56”.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-157 Log #2754 NEC-P08 **Final Action: Accept in Principle**
(376.80)

Submitter: Jonathan R. Althouse, Michigan State University
Recommendation: Move the last two sentences of 376.22 to a new section 376.24 to read as follows:
<u>376.80 Conductor Ampacity. The Ampacity of conductors installed in metal wireway shall be determined in accordance with 310.15.</u> The ~~derating~~ <u>adjustment</u> factors in 310.15(B)(2)(a) shall be applied only where the number of current-carrying conductors, including neutral conductors classified as current-carrying under the provisions of 310.15(B)(4), exceeds 30. Conductors for signaling circuits or controller conductors between a motor and its starter and used only for starting duty shall not be considered as current carrying conductors.
Substantiation: Provisions dealing with wireway fill and ampacity of conductors installed within a wireway are covered in the same section. These two different subjects need to be in separate sections. It is confusing for some trades persons to find the ampacity rule when it is hidden within a section dealing with fill. The code refers to adjustment factors not derating factors in 310.15(B)(2)(a).
Panel Meeting Action: Accept in Principle
Modify existing 376.22 as follows:
376.22 Number of Conductors <u>and Ampacity.</u> The number of conductors and their ampacity shall comply with (A) and (B).
<u>(A)</u> The sum of the cross-sectional areas of all contained conductors at any cross section of a wireway shall not exceed 20 percent of the interior cross-sectional area of the wireway.
<u>(B)</u> The ~~derating~~ <u>adjustment</u> factors in 310.15(B)(2)(a) shall be applied only where the number of current-carrying conductors, including neutral conductors classified as current-carrying under the provisions of 310.15(B)(4), exceeds 30. Conductors for signaling circuits or controller conductors between a motor and its starter and used only for starting duty shall not be considered as current-carrying conductors.
Panel Statement: The submitter’s intent was met. Additional editorial changes were made for clarity.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-157a Log #CP802 NEC-P08 **Final Action: Accept**
(376.100 (new))

TCC Action: The Technical Correlating Committee directs that the panel add Titles to (A) and (B). This action will be considered by the panel as a public comment.
Submitter: Code-Making Panel 8,
Recommendation: Insert a new 376.100 as follows:
376.100 Construction.
(A) Electrical and Mechanical Continuity. Wireways shall be constructed and installed so that adequate electrical and mechanical continuity of the complete system is secured.
(B) Substantial Construction. Wireways shall be of substantial construction and shall provide a complete enclosure for the contained conductors. All surfaces, both interior and exterior, shall be suitably protected from corrosion. Corner joints shall be made tight, and where the assembly is held together by rivets, bolts, or screws, such fasteners shall be spaced not more than 300 mm (12 in.) apart.
(C) Smooth Rounded Edges. Suitable bushings, shields, or fittings having smooth, rounded edges shall be provided where conductors pass between wireways, through partitions, around bends, between wireways and cabinets or junction boxes, and at other locations where necessary to prevent abrasion of the insulation of the conductors.
(D) Covers. Covers shall be securely fastened to the wireway.
Substantiation: See action on Proposal 8-151 for field fabricated wireways.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 378 — NONMETALLIC WIREWAYS

8-158 Log #318 NEC-P08 **Final Action: Reject**
(378.10, FPN)

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
FPN: Extreme cold may cause some nonmetallic wireways to become brittle and, therefore, more susceptible to damage from ~~physical~~ contact.
Substantiation: Use of the word “physical” is superfluous– the purpose is obvious.
Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the use of “physical” is not only poor writing–look at William Zinsser’s classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to “physical damage,” in 1959, from “mechanical injury” (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, “Is anyone claiming electrical equipment needs protection from non-physical injury?” (Substitute the snide adjective of your choice.)
Let’s take care of that for good: for our purposes, “contact” means “physical contact.”
Panel Meeting Action: Reject

(378.12(2))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Change the text of 378.12(2) to read as shown:
378.12(2) in any hazardous (classified) locations, except as permitted by other Articles in this Code . ~~in 504.20~~
Substantiation: This change is necessary because the current text is too limiting. The areas of usage for Nonmetallic Wireways within the hazardous (Classified) locations Articles in the Code are broader. The current text may limit the use of Nonmetallic Wireways, by an AHJ, because the Nonmetallic Wireways Article itself does not recognize the broader permissions. The proposed text is preferred to a laundry list of section references.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-161 Log #1924 NEC-P08 **Final Action: Accept in Principle**
(378.44, FPN (New))

Submitter: William Wagner, Certification Solutions
Recommendation: Revise the FPN to 378.44 as follows:
FPN: See Table 352. ~~44(A)~~ for expansion characteristics of rigid PVC ~~rigid nonmetallic~~ conduit. The expansion characteristics of PVC nonmetallic wireway are identical.
Substantiation: This is a companion proposal for the revised Article 352 for Type PVC Conduit. Article 352 will now apply only to rigid polyvinyl chloride conduit (Type PVC), rather than to rigid nonmetallic conduit (Type RNC) which includes PVC, HDPE and RTRC. Therefore, there will only be one Table in 352.44 and the reference should be revised accordingly. It additionally corrects the reference to Type PVC conduit in order to employ uniform terminology for this product throughout the code.
Panel Meeting Action: Accept in Principle
Revise the FPN to 378.44 as follows:
FPN: See Table 352.44 ~~(A)~~ for expansion characteristics of ~~rigid~~ PVC ~~rigid nonmetallic~~ conduit. The expansion characteristics of PVC nonmetallic wireway are identical.
Panel Statement: The submitter's intent is met and a minor editorial change in the table reference is corrected. The word "rigid" was removed from the proposed language for consistency with other articles.

ARTICLE 382 — NONMETALLIC EXTENSIONS

7-98 Log #3450 NEC-P07 **Final Action: Accept in Principle**
(382)

Submitter: Richard Temblador, Southwire Company
Recommendation: Revise text to read:
I. General
382.1 Scope. This article covers the use, installation, and construction specifications for nonmetallic extensions.
382.2 Definition.
Concealable Nonmetallic Extension. A Listed assembly of two, three, or four insulated circuit conductors within a nonmetallic jacket, an extruded thermoplastic covering, or a sealed nonmetallic covering. The classification includes surface extensions intended for mounting directly on the surface of walls or ceilings, and concealed with paint, texture, joint compound, plaster, wallpaper, tile, wall paneling, or other similar materials.
382.6 Listing Requirements. Concealable nonmetallic extensions and associated fittings and devices shall be listed and shall provide a level of shock protection equivalent to a GFCI.
II. Installation
382.10 Uses Permitted. Nonmetallic extensions shall be permitted only in accordance with 382.10(A), (B), and (C).
(A) From an Existing Outlet. The extension shall be from an existing outlet on a 15- 20-ampere branch circuit. Where a concealable nonmetallic extensions originates from non-grounding Type receptacles, the installation shall comply with 250.130(C), 406.3(D)(3)(b), or 406(D)(3)(c).
(B) Exposed and in a Dry Location. The extension shall be run exposed or concealed as permitted in 382.15, and in a dry location.
(C) Residential or Offices. For nonmetallic surface extensions mounted directly on the surface of walls or ceilings, the building shall be occupied for residential or office purposes and shall not exceed three floors above grade. Where identified for the use, concealable nonmetallic extensions shall be permitted more than three floors above grade.
382.12 Uses Not Permitted. Nonmetallic extensions shall not be used as follows:
(1) In unfinished basements, attics, or roof spaces
(2) Where the voltage between conductors exceeds 150 volts for nonmetallic surface extension and 300 volts for aerial cable
(3) Where subject to corrosive vapors
(4) Where run through a floor or partition, or outside the room in which it originates
382.15 Exposed.
(A) Nonmetallic Extensions. One or more extensions shall be permitted to be run in any direction from an existing outlet, but not on the floor or within 50 mm (2 in.) from the floors.
(B) Concealable Nonmetallic Extensions. Where identified for the use, nonmetallic extensions may be concealed with paint, texture, concealing compound, plaster, wallpaper, tile, wall paneling, or other similar materials and installed per 382.15(A).
382.26 Bends.
(A) Nonmetallic Extensions. A bend that reduces the normal spacing between the conductor shall be covered with a cap to protect the assembly from physical damage.
(B) Concealable Nonmetallic Extensions. Concealable extensions shall be permitted to be folded back over itself and flattened as required for installation.
382.30 Securing and Supporting.
(A) Nonmetallic Extensions. Nonmetallic surface extensions shall be secured in place by approved means at intervals not exceeding 200 mm (8 in.), with an allowance for 300 mm (12 in.) to the first fastening where the connection to the supplying outlet is by means of an attachment plug. There shall be at least one fastening between each two adjacent outlets supplied. An extension shall be attached to woodwork plaster finish and shall not be in contact with any metal work or other conductive material other than with metal plates on receptacles.
(B) Concealable Nonmetallic Extensions. All surface mounted concealable nonmetallic extension components shall be firmly anchored to the wall or ceiling using an adhesive or mechanical anchoring system identified for this use.
382.40 Boxes and Fittings. Each run shall terminate in a fitting , connector, or box that covers the end of the assembly. All fittings, connectors, and devices shall be of a type identified for the use.
382.42 Devices.
(A) Receptacles. All receptacles, receptacle housings, and self-contained devices used with concealable nonmetallic extensions shall be identified for this use.
(B) Receptacles and Housings. Receptacle housings and self-contained devices designed either for surface or for recessed mounting shall be permitted for use with concealable nonmetallic extensions. Receptacle housings and self-contained devices shall incorporate means for facilitating entry and termination of concealable nonmetallic extensions and for electrically connecting the housing or device. Receptacle and self-contained devices shall comply with 406.3. Power and communications outlets installed together in common housing shall be permitted in accordance with 800.133(A)(1)(c), Exception No. 2.
382.56 Splices and Taps. Extensions shall consist of a continuous unbroken length of the assembly, without splices, and without exposed conductors between fittings , connectors, or devices . Taps shall be permitted where approved fittings completely covering the tap connections are used. Aerial cable and its tap connectors shall be provided with an approved means for polarization. Receptacle-type tap connectors shall be of the locking type.
III. Construction Specifications (Concealable Nonmetallic Extensions only)
382.100 Construction. Concealable nonmetallic extensions shall be a multi-layer flat conductor design consisting of a center ungrounded conductor enclosed by a sectioned grounded conductor, and an overall sectioned grounding conductor.
382.104 Flat Conductors. Concealable nonmetallic extensions shall be constructed, using flat copper conductors equivalent to 14 AWG or 12 AWG conductor sizes, and constructed per 382.104(A), (B), and (C).
(A) Ungrounded Conductor (Center Layer). The ungrounded conductor shall consist of one or more ungrounded flat conductor(s) enclosed per 382.104(B) and (C), and identified in accordance with 310.12(C).
(B) Grounded Conductor (Inner Sectioned Layers). The grounded conductor shall consist of two sectioned inner flat conductors that enclose the center ungrounded conductor(s). The sectioned grounded conductor shall be enclosed by the sectioned grounding conductor, and identified in accordance with 200.6.
(C) Grounding Conductor (Outer Sectioned Layers). The grounding conductor shall consist of two overall sectioned conductors that enclose the grounded conductor and ungrounded conductor(s), and shall comply with 250.4(A)(5). The grounding conductor layers shall be identified by any one of the following methods:
(1) As permitted in 250.119,
(2) A clear covering,
(3) One or more continuous green stripes or hash marks, or
(4) The term “Equipment Ground” printed at regular intervals throughout the cable.
382.112 Insulation. The ungrounded and grounded flat conductor layers shall be individually insulated and comply with 310.10. The grounding conductor shall be covered or insulated.
382.120 Marking.
(A) Cable. Concealable nonmetallic extensions shall be clearly and durably marked on both sides at intervals of not more than 610 mm (24 in.) with the information required by 310.11(A) and with the following additional information:
(1) Material of conductors
(2) Maximum temperature rating
(3) Ampacity
(B) Conductor Identification. Conductors shall be clearly and durably identified on both sides throughout their length as specified in 382.104.
Substantiation: This proposal seeks to revise Article 382 to recognize a nonmetallic extension that can be concealed on the surface of walls and ceilings.

New technologies, consumer electronics devices and ever changing lifestyles have increased the need for additional power outlets and the desire to place power or lighting where needed to obtain an aesthetically pleasing environment. Often these changes are accommodated through the use of extension cords that are easily damaged and misused. This has led to distressing statistics such as:

"The U.S. Consumer Product Safety Commission (CPSC) estimates that each year, about 4,000 injuries associated with electric extension cords are treated in hospital emergency rooms. About half the injuries involve fractures, lacerations, contusions, or sprains from people tripping over extension cords. Thirteen percent of the injuries involve children under five years of age; electrical burns to the mouth accounted for half the injuries to young children."

"CPSC also estimates that about 3,300 residential fires originate in extension cords each year, killing 50 people and injuring about 280 others. The most frequent causes of such fires are short circuits, overloading, damage, and/or misuse of extension cords. Nearly 30 percent of home electrical wiring fires can be traced to the misuse of electric cords, such as overloading circuits, poor maintenance and running the cords under rugs or through high traffic areas."

Consumers are commonly using "temporary" methods to compensate for the limitations of their existing fixed wiring.

The proposed nonmetallic extension is a concealable multi-layer flat wire nonmetallic extension that can serve as a safe alternative to temporary extension cords. The design is inherently safe and eliminates the need to mechanically protect the cable from physical damage. Branch circuit wiring can be safely extended using concealable flat wire nonmetallic extension for power or lighting where needed, and as needed, to accommodate decorating schemes, placement of specific equipment or furniture to suit ever-changing lifestyles.

Because the concealable flat wire nonmetallic extension is inherently safe, requirements for mechanical protection are not necessary to insure the practical safeguarding of persons and property in the event physical damage to the cable. Unlike standard nonmetallic extensions, the conductors of the concealable flat wire nonmetallic extension are flat and layered in a manner that insures practical safeguarding of persons or property. The flat wire cable is a multi-layer flat conductor design consisting of a center ungrounded conductor enclosed by a sectioned grounded conductor, and an overall grounding conductor. The cable itself is a symmetrical design providing two levels of protection on both sides of the flat wire cable via the outer grounding conductor layers and inner grounded (neutral) conductor layers. This design insures that if the cable is damaged, punctured or penetrated, it will trip the over-current protection device (OCPD) and safely open the circuit. If the OCPD is reset, the circuit will trip and continue to do so upon subsequent resets. The concealable flat wire nonmetallic extension provides a level of shock protection equivalent to a GFCI.

The concealable flat wire nonmetallic extension is unlike most NEC recognized wiring methods that have installation requirements to prevent physical damage during normal use. These traditional wiring methods have relied on concealment, routing requirements, and mechanical protection to minimize the potential for damage. Exposed wiring methods rely on special installation requirements for routing and limited use to minimize the potential for damage. These requirements are in place because physical damage greatly increases the likelihood of shock and fire hazards. The concealable flat wire nonmetallic extension relies on an inherently safe design eliminating the need for these traditional installation requirements. The proposed system has been thoroughly investigated under a Fact-Finding Study performed by Underwriters Laboratories to assure the safeguarding of persons and property from shock and fire hazards.

Panel Meeting Action: Accept in Principle

The panel accepts the proposal in principle, with the following revisions to 382.6 listing requirements to read as follows:

"382.6 Listing Requirements. Concealable nonmetallic extensions and associated fittings and devices shall be listed. The starting/source tap device for the extension shall contain and provide the following protection for all load-side extensions and devices:

(1) Supplementary over-current protection

(2) Level of protection equivalent to a Class A GFCI

(3) Level of protection equivalent to a portable GFCI

The remainder of the proposal remains as submitted.

Panel Statement: The revised wording provides protection against possible miswiring.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 12 Negative: 2

Explanation of Negative:

BROWN, H.: We disagree with the panel action to accept this proposal.

The panel action on Proposal 7-99 serves to recognize the requirement that "nonmetallic extensions" should not be located: (382.12(5), (new), WHERE SUBJECT TO PHYSICAL DANGER IN RESIDENTIAL OR OFFICE AREAS.

Although we encourage and promote the development of innovative wiring methods, the "concealable flatwire nonmetallic extension method" is unacceptable.

The opening sentence of the NEC, (90.1), clearly states that the intended purpose of the NEC is the practical safeguarding of persons and property from hazards arising from the use of electricity.

AC Flatwire is a fragile wiring method, with thin flat conductors, separated by thin layers of insulating material. The material is designed to be surface mounted on a dwelling or office wall using adhesives, and then painted for " CONCEALMENT ". The system is designed to have an inherent safety system that is built within.

Good judgment has prevailed. Everyone with whom we have discussed this wiring method, has quickly asked: Since I cannot see the wire, how can I avoid penetrating it with a nail, screw, or some other foreign object? The answer is quite clear. YOU CANNOT PROTECT THIS WIRING METHOD FROM PHYSICAL DAMAGE!!!

The proposal suggests that there is no need to protect the wiring method from physical damage. We disagree for a number of reasons. AC Flatwire is non-repairable, and it must be stripped from the wall in the inevitable event of failure. We feel that - in all likelihood of failure, this will become an economical disadvantage to the consumer.

Our foremost concern is product safety. The panel accepted this proposal on a "fact-finding study", and not on the merits of "product approval" by a recognized testing lab.

The substantiation for this proposal suggests that no protection from physical damage is necessary because the circuit for the nonmetallic extension is designed with "inherent" protection to protect against shock hazards.

Would you or your loved ones feel safe, while standing on a grounded surface, or being grounded --- And driving a nail into an energized 120 volt circuit under any set of circumstances that could possibly exist?

Circuits containing "inherent" safety devices are vital in preventing shock hazards associated with approved wiring methods. We feel, however, that the "inherent" design of an electrical circuit is placed within the circuit to augment the safety of an acceptable wiring method, and NOT FOR THE PURPOSE OF ATTEMPTING TO "MAKE SAFE" THE DESIGN OF AN UNSAFE CIRCUIT.

Make no mistake about it. We have been against this method of extending a branch circuit from the very beginning. The safety of an electrical circuit is a product of design and conditions of use. This product cannot be designed to meet the needs of safety as set forth in 90.1.

In the name of safety, we have an obligation to recommend the rejection of this proposal, and also refer the issue to CMP 10 for further review.

STEWART, H.: This application by which the surface mounted nonmetallic extension conductor(s) are installed per a flat wiring system covered by paint, texture, joint compound plaster, wallpaper, tile, wall paneling or other similar materials are not considered guarded or otherwise protected to remove the likelihood of contact by persons or objects to a point of inherent danger.

This type of installation is for convenience that will be favored among the inexperienced user when available as a shelf item.

Once concealed by paint or plaster or wall paper, etc., the occupant's visual awareness will be lowered and will increase the hazard potential.

New occupants or a change in classification in the occupied area(s) with this type of concealed wiring will increase the level of unawareness and reduce the concern for physical damage: Out of site, out of mind. Listing does not constitute a level of safety when there is the potential for a shock hazard or fire damage to property from no installed physical protection.

There was no data presented and no discussion of test results concerning the flammability of product or potential flame propagation.

Comment on Affirmative:

ROGERS: Other considerations for this proposal are:

1. The length of the extension should be limited.
2. Only one extension per branch circuit should be allowed.
3. The connection of the extension to any branch circuit should not make required receptacle outlets (such as dwellings) unusable.
4. The safety of this extension needs to be carefully considered since dwellings are sold and the new owners may not know that a concealed surface wiring method has been installed.
5. The overcurrent protection for the extension must be selectively co-coordinated with the branch circuit overcurrent protection.
6. Bends and any crossings need further requirements.
7. Installation of this extension should be completed by a qualified installer.
8. Installation of this extension cannot be under the baseboard or on the floor.

7-99 Log #1067 NEC-P07 **Final Action: Accept**
(382.12(5) (New))

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Add: (5) Where subject to physical damage.

Substantiation: Other wiring methods such as EMT, ENT etc., are not permitted where subject to physical damage in residential or office locations.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

Comment on Affirmative:

BROWN, H.: We agree with the panel, and that this proposal should continue to be accepted.

The NEC is written on the premise that no wiring method is to be exposed to any form of physical damage.

Nonmetallic extensions are no exception. The language that the panel accepted is exemplary of its commitment to the safety of the wiring methods under its purview.

The new text: 382.12(5), (new), (under uses not permitted) that states: Nonmetallic extensions are not permitted WHERE EXPOSED TO PHYSICAL DAMAGE is essential to the proper installation of nonmetallic extensions.

The submitter's substantiation is correct in stating that EMT, ENT, etc. are not permitted where subject to physical damage in residential or office locations.

No wiring method of any type should knowingly be located in an area that subjects the wiring method to an occurrence that will "LIKELY" damage the installation.

There are many safe and affordable wiring methods on the market today for the purpose of extending branch circuits that will not subject the installation to physical damage.

7-100 Log #337 NEC-P07 **Final Action: Reject**
(382.26)

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:

382.26 Bends. A bend that reduces the normal spacing between the conductors shall be covered with a cap to protect the assembly from ~~physical~~ damage.

Substantiation: Use of the word "physical" is superfluous– the purpose is obvious. In some instances, one could argue for the use of "mechanical" to differentiate that from e.g., "thermal" damage, but context makes the intended sense quite clear, rendering anything like this completely unnecessary.

Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.

Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."

Panel Meeting Action: Reject

Panel Statement: The word "physical" is appropriate since it specifically defines the type of protection being provided and complies with 3.2.5.5 of the NEC Style Manual. There are other types of protection that may be provided, such as protection from EMF interference.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-101 Log #3451 NEC-P07 **Final Action: Accept in Principle**
(383 (New))

Submitter: Richard Temblador, Southwire Company
Recommendation: Revise text to read:

I. General

383.1 Scope. This article covers the use, installation, and construction specifications for Concealable Nonmetallic Extenstions.

383.2 Definition.

Concealable Nonmetallic Extension (CNE). A Listed assembly of two, three, or four insulated conductors within a nonmetallic jacket, an extruded thermoplastic covering, or a sealed nonmetallic covering. The classification includes surface extensions intended for mounting directly on the surface of walls or ceilings, and concealed with paint, texture, joint compound, plaster, wallpaper, tile, wall paneling, or other similar materials.

383.6 Listing Requirements. Concealable nonmetallic extensions and associated fittings and devices shall be listed and shall provide a level of protection equivalent to a GFCI.

II. Installation

383.10 Uses Permitted. Concealable nonmetallic extensions shall be permitted only in accordance with 382.10(A), (B), and (C).

(A) From an Existing Outlet. The CNE shall originate from an existing outlet on a 15- 20-ampere branch circuit. Where a CNE originates from non-grounding Type receptacles, the installation shall comply with 250.130(C), 406.3(D)(3)(b), or 406(D)(3)(c).

(B) Exposed or Concealed, and in a Dry Location. The CNE shall be run exposed as permitted in 382.15 or concealed as permitted in 382.16, and in dry locations.

(C) Residential or Offices. Concealable nonmetallic extensions shall be mounted directly on the surface of walls or ceilings in buildings or structures occupied for residential or office purposes.

383.12 Uses Not Permitted. Concealable nonmetallic extensions shall not be used as follows:

(1) In unfinished basements, attics, or roof spaces

(2) Where the voltage between conductors exceeds 150 volts for nonmetallic surface extension and 300 volts for aerial cable

(3) Where subject to corrosive vapors

(4) Where run through a floor or partition, or outside the room in which it originates

383.15 Exposed. One or more extensions shall be permitted to be run in any direction from an existing outlet, but not on the floor or within 50 mm (2 in.) from the floor.

383.16 Concealed. Concealable nonmetallic extensions may be concealed with paint, texture, concealing compound, plaster, wallpaper, tile, wall paneling, or other similar materials and isntalled in accordance with 382.15.

383.26 Bends. Concealable nonmetallic extensions shall be permitted to be folded back over itself and flattened as reuqired for installation.

383.30 Securing and Supporting. All surface mounted concealable nonmetallic extension components shall be firmly anchored to the wall or ceiling using an adhesive or mechanical anchoring system identified for this use. The CNE shall not be in contact with any metal work or other conductive material other than with metal plates on receptacles or connectors.

383.40 Boxes and Fittings. Each run shall terminate in a fitting, connector, or box that covers the end of the assembly. All fittings, connectors, and devices shall be of a type identified for the use.

383.42 Devices.

(A) Receptacles. All receptacles, receptacle housings, and self-contained devices used with concealable nonmetallic extensions shall be identified for this use.

(B) Receptacles and Housings. Receptacle housings and self-contained devices designed either for surface or for recessed mounting shall be permitted for use with concealable nonmetallic extensions. Receptacle housings and self-contained devices shall incorporate means for facilitating entry and termination of concealable nonmetallic extensions and for electrically connecting the housing or device. Receptacle and self-contained devices shall comply with 406.3. Power and communications outlets installed together in common housing shall be permitted in accordance with 800.133(A)(1)(c), Exception No. 2.

383.56 Splices and Taps. Concealable nonmetallic extensions shall consist of a continuous unbroken length of the assembly, without splices, and without exposed conductors between fittings, connectors, or devices. Taps shall be permitted where approved fittings completely covering the tap connections are used. Receptacle-type tap connectors shall be of the locking type.

III. Construction Specifications.

383.100 Construction. Concealable nonmetallic extensions shall be a multi-layer flat conductor design consisting of a center ungrounded conductor enclosed by a sectioned grounded conductor, and an overall sectioned grounding conductor.

383.104 Flat Conductors. Concealable nonmetallic extensions shall be constructed, using flat copper conductors equivalent to 14 AWG or 12 AWG conductor sizes, and constructed per 382.104(A), (B), and (C). Where sectioned conductors layers are utilized, the sum total of all sectioned conductor layers shall be equivalent to 14 or 12 AWG conductor sizes.

(A) Ungrounded Conductor (Center Layer). The ungrounded conductor shall consist of one or more ungrounded flat conductor(s) enclosed per 382.104(B) and (C), and identified in accordance with 310.12(C).

(B) Grounded Conductor (Inner Sectioned Layers). The grounded conductor shall consist of two sectioned inner flat conductors that enclose the center ungrounded conductor(s). The sectioned grounded conductor shall be enclosed by the sectioned grounding conductor, and identified in accordance with 200.6.

(C) Grounding Conductor (Outer Sectioned Layers). The grounding conductor shall consist of two overall sectioned conductors that enclose the grounded conductor and ungrounded conductor(s), and shall comply with 250.4(A)(5). The grounding conductor layers shall be identified by any one of the following methods:

(1) As permitted in 250.119,

(2) A clear covering,

(3) One or more continuous green stripes or hash marks, or

(4) The term "Equipment Ground" printed at regular intervals throughout the cable.

383.112 Insulation. The ungrounded and grounded flat conductor layers shall be individually insulated and comply with 310.10. The grounding conductor shall be covered or insulated.

383.120 Marking.

(A) Cable. Concealable nonmetallic extensions shall be clearly and durably marked on both sides at intervals of not more than 610 mm (24 in.) with the information required by 310.11(A) and with the following additional information:

(1) Material of conductors

(2) Maximum temperature rating

(3) Ampacity

(B) Conductor Identification. Conductors shall be clearly and durably identified on both sides throughout their length as specified in 382.104.

Substantiation: This proposal seeks to revise Article 383 to recognize a concealable nonmetallic extension that can be concealed on the surface of walls and ceilings.

New technologies, consumer electronics devices and ever changing lifestyles have increased the need for additional power outlets and the desire to place power or lighting where needed to obtain an aesthetically pleasing environment. Often these changes are accommodated through the use of extension cords that are easily damaged and misused. This has led to distressing statistics such as:

"The U.S. Consumer Product Safety Commission (CPSC) estimates that each year, about 4,000 injuries associated with electric extension cords are treated in hospital emergency rooms. About half the injuries involve fractures, lacerations, contusions, or sprains from people tripping over extension cords. Thirteen percent of the injuries involve children under five years of age; electrical burns to the mouth accounted for half the injuries to young children."

"CPSC also estimates that about 3,300 residential fires originate in extension cords each year, killing 50 people and injuring about 280 others. The most frequent causes of such fires are short circuits, overloading, damage, and/or misuse of extension cords. Nearly 30 percent of home electrical wiring fires can be traced to the misuse of electric cords, such as overloading circuits, poor maintenance and running the cords under rugs or through high traffic areas."

Consumers are commonly using "temporary" methods to compensate for the limitations of their existing fixed wiring.

The proposed nonmetallic extension is a concealable multi-layer flat wire nonmetallic extension that can serve as a safe alternative to temporary extension cords. The design is inherently safe and eliminates the need to mechanically protect the cable from physical damage. Branch circuit wiring can be safely extended using concealable flat wire nonmetallic extension for power or lighting where needed, and as needed, to accommodate decorating schemes, placement of specific equipment or furniture to suit ever-changing lifestyles.

Because the concealable flat wire nonmetallic extension is inherently safe, requirements for mechanical protection are not necessary to insure the practical safeguarding of persons and property in the event physical damage to the cable. Unlike standard nonmetallic extensions, the conductors of the concealable flat wire nonmetallic extension are flat and layered in a manner that insures practical safeguarding of persons or property. The flat wire cable is a multi-layer flat conductor design consisting of a center ungrounded conductor enclosed by a sectioned grounded conductor, and an overall grounding conductor. The cable itself is a symmetrical design providing two levels of protection on both sides of the flat wire cable via the outer grounding conductor layers and inner grounded (neutral) conductor layers. This design insures that if the cable is damaged, punctured or penetrated, it will trip the over-current protection device (OCPD) and safely open the circuit. If the OCPD is reset, the circuit will trip and continue to do so upon subsequent resets. The concealable flat wire nonmetallic extension provides a level of shock protection equivalent to a GFCI.

The concealable flat wire nonmetallic extension is unlike most NEC recognized wiring methods that have installation requirements to prevent physical damage during normal use. These traditional wiring methods have relied on concealment, routing requirements, and mechanical protection to minimize the potential for damage. Exposed wiring methods rely on special installation requirements for routing and limited use to minimize the potential for damage. These requirements are in place because physical damage greatly increases the likelihood of shock and fire hazards. The concealable flat wire nonmetallic extension relies on an inherently safe design eliminating the need for these traditional installation requirements. The proposed system has been thoroughly investigated under a Fact-Finding Study performed by Underwriters Laboratories to assure the safeguarding of persons and property from shock and fire hazards.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Proposal 7-98.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 11 Negative: 3

Explanation of Negative:

ADAMS, M.: NECA opposes the acceptance of concealed nonmetallic extensions (CNE). A wiring method that can be concealed on building surfaces by paint or wallpaper is inherently subject to damage by, for example, building occupants driving nails to hang pictures. Even if this product is manufactured so that overcurrent devices will act to protect persons and property, there appears to be no practical way to repair such damage, except to replace large sections of CNE, with consequent inconvenience and damage to wall finishes. We believe these serious disadvantages make CNE an impractical wiring method.

BROWN, H.: We disagree with the panel action to accept this proposal.

The panel action on Proposal 7-99 serves to recognize the requirement that "nonmetallic extensions" should not be located: (382.12(5), (new) WHERE SUBJECT TO PHYSICAL DANGER IN RESIDENTIAL OR OFFICE AREAS.

This proposal, which serves to establish a new article governing "concealable nonmetallic extensions" should have the same requirement. This formulates the basis for our opposition to this proposal.

Although we encourage and promote the development of innovative wiring methods, the "Concealable flatwire nonmetallic extension method" is unacceptable.

The opening sentence of the NEC, (90.1), clearly states that the intended purpose of the NEC is the practical safeguarding of persons and property from hazards arising from the use of electricity.

AC Flatwire is a fragile wiring method, with thin flat conductors, separated by thin layers of insulating material. The material is designed to be surface mounted on a dwelling or office wall using adhesives, and then painted for " CONCEALMENT ". The system is designed to have an inherent safety system that is built within.

Good judgment has prevailed. Everyone with whom we have discussed this wiring method, has quickly asked; since I cannot see the wire, how can I avoid penetrating it with a nail, screw, or some other foreign object? The answer is quite clear. YOU CANNOT PROTECT THIS WIRING METHOD FROM PHYSICAL DAMAGE!!!

The proposal suggests that there is no need to protect the wiring method from physical damage. We disagree for a number of reasons. AC Flatwire is nonrepairable, and it must be stripped from the wall in the inevitable event of failure. We feel that - in all likelihood of failure, this will become an economical disadvantage to the consumer.

Our foremost concern is product safety. The panel accepted this proposal on a "fact-finding study", and not on the merits of "product approval" by a recognized testing lab.

The substantiation for this proposal suggests that no protection from physical damage is necessary because the circuit for the nonmetallic extension is designed with "inherent' protection to protect against shock hazards.

Would you or your loved ones feel safe, while standing on a grounded surface, or being grounded---and driving a nail into an energized 120 volt circuit under any set of circumstances that could possibly exist?

Circuits containing "inherent" safety devices are vital in preventing shock hazards associated with approved wiring methods. We feel, however, that the "inherent" design of an electrical circuit is placed within the circuit to augment the safety of an acceptable wiring method, and NOT FOR THE PURPOSE OF ATTEMPTING TO "MAKE SAFE" THE DESIGN OF AN UNSAFE CIRCUIT .

Make no mistake about it. We have been against this method of extending a branch circuit from the very beginning. The safety of an electrical circuit is a product of design and conditions of use. This product cannot be designed to meet the needs of safety as set forth in 90.1.

In the name of safety, we have an obligation to recommend the rejection of this proposal, and also refer the issue to CMP 10 for further review.

STEWART, H.: This application by which the surface mounted nonmetallic extension conductor(s) are installed per a flat wiring system covered by paint, texture, joint compound plaster, wallpaper, tile, wall paneling or other similar materials are not considered guarded or otherwise protected to remove the likelihood of contact by persons or objects to a point of inherent danger.

This type of installation is for convenience that will be favored among the inexperienced user when available as a shelf item.

Once concealed by paint or plaster or wall paper, etc., the occupant's visual awareness will be lowered and will increase the hazard potential.

New occupants or a change in classification in the occupied area(s) with this type of concealed wiring will increase the level of unawareness and reduce the concern for physical damage: Out of site, out of mind. Listing does not constitute a level of safety when there is the potential for a shock hazard or fire damage to property from no installed physical protection.

There was no data presented and no discussion of test results concerning the flammability of product or potential flame propagation.

ARTICLE 384 — STRUT-TYPE CHANNEL RACEWAY

8-168 Log #1152 NEC-P08 **Final Action: Reject**
(384.10(8))

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Delete.

Substantiation: Edit. Unnecessary; (3) requires suitable finishes where subject to corrosion; (2) requires dry locations, which are essentially indoors since outdoor locations are either wet or damp per definitions.

Panel Meeting Action: Reject

Panel Statement: The product is produced in many finishs. It is important to limit painted strut to indoor dry atmospheres.

Substantiation: Use of the word "physical" is superfluous– the purpose is obvious. In some instances, one could argue for the use of "mechanical" to differentiate that from e.g., "thermal" damage, but context makes the intended sense quite clear, rendering anything like this completely unnecessary.
The proposed rewording is an attempt at precision. I would argue that if you prefer to leave the wording general, in that case the term "physical" should be eliminated. Here, in fact, leaving "physical" in place in (2) in principle would mean that (4), (6), and (7) could be eliminated, as all these represent physical threats to the raceway.
Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.)
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-4 (Log 336).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-173 Log #1047 NEC-P08 **Final Action: Reject**
(388.12(2))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Delete the word "severe".
Substantiation: Edit. "Severe" is subjective and argumentative. Other similar sections do not use the word "severe".
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-98.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-174 Log #1960 NEC-P08 **Final Action: Accept**
(388.12(5))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Change the text of 388.12(5) to read as shown:
388.12(5) In any hazardous (classified) location except ~~, Class I, Division 2 locations~~ as permitted by other Articles in this Code. ~~in 501.10(B)(3)~~
Substantiation: This change is necessary because the current text is too limiting. The areas of usage for Surface Nonmetallic Raceways within the hazardous (Classified) locations Articles in the Code are broader. The current text may limit the use of Surface Nonmetallic Raceways, by an AHJ, because the Surface Nonmetallic Raceways Article itself does not recognize the broader permissions. The proposed text is preferred to a laundry list of section references.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-175 Log #1925 NEC-P08 **Final Action: Accept**
(388.30)

Submitter: William Wagner, Certification Solutions
Recommendation: Add 388.30 as follows:
388.30 Securing and Supporting. Surface nonmetallic raceways shall be supported at intervals in accordance with the manufacturer's installation instructions.
Substantiation: The listing standards for both nonmetallic surface raceway and surface metal raceway require that they be provided with installation instructions indicating the method of securement. Therefore, in order to establish uniformity between Articles 386 and 388, 388.30 should be added.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-176 Log #1926 NEC-P08 **Final Action: Accept**
(388.56)

Submitter: William Wagner, Certification Solutions
Recommendation: Revise 388.56 as follows:
388.56 Splices and Taps. Splices and taps shall be permitted in surface nonmetallic raceways having a ~~removable~~ cover that is accessible after installation. The conductors, including splices and taps, shall not fill the raceway to more than 75 percent of its area at that point. ~~Splices and taps in surface nonmetallic raceways without removable covers shall be made only in boxes.~~ All splices and taps shall be made by approved methods.
Substantiation: 388.6 of the National Electrical Code requires that surface nonmetallic raceway and associated fittings be listed. The listing standard for these products states that the cover for a raceway or fitting shall be constructed and installed so that it is capable of being removed or opened. For the purposes of the application of 388.56 there is no difference between raceway that has a cover that can be removed and one that has a cover that can be opened. Therefore, the references in 388.56 to raceway without a removable cover are contradictory and should be revised accordingly.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
DABE, J.: The current text is necessary so that splices are not made in the portions of Surface Nonmetallic Raceways that are made inaccessible by 388.10(2) unbroken extensions through walls and floors.

8-177 Log #959 NEC-P08 **Final Action: Reject**
(388.60)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise as follows:
Where an equipment grounding conductor is ~~required~~ provided , a separate equipment grounding conductor shall be installed in the raceway.
Substantiation: Where equipment is not required to be grounded, but grounded by choice, present wording does not preclude an EGC installed in any manner, and if not in the raceway is not covered by 250.120(A). Code provisions are not limited to mandatory requirements and 110.12 applies to all wiring. 250.1(1) indicates Article 250 covers installations "permitting" and the proposal would correlate this section.
Panel Meeting Action: Reject
Panel Statement: The submitter's concerns are addressed in Section 300.3(B) for equipment grounding conductors that are provided but not required.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 390 — UNDERFLOOR RACEWAYS

8-178 Log #1051 NEC-P08 **Final Action: Reject**
(390.6)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise second sentence as follows:
For the purpose of this section, so-called loop wiring (continuous unbroken conductor connecting the individual outlets) or connection to feed-through terminals shall not be considered a splice or tap.
Substantiation: Where conductors are terminated on terminals designed for feed-through connections but are not unbroken, it seems reasonable not to consider this type connection a splice or tap, also.
Panel Meeting Action: Reject
Panel Statement: The Code is clear as to intent that splices or taps will only be allowed in junction boxes. The exception allows splices in removable accessible covers. Loop wiring is continuous and unbroken, where using the terminals on a device to join two wires is a splice. Splices are made in junction boxes not only to have access but also to limit the affects of arcing.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-179 Log #1055 NEC-P08 **Final Action: Reject**
(390.17 Exception (New))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Add a new Exception as follows:
Exception: Where more than one outlet is individually supplied by a set of conductors on the same circuit, it shall be permitted to count only one set of current-carrying conductors of that circuit for derating purposes.
Substantiation: The present derating factors discourages individual sets of conductors to outlets on the same circuit, which results in loop wiring and a tendency to violate 390.7 since inspection is not generally required to remove wiring. The proposal would improve efficiency, reduce voltage drop and heating of conductors.
Panel Meeting Action: Reject
Panel Statement: The current text is clear. It is the intent of the panel to have the adjustment factors of 310.15(B)(2) apply to underfloor raceways.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 392 — CABLE TRAYS

8-180 Log #2840 NEC-P08 **Final Action: Accept in Principle**
(392.3 and 392.4)

TCC Action: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal in the reorganization of Article 392. This action will be considered by the Panel as a Public Comment.
Submitter: Robert P. McGann, City of Cambridge
Recommendation: Move:
392.3 to 392.10
392.4 to 392.12
Relocate and renumber existing 392.10 and 392.12.
Substantiation: To comply with numbering system in Chapter 3.
Panel Meeting Action: Accept in Principle
Panel Statement: Article 392 is renumbered for consistency with the rest of the document. The panel's intent was that there were no technical changes made. The submitter's intent was met.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
LOYD, R.: I believe the proposal to rewrite Article 392 has merit, however, it is incomplete as submitted. Editorial changes to align its numbering with the raceway articles can be completed during the comment period. Therefore, I support the proposal and hope the work can be completed.

8-181 Log #23 NEC-P08 **Final Action: Reject**
(392.3(A))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 16 for Comment.
Submitter: Stanley Kaufman, Cable Safe Inc.
Recommendation: Revise as follows:
~~Multipurpose and~~ communications cables
Substantiation: Panel 16 eliminated multipurpose cables in the last code cycle and succeeded in removing most references to multipurpose cables. This is a cleanup proposal to remove the remaining traces.
Panel Meeting Action: Reject
Change the reference to "Table"
Panel Statement: CMP 8 is uncomfortable with the removal of the term "Multipurpose" since there are other articles that have this in their text, i.e. 800.133(A)(1)(b).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-182 Log #67 NEC-P08 **Final Action: Reject**
(Table 392.3(A))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action taken on Proposal 16-181. This action will be considered by the Panel as a Public Comment.
Submitter: Stanley Kaufman, Cable Safe Inc.
Recommendation: Revise the columns "Wiring Method" and "Article" as shown below.

Table 392.3(A) Wiring Methods

Wiring Method		
Armored cable	Article	Section
CATV cables	320	
CATV raceways	820	
Class 2 & 3 cables	820	
Communications cables	725	
Communications raceways	800	
Electrical metallic tubing	800	
Electrical nonmetallic tubing	358	
Fire alarm cables	362	
Flexible metal conduit	760	
Flexible metallic tubing	348	
Instrumentation tray cable	360	
Intermediate metal conduit	727	
Liquidtight flexible metal conduit	342	
Liquidtight flexible nonmetallic conduit	350	
Metal-clad cable	356	
Mineral-insulated, metal-sheathed cable	330	
Multiconductor service-entrance cable	332	
Multiconductor underground feeder and branch-circuit cable	338	
~~Multipurpose and communications cables~~	340	
Network-powered broadband communications cables	~~800~~	-
Nonmetallic-sheathed cable	830	
Non-power-limited fire alarm cable	334	
Power and control tray cable	760	
Power-limited fire alarm cable	336	

	Article	Section
Power-limited tray cable	760	
Optical fiber cables	725	725.61(C) and 725.82(E)
Optical fiber raceways	770	
Other factory-assembled, multiconductor control, signal, or power cables that are specifically approved for installation in cable trays	770	
Rigid metal conduit		
Rigid nonmetallic conduit	344	
Signaling raceway	352	

Substantiation: Panel 16 eliminated multipurpose cables in the last code cycle and succeeded in removing most references to multipurpose cables. The following cables and raceways should be added to the table in order to make it complete: CATV cables, CATV raceways, Class 2 & 3 cables, signaling raceways and network-powered broadband cables.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-181. Additionally, the panel notes that there are errors in the table submitted.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-183 Log #1927 NEC-P08 **Final Action: Accept in Principle in Part**
(392.3(A))

Submitter: William Wagner, Certification Solutions
Recommendation: Revise the last line of Table 392.3(A) as follows:
Rigid ~~nonmetallic~~ polyvinyl chloride conduit 352
High density polyethylene conduit 353
Reinforced thermosetting resin conduit 355
Substantiation: This is a companion proposal for the new definition of Rigid Nonmetallic Conduit in Article 100, the revised Article 352 for Type PVC Conduit and the new Article 355 for RTRC. It clarifies that the broad designation of rigid nonmetallic conduit (Type RNC) includes PVC HDPE and RTRC and specifies each acceptable raceway type that is covered by a separate Code Article as a separate line item.
Panel Meeting Action: Accept in Principle in Part
Revise the last line of Table 392.3(A) as follows:
~~Rigid~~ ~~nonmetallic~~ polyvinyl chloride PVC conduit 352
~~High density polyethylene conduit 353~~
~~Reinforced thermosetting resin conduit~~ RTRC 355
Panel Statement: The submitter's intent was met. The committee rejected the HDPE conduit because it is not permitted for use in cable trays.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-184 Log #2624 NEC-P08 **Final Action: Reject**
(392.3(F) (New))

Submitter: David H. Kendall, Carlon
Recommendation: Add a new section to 392.3 to read as follows:
392.3 Uses Permitted.
(F) Cable Tray in a Plenum. Metal cable tray systems, including, but not limited to solid bottom metal cable trays systems with solid metal covers, are permitted to be used in ducts, plenums, and other air-handling spaces to support those wiring methods defined in 300.22 and to support raceway and cable types permitted for such use elsewhere in this code. Solid bottom metal cable trays systems with solid metal covers shall be permitted to be used in ducts, plenums, and other air-handling spaces to support other types of cables, conductors, raceways not defined in 300.22.
Substantiation: This proposal is a companion proposal for 392.4. This new language clarifies the use of Cable Trays systems in plenum application. 300.22(C)(1) makes it clear that solid bottom metal cable tray systems with solid covers are permitted to be used with nonplenum rated cables and raceways. Other types of metallic cable trays system such as ladder or ventilated are permitted to be used with those wiring methods defined in 300.22 and the raceways and cables found in Chapters 7 and 8.
Panel Meeting Action: Reject
Panel Statement: The panel's understanding is that they cannot evaluate the technical merits of this proposal because of a Standards Council directive. The Panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:
"[S]o as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."
This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-185 Log #265 NEC-P08 **Final Action: Reject**
(392.4)

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
Cable tray systems shall not be used in hoistways or where subject to severe ~~physical~~ damage.
Substantiation: Use of the word "physical" is superfluous - the purpose is obvious. In some instances, one could argue for the use of "mechanical" to differentiate that from e.g., "thermal" damage, but context makes the intended sense quite clear, rendering anything like this completely unnecessary.
Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."
I might suggest you consider whether what you really want to say is severe *abuse* or *blows* (or some synonym), that could result in damage, but I defer to your cable tray expertise.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-4 (Log 336).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-186 Log #2126 NEC-P08 **Final Action: Reject**
(392.4)

Submitter: Thomas F. Mueller, Southern Company Services
Recommendation: Revise second sentence as follows:
Cable tray systems shall not be used in ducts, plenums, and other air-handling spaces, except as permitted in 300.22 where installed behind panels designed to allow access , to support wiring methods recognized for use in such spaces.
Substantiation: 300.22 allows installation of wiring in ducts and plenums where the wiring is not exposed or accessible. This conflicts with the exposed and accessible provisions of 392.6(H). The change will eliminate conflicting requirements and require the tray installation to meet the exposed and accessible requirements.
Panel Meeting Action: Reject
Panel Statement: The current text is clearer than the proposed text. Cable trays are required to comply with 392.4 and 392.6(H), except as permitted by 392.6(G). For example, it is the panel's intent that cable trays behind panels designed to allow access, and in other air handling spaces, be permitted to go through a wall when installed in compliance with all applicable code articles.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-187 Log #2625 NEC-P08 **Final Action: Reject**
(392.4)

Submitter: David H. Kendall, Carlon
Recommendation: Revise section to 392.4 to read as follows:
392.4 Uses Not Permitted.
Cable tray systems shall not be used in hoistways or where subject to severe physical damage. ~~Cable tray systems shall not be used in ducts, plenums, and other air handling spaces, except as permitted in 300.22, to support wiring methods recognized for use in such spaces.~~
Substantiation: This proposals a companion proposal for 392.3. This section was revised to remove the statement that cable trays cannot be used in plenum since that metal cable trays are permitted per 300.22.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-184.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-188 Log #3100 NEC-P08 **Final Action: Reject**
(392.4)

Submitter: Donald Hall, Corning Cable Systems
Recommendation: This proposal may be considered as an alternate to my proposal to revise 300.22 or it may be considered in addition to acceptance of my proposal to revise 300.22.

Revise text as follows:

392.4 Uses Not Permitted.

Cable tray systems shall not be used in hoistways or where subject to severe physical damage. Nonmetallic ~~C~~ cable tray systems shall not be used in ducts, plenums, and other air-handling spaces ~~, except as permitted in 300.22, to support wiring methods recognized for use in such spaces~~ .

Substantiation: The existing reference to 300.22 adds no value and is confusing users of the Code. Because of this reference, code users are concluding that metallic tray systems can only be used in ducts, plenum, and other air handling spaces if they have solid bottoms and solid metal covers. This is not the intent of 392.4 or 300.22. The commentary to 392.4 in the NEC handbook correctly identifies the Code's intent by stating,

"Section 300.22 specifically limits the types of wiring methods that may be used within other spaces used for environmental air. Metallic cable trays may be used within these spaces to support only the recognized wiring methods permitted in these spaces. The cable tray types may be ladder ventilated trough, ventilated channel, or solid bottom. Metal cable trays are not the limiting factor; rather the cable or wiring method is the limiting factor".

392.4 addresses the use of trays as support structures .

300.22 refers to wiring methods . It allows "other types of cables and conductors", meaning those which 300.22 does not specifically mention by name, to be placed in various types of raceway, in metal wireway with metal covers, or in metallic trays having solid bottoms and solid metal covers. It does not require metal trays to have solid bottoms or solid metal covers unless the trays contain "other types of cables or conductors" which are not listed for use in that space. Furthermore, although "other cables and conductors" is inclusive of the various types of low voltage cable described in Articles 725, 760, 800, 820, and 830, these articles all contain sufficiently clear language explaining that plenum rated cables may be installed within other air-handling spaces without compliance to 300.22. Therefore, if a metal tray used in "other air-handling spaces" is used to support only wiring methods permitted in that space, there is no requirement or reason for them to have solid bottoms or solid metal covers.

Other proposals may be submitted which would propose to address this issue by adding text to Articles 725, 760, 800, 820, and 830 explicitly permitting the use of metal trays without solid bottom and solid metal covers. Since these other articles are not the source of the confusion and since these trays are already permitted to be used, it is more desirable to change 300.22 and/or 392.4 which are the source of confusion.

Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-184.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-189 Log #144 NEC-P08 **Final Action: Reject**
(392.6)

Submitter: Gary Wilson, Albert Garandy & Associates, Inc.
Recommendation: Revise as follows:

~~Sufficient Space~~ (Cable trays) shall be provided and maintained (12- 18 inches of workable clearance) about cable trays to permit adequate access for installing and maintaining the cables.

Substantiation: One of the biggest problems with the NEC is interpretation. On a recent project, we needed to stack 2 rows of 3.36 inch trays. A long discussion ensued dealing with how much workable space to leave between cable trays. By giving a specific length of 12 to 18 inches, it will eliminate confusion and make a project more efficient.
Panel Meeting Action: Reject
Panel Statement: The submitter did not supply substantiation to justify the dimensions (12 to 18 inches) in the proposal. The intent of the current text is clear and allows judgment by the designer/installer and AHJ.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-190 Log #321 NEC-P08 **Final Action: Reject**
(392.6)

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:

"...the conductors shall be secured to the cable tray(s) at the transition and they shall be protected, by guarding or by location, from ~~physical~~ damage.

Substantiation: Use of the word "physical" is superfluous– the purpose is obvious. In some instances, one could argue for the use of "mechanical" to differentiate that from e.g., "thermal" damage, but context makes the intended sense quite clear, rendering anything like this completely unnecessary.

Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.

Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.)

Let's take care of that for good: for our purposes, "damage" means "physical damage."

I might suggest you consider whether what you really want to say is severe *abuse* or *blows* (or some synonym), that could result in damage, but I defer to your cable tray expertise.

Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-4 (Log 336).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-191 Log #1181 NEC-P08 **Final Action: Reject**
(392.7)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 5 for information.
Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise as follows:

Metallic cable tray that supports electrical conductors shall be grounded and bonded ~~as required for conductor enclosures in accordance~~ ~~with 250.96.~~ The provisions of 250.86 shall not apply.

Substantiation: Edit. 250.96 relates to bonding, not grounding. Since cable tray may be perceived as a type of (partial) enclosure, 250.86 Exception No. 2 may apply. The requirement to be grounded and bonded requires compliance with Article 250.
Panel Meeting Action: Reject
Panel Statement: The current text is clearer than the proposed text. By meeting the requirements of 392.7, which refers to 250.96, the cable tray will both be bonded and grounded.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

GRIFFITH, M.: The submitter is correct that 250.96, referenced in the existing text, describes specific methods for bonding and is not an appropriate reference for grounding. The submitter's proposed "fix", however, is believed to be only partly correct. Panel vote, therefore, should have been to "Accept in Principle in Part" with the following Panel Action:

Revise 392.7 as follows:

"Metallic cable tray that supports electrical conductors shall be grounded and bonded. Bonding shall be as required for conductor enclosures in accordance with 250.96."

8-192 Log #2755 NEC-P08 **Final Action: Reject**
(392.8(A))

Submitter: Jonathan R. Althouse, Michigan State University
Recommendation: Revise the paragraph to prohibit cables from projecting above the side rails with the paragraph to read as follows:

(A) Cable and Splices. Cable splices shall be permitted where accessible and where made and insulated by approved methods. ~~shall be permitted to be located within a cable tray, provided they are accessible and do~~ Cable and splices shall not project above the side rails except at points where a cable enters or leaves a cable tray .

Substantiation: There is no rule limiting the height of cables in a cable tray. Where cables are permitted to be in multiple layers, they are permitted to be stacked above the side rails. This is especially a problem where cables are added to an existing cable tray system. There must be an exception where cables enter or leave a cable tray from the top. Sometimes it is not practical to keep a splice completely below the top of the side rail when a splice is made at a tap point where the tap is leaving the cable tray.
Panel Meeting Action: Reject
Panel Statement: The existing text allows for safe work practices, and the proposed text doesn't increase safety. See panel action and substantiation on Proposal CP800.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

GRIFFITH, M: Although I am in agreement with panel action on this panel proposal, a revision to the proposed wording is suggested as follows:

"(A) Cable Splices. Cable splices made and insulated by approved methods shall be permitted to be located within a cable tray, provided they are accessible. Splices that are subjected to physical damage shall not project above the tray side rails."

KENDALL, D: Section 392.8(A) should read as follows:
(A) Cable Splices. Cable splices made and insulated by approved methods shall be permitted to be located within a cable tray, provided they are accessible.
Splices that are subject to physical damage shall not project above the side rails.

8-192a Log #CP800 NEC-P08 **Final Action: Accept**
(392.8(A))

Submitter: Code-Making Panel 8,
Recommendation: Modify existing 392.8(A) as follows:
(A) Cable Splices. Cable splices made and insulated by approved methods shall be permitted to be located within a cable tray, provided they are accessible and do not project above the side rails where the splices are subject to physical damage .
Substantiation: The Panel believes the present wording is unnecessarily restrictive and does not currently allow proven installation practice.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
GRIFFITH, M: Although I am in agreement with panel action on this panel proposal, a revision to the proposed wording is suggested as follows:
"(A) Cable Splices. Cable splices made and insulated by approved methods shall be permitted to be located within a cable tray, provided they are accessible. Splices that are subjected to physical damage shall not project above the tray side rails."
KENDALL, D: Section 392.8(A) should read as follows:
(A) Cable Splices. Cable splices made and insulated by approved methods shall be permitted to be located within a cable tray, provided they are accessible.
Splices that are subject to physical damage shall not project above the side rails.

8-193 Log #268 NEC-P08 **Final Action: Reject**
(392.8(C))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
(C) Bushed Conduit and Tubing. A box shall not be required where cables or conductors are installed in bushed conduit and tubing used for support or for protection against ~~physical~~ damage.
Substantiation: Use of the word "physical" is superfluous - the purpose is obvious. In some instances, one could argue for the use of "mechanical" to differentiate that from e.g., "thermal" damage, but context makes the intended sense quite clear, rendering anything like this completely unnecessary.
Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."
I might suggest you consider whether what you really want to say is severe *abuse* or *blows* (or some synonym), that could result in damage, but I defer to your cable tray expertise.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-4 (Log 336).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-194 Log #3129 NEC-P08 **Final Action: Accept**
(392.9(A)(1))

Submitter: Jonathan R. Althouse, Michigan State University
Recommendation: Add a new sentence to deal with the case where a single layer of cables are installed with a maintained spacing between each cable with the last sentence to read as follows:
"... Where cable ampacity is determined according to 392.11(A)(3), the cable tray width shall not be less than the sum of the diameters of the cables and the sum of the required spacing widths between the cables .
Substantiation: As the rule stands now, the cable tray is not required to be wide enough for the cables to be installed. There is a problem with cables being added to cable trays during remodeling and there needs to be enough flags in the Code language to indicate that cables are deliberately installed with a maintained spacing with the ampacity determined accordingly. Personnel doing remodeling are not necessarily aware of the rules that applied when the conductors were first installed.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-195 Log #381 NEC-P08 **Final Action: Accept**
(392.10(A)(2))

Submitter: Brian Dolan, IBEW/NECA Technical Institute
Recommendation: Revise text to read:
"Where all of the cables are from 250 kcmil up to 1000 through 900 kcmil,...".
Substantiation: The present wording is confusing. The reader must look elsewhere to determine whether a 1,000 kcmil cable is included in the phrase "up to 1,000". In addition, the wording proposed is consistent with the wording of 392.10(A)(4) and 392.11(B)(2).
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-196 Log #3085 NEC-P08 **Final Action: Reject**
(392.11(A)(3))

Submitter: Christel Hunter, Alcan Cable
Recommendation: Revise text to read as follows:
(3) Where multiconductor cables are installed in a single layer in uncovered trays, with a maintained spacing of not less than one cable diameter between cables, the ampacity shall not exceed the allowable ambient temperature-corrected ampacities of multiconductor cables, with not more than three ~~insulated~~ current-carrying conductors rated 0 through 2000 volts in free air, in accordance with 310.15(C).
Substantiation: There is a wording inconsistency within 392.11(A) that affects its application. This change would make 392.11(A)(3) consistent with the wording in 392.11(A)(1).
Panel Meeting Action: Reject
Panel Statement: Section 392.11(A)(1) refers to derating criteria and has a correct reference to current carrying conductors, whereas 392.11(A)(3) and FPN correctly refer to Ampacity Table B.310.3, which covers "insulated conductors".
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-197 Log #2703 NEC-P08 **Final Action: Accept in Principle**
(392.11(C))

Submitter: Dorothy Kellogg, American Chemistry Council
Recommendation: Revise text to read:
392.11(C) Combinations of Multiconductor and Single-Conductor Cables. Where a cable tray contains a combination of multiconductor and single-conductor cables, the allowable ampacities shall be as given in 392.11(A) for multiconductor cables and 392.11(B) for single-conductor cables, provided that:
(1) The sum of the multiconductor cable fill area as a percentage of the allowable fill area for the tray calculated per 392.9, and the single-conductor cable fill area as a percentage of the allowable fill area for the tray calculated per 392.10, totals not more than 100%.
(2) Multiconductor cables are installed according to 392.9 and single-conductor cables are installed according to 392.10.
Substantiation: Existing NEC does not provide guidance for installation for a combination of multiconductor and single-conductor cable in the same tray. This proposal clarifies that multiconductor and single-conductor cable installed in the same tray shall not exceed the fill requirements for each type of cable as if installed in its own tray and that all installation requirements and ampacity limits for each cable type apply.
Panel Meeting Action: Accept in Principle
Revise text to read:
392.11(C) Combinations of Multiconductor and Single-Conductor Cables. Where a cable tray contains a combination of multiconductor and single-conductor cables, the allowable ampacities shall be as given in 392.11(A) for multiconductor cables and 392.11(B) for single-conductor cables, provided that:
(1) The sum of the multiconductor cable fill area as a percentage of the allowable fill area for the tray calculated per 392.9, and the single-conductor cable fill area as a percentage of the allowable fill area for the tray calculated per 392.10, totals not more than 100%.
(2) Multiconductor cables are installed according to 392.9 and single-conductor cables are installed according to 392.10 and 392.8(D) and (E).
Panel Statement: The phrase " and 392.8(D) and (E)" was added to more completely address the submitter's intent.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 394 — CONCEALED KNOB-AND-TUBE WIRING

7-102 Log #1048 NEC-P07 **Final Action: Reject**
(394.19(B))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Add "or flexible nonmetallic loom" after "tubing".
Substantiation: Edit. Loom should also be suitable, and may not be perceived as tubing.
Panel Meeting Action: Reject
Panel Statement: "Loom" is a generic term and is not defined or used anywhere else in the Code. Flexible nonmetallic tubing for electrical wiring is the true historical term.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 396 — MESSENGER SUPPORTED WIRING

7-103 Log #2795 NEC-P07 **Final Action: Accept**
(Table 396.10(A))

Submitter: George Straniero, AFC Cable Systems
Recommendation: In Table 396.10(A) Add " <u>Medium Voltage Cable</u> " under the "Cable Type" Column and add " <u>328</u> " under the "Article" Column.
Substantiation: Medium Voltage Cable Section 328.10(5), under uses permitted, includes messenger supported Wwiring. Table 396.10(A) specifies the cable types permitted to be installed in messenger supported wiring. The table should be revised to include the permitted use of medium voltage cable.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-104 Log #333 NEC-P07 **Final Action: Reject**
(396.12)

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
Uses Not Permitted. Messenger supported wiring shall not be used in hoistways or where subject to ~~physical~~ damage.
Substantiation: Use of the word "physical" is superfluous– the purpose is obvious. In some instances, one could argue for the use of "mechanical" to differentiate that from e.g., "thermal" damage, but context makes the intended sense quite clear, rendering anything like this completely unnecessary.
Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."
Panel Meeting Action: Reject
Panel Statement: The word "physical" is appropriate since it specifically defines the type of protection being provided and complies with 3.2.5.5 of the NEC Style Manual. There are other types of protection that may be provided, such as protection from EMF interference.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-105 Log #2426 NEC-P07 **Final Action: Accept**
(396.12(B))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panels 4, 5, and 19 for comment.
The Technical Correlating Committee directs that further consideration be given to the comments expressed in the voting. This action will be considered by the panel as a public comment.
Submitter: Donald W. Zipse, Zipse Electrical Engineering, Inc.
Recommendation: Rearrange Section and add new.
396.12 Uses Not Permitted.
(A) (move existing sentence to here) Messenger supported wiring shall not be used in hoistways or where subject to physical damage.
(B) (new) The messenger shall not be used as a continuous current carrying conductor such as a neutral conductor.
Substantiation: This panel is to be complemented for their insight in accepting this proposal at this time during the last cycle.
Addressing the comments from the previous Code cycle, 2005 ROC.
"In certain instances, the messenger is permitted to be a current carrying conductor. For example, the Exception to 225.4 and Exception No. 2 to 250.184(A) make it clear that a bare messenger conductor is permitted to be a current carrying conductor for certain conditions. Acceptance of this proposal would create a conflict with other provisions of the Code." A proposal is being submitted to Code Making Panel 4 to eliminate the phrase, "and grounded circuit conductors"
In addition, a proposal is being submitted to Code Making Panel 5 to eliminate the exceptions 1 and 2 to 250.184 (A) (1) as these two exception are contribution to the death of cows and pigs and shocking humans since exercising these two exceptions results in on farm stray current being generated and stray current producing electrical shocks in swimming pools, showers, hot tubs, etc.
Zipse's Law states "In order to have and maintain an electrical installation safe from electrical shocks and to prevent electrocution from stray current:: All continuously, flowing current shall be contained within a conductor, insulated from earth, except at one place within the system and only one place can the neutral be connected to earth." This is accomplished within industrial facilities since they do not make the bastardized electrical transformer connection between the primary neutral and the secondary neutral which allows the continuous flow of dangerous and hazardous high voltage neutral current over the earth and ground conductors.
Now as far as the previous comment about ice and snow breaking the messenger, the commenter forgot that the neutral is connected to the ground conductor in the service entrance panel. Therefore, there would be no lost of ground if the messenger broke.
The messenger has been used for three dissimilar functions:
1. As a messenger used to support insulated conductors.
2. As a ground or equipment grounding conductor.
3. As a continuous current carrying neutral conductor.
Approximately 35 years ago the panel that had metallic house trailers and travel trailers realized the combining of the equipment ground conductor with the continuous current carrying neutral as in a cable connecting electrical power to the metallic trailers which had the two conductors combined into one and was connected to the metallic frame, grounding the frame resulted in stray neutral current flowing on the metallic surfaces. When someone standing in water touched the metallic side, they were either shocked or electrocuted.
The panel, one of the more astute panels with keen insight and perception, required the separation of the equipment grounding conductor or ground conductor from the continuous current carrying neutral conductor. Insulated phase(s) conductor(s) were still required, but then an insulated neutral conductor and a separate equipment-grounding conductor were required. This could be referred to as a 3-wire replaced with a 4-wire safe connection.
The next code cycle the marina panel required 4-wire connections. However, panel 5, was very slow to realize dangers associated with combining of the continuous current carrying neutral and the equipment-grounding conductor and it took Panel 5, 21 years to require ranges and dryer to be wired with 4-wires, separating the continuous current carrying neutral conductor from the equipment-grounding conductor. This became code in 1996.
The next logical step in the progression of safety for the public is separation in the section for the messenger.
However, you no doubt are concern about this change after many, many years of unsafe wiring 3-wire messenger cable. The safer 4-wire, 2 phase conductors, (3 rd) an insulated neutral and a (4 th) combination ground / equipment-grounding conductor combined with the messenger where it connects with the utilities unsafe 3-wire service drop. Let the utilities make the error of combining the neutral and the ground and the messenger together. At least the NEC will be clean and free from future potential legal action.
Someone has to make the first move and let it be the more safer code, the NEC to do so. With your action, the NESC code cycle follows the NEC and that will allow them your concern for safety. The NESC will have to "you know What" or get off the pot.
In previous cycles, changes have been proposed to both the NESC and the NEC allowing 4-wire service. In the case of the NESC, it was worded that the customer would pay for the 4 th conductor.
Concern pervades the industry about stray current and cows. Cows are much more sensitive to stray current than humans. However, as the electrical load increases more and more humans will be experiencing electrical shocks and possible electrocutions.
Stray current has contributed to the death of 5 cows per day on one dairy farm. This lasted for over a year before stray current was realized.
Go to <u>www.app.com</u> and scroll down to "stray voltage and read about the many persons in NJ who are experiencing electric shocks from stray current. In fact, one family was told by the utility not to let their 3 boys play bare foot in their own back yard. This lasted all summer, in addition the inability to use their own above ground swimming pool and their hot tub lasted all summer and fall and the utility has yet to find and fix the problem.
Now I have come across a case where persons in a swimming pool complained about bugs biting them under the water. All electric power was turned off to the pool. Not confirmed that one person while trying to climb out of the pool muscles froze. It is preliminarily assumed another boy's muscles froze while in the water and after he was found, missing, the dark and cloudy pool was dragged. He was found dead.

Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 11 Negative: 3
Explanation of Negative:
ADAMS, M.: Messengers are widely used as current carrying conductors for applications such as overhead service-entrance conductors and feeders between industrial buildings. The submitter's substantiation is not sufficient to ban this common practice. NECA recommends that the NEC Technical Correlating Committee refer this proposal to CMP 5 and CMP 19 for information.
CANGEMI, J.: This proposal should be rejected. Presently, a bare messenger is permitted to serve as a current carrying conductor in given situations. Examples of areas of concern are sections 225.4, 250.32(B) and 250.184(A). Considering the forgoing, CMP-7 should reject the proposal since there appears to be a correlation issue, and jurisdiction of the material in question falls under the purview of CMP-4 and CMP-5.
RAY, J.: This proposal should be rejected. The proposal should be forwarded by the Technical Correlating Committee to Panel 5 for action. The submitter's intent is to prohibit the use of the messenger from ever being a current carrying conductor. 250.32(B)(1) and 250.32(B)(2) clearly set forth the rules for when this conductor can be a grounding conductor and when it can be a grounded conductor. Acceptance of this proposal would negate these applicable grounding rules when this wiring method is used. Article 396 should be used to determine the use, installation, and construction specifications for messenger supported wiring. Article 250 should be used to determine the grounding requirements.
Comment on Affirmative:
ROGERS: Code Panel 4 and Code Panel 5 action, as outlined in this proposal, will have an impact on whether this should be accepted.
SCHUMACHER, D.: The panel was correct in accepting this, the bare messenger conductor should not be a current carrying conductor.

7-106 Log #3361 NEC-P07 **Final Action: Accept**
(396.60)

TCC Action: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panels 4, 5, and 19 for comment.
The Technical Correlating Committee directs that further consideration be given to the comments expressed in the voting and that this proposal be reconsidered and correlated with the action on Proposal 5-119. This action will be considered by the panel as a public comment.
Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc. / Rep. Massachusetts Electrical Code Advisory Committee
Recommendation: Insert the following sentence at the end:
The messenger shall not be used as a current-carrying conductor unless used as a grounded conductor in accordance with 250.32(B)(2).
Substantiation: This application has been in routine use since the earliest days of the NEC. See, for example, the NFPA staff comments in the NEC Handbook at 225.4. However, a close reading of many sections of the NEC reveals that no explicit permission to use this procedure now exists, however obvious the intent in 225.4 Exception. This proposal supplies the specific permission that 225.4 Exception intends correlation with, and that does not, as of yet, exist elsewhere in the NEC. This simple proposal prevents the unintended obstruction of an allowance that goes back almost a century.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 2
Explanation of Negative:
CANGEMI, J.: See my explanation of negative vote on Proposal 7-105.
RUNYON, G.: The panel should have voted to Reject this proposal based on their acceptance of Proposal
7-105 which will prohibit the use of the messenger to be used as a current carrying conductor.
Comment on Affirmative:
RAY, J.: Panel action on Proposal 7-105 is in conflict with action taken on this proposal.

ARTICLE 398 — OPEN WIRING ON INSULATORS

7-107 Log #267 NEC-P07 **Final Action: Reject**
(398.15(A))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
(A) Dry Locations. In dry locations, where not exposed to severe ~~physical~~ damage, conductors shall be permitted to be separately enclosed in flexible nonmetallic tubing.
Substantiation: Use of the word "physical" is superfluous - the purpose is obvious. In some instances, one could argue for the use of "mechanical" to differentiate that from e.g., "thermal" damage, but context makes the intended sense quite clear, rendering anything like this completely unnecessary.
Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. ARTICLE 400 — FLEXIBLE CORDS AND CABLES

6-72 Log #2587 NEC-P06 **Final Action: Reject**
(400)

TCC Action: The Technical Correlating Committee advises that the location of Articles is the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.
Submitter: Jebediah Novak, Cedar Rapids Electrical JATC
Recommendation: Relocate Article 400-Flexible Cords and Cables, to Chapter 3, Wiring Methods and Materials.
Substantiation: Flexible cords are a means to connect to utilization equipment. They are used where flexibility is required, much like flexible metal conduit and other wiring methods. The parallel numbering system utilized in Chapter 3 and adopted by the 2002 NEC would translate well to this article.
Panel Meeting Action: Reject
Panel Statement: Chapter 3 addresses general wiring methods whereas Chapter 4 addresses more limited applications as permitted in 400.7.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:
CLINE, S.: Sorry gentlemen, but I still disagree. - "Flexible Cords and Cables" - These are common, everyday conductors. Can you think of a building which does not have many them? Their limitations of allowable installation/application are well defined in the existing text. However it occurred in the Code's history, the text is just in a place which seems wrong to me.
The title of Chapter 3 is "Wiring Methods and Materials"; the title of Article 300 is "Wiring Methods"; and I. Of Article 300 is "General Requirements." Chapter 4 is "Equipment for General Use"; I don't think conductors belong there. If the cords and cables are indeed "General" as indicated by the title of Chapter 4, then don't they belong in Chapter 3?

6-73 Log #815 NEC-P06 **Final Action: Accept**
(Table 400.4)

Submitter: Austin D. Wetherell, Underwriters Laboratories, Inc.
Recommendation: In the 6th column (Insulation), the horizontal line which is now located between HSJ and HJSO, should be moved down so that it is located between HSJO and HSJOO and so that the words "Oil-resistant thermoset" remain below that line and adjacent to HSJOO.
Substantiation: As the table currently reads, it indicates that HSJO has oil resistant insulation, which it does not. As with the other Types throughout this table, a single "O" means oil resistant jacket, two "O"s means oil resistant insulation and jacket. Moving the line down as proposed would fix this error in the Table.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-74 Log #2282 NEC-P06 **Final Action: Accept**
(Table 400.4)

Submitter: Susan L. Stene, Underwriters Laboratories
Recommendation: Excerpt from current Table 400.4 (see following page)
Substantiation: SPT-1W and SPT-2W show "2 or 3" conductors. In UL 62, The Standard for Flexible Cords, they are restricted to only 2 conductors, since they are only for use in Decorative Lighting strings where there are no 3-wire applications.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-75 Log #816 NEC-P06 **Final Action: Accept**
(Table 400.4 & Note 6 to Table 400.4)

Submitter: Austin D. Wetherell, Underwriters Laboratories, Inc.
Recommendation: 1. In Table 400.4, a second column, remove "See Note 6" from Types NISP-1, NISP-2, SP-1, SP-2, SP-3, SV, SVE, SVEO, SVEOO, SVT, and SVTO.
2. Revise the first sentence of Note 6 to Table 400.4 to read:
"The third conductor in Type HPN shall be used for equipment grounding purpose only."
Substantiation: Note 6 currently specifies that the third conductor of the parallel cords (e.g., NISPT-1, SPE-2) and vacuum cleaner cords (e.g., SV, SVTO) is for grounding only. However, UL 62, the ANSI approved Standard for Flexible Cords, permits a 3-conductor, nongrounding version of these cords and has done so for many years. The first sentence of Note 6 should only pertain to Type HPN cord. The second sentence of Note 6 permits a thermoset-insulated grounding conductor on thermoplastic-insulated parallel types. Thermoset types already have that option.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-76 Log #2281 NEC-P06 **Final Action: Accept**
(Table 400.5(A))

Submitter: Susan L. Stene, Underwriters Laboratories
Recommendation: Revise Table 400.5(A) to read:
(see table below)
Substantiation: Manufacturers are producing 15 AWG and 17 AWG cords for use in cord sets and power supply cords. The ampacity values have not been stated, as there were previously no manufacturers of these cords. In addition, the "_" makes it appear that these sized cords cannot be manufactured.
The value used for the 15 AWG conductors is the same as that found in UL 1659, the Standard for Attachment Plug Blades for Use in Cord Sets and Power Supply Cords. The other ampacity values were interpolated using the values for one size smaller and larger conductors.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-77 Log #1592 NEC-P06 **Final Action: Accept**
(400.5(B))

Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Make the following change in 400.5(B) fourth paragraph:
Change "neutral" to "neutral conductor."
The revised text would appear as follows:
On a 4-wire, 3-phase, wye circuit where the major portion of the load consists of nonlinear loads, there are harmonic currents present in the neutral conductor and the neutral conductor shall be considered to be a current-carrying conductor.
Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).
The Task Group has proposed the following definitions to be added to Article 100:
- **Neutral conductor.** A circuit conductor connected to the neutral point of a system.
- **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.

This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals
- The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.
- The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.

Additional information is available in the Task Group report.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:
LAIDLER, W.: See my Explanation of Negative Vote on Proposal 6-59.
Comment on Affirmative:
CLINE, S.: While I agree that the use of the word "neutral" itself demands change, that is a separate argument for another Panel.
I can agree that changing "wire" to "conductor" in either "3-wire" or "4-wire" is a different subject with different impacts in the trade, and should not be done here.
The addition of the word "conductor" after "neutral" will help to focus that the item being discussed is part of the circuit construction, not a point of connection in a piece of equipment. This section has a disjointed use diction which this will clear up.

6-78 Log #1593 NEC-P06 **Final Action: Accept**
(400.5(B))

Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Make the following change in 400.5(B) third paragraph:
Change "neutral" to "neutral conductor." Also change "wire" to "conductor."
The revised text would appear as follows:
In a 3-wire circuit consisting of two phase ~~wires~~ conductors and the neutral conductor of a 4-wire, 3-phase, wye-connected system, a common conductor carries approximately the same current as the line-to-neutral currents of the other conductors and shall be considered to be a current-carrying conductor.
Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).
The Task Group has proposed the following definitions to be added to Article 100:
- **Neutral conductor.** A circuit conductor connected to the neutral point of a system.
- **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.

This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals
- The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.
- The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.

Also, the word "wire" should be replaced by "conductor" for consistency.
Note: Supporting material is available for review at NFPA Headquarters.

I can agree that changing "wire" to "conductor" in either "3-wire" or "4-wire" is a different subject with different impacts in the trade, and should not be done here.
The addition of the word "conductor" after "phase" and "neutral" will help to focus that the item being discussed is part of the circuit construction, not a point of connection in a piece of equipment. This section has a disjointed use diction which this will clear up.

6-79 Log #283 NEC-P06 **Final Action: Reject**
(400.5(B) Note 1)

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
"And are not in ~~physical~~ contact with each other except in lengths...".
Substantiation: Use of the word "physical" is superfluous– the purpose is obvious. You're not going to be in solely electromagnetic contact for a length not to exceed two feet, after all, unless you have wonderfully precise shielding.
Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every unnecessary instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on. Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "contact" means "physical contact."
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 6-54. The panel understands that this proposal refers to Table 400.5(B), Note 1.1
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-80 Log #3323 NEC-P06 **Final Action: Reject**
(400.7(A)(12))

Submitter: Jerry D. Cain, Charolais Coal No. 1 LLC
Recommendation: Add new text to read:
(12) Wiring supplying power to mobile office or storage trailers receiving power from a portable generator.
Substantiation: We commonly use box type trailers as office and storage units. We have recently added GFCI receptacles at regular intervals along each side to facilitate connecting engine block heaters on heavy equipment located at the mine site, each having an individual 20 amp 120 VAC Circuit.
Since these trailers are moved every few months to keep them close to the mining area, it is not practical to serve them in a permanent manner such as conduit or MC cable. I feel a better solution would be a Type W, G or other hard service cable routed in an area that affords it protection from damage. The cable can be reused upon moving similar to trailing cables on mining equipment.
Please note the fixed wiring on these trailers is conduit and device boxes, the only place the cable would be used is between the generator and the load center at the trailer.
Panel Meeting Action: Reject
Panel Statement: The proposed text is not necessary. The present language would permit the use of flexible cord or cable in the installation the submitter described.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-81 Log #1752 NEC-P06 **Final Action: Accept**
(400.7(A)(3) and 400.11 Exception No. 2)

Submitter: David Belt, Underwriters Laboratores Inc.
Recommendation: Replace the term "portable lamp" with the term "portable luminaire". Revise text as follows:
400.7 Use Permitted
(A) Uses
(3) Connection of portable ~~lamps~~ luminaires , portable and mobile signs or appliances
400.11 In Show Windows and Show Cases
Exception No. 2: As supply cords for portable ~~lamps~~ luminaires and other merchandise being displayed or exhibited.
Substantiation: The term "luminaire" has already been accepted in the Code as the correct terminology for a lighting system and replaces the terms "fixture" or "lighting fixture", which were terms for fixed lighting systems.
The term "portable luminaire" has been accepted by the IEC as the correct term for cord and plug connected lighting products and has also been adopted by UL in their ANSI/UL153 Safety Standard, which was previously titled "Portable Electric Lamps" and is now titled "Portable Electric Luminaires".
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-82 Log #3083 NEC-P06 **Final Action: Reject**
(400.8 Exception No. 2 (New))

Submitter: Joseph A. Hertel, Safety and Buildings
Recommendation: Revise as follows:
Uses not Permitted [NEC 400.8] This is an exception in addition to the exception in 408.4(4):
Exception No. 2: Flexible cords and cables permitted by 400.7(A) that are connected to sources other than busways shall be permitted to be attached to adequately supported equipment or building surfaces provided the type of cord or cable, the attachment to the building and equipment, and the support comply with the provisions of 368.56(B).
Substantiation: The exception to 400.8(4) permits cord drops to be attached to building surfaces in accordance with the provisions of 368.56(B). This allows cord drops to have a take-up only if they originated in a busway. The use of the language permitting the surface attachment should be extended to all installations permitted in 400.7(A).
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any technical substantiation for this new exception. The existing exception provides a deviation from the requirement that flexible cords and cables not be attached to building surfaces for a specific type of installation. Also see the first sentence of 400.8.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-83 Log #282 NEC-P06 **Final Action: Reject**
(400.8(7))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
(7) Where subject to ~~physical damage~~ blows or abrasion .
Substantiation: Use of the word "physical" is superfluous– the purpose is obvious. In some instances, one could argue for the use of "mechanical" to differentiate that from e.g., "thermal" damage, but context makes the intended sense quite clear, rendering anything like this completely unnecessary.
The proposed rewording is an attempt at precision. Furthermore, some of the other prevented uses are there to avoid sources of physical damage. If you retain "damage," I would then have to fall back to arguing that in that case the term "physical" should be eliminated.
Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.)
Panel Meeting Action: Reject
Panel Statement: As the submitter points out, the term "physical damage" has been used in the Code since 1959 and is more encompassing than the language recommended by the submitter.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-84 Log #981 NEC-P06 **Final Action: Reject**
(400.8(1) and (4))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
(1) As a substitute for ~~the fixed~~ wiring ~~of a structure~~ methods covered by 225.1 and 300.1(A) .
(4) Where attached to buildings or structures except as otherwise permitted by this Code .
Delete exception to (4).
Substantiation: Fixed wiring is not defined. Does it mean attached in place, "permanent" installations? Structures that are not "buildings" should be included in (4) and the proposed additional wording follows that of (6). Attachment to structures is also permitted by 590.4(J) and 620.21. Flexible cords are permitted as permanent (fixed) wiring by 525.20, 553.7(B) and 555.13(A) and for underwater lighting fixtures by 680.23(B).
Panel Meeting Action: Reject
Panel Statement: The term "fixed wiring" is well understood and accepted within the industry. The references to Chapters 5 and 6 modify the general rule in Chapter 4. 590.4(J) and 620.12 apply to limited applications. 525.20 is not applicable to fixed/permanent wiring; it addresses portable wiring. 553.7(B) limits portable wiring to those lengths where flexibility is required. Section 553.13(A) limits the use of portable cables. Section680.23(B) limits the use of portable cords or cables to wet-niche luminaires.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

(Note: Sequence 6-85 was not used)

6-86 Log #3362 NEC-P06 **Final Action: Reject**
(400.8(4) Exception)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc. / Rep. Massachusetts Electrical Code Advisory Committee
Recommendation: Revise text to read:
Exception to (4): Flexible cord and cable shall be permitted to be installed in accordance with 368.56(B). For other applications, where the length of the cord from the supply termination to a suitable tension take-up device is limited to 2.5 m (8 ft), flexible cord shall be permitted to have one connection to the building surface.
Substantiation: This proposal allows for traditional cord extensions from other, non-busway sources such as overhead wireways. The present NEC wording prohibits an entire family of cord uses that have been an integral part of untold thousands of industrial and commercial applications over the years. This represents an enormous change in standard installation practice, which should have been allowed to continue. This proposal restores the traditional applications.
By not allowing a connection to the building surface, the NEC is inviting the arrangement of cords at oblique angles, instead of the neat and workmanlike arrangement involved in a swag to a point directly over the load. In addition, the vertical strain is better accommodated by a take-up connected to the building instead of exclusively reliance on a basket or gland connector at the cord exit. Such arrangements are much more likely to fail over time.
Panel Meeting Action: Reject
Panel Statement: The current wording allows sufficient traditional uses.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-87 Log #281 NEC-P06 **Final Action: Reject**
(400.14)

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
"In ~~industrial establishments~~ premises where the Authorities Having Jurisdiction are satisfied that the conditions of maintenance and supervision ensure that only qualified persons service the installation, a flexible cord ~~s~~ ~~and cable~~ or cable shall be permitted to be installed in an aboveground raceway ~~s~~ that ~~are~~ is no longer than 15 m (50 ft) to protect the flexible cord or cable from ~~physical~~ damage...".
Substantiation: Industrial establishments are not the only ones where AHJs are wont to accept this; warehousing operations are another example. Formal 90.4 documentation is not always provided, and given that there is no substantiation for differentiating the ill-defined "industrial" operation from other establishments that may have well-trained-in-house electricians, why not ease the liability picture for such inspectors? Also, why not use the more common code term "premises"?
Next, it seems like better English to the singular "raceway" to correspond to the singular "cord" or "cable" that it protects. Finally, use of the word "physical" is superfluous – the purpose is obvious. In some instances, one could argue for the use of "mechanical" to differentiate that from e.g., "thermal" damage, but context makes the intended sense quite clear, rendering anything like this completely unnecessary. Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However,

doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.

Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.)

Panel Meeting Action: Reject

Panel Statement: The first phrase in the second paragraph is well understood and used throughout the Code. The word "physical" is appropriate since it specifically defines the type of protection being provided and complies with 3.2.5.5 of the NEC Style Manual. There are other types of protection that may be provided, such as protection from EMF interference. The other proposed changes do not improve clarity.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

6-88 Log #3363 NEC-P06 **Final Action: Reject**

(400.14)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc. / Rep. Massachusetts Electrical Code Advisory Committee

Recommendation: Revise the second paragraph to read as follows:

Flexible cord shall be permitted to be installed in raceways not longer than 15 m (50 ft) in length where required to protect the flexible cord or cable from physical damage. The ampacity of the conductors within a raceway shall be adjusted in accordance with Table 400.5 based on the total number of current-carrying conductors within the raceway, and then further derated by a factor of 0.8, or the ampacity shall be calculated in accordance with 310.15(C). The raceway shall be exposed over its entire length.

Substantiation: The only reason on the public record for the general prohibition against running cord in raceways (new in the 1990 NEC) is that the table ampacities are figured with the cord able to dissipate its heat freely. Unfortunately, there are many, many legitimate uses for cord in raceway, far too many to give this up entirely. There are many machine tool applications where putting a suitable cord fitting on the end of a piece of conduit was the only way to go. The cord might provide some necessary flexibility to a movable solenoid, for example. Then, the cord would run through the raceway to the terminal blocks in a remote enclosure. The panel took an important step in the 2005 cycle by recognizing these applications in industrial environments.

There is more work to be done, however, because the current NEC wording does not correlate with the diminished ampacities that caused this limitation to go in the Code. Typically these applications never approached the ampacity of the cord. A designer frequently will be more than willing to pay a meaningless derating penalty (given the low loading) in exchange for reducing the numbers of splices in his system, since splices are always potential failure points. This proposal allows the engineering calculation, as well as a Table 400-5 type factor of 80%. The 80% factor is very conservative; reviewing similar tables in Appendix B and looking at the spread between 3/C cable in air vs. in raceway, the differences are less than 80%. The industry needs a practical way to quickly figure a revised ampacity here, and this revision provides the method.

This wording also assures the raceway will be exposed, which also improves air circulation. The only restriction in the Code now on this topic is to prohibit the use of cord underground. Very few installations would be so tempted, and that wording leaves open the possibility of sleeving cords through raceways in walls and ceilings, which should not be the point of this allowance.

Finally, this proposal omits the industrial/engineering supervision restriction. The NEC should, wherever possible, not include ever more provisions that require engineering and an industrial location to implement. The wording submitted with this proposal adequately covers the engineering issues, and in this form it will therefore be safe to apply in other occupancies as well.

Panel Meeting Action: Reject

Panel Statement: The panel intended this provision be used only in industrial applications and limited the length to 50 feet so that cords would not be used for fixed wiring. The rating does not have to be reduced by an additional 80% since cord ampacities are already lower than those in Table 310.16 for 60ºC products in conduit.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

6-89 Log #3565 NEC-P06 **Final Action: Reject**

(400.15(A) & (B) (New))

Submitter: Edward A. Schiff, Technology Research Corp.

Recommendation: Add new text to read:

400.15 Leakage Current Detection and Interruption (LCDI) Protection.

(a) Definition. Leakage Current Detection and Interruption (LCDI) Protection. A device provided in a power supply cord or cord set that senses leakage current flowing between or from the cord conductors and interrupts the circuit at a predetermined level of leakage current.

(b) Leakage Current Detection and Interruption (LCDI). Indoor extension cord sets shall be provided with factory-installed LCDI protection. The LCDI protection shall be an integral part of the attachment plug or be located in the power supply cord within 300 mm (12 in.) of the attachment plug.

Substantiation: Extension Cord Fire Problem

Faulty or damaged cords or plugs caused an estimated 6,900 attended fires, 91 civilian deaths, 421 civilian injuries, and $115.9 million in direct property damage per year in US homes between 194 and 1998 according to The US Home Product Report , published January, 2002 by the NFPA. The leading cause of cord and plug fires was short circuits and ground faults (52.3% of fires and 39.2% of deaths). Other electrical failure and overloads account for the majority of the balance.

Electrical cord fires and leading cause of residential fires in the United States. During the five year period from 1994 to 1998, there were 27,400 cord fires attended by the fire service according to the 1998 Residential Fire Loss Estimates published by the U.S. Consumer Safety Commission (CPSC) in 2002. These fires resulted in 350 deaths and 1,680 injuries. Extension cords were responsible for over half of these incidents.

The extension cord fire problem is getting worse. 2002 has been another terrible year for extension cord fires. In January alone, there were seven different fatal extension cord fires in US residences. Additionally two catastrophic fires have occurred that summer.

1. On August 3, 2002 an overloaded extension cord caused the fire that killed six children (ages 10, 4, 3, 2 and eight month old twins) in Baton Route, LA.

2. On June 11, 2002, an overloaded extension cord melted and set the couch on fire in Silver City, NC killing six family members. The 33 year old mother, daughter 6, two stepsons age 10 and 13, 48 year-old brother, and the children's 41 year-old aunt died of smoke inhalation. the father and their 2 year-old daughter escaped by braking out a rear window.

Extension Cord Fire Problem

Faulty or damaged cords or plugs caused an estimated 6,900 attended fires, 91 civilian deaths, 421 civilian injuries, and $115.9 million in direct property damage per year in US homes between 1994 and 1998 according to The US Home Product Report , published January, 2002 by the NFPA. The leading cause of cord and plug fires was short circuits and ground faults (52.3% of fires and 39.2% of deaths). Other electrical failure and overloads account for the majority of the balance.

Electrical cord fires are a leading cause of residential fires in the United States. During the five year period from 1994 to 1998, there were 27,400 cord fires attended by the fire service according to the 1998 Residential Fire Loss Estimates published by the U.S. Consumer Product Safety Commission (CPSC) in 2002. These fires resulted in 350 deaths and 1,680 injuries. Extension cords were responsible for over half of these incidents.

The extension cord fire problem is getting worse. 2002 has been another terrible year for extension cord fires. In January alone, there were seven different fatal extension cord fires in US residences. Additionally, two catastrophic fires have occurred that summer.

1. On August 3, 2002 an overloaded extension cord caused the fire that killed six children (ages 10, 4, 3, 2 and eight month old twins) in Baton Route, LA.

2. On June 11, 2002, an overloaded extension cord melted and set the couch on fire in Silver City, NC killing six family members. The 33 year old mother, daughter 6, two stepsons age 10 and 13, 48 year-old brother, and the children's 41 year-old aunt died of smoke inhalation. The father and their 2 year-old daughter escaped by braking out a rear window.

These two fires accounted for 12 deaths, nine of which were children. The table entitled, "Fire Event Summary Report", highlights the severity of the problem.

Causes of Extension Cord Fires.

Extension cord fires have been and continue to be a major problem. There are many causes of cord fires including overload, overheating, pinching, crimping, crushing, customer misuse, fraying, and aging of the cord. These problems can cause combustion on their own or in conjunction with one another.

Extension cords are easily overloaded by exceeding the typical 13 Amp rating of the cord with multiple loads. Circuit breakers are designed to protect the fixed wiring in a dwelling. Their continuous current rating is typically 15A or 20A. A breaker allows an overload to exist for a period of time depending on its inverse-time trip curve; therefore, they do not provide overload protection for cords. Overloading damages the insulation from the inside (next to the conductor) to the outside of the cord.

Extension cords are frequently overheated. Consumers often run them under carpet or leave them coiled for ascetic reasons. Combustibles such as clothes or newspapers are put onto the cords. These scenarios prevent proper cooling and will overheat the cord. As with the overload condition, the insulation is damaged from the inside out. This damage is irreversible and may not be visible to inspection.

Extension cords can be mechanically damaged. They are frequently pinched or cramped by furniture and doorways. This will result in broken conductors within the cord and can cut or scrape the insulation. Cords may also be crushed by pedestrian traffic or by heavy items (furniture being placed on top of the cord). This damage is also irreversible and not visible to inspection.

Customer misuse comes in a variety of fashions including leaving the cord in pedestrian traffic, stapling of the cord to baseboards, using the cord as a permanent extension of premises wiring, and using the cord around pets or infants who chew cords. This misuse can result in fires caused by broken conductors and degraded insulation.

Finally, extension cords wear out in time resulting in cracked insulation and fraying of the conductors. Unlike the proposed LCDI cords, they will continue to pass current even though they present a major fire, injury and loss of life risk.

This damage described above results in insulation degradation and breaking of the current carrying conductors. The damage is irreversible and may not be visible to inspection. Circuit breakers and fuses are not sensitive enough to detect this damage before combustion can occur. Even the arc fault breakers (AFCIs) require a significant arc over a period of time which may be a fire in progress before detection. AFCIs are only being required on certain branch circuits in new homes, when the majority of electrical fires occur in older homes that do not have this limited protection.

Extension cords are used in high risk applications. Some of the common characteristics of these applications include unattended operation, high current loads, operation while people are sleeping and used around children and elderly people.

There are two primary types of cord faults. Series faults (the fault is in series with the load) are partially or completely severed conductors within the cord set. A parallel fault, either line to neutral or a ground fault is typically caused by degraded insulation. Both of these faults will lead to tracking within the cord set, leakage current, arcing and then combustion.

Over the past two decades, efforts have been made to reduce the number of extension cord fires including increased conductor size, improved labeling, improved materials and education. These efforts have reduced the annual number of extension cord fires by 35 percent since 1980. However, data for the most current years (1996 to 1998) demonstrates a plateau in number of extension cord fires (the same is true for other electrical cords). The fires cited in the table indicate the actual number of fatalities for 2002 will show a significant increase. LCDI protected cords provide the ability to eliminate extension cord fires.

LCDI protected cord sets sense leakage current flowing from or between conductors. Leakage current is the precursor to an arcing fault. This technology employs a ground fault sensing circuit as the disconnecting means so it also will prevent ground fault fires beyond the power supply cord and provide shock protection for the cord. Over the past six years, millions of LCDI protected cords have been field proven on extension cords, power strips, space heaters, and other appliance cords.

An additional benefit to this technology is preventing electrocutions and serious injury from electrical shock. According to the <u>1998 Electrocutions Associated with Consumer Products</u> , published by the U.S. Consumer Product Safety Commission in July, 2001 there were 12 electrocutions caused by extension cords in 1998. Since the LCDI utilizes a ground fault sensing circuit as the disconnect means, these deaths would also be prevented.

Economic Impact

This improvement in safety will have a positive economic impact on society. The current retail price of an eight foot 120V/13A two wire LCDI protected extension cord is under $9.00. TRC anticipates the retail price will be under $5.00 for this product in large scale production. Unprotected indoor extension cords currently sell for between $1.00 and $7.00 dependent on length, gauge, number of conductors and receptacle type. The added cost borne by the consumer will be minimal.

In 1998, the property damage from the 2,800 attended extension cord fires was $57.5 million. These fires resulted in 170 serious injuries. The costs associated with the medical treatments, lost work expense, quality of life and pain and suffering, and product liability from these injuries will likely exceed the property damage. The reduction in fire fighting expenses associated with the 2,800 fires per year will also be in the millions. The rough estimate of well over $100,00,000.00 in annual costs caused by these fires will offset the majority of the added cost of the cords.

It is difficult to put a price tag on the loss of life. The fact that the most of the victims are children, makes this cost to society even greater. 40 people each year die from extension cord fires. An additional 12 lives are lost from electrocution. The ground fault protection provided down stream of the extension cord will prevent additional fires electrocutions, and the related costs of property damage and injuries.

Incorporation into the NEC

There are many precedents for incorporation of this requirement in the code. 440.63 requires either AFCI or LCDI protected cord sets for room air conditioners. Ground fault protection on the cord sets for pressure washers and portable hot tubs are long standing NEC requirements. Immersion protection for hair dryers has been part of the code for years.

The NEC code panels provides the only complete representation of the electrical community. This includes standards organizations, industry trade associations, insurance industry, electrical inspectors, contractors, and electricians. Safety is the primary reason for the code and clearly this is a critical safety issue.

Conclusion

Today's indoor extension cords are cheap. The U.S. Consumer Product Safety Commission (CPSC) recalls hundreds of thousands of extension cords every year. Undersized conductors and fake UL markings are common reasons. Raising the bar on performance to an LCDI protected cord set should reduce the likelihood of recalls.

A serious safety problem continues to exist. A proven, cost effective solution exists. There are many precedents for incorporation of this safety improvement into the NEC including the new requirement for AFCI or LCDI protected cord fires, injuries and reduce property damage and have a positive economic impact on society. Most importantly, adoption of this proposal will save lives!

This proposal was referred by Panel 6 to Article 240 and Article 210 during the last code cycle. None of the panels felt it was in their domain (the opinion of those panels was this is not an overcurrent device nor part of the branch circuit). From the work on the task force, Panel 17 is uniquely aware of the problem and the solution. The submitter respectfully requests that the panel take action on this proposal.

Panel Meeting Action: Reject

Panel Statement: As stated in the panel statement on Proposal 6-97 in the 2004 ROP:

"Use of this device is not prohibited in current Code text. Even though "appliance applications" is not defined, the panel considers this requirement to be unenforceable by an AHJ. This requirement would be more appropriately addressed in the product safety standard.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 8 Negative: 3

Explanation of Negative:

HUDDLESTON, JR., R.: This proposal should have been accepted. The panel continues to allude to the apparent lack of enforceability of this proposal; however, there is precedent set in other NEC sections where enforceability apparently did not come into play (for example, immersion detection devices on hair dryers, as required in 422.21). The simple facts are this - accepting this proposal, or at least accepting in principle with a designated time to allow compliance, would eliminate a significant percentage of house fires due to damaged extension cords. Users of extension cords in residential dwellings are generally untrained and unqualified in terms of electrical training, and they simply do not know the implications of running a cord under a rug or pushing a bed up against a plug and outlet. The National Fire Protection Association (NFPA), which is the organization that publishes the National Electrical Code, would certainly seem to be interested in preventing house fires. The panel expressed concerns about someone modifying one of these extension cords and removing the leakage detection device; this again is a cop-out and is not a legitimate concern. What if someone removed a GFCI breaker and replaced it with a standard circuit breaker? What if someone cut the end off of the hair dryer cord and installed a standard plug? This sort of argument does not make sense.

This proposal could have been accepted in principle, and allowed to include other technologies besides leakage current detection; however, this Panel Member believes that leakage current detection may be the best technology available to alleviate the problem of extension cord fires in residential dwellings.

KENT, G.: This proposal should have been accepted in part and principal. Not all extension cords would need to be covered to enhance the safety to most homes using extension cords. Although it will never be acceptable practice to run cords under rugs, etc., it is done and will continue to be done. This is done most often with cords smaller than #14 that are commonly referred to as 'lamp extension cords'. The panel should have accepted the requirement of LCDI protection on these types and sizes of cords.

LAIDLER, W.: This proposal should be accepted outright or at least accepted in part requiring that 18 and 16 gauge parallel cord sets be provided with internal LCDI protection. Many residential electrical fires can be traced to the misuse of electric cords such as overloading, poor maintenance, and running under rugs. Requiring that cord sets be manufactured to provide LCDI protection could help prevent some of these fires. Some Panel members expressed concerns about this proposal; one was that it could not be enforced by an AHJ. That is true, but if the only cord that could be bought and used came with this type of protection it would in most cases be self-enforcing. The other concern was that it would be more appropriate as a product standard rather than a Code requirement. That also may be true, but there are several Code sections that could also be considered product standards such as 422.41 and 440.65. These sections were added to promote safety. This proposal is no different.

6-90 Log #2280 NEC-P06 **Final Action: Accept**
(400.31(A))

Submitter: Susan L. Stene, Underwriters Laboratories

Recommendation: Revise text to read:

400.31 Construction.

(A) Conductors. The conductors shall be ~~8~~ <u>12</u> AWG copper or larger and shall employ flexible stranding.

~~Exception: The size of the insulated ground check conductor of Type G-GC cables shall not be smaller than 10 AWG.~~

Substantiation: The low end of the size range of Types G, G-GC, PPE, and W was extended from 8 AWG to 12 AWG in the 2002 NEC. The rationale used was the need for a 2000-volt rated cord in those smaller sizes that could use the ampacities in Table 400.5(B). At the time of the proposal, the wording in Table 400.4 was revised but the wording in 400.31 was inadvertently overlooked. This proposal resolves that conflict. The ground-check conductor for a 12 AWG Type G-GC is 12 AWG, so the Exception is no longer needed.

Panel Meeting Action: Accept

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

ARTICLE 402 — FIXTURE WIRES

6-91 Log #1470 NEC-P06 **Final Action: Reject**
(402)

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Rename the term "fixture wires" to "luminaire wires" in Article 402.
Substantiation: With the changing of the term "fixture" to "luminaire" it only makes sense that the term "fixture wires" be changed to "luminaire wires".
For the purposes of correlation, this proposal is also being submitted to the following Articles/Sections/Tables/Annexes: 200.6; 210.19; 210.20; 210.24; 240.4; 240.5; 300.17; 310.1; 314.16; Article 402; 517.74; 660.9; Table 1; Table 5; Annex C.
Panel Meeting Action: Reject
Panel Statement: The use of fixture wire is not limited to luminaires or lighting fixtures; they are also used within equipment. The action on this proposal should also be forwarded for information to CMPs 2, 3, 5, 8, 9, 10, 12, and 15.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 9 Negative: 2
Explanation of Negative:
CLINE, S.: If "fixture" was the word which gave rise to "fixture wires" in the past, then it seems that the term should now be "luminaire wires." It is possible that a different word more inclusive of current applications for these conductors could be better than "luminaire," but "luminaire" is the defined word the Code now uses in place of "fixture." A new word could be done as a Comment should someone have one to suggest. I believe in struggling for uniformity and simplicity in the Code as much as is practically possible.
KENT, G.: See my Explanation of Negative Vote on Proposal 6-5.

6-92 Log #997 NEC-P06 **Final Action: Accept in Principle**
(402.11)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Fixture wires shall not be used as branch-circuit conductors <u>except as required in 725.27(B)</u>
Substantiation: Edit. Although covered by 90.3, the proposal would be helpful to Code users. A Class I motor control circuit that is not tapped from the load side of a motor circuit protective device (430.72) and has overcurrent protection is a branch circuit.
Panel Meeting Action: Accept in Principle
Revise the section to read as follows:
Fixture wires shall not be used as branch-circuit conductors except as permitted elsewhere in the Code.
Panel Statement: Chapters 1 through 4 apply generally except as amended by Chapters 5, 6, and 7 for the particular conditions. It is not necessary to specifically reference 725.27(B) in 402.11.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

(Note: Sequence 6-93 was not used)

ARTICLE 404 — SWITCHES

9-82 Log #661 NEC-P09 **Final Action: Reject**
(404 and 406)

Submitter: Richard Shackelford, NEO Products Inc.
Recommendation: Add new text as follows:
<u>To cover all exposed termination points such as the screws on the sides of snap switches and receptacles.</u>
Substantiation: The exposed terminals on these devices offer the easiest access for people to come in contact with electricity. With receptacles mounted approximately 16 in. off of the floor, any baby that can crawl can reach high enough. Most covers are removed at some point for cleaning or painting, etc. I think that it offers an unnecessary risk to leave these terminals exposed.
Panel Meeting Action: Reject
Panel Statement: The proposal is not properly submitted as it lacks specific location identification and code language. All exposed terminals are required to be in an enclosure with covers and plates installed. This is a design option that can be addressed in the field where necessary. There is no technical substantiation to support the need for requirements to anticipate the level of misuse anticipated by the submitter.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.
Comment on Affirmative:
BELISLE, R.: Although we agree that the proposal was incorrectly submitted, we cannot ignore the fact that device terminals, receptacles specifically, pose a serious threat to children. NEC requirements in 517.18 (c) reflect the serious nature of receptacle location with respect to children. The panel statement reassures the submitter that a system is not complete without receptacle covers; yet Article 517 goes beyond that to protect children from the risks of accidental contact in a completed installation. Action should be taken to require protected terminations in areas prone to free roaming children, such as schools, daycare facilities and dwelling locations. Perhaps the language used in 517.18(c) could be edited and placed in 406.3 <u>(G)</u> to reflect the submitter's request.

9-83 Log #3146 NEC-P09 **Final Action: Reject**
(404.2(A) and (B))

Submitter: Ian McDonald, Underwriters Laboratories Inc.
Recommendation: Add new text as follows:
404.2 Switch Connections.
(A) Three-Way and Four-Way Switches. Three-way and four-way switches shall be wired so that all switching is done only in the ungrounded circuit conductor. Where in metal raceways or metal-armored cables, wiring between switches and outlets shall be in accordance with 300.20(A).
Exception: Switch loops <u>, three-way and four-way,</u> shall not require a grounded conductor.
<u>(B) Grounded Conductors.</u>
<u>(1) Disconnecting</u> Grounded Conductors. Switches or circuit breakers shall not disconnect the grounded conductor of a circuit.
Exception: A switch or circuit breaker shall be permitted to disconnect a grounded circuit conductor where all circuit conductors are disconnected simultaneously, or where the device is arranged so that the grounded conductor cannot be disconnected until all the ungrounded conductors of the circuit have been disconnected.
<u>(2) Providing Grounded Conductors. A grounded conductor shall be provided in all device boxes to permit connection of switches with a grounded conductor termination.</u>
Substantiation: Present wiring practice does not require a grounded conductor to be wired to device boxes used for installation of switches. Control type switches (such as motion detectors and photoelectric switches) are being used in increasing numbers based on legislation for energy conservation and other factors. These control type switches contain circuitry that uses small levels of sensing current. In many instances, numerous control type switches have been wired on a single branch circuit. To prevent the cumulative control current from flowing through the grounding conductor, a return path using a grounded conductor is needed. The standard for Nonindustrial Photoelectric Switches for Lighting Control, ANSI/UL 773A, is being revised to require a provision of a grounded conductor termination for control current. Requiring a grounded conductor to be wired to the switch box will provide a return path for operational current, and prevent cumulative control current on the grounding conductor.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 9-84.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 9 Negative: 1
Ballot Not Returned: 1 de Vega, H.
Explanation of Negative:
OSBORNE, R.: See negative comment on Proposal 9-84.

9-84 Log #1962 NEC-P09 **Final Action: Reject**
(404.2(C) (New))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.
Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Add text to read as follows:
404.2 Switch Connections
<u>(C) Switches Controlling Lighting Loads. Where switches control lighting loads supplied by a grounded general purpose branch circuit a grounded circuit conductor shall be provided at the switch location</u> .
Substantiation: There are electronic control devices that require a standby current to maintain the ready state of the device. This allows immediate switching of the load to the "on" condition. These devices require this standby current when they are in the "off" state, i.e., when no current is flowing to the load. The typical design of these devices may utilize the grounding conductor for the standby current flow. These products are commonly used for lighting control.
In many, if not most installations, a grounded conductor is not provided in the switch box. This forces the design of these control devices to utilize the grounding conductor to conduct the standby current. This has been tacitly acknowledged as an operational necessity by a number of UL Standards, which permit up to a 0.5 ma ground leakage current. The design of the devices available on the market today use this ground leakage provision in the UL standard as the means for providing a path for the standby current that is required for the operation of the product.

The lack of a grounded conductor in the switch box forces the use of the grounding conductor for the operation of the device. Product designers have no reasonable option but to accommodate the lack of a grounded conductor by relying on the grounding conductor. Installers will continue to use the grounding conductor in lieu of the grounded conductor when there is no grounded conductor available in the switch box.

Many lighting control devices are installed as a means of realizing significant energy savings associated with the control of lighting circuits. Due to escalating energy costs and the increased recognition and adoption of energy saving codes, it is expected that there will be a substantial increase in the installation of these products. In order to promote the use of these products, the NEC should recognize an installation practice that requires the appropriate circuit conductor to be available for the standby operation of the control device.

Although the current design of many lighting control devices relies on the grounding conductor for conducting current, adopting this proposed requirement will ensure that future designs will take advantage of the presence of the grounded conductor in the switch box and no longer compel the design of the product or installation practice to use the grounding conductor to conduct the standby current. The availability of a grounded conductor will also promote the design of many new and improved lighting control products.

Panel Meeting Action: Reject

Panel Statement: The proposed requirement is a design issue and is the responsibility of the installer, and the associated cost should be a choice of the consumer, not the code panel. See 90.1(B) and (c)

Switches with grounded circuit connections should only be used where a grounded conductor is present. These devices should not be connected to equipment grounding conductors per Part VI of Article 250.

The panel agrees that this is a concern but that a more appropriate solution would be to require manufacturers of products needing additional grounded conductors to provide appropriate, clearly visible warnings and instructions on their packaging and installation instructions.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 6 Negative: 4

Ballot Not Returned: 1 de Vega, H.

Explanation of Negative:

BELISLE, R.: My notes indicate that CMP-9 was surprised to learn that manufacturers are designing switches that operate with low level currents flowing on the grounded conductor, and when that is not present, by default, the equipment grounding conductor. This appears entirely legal and deemed safe in a singular installation. The problem lies in the fact that most aftermarket switches and homeowner modifications are not installed in just one location, but several throughout the home and the combined effect of what was a safe minimal current on the EGC is now additive to create a serious shock hazard. The submitter's proposal is all-inclusive and probably not necessary for commercial and industrial applications, as wiring methods would typically permit the addition of a grounded conductor to those specific modified locations. The proposal has merit and should be considered with the additional language of " <u>In dwelling locations,</u> switches controlling lighting loads supplied by a grounded general purpose branch circuit…

LEMAY, T.: There are many safety and convenience benefits to the electrical system of an occupancy having a grounded circuit conductor available at an outlet control point when the control point is wired using a cabled wiring method.

There are many control devices currently on the market, such as occupancy sensors, power line carrier devices, and surely more to come that require the use of a grounded circuit conductor for their operation.

There are instances where the branch circuit could be extended from the switch box to provide additional outlets or power to other loads in the area of the switch. There are also instances where the installation of a multi-level controlled luminaire or paddle fan/light assembly are not contemplated at rough in and installed after the fact by the end user, requiring an additional insulated control conductor. This rule would provide for a means to accomplish that task. I have seen where the equipment grounding conductor was used as a part of a switch loop system.

Additionally, devices that use the equipment grounding conductor for their operation produce objectionable leakage current in the ground return path.

OSBORNE, R.: The consensus among panel members is that, for those devices requiring connection to a grounded conductor, it is imperative that a grounded conductor be available at the device location. This position is in full alignment with Article 250 and a long-standing position held by panel 5.

It should be noted that the panel statement is consistent with past decisions by panel 9, which concluded that it is the responsibility of the installer to ensure the appropriate conductors are provided at the device box. However, the panel fails to acknowledge that, without a grounded conductor in a switch box being mandated in Article 404, improper use of the equipment grounding conductor is commonplace when these products are installed retroactively.

It appears that there is a potential correlation issue in that the requirements in Article 250 cannot be satisfied by the decision by panel 9 not to address grounded conductors in switch loops. The TCC needs to take a closer look at this proposal and accompanying comments as they relate to satisfying the requirements of Article 250 to determine if the Code is providing adequate guidance regarding the installation of devices requiring the use of the grounded conductor.

The reality is that control devices which need a return path for inboard control circuitry are becoming much more prevalent in both residential and commercial installations. As the use of these devices increase, the likelihood that unintended current will make its way onto equipment grounding conductors increases. Additionally, proliferation of these devices also increases the likelihood that, based on the cumulative effects of control currents, higher levels of unintended current flow will be present on the equipment grounding conductor.

Acknowledging the ever-increasing use of these devices, the panel should have concluded that it is time to readdress this issue. A step in the right direction would be to "Accept in Principle" the proposal, with additional language that limits the new requirement to only those installations where it is impractical to add the grounded conductor at a future date. The reality of such an exception is that, in most installations where a cable wiring method is used, the grounded conductor will be required. This would include the majority of residential applications where the homeowner, unaware of the safety issues related to current flow on the equipment grounding conductor, would have a grounded conductor available at all switch locations which control lighting loads. This exception would have the opposite affect in most commercial applications where raceways are employed and trained electrical workers appreciate the needed for a grounded conductor. It is in these applications, due to the presence of a raceway, that the installer has the ability to install the required conductor without damage to the building structure or building finish. To address the submitters concerns, the following text is offered for consideration:

Add text to read as follows:

404.2 Switch Connections

<u>(C) Switches Controlling Lighting Loads. Where switches control lighting loads supplied by a grounded general purpose branch circuit, a grounded circuit conductor shall be provided at the switch location.</u>

<u>*Exception: Grounded conductors shall not be required in installations where it is possible to install conductors into the device boxes without damaging the building structure or building finish.*</u>

RUPP, B.: Occupancy sensors are permitted by UL773A to have a current of up to 0.5 ma on the grounding conductor. This is allowed because the operation of an occupancy sensor requires a low level standby current. The standard permits this current on the grounding conductor because in a typical installation there is no grounded circuit conductor in the switch box which can be used as the return conductor for the standby current. An occupancy sensor can be installed in any switch location. It is impractical to expect the customer or installer to anticipate all instances where an occupancy sensor will be installed. Accepting this proposal will insure that a grounded conductor is available at all switch locations which will allow occupancy sensors to use the grounded conductor for conducting standby current instead of using the equipment grounding conductor.

Comment on Affirmative:

HARTWELL, F.: On another proposal (9-60) this panel member took considerable pains to point out the essential requirement of electrical inspection as a component of the electrical safety system. This proposal provides a perfect opportunity to bring in the third component, that of a set of product standards that assure that products used in electrical systems have been manufactured to work in the context of the NEC, which is the installation code. With the correct markings and instructions, these products will be selected and installed, and the systems designed, so the equipment grounding system will not become a routine circuit conductor. It was established at the panel meeting that the applicable standards are already in the process of modification in this area.

9-85 Log #3142 NEC-P09 **Final Action: Reject**
(404.2(C))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 17 for Action in Article 422. This action will be considered by Code-Making Panel 17 as a public comment.

Submitter: Dale Rooney, Municipality of Anchorage

Recommendation: Add new sub-section (C) to read:

(C) Off indication. A switch with a marked off position shall disconnect all ungrounded conductors to the load it controls.

Substantiation: 404.15(B) currently contains this requirement as a construction specification but as such it does not prohibit switches being installed in parallel. Locally, we have seen humidity controls with a marked off position being installed in parallel with a manual switch which also has a marked off position.

Panel Meeting Action: Reject

Panel Statement: CMP-9 recognizes that the proposal raises valid safety concerns. However, the problem relates to servicing the connected equipment. CMP-9 recommends that the Technical Correlating Committee refer this proposal to CMP-17 for possible action in Article 422 relative to field markings and or disconnection requirements that could be mandated for such equipment.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 9 Negative: 1

Ballot Not Returned: 1 de Vega, H.

Explanation of Negative:

BELISLE, R.: The submitter provides adequate substantiation and description of an unsafe installation practice that is currently legal. Although the panel statement states that this is a maintenance issue-requiring field marking, Panel 9 covers Installation practices. This is an allowable practice due to a loophole in the NEC and needs to be corrected. Marking only allows the installer to continue to violate safe installation practices.

It is clearly not intended by the NEC to allow a switch to be in the “OFF” position, yet still energize its connected load. The installer has other options in wiring the parallel installation without using a single pole switch with a marked “off” position.

9-86 Log #1350 NEC-P09 **Final Action: Reject**
(404.3(C))

Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: New subsection

(C) Phase Arrangement. The phase arrangement on 3-phase enclosures shall be A, B, C from front to back, top to bottom, or left to right, as viewed from the front of the switchboard or panelboard. The B phase shall be that phase having the higher voltage to ground on 3-phase, 4-wire, delta-connected systems. Other phasing arrangements shall be permitted for additions to existing installations and shall be marked.

Exception: Equipment within the same single section or multisection enclosure as the meter on 3-phase, 4-wire, delta-connected systems shall be permitted to have the same phase configuration as the metering equipment.

Substantiation: This is proposed in an effort to correlate the rules of panelboards and the rules of switches. Similar language can be found in 408.3(E) for panelboards.

Panel Meeting Action: Reject

Panel Statement: This requirement is not needed in this section. The phase arrangement requirements for switchboards, panelboards, and motor control centers are in place to aid the user when additional overcurrent devices are added to an existing assembly. That situation does not exist for switches.

Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-87 Log #82 NEC-P09 **Final Action: Reject**
(404.4)

Submitter: Joe Riley, City of Arlington
Recommendation: Revise as follows:

Switches shall not be installed within wet locations ~~in a tub or shower space~~ or directly over a bathtub or shower stall measuring 900 m (3 ft) horizontally and vertically to the ceiling from the top of the bathtub rim or shower stall threshold unless installed as part of a listed tub or shower assembly.

Substantiation: Tub and shower spaces for devices is a little vague and up to interpretation. Consistency of electrical device and equipment locations with other parts of the code such as 410.4(D) only makes sense in ensuring electrical safety.

Panel Meeting Action: Reject

Panel Statement: The proposed requirement is excessive. This section has always restricted itself to applications where the switch might be actually subject to a water stream. It never had to do with the issue of a reaching exposure from the tub or shower area. This is intentionally different from receptacles that extend a power circuit (through the attached cord) a significant distance.

Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-88 Log #974 NEC-P09 **Final Action: Accept in Principle**
(404.4)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise first sentence:

A switch or circuit breaker in a wet location ~~or outside a building~~ shall be...(remainder unchanged).

Substantiation: Edit. All locations outside a building are not wet locations. 312.2 doesn’t use the phrase “outside a building” (or structure, which is not included in this rule) and this section goes beyond the requirements of 312.2 The definition of Location, Damp, indicates locations outside a building which are damp, not wet.

Panel Meeting Action: Accept in Principle

Change 404.4 to read as follows:

404.4 Damp or Wet Locations. A surface-mounted switch or circuit breaker in a damp or wet location ~~or outside of a building~~ shall be enclosed in a weatherproof enclosure or cabinet that shall comply with 312.2(A). A flush-mounted switch or circuit breaker in a damp or wet location shall be equipped with a weatherproof cover. Switches shall not be installed within wet locations in tub or shower spaces unless installed as part of a listed tub or shower assembly.

Panel Statement: CMP-9 agrees that all locations outside of buildings are not wet locations, and has rewritten the section to address the differing requirements for damp and wet locations accordingly. The added sentence correlates with 406.8(A) for receptacles with equivalent exposure.

Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-89 Log #1029 NEC-P09 **Final Action: Accept in Principle**
(404.4)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise as follows:

A switch or circuit breaker in a wet location ~~or outside of a building~~ shall be enclosed...(remainder unchanged).

Substantiation: All locations outside are not wet locations per definition of Location, Wet in Article 100. Present wording equates outside of a building with a wet location. 312.2(A) only requires enclosures (cabinets, cut-out boxes) in wet locations to be weatherproof. Circuit breakers and switches are installed in cabinets or cut-out boxes per definition of panelboard in Article 100. Section 314.15(A) only requires (snap switch) boxes in wet (not damp) locations to be listed for wet locations. Switches and circuit breakers installed outside of structures which are not “buildings” per se and in a damp location are not required by this section to be weatherproof. 225.22 only requires raceways on exteriors of buildings to be raintight in wet locations.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Proposal 9-88.

Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-90 Log #2244 NEC-P09 **Final Action: Reject**
(404.4)

Submitter: Donald A. Ganiere, Ottawa, IL
Recommendation: Revise as follows:

404.4 Wet Locations. A switch or circuit breaker in a wet location or outside of a building shall be enclosed in a weatherproof enclosure or cabinet that shall comply with 312.2(A). Switches shall not be installed within or directly over a bathtub or shower stall ~~wet locations in tub or shower spaces~~ unless installed as part of a listed tub or shower assembly.

Substantiation: The current wording would permit the installation of a switch directly above a bathtub if that space was said to be a dry or damp location. This proposed change uses the wording from 406.8(C).

Panel Meeting Action: Reject

Panel Statement: The submitter has not provided any definitive technical substantiation that a problem exists with the present wording.

All exposed terminals are required to be in an enclosure with covers and plates installed. This is a design option that can be addressed in the field where necessary. There is no technical substantiation to support the need for requirements to anticipate the level of misuse anticipated by the submitter.

Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

Comment on Affirmative:

HARTWELL, F.: Although the action to reject is appropriate, it appears that a word-processing mistake was made by staff with respect to pasting the Panel Statement, the second paragraph of which duplicates that given for the action on unrelated Proposal 9-97. The proposal is functionally similar (although less far-reaching) to Proposal 9-87 and the same statement would apply. The submitter of this proposal and ROP users should refer to the statement on Proposal 9-87 for the correct technical basis for rejection.

9-91 Log #662 NEC-P09 **Final Action: Reject**
(404.8)

Submitter: Richard Shackelford, NEO Products Inc.
Recommendation: Revise text to read as follows:

To offer an alternative method to separate devices with voltages exceeding 300 volts other than a securely installed barrier, such as an insulated band on each device or electrical tape to prevent contact between devices.

Substantiation: The most commonly used partition is a metal plate. Even though the plate when fastened to the box becomes bonded, an insulator on each device is a safer application. The screws on the devices are no longer exposed, preventing accidental shorting between terminals. Using an insulator whether it is tape or an approved insulating band in no way inhibits or detracts from the grounding of the devices.

Panel Meeting Action: Reject

Panel Statement: An insulator installed on switches such as tape could be inadvertantly removed, or not replaced when devices are replaced. Additionally, a permanent barrier prevents this occurance.

The panel rejects this proposal as it does not comply with the NEC Manual of Style, 3.2.1.

Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-92 Log #3406 NEC-P09 **Final Action: Accept**
(404.8(C) (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Insert a new 404.8(C) as follows:
(C) Multipole Snap Switches. A multipole, general use snap switch shall not be permitted to be fed from more than a single circuit unless it is listed and marked as a two-circuit or three-circuit switch, or unless its voltage rating is not less than the nominal line-to-line voltage of the system supplying the circuits.
Substantiation: The device industry still shows no inclination to mark two-pole switches "2-circuit", and thereby allow their use on two circuits with a total voltage spread within the switch rating. Representatives generally declare their willingness to act promptly if there were market demand. Unfortunately, the submitter strongly suspects the lack of demand is a result of lack of knowledge, and not any lack of applications. In other words, installers are routinely installing these switches and inspectors are accepting them for want of any observable hazard. A routinely available 277-volt rated two-pole snap switch used to control two 120-volt circuits within the ampere rating of the switch to control related equipment, such as two oil burners, is a completely reasonable application. It can be frustrated, usually only on paper, by the UL Guide Card restriction. If this proposal is accepted, UL will have to revisit the Guide Card information, and the problem will disappear. Note that under the terms of this proposal, as soon as the potential line-to-line voltage exceeded that of the switch, the enhanced marking provisions would still apply.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-93 Log #1153 NEC-P09 **Final Action: Accept in Principle**
(404.9(B))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise as follows:
<u>The metal yoke or strap</u> of snap switches, including dimmer and similar control switches, shall be effectively grounded and shall provide a means to ground metal faceplates, whether or not a metal faceplate is installed. Snap switches shall be considered effectively grounded if either of the following conditions is met: (1) The <u>metal yoke or strap of the</u> switch is mounted with metal screws to a <u>grounded</u> metal box <u>or enclosure</u> or to a nonmetallic box <u>or enclosure</u> with an integral <u>grounded</u> means used for grounding the <u>switch</u> ~~device~~ .
Substantiation: Edit. Some switches have nonmetallic mounting yokes. Enclosures other than "boxes" should be included. The metal box (and enclosure) and the integral means for grounding should be specified as being grounded.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 9-18.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.
Comment on Affirmative:
HARTWELL, F.: Specifically, the submitter and readers should review item 3 of the 13-part set of actions taken under Proposal 9-18.

9-94 Log #1541 NEC-P09 **Final Action: Accept in Principle**
(404.9(B))

TCC Action: The Technical Correlating Committee directs that the action on this proposal be sent to the Technical Correlating Committee Grounding and Bonding Task Group for review and comment.
Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Delete the term "effectively" from the terms "effectively grounded" and "effectively bonded" from Articles 404 and revise text as shown for the affected NEC sections.
404.9(B): (B) Grounding. Snap switches, including dimmer and similar control switches, shall be ~~effectively~~ <u>grounded in either of the methods provided in (1) or (2) below</u> and shall provide a means to ground metal faceplates, whether or not a metal faceplate is installed. Snap switches shall be considered ~~effectively~~ grounded if either of the following conditions is met:
Substantiation: 404.9(B): The definition is ambiguous and very subjective without any defined values or parameters for one to judge as either "effective" or "ineffective." This section is revised to be more prescriptive.
This is the result of the TCC Task Group on Grounding and Bonding in resolve of the 2005 NEC cycle actions related to Proposal 5-1 and Comment 5-1 as directed by the Technical Correlating Committee. This is a companion proposal to delete the term "grounded, effectively" and its definition from Article 100 and other companion proposals throughout the NEC relative to this Task Group's recommendations. The substantiation of this proposal is as follows.
The term "Effectively Grounded" is used 29 times in the NEC. It appears as though in the majority of the locations where it is used, the word "grounded" or phrase "connected to an equipment grounding conductor" could be used. Other proposals are submitted to make those changes.
The 1996 NEC in Section 250.51 used the term "effective grounding path," and those concepts were incorporated in 250.2 (1999 NEC) and then expanded in 250.4(A) and (B) in the 2002 NEC. The performance criteria of grounding and bonding are currently provided in Section 250.4 and include the concepts contained in the vague definition of the term "effectively grounded."
The definition "Effectively Grounded" is very subjective and without any defined values or parameters for one to judge grounding as either "effective" or "ineffective." "Effective" is described in Section 250.4(A) and (B), but it relates to the effective ground-fault current path as a performance criteria. Deleting the term in the NEC and the definition is logical because there are no definitive parameters for Code users to make a determination on what constitutes "effectively grounded." Systems are solidly grounded, grounded through a resistor or impedance, or ungrounded. Equipment (normally noncurrent-carrying metal parts are grounded where connected to an equipment grounding conductor.
This proposal is to change the term "Effectively Bonded" to just "Bonded" in each of the section where it is used. The term "Effectively Bonded" is currently not defined in the NEC.
The term "effectively bonded" is also used a few times in the NEC and is undefined. The same situation exists. There are no defined parameters for Code users to judges what the difference between "Effectively Bonded" and "Bonded" really is. Where the term appears in the NEC, it is revised to just "bonded" and still has the same meaning in each rule.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 9-18.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-95 Log #598 NEC-P09 **Final Action: Reject**
(404.9(B)(1))

Submitter: Robert D. Detter, Phoenix, AZ
Recommendation: Revise 404.9(B)(1) as follows:
The switch is mounted with metal screws to a <u>surface-mounted</u> metal box <u>with at least one of the insulating washers removed</u> or to a nonmetallic box with integral means for grounding devices.
Substantiation: This change would specify a more positive means for providing effective grounding of the snap switch to a metal enclosure. It would parallel a similar requirement for receptacles in 250.146(A). The current code seems to allow switches to be considered effectively grounded, even if there is no solid metal-to-metal contact with the enclosure (i.e., a flush mounted box that is recessed 1/4 in).
Panel Meeting Action: Reject
Panel Statement: The requirements for snap switches are different than those for receptacles, because the reach of a snap switch is essentially its faceplate, whereas the receptacle is an originating point for a quasi-branch circuit extension of indefinite length through a cord plugged into it while it is in use.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 9 Negative: 1
Ballot Not Returned: 1 de Vega, H.
Explanation of Negative:
BELISLE, R.: The requirements in 404.9(B) state that a switch shall be "effectively grounded".
The definition of effectively grounded in Article 100, states that it shall be sufficiently low impedance and have sufficient current carrying capacity to prevent the buildup of voltages that may result…
We have trouble believing that a switch mounted on a non-conductive surface, secured to a metal box that is recessed ¼", therefore not touching the switch, meets the requirements of "Effectively grounded". We realize that this requirement is not the same as the requirement for receptacles, but the terminology used in 404.9(B) does not make differentiate for the code user.
The use of the term "effectively grounded" needs to mean the same as it is described in article 100
We believe the requirement should apply to all switch mounting locations, not just surface mounted, as the submitter proposed. The proposal should have been "accepted in principle" after removal of the "surface mounted" requirement.

9-96 Log #2248 NEC-P09 **Final Action: Accept in Principle**
(404.9(B)(1))

Submitter: Joseph Penachio, Joe Penachio Electrician
Recommendation: Revise as follows:
(B) Grounding. Snap switches, including dimmer and similar control switches, shall be effectively grounded and shall provide a means to ground metal faceplates, whether or not a metal faceplate is installed. Snap switches shall be considered effectively grounded if either of the following conditions is met.
(1) The switch is mounted with metal screws to a metal box <u>or device extension, raised cover that is secured to the box with a minimum two 8/32 in. screws and is in direct metal to metal contact to the box,</u> or to a nonmetallic box with integral means for grounding devices.
(2) An equipment grounding conductor or equipment bonding jumper is connected to an equipment grounding termination of the snap switch.
Substantiation: A 4 in. square blank cover is not required to have a bonding jumper installed to ground it to the box because it is considered effectively grounded by being secured by two screws and having metal to metal contact between the box and the cover. In fact, there is more yoke contact to a raised cover than there is from a yoke to a handy box which is allowed as metal-to-metal contact. Being secured by two 8/32 in. screws the extension or raised cover are electrically and mechanically secure. Removing the cover with the switch on it does not pose any danger to a qualified person than if there were a jumper installed.
Panel Meeting Action: Accept in Principle
Revise 404.9(B)(1) as it is incorporated within Proposal 9-18 by adding the words "or metal cover" after the words "metal box" and before the words "that is connected to an equipment grounding conductor …"
The final text of 404.9(B)(1) will read as follows:
(1) The switch is mounted with metal screws to a metal box or metal cover that is connected to an equipment grounding conductor or to a nonmetallic box with integral means for connecting to an equipment grounding conductor.
Panel Statement: The panel action meets the objectives of the submitter, who correctly pointed out the absence of coverage for snap switches mounted in raised covers. As in the case of receptacles in raised covers, the requirements for snap switches are less severe than those for receptacles.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 9 Negative: 1
Ballot Not Returned: 1 de Vega, H.
Explanation of Negative:
BELISLE, R.: The proposed action and statement by the panel allows for switches mounted in raised industrial covers to be grounded via the cover, therefore exposing the electrician to a shock hazard when mounting screws become loose, the cover is removed to service the device, take test measurements, or other activities OSHA would allow while energized. Installation of a bonding jumper to the box from the device is a small request in exchange for a safe installation. See my statement for proposal 9- 95 also regarding the effective grounding of a switch.

9-97 Log #2778 NEC-P09 **Final Action: Reject**
(404.10(C) (New))

Submitter: Ted Smith, Ludvik Electric Co. / Rep. International Electrical Instructors & Students Assoc.
Recommendation: Add new text to read as follows:
404.10(C) Safeguarding of Termination Screws. <u>Switches shall be installed in a manner that protects the termination screws of the switch from accidental contact with persons or tools after installation.</u>
Substantiation: Switch cover plates are often removed during the construction phase for the purpose of wall finishing. The switches are very often energized at this phase of construction. The switch cover plates are often left off of the devices inadvertently for a period of time, until they are discovered and replaced. This circumstance causes a potential safety problem and exposes workers to possible electrical shock or arc blast. Requiring an approved method of covering the termination screws on the switch after installation will reduce this potential hazard.
Switches are also often times removed from their mountings during maintenance while in the energized state. This is not a recommended practice and power should be tuned off to the switch before its removal. However; we must recognize that some individuals will not take these necessary safety measures and will expose themselves to the risk of electrical shock or arc blast. Requiring a covering over the switch termination screws will reduce the potential of electrical shock and arc blast in these circumstances.
The required covering can be any of numerous methods and will be left up to the AHJ to determine its effectiveness. There is available an inexpensive UP listed plastic snap over cover that will meet these requirements completely in addition to other methods.
Panel Meeting Action: Reject
Panel Statement: All exposed terminals are required to be in an enclosure with covers and plates installed. This is a design option that can be addressed in the field where necessary. There is no technical substantiation to support the need for requirements to anticipate the level of misuse anticipated by the submitter.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.
Comment on Affirmative:
BELISLE, R.: The proposal listed a number of problems with which we concur to be of concern. The intent of the submitter may be met with the following text:
"404.10(C) Exposed Terminals. Switches shall be enclosed so that energized wiring terminals are not exposed to contact.
Exception: Switches with no exposed terminals shall be permitted to be energized for use in the final stages of construction where temporary wiring is removed as required by 590.3(D)".

9-98 Log #522 NEC-P09 **Final Action: Accept in Principle**
(404.12)

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read:
404.12 Grounding of Enclosures. Metal enclosures for switches or circuit breakers shall be grounded as specified in Article 250. Where nonmetallic enclosures are used with metal raceways or metal-armored cables, provision shall be made for grounding continuity. Except as covered in 404.9(B), Exception, nonmetallic boxes for switches shall be installed with a wiring method that provides or includes an equipment ground <u>ing conductor in accordance with 250.118</u> .
Substantiation: This proposal is intended as an editorial revision for clarification.
Panel Meeting Action: Accept in Principle
Panel Statement: CMP-9 concludes that it agrees with the submitter's intent.
See panel action and statement on Proposal 9-18.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.
Comment on Affirmative:
HARTWELL, F.: Specifically, the submitter and readers should review item 4 of the 13-part set of actions taken under Proposal 9-18.

9-99 Log #3162 NEC-P09 **Final Action: Reject**
(404.14(E))

Submitter: Wally Harris, Atlantic Inland Inspections
Recommendation: Add FPN as follows:
Dimmer switches may include instructions that reduce their rated wattage where installed in 2 gang or larger boxes.
Substantiation: Often times as an inspector, I see dimmer switches installed where the marked wattage rating is exceeded in ganged switch configurations. When telling contractors or other installers of the requirement most state that they never knew of the derating requirement for ganged installations. All too often instructions are not read, and at present the inspector has only 110.3(B) to refer to. By adding the proposed FPN time could be saved and knowledge imparted.
Panel Meeting Action: Reject
Panel Statement: CMP-9 refers the submitter to 110.3(B). The installer needs to follow the manufacturer's installation instructions.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

ARTICLE 406 — RECEPTACLES, CORD CONNECTORS, AND ATTACHMENT PLUGS (CAPS)

18-8 Log #1529 NEC-P18 **Final Action: Accept in Part**
(406, 410, 600, and 605)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Technical Correlating Committee Task Group on Grounding & Bonding for Comment.
Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Revise Articles 406, 410, 600, and 605 as described in the following, relative to the terms bonding and grounding.
406.2(D) Revise 406.2(D) to read as follows:
Isolated Ground Receptacles. Receptacles incorporating an isolated grounding <u>conductor</u> connection intended for the reduction of electrical noise (electromagnetic interference) as permitted in <u>250.146(D)</u> shall be identified by an orange triangle located on the face of the receptacle.
406.2(D)(1) Revise 406.2(D)(1) to read as follows:
Isolated Equipment Grounding Conductor Required. Receptacles so identified shall be used only with <u>equipment</u> grounding conductors that are isolated in accordance with <u>250.146(D)</u> .
406.3(B) Revise 406.3(B) to read as follows:
To Be Grounded. Receptacles and cord connectors that have <u>equipment</u> grounding <u>conductor</u> contacts shall have those contacts effectively grounded.
406.3(C) Revise 406.3(C) to read as follows:

Methods of Grounding. The equipment grounding conductor contacts of receptacles and cord connectors shall be grounded by connection to the equipment grounding conductor of the circuit supplying the receptacle or cord connector.

FPN: For installation requirements for the reduction of electrical noise, see 250.146(D) .

The branch-circuit wiring method shall include or provide an equipment-grounding conductor to which the equipment grounding conductor contacts of the receptacle or cord connector are connected.

FPN No. 1: See 250.118 for acceptable grounding means.

FPN No. 2: For extensions of existing branch circuits, see 250.130 .

406.3(D)(1) Revise 406.3(D)(1) to read as follows:

Grounding-Type Receptacles. Where a grounding means exists in the receptacle enclosure or ~~a~~ an equipment grounding conductor is installed in accordance with 250.130(C) , grounding-type receptacles shall be used and shall be connected to the equipment grounding conductor in accordance with 406.3(C) or 250.130(C) .

406.3(D)(3) Revise 406.3(D)(3) to read as follows:

Non–grounding-Type Receptacles. Where ~~grounding~~ attachment to an equipment grounding conductor ~~means~~ does not exist in the receptacle enclosure, the installation shall comply with (D)(3)(a), (D)(3)(b), or (D)(3)(c). …

406.9(B) Revise 406.9(B) to read as follows:

406.9 Grounding-Type Receptacles, Adapters, Cord Connectors, and Attachment Plugs.

(B) Grounding-Pole Identification. Grounding-type receptacles, adapters, cord connections, and attachment plugs shall have a means for connection of ~~a~~ an equipment grounding conductor to the grounding pole.

406.9(B)(3) Revise 406.9(B)(3) to read as follows:

A similar green-colored connection device, in the case of adapters. The grounding terminal of a grounding adapter shall be a green-colored rigid ear, lug, or similar device. The equipment grounding connection shall be so designed that it cannot make contact with current-carrying parts of the receptacle, adapter, or attachment plug. The adapter shall be polarized.

406.9(B)(4) Revise 406.9(B)(4) to read as follows:

If the terminal for the equipment grounding conductor is not visible, the conductor entrance hole shall be marked with the word *green* or *ground* , the letters *G* or *GR* , a grounding symbol, or otherwise identified by a distinctive green color. If the terminal for the equipment grounding conductor is readily removable, the area adjacent to the terminal shall be similarly marked.

FPN: See FPN Figure 406.9(B)(4) .

406.9(D) Revise 406.9(D) to read as follows:

Grounding-Pole Requirements. Grounding-type attachment plugs and mating cord connectors and receptacles shall be designed such that the equipment grounding connection is made before the current-carrying connections. Grounding-type devices shall be so designed that grounding poles of attachment plugs cannot be brought into contact with current-carrying parts of receptacles or cord connectors.

410.15(B)(3) Revise 410.15(B)(3) to read as follows:

A metal pole shall be provided with ~~a~~ an equipment grounding terminal as follows:

a. A pole with a handhole shall have the equipment grounding terminal accessible from the handhole.

b. A pole with a hinged base shall have the equipment grounding terminal accessible within the base.

410.15(B)(4)Revise 410.15(B)(4) to read as follows:

A metal pole with a hinged base shall have the hinged base and pole ~~bonded together~~ connected to the equipment grounding conductor .

410.18(A) Revise 410.18(A) to read as follows:

Exposed Conductive Parts. Exposed metal parts shall be ~~grounded~~ connected to an equipment grounding conductor or insulated from ~~ground~~ the equipment grounding conductor and other conducting surfaces or be inaccessible to unqualified personnel. Lamp tie wires, mounting screws, clips, and decorative bands on glass spaced at least 38 mm (1 in.) from lamp terminals shall not be required to be grounded.

410.18(B) Revise 410.18(B) to read as follows:

Made of Insulating Material. Luminaires (fixtures) directly wired or attached to outlets supplied by a wiring method that does not provide a ready means for grounding attachment to an equipment grounding conductor shall be made of insulating material and shall have no exposed conductive parts.

410.18(B) Exception No. 1: Revise 410.18(B) Exception No. 1 to read as follows:

Exception No. 1: Replacement luminaires (fixtures) shall be permitted to connect an equipment grounding conductor from the outlet in compliance with 250.130(C). The luminaire (fixture) shall then ~~be grounded in accordance~~ comply with 410.18(A).

410.21 Revise 410.21 to read as follows:

Luminaires (fixtures) and equipment shall be ~~considered grounded where~~ mechanically connected to an equipment grounding conductor as specified in 250.118 and sized in accordance with 250.122.

410.45 Revise 410.45 to read as follows:

All wiring shall be free from short circuits and ~~grounds~~ ground faults and shall be tested for these defects prior to being connected to the circuit.

410.101(D) Revise 410.101(D) to read as follows:

Fittings identified for use on lighting track shall be designed specifically for the track on which they are to be installed. They shall be securely fastened to the track, shall maintain polarization and ~~grounding~~ connections to the equipment grounding conductor , and shall be designed to be suspended directly from the track.

600.7 Revise 600.7 to read as follows:

Grounding Signs and metal equipment of outline lighting systems shall be ~~grounded~~ connected to an equipment grounding conductor .

600.7(A) Revise 600.7(A) to read as follows:

(A) Flexible Metal Conduit Length Listed flexible metal conduit or listed liquidtight flexible metal conduit that encloses the secondary circuit conductor from a transformer or power supply for use with electric discharge tubing shall be permitted as a ~~bonding means~~ the equipment grounding conductor if the total accumulative length of the conduit in the secondary circuit does not exceed 30 m (100 ft).

600.7(B) Revise 600.7(B) to read as follows:

(B) Small Metal Parts Small metal parts not exceeding 50 mm (2 in.) in any dimension, not likely to be energized, and spaced at least 19 mm (3/ 4 in.) from neon tubing shall not require ~~bonding.~~ a connection to an equipment grounding conductor .

600.7(C) Revise 600.7(C) to read as follows:

(C) Nonmetallic Conduit Where listed nonmetallic conduit is used to enclose the secondary circuit conductor from a transformer or power supply and a ~~bonding~~ equipment grounding conductor is required, the ~~bonding~~ equipment grounding conductor shall be installed separate and remote from the nonmetallic conduit and be spaced at least 38 mm (1 1/ 2 in.) from the conduit when the circuit is operated at 100 Hz or less or 45 mm (1 3/ 4 in.) when the circuit is operated at over 100 Hz.

600.7(D) Revise 600.7(D) to read as follows:

(D) ~~Bonding~~ Equipment Grounding Conductors. ~~Bonding~~ Equipment Grounding conductors shall be copper and not smaller than 14 AWG.

600.32(4) Revise 600.32(4) to read as follows:

Spacing from ~~Ground~~ Grounded Parts . Other than at the location of connection to a metal enclosure or sign body, nonmetallic conduit or flexible nonmetallic conduit shall be spaced no less than 38 mm (1 in.) from grounded or bonded parts when the conduit contains a conductor operating at 100 Hz or less, and shall be spaced no less than 45 mm (1 in.) from grounded or bonded parts when the conduit contains a conductor operating at more than 100 Hz.

605.4(1) Revise 605.4(1) to read as follows:

The cord is extra-hard usage type with 12 AWG or larger conductors, with an insulated equipment grounding conductor.

Substantiation: 406.2(D): The word "conductor" was added to more specifically describe the conductor and grounding path being referred to in this section.

406.2(D)(1): The word "equipment" was added to more specifically describe the conductor and grounding path being referred to in this section.

406.3(B): The word "equipment" and "conductor" was added to more specifically describe the contacts grounding path being referred to in this section. This change leaves no room for confusion over the intended use of the equipment grounding conductor.

406.3(C): The word "equipment" and "conductor" was added to more specifically describe the contacts grounding path being referred to in this section. This change leaves no room for confusion over the intended use of the equipment grounding conductor.

406.3(C)(1): The word "equipment" was added to more specifically describe the grounding path being referred to in this section.

406.3(C)(3): The wording "attachment to an equipment grounding conductor" is more consistent with the proposed definitions of ground and grounding than the wording "grounding connection" The wording was changed to more prescriptively specify the path being referred to in this subsection. Grounding means is determined by attachment to equipment grounding conductor.

406.9(B): The word "equipment" was added to more specifically describe the grounding path being referred to in this section.

406.9(B)(3): The word "equipment" was added to more specifically describe the grounding path being referred to in this section.

406.9(B)(4): The word "equipment" was added to more specifically describe the grounding path being referred to in this section.

406.9(D): The word "equipment" was added to more specifically describe the grounding path being referred to in this section.

410.15(B)(3): The word "equipment" was added to more specifically describe the grounding path being referred to in this section.

410.15(B)(4): Wording was changed to specifically describe the intended connection to ground.

410.18(A): The wording was changed to specifically describe the grounding connection. The use of equipment grounding conductor accurately describes the intentional connection to ground.

410.18(B): The wording was changed to specifically describe the grounding connection. The use of equipment grounding conductor accurately describes the intentional connection to ground.

410.18(B) Exception No. 1: Wording was remove to simplify the exception. If the connection complies with 410.18(A) there is no need here to specify grounding.

410.21: The use of "equipment grounding conductor" accurately describes a grounding connection without further explanation.

410.45: The use of "ground faults" more accurately describes the fault condition tested.

410.101(D): Using the wording "connections to the equipment grounding conductor" accurately describes the intentional connection to ground.

600.7: Using the wording "connected to an equipment grounding conductor" accurately describes the intentional connection to ground.

600.7(A): The use of "the equipment grounding conductor" accurately describes the intended grounding objective.

600.7(B): The use of "the equipment grounding conductor" accurately describes the intended grounding objective.

600.7(C): The use of "equipment grounding" accurately describes the intended grounding objective.

600.7(D): The use of "equipment grounding" accurately describes the intended grounding objective.

600.32(4): The use of "Grounded Parts" accurately describes the intended NEC requirement.

605.4(1): The wording was changed to specifically describe the insulated grounding connection. The use of equipment grounding conductor accurately describes the intentional connection to ground.

This is the result of the TCC Task Group on Grounding and Bonding in resolve of the 2005 NEC cycle actions related to Proposal 5-1 and Comment 5-1 as directed by the Technical Correlating Committee. This is a companion proposal to the proposed revision to the terms "bonded", "grounded", and "equipment grounding conductor" in Article 100 relative to this Task Group's recommendations. These changes clarify the present requirement in more prescriptive language.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Part

Revise Articles 406, 410, 600, and 605 as described in the following, relative to the terms bonding and grounding.

406.2(D) Revise 406.2(D) to read as follows:

Isolated Ground Receptacles. Receptacles incorporating an isolated grounding conductor connection intended for the reduction of electrical noise (electromagnetic interference) as permitted in 250.146(D) shall be identified by an orange triangle located on the face of the receptacle.

406.2(D)(1) Revise 406.2(D)(1) to read as follows:

Isolated Equipment Grounding Conductor Required. Receptacles so identified shall be used only with equipment grounding conductors that are isolated in accordance with 250.146(D) .

406.3(B) Revise 406.3(B) to read as follows:

To Be Grounded. Receptacles and cord connectors that have equipment grounding conductor contacts shall have those contacts effectively grounded.

406.3(C) Revise 406.3(C) to read as follows:

Methods of Grounding. The equipment grounding conductor contacts of receptacles and cord connectors shall be grounded by connection to the equipment grounding conductor of the circuit supplying the receptacle or cord connector.

FPN: For installation requirements for the reduction of electrical noise, see 250.146(D) .

The branch-circuit wiring method shall include or provide an equipment-grounding conductor to which the equipment grounding conductor contacts of the receptacle or cord connector are connected.

FPN No. 1: See 250.118 for acceptable grounding means.

FPN No. 2: For extensions of existing branch circuits, see 250.130 .

406.3(D)(1) Revise 406.3(D)(1) to read as follows:

Grounding-Type Receptacles. Where a grounding means exists in the receptacle enclosure or ~~a~~ an equipment grounding conductor is installed in accordance with 250.130(C) , grounding-type receptacles shall be used and shall be connected to the equipment grounding conductor in accordance with 406.3(C) or 250.130(C) .

406.3(C)(3) Revise 406.3(C)(3) to read as follows:

Non–grounding-Type Receptacles. Where ~~grounding~~ attachment to an equipment grounding conductor ~~means~~ does not exist in the receptacle enclosure, the installation shall comply with (D)(3)(a), (D)(3)(b), or (D)(3)(c). …

406.9(B) Revise 406.9(B) to read as follows:

406.9 Grounding-Type Receptacles, Adapters, Cord Connectors, and Attachment Plugs.

(B) Grounding-Pole Identification. Grounding-type receptacles, adapters, cord connections, and attachment plugs shall have a means for connection of ~~a~~ an equipment grounding conductor to the grounding pole.

406.9(B)(3) Revise 406.9(B)(3) to read as follows:

A similar green-colored connection device, in the case of adapters. The grounding terminal of a grounding adapter shall be a green-colored rigid ear, lug, or similar device. The equipment grounding connection shall be so designed that it cannot make contact with current-carrying parts of the receptacle, adapter, or attachment plug. The adapter shall be polarized.

406.9(B)(4) Revise 406.9(B)(4) to read as follows:

If the terminal for the equipment grounding conductor is not visible, the conductor entrance hole shall be marked with the word *green* or *ground* , the letters *G* or *GR* , a grounding symbol, or otherwise identified by a distinctive green color. If the terminal for the equipment grounding conductor is readily removable, the area adjacent to the terminal shall be similarly marked.

FPN: See FPN Figure 406.9(B)(4) .

406.9(D) Revise 406.9(D) to read as follows:

Grounding-Pole Requirements. Grounding-type attachment plugs and mating cord connectors and receptacles shall be designed such that the equipment grounding connection is made before the current-carrying connections. Grounding-type devices shall be so designed that grounding poles of attachment plugs cannot be brought into contact with current-carrying parts of receptacles or cord connectors.

410.15(B)(3) Revise 410.15(B)(3) to read as follows:

A metal pole shall be provided with ~~a~~ an equipment grounding terminal as follows:

a. A pole with a handhole shall have the equipment grounding terminal accessible from the handhole.

b. A pole with a hinged base shall have the equipment grounding terminal accessible within the base.

410.18(A) Revise 410.18(A) to read as follows:

Exposed Conductive Parts. Exposed metal parts shall be ~~grounded~~ connected to an equipment grounding conductor or insulated from ~~ground~~ the equipment grounding conductor and other conducting surfaces or be inaccessible to unqualified personnel. Lamp tie wires, mounting screws, clips, and decorative bands on glass spaced at least 38 mm (1 in.) from lamp terminals shall not be required to be grounded.

410.18(B) Revise 410.18(B) to read as follows:

Made of Insulating Material. Luminaires (fixtures) directly wired or attached to outlets supplied by a wiring method that does not provide a ready means for grounding attachment to an equipment grounding conductor shall be made of insulating material and shall have no exposed conductive parts.

410.18(B) Exception No. 1: Revise 410.18(B) Exception No. 1 to read as follows:

Exception No. 1: Replacement luminaires (fixtures) shall be permitted to connect an equipment grounding conductor from the outlet in compliance with 250.130(C). The luminaire (fixture) shall then ~~be grounded in accordance~~ comply with 410.18(A).

410.21 Revise 410.21 to read as follows:

Luminaires (fixtures) and equipment shall be ~~considered grounded where~~ mechanically connected to an equipment grounding conductor as specified in 250.118 and sized in accordance with 250.122.

410.45 Revise 410.45 to read as follows:

All wiring shall be free from short circuits and ~~grounds~~ ground faults and shall be tested for these defects prior to being connected to the circuit.

410.101(D) Revise 410.101(D) to read as follows:

Fittings identified for use on lighting track shall be designed specifically for the track on which they are to be installed. They shall be securely fastened to the track, shall maintain polarization and ~~grounding~~ connections to the equipment grounding conductor , and shall be designed to be suspended directly from the track.

600.7 Revise 600.7 to read as follows:

Grounding Signs and metal equipment of outline lighting systems shall be ~~grounded~~ connected to an equipment grounding conductor .

600.32(4) Revise 600.32(4) to read as follows:

Spacing from ~~Ground~~ Grounded Parts . Other than at the location of connection to a metal enclosure or sign body, nonmetallic conduit or flexible nonmetallic conduit shall be spaced no less than 38 mm (1 in.) from grounded or bonded parts when the conduit contains a conductor operating at 100 Hz or less, and shall be spaced no less than 45 mm (1 in.) from grounded or bonded parts when the conduit contains a conductor operating at more than 100 Hz.

605.4(1) Revise 605.4(1) to read as follows:

The cord is extra-hard usage type with 12 AWG or larger conductors, with an insulated equipment grounding conductor.

Panel Statement: The changes in Section 600.7(A) through (D) were not accepted because they did not appropriately differentiate between bonding on the secondary side of the power supply or transformer on the neon sign and equipment grounding. Also, the changes in Section 410.15(B)(4) were not accepted because bonding is the correct term.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

ARTICLE 406 — RECEPTACLES, CORD CONNECTORS, AND ATTACHMENT PLUGS (CAPS)

18-9 Log #420d NEC-P18 **Final Action: Reject**
(406.2(C))

Submitter: John Brouzakis, John's Electric

Recommendation: Discontinue use of all aluminum and copper clad wire in homes, business, and industry. Discontinue using aluminum bus bars in breaker panels and MCC panels. Aluminum and copper clad wire and bus bars are still being used in homes, business and industry.

Substantiation: I've seen aluminum or copper clad wire connections to 240 volt a.c. circuits such as on ranges, dryers and other circuits become loose or corroded and start arcing and burn the wire.

Some breaker panels in basements with aluminum bus bars corrode and start arcing where the breaker plugs into the bus bar. On one job, I had to remove all the breakers, clean the bus bar and replace some of the breakers.

These are just a couple of problems that I experienced with people using AL or copper clad wire and panels with AL bus bars. These situations could have turned into electrical fires with loss of life and property. I believe only copper wire and bus bars should be used in homes, buildings and industry.

When I see AL or copper clad wiring inside a home, I tell the owner it should be replaced with copper. I would appreciate it if you discontinue the usage of aluminum and copper clad wire inside homes, business and industry in your next code.

Panel Meeting Action: Reject

Panel Statement: CMP 18 does not have jurisdiction over whether or not to permit the use of aluminum or copper clad aluminum as a conductor.

However, even if another CMP should decide to prohibit such use, CMP 18 would continue to include the requirements in 406.2(C) because replacement receptacles would be required to be installed on all legacy installations of such conductors and 406.2(C) contains appropriate requirements for such installations and the substantiation did not address this issue.

Further, CMP 18 refers the submitter to the 2005 Directory on the NFPA website and specifically to the Regulations Governing Committee Projects, Section 4-3.3, requiring that proposals include proposed text.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

18-10 Log #1997 NEC-P18 **Final Action: Reject**
(406.2(D))

Submitter: Robert Schuerger, EYP Mission Critical Facilities, Inc.

Recommendation: Revise as follows:

406.2(D) ~~Isolated~~ <u>Insulated Grounding</u> Receptacles. Receptacles incorporating ~~an isolated~~ grounding connection <u>purposely insulated from the receptacle mounting means</u> , intended for the reduction...

(1) ~~Isolated~~ <u>Insulated</u> Equipment Grounding Conductor Required. Receptacles so identified shall be used only with grounding conductors that are ~~isolated~~ <u>insulated</u> in accordance with 250.146(D).

(2) Installation in Nonmetallic Boxes. ~~Isolated~~ <u>Insulated</u> grounding receptacles installed in nonmetallic boxes shall be covered with a nonmetallic faceplate.

Exception: Where an ~~isolated~~ <u>insulated</u> ground receptacle is installed in a nonmetallic box, a metal faceplate shall be permitted if the box contains a feature or accessory that permits the effective grounding of the faceplate.

Substantiation: The use of the term “isolated” has caused confusion which has led to improper and unsafe installations in which a separate grounding electrode and grounding system is installed isolated from the rest of the grounding system of the building. Since the separate grounding system is not properly bonded to the grounding system of the building, a hazardous voltage can be developed between the two grounding systems by an electrical fault or lightning strike.

There have been many cases of this type of installation in the past, with data procession equipment, machine tools and other sensitive electronic equipment. The 2005 edition of IEEE Standard 1100, <u>Recommended Practice for Powering and Grounding Electronic Equipment</u> has “insulated ground receptacle” as the recommended terminology and has recommended the “isolated ground” and “isolated ground receptacle” be avoided.

Panel Meeting Action: Reject

Panel Statement: The requirements of 250.146 are very clear regarding the use of isolated equipment grounding conductors. The panel is not convinced by the substantiation that changing the term “isolated” to “insulated” would correct the problem identified by the submitter and can possibly result in additional misapplication. The basic requirement is in 250.146 and four alternatives are given in 250.146(A) through (D). Section 250 146(D), which covers “isolated receptacles,” is likewise clear that the insulated equipment grounding conductor may be terminated at a panelboard or pass through the panelboard(s) to terminate at the equipment grounding terminal of the applicable derived system or service. Nowhere is it permitted to connect to another grounding electrode. Changing the term for these receptacles from “isolated” to “insulated” would not prevent installers from incorrectly installing the device, but the change may confuse those who are following the Code and installing them correctly.

Ballot Results: Affirmative: 12

18-11 Log #2279 NEC-P18 **Final Action: Reject**
(406.2(E))

Submitter: Bob Boutin, BE Safe Consultants, Inc.

Recommendation: Add new text to read:

There should be an enhancement to current outlets that would allow them to detect any situation where an appliance is pulling more current than is safe for that specific appliance. Once detected, the outlet would shut off the power to the outlet.

Substantiation: Electrical outlets should be designed to detect if an appliance plugged into the outlet is drawing more current than the appliance is intended to receive. If the outlet senses this overage, the power source should be interrupted. This threshold should be variable, and much more sensitive than circuit breakers currently in homes. Even a relatively small amount of excess current running through an appliance cord (either through an overload situation, arching, or other dangerous conditions) could result in a hazardous situation.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 18-13.

Ballot Results: Affirmative: 12

18-12 Log #2314 NEC-P18 **Final Action: Reject**
(406.2(E))

Submitter: Mike George, Township of Wilmot

Recommendation: Recommended new wording:

All receptacles shall incorporate Overload Fault Interrupter electrical fire protection.

All residential and commercial structures should incorporate Overload Fault Interrupter technology in all electrical receptacles as a basic standard for electrical fire protection. An Overload Fault Interrupter should be located within an electrical outlet and connects electricity only to valid appliances and disconnects electricity when it detects an electrical overload fault.

Substantiation: The Council of Canadian Fire Marshals and Fire Commissioners and the National Fire Protection Association have published reports on the incidents of fires that indicate that a large portion of fires are caused by electrical appliances. Many of these fires could be prevented. In addition to the reported evidence, my personal experience with fire suppression and prevention spans 32 years, with 30 years in the fire department of the University City of Waterloo and 2 years in the small town of Baden. The last 17 years, I have served as Fire Prevention Officer or Chief Fire Prevention Officer and I am a certified Fire and Explosion Investigator by the National Association of Fire Investigators. <u>Based upon my experiences investigating the sources of fires, I believe that the Overload Fault Interrupter technology can prevent a large number of fires and save many lives.</u>

Many of the electrical fires in my jurisdiction have started in appliances and other devices such as battery chargers, coffee makers, toaster ovens, toasters, fans, motors and air conditioners. The recent widespread use of countertop appliances in the kitchen has increased the percentage of electrically caused fires over 30 years ago. These electrical appliance fires have occurred in residential construction, mobile homes and industrial buildings.

In my 32 years of experience, approximately 25 percent of all the fires I have investigated have been caused by electrical faults. As an investigator, I use the burn pattern to locate the fire source. Many structures have so much fire damage that the cause cannot be proven. Therefore, many of these electrically caused fires must be reported under the source category of “undetermined”.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

18-13 Log #3562 NEC-P18 **Final Action: Reject**
(406.2(E))

Submitter: Scott Tegler, City of Woodstock

Recommendation: Recommended new wording:

“All receptacles shall incorporate Overload Fault Circuit Interrupter protection.”

All residential and commercial structures should incorporate Overload Fault Circuit Interrupter (OFCI) technology in all electrical receptacles as a basic standard for electrical fire protection. The term OFCI refers to a type of circuit interrupter or disconnect device that activates upon detection of an electrical current overload condition in an electrical device (appliance, power supply, cord) that could elevate wire temperatures high enough to initiate a fire in close-proximity flammables.

This OFCI technology should be implemented in electrical receptacles to be able to detect faults in plugged-in electrical devices. The OFCI should continuously measure the actual current draw and compare it to the normal current draw levels for the device. If the load current exceeds an upper limit for a period of time long enough to overheat the wires, it should disconnect the line voltage from the branch circuit to the associated receptacle plug.

Since some appliances such as refrigerators and coffee makers have two normal operating current levels, the OFCI implementation should have a basic overcurrent trip level, and a second higher trip level with a maximum duration limit. For example, a refrigerator has both a normal cooling mode and a defrost mode. The cooling mode runs an electric motor that drives a refrigerant pump. The defrost mode runs an electric heater element at a significantly higher current draw, but for a limited time. The manufacturer may invoke the defrost mode on an interval or on a condition, based upon the design. With properly selected threshold and duration limits, the OFCI protection would trip on an overheating pump motor condition but not trip on the normal defrost mode current. For a second example, a coffee maker toggles its heating element between on and off in a different duty cycle based upon its mode. Thus, the OFCI protection would trip when the power-on condition continues past a maximum duration time determined by the appliance manufacturer. Due to the complexity of our modern appliances, simple fusing of each appliance is not adequate protection to prevent fires in many cases.

The OFCI trip threshold conditions must match the device plugged into that receptacle. Each receptacle must trip independently for maximum protection. For example, an OFCI protected dual-receptacle outlet should independently detect and disconnect an overload condition in either a 50W wall-mount power supply for a cellular phone (0.5 Amp) plugged into one receptacle or in a 1200W heater (10A) plugged into the other receptacle. Furthermore, each OFCI receptacle must adjust its own trip thresholds and durations automatically to match the characteristics of the electrical device plugged into the receptacle. The electrical device cord-set plug should be encoded with trip-condition data such that the data can be read by detection circuitry in the associated OFCI receptacle. This communication should be adequately robust to withstand reasonable abuse and harsh environmental conditions. For this reason, a non-contact communcation method should be used to transfer the data between the device plug and receptacle.

Substantiation: According to the report "Fire loses in Canada Annual Report, 2001" published by the Council of Canadian Fire Marshals and Fire Commissioners, Canada experiences over 7,400 reported electrical fires each year caused by electrical distribution equipment, appliances and other electronic devices. Of course, with a higher population the US experiences more of these fires. According to the NFPA report "The U.S. Home Product Reports: Appliances and Equipment", by Rohr D. Kimberly of the Fire Analysis and Research Division of NFPA (published in January 2002), between 1994 and 1998, the United States experienced 62,400 reported electrically induced fires per year. Furthermore, these numbers could be understated in two ways.

First, many electrically caused fires cannot be accurately categorized by the fire analysis team. In our city of Woodstock, I have found that over the past 4 1/2 years of investigating we have not had any fire that was able to be conclusively determined to be an electrica; and or electrical equipment fault fire, but that possibility has been a major factor in most of the large loss fires we have experienced. In all, approximately 5 of the 24 major incidents investigated since 2002 have the possibility of being electrically started. With twenty (20) years of firefighting experience, I would say there are many other incidents that most likely wouldn't have been reported (outlets arcing, melting, etc.) because of the reporting protocols and lack of conclusive evidence, therefore, defaulting to undetermined incidents.

The following data is from the Ontario Fire Marshall indicating the number of fires attributed to electrical equipment by year (last 5 years) in the province of Ontario:

2000 - 1082 fires resulting in 40 injuries and 2 deaths, 564 were residential fires

2001 -1221 fires resulting in 38 injuries and 4 deaths, 613 were residential fires

2002 - 1164 fires resulting in 37 injuries and 2 deaths, 635 were residential fires

2003 - 1193 fires resulting in 49 injuries and 2 deaths, 589 were residential fires

2004 - 973 fires resulting in 63 injuries and 0 deaths, 543 were residential fires.

Second, the number of unreported fires dwarfs the number of reported fires. The U.S. Consumer Product Safety Commission, in its 1988 report "Residential Electrical Distribution System Fires", estimates a further 890,000 unreported U.S. electrical fires every year. Using the US-Canada reported fire ratio of 8 to 1, we can estimate that Canada experiences over approximately 111,250 unreported electrically-caused fires, suggesting the total number of electrically-caused house fires in North America could be as high as a million per year.

A majority of these fires are caused by electrical overload faults and overload associated electrical device malfunctions, such as device misuse, device abuse, natural wear and tear, and part breakage. According to Kim Rohr's US report and the "Fire Losses in Canada" report, these fires cause up to 415 deaths (24 in Canada and 391 in the U.S.), 2,226 injuries (325 in Canada and 1,901 in the U.S.) and nearly $1,000,000,000 in direct property loss ($228 million in Canada and approximately $741 million in the U.S.). Indisputably, electrical devices cause too many fires, financial loss, injuries and death. The problems should be addressed as soon as possible by prevention.

OFCI protection could dramatically reduce the loss of life, injury and property each year in North America.

Presently, neither the U.S. nor Canadaian electric codes describe or require a solution to this problem. Circuit breakers and fuse panels protect in-wall wiring against overloads and arcing. However, they cannot adequately protect against fires caused by small appliances and cord overloads. Many electrical devices have 16, 18, 20 and 22 gauge wires inside. The smaller wires can overheat without tripping a 15 Amp circuit breaker. Improper replacement of circuit breakers further weakens protection against electrical device overloads. We have found that homeowners occasionally will replace 15A breakers with 20A or 30A breakers or short out a fuse with a penny on a circuit rated to handle only 15A of current to avoid nuisance tripping on that circuit.

Panel Meeting Action: Reject

Panel Statement: The Panel rejects this proposal for a number of reasons:

1. The proposal does not comply with NFPA Regulations Governing Committee Projects or the NEC Manual of Style (both available to the submitter on the NFPA web site) in that the text provided does not comply with the Manual of Style, for example the use of the word "should".

2. There is nothing in the current edition of the NEC that prohibits such a receptacle. The substantiation raises questions as to its specific applicability to the proposal. Over the past several code cycles, much of the same incident data has been used to support AFCI proposals indicating that the incidents are the result of arcing faults on the interior wiring. The last code cycle, this data was used to support a thermally protected receptacle indicating that the incidents resulted from overheated receptacle contacts or terminals. Now the claim is that the incidents are resulting from electrical overload of connected utilization equipment.

An authoritative clear and unambiguous analysis of the data is necessary to clearly identify the cause of these incidents. Failure to specifically identify cause leads to redundant solutions or, worse solving the wrong problem.

3. This appears to be a proposal that would recommend a "theoretical" product. CMP 18 is not aware of any such product on the market. Nor is CMP 18 aware of any standards or fact finding report covering such a product. Before considering a proposal such as this, CMP 18 would look for information from a standard or fact finding report dealing with performance characteristics such as (but not limited to) the following:

• Endurance
• Capacity to withstand overload and short circuit
• Ability to operate in normal and abnormal temperature ranges
• Ability to withstand surges
• Ability to withstand under-voltages
• Ability to withstand moisture / corrosive atmosphere
• Etc.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

18-14 Log #1542 NEC-P18 **Final Action: Accept**
(406.3(B))

Submitter: Technical Correlating Committee on National Electrical Code®,

Recommendation: Delete the term "effectively" from the terms "effectively grounded" and "effectively bonded" from Articles 406 and revise text as shown for the affected NEC sections.

406.3(B): (B) To Be Grounded. Receptacles and cord connectors that have grounding contacts shall have those contacts ~~effectively~~ connected to an equipment grounding conductor ~~grounded~~ .

Substantiation: 406.3(B): The definition is ambiguous and very subjective without any defined values or parameters for one to judge as either "effective" or "ineffective." This section has been revised to prescribe the connection to the equipment grounding conductor.

This is the result of the TCC Task Group on Grounding and Bonding in resolve of the 2005 NEC cycle actions related to Proposal 5-1 and Comment 5-1 as directed by the Technical Correlating Committee. This is a companion proposal to delete the term "grounded, effectively" and its definition from Article 100 and other companion proposals throughout the NEC relative to this Task Group's recommendations. The substantiation of this proposal is as follows.

The term "Effectively Grounded" is used 29 times in the NEC. It appears as though in the majority of the locations where it is used, the word "grounded" or phrase "connected to an equipment grounding conductor" could be used. Other proposals are submitted to make those changes.

The 1996 NEC in Section 250.51 used the term "effective grounding path," and those concepts were incorporated in 250.2 (1999 NEC) and then expanded in 250.4(A) and (B) in the 2002 NEC. The performance criteria of grounding and bonding are currently provided in Section 250.4 and include the concepts contained in the vague definition of the term "effectively grounded."

The definition "Effectively Grounded" is very subjective and without any defined values or parameters for one to judge grounding as either "effective" or "ineffective." "Effective" is described in Section 250.4(A) and (B), but it relates to the effective ground-fault current path as a performance criteria. Deleting the term in the NEC and the definition is logical because there are no definitive parameters for Code users to make a determination on what constitutes "effectively grounded." Systems are solidly grounded, grounded through a resistor or impedance, or ungrounded. Equipment (normally noncurrent-carrying metal parts are grounded where connected to an equipment grounding conductor.

This proposal is to change the term "Effectively Bonded" to just "Bonded" in each of the section where it is used. The term "Effectively Bonded" is currently not defined in the NEC.

The term "effectively bonded" is also used a few times in the NEC and is undefined. The same situation exists. There are no defined parameters for Code users to judges what the difference between "Effectively Bonded" and "Bonded" really is. Where the term appears in the NEC, it is revised to just "bonded" and still has the same meaning in each rule.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept

Panel Statement: The panel accepts that the new wording provides the needed clarity of the intent of this section.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

18-15 Log #2674 NEC-P18 **Final Action: Reject**
(406.3(B))

Submitter: Earl W. Roberts, Reptec

Recommendation: Add a new paragraph to 406.3(B) as follows:

Receptacle outlet circuit testers designed for use in 15A or 20A, 125V, 2P3W receptacles shall display a lighted warning signal when the equipment grounding terminal is energized at line voltage.

Substantiation: All the presently UL - listed receptacle outlet circuit testers give erroneous readings under conditions that have proven fatal to people in several known cases.

All of these testers have a light between the hot and grounded circuit conductor blades, that we will call Light 1, a light between hot and equipment grounding blades, that we will call Light 2, and a light between the grounded circuit conductor and the equipment grounding blades, that we will call Light 3.

Under a normal condition, Lights 1 and 2 would be lit and Light 3 would be off. It is noted that when two terminals are at the SAME voltage, whether zero or 120V, the light will be off. Also, these testers do not differentiate as to which terminal is energized, and which terminal is grounded.

406.3(D) of the 2005 NEC permits the replacement of two-wire receptacles by three-wire receptacles, when protected by GFCIs and properly labeled. It is now possible to have an entire old two-wire home with all three-wire receptacles, and NO equipment grounds.

Black and white wire transposition is a common occurrence in two-wire homes. Since both wires are totally insulated at 600v, the problems were insignificant. Now, the chances of serious shock conditions have greatly increased.

With reversed polarity and an intentional or unintentional connection between the white terminal and the equipment grounding terminal, the equipment grounding terminal is energized at 120V.

Under these conditions, the tester lights are the same as on a correct circuit.

We have built into several UL - listed outlet circuit testers electronic components that warns of this fatal condition. We believe that all of these testers should have this capability.

Panel Meeting Action: Reject

Panel Statement: The panel agrees that this concept identifies a set of multiple circumstances that can result in a safety hazard. However, the panel disagrees that requirements for usage of a device not permanetly connected to the premises wiring system belong in the NEC. The submitter is encouraged to address this issue through the UL 1436 STP.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

18-16 Log #1396 NEC-P18 **Final Action: Reject**
(406.3(D))

Submitter: George Stolz, II, Pierce, CO

Recommendation: Add new text to read:

(D) Replacement. Replacement of receptacles shall comply with 406.3(D)(1), (2), and (3) as applicable. <u>Receptacles installed to additions to existing branch circuits shall be considered replacements for the purpose of this section.</u>

Substantiation: The section in question (406.3(D)) effectively bends the standard requirements for new installations to provide relief for the installer when dealing with old work. Given the leniency put forth by this section regarding replacement receptacles, it appears that old 2-wire installations, while regrettable, do not present an “imminent danger to occupants” as stated in 80.5(B).

80.5(C) expresses that “Additions...shall not cause a building to become unsafe...”. By expressing explicit guidelines for additions to existing circuits, installers will be forbidden to connect an unbonded EGC between receptacles, decreasing the shock hazard in the event of an unbonded fault. In many cases, these existing circuits are extended to add receptacles to conform with 210.52. The elimination of extension cord use should carry nearly as much importance as EGC’s in this environment.

Panel Meeting Action: Reject

Panel Statement: Section 406.3(D) addresses the installation of replacement receptacles. This proposal addresses the installation of new receptacles. Therefore, this text does not apply to this section. The panel rejects the concept of adding new receptacles to an existing two-wire circuit and applying the provisions for replacement receptacles rules. Replacement receptacles rules are to increase the safety of older two-wire branch circuits where a replacement receptacle is desired. Section 406.3(D)(3) does not address the extension of existing two-wire circuits. The applicable rules for extending two-wire branch circuits are contained in Section 250.130(C) and require the extension to provide an equipment grounding conductor. The references to Sections 80.5(B) and 80.5(C) are now contained in Annex G of the 2005 NEC as 80.9(B) and (C). Annex G is not enforceable unless specifically adopted by local ordinance.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

18-17 Log #2779 NEC-P18 **Final Action: Reject**
(406.3(E))

Submitter: Ted Smith, Ludvik Electric Co. / Rep. International Electrical Instructors & Students Assoc.

Recommendation: Add new text to read as follows:

<u>406.3(E) Safeguarding of Termination Screws. Receptacle outlets shall be installed in a manner that protects the termination screws of the receptacle from accidental contact with persons and tools after installation.</u>

Substantiation: Receptacle cover plates are often removed during the construction phase for the purpose of wall finishing. The receptacles are very often energized at this phase of construction. The receptacle cover plates are often left off of the devices inadvertently for a period of time, until they are discovered and replaced. This circumstance causes a potential safety problem and exposes workers to possible electrical shock or arc blast. Requiring an approved method of covering the termination screws on the receptacle after installation will reduce this potential hazard.

Receptacles are also often times removed from their mounting during maintenance while in the energized state. This is not a recommended practice and power should be turned off to the receptacle before it is removed. However, we must recognize that some individuals will not take these necessary safety measures and will expose themselves to the risk of electrical shock or arc blast. Requiring a covering over the receptacle termination screws will reduce the potential of electrical shock and arc blast in these circumstances.

The required covering can be any of numerous methods available and will be left up to the AHJ to determine its effectiveness. There is available in inexpensive UL listed plastic snap over cover that will meet these requirements completely in addition to other methods.

Panel Meeting Action: Reject

Panel Statement: The substantiation cites a safety problem associated with energized receptacles without proper covers during part of the construction process. CMP 18 points out that this is a violation of Section 314.25 and 406.4(F). The proposal only addresses terminal screws. Other parts of receptacles such as break-off tabs, or terminals to which leads are welded could also be exposed.

The proposer’s substantiation indicates that the recommended practice is to turn off the power to the receptacle before the terminals are exposed. However, the proposer identifies the practice of removing the receptacle while the circuit is energized. The panel does not endorse this unsafe practice. It should be noted that failure to comply is a violation of the applicable OSHA regulations.

Finally, CMP 18 points out the vast range of receptacles is from a 3-wire, 15-ampere, 125-volt to a 5-wire, 60 to 100-ampere, 600-volt receptacles. Presently there are no UL listed snap covers suitable for this application as stated in the substantiation. Placing the responsibility on the AHJ for determining the suitability of the protection method selected to withstand the available voltage and other conditions that may be encountered is an unreasonable expectation.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

COSTELLO, P.: The submitter raises a valid concern in which an individual may be exposed to an electric shock or arc blast when a cover is not properly installed or has been removed for various reasons. The individual exposed is more than likely one that is not aware or has been trained in the hazards that exists in that condition. The submitter’s intent can possibly be met in a number of and variety of ways. The termination screws can be protected with listed products or devices that utilize leads permanently attached to the device. There are other devices that use a snap in connector that offers the level of protection the submitter stated.

Comment on Affirmative:

WELLS, J.: The panel listed a number of concerns with which I concur. What is not published or available for public comment is a suggested alternative proposed by IBEW that was also rejected by the panel. This proposal read as follows:

406.4 Receptacle Mounting.

(F) Exposed Terminals. Receptacles shall be enclosed so that live wiring terminals are not exposed to contact.

<u>Exception: Receptacles with no exposed terminals shall be permitted to be energized for use in the final stages of construction where temporary wiring is removed as required by 590.3(D). Where these receptacles are in use by persons in the final stages of construction, such use shall be in accordance with 590.6.</u>

While this proposal addresses a number of my concerns, in my mind the conflict it does not resolve is the NFPA 70B and OSHA requirements that circuits being worked on be de-energized, except under a very limited set of circumstances, such as when de-energizing would create a greater hazard. Permitting either the original proposal or the IBEW initiated alternative would, I fear encourage working circuits hot exposing workers to shock and arc hazards and employers to OSHA citations.

(Note: Sequence 8-18 was not used)

2-360a Log #427 NEC-P02 **Final Action: Reject**
(406.3(G) (New))

Submitter: Kenneth Wilee, Wilee Electric Inc.

Recommendation: Add new text as follows:

<u>GFCI devices shall be readily accessible.</u>

Substantiation: At times, GFCI devices (i.e., receptacles) are installed behind refrigeration equipment, under hydro-massage tubs and concealed by objects not easily moved. This creates certain inconvenience and possibly a hazard, depending on the load served. These tripped devices cannot be reset reasonably by some people. There is currently no provision to prohibit this in the NEC. I once had to use a broom handle behind a refrigerator.

Panel Meeting Action: Reject

Panel Statement: Requiring these devices to be readily accessible may prove overly restrictive in some cases. The submitter has not provided substantiation that there has been a compromise in safety, only an inconvenience in accessing the device.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

LAROCCA, R.: I do not agree with all of the material provided in the substantiation for Proposal 2-360a, however, I cannot support the Panel's action to reject this proposal.

The expected reliability level of GFCIs is based on the user testing them monthly as contained in the instructions and markings required by the listing. In order for the user to perform the monthly testing, the GFCI needs to be accessible to the user.

18-19 Log #1945 NEC-P18 **Final Action: Reject**

(406.4(D) Exception No. 2)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Recommendation: Delete the following text:

~~Exception No. 2: Listed nonmetallic faceplates that cover the receptacle face to a maximum of 1 mm (0.040 in.) shall be permitted.~~

Substantiation: The NEC serves a valuable purpose, which as stated in article 90.1(A) is, "The purpose of this Code is the practical safeguarding of persons and property from hazards arising from the use of electricity". The addition of article 406.4(D), Exception No.2 does not conform with the purpose of the Code because it does not offer any safeguarding against hazards arising from the use of electricity. As documented herein, it has the opposite effect because it introduces new hazards. Further, Exception No. 2 creates a conflict with article 406.5, which specifies that "receptacle faceplates shall be installed so as to completely cover the opening and seat against the mounting surface." The intent of article 406.5 is to prevent against an opening in the enclosed area to protect people from live electrical parts that would pose as a shock hazard if contacted. Exception No 2 would allow the introduction of products that, when used in conjunction with some existing receptacles in the electrical infrastructure, would **defeat** the requirement in article 406.5.

The introduction of Exception No. 2 to Article 406.4(D) goes against a Code requirement in place since 1971, requiring the full seating of a plug into a receptacle. It does not provide an enhancement in safety. Further, the text in Exception No. 2 results in a requirement that cannot be enforced by an AHJ as this allows a decorative product to be installed after initial inspection of the electrical system. This lack of control cannot assure that even the 0.040 inch spacer dimension is maintained due to numerous installation factors. The concerns outlined below over the 0.040 inch spacer were not presented to the Code Making Panel since the fact finding report used as technical substantiation to allow this was not submitted in time for public review. This important safety concern, particularly in light of the conflict with another NEC Article, establishes that the intent of the NEC is not being preserved by Exception No. 2. Exception No. 2 would represent an absolute minimum 0.040 inch reduction in plug blade/receptacle contact interaction, that would never be any less and can under the circumstances discussed herein be significantly worse.

IMPROPER PLUG BLADE ENGAGEMENT WITH RECEPTACLE CONTACTS

Exception No. 2 permits a faceplate of insulating material not exceeding 0.040 inches to completely cover the face of a receptacle. Prior to the adoption of this Exception, the NEC required that receptacles and their associated faceplates be installed so that the receptacle is flush with or projects through faceplates of insulating material. Exception No. 2 permits faceplates of insulating material to literally cover the receptacle face, thereby restricting the attachment plug blades from being fully inserted into the receptacle.

Introducing additional space between the receptacle contact and attachment plug can create a potential fire hazard by not allowing full insertion of the attachment plug, resulting in arcing and/or overheating of the receptacle. Hazardous effects of arcing in causing fires was recognized in the adoption of AFCI technology during the 2002 and 2005 Code cycles. Adoption of Exception No. 2 creates an undesirable condition that can introduce arcing in an installation.

It is important to recognize that since the introduction of grounding-type receptacles, literally billions of such receptacles have been installed in this country. There are many different designs of receptacle contacts, and the depth of contacts below the face of the receptacle varies significantly. Similarly, there are different designs of plugs and the length of the attachment plug blades varies by as much as 0.093 inches. In the design of receptacles, manufacturers consider the minimum and maximum length of attachment plug blades and accommodate such variation in determining the appropriate depth of the receptacle contacts.

Receptacle designs do not compensate for a 0.040 inch thickness of additional material interposed between the receptacle contacts and the attachment plug. None of the billions of installed receptacles were designed to take this condition into account. When the plug is mated with the receptacle, the plug blades may not be long enough to compensate for the additional material covering the face of the receptacle. The additional material allows an unanticipated standoff of the plug and can result in a teasing or intermittent condition between the plug blades and receptacle contacts which may produce arcing and overheating. (see two video clips which demonstrate arcing due to teasing of contacts at **http://www.nema.org/FILES/5wd/Teasing Contacts 1.avi** and **http://www.nema.org/FILES/5wd/Teasing Contacts 2.avi**)

This situation can be exacerbated by the use of heavier products, such as transformers, especially those with only two plug blades. Due to the weight of these products, the product has a tendency to "sag" and pull the plug blades out of the receptacle contacts. The plug blades used on these products are designed for full engagement with receptacle contacts. Locating additional material over the receptacle face serves to reduce the engagement of the plug blades and increases the likelihood that the product will "sag" away from the receptacle face, decreasing plug blade/receptacle engagement.

Installation variables can also affect engagement. The reality is that very few receptacles are indeed installed perfectly and the chances of an installation resulting in two to three times the 0.040 inch dimension are more likely than the dimension represented in Exception No. 2. (See photographs #1 through #5 below)

The overall effect of allowing 0.040 inches of material to cover the receptacle face is the same as permitting a plug to be designed with the minimum plug blade length reduced by 0.040 inches. This is unacceptable because receptacles are designed and listed to function properly with plug blades of the minimum specified length. Receptacles may not function as intended if there is any reduction in the plug blade/receptacle contact engagement.

Although it is impossible to assess the entire installed base of receptacles, NEMA is aware of existing designs that would reduce the plug blade penetration into the receptacle contact to a few thousandths of an inch when a 0.040 inch thick cover is installed over the receptacle. Illustration #1 below shows the effect of installing a 0.040 inch thick cover over the face of this receptacle. This illustration represents an actual production model receptacle and a plug with a minimum blade length.

Article 406.4(D) Exception No. 2 presents additional safety concerns. Although providing its intended decorative function, a coverplate can conceal a broken or obviously defective receptacle that should be replaced, or conceal a recessed receptacle installation such as shown in photograph #5. By concealing a broken, defective, or recessed receptacle, no one would be aware of these potentially hazardous conditions.

A receptacle, plug, and wallplate design is a carefully coordinated interface system which insures full and secure plug blade engagement with the receptacles contacts. Exception No. 2 defeats this safe interface.

UL/ANSI and ANSI/NEMA FACEPLATE STANDARDS PROHIBIT IMPROPER ENGAGEMENT

The importance of flush seating of the plug to the receptacle is recognized in two American National Standards - ANSI/UL 514D, Underwriters Laboratories "Standard for Cover Plates for Flush Mounted Wiring Devices", and ANSI/NEMA WD6, the National Electrical Manufacturers Association Standard for "Wiring Devices - Dimensional Specifications". UL 514D, Section 4.1.1 states, "A cover plate or outlet box hood that is used with a receptacle shall not hinder the complete seating of an attachment plug of the type intended for use with the receptacle." When this section was added to the standard, the UL listings of wallplates that interposed material between the plug and receptacle were withdrawn because the reduction in the interaction of plug blades and receptacle contacts effectively invalidates the "listing" of all receptacles.

ANSI/NEMA WD 6 states on page 1 that, "…decorative contours should not preclude the flush seating of a plug into a receptacle." It is evident that both of these standards recognize that there is a potentially unsafe condition created when flush seating of the plug into the receptacle is prevented by a cover.

The significance of insuring flush seating of the plug is also recognized in 406.4(D), but the recent adoption of Exception No. 2 overrides this important requirement. Exception No. 2 is clearly in conflict with both ANSI standards.

CONFLICTING REQUIREMENTS CAN LEAD TO INSTALLATIONS WHICH DO NOT COMPLY WITH THE NEC

406.5 requires faceplates to seat against the mounting surface. 406.4(D) Exception No. 2 permits a 0.040 inch thick cover. Due to varying depths from the bottom of the receptacle mounting yoke to the top face of the receptacle, the cover may not seat against the mounting surface as required by 406.5. Depending on the given cover and receptacle dimensions, installing a cover over the face of the receptacle may result in an installation that either does not comply with 406.5 or does not comply with 406.4(D). The overall depth of the faceplate must exactly match the dimension from the underside of the receptacle yoke to the face of the receptacle. If the depth of the faceplate is greater than the receptacle yoke to face dimension, then the face of the receptacle will not contact the inside surface of the cover. The gap between the receptacle face and the inside surface of the cover results in causing the plug to stand off from the receptacle to a dimension of greater than 0.040 inches, which in practice violates Exception No. 2. If the depth of the faceplate is less than the receptacle yoke to face dimension, then there will be a gap between the faceplate and the wall. These conditions are shown in photographs #6 through #9 and illustration #2 below. Therefore, installations complying with 406.4(D) Exception No. 2 and 406.5 must use covers and receptacles designed to be dimensionally compatible with each other. A single cover design cannot be used with all receptacles. Only a cover of this type that is an exact match with a receptacle will result in an installation that complies with the NEC. This is the receptacle/faceplate combination that is addressed by 406.4(D) Exception No. 1.

Take note that with consideration of certain variables in receptacle design, there can either be a significant gap between the receptacle face and the coverplate that allows arcing to occur, or a gap between the coverplate and the wall, creating a hazardous condition by exposing live parts.

FLAWS IN FACT FINDING REPORT PROVIDED TO CODE PANEL MEMBERS

As previously mentioned, part of the substantiation for Exception No. 2 in the 2005 Code cycle was a fact finding report provided to members of the Code Panel. Unfortunately, this fact finding report did not appear in the public record and could not be examined until after the Code Panel meeting. Review of this report revealed the following significant inadequacies in the testing used to validate the use of the 0.040 inch thick cover.

- The fact finding report evaluated only 4 currently available receptacle models and ignored the hundreds of models of receptacles that are currently installed and in use.
- The fact finding report used an attachment plug that was 1/16” longer than the minimum length permitted.
- The fact finding report did not take into consideration that many molded cords have reduced blade thickness at the tip of the blade.
- No attempt was made in the fact finding report to simulate use with old receptacles that may have abused receptacle contacts with reduced retention.
- The fact finding report erroneously claimed to simulate “end of life” of a receptacle by the laboratory controlled, mechanical insertion and removal of the attachment plug from a receptacle. Typically, end of life occurs in the real world as a result of the abusive yanking out of cords from severe angles thus separating the contacts and sometimes damaging the face.
- No attempt was made in the fact finding report to define the worst case of receptacle with the maximum contact recess, worn contacts or improper installation such that the receptacle does not fit flush with the wall surface.

The fact finding report presented to the Code Making Panel was used to justify that a 0.040 inch spacer over a receptacle would not have an adverse affect on the receptacle and plug interface performance. While the report may have concluded this, the testing to support this was **not** in accordance with the correct and long established test protocol used to evaluate receptacles for listing in the United States. Some key omissions or inaccuracies were the failure to use test gauges; not conducting tests without a ground pin; and not subjecting the products to the specified current level for the overload / resistance to arcing tests. All of these flawed test protocols cannot lead to any indication as to whether a 0.040 inch spacer over the face of a receptacle is compromised or not.

The testing conducted with a 3 wire plug with line blade lengths of 0.690 inches is not indicative of whether or not the retention ability of a receptacle is compromised. ANSI/UL 498 testing is done with line blade gauges of a length of 0.625 inches. The fact finding report’s testing diverging from this protocol produces a favorable condition over real world occurrences in two aspects. There are many products (appliances, transformers, etc.) that utilize two wire plugs. The fact finding report’s test protocol of using a three wire plug enhances the test performance for plug retention by having the ground pin included which increases the plug retention. Compound this with the fact that a longer length plug is used (0.690 versus 0.625 inches), the fact finding report discloses only favorable conditions to demonstrate that retention is not compromised by the introduction of a 0.040 inch spacer. It is essential to consider that the ANSI/UL Standards test protocols are based on actual permissible worst case conditions in the field, which is the allowable use of a plug with 0.625 inch blades. The fact finding report does not disclose permissible worst-case conditions in the field, described herein, which demonstrate that the retention of a plug can be compromised. Plug retention with receptacle contacts is a vital connection in the electrical infrastructure. Intermittent retention can result in arcing, which can lead to fires. The failure of the fact finding report to ascertain if the introduction of a 0.040 inch spacer would introduce this hazard is a serious flaw

The fact finding report failed to conduct the overload/resistance to arcing tests at the ANSI/UL 498 test current levels. The test current levels were established many decades ago and are used to evaluate all listed receptacles in the United States. Receptacle contacts and the product’s enclosure material can not be compromised when subjected to the specified test load (pre-determined value to simulate the aging of a receptacle over its life) that would result in a fire or shock hazard. The test current that is employed on 15 ampere receptacles is 22.5 amperes of D.C. current. The fact finding report’s test protocol was conducted using 11 amperes of current. Again, no conclusions can be reached as to how the introduction of a 0.040 inch spacer over the face of a receptacle would be affected since the testing current levels do not correlate. The fact finding report’s lower test current level was far below the value necessary to determine if a 0.040 inch spacer over the face of the receptacle meets the requirements of UL498.

The UL498 Resistance to Arcing test is conducted to insure that there will be not be any electrical tracking, formation of a carbon conductive path or sustained flaming of the receptacle face material. Exception No. 2 permits a faceplate to completely cover the receptacle face. The faceplate acts as the receptacle face and must comply with the same requirements used to evaluate the receptacle face material. The fact finding report was inadequate in determining the suitability of the cover faceplate material to perform at the same level as a receptacle face. Exception No. 1 to 406.4(D) that requires “Listed kits or assemblies” was adopted specifically to address that the safety performance level was assured even with decorative or functional coverplates.

There is no explanation in the fact finding report as to why more favorable testing conditions were used than what has been standard practice for the evaluation of receptacles. Hence, it would be impossible on these facts alone to draw any conclusion that the introduction of a 0.040 inch spacer over a receptacle would not have a detrimental effect.

It is also important to consider that these are only a couple of examples of where the fact finding report’s test protocol conflicted in a more favorable fashion than what is the long standing practice used to evaluate receptacles. Indeed, the testing in the fact finding report simulated favorable conditions, not “worst case”.

Most importantly, even if the test protocol were conducted in accordance with established standards, it would be impossible to evaluate or even anticipate the safety of all receptacle designs and installations that could potentially be used with a 0.040 inch cover. Exception No. 1 is the only method to ensure this.

As noted below, Underwriters Laboratories also determined that the fact finding report was flawed.

STANDARDS COUNCIL STATEMENT ACKNOWLEDGES TECHNICAL ARGUMENTS

During the July 14, 2004 NFPA Standards Council Meeting there was an appeal dealing with comment 18-12a, which is the comment that resulted in Exception No. 2. (Transcript of meeting provided separately, see transcript pages 156 – 230.) There was significant technical discussion that took place during this meeting that will be of interest to the Code Panel. During the hearing, Underwriters Laboratories provided a review of the technical work that was done in the past that resulted in development of the extensive test and evaluation program that insures full functional engagement between plugs and receptacles. UL commented that the cover plates that interposed material between the plug and receptacle were delisted because, “… there was no way, given the range of plug blades, the range of contact designs, the range receptacle designs, that we could be sure that the product out there was not going to cause a problem.” (page 192, lines 4 – 10 of the transcript.) UL also commented on the inadequacies of the fact finding report that was used to support adoption of Exception No. 2. (UL comments begin on page 186 of the transcript.)

The NFPA Standards Council September 22, 2004 final decision on the appeal included the following statement:

“In conclusion, the Council notes that the presentations to the Council during the appeal demonstrated that some disagreements remain on the technical issues involved in this appeal, and that reasonable minds may differ with the actions of the Panel. As with the TCC, it is not for the Council to itself make judgments and reach conclusions on the technical issues; rather its role is to determine whether the Panel has done so reasonably and in accordance with

NFPA rules. The Council has concluded that the Panel has done so and that its judgment should prevail. This does not mean that the consideration of these issued must end. If the presentations made to the Council deserve further consideration or if new information becomes available, those interested can seek to have Panel 18 consider these matters either through the next revision cycle of the NEC or through a Tentative Interim Amendment (TIA) if deemed to be of an emergency nature."

The Standards Council decision makes it clear that the appeal was upheld on procedural grounds and that reconsideration of the technical issues is appropriate.

CONCLUSION

In view of the additional technical information brought forward during the appeal hearings, and considering the concerns presented in this substantiation, NEMA requests that the panel delete Exception No. 2 to Section 406.4(D).

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The panel reviewed and considered the proposal and its substantiation together with a presentation made to the panel by TayMac Corporation. In the panels opinion there were conflicts between the proposal with its substantiation and the TayMac Corporation presentation. The TayMac presentation is being included as a part of this panel statement to enable full evaluation and public review.

In order to make a change to the Code, the panel requests that further technical justification and substantiation of the issue be provided.

Note: Supporting material mentioned in this panel statement is available for review at NFPA Headquarters.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 6 Negative: 6

Explanation of Negative:

CARPENTER, F.: The technical substantiation provided with the proposal clearly indicates that Exception No. 2 should be eliminated in the interest of public safety.

COSTELLO, P.: The submitter of the proposal provided significant technical substantiation in his proposal to warrant a change in the current text.

KEMPEL, K.: The substantiation provided by the proposer points out significant technical safety concerns and omissions in the fact-finding report used to support the adoption of Exception 2, during the 2005 Code cycle. The manufacturer's presentation, at the code panel meeting, did not sufficiently address a number of those technical safety concerns. The Panel is being asked to accept the premise that test results presented in the fact-finding report are equivalent to test results that would be expected when performing an investigation in accordance with the ANIS\UL514D standard, when it is clear that the test protocols of these two documents are substantially different. This raises the issue of the credibility of the fact-finding report in general. Therefore, the proposal to delete Exception 2 should be accepted.

LARSON, S.: The substantiation that has been supplied to the panel is helpful but is not sufficiently convincing to make a firm case for either acceptance or rejection of this proposal. Strong and seemingly valid arguments are present on both sides. IEEE hopes that the additional information requested by the panel will be in the form of technical data that can assist the panel in resolving the apparent conflicts in the substantiation, so that a correct decision can be made based on the technical merits of the proposal. The arguments that usage of this style of faceplate introduces no additional hazards related to blade penetration depth are persuasive for those cases where proper receptacle installation practices have been followed. No accident reports have been submitted to the panel that point to usage of these faceplates as the cause of a fire or electrocution. On the other hand, the arguments that the opportunities are high for misuse and misapplication of this product by innocent homeowners and devious contractors are also persuasive. These faceplates may be used to conceal damaged or improperly installed receptacles. At this proposal stage of the code revision process, IEEE has elected to vote against the panel action to reject Proposal 18-19. The possible conflicts with UL514D and NEMA WD6 are an important element in influencing this vote.

WELLS, J.: In the 2005 ROP and ROC stages, I voted to abstain to avoid the appearance of a conflict of interest. I am voting against rejection of this proposal because I believe the substantiation is compelling in depicting substantive safety hazards.

The TayMac "Fact Finding Report" referred to in the NEMA substantiation and the TayMac presentation made at the ROP meeting has not been submitted to NFPA as part of the documentation supporting their position in this Code cycle. I encourage they do so during the comment period. Both CMP 18 and the public should have the opportunity to review all information available on this subject.

The NEMA substantiation raises serious technical deficiencies in the manner in which the testing covered by this report was conducted.

However, the safety concerns raised in the NEMA substantiation are more than whether or not a.040 inch plate covering a receptacle provides sufficient obstruction to the plug to create a safety hazard. This is not merely a.040 inch issue.

NEMA points out that:

● Such a plate can be used to cover an old worn and broken receptacle thereby concealing the hazard.

● Such a plate can be used to cover an improperly recessed receptacle resulting in far more than a.040 inch obstruction.

Neither the presentation nor report submitted by TayMac address these issues. The TayMac web site, however, states in part:

"Decorator Covers improve the appearance of your room in seconds. There is no need to rewire saving you time and money. Throw away the unsightly, outdated, and worn out outlet covers. Decorator Covers give you the designer decorator look you want by covering the old outlet not replacing it."

I could not locate any information on the TayMac website installation guide cautioning the installer about replacing worn, broken receptacles.

The 2002 edition of NFPA 70B <u>Recommended Practice for Electrical Equipment Maintenance</u> states:

18.3 Receptacles.

18.3.1 If the receptacle is badly worn, cracked or broken, or if contacts are exposed, the receptacle should be replaced.

NEMA, I believe, has provided technical documentation about certain risks that may be associated with such a product that merit consideration.

WRIGHT, R.: I disagree with the panel action to reject the proposal to not delete the exception. I feel NEMA presented a compelling case. Loss of Listing is important when safety is involved. During the presentation to the panel there seemed to develop a controversy with the testing procedure, the standard is clear and the current listing organization, I feel, may not take liberty on their behalf with the standard. It was also clear to me when the presenter was asked for a yes or no answer about whether the standard was followed would not directly answer the question.

Hopefully, during the comment period clear and concise information can be submitted to convince the panel to all agree.

Comment on Affirmative:

PIERCE, J.: In addition, insufficient technical substantiation was submitted with regard to why a Nationally Recognized Testing Laboratory (NRTL) should not be allowed to evaluate and list nonmetallic faceplates that cover the receptacle face to a maximum of 1.0 mm. Some debatable details may have been submitted regarding testing nuances in the Trace Laboratories Test Report (Fact Finding Report), but insufficient details were submitted as to why an NRTL should not be allowed to evaluate, test and list such faceplates. Additionally, no data was submitted regarding <u>any</u> recalls from the marketplace of any such faceplates due to confirmed field incident reports of hazards or Consumer Product Safety Commission (CPSC) public notices of increased risk with the use of any such faceplates. If there are documented field incidents with similar faceplates in marketplace; please provide such details and I am sure the CPSC will pursue.

18-19a Log #2197 NEC-P18 **Final Action: Reject**
(406.4(D)(1))

Submitter: P. Bruce King, Stanley Consultants Inc.

Recommendation: Revise as follows:

(1) 2-pole, 3-wire, and 3-pole, 4-wire grounding, blade type receptacles shall have the ground pin oriented on the top for vertical installations, and to the left hand side for horizontal installations.

Substantiation: Reduce potential for fire in all types of buildings by reducing or eliminating the possibility of objects falling onto the current carrying conductor and grounded conductor, which could arc, thereby igniting surrounding materials. The problem has been specifically identified in hospital and residential settings.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 18-21.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

COSTELLO, P.: As this proposal continues to reappear there seems to be real concern as to the direction the code would prefer for a safe installation. A Fine Print Note would serve as a guide for most installations. With direction for the safest use based on the outlets intended use, with general purpose outlets configured with the ground, or grounded conductor in the up position unless the stationary equipment served would be best served with a different configuration based on the cord set and other location consideration.

WELLS, J.: I believe the substantiation, particularly that in Proposal 18-23, is compelling. Our company, believing that where alternative installation choices are available the safer alternative is preferred, stamped "TOP" on some of our receptacles oriented such that the ground was up. Where installers chose to install it ground down, some inspectors, citing Section 110.3(B) forced the contractors to rewire the receptacles with ground up. Regrettably, we were forced to remove the marking.

18-20 Log #667 NEC-P18 **Final Action: Reject**
(406.4(E))

Submitter: Jamie McNamara, Hastings, MN

Recommendation: Revise as follows:

406.4 (E) Receptacles in Countertops and Similar Work Surfaces ~~in Dwelling Units~~ .

Substantiation: This requirement should not be limited to dwellings.

Panel Meeting Action: Reject

Panel Statement: The submitter does not provide sufficient technical substantiation to support expanding this requirement to other than dwelling units and did not provide technical substantiation to support the recommendation as is required by 4-3.3(d) of the NFPA Regulations Governing Committee Projects.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

COSTELLO, P.: While the submitter did not provide the required technical substantiation, I agree with the submitter that the requirement should not be limited to dwelling units. I feel the same hazards exist in any similar location whether it is in a dwelling or non-dwelling location. I can envision a higher risk in locations such as educational facilities with students working on laboratory benches, in lunchrooms or commercial kitchens to name a few. These receptacles in the face up position would be subject to the same laws of gravity of any spilled liquid or conductive materials that may enter it. Perhaps a self closing cover should be the minimum protection for these types of installations when the receptacle is not in use.

SMITH, M.: The submitter brings up a very good point about this requirement being limited to just dwellings. I agree that more information should have been given to substantiate his/her proposal. Yet, I cannot see when the hazard in the dwelling would be eliminated in other occupancies. After much discussion with several design Engineers and Architects, they could not come up with any exception or condition that they would need a device in the countertop in a face up position.

18-21 Log #119 NEC-P18 **Final Action: Reject**
(406.4(G) (New))

Submitter: Gary Mayer, Jackson, MI

Recommendation: This is my proposal for the safe wiring and installation of the standard 120 volt receptacle. Including Ground fault interrupter. I propose that when installing the receptacle it be mounted with the ground terminal to be in the up or top position. I have done it this way for many years now.

Substantiation: If a dead front plug is plugged into the receptacle that has a heavy cord attached to it the weight of the cord will pull the plug down as shown in photo #1 (if the receptacle is installed with the ground terminal in the down position). When this happens, both terminals are exposed. In an industrial or residential setting, this could lead to a dangerous situation. Someone could accidentally come into contact with the energized side of the plug.

In photo #2, the same plug is in the receptacle, however the receptacle has been changed to the ground in the up or top position. Now, even with the weight of the cord pulling down it actually forces the terminals into the receptacle. Now, there is no chance of anyone accidentially coming in contact with the energized terminals.

I have seen may 220 volt dryer plugs wired with the ground terminal in the down position and this is even more dangerous than the 120 volt receptacle.

The same as above also stands for the 220 volt receptacle. It should always be installed with the ground terminal in the up or top position.

With that I will close. In the large scope of things it may seem quite small, but I think it is something that has been overlooked for many years now and it needs to be addressed. It may save someone from a painful shock, or worse. I hope you will consider this suggestion and include it in the NEC.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: This proposal does not comply with the Regulations Governing Committee Projects, Section 4-3.3, in that it does not contain recommended text. See www.nfpa.org.

The panel rejects the proposal that receptacles should be mounted with the grounding contact in the up position for vertical installations or the grounded circuit conductor slot in the up position for horizontal installations. The panel has consistently rejected similar proposals and there is no ensurance that the orientation of the receptacle will prevent the type of accident described in the recommendation. The orientation of the grounding contact on the receptacle is installation specific.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

COSTELLO, P.: As this proposal continues to reappear there seems to be real concern as to the direction the code would prefer for a safe installation. A FPN would serve as a guide for most installations. With direction for the safest use based on the outlets intended use, with general purpose outlets configured with the ground, or grounded conductor in the up position unless the stationary equipment served would be best served with a different configuration based on the cord set and other location consideration.

WELLS, J.: I believe the substantiation, particularly that in Proposal 18-23, is compelling. Our company, believing that where alternative installation choices are available the safer alternative is preferred, stamped "TOP" on some of our receptacles oriented such that the ground was up. Where installers chose to install it ground down, some inspectors, citing Section 110.3(B) forced the contractors to rewire the receptacles with ground up. Regrettably, we were forced to remove the marking.

18-22 Log #583 NEC-P18 **Final Action: Reject**
(406.4(G))

Submitter: Robert Tribbie, West Virginia State Fire Marshal's Office

Recommendation: Add new text to read:

406.4(G) Grounding - Type Receptacles. All vertically mounted grounding-type receptacles shall be installed with the blades up. Common practices for installation should be used for receptacles that have grounds in the center.

Substantiation: The National Electrical Code does not state which way grounding-type receptacles are to be installed.

Industry provides many types of cords with "plug in" connectors with neutral positions. However, with today's appliances, devices, and equipment with newer materials, many of these are installed in a "flush mount" position. In this application, the plugs are pre-formed into a space saving design. When these types of plugs are installed in a blade down-position, the natural flow of the trailing cord is disrupted and the trailing cord is then in a position of natural stress. This stress is caused by (once it's plugged in), the trailing cord, which travels in an upward manner, then descends down to a position of where the cord may lay on a surface or become suspended. This action weights the plug to produce a backwards and/or twisting torque upon it. This weighting/torque action could cause the plug to partially back out and expose the ground pin (on top) and the current carrying blades (below) to open air (in a somewhat tilted manner, the ground pin being pulled out prior to the current/carrying blades). This action could cause the cord to become ungrounded. Moreover, in applications where the blades are installed in a downward position, if something were to fall between (or possibly build up between) the receptacle and the plug - the foreign material could cause (a pendulum effect) contact between the ground and the current-carrying parts of the plug. This would energize the equipment ground, possibly damaging the equipment or causing injury.

This statement could also be supported by:

406.9(D) Grounding-Pole Requirements. (second sentence) Which states: "Grounding-type devices shall be so designed that grounding poles of attachment plugs cannot be brought into contact with current-carrying parts of the receptacles or cord connectors."

Furthermore when an appliance, device, or piece of equipment is installed in the "flush mount" position a trailing cord (in the blades down position) could become kinked or pinched behind the installation and hasten the deterioration of the cord.

Although (with the receptacle installed with the blades up) a plug could be subject to the same actions as above, excluding the deterioration of the cord, the results would be different; in that the ground pin would be held in place and the current-carrying blades would come out first. In this instance (with proper installation of the system), if something were to contact the blades the resulting short would trip the circuit breaker. This is less likely to create the pendulum effect described above.

Also, with this installation (blades up), if the plug is sufficiently backed out, the plug could become de-energized while remaining grounded to the last movement.

This statement could be supported by:

406.9(D) Grounding-Pole requirements (first sentence) Which states: "Grounding-type attachment plugs and mating cord connectors and receptacles shall be designed such that the grounding connection is made before the current-carrying connections."

This installation (receptacles installed with the blades up) would not only be safer by intention, it would enhance the connectivity design that is currently supplied by industry in support of 406.9(D).

Panel Meeting Action: Reject

Panel Statement: The panel has consistently rejected similar proposals and there is no assurance that the orientation of the receptacle will prevent the type of accident described in the recommendation. The orientation of the equipment grounding conductor slot on the receptacle is installation specific.

The panel does not agree with the portion of the substantiation concerning the necessity of equipment grounding conductor opening orientation to ensure that the ground will break last. ANSI/UL 498 requires the equipment grounding conductor prong to be longer than the current-carrying,blades and thus ensure it makes first and breaks last regardless of receptacle mounting orientation. Further, the panel points out that there is no industry standard as to the entry point of the cord into attachment plugs.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

18-23 Log #863 NEC-P18 **Final Action: Reject**
(406.4(G) (New))

Submitter: Ray C. Mullin, Ray C. Mullin Books

Recommendation: Add new text to read:

406.4(G) Receptacles mounted vertically shall have the equipment grounding conductor slot on top. Receptacles mounted horizontally shall have the equipment grounding conductor slot on the left.

Substantiation: I sent this proposal in for previous code cycles. These were rejected. I continue to sincerely believe that the added safety of preventing or reducing the electrical shock hazard and arc-flash burn hazard can be significantly reduced by accepting the above proposal. A very simple, no additional cost code requirement that enhances safety.

It will be easy for electricians to remember how to position the ground slot. Think UL:

U for "up"... L for "left".

Dropping a metal faceplate (chrome, stainless steel, etc.) or other metal object onto a partially inserted male attachment plug cap leads to arc-flashes and/or electrical shock. Metal faceplates do come loose.

Most manufacturers of receptacles are already positioning the equipment grounding slot on top as well as identifying marking on the yoke on their receptacles in conformance to my proposal. See the catalog cuts which I have provided.

With an NEC requirement, UL would no doubt revise their standard...that is if they have not already done so.

Furthermore, positioning the equipment grounding conductor on top would support the requirement in 409.6 which states:

(D) Grounding-Pole Requirements. Grounding-type attachment plus and mating cord connectors and receptacles shall be designed such that the grounding connection is made before the current-carrying connections. Grounding-type devices shall be so designed that grounding poles of attachment plugs cannot be brought into contact with current-carrying parts of receptacles or cord connectors.

Yes, the longer equipment grounding blade helps accomplish the "made before" requirement. Inserting or removing an attachment plug cap from above the receptacle adds to the assurance that the grounding connection will be made before the current-carrying connections.

Just think, added safety at no additional cost! What more could you ask for?

I have provided a number of catalog pages from various receptacle manufacturers. Note the position of the equipment grounding slot.

I ask the Code Making Panel to accept this proposal.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The panel rejects the proposal that receptacles should be mounted with the grounding contact in the up position for vertical installations or the grounded circuit conductor slot in the up position for horizontal installations. The panel has consistently rejected similar proposals and there is no assurance that the orientation of the receptacle will prevent the type of accident described in the recommendation. The orientation of the grounding contact on the receptacle is installation specific.

Number Eligible to Vote: 12

Regrettably, we were forced to remove the marking.

18-24 Log #2129 NEC-P18 **Final Action: Reject**
(406.4(G) (New))

TCC Action: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the Panel as a Public Comment.

Submitter: Russell LeBlanc, Peterson School of Engineering

Recommendation: Add new section to read:

Voltage between adjacent devices. A receptacle shall not be grouped or ganged in enclosures with other receptacles, snap switches, or similar devices unless they are arranged so that the voltage between adjacent devices does not exceed 300 volts, or unless they are installed in enclosures with permanently installed barriers between adjacent devices.

Substantiation: The same hazard for switches exists for receptacles. See 404.8(B).

Panel Meeting Action: Reject

Panel Statement: The submitter does not provide sufficient technical substantiation nor cite incident reports to support copying the switch requirement of Section 404.8(B) into 406.4(G) for receptacles.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 8 Negative: 4

Explanation of Negative:

COSTELLO, P.: While the submitter did not provide the required technical substantiation, I agree with the submitter that the same hazard exists whether the installation consists with switches or receptacles.

LARSON, S.: The panel should have accepted this proposal. The submitter is correct that the hazards that exist for grouped switches also exist for grouped receptacles where voltage differences over 300 volts are present. The requirements for receptacle mounting should be in Article 406, and should not require the user to refer back to Article 404. The lack of technical substantiation and incident reports, in this case, does not justify rejection of the proposal.

OWENS, T.: The concept of applying the same rules for switches to receptacles is a logical extension of Code language. I think that too much emphasis is placed on providing concrete examples of hazards prior to changing Code language versus providing logically deduced requirements to prevent the hazards from occurring. The question that must be answered concerning this issue is why this requirement was instituted for switches. The second question then becomes whether the reasoning for switch requirements applies to receptacles. I think that both situations are equal and the requirements for both ganged installations must be the same.

I would encourage any person that has details or any incidents involving ganged 277v receptacles to submit them during the comment period for consideration by Panel 18.

SMITH, M.: The submitter has pointed out that the same hazard that occurs with two 277V switches in the same box could occur with devices. I agree that more information should have been given to substantiate his/her proposal. Yet, I can not see when the hazard in the switch installation would be eliminated in devices. After much discussion with several Manufacturers of these devices, they do make a 15 amp 277V duplex receptacle (Example: Hubbell #HBL5302), which if installed next to a second 277V duplex or single receptacles, it could create the same hazard (Voltage between devices exceeding 300V) as in the switches, 404.8(B).

(406.6(B))

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Add "or cord connectors" after "receptacle" in the first sentence.

Substantiation: Edit. Cord connectors, a separate entity from receptacles per the article title should be included.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

18-26 Log #1157 NEC-P18 **Final Action: Reject**
(406.7)

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Add:

Except the grounding-type plug-in ground-fault circuit interrupters with a movable self-restoring grounding pole as permitted in 406.9(A).

Substantiation: Edit. A grounding type plug-in type GFCI with a movable self-restoring grounding pole is designed specifically to permit use with a non-grounding type receptacle. Which section has precedence?

Panel Meeting Action: Reject

Panel Statement: What is being proposed as an exception is exactly what 406.9 (A) says in positive language which is the preferred method given in the NEC Manual of Style. There is no conflict with 406.7, which deals with noninterchangeability. When a GFCI plug with a moveable, self-restoring ground prong plugs into a two-wire receptacle, it is no longer a grounding type plug.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

18-28 Log #3639 NEC-P18 **Final Action: Accept in Principle**
(406.8(A))

Submitter: Aaron B. Chase, Leviton Mfg. Co. Inc.

Recommendation: Revise text to read:

406.8 Receptacles in Damp or Wet Locations.

(A) Damp Locations. A receptacle installed outdoors in a location protected from the weather or in other damp locations shall have an enclosure for the receptacle that is weatherproof when the receptacle is covered (attachment plug cap not inserted and receptacle covers closed).

An installation suitable for wet locations shall also be considered suitable for damp locations.

A receptacle shall be considered to be in a location protected from the weather where located under roofed open porches, canopies, marquees, and the like, and will not be subjected to a beating rain or water runoff.

The receptacle shall be a Listed weather-resistant type.

Substantiation: The protection of outdoor receptacles in damp locations via weatherproof cover plates is commendable. Unfortunately in reality, the outlets intended to be protected are often subjected to exposure to water; UV and impact. The protection of outlets typically used in indoor environments as well is often not afforded this protection as anticipated by the current text of 406.8.

Unfortunately, many of these protective covers are defeated by either the user intentionally or unintentionally breaking off the protective covers. Often in other cases there is a misapplication of the proper cover plate when a vertical closing plate is used in a horizontal application due to limited space after construction was planned out. The submitter has also seen unfortunately in the South Eastern USA a propensity for outlet covers not to be the self closing type. Additionally, 406.8 is misapplied in that the weatherproof enclosure is often used with a product that 406.8(B)(2)(a) addresses as a product needing a wet while-in-use cover. This often results from the homeowner's needs.

Consequentially, receptacles are being exposed to moisture, UV and impact under detrimental conditions (low temperatures). These products have not been constructed or evaluated to being exposed to harsh conditions. An appropriately Listed weather resistant outlet (able to withstand the harsh elements) is needed to address the associated hazards with electrical products and outdoor use. Statistical data* has illustrated the need for a more weather resilient device in spite of the use of protective covers. The inclusion of the proposed additional text in conjunction with the existing code language would address this dangerous condition and noted failure rates.

*A joint NEMA/UL Field study revealed that the greatest number of inoperable GFCI receptacles were located outdoors. The rate of failure was more than double the next highest known location.

Panel Meeting Action: Accept in Principle

In addition to the recommended text, add a new last sentence to read as follows:

This listed weather-resistant requirement shall become effective on January 1, 2011.

Panel Statement: A new last sentence was added to ensure availability.

Ballot Results: Affirmative: 12

18-29 Log #2105 NEC-P18 **Final Action: Reject**

(406.8(B))

Submitter: Wesley Gerrans, Northwest Kansas Technical College

Recommendation: Option #1

(1) ~~15- and 20-Ampere~~ Receptacles in a Wet Location. ~~15- and 20-ampere, 125- and 250-volt~~ Receptacles installed in a wet location, where the product intended to be plugged into it is not attended while in use or where wet conditions can reasonably be expected to occur during their use, shall have an enclosure that is weatherproof whether or not the attachment plug is inserted.

~~(2) Other Receptacles. All other receptacles installed in a wet location shall comply with (B)(2)(a) or (B)(2)(b).~~

~~(a) A receptacle installed in a wet location, where the product intended to be plugged into it is not attended while in use, shall have an enclosure that is weatherproof whether or not the attachment plug is inserted.~~

(2)(b) A receptacle installed in a wet location, where the product intended to be plugged into it will be attended while in use (e.g., portable tools) and where the conditions that make this a wet location are not expected to occur during the use of the receptacle, shall have an enclosure that is weatherproof when the attachment plug is removed.

Option #2

(1) ~~15- and 20-Ampere~~ Receptacles in a Wet Location. ~~15- and 20-ampere, 125- and 250-volt~~ Receptacles installed in a wet location shall have an enclosure that is weatherproof whether or not the attachment plug is inserted.

~~(2) Other Receptacles. All other receptacles installed in a wet location shall comply with (B)(2)(a) or (B)(2)(b).~~

~~(a) A receptacle installed in a wet location, where the product intended to be plugged into it is not attended while in use, shall have an enclosure that is weatherproof with the attachment plug inserted or removed.~~

~~(b) A receptacle installed in a wet location, where the product intended to be plugged into it will be attended while in use (e.g., portable tools) shall have an enclosure that is weatherproof when the attachment plug is removed.~~

Substantiation: It seems obvious in 406.(B)(2)(b) in the reference to the "portable tools" and in the 2002 NFPA 70 code, the references in 406.8(B)(2)(a) to sprinkler systems and various lighting is indeed also referring to 15- and 20-ampere 120- and 250-volt receptacles.

As written 406.8(B)(2) now would have to refer to something else. Among the "other" available options are 30 ampere or larger receptacles, 208V-3 phase at any ampere rating, or receptacles for systems operating at more than 250V.

Why would we limit the scope of this section in this way, giving more leniency to receptacles rated with higher ampacity or greater voltage?

This proposal is an attempt to clean up this article so that it conveys the intent of the current code while taking into account the evolution that has taken place in this section over the past couple of decades.

Considering the greater vulnerability of in-use covers to damage because of their additional intrusion into environmental space and recognizing the placement of receptacles in areas where they would not be used while wet conditions exist, (such as those placed in automatic carwash areas to service equipment, on rooftops to service air conditioners or on the sides of homes where subject to direct spray from irrigation equipment or beating rain, etc.) it is my opinion that Option #1 is the more appropriate.

Panel Meeting Action: Reject

Panel Statement: The present wording of 406.8 (B)(1) applies to 15- and 20-ampere receptacles in any wet location and very simply requires a so-called "bubble" cover that is suitable whether or not and attachment plug is inserted. It no longer matters whether it is attended or not attended. The bubble cover must be used.

All other receptacles (other than 15- and 20- ampere) are given alternatives based on whether or not they are expected to be attended while in use.

The proposed wording does not clarify this requirement.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

WELLS, J.: The panel statement has a typo. The first sentence should read: The present wording of 406.8(B)(1) applies to 15- and 20-ampere receptacles in any wet location and very simply requires a so called "bubble" cover that is suitable whether or not ~~and~~ an attachment plug is inserted.

18-30 Log #1351 NEC-P18 **Final Action: Accept**

(406.8(B)(1))

Submitter: Mike Holt, Mike Holt Enterprises

Recommendation: Edit to include all voltage between 120 and 250 volts

15- and 20-ampere, ~~125- and~~ 125 through 250-volt receptacles installed in a wet location shall have an enclosure that is weatherproof whether or not the attachment plug cap is inserted.

Substantiation: Clarification. The receptacle could be a four or five pin twist-lock for a 120/208 Volt circuit.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

WELLS, J.: I believe the panel intended that the wording in 496.8(B)(1) be limited to 125- and 250-volt receptacles. These are the most common types found in general use outside of residences and commercial buildings. The 120/208-volt four or five wire locking receptacles the submitter refers to are intended to be included in 406.8(B)(2).

18-31 Log #2245 NEC-P18 **Final Action: Accept**

(406.8(B)(1))

Submitter: Donald A. Ganiere, Ottawa, IL

Recommendation: Revise as follows:

(1) 15- and 20-Ampere Receptacles in a Wet Location. 15- and 20-ampere, 125- ~~and~~ through 250-volt receptacles installed in a wet location shall have an enclosure that is weatherproof whether or not the attachment plug cap is inserted.

Substantiation: The current rule does not apply to 208 volt receptacles. If there is a hazard with 125 volt and 250 volt receptacles, then it stands to reason that there is a similar hazard with 208 volt receptacles.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

WELLS, J.: I believe the panel intended that the wording in 496.8(B)(1) be limited to 125- and 250-volt receptacles. (406.8(B)(1))

Submitter: H. Dean Schumacher, H. Dean Schumacher Electrical Inspections

Recommendation: Eliminate/delete 406.8(B)(1). Revise 406.8(B)(2) to include ALL receptacles.

Substantiation: Residential receptacles wet locations are generally short usage when not attended such as Christmas decorations and have not constituted an endangerment or safety concern.

Panel Meeting Action: Reject

Panel Statement: CMP 18 disagrees with the proposal and opinion expressed in the substantiation. Christmas lighting is often left connected for well over a month. We believe that does not constitute short usage. Garden lighting is left connected for even longer.

The NEMA/UL study referenced in Proposal 18-28 clearly demonstrates that GFCI receptacles are rendered inoperable or are exposed to abusive conditions when not properly covered to prevent water from entering.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

18-33 Log #3641 NEC-P18 **Final Action: Accept in Principle**

(406.8(B)(1))

Submitter: Aaron B. Chase, Leviton Mfg. Co. Inc.

Recommendation: Revise text to read:

406.8 Receptacles in Damp or Wet Locations.

(B) Wet Locations.

(1) 15- and 20-Ampere Receptacles in a Wet Location. 15- and 20-ampere, 125- and 250-volt receptacles installed in a wet location shall have an enclosure that is weather-proof whether or not the attachment plug cap is inserted. The receptacle shall be a Listed weather-resistant type.

Substantiation: The protection of outdoor receptacles in wet locations via weatherproof cover plates with or without the plug attached is commendable. Unfortunately, the use of these plates is often not achieving the desired effect.

Misapplications, poor installation and assembly, improper installations and improper reinstallations have all led to detrimental effects on outdoor outlets which have led to product failure with the gravest consequences. Additionally, installations that may at one time (initial inspection) would have required a weatherproof plate as described in 406.8(A) often is utilized as if the outlet was being protected by 406.8(B). For example the addition of a new outdoor lighting system or a new fountain or pond would create a misapplication of the NEC after the initial inspection. As a foreseeable hazard this can be addressed by requiring an outdoor weather resistant receptacle would address these concerns. Statistical data* has illustrated the need for a more weather resilient device in spite of the use of protective covers. Including a Listed weather resistant receptacle in coordination with the existing code language requiring the wet location cover plates, would address these hazards and noted failure rates.

*A joint NEMA/UL Field Study revealed that the greatest number of inoperable GFCI receptacles were located outdoors. The rate of failure was more than double the next highest known location.

Panel Meeting Action: Accept in Principle

In addition to the recommended text, add a new last sentence to read as follows:

Panel Statement: A new last sentence was added to ensure availability.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

18-34 Log #648 NEC-P18 **Final Action: Accept in Principle**

(406.8(B)(1) Exception (New))

Submitter: Larry T. Smith, National Electrical Seminars

Recommendation: Add new text as follows:

(1) 15- and 20-Ampere Receptacles in a Wet Location. 15- and 20-ampere, 125- and 250-volt receptacles installed in a wet location shall have an enclosure that is weatherproof whether or not the attachment plug cap is inserted.

Exception: A receptacle installed in an indoor wet location subject to routine high-pressure spray washing shall be permitted to have an enclosure that is weatherproof when the attachment plug is removed.

Substantiation: High-pressure spray wash cleaning is done on a daily basis in meat packing plants. The cleaning solution is extremely hot and caustic; there is the distinct possibility that it will spray into the enclosure through the cable openings in the in-use cover, causing corrosion to the receptacle, and there is the added danger of foreign materials (blood, etc.) being forced into the enclosure by high-pressure spray.

Panel Meeting Action: Accept in Principle

Modify the proposed exception as follows:

Exception: 15- and 20-ampere, 125- through 250-volt receptacles installed in a wet location and subject to routine high-pressure spray washing shall be permitted to have an enclosure that is weatherproof when the attachment plug is removed.

Panel Statement: The proposed exception was modified to make it clear that the exception applied only to those enclosures addressed in (1). "Indoor" was removed to ensure the exception could be applied to all locations that could have high pressure spray.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

18-35 Log #3642 NEC-P18 **Final Action: Accept in Principle**

Submitter: Joe Riley, City of Arlington

Recommendation: Revise as follows:

Receptacles shall not be installed within or directly over a bathtub or shower stall measuring 900 m (3 ft) horizontally and vertically to the ceiling from the top of the bathtub rim or shower stall threshold.

Substantiation: Tub and shower spaces for devices is little vague and up to interpretation. Consistency of electrical device and equipment locations with other parts of the code such as

410.4(D) only makes sense in ensuring electrical safety.

Panel Meeting Action: Reject

Panel Statement: Section 406.8(C) is intended to be different from 410.4(D). Cord-connected and similar luminaries are required to be grounded and are not required to be protected by GFCIs. They are, however, prohibited from being installed near or above a tub or shower zone. Receptacles, on the other hand, are required to be both grounded and protected by a GFCI. Further, they are required to be installed at the sink location. In many bathrooms, it is impossible to install a receptacle if it is also prohibited from being installed within 3 feet horizontally of a shower or tub.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

18-36 Log #590 NEC-P18 **Final Action: Reject**

(406.8(C))

Submitter: Raymond Gendron, Olympia Electric Inc.

Recommendation: Revise text to read as follows:

Receptacles shall not be installed within (5 ft) or over. A bathtub or shower stall recommended (new 5 ft) safe distance.

Substantiation: The problem in question "Bathroom GFCI Receptacles". Question the practice of installation of GFCI receptacles and also TV and phone jacks, adjacent to tubs and shower?

I am aware of 210.52 - 3 - D - Rec Bg sink 3 ft

210.8 - A - 1 + Bathroom

406.8-C = + Bath tub and shower spaces,

but also aware of 550.13 F1 Mobile and Manufactured homes not within 30 in. of tub and shower

also 680.43(A) not within 5 ft of spa and hot tub

680.43 A1(2) + (4) GFCI and permanent barrier

I consider the fact that a very serious shock hazard seems not to be addressed by code.

Not all persons we are trying to safeguard against the use of electrical equipment and appliances have any common sense.

I can picture a TV, phone, radio, hair dryer etc. becoming in contact or by accident submersed in, at a tub or shower location.

It has come too, also considering the fact that GFCI protection not totally dependable when electronic appliances are submersed.

I am also aware of 314.15(A) - damp and wet locations, 404.4 - SW. by tub or shower, 406.8(A) - damp locations, and 406.8(2) - Rec. wet locations.

Is the use of w/p covers the answer? By avoiding the look or asthetics in bathrooms enough to make builder or electrical contractors to move GFCI & TV & Ph outlets a safe distance from tubs and shower locations.

What is a safe distance? 30 ft or 5 ft? or other?

Lately, bathrooms are becoming places to relax, sit in tub, watch TV, read, have phone by tub not to miss a call.

I am greatly concerned of the life safety issue and if only 1 life is saved by your input, I consider this a worthwhile effort.

Is local amendment the answer?

Does 90.4 AHJ come into play?

Note: Supporting Material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 18-27.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

18-37 Log #70 NEC-P18 **Final Action: Accept in Principle**

(406.9(C))

Submitter: Wesley Gerrans, Northwest Kansas Technical College

Recommendation: Revise as follows:

A grounding Terminal ~~or~~ on a grounding type device shall not be used for purposes other than grounding.

Substantiation: I realize this section has had this typographical error for many years. As it reads the effect is to negate 406.9 in its entirety, i.e.; if I can only use a grounding type device for grounding, I cannot use the receptacle adapter, cord connector or attachment plug for its intended purpose.

Panel Meeting Action: Accept in Principle

Revise as follows:

A grounding terminal ~~or~~ on a ~~grounding type device~~ shall not be used for purposes other than grounding.

Panel Statement: The panel has reworded the text for further clarity but disagrees that there was a typographical error.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-39 Log #3115 NEC-P18 **Final Action: Reject**
(406.9(F))

Submitter: Arthur Silverman, General Wire Spring Company
Recommendation: Add a new paragraph (F) to 406.9 as follows:
(F) A listed device that disconnects the equipment grounding conductor internally, either at the power supply cord plug, or within one foot of the plug, where all of the following conditions are met:
1) The plug configuration is 15 or 20 amp., 125 volt, 2P3W.
2) A listed 15 or 20 amp., 125 volt GFCI is installed in the power supply cord, integral with the plug, or within one foot of the plug.
3) The equipment-grounding conductor path is interrupted only when the supply-side of the equipment-grounding conductor is energized at line voltage.
4) The device provides labeling and a clear signal by a light or other means to indicate that the equipment-grounding conductor has been interrupted.
Substantiation:
In spite of the many safety rules in the 2005 NEC, including detailed equipment grounding and bonding and GFCI requirements, people are still being killed by electric shock at the 120-volt level.
Our company manufactures cord-and-plug-connected, heavy-duty plumbing pipe cleaning equipment. The equipment usage often exposes workers to the particularly dangerous combination of water, metal piping, and electricity.
We use nothing but the highest quality electrical equipment as components of our products – three-wire grounding plugs, heavy-duty jacketed cables with an equipment grounding conductor, GFCIs, and motors.
In spite of our quality safety efforts, we find our UL-listed products involved in electrocutions that result from an energized equipment grounding conductor. Typically, there is a gap in the equipment grounding path somewhere back to the grounding electrode, and the equipment grounding conductor becomes energized on the load side of the gap. Under these conditions, the GFCI protection is totally ineffective.
The following fatalities involved this scenario and our products. More detail is available from our office.

Date of Fatality	Location	Number Killed	Comment
8-11-86	Michigan	2	Working on sewer pipes near stream
10-5-98	Texas	1	In ditch with sewer line
9-27-99	Oklahoma	1	Energized wall receptacle grounding terminal
10-12-01	Alabama	1	240v to 120v conversion involved
5-4-03	Texas	1	Homeowner in bathroom – wet floor

We have developed a device that we would like to install on our equipment that would disconnect the equipment-grounding conductor when it is energized. Present NEC wording prevents such a device from being evaluated by a third-party testing laboratory to determine its suitability for listing. Without listing, we cannot install it on our equipment, thereby being deprived of the opportunity to save lives.
Panel Meeting Action: Reject
Panel Statement: The panel agrees that this concept identifies a set of multiple circumstances that can result in a safety hazard. However, the panel disagrees that requirements for usage of a device not permanently connected to the premises wiring system belong in the NEC. The submitter is encouraged to address this issue through the UL STP process.
The panel disagrees with the submitter's proposal to disconnect the equipment grounding conductor only. Any disconnection should involve all circuit conductors.
CMP-18 considers the proposal that the disconnection of the equipment grounding conductor only violates Section 250.4. CMP-18 recommends that this proposal be forwarded to CMP-5 for action.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-40 Log #1944 NEC-P18 **Final Action: Accept**
(406.11 (New))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Add text to read as follows:
<u>406.11 Tamper Resistant Receptacles in Dwelling Units. In all areas specified in 210.52, all 125-volt, 15- and 20-ampere receptacles shall be listed tamper resistant receptacles.</u>
Substantiation: 210.52 specifies the areas in dwelling units where receptacles shall be installed. This proposal references those areas.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept
Panel Statement: The panel is concerned about the possible increased insertion force required for our aging population. The panel requests data concerning the amount of force necessary to insert a plug into the shutter and the amount of force necessary to fully insert a plug into a tamper-resistant receptacle.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
WALL, C.: The submitter of the proposal has provided much data to identify an issue with small children in dwellings and a proposed cost to implement a solution. However, the submitter of the proposal has not provided sufficient technical substantiation to mandate or justify the installation and use of tamper resistant receptacles throughout all dwellings for all cases and in all circumstances. Many dwellings do not contain small children and may only be inhabited by adults, older children, the elderly or adults with physical impediments. Also, there was no evidence provided that the operation of these devices will not or cannot be circumvented by small children. The submitter has not provided a fact-finding report showing the potential reductions of the injuries with the implementation of the proposed solution of having all dwelling unit receptacles as tamper resistant.
The submitter's proposal will also mandate future installations of GFCIs and AFCIs as tamper resistant. The submitter provided no evidence that the use of the current protective devices such as GFCIs and AFCIs has proven totally unreliable in all cases and where they may have been historically installed or used. The submitter did present some anecdotal evidence that receptacle caps could be removed by small children. However, this evidence does not discount the use or effectiveness of receptacle caps in dwellings with small children.
We support the equipment device manufacturers producing tamper resistant receptacles with only a $0.50 premium over standard receptacles. We believe this first step by the device manufacturers to reduce the cost will be a giant step in the use of those devices for future occupancies. However, each dwelling owner needs to have the ability to decide if these devices are appropriate for their circumstances and provide their desired protection. But, there is no justification for such a broad, all encompassing mandate of tamper resistant devices in all dwelling occupancies.
Comment on Affirmative:
COSTELLO, P.: This proposal addresses a long recognized problem in dwelling units. While concerns may come up as to the need for installing tamper resistant receptacles on areas such as fixed appliances, refrigerators, sump pumps and washers, the additional safety that would be there when these plugs are not in use would outweigh the advantages of allowing for exceptions not requiring them.
KEMPEL, K.: The Panel Statement does not reflect the fact that the Panel considered limiting the locations where tamper resistant receptacles are required. It considered locations such as the receptacle for the refrigerator, above stove for a microwave, above kitchen counters, in garages and outdoor locations. Limitations were not included to avoid potential installation errors and the minimal cost difference (based on the info in the substantiation).
LARSON, S.: The panel's deliberation of this issue would benefit from an accurate cost comparison between the standard and tamper-resistant type receptacles manufactured for home use. Also, the panel should clarify that this provision is invoked for new home construction only, and is not intended to be applicable to new work in existing homes, nor to existing homes put on the market for resale. If this is not the case, the panel should make this clarification.
OWENS, T.: The concern that I have with this proposal is the availability of tamper resistant GFCI receptacles. My understanding is that there are none currently available and it is not known whether they will become available prior to adoption of the Code. In most cases, this requirement can be met using GFCI circuit breakers. However, in receptacle replacement conditions, a circuit breaker may not be workable (i.e., a multi-wire branch circuit). This would create a possible conflict within the Code where a receptacle may be required to be both GFCI protected and tamper resistant. I think that this proposal needs to be revisited during the comment stage to ensure that no conflicts or unworkable situations are created.

ARTICLE 408 — SWITCHBOARDS AND PANELBOARDS

9-100 Log #284 NEC-P09 **Final Action: Reject**
(408.3(1))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
"Location. Conductors and busbars shall be located so as to be free from ~~physical damage~~ blows or abrasion...".
Substantiation: Use of the word "physical" is superfluous– the purpose is obvious. In some instances, one could argue for the use of "mechanical" to differentiate that from e.g., "thermal" damage, but context makes the intended sense quite clear, rendering anything like this completely unnecessary.
The proposed rewording is an attempt at precision. Furthermore, if you don't care to reword it I would then have to fall back to arguing that in that case the term "physical" should be eliminated.
Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.)
Panel Meeting Action: Reject
Panel Statement: The use in CMP-9's articles is consistent with the rest of the Code. CMP-9 understands that this is a global proposal and if this terminology changes, it must be evaluated by the Technical Correlating Committee and guidance provided to code making panels so the results will be consistent.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-101 Log #362 NEC-P09 **Final Action: Accept in Principle**
(408.4)

TCC Action: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal with respect to the Panel Action on Proposal 9-105. This action will be considered by the Panel as a Public Comment.
Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read:
408.4 Circuit Directory or Circuit Identification. Every circuit and circuit modification shall be legibly identified as to its clear, evident, and specific purpose or use. The identification shall include sufficient detail to allow each circuit to be distinguished from all others. The identification shall be included in a circuit directory that is located on the face or inside of the panel door in the case of a panelboard, and located at each switch on a switchboard. <u>Unused or spare switches or circuit breakers shall be clearly identified as "spare." Additional spaces for switches or circuit breakers in panelboards or switchboards shall not be required to be identified.</u>
Substantiation: The Code currently only requires circuits to be identified as to their purpose. 110.22 does require the disconnecting means to be identified to indicate its purpose, but applies to disconnecting means, which by definition can be devices in addition to and other than overcurrent devices. A rule that requires additional or redundant fused switches or circuit breakers in panelboards or switchboards will provide additional guidance and safety for occupants and workers. Additional spaces in such equipment are typically self-evident as to their purpose.
Panel Meeting Action: Accept in Principle
Change 408.4 to read as follows:
Every circuit and circuit modification shall be legibly identified as to its clear, evident, and specific purpose or use. The identification shall include sufficient detail to allow each circuit to be distinguished from all others. Spare positions that contain unused overcurrent devices or switches shall be described accordingly. The identification shall be included in a circuit directory that is located on the face or inside of the panel door in the case of a panelboard, and located at each switch on a switchboard.
Panel Statement: CMP-9 believes this approach addresses the concerns raised by the submitter but with simpler language.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-102 Log #811 NEC-P09 **Final Action: Reject**
(408.4)

Submitter: Larry Covelli, Lighthouse Electrical Contractor Inc.
Recommendation: Revise text to read as follows:
Every circuit and circuit modification shall be legibly identified at to its clear, evident, and specific purpose or use. <u>In the language used in that household or facility public or private.</u>
Substantiation: When a circuit is identified, it should be in the language spoken in the household or facility public or private. This is a serious safety issue. If you can not read what is written on a panelboard or any circuit directory. The potential for life or limb is current.
Panel Meeting Action: Reject
Panel Statement: The language of the proposal is unenforceable in most situations, as the language of the household may be unknown (i.e., spec. house with no buyer). Additionally, tenants of a residence are a dynamic factor, with no way to anticipate the native language of future residents. Introducing language as a variable in such marking requirements does not increase the safety of the installation.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-103 Log #1655 NEC-P09 **Final Action: Reject**
(408.4)

Submitter: John Steinke, Reno, NV
Recommendation: Modify second half of paragraph to read:
"The identification MAY be included in a circuit directory on the door (or face) of a panelboard, OR (new option here) at the specific breaker, either on the face of the breaker, or immediately next to it."
Substantiation: Directories are often poorly placed, arranged so it is unclear just which breakers they refer to, and offer inadequate space to identify the circuit properly.
More important, they often conflict with markings places on the panel, immediately next to the breaker.
I submit that a label next to a breaker is clearer in meaning, and quicker to find, than a directory that may be upside down, and above you, as you hold the panel door open.
Likewise, the application of a label to the face of the breaker itself is not only clear- it remains in place when the door is removed by the electrician. During construction, this practice also allows the electrician to move breakers about without having to worry about what the directory (or prints) may say.
The most current information is always available with this method. Yet, as written, a directory is still required!
Panel Meeting Action: Reject
Panel Statement: The Code permits for the directory to be located on the panel face, which could include markings on each circuit breaker provided they met all the rules for specificity.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-104 Log #3143 NEC-P09 **Final Action: Reject**
(408.4)

Submitter: Dale Rooney, Municipality of Anchorage
Recommendation: Add new exception to read:
Exception: Where multiple circuits serve receptacles in a room or area it shall be permitted to identity the circuit number on the faceplate and the room or area served at the panel.
Substantiation: There are situations where "clear, evident and specific" identification at the panel is difficult without lengthy descriptions. Common practices such as alternating the circuit supplying receptacles around a room, and supplying duplex or double-duplex receptacles with multiple circuits are actually discouraged by the difficulty of identifying them to be "distinguished from all others". This exception provides an alternative that is practical and in many ways better than the general requirement.
Panel Meeting Action: Reject
Panel Statement: The Code requires unique identification on all circuits. For example, a circuit directory that said "Kitchen receptacles (A)" and "Kitchen receptacles (B)" would comply with the Code without any changes, provided the markings were applied in the kitchen accordingly, and the inspector could be persuaded that the markings were likely to be permanent.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-105 Log #3407 NEC-P09 **Final Action: Accept in Principle**
(408.4)

TCC Action: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal with respect to the Panel Action on Proposal 9-101. This action will be considered by the Panel as a Public Comment.
Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Add the following sentence at the end:
"No circuit shall be distinguished in a manner that depends on transient conditions of occupancy."
Substantiation: CMP 9 did an excellent job in the 2005 cycle when it modernized this rule, however, one concept was missed, and it can easily frustrate the effective use of the rule in many cases. If circuits are identified as "receptacles in Suzie's room" or "lights in Joe's office" the identifications meets the literal text for completeness, for being distinguishable from all others, etc. However, when Suzie leaves home and Joe's business moves to a different address, either or both of which may happen one week after the final inspection, even the most accurate circuit directory becomes entirely unusable unless some local party happens to remember who Suzie and Joe were. This happens repeatedly in the field.
Panel Meeting Action: Accept in Principle
Change 408.4 to read as follows:
Every circuit and circuit modification shall be legibly identified as to its clear, evident, and specific purpose or use. The identification shall include sufficient detail to allow each circuit to be distinguished from all others. The identification shall be included in a circuit directory that is located on the face or inside of the panel door in the case of a panelboard, and located at each switch on a switchboard. No circuit shall be described in a manner that depends on transient conditions of occupancy.
Panel Statement: CMP-9 concludes that it agrees with the submitter's intent.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-106 Log #2267 NEC-P09 **Final Action: Reject**
(408.6 (New))

Submitter: H. Brooke Stauffer, National Electrical Contractors Assn. (NECA)
Recommendation: Add new text to read:
408.xx Panelboards shall be installed in a neat and workmanlike manner.
FPN: Accepted industry practices are described in ANSI/NECA 407-2002, Recommended Practice for Installing and Maintaining Panelboards, and other ANSI-approved installation standards.
Substantiation: The general workmanship requirement of 110.12 applies to electrical equipment covered by Article 408. However, safety would be improved by offering more detailed installation guidance for panelboards.
Panel Meeting Action: Reject
Panel Statement: It is inappropriate to reference a particular guide since there are many installation and maintenance guides from other sources, in particular the manufacturer. The requirement in 110.12 is sufficient.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-107 Log #425 NEC-P09 **Final Action: Reject**
(408.8(A)(1))

Submitter: Mario Mumfrey, Inspection Bureau Inc.
Recommendation: Add text to read as follows:
408.8(A)(1) Deadfront covers of panelboards and switchboards shall be so designed as to remain in place without reliance on its supporting hardware or overcurrent devices.
Substantiation: As these load centers are getting larger to meet other issues in the NEC, the removal of these new large and heavy covers can become a serious safety concern. The degree of difficulty in safely removing or installing these deadfront covers has become an acceptable risk for the experienced. However, this risk should not be extended to the general public, whom the industry is now marketing this equipment to specifically. The danger lies in having to remove or install an average of six screws while attempting to hold the cover, ensuring it does not slip and contract any current carrying parts within the enclosure. This is really a simple inexpensive fix which some have already implemented without the need for code language, understanding fully the safety and liability issues, respectfully.
Panel Meeting Action: Reject
Panel Statement: CMP-9 is uncertain as to submitter's intent for the location of the proposed material. Section 408.8(A)(1) is not the correct Code reference.
Regardless of the intended location, CMP-9 concludes that this is a design/product standard issue. Manufacturers of panels are doing an excellent job in accommodating the objectives set out in the proposal.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 9 Negative: 1
Ballot Not Returned: 1 de Vega, H.
Explanation of Negative:
BELISLE, R.: The panel action commends the manufacturers for doing a good job of accommodating the needs of the industry. It appears there should be requirements to ensure that the needs continue to be met, if in fact they are already doing so. My notes reflect that the panel discussion determined there are no requirements regarding independent support for "Panelboard" covers of any weight. UL 67 needs direction from CMP 9 to require independent support such as hinged covers for panelboard covers over 225 amps.

9-108 Log #2571 NEC-P09 **Final Action: Reject**
(408.9 (New))

Submitter: Larry Rogers, Vattertott College-Tulsa / Rep. Vattertott Colleges, NFPR and IAEI Member
Recommendation: Add new text as follows:
Enclosure fronts or faces; All unfinished edges, internally and externally of enclosure faces shall be rounded or de-burred to a smooth finish.
Substantiation: I am using enclosures in a generic form to include panel boards, auxiliary gutters, surface metal raceways, and large junction boxes above 4 11/16. Sharp corners/edges on enclosures have caused thousands of injuries to workmen and also thousands of hours of lost time man hours. Also, damage to the integrity of conductor insulation during installation or inspection is a problem with results of sometimes immediate arc flash or they are found later with a bare hand, which could lead to a fatal shock or serious cut due to jerk reaction. We ask this panel to consider having the manufacturer remove these sharp edges prior to shipment, thus attacking the problem from the start. Sharp edges stay sharp for years.
Panel Meeting Action: Reject
Panel Statement: CMP-9 agrees with the submitter that there are legitimate concerns in this area.
This proposal is a product standards requirement and does not need to be part of the installation code. It is suggested that the submitter propose revisions to the appropriate product standards through the particular standards revision process.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 9 Negative: 1
Ballot Not Returned: 1 de Vega, H.
Explanation of Negative:
BELISLE, R.: My notes indicate CMP-9 generally agreed that there is a legitimate concern over the issue relating to sharp edges and worker injuries, yet failed to act due to product standards. We believe the submitter has a valid point, which deserves attention. Product standards are responsible for construction of electrical equipment, but will not change until the NEC changes. If the NEC disallows the practice of sharp edges, Standards will be quick to follow with appropriate changes.
We believe the CMP should act to insert the proposed language into new sections 408.54, falling under the heading of "Construction Specifications"
This location would affect product standards in a positive manner.
Comment on Affirmative:
LEMAY, T.: The submitter's concerns are valid with regard to numerous electrical equipment parts and enclosures having sharp corners and edges that cause accidental injury.
There are many emergency room visits requiring suturing of open wounds caused by accidental impact with these items that could be avoided if efforts were taken to provide for rounded or deburred edges.
I agree with the panel in that this is a product standards issue.

(Note: Sequence 9-110 was not used)

9-111 Log #476 NEC-P09 **Final Action: Reject**
(408.15 (New))

Submitter: Joseph Rossi, Township of Clinton
Recommendation: Add new text to read:
All new one-family, two-family, and multifamily dwellings main circuit breaker panels shall have at least 10 percent free space or a minimum of three open slots.
Substantiation: On most of my inspections for a final of a new house, which are ranging anywhere from $850,000 to $1.55M, I open the panel door and find one free 1/2 breaker available for the new home owner. Square D makes a 30 breaker 200-amp panel, which is very popular in our area. Of course, the first thing the homeowner wants to do is install a pool. Getting a price for a sub panel makes the homeowner think he or she can do it themselves and since many of these homes are back from the road, this temptation makes the permit be bypassed. Next, which is more dangerous, the homeowner's friend who knows a little about electricity thinks, "I can double up on some circuits" or by a whole bunch of thin line breakers and starts to wire up basements and other rooms. Therefore, I feel we would be doing us all a favor by installing this rule.
Panel Meeting Action: Reject
Panel Statement: The NEC is not intended to mandate provisions for future expansion; see 90.1(B).
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-112 Log #143 NEC-P09 **Final Action: Reject**
(408.16(B))

Submitter: Alireza Heidariabhari, Cater Bergess
Recommendation: In addition to the requirements of 408.13, a power panelboard with supply conductors that include a neutral and having ~~more~~ less than 10 percent of its overcurrent devices protecting branch circuits rated 30 amperes or less shall be protected by overcurrent...
Substantiation: 408.14(B) describes a power panelboard, by correcting 408.16(B) we will follow the same description in this paragraph.
Panel Meeting Action: Reject
Panel Statement: CMP-9 notes that the proposal is written on a different edition of the Code; in the 2005 NEC, this is 408.36(B). The Code is correctly written; this section addresses power panelboards with a substantial number of small branch circuits that are akin to lighting and appliance branch-circuit panelboards. Only these power panelboards get an individual protection rule. Power panelboards with traditional large feeder loads originating from them are still eligible to be protected by a load calculation under 408.30. This proposal would invert that long-standing allowance without substantiation.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-113 Log #130 NEC-P09 **Final Action: Reject**
(408.18(A)(1) (New))

Submitter: Mario Mumfrey, Inspection Bureau Inc.
Recommendation: Add new text to read as follows:
Deadfront covers of panelboards and switchboards shall be so designed as to remain in place without reliance on its supporting hardware or overcorrect devices.
(This proposal is to include the change in 2008 giving notice only in 2005).
Substantiation: As these load centers are getting larger to meet other issues in the NEC, the removal of these new large and heavy covers can become a serious safety concern. The degree of difficulty in safely removing or installing these deadfront covers has become an acceptable risk for the experienced. However, this risk should not be extended to the general public, whom the industry is now marketing this equipment to specifically. The danger lies in having to remove or install an average of 6 screws while attempting to hold the cover, ensuring it does not slip and contact any current carrying parts within the enclosure.
Panel Meeting Action: Reject
Panel Statement: CMP-9 is uncertain as to submitter's intent for the location of the proposed material. Section 408.18(A)(1) is not the correct Code reference.
Regardless of the intended location, CMP-9 concludes that this is a design/ product standard issue. Manufacturers of panels are doing an excellent job in accommodating the objectives set out in the proposal.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-109 Log #674 NEC-P09 **Final Action: Accept in Principle**
(408.24)

Submitter: Jamie McNamara, Hastings, MN
Recommendation: Revise as follows:
General new **<u>408.24 High-Leg Identification.</u>**
<u>A panelboard containing a 4-wire, delta-connected system where the midpoint of one phase winding is grounded, shall have the panelboard legibly marked</u> **<u>"Caution B Phase Has _______ Volts to Ground".</u>**
Substantiation: There are numerous reports of injury and property damage due to people not recognizing there is a high leg in the panelboard. This requirement would help maintenance people and installer recognize the conductor and bus bar with the higher voltage to ground. This requirement would eliminate some of the hazards of accidentally connecting outlets to the high leg and causing injury to people and burning up equipment.
Panel Meeting Action: Accept in Principle
C hange 408.3(F) to read as follows:
(F) High-Leg Identification. A switchboard or panelboard containing a 4-wire, delta-connected system where the midpoint of one phase winding is grounded, shall be legibly and permanently field marked.
"Caution _____ Phase Has _____ Volts to Ground"
Change existin g 408.3(F) to be 408.3(G).
Panel Statement: CMP-9 concludes that it agrees with the submitter's intent but was expanded to apply to both switchboards and panelboards. In part, this was the reasoning for locating the text in Part I.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.
Comment on Affirmative:
LEMAY, T.: It has long been assumed that the high leg in a panelboard or switchboard is apparent to electrical engineers, electrical workers, estimators, owners and inspectors. This is clearly not the case. One typically has to either remove the panelboard and measure the voltage or if possible, look at the transformer configuration on the utility pole to determine the type of three phase system that was being used in the premises.
Additionally, the fact remains that there have been numerous pieces of 110 volt equipment that have been damaged because of connection to the phase with higher voltage to ground.
This can be avoided with proper field labeling of panelboards or switchboards that this proposal provides for.

9-114 Log #1154 NEC-P09 **Final Action: Accept**
(408.30)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Insert "Parts II, III, IV, and V" ahead of "Article 220."
Substantiation: Edit. To comply with Style Manual.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-115 Log #2945 NEC-P09 **Final Action: Accept in Principle**
(408.30)

Submitter: Philip Simmons, Simmons Electrical Services
Recommendation: Revise existing 408.30 as follows:
408.30 General. All panelboards shall have a rating not less than the minimum feeder capacity required for the load calculated in accordance with Article 220. ~~Panelboards shall be durably marked by the manufacturer with the voltage and the current rating and the number of phases for which they are designed and with the manufacturer's name or trademark in such a manner so as to be visible after installation, without disturbing the interior parts or wiring.~~
~~FPN: See 110.22 for additional requirements.~~
Substantiation: It is proposed to move these construction requirements to Part IV, Construction Requirements so as to be located more appropriately. See the companion proposal.
Panel Meeting Action: Accept in Principle
Insert "Parts II, III, IV, and V" ahead of "Article 220."
Retain the FPN in 408.30.
Panel Statement: See panel action and statement on Proposal 9-123.
The panel changed references to "Parts II, III, IV, and V" to comply with the NEC Manual of Style.
The FPN refers to a field installation practice and not manufacturing; therefore, it needs to be retained in its current location.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-116 Log #1594 NEC-P09 **Final Action: Accept in Principle**
(408.34)

TCC Action: The Technical Correlating Committee directs that the action on this proposal be sent to the Technical Correlating Committee Task Group on the definition of "Neutral Conductor" for review and comment.
Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Make the following change in 408.34:
Change "neutral" to "neutral conductor."
The revised text would appear as follows:
Panelboards shall be classified for the purposes of this article as either lighting and appliance branch-circuit panelboards or power panelboards, based on their content. A lighting and appliance branch circuit is a branch circuit that has a connection to the neutral <u>conductor</u> of the panelboard and that has overcurrent protection of 30 amperes or less in one or more conductors.
Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).
The Task Group has proposed the following definitions to be added to Article 100:
● **Neutral conductor.** A circuit conductor connected to the neutral point of a system.
● **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.
This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals
● The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.

● The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.

Additional information is available in the Task Group report.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle

In the submitter's text, change "neutral conductor" to "neutral busbar or equivalent connection provisions".

Panel Statement: The change is an editorial preference because the wording chosen more accurately describes the nature of the connection. CMP-9 notes that if Proposal 9-117 is accepted, then the action on this proposal is superseded.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10

Ballot Not Returned: 1 de Vega, H.

9-117 Log #2643 NEC-P09 **Final Action: Accept in Principle**
(408.34, 408.35, and 408.36)

Submitter: Kevin J. Lippert, Eaton Corporation

Recommendation: Delete the following text:

~~408.34 Classification of Panelboards. Panelboards shall be classified for the purpose of this article as either lighting and appliance branch circuit panelboards or power panelboards, based on their content. A lighting and appliance branch circuit is a branch circuit that has a connection to the neutral of the panelboard and that has overcurrent protection of 30 amperes or less in one or more conductors.~~

~~(A) Lighting and Appliance Branch Circuit Panelboard. A lighting and appliance branch circuit panelboard is one having more than 10 percent of its overcurrent devices protecting lighting and appliance branch circuits.~~

~~(B) Power Panelboard. A power panelboard is one having 10 percent or fewer of its overcurrent devices protection lighting and appliance branch circuits.~~

~~408.35 Number of Overcurrent Devices on One Panelboard. Not more than 42 overcurrent devices (other than those provided for in the mains) of a lighting and appliance branch circuit panelboard shall be installed in any one cabinet or cutout box.~~

~~A lighting and appliance branch circuit panelboard shall be provided with physical means to prevent the installation of more overcurrent devices than that number for which the panelboard was designed, rated, and approved.~~

~~For the purpose of this article a 2 pole circuit breaker shall be considered two overcurrent devices; a 3 pole circuit breaker shall be considered three overcurrent devices.~~

408.36 Overcurrent Protection.

~~(A) Lighting and Appliance Branch Circuit Panelboard Individually Protected. Each lighting and appliance branch circuit panelboard shall be individually protected on the supply side by not more than two main circuit breakers or two sets of fuses having a combined rating not greater than that of the panelboard.~~

~~Exception No. 1: Individual protection for alighting and appliance panelboard shall not be required if the panelboard feeder has overcurrent protection not greater than the rating of the panelboard.~~

~~Exception No. 2: For existing installations, individual protection for lighting and appliance branch circuit panelboards shall not be required where such panelboards are used as service equipment in supplying an individual residential occupancy.~~

~~(B) Power Panelboard Protection.~~ In addition to the requirements of 408.30, a ~~power~~ panelboard ~~with supply conductors that include a neutral, and having more than 10 percent of its overcurrent devices protecting branch circuits rated 30 amperes or less,~~ shall be protected by an overcurrent protective device having a rating not greater than that of the panelboard. This overcurrent protective device shall be located within or at any point on the supply side of the panelboard.

Exception No. 1 : ~~This individual protection shall not be required for a power.~~ A panelboard used as service equipment when not supplying a residential occupancy, may be provided with multiple disconnecting means in accordance with 230.71.

Exception No. 2: A panelboard used as service equipment and supplying an individual residential occupancy, may be individually protected on the supply side by not more than two main circuit breakers or two sets of fuses having a combined rating not greater than that of the panelboard.

Exception No. 3: For existing installations, individual protection for panelboards shall not be required where such panelboards are used as service equipment in supplying an individual residential occupancy.

~~(C)~~ (A) Snap Switches Rated at 30 Amperes or Less. (No change.)

~~(D)~~ (B) Supplied Through a Transformer. (No change.)

~~(E)~~ (C) Delta Breakers. (No change.)

~~(F)~~ (D) Back-Fed Devices. (No change.)

Substantiation: The intent of this proposal is 3-fold: 1) Permit more than 42 circuits in all panelboards; 2) Eliminate the category of "Lighting and Appliance Branch Circuit Panelboard"; and 3) Require that all panelboards (for new installations) be protected on the line side by a single integral or remote main overcurrent protective device (except as presently permitted for service equipment).

A code-making panel Task Group studied this topic for Proposal 9-142 to the 1996 NEC. That resulted in Proposal 9-120 for the 1999 code and included revised material for 384-14 and 384-16 as recorded in NFPA 70 - A98 ROP. Those changes were a "step in the right direction." However, continuing harmonization of codes and product standard requirements, along with the desire to simplify and clarify requirements, indicates that it is now time to "finish the job" on this subject.

As documented by the Task Group, an original (circa 1933) intent of the circuit limitation was to prevent overheating by installing too many rubber-insulated wires in the panelboard. This preceded the present UL 67 Panelboard Standard constructional requirements for Wiring Space, Wiring Gutters and Wire Bending Space. UL 67's thermal test requirements that incorporate "worst-case" loading conditions, coupled with industry advances in conductor insulation, entirely eliminate this as a concern.

As documented by the Task Group, the method to restrict the 42-circuit limitation only to "certain" panelboards results in the category of "Lighting and Appliance Branch Circuit Panelboard." Therefore, if the 42-circuit limitation is lifted, then the category itself is no longer needed. It is ironic that when a panelboard is presently categorized as "power" panelboard, the 42-circuit limitation is no longer a concern. In fact, most domestic panelboard manufacturers make a 2nd design of product without the 42-circuit restriction, and export them for installation in Canada where there is no circuit restriction for any panelboard application.

Lastly, the Task Group report states "the Task Group believes that these panelboards will be safer with main overcurrent protection sized to the panel bussing" and yet not so for "service equipment (which) are likely to have much better supervision and inspection than the same equipment used as remote subpanels." This concern is addressed by requiring overcurrent protection for all panelboards, but retaining the reference to service equipment in 230.71. (Note that this proposal would also exempt existing installations because the intent is not to require a complete panelboard replacement when a circuit is added to this type of existing construction.)

Panel Meeting Action: Accept in Principle

Delete section 408.34.

Delete section 408.35.

Change 408.36 to read as follows:

408.36 Overcurrent Protection. In addition to the requirements of 408.30, a ~~power~~ panelboard ~~with supply conductors that include a neutral, and having more than 10 percent of its overcurrent devices protecting branch circuits rated 30 amperes or less,~~ shall be protected by an overcurrent protective device having a rating not greater than that of the panelboard. This overcurrent protective device shall be located within or at any point on the supply side of the panelboard.

Exception No. 1: Individual protection shall not be required for a panelboard used as service equipment and containing not more than six overcurrent devices. For the purposes of this exception, the term "overcurrent device" means a single or a multipole circuit breaker, or a single fuse or set of fuses, operable or disconnectable by a single motion of the hand and that supplies a single load.

Exception No. 2: Individual protection shall not be required for a panelboard individually protected on its supply side by not more than two main circuit breakers or two sets of fuses having a combined rating not greater than that of the panelboard. A panelboard wired under this exception shall not contain more than 42 overcurrent devices. For the purposes of this exception, a 2-pole or a 3-pole circuit breaker shall be considered as two or three overcurrent devices, respectively.

Exception No. 3: For existing panelboards, individual protection shall not be required for a panelboard used as service equipment for an individual residential occupancy.

~~(C)~~ (A) Snap Switches Rated at 30 Amperes or Less. (No change.)

~~(D)~~ (B) Supplied Through a Transformer. (No change.)

~~(E)~~ (C) Delta Breakers. (No change.)

~~(F)~~ (D) Back-Fed Devices. (No change.)

Panel Statement: The panel has reworded the exceptions to maintain as much continuity as practical with prior code practice. Exception No. 1 is based on current 408.36(B) Exception, which is intended to recognize a long standing practice of allowing a small panel to be used as service equipment, with large line-to-line loads leaving at this point and a smaller feeder entering the building to supply what formerly was called a lighting and appliance branch circuit panelboard. The limitations now to be built into this exception prevent the extension of this limited practice to what could otherwise become a split-bus panelboard of unlimited size in the future. The six-circuit limit echoes the customary service limitation in 230.71.

Exception No. 2 corresponds to the parent language in 408.36(A). Since prior practice effectively limited these panelboards to 42 circuits, the wording in the panel action carries that limitation forward, but only for these split-bus panels.

Exception No. 3 corresponds to present 408.36(A) Exception No. 2, and it continues without change.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 9 Abstain: 1

Ballot Not Returned: 1 de Vega, H.

Explanation of Abstention:

OSBORNE, R.: It is acknowledged that the classification of panelboards into two types has a long-standing history, with the "42 circuit" limitation for lighting and appliance branch-circuit panelboards prevailing as a well established limit for the maximum number of overcurrent devices. As noted by the submitter, proposals to modify this portion of the Code have been debated for multiple Code cycles. During the 1999 Code revision process, the panel took a conservative approach in revising the requirements, with the intent to have minimal effect on product standards. Of specific mention was that a move as radical as eliminating the differentiation between the two types of panelboards should await more adequate substantiation over the course of the 1999 revision cycle. This proposal brings this issue back before the panel, with a request to "'finish the job' on this subject." With the product standard (UL Standard for Panelboards, UL 67) and the Code in step with one another, effecting a change as fundamental as that proposed has an inherent "chicken and egg" dilemma.

With respect to this specific proposal, it should be understood that changing the Code does not automatically change the product Standard. Requirements for lighting and appliance branch-circuit panelboards, including the 42 circuit limitation, will remain in the product standard regardless of the outcome of this vote. Should the proposal maintain its present status as an "Accept in Principle", this change creates an opportunity for updating the Standard. Safety concerns related to the "declassification" of panelboards can then be identified, debated and resolved during the revision process of the UL standard.

Comment on Affirmative:

LEMAY, T.: This proposal provides for much needed rule changes.

With the evolution of insuring proper wire bending space in panelboards and switchboards, calculations to provide for adequately sized wiring compartments and gutter space and improvement in distribution equipment design, it is clearly a safe improvement to the industry to allow for an increase in the number of overcurrent spaces available in a single panelboard.

Additionally, it would be desirable if the use of tandem breakers was prohibited in new installations and allowed only for the addition of post construction loads.

SENGUPTA, S.: Rewrite Exception no. 2 to clarify the intent of limitation of "split bus" wiring practices to assure installation of no more than 42 circuits.

YOUNG, R.: Panel should consider adding the description "Split-bus" in Exception 2 for clarification. This term is used in the panel statement.

9-118 Log #1747 NEC-P09 **Final Action: Accept in Principle**
(408.35)

Submitter: Robert A. Jones, IEC Texas Gulf Coast
Recommendation: Delete first sentence. Revise second sentence to read:

"A lighting and appliance branch-circuit panelboard shall be provided with physical means to prevent the installation of more overcurrent devices than the number for which the panelboard was ~~designed, rated, and approved~~ listed."

Delete third sentence.

Substantiation: Dwelling units are typically requiring more than 42 spaces for overcurrent devices. Panelboards can be designed for more than 42 spaces and a single panelboard would be more desirable than multiple panelboards. The addition of a sub-panel increases the cost of a dwelling unit and reduces the reliability of the electrical system due to additional electrical connections.
Panel Meeting Action: Accept in Principle
Panel Statement: The first and third sentences are deleted. The change meets the submitter's intent. See panel action and statement on Proposal 9-117.

(408.36)

Submitter: Philip Simmons, Simmons Electrical Services
Recommendation: Revise existing 408.36 as follows:

408.36 Overcurrent Protection.

(A) Lighting and Appliance Branch-Circuit Panelboard Individually Protected. Each lighting and appliance branch-circuit panelboard shall be individually protected on the supply side by not more than two main circuit breakers or two sets of fuses having a combined rating not greater than that of the panelboard.

Exception No. 1: Individual protection for a lighting and appliance panelboard shall not be required if the panelboard feeder has overcurrent protection not greater than the rating of the panelboard.

Exception No. 2: For existing installations, individual protection for lighting and appliance branch-circuit panelboards shall not be required where such panelboards are used as service equipment in supplying an individual residential occupancy.

(B) Power Panelboard Protection. <u>Power panelboards shall comply with</u> ~~In addition to~~ the requirements of 408.30.

<u>(C) Power Panelboards With Neutral Connections.</u> A power panelboard with supply conductors that include a neutral and having more than 10 percent of its overcurrent devices protecting branch circuits rated 30 amperes or less, shall be protected by an overcurrent protective device having a rating not greater than that of the panelboard. This overcurrent protective device shall be located within or at any point on the supply side of the panelboard.

Exception: This individual protection shall not be required for a power panelboard used as service equipment with multiple disconnecting means in accordance with 230.71.

Substantiation: None provided.
Panel Meeting Action: Reject
Panel Statement: The new wording is no more clear than the existing text. The proposal contained no substantiation to support the change.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-121 Log #1595 NEC-P09 **Final Action: Accept in Principle**
(408.36(B))

TCC Action: The Technical Correlating Committee directs that the action on this proposal be sent to the Technical Correlating Committee Task Group on the definition of "Neutral Conductor" for review and comment.
Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Make the following change in 408.36(B):

Change "neutral" to "neutral conductor."

The revised text would appear as follows:

(B) Power Panelboard Protection. In addition to the requirements of 408.30, a power panelboard with supply conductors that include a neutral <u>conductor</u>, and having more than 10 percent of its overcurrent devices protecting branch circuits rated 30 amperes or less, shall be protected by an overcurrent protective device having a rating not greater than that of the panelboard. This overcurrent protective device shall be located within or at any point on the supply side of the panelboard.

Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).

The Task Group has proposed the following definitions to be added to Article 100:

- **Neutral conductor.** A circuit conductor connected to the neutral point of a system.
- **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.

This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals

- The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.

● The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.

Additional information is available in the Task Group report.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle

In addition to the change in the recommendation, add the following sentence at the end of 408.36(B) to read as follows:

To qualify for this classification, the panelboard shall be supplied by no fewer than two ungrounded conductors that have an equal nominal voltage between them and the neutral conductor, that voltage being less that the nominal voltage between the ungrounded conductors.

Panel Statement: The additional sentence restores the original concept behind this rule that is now upended due to the new neutral definition. If the neutral definition does not pass ballot, then the new final sentence is unnecessary and need not go forward. CMP-9 notes that if Proposal 9-117 remains accepted, then the action on this proposal is superseded.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10

Ballot Not Returned: 1 de Vega, H.

9-122 Log #3546 NEC-P09 **Final Action: Reject**

(408.39)

Submitter: Michael French, Clackamas County

Recommendation: Add new text to read as follows:

<u>408.39 Flush Mounted Panelboards. Where installed in concrete, tile, or other noncombustible material, a flush mounted panelboard shall be installed so that the front edge of the enclosure is not set back of the finished surface more than 6 mm (1/4 in.) Where installed in wood or other combustible material, a flush mounted panelboard shall be installed so that the front edge of the enclosure is flush with, or project forward from the finished surface.</u>

(Renumber existing 408.39, 408.40, and 408.41 to 408.40, 408.41 and 408.42).

Substantiation: Panelboard installed with the front edge of the enclosure set back of the surface of combustible materials present a significant potential fire hazard. This proposed new 408.39 would bring the same level of protection required in 312.3 and 314.20 to Article 408, Part III for panelboards. This will provide for better consistency to the code requirements for installation and inspection of panelboards.

Panel Meeting Action: Reject

Panel Statement: The addition of this text is unnecessary since panelboards are installed in cabinet or cutout boxes. The requirements in Article 312 already apply.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10

Ballot Not Returned: 1 de Vega, H.

9-123 Log #2946 NEC-P09 **Final Action: Accept in Principle**

(408.40)

Submitter: Philip Simmons, Simmons Electrical Services

Recommendation: Create a new 408.40 to include the text proposed to be relocated from 408.30 as follows:

<u>408.40 Panelboard Marking. Panelboards shall be durably marked by the manufacturer with the voltage and the current rating and the number of phases for which they are designed and with the manufacturer's name or trademark in such a manner so as to be visible after installation, without disturbing the interior parts or wiring.</u>

<u>FPN: See 110.22 for additional requirements.</u>

Renumber the existing sections.

Substantiation: This text proposed for relocation here contains requirements applicable to the construction of panelboards and should be located in Part IV of Article 408 rather than in the parts of the article that has installation rules.

Panel Meeting Action: Accept in Principle

Create a new section 408.58 to include the text proposed to be relocated from 408.30 as follows:

408.58 Panelboard Marking. Panelboards shall be durably marked by the manufacturer with the voltage and the current rating and the number of phases for which they are designed and with the manufacturer's name or trademark in such a manner so as to be visible after installation, without disturbing the interior parts or wiring.

Retain FPN in 408.30.

Panel Statement: The panel relocated the submitter's text to 408.58 as the text pertains to the construction of panelboards.

The FPN provides guidance regarding field marking procedures, and should not be in Part IV.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10

Ballot Not Returned: 1 de Vega, H.

9-124 Log #1596 NEC-P09 **Final Action: Accept**

(408.40 Exception)

Submitter: Technical Correlating Committee on National Electrical Code®,

Recommendation: Make the following change in 408.40 Exception:

Change "(may be a neutral)" to "or neutral conductors"

The revised text would appear as follows:

Grounding conductors shall not be connected to a terminal bar provided for grounded conductors ~~(may be a neutral)~~ <u>or neutral conductors</u> unless the bar is identified for the purpose and is located where interconnection between equipment grounding conductors and grounded circuit conductors is permitted or required by Article 250.

Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).

The Task Group has proposed the following definitions to be added to Article 100:

● **Neutral conductor.** A circuit conductor connected to the neutral point of a system.

● **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.

This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals

● The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.

● The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.

Additional information is available in the Task Group report.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept

Panel Statement: Note that the change is in the second paragraph of 408.40 and not in 408.40 Exception.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10

Ballot Not Returned: 1 de Vega, H.

9-125 Log #1998 NEC-P09 **Final Action: Reject**

(408.40 Exception)

Submitter: Robert Schuerger, EYP Mission Critical Facilities, Inc.

Recommendation: Revise as follows:

Exception: Where an ~~isolated~~ <u>insulated</u> equipment grounding conductor is provided as permitted by 250.146(D), the insulated equipment grounding conductor that is run with the circuit conductors shall be permitted to pass through the panelboard without connection to the panelboard's equipment grounding terminal bar.

Substantiation: The use of the term "isolated" has caused confusion which has led to improper and unsafe installations in which a separate grounding electrode and grounding system is installed isolated from the rest of the grounding system of the building. Since the separate grounding system is not properly bonded to the grounding system of the building, a hazardous voltage can be developed between the two grounding systems by an electrical fault or lightning strike.

There have been many cases of this type of installation in the past, with data procession equipment, machine tools and other sensitive electronic equipment. The 2005 edition of IEEE Standard 1100, <u>Recommended Practice for Powering and Grounding Electronic Equipment</u> has "insulated ground receptacle" as the recommended terminology and has recommended the "isolated ground" and "isolated ground receptacle" be avoided.

Panel Meeting Action: Reject

Panel Statement: This usage must follow 250.146(D), which presently uses the term "isolated."

CMP-9 note to the Technical Corrolating Committee that if and only if, CMP-5 changes 250.146(D), then this proposal is accepted.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10

Ballot Not Returned: 1 de Vega, H.

9-126 Log #2913 NEC-P09 **Final Action: Reject**
(408.41)

Submitter: Marcus Sampson, Lysistrata Electric
Recommendation: Revise as follows:
408.41 Grounded and Grounding Conductor Terminations. Each grounded and grounding conductor shall terminate within the panelboard in an individual terminal that is not also used for another conductor.
Exception: Grounded and grounding conductors of circuits with parallel conductors shall be permitted to terminate in a single terminal if the terminal is identified for connection of more than one conductor.
Substantiation: While the importance of the grounded circuit conductor termination was clarified with the addition of this requirement, the quality of the grounding conductor termination is often compromised. Multiple equipment grounding conductors at a single terminal or installed in a single lug is a commonly accepted industry practice.
Since it is necessary that an equipment grounding conductor be present in Type NM cable and installed in nonmetallic conduit, shouldn't that conductor also be properly terminated?
Panel Meeting Action: Reject
Panel Statement: The reason for treating grounded and grounding conductor terminations differently is that grounded conductors routinely carry current and their terminations are tested differently (must pass a heat cycling test). The NEC text reflects this distinction correctly.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-127 Log #2948 NEC-P09 **Final Action: Accept in Principle**
(408.42)

Submitter: Philip Simmons, Simmons Electrical Services
Recommendation: Create a new 408.42 with the text to be relocated from existing 408.35 as follows:
408.42 Number of Overcurrent Devices in Lighting and Appliance Branch-Circuit Panelboard. A lighting and appliance branch-circuit panelboard shall be provided with physical means to prevent the installation of more than 42 overcurrent devices and not more than that number for which the panelboard was designed, rated, and approved.
Renumber the existing sections.
Substantiation: The new section contains construction requirements proposed to be moved from Part III to Part IV of Article 408 as the text is construction requirements rather than installation requirements and should be located in Part IV. The text should also specifically include the 42-overcurrent-device limitation as presently included in 408.35.
Panel Meeting Action: Accept in Principle
Create a new 408.54 with the text to be relocated from existing 408.35 as follows:
408.54 Maximum Number of Overcurrent Devices. A panelboard shall be provided with physical means to prevent the installation of more overcurrent devices than that number for which the panelboard was designed, rated, and listed.
For the purposes of this section, a 2-pole circuit breaker or fusible switch shall be considered two overcurrent devices; a 3-pole circuit breaker or fusible switch shall be considered three overcurrent devices.
Panel Statement: The panel relocated the submitter's text to 408.54 as the text pertains to the construction of panelboards.
The language was changed to correlate with the language of Proposal 9-117.
Due to the potential increase in the number of circuits, CMP-9 chooses to assure that the maximum number of overcurrent devices is a subject of a listing evaluation.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.
Comment on Affirmative:
LEMAY, T.: This proposal provides for much needed rule changes.
With the evolution of insuring proper wire bending space in panelboards and switchboards, calculations to provide for adequately sized wiring compartments and gutter space and improvement in distribution equipment design, it is clearly a safe improvement to the industry to allow for an increase in the number of overcurrent spaces available in a single panelboard.
Additionally, it would be desirable if the use of tandem breakers was prohibited in new installations and allowed only for the addition of post construction loads.

9-128 Log #420c NEC-P09 **Final Action: Reject**
(408.51)

Submitter: John Brouzakis, John's Electric
Recommendation: Discontinue use of all aluminum and copper clad wire in homes, business, and industry. Discontinue using aluminum bus bars in breaker panels and MCC panels. Aluminum and copper clad wire and bus bars are still being used in homes, business and industry.
Substantiation: I've seen aluminum or copper clad wire connections to 240 volt a.c. circuits such as on ranges, dryers and other circuits become loose or corroded and start arcing and burn the wire.
Some breaker panels in basements with aluminum bus bars corrode and start arcing where the breaker plugs into the bus bar. On one job, I had to remove all the breakers, clean the bus bar and replace some of the breakers.
These are just a couple of problems that I experienced with people using AL or copper clad wire and panels with AL bus bars. These situations could have turned into electrical fires with loss of life and property. I believe only copper wire and bus bars should be used in homes, buildings and industry.
When I see AL or copper clad wiring inside a home, I tell the owner it should be replaced with copper. I would appreciate it if you discontinue the usage of aluminum and copper clad wire inside homes, business and industry in your next code.
Panel Meeting Action: Reject
Panel Statement: The submitter did not provide a recommendation for consideration in accordance with the Regulations Governing Committee Projects, Section 4-3.3(c).
Aluminum connections when properly installed and terminated are safe. Cleaning of bus bars in panels should only be done by following manufacturer's recommendations, as important coating may be removed during any cleaning attempts.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-128a Log #CP904 NEC-P09 **Final Action: Accept**
(408.55 Exception No. 1)

Submitter: Code-Making Panel 9,
Recommendation: 408.55 Exception No. 1
Revise 408.55 Exception No. 1 to read as follows:
Exception No. 1: Either the top or bottom wire-bending space shall be permitted to be sized in accordance with Table 312.6(A) for a panelboard rated 225 amperes or less and designed to contain not over 42 overcurrent devices. For the purposes of this exception, a 2-pole or a 3-pole circuit breaker shall be considered as two or three overcurrent devices, respectively.
Substantiation: CMP-9 has removed the category of "lighting and appliance branch circuit panelboard" from Article 408 by virtue of its action on Proposal 9-117. This proposal correlates the provisions in this exception accordingly. Since prior practice effectively limited these panelboards to 42 circuits, the wording in the panel action carries that limitation forward, along with information from former 408.35 defining how the circuit numbering is to be done.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

ARTICLE 409 — INDUSTRIAL CONTROL PANELS

11-1 Log #1522 NEC-P11 **Final Action: Accept**
(409, 430, 440, and 470)

Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Revise Articles 409, 430, 440, and 470 as described in the following, relative to the terms bonding and grounding.
409.60: Revise 409.60 to read as follows:
409.60 Grounding. Multisection industrial control panels shall be bonded together with an equipment grounding conductor or an equivalent equipment grounding bus sized in accordance with Table 250.122. Equipment grounding conductors shall ~~terminate on~~ be connected to this equipment grounding bus or to ~~a~~ an equipmen t grounding termination point provided with a single-section industrial control panel.
409.108: Revise 409.108 to read as follows:
409.108 Service-Entrance Equipment. Where used as service equipment, each industrial control panel shall be of the type that is suitable for use as service equipment.

Where a grounded conductor is provided, the industrial control panel shall be provided with a main bonding jumper, sized in accordance with 250.28(D), for connecting the grounded conductor, on its supply side, to the industrial control panel equipment ground bus or equipment ground terminal.

430.96: Revise 430.96 to read as follows:

Multisection motor control centers shall be connected ~~bonded~~ together with an equipment grounding conductor or an equivalent equipment grounding bus sized in accordance with Table 250.122. Equipment grounding conductors shall ~~terminate on~~ be connected to this equipment grounding bus or to a grounding termination point provided in a single-section motor control center.

430.244: Revise 430.244 to read as follows:

Controller enclosures shall be connected to the equipment grounding conductor ~~grounded~~ regardless of voltage. Controller enclosures shall have means for attachment of an equipment grounding conductor termination in accordance with 250.8.

440.61: Revise 440.61 to read as follows:

440.61 Grounding. The enclosures of r ~~R~~ oom air conditioners shall be ~~grounded~~ connected to the equipment grounding conducto r in accordance with 250.110, 250.112, and 250.114.

470.19: Revise 470.19 to read as follows:

470.19 Grounding. Resistor and reactor cases or enclosures shall be connected to the equipment grounding conductor ~~grounded~~ in accordance with Article 250.

Exception: Resistor or reactor cases or enclosures supported on a structure designed to operate at other than ground potential shall not be connected to the equipment grounding conductor ~~grounded~~ .

Substantiation: 409.60: The word "equipment" is inserted to clarify the requirement.

409.108: Added the words "equipment ground" to clarify that this is the equipment ground terminal.

430.96: The change reflects a prescriptive language to clarify the requirements.

The word "equipment" is inserted to clarify the requirement.

430.244: The proposed revision is intended to be more specific as to where the connection of the specified parts is to be made. The equipment grounding conductor, by definition establishes the connection to ground.

440.61: The proposed revision is intended to be more specific as to where the connection of air conditioners is to be made. The words "enclosures of" are added to indicate what part of the room air conditioner needs to be connected to the equipment grounding conductor. The equipment grounding conductor, by definition establishes the connection to ground.

470.19: The proposed revision is intended to be more specific as to where the connection of the specified parts is to be made. The equipment grounding conductor, by definition establishes the connection to ground.

This is the result of the TCC Task Group on Grounding and Bonding in resolve of the 2005 NEC cycle actions related to Proposal 5-1 and Comment 5-1 as directed by the Technical Correlating Committee. This is a companion proposal to the proposed revision to the terms "bonded", "grounded", and "equipment grounding conductor" in Article 100 relative to this Task Group's recommendations. These changes clarify the present requirement in more prescriptive language.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

11-2 Log #151 NEC-P11 **Final Action: Reject**

(409.2)

Submitter: Dennis Coyne, Farmingdale, NY

Recommendation: In the form of a FPN follow definition of an industrial control panel that a factory assembled combination starter is not an example of an industrial control panel.

Substantiation: Reading definition of industrial control panel 409.2 fits a combination starter, which I think was not the intent of CMP 11.

Panel Meeting Action: Reject

Panel Statement: No recommended text is provided with the proposal as required by 4-3.3(c) of the Regulations Governing Committee Projects.

A combination motor controller can be assembled or applied in different ways that may cause its installation to be evaluated to other articles of the NEC, it may be a combination motor controller unit for a motor control center, or a self-protected combination motor controller, or a series of discrete components that have been assembled together with utilization equipment, or it may be assembled into an industrial control panel. The recommendation is not specific to whose factory is involved relative to the component part(s) being assembled. As such, the panel does not perceive a benefit to the creation of a list of products thought to be installable to other articles of the NEC.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

11-3 Log #1953 NEC-P11 **Final Action: Accept**

(409.2)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Recommendation: Replace 409.2 as shown:

~~Industrial Control Panel. An assembly of a systematic and standard arrangement of two or more components such as motor controllers, overload relays, fused disconnect switches, and circuit breakers and related control devices such s pushbutton stations, selector switches, timers, switches, control relays, and the like with associated wiring, terminal blocks, pilot lights, and similar components. The industrial control panel does not include the controlled equipment.~~

Industrial Control Panel. An assembly of two or more components consisting of

(a) power circuit components only, such as motor controllers, overload relays, fused disconnect switches, and circuit breakers, or

(b) control circuit components only, such as pushbuttons, pilot lights, selector switches, timers, switches, control relays, or

(c) a combination of power and control circuit components.

These components, with associated wiring and terminals, are mounted on or contained within an enclosure or mounted on a sub-panel. The industrial control panel does not include the controlled equipment.

Note: This a companion proposal to 409.110(3).

Substantiation: The approved method for determining the short circuit current rating of an industrial control panel is based only on power circuit components. However, an industrial control panel consisting only of control circuit components is not required to be marked with a short circuit current rating. The proposal adds clarification to the definition by recognizing that some panels may be constructed solely of control components.

Acceptable mounting locations are specifically identified.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

11-4 Log #646 NEC-P11 **Final Action: Accept**

(409.21(B))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Recommendation: Revise text to read as follows:

409.21 Overcurrent Protection.

(A) General. Industrial Control Panels shall be provided with overcurrent protection in accordance with Parts I, II, and IX of Article 240.

(B) Location. This protection shall be provided for each incoming supply circuit by either,

(1) An overcurrent protective device located ahead of the industrial control panel or

(2) A single main overcurrent protective device located within the industrial control panel. Where overcurrent protection is provided as part of the industrial control panel, the supply conductors shall be considered either as feeders or taps as covered by 240.21.

Substantiation: This change accommodates the industrial control panels with more than one supply source, e.g., a duplex pump panel.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

11-5 Log #1688 NEC-P11 **Final Action: Accept in Principle**

(409.21(B)(1))

Submitter: Paul E. Guidry, Fluor Enterprises, Inc.

Recommendation: This is a companion proposal to one for 409.21(B)(2).

~~409.21(B)(1) An overcurrent protective device located ahead of the industrial control panel.~~

409.21(B)(1) One or more overcurrent protective devices located ahead of the industrial control panel.

Substantiation: Industrial control panels should be able to have the components protected by more than one overcurrent protective device. The present wording, "An overcurrent...", implies only one overcurrent protective device may be used per control panel. Many times in control panels, such as heat tracing control panels, the controller and relays are located in the control panel and fed from an adjacent panelboard. There may be an unlimited number of controllers in the control panel fed by multiple branch circuit overcurrent protective devices.

Panel Meeting Action: Accept in Principle
Panel Statement: Refer to the panel action on Proposal 11-4, which addresses the submitter's concerns.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-6 Log #1689 NEC-P11 **Final Action: Accept in Principle**
(409.21(B)(2))

Submitter: Paul E. Guidry, Fluor Enterprises, Inc.
Recommendation: This is a companion proposal to one for 409.21(B)(1).
~~409.21(B)(2) A single main overcurrent protective device located within the industrial control panel.~~ Remainder of paragraph unchanged.
409.21(B)(2) One or more overcurrent protective devices located within the industrial control panel. Remainder of paragraph unchanged.
Substantiation: Industrial control panels should be able to have the components protected by more than one overcurrent protective device.
The present wording, "A single main..." requires a single main overcurrent protective device per control panel. A control panel should be able to be fed with one or more circuits. There shouldn't have to be a main unless the control panel is used as service equipment, where up to six overcurrent protective devices could serve as such.
Panel Meeting Action: Accept in Principle
Panel Statement: Refer to the panel action on Proposal 11-4, which addresses the submitter's concerns.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-7 Log #1955 NEC-P11 **Final Action: Accept**
(409.100)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Correct cross reference in first sentence, as a result of new Table location, as follows:
"Table ~~430.91~~ 110.20 shall be used as the basis for selecting industrial control panel enclosures for use in specific locations other than hazardous (classified) locations."
Substantiation: This is a companion proposal to the proposal to move text from 430.91 and Table 430.91 into a new 110.20. It should be done ONLY IF that proposal is accepted.
Panel Meeting Action: Accept
Panel Statement: The acceptance of this proposal is based on acceptance of Proposal 11-55 to relocate Section 430.91 and Table 430.91 to a new Section 110.20. In the event, the proposal to include this information in Article 110 is not accepted, it is the intention of the panel to retain the current reference to Table 430.91 in Section 409.100.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-8 Log #643 NEC-P11 **Final Action: Reject**
(409.104(B))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Revise text to read as follows:
409.104 Wiring Space in Industrial Control Panels.
(B) Wire Bending Space. ~~Wire bending space for the main supply terminals shall be in accordance with the requirements in 312.6.~~ Wire bending space within industrial control panels ~~for other terminals~~ shall be in accordance with the requirements in 430.10(B). ~~The gutter space shall comply with 312.8.~~
Substantiation: The first sentence of item (B) contains an incorrect reference to 312.6 and creates a conflict with UL 508A in that 508A uses the values for wire bending space from 430.10(B). The third sentence was deleted because it does not relate to wire bending space from 430.10(B). The third sentence was deleted because it does not relate to wire bending space.
Panel Meeting Action: Reject
Panel Statement: The present wording referring to 312.6 addresses installation issues that 430.10(B) does not. The requirements of 312.6 provide for increased wire bending space for supply terminals and the exception to 312.6 allows an alternate Table 430.10(B) for motor controllers. The panel encourages the submitter to reconsider this and resubmit a public comment.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:
TODD, L.: I agree with the submitter that the requirements for the internal sections of control panels should match the requirements in UL 508A. This means that the change recommended in the proposal should be accepted.
WRIGHT, J.: NEMA disagrees with the panel statement regarding the installation issues addressed by 312.6, as opposed to the use of Table 430.10(B). Section 430.10(B) permits the use of Table 430.10(B) for enclosures containing motor controllers, which include the main supply terminals to the motor controller. These enclosures may also contain disconnecting means and branch circuit protective devices, the terminals of which would be the main supply terminals for the equipment in the enclosure. Under 430.10(B), all the terminals in an enclosure containing a motor controller, including the main supply terminals, must meet the wire-bending requirements of Table 430.10(B).
The current reference in section 409.104(B) to 312.6, regarding the main supply terminals, could be misinterpreted to mean that the main supply terminals in an enclosure containing a motor controller must meet the wire-bending requirements of 312.6. This creates confusion concerning the wire bending space required for the main supply terminals in an Industrial Control Panel containing a motor controller. A direct reference to 430.10(B) eliminates that confusion.
The panel did not address the statement concerning the conflict with UL 508A (the UL Standard for Industrial Control Panels). Under that standard, the wire-bending requirements for all field-wiring terminals in any Industrial Control Panel are the same as those contained in Table 430.10(B). Without the proposed change to 409.104(B), listed panels might be turned down by the AHJ.

11-9 Log #644 NEC-P11 **Final Action: Accept**
(409.106 (New))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Add new text as follows:
409.106 Spacings. Spacings between live bare metal parts in feeder circuits shall not be less than specified in Table 430.97.
Exception: The distance shall be permitted to be less than that specified in Table 430.97 at circuit breakers and switches and in listed components installed in industrial control panels.
Substantiation: This section and exception is necessary to allow for field assembly of industrial control panels. This is consistent with 408.56 to allow use of listed components within their listing requirements.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-10 Log #2645 NEC-P11 **Final Action: Accept in Principle**
(409.108)

Submitter: Kevin J. Lippert, Eaton Corporation
Recommendation: Revise text to read:
430.95 Service ~~Entrance~~ Equipment.
The proposal addresses only the title, the actual requirement remains unchanged.
Substantiation: The word "Entrance" should be deleted. Throughout the Code, the term "service entrance" is usually reserved for identifying the service conductors/cables. When referring to equipment, the correct term is "service equipment".
Panel Meeting Action: Accept in Principle
Revise text to read:
409.108 Service ~~Entrance~~ Equipment.
The proposal addresses only the title, the actual requirement remains unchanged.
Panel Statement: The panel has corrected the intended section to be changed, which meets the intent of the submitter.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-11 Log #2157 NEC-P11 **Final Action: Reject**
(409.110)

Submitter: Thomas F. Mueller, Southern Company Services
Recommendation: Revise text to read:
An industrial control panel where applicable shall be marked with the following information that is plainly visible after installation.
Substantiation: In 409.2, it is stated that an industrial control panel can be as little as a two push button station or a selector switch/lamp box. Many, if not all the required marks would be inappropriate for such control stations. For example, it would be ridiculous to place the short circuit current rating on a push button station.
I would prefer that this entire Article 409 be deleted from the code as it does nothing more than to restate rules found in other code sections. But in lieu of that, this change will allow some sanity in its application.

Panel Meeting Action: Reject

Panel Statement: The panel disagrees that markings are not required for simple constructions of industrial control panels. In the scenario presented as substantiation, the markings noted in 409.110(1), (2), (5) and (6) are appropriate. These markings provide a positive indication of the intended conditions/ratings for which the panel was built and installed. The markings are also readily available for use by subsequent users, service personnel, and inspection authorities.

Section 409.110(4), referring to service equipment, already contains the conditional text, so the current text does not require all industrial control panels to comply.

The committee agrees that a shortcircuit current rating for an industrial control panel containing only control circuit devices is unnecessary.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

11-12 Log #1957 NEC-P11 **Final Action: Accept in Principle**

(409.110(2))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Recommendation: 409.110 Marking. An industrial control panel shall be marked with the following information that is plainly visible after installation:

(2) Supply voltage, <u>number of</u> phase <u>s</u> , frequency, and full-load current

Note: This is a companion proposal to 409.110(3) and 409.110(5)

Substantiation: Clarification of existing text, to align with the marking requirements of NFPA 79 and UL 508A.

Panel Meeting Action: Accept in Principle

Add text to read as follows:

409.110 Marking. An industrial control panel shall be marked with the following information that is plainly visible after installation:

(2) Supply voltage, <u>number of</u> phase <u>s</u> , frequency, and full-load current <u>for each incoming supply circuit</u>

Panel Statement: The panel has added the words "for each incoming supply circuit" to be consistent with the action taken on Proposal 11-4.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

11-13 Log #801 NEC-P11 **Final Action: Reject**

(409.110(3))

Submitter: Keith Merrill, Retrofit Electric

Recommendation: Revise text to read as follows:

409.110 Marking. An industrial control panel shall be marked with the following information that is plainly visible after installation:

~~(3) Short-circuit current rating of the industrial control panel based on one of the following:~~

~~a. Short-circuit current rating of a listed and labeled assembly~~

~~b. Short-circuit current rating established utilizing an approved method~~

~~FPN: UL 508A-2001, Supplement SB, is an example of an approved method.~~

Substantiation: I have been an industrial electrician for 11 years and have built or overseen the building of many and various types of electrical control panels of many different sizes and for many different purposes.

I agree with all of the marking requirements of 409.110 with the exception of (3) which requires a short circuit current rating.

My disagreements are for the following reasons:

1. The wording of this requirement is obviously vague as to exactly what it requires. Are we talking about the short-circuit current rating of the main disconnect or exactly what component or components are we needing the short-circuit current rating for?

2. If this is such a critical piece of information than the necessary formula(s) and procedure for determining it should also be stated IN THE TEXT of the article. I have attempted to find this UL 508A-2001 reference without success. UL's web site was no help as I was unable to gain access to this magical formula or procedure.

3. What difference does this really make to anybody? Unless the inspector is capable of performing the necessary calculation they could not possibly determine if the figure was accurate or not anyway. How can they be expected to enforce a requirement that they have no ability to determine the accuracy of? WHO is going to benefit from this requirement or gain any useable advantage from it? In short what purpose does it serve and for who?

4. What does this figure have to do with the safe operation or performance of the panel? None of the panels I have built have it and not one of them has failed because of it. If a panel is built with all UL listed components, and all components are sized and all wiring done according to the NEC, do we have any reason to doubt that the panel will perform in a satisfactory manner? (As in fact thousands of panels are doing at this very moment).

Even if it should fail to do so, who could possibly look at the short-circuit current rating and determine that that was there reason for the failure?

I move that this marking requirement (number 3) and the associated (and worthless) footnote be stricken from the code as TOTALLY SUPERFLUOUS.

Panel Meeting Action: Reject

Panel Statement: Product standards are available. UL 508A, Supplement SB is an example of an approved method. The requirement for a short-circuit current rating does not mandate the use of UL 508A. The panel agrees with the original substantiation presented in the 2005 ROP, number 11-5. Short-circuit current ratings are important safety criteria in the installation and use of industrial control panels.

It is expected that the method used will be consistent with Sections 110.9 and 110.10 where short circuit current ratings of individual components are considered and resolved into a single rating for the industrial control panel.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

11-14 Log #1954 NEC-P11 **Final Action: Accept in Principle**

(409.110(3))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Recommendation: Add text to read as follows:

409.110 Marking. An industrial control panel shall be marked with the following information that is plainly visible after installation:

3) Short-circuit current rating of the industrial control panel based on one of the following:

a. short circuit current rating of a listed and labeled assembly

b. short circuit current rating established utilizing an approved method

FPN No. <u>1</u> : UL508A-2001 Supplement SB is an example of an approved method.

<u>Exception: Short circuit current rating markings are not required for industrial control panels containing only control circuit components.</u>

<u>FPN No. 2: A control circuit is the circuit of a control apparatus or system that carries the electric signals directing the performance of the controller but does not carry the main power current.</u>

Note: This is a companion proposal to 409.2, 409.110(2) and 409.110(5).

Substantiation: Control circuit devices do not have short-circuit current ratings. FPN No. 2 was added to assist in the identification of components in the control circuit.

Panel Meeting Action: Accept in Principle

Add text to read as follows:

409.110 Marking. An industrial control panel shall be marked with the following information that is plainly visible after installation:

3) Shortcircuit current rating of the industrial control panel based on one of the following:

a. Shortcircuit current rating of a listed and labeled assembly

b. Shortcircuit current rating established utilizing an approved method

FPN: UL508A, ~~2001~~ Supplement SB, is an example of an approved method.

<u>Exception: Shortcircuit current rating markings are not required for industrial control panels containing only control circuit components.</u>

Add a new definition in 409.2 for Control Circuit to read as follows:

<u>Control Circuit. The circuit of a control apparatus or system that carries the electric signals directing the performance of the controller but does not carry the main power current.</u>

Panel Statement: The panel has more appropriately placed the definition contained in the proposed FPN No. 2 in Section 409.2, which meets the intent of the submitter. The panel has also editorially removed the date associated with UL 508A in the existing FPN.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

11-15 Log #645 NEC-P11 **Final Action: Accept**

(409.110(5))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Recommendation: Revise text to read as follows:

409.110 Marking. An industrial control panel shall be marked with the following information that is plainly visible after installation:

(5) Electrical wiring diagram or the <u>identification</u> number of ~~the index to the electrical drawings showing the~~ <u>a separate</u> electrical wiring diagram <u>or a designation referenced in a separate wiring diagram.</u>

Substantiation: Clarification of existing text.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

ARTICLE 410 — LUMINAIRES (LIGHTING FIXTURES), LAMPHOLDERS, AND LAMPS

18-40a Log #CP1804 NEC-P18 **Final Action: Accept**
(410)

Submitter: Code-Making Panel 18,
Recommendation: First, add a new Section to Part I of Article 410 to read as follows:
410.XX Listing Required. All luminaires, lampholders, and lighting assemblies shall be listed.
Second, modify the following Sections of Article 410:
410.4(D) Bathtub and Shower Areas No parts of cord-connected luminaires ~~(fixtures)~~ , chain-, cable-, or cord-suspended-luminaires ~~(fixtures)~~ , lighting track, pendants, or ceiling-suspended (paddle) fans shall be located within a zone measured 900 mm (3 ft) horizontally and 2.5 m (8 ft) vertically from the top of the bathtub rim or shower stall threshold. This zone is all encompassing and includes the zone directly over the tub or shower stall. Luminaires ~~(lighting fixtures)~~ located in this zone shall be ~~listed~~ marked for damp locations, or ~~listed~~ marked for wet locations where subject to shower spray.
410.8(B) Luminaire ~~(Fixture)~~ Types Permitted ~~Listed~~ ~~l~~ L uminaires ~~(fixtures)~~ of the following types shall be permitted to be installed in a closet:
410.27(B) Size Unless part of ~~listed~~ decorative lighting assemblies, pendant conductors shall not be smaller than 14 AWG for mogul-base or medium-base screw-shell lampholders or smaller than 18 AWG for intermediate or candelabra-base lampholders.
410-27(C) Twisted or Cabled Pendant conductors longer than 900 mm (3 ft) shall be twisted together where not cabled in a ~~listed~~ lighting assembly.
410.30(C)(1) Cord-Connected Installation A ~~listed~~ luminaire ~~(fixture)~~ or a ~~listed~~ lighting assembly shall be permitted to be cord connected if the following conditions apply:
410.30(C)(1)(2)c Is terminated in a grounding-type attachment plug cap or busway plug, or is a part of a ~~listed~~ lighting assembly incorporating a manufactured wiring system connector in accordance with 604.6(C), or has a luminaire ~~(fixture)~~ assembly with a strain relief and canopy.
410.31 Luminaires ~~(Fixtures)~~ as Raceways
Luminaires ~~(fixtures)~~ shall not be used as a raceway for circuit conductors unless ~~listed and~~ marked for use as a raceway.
410.32 Wiring Supplying Luminaires ~~(Fixtures)~~ Connected Together Luminaires ~~(fixtures)~~ designed for end-to-end connection to form a continuous assembly, or luminaires ~~(fixtures)~~ connected together by recognized wiring methods, shall be permitted to contain the conductors of a 2-wire branch circuit, or one multiwire branch circuit, supplying the connected luminaires ~~(fixtures)~~ and need not be ~~listed~~ marked as a raceway. One additional 2-wire branch circuit separately supplying one or more of the connected luminaires ~~(fixtures)~~ shall also be permitted.
410.33 Branch Circuit Conductors and Ballasts
Branch-circuit conductors within 75 mm (3 in.) of a ballast shall have an insulation temperature rating not lower than 90°C (194°F) unless supplying a luminaire ~~(fixture) listed and~~ marked as suitable for a different insulation temperature.
410.65(B) Fire-Resistant Construction Where a luminaire ~~(fixture)~~ is recessed in fire-resistant material in a building of fire-resistant construction, a temperature higher than 90°C (194°F) but not higher than 150°C (302°F) shall be considered acceptable if the luminaire ~~(fixture)~~ is plainly marked ~~that it is listed~~ for that service.
410.76(B) Combustible Low-Density Cellulose Fiberboard Where a surface-mounted luminaire ~~(fixture)~~ containing a ballast is to be installed on combustible low-density cellulose fiberboard, it shall be ~~listed~~ marked for this condition or shall be spaced not less than 38 mm (1 1/2 in.) from the surface of the fiberboard. Where such luminaires ~~(fixtures)~~ are partially or wholly recessed, the provisions of 410.64 through 410.72 shall apply.
Substantiation: CMP18 concludes that all luminaires, lampholder, and lighting assemblies require listing. Luminaire interior wiring, construction, clearances, suitability for specific locations and conditions, and other safety measures are more properly contained within the product standards. Adding a general requirement for listing removes that requirement in the remaining Sections of Article 410.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
CARPENTER, F.: The term “lighting assemblies” is undefined, vague, and likely to lead to a variety of interpretations from different Authorities Having Jurisdiction. Will optional parts that are normally shipped separately from a luminaire be considered to be lighting assemblies which must carry a listing mark? (For instance, visors or vandal guards). Are poles lighting assemblies? Without clearly defined terms, NEMA cannot support this proposal.

18-41 Log #458 NEC-P18 **Final Action: Accept in Principle**
(410)

Submitter: Amos D. Lowrance, Jr., City of Chattanooga, TN
Recommendation: Revise Article 410 to read as follows:

ARTICLE 410 Luminaires (Lighting Fixtures), Lampholders, and Lamps

I. General
410.1 Scope. This article covers luminaires (lighting fixtures), lampholders, pendants, incandescent filament lamps, arc lamps, electric-discharge lamps, decorative lighting products, lighting accessories for temporary seasonal and holiday use, portable flexible lighting products, and the wiring and equipment forming part of such products and lighting installations.

2.2 Definition
Storage Space. The volume bounded by the sides and back closet walls and planes extending from the closet floor vertically to a height of 1.8 m (6 ft) or to the highest clothes-hanging rod and parallel to the walls at a horizontal distance of 600 mm (24 in.) from the sides and back of the closet walls, respectively, and continuing vertically to the closet ceiling parallel to the walls at a horizontal distance of 300 mm (12 in.) or the width of the shelf, whichever is greater; for a closet that permits access to both sides of a hanging rod, this space includes the volume below the highest rod extending 300 mm (12 in.) on either side of the rod on a plane horizontal to the floor extending the entire length of the rod.
FPN: See Figure 410.2.

Lighting Track. A manufactured assembly designed to support and energize luminaires (lighting fixtures) that are capable of being readily repositioned on the track. Its length can be altered by the addition or subtraction of sections of track.

410.3 Application of Other Articles. Equipment for use in hazardous (classified) locations shall conform to Articles 500 through 517. Lighting systems operating at 30 volts or less shall conform to Article 411. Arc lamps used in theaters shall comply with 520.61, and arc lamps used in projection machines shall comply with 540.20. Arc lamps used on constant-current systems shall comply with the general requirements of Article 490.

410.4 Live Parts. Luminaires (fixtures), lampholders, and lamps shall have no live parts normally exposed to contact. Exposed accessible terminals in lampholders and switches shall not be installed in metal luminaire (fixture) canopies or in open bases of portable table or floor lamps.
Exception: Cleat-type lampholders located at least 2.5 m (8 ft) above the floor shall be permitted to have exposed terminals.

II. Luminaire (Fixture) Locations

10.10 Luminaires (Fixtures) in Specific Locations.
(A) Wet and Damp Locations Luminaires (fixtures) installed in wet or damp locations shall be installed so that water cannot enter or accumulate in wiring compartments, lampholders, or other electrical parts. All luminaires (fixtures) installed in wet locations shall be marked, ``Suitable for Wet Locations.'' All luminaires (fixtures) installed in damp locations shall be marked, ``Suitable for Wet Locations'' or ``Suitable for Damp Locations.''
(B) Corrosive Locations Luminaires (fixtures) installed in corrosive locations shall be of a type suitable for such locations.
(C) In Ducts or Hoods Luminaires (fixtures) shall be permitted to be installed in commercial cooking hoods where all of the following conditions are met:
(1) The luminaire (fixture) shall be identified for use within commercial cooking hoods and installed such that the temperature limits of the materials used are not exceeded.
(2) The luminaire (fixture) shall be constructed so that all exhaust vapors, grease, oil, or cooking vapors are excluded from the lamp and wiring compartment. Diffusers shall be resistant to thermal shock.
(3) Parts of the luminaire (fixture) exposed within the hood shall be corrosion resistant or protected against corrosion, and the surface shall be smooth so as not to collect deposits and to facilitate cleaning.
(4) Wiring methods and materials supplying the luminaire(s) [fixture(s)] shall not be exposed within the cooking hood.
FPN: See 110.11 for conductors and equipment exposed to deteriorating agents.
D) Bathtub and Shower Areas No parts of cord-connected luminaires (fixtures), chain-, cable-, or cord-suspended-luminaires (fixtures), lighting track, pendants, or ceiling-suspended (paddle) fans shall be located within a zone measured 900 mm (3 ft) horizontally and 2.5 m (8 ft) vertically from the top of the bathtub rim or shower stall threshold. This zone is all encompassing and includes the zone directly over the tub or shower stall. Luminaires (lighting fixtures) located in this zone shall be listed for damp

locations, or listed for wet locations where subject to shower spray.
E) Luminaires (Fixtures) in Indoor Sports, Mixed-Use, and All-Purpose Facilities Luminaires (fixtures) subject to physical damage, using a mercury vapor or metal halide lamp, installed in playing and spectator seating areas of indoor sports, mixed-use, or all-purpose facilities shall be of the type that protects the lamp with a glass or plastic lens. Such luminaires (fixtures) shall be permitted to have an additional guard.

410.11 Luminaires (Fixtures) Near Combustible Material. Luminaires (fixtures) shall be constructed, installed, or equipped with shades or guards so that combustible material is not subjected to temperatures in excess of 90°C (194°F).

410.12 Luminaires (Fixtures) Over Combustible Material. Lampholders installed over highly combustible material shall be of the unswitched type. Unless an individual switch is provided for each luminaire (fixture), lampholders shall be located at least 2.5 m (8 ft) above the floor or shall be located or guarded so that the lamps cannot be readily removed or damaged.

410.13 Luminaires (Fixtures) in Show Windows. Chain-supported luminaires (fixtures) used in a show window shall be permitted to be externally wired. No other externally wired luminaires (fixtures) shall be used.

410.14 Luminaires (Fixtures) in Clothes Closets.

(A)Luminaire (Fixture) Types Permitted Listed luminaires (fixtures) of the following types shall be permitted to be installed in a closet:
(1) A surface-mounted or recessed incandescent luminaire (fixture) with a completely enclosed lamp
(2) A surface-mounted or recessed fluorescent luminaire (fixture)
(B) Luminaire (Fixture) Types Not Permitted Incandescent luminaires (fixtures) with open or partially enclosed lamps and pendant luminaires (fixtures) or lampholders shall not be permitted.
(C)Location Luminaires (fixtures) in clothes closets shall be permitted to be installed as follows:
(1) Surface-mounted incandescent luminaires (fixtures) installed on the wall above the door or on the ceiling, provided there is a minimum clearance of 300 mm (12 in.) between the luminaire (fixture) and the nearest point of a storage space
(2) Surface-mounted fluorescent luminaires (fixtures) installed on the wall above the door or on the ceiling, provided there is a minimum clearance of 150 mm (6 in.) between the luminaire (fixture) and the nearest point of a storage space
(3) Recessed incandescent luminaires (fixtures) with a completely enclosed lamp installed in the wall or the ceiling, provided there is a minimum clearance of 150 mm (6 in.) between the luminaire (fixture) and the nearest point of a storage space
(4) Recessed fluorescent luminaires (fixtures) installed in the wall or the ceiling, provided there is a minimum clearance of 150 mm (6 in.) between the luminaire (fixture) and the nearest point of a storage space

410.15 Space for Cove Lighting. Coves shall have adequate space and shall be located so that lamps and equipment can be properly installed and maintained.

III. Provisions at Luminaire (Fixture) Outlet Boxes, Canopies, and Pans

410.20 Space for Conductors. Canopies and outlet boxes taken together shall provide adequate space so that luminaire (fixture) conductors and their connecting devices can be properly installed.

410.21 Temperature Limit of Conductors in Outlet Boxes. Luminaires (fixtures) shall be of such construction or installed so that the conductors in outlet boxes shall not be subjected to temperatures greater than that for which the conductors are rated.
Branch-circuit wiring, other than 2-wire or multiwire branch circuits supplying power to luminaires (fixtures) connected together, shall not be passed through an outlet box that is an integral part of a luminaire (fixture) unless the luminaire (fixture) is identified for through-wiring.
FPN:See 410.32 for wiring supplying power to fixtures connected together.

410.22 Outlet Boxes to Be Covered. In a completed installation, each outlet box shall be provided with a cover unless covered by means of a luminaire (fixture) canopy, lampholder, receptacle, or similar device.

410.23 Covering of Combustible Material at Outlet Boxes. Any combustible wall or ceiling finish exposed between the edge of a luminaire (fixture) canopy or pan and an outlet box shall be covered with noncombustible material.

410.24 Connection of Electric-Discharge Luminaires (Lighting Fixtures).
(A) Independent of the Outlet Box Electric-discharge luminaires (lighting fixtures) supported independently of the outlet box shall be connected to the branch circuit through metal raceway, nonmetallic raceway, Type MC cable, Type AC cable, Type MI cable, nonmetallic sheathed cable, or by flexible cord as permitted in 410.56(B) or 410.56(C).
(B) Access to Boxes Electric-discharge luminaires (fixtures) surface mounted over concealed outlet, pull, or junction boxes and designed not to be supported solely by the outlet box shall be provided with suitable openings in the back of the luminaire (fixture) to provide access to the wiring in the box.

IV. Luminaire (Fixture) Supports

410.30 Supports.
(A) General Luminaires (fixtures) and lampholders shall be securely supported. A luminaire (fixture) that weighs more than 3 kg (6 lb) or exceeds 400 mm (16 in.) in any dimension shall not be supported by the screw shell of a lampholder.
(B) Metal or Nonmetallic Poles Supporting Luminaires (Lighting Fixtures) Metal or nonmetallic poles shall be permitted to be used to support luminaires (lighting fixtures) and as a raceway to enclose supply conductors, provided the following conditions are met:
(1) A pole shall have a handhole not less than 50 mm × 100 mm (2 in. × 4 in.) with a raintight cover to provide access to the supply terminations within the pole or pole base.
Exception No. 1: No handhole shall be required in a pole 2.5 m (8 ft) or less in height above grade where the supply wiring method continues without splice or pull point, and where the interior of the pole and any splices are accessible by removing the luminaire (fixture).
Exception No. 2: No handhole shall be required in a pole 6.0 m (20 ft) or less in height above grade that is provided with a hinged base.
(2) Where raceway risers or cable is not installed within the pole, a threaded fitting or nipple shall be brazed, welded, or attached to the pole opposite the handhole for the supply connection.
(3) A metal pole shall be provided with a grounding terminal as follows:
a. A pole with a handhole shall have the grounding terminal accessible from the handhole.
b. A pole with a hinged base shall have the grounding terminal accessible within the base.
Exception to (3): No grounding terminal shall be required in a pole 2.5 m (8 ft) or less in height above grade where the supply wiring method continues without splice or pull, and where the interior of the pole and any splices are accessible by removing the luminaire (fixture).
(4) A metal pole with a hinged base shall have the hinged base and pole bonded together.
(5) Metal raceways or other equipment grounding conductors shall be bonded to the metal pole with an equipment grounding conductor recognized by 250.118 and sized in accordance with 250.122.
(6) Conductors in vertical poles used as raceway shall be supported as provided in 300.19.

410.31 Means of Support.
(A) Outlet Boxes Outlet boxes or fittings installed as required by 314.23 and complying with the provisions of 314.27(A) and 314.27(B) shall be permitted to support luminaires (fixtures).
B) Inspection Luminaires (fixtures) shall be installed such that the connections between the luminaire (fixture) conductors and the circuit conductors can be inspected without requiring the disconnection of any part of the wiring unless the luminaires (fixtures) are connected by attachment plugs and receptacles.
(C) Suspended Ceilings Framing members of suspended ceiling systems used to support luminaires (fixtures) shall be securely fastened to each other and shall be securely attached to the building structure at appropriate intervals. Luminaires (fixtures) shall be securely fastened to the ceiling framing member by mechanical means such as bolts, screws, or rivets. Listed clips identified for use with the type of ceiling framing member(s) and luminaire(s) [fixture(s)] shall also be permitted.
(D) Luminaire (Fixture) Studs Luminaire (fixture) studs that are not a part of outlet boxes, hickeys, tripods, and crowfeet shall be made of steel, malleable iron, or other material suitable for the application.
(E) Insulating Joints Insulating joints that are not designed to be mounted with screws or bolts shall have an exterior metal casing, insulated from both screw connections.
(F) Raceway Fittings Raceway fittings used to support a luminaire(s) [lighting fixture(s)] shall be capable of supporting the weight of the complete fixture assembly and lamp(s).
(G) Busways Luminaires (fixtures) shall be permitted to be connected to busways in accordance with 368.17(C).
(H) Trees Outdoor luminaires (lighting fixtures) and associated equipment shall be permitted to be supported by trees.
FPN No. 1: See 225.26 for restrictions for support of overhead conductors.

FPN No. 2: See 300.5(D) for protection of conductors.

V. Grounding

410.40 General. Luminaires (fixtures) and lighting equipment shall be grounded as required in Article 250 and Part V of this article.

410.41 Exposed Luminaire (Fixture) Parts.

(A) Exposed Conductive Parts Exposed metal parts shall be grounded or insulated from ground and other conducting surfaces or be inaccessible to unqualified personnel. Lamp tie wires, mounting screws, clips, and decorative bands on glass spaced at least 38 mm (1 1/ 2 in.) from lamp terminals shall not be required to be grounded.

(B) Made of Insulating Material Luminaires (fixtures) directly wired or attached to outlets supplied by a wiring method that does not provide a ready means for grounding shall be made of insulating material and shall have no exposed conductive parts.

Exception No. 1: Replacement luminaires (fixtures) shall be permitted to connect an equipment grounding conductor from the outlet in compliance with 250.130(C). The luminaire (fixture) shall then be grounded in accordance with 410.41(A).

Exception No. 2: Where no equipment grounding conductor exists at the outlet, replacement luminaires (fixtures) that are GFCI protected shall not be required to be connected to an equipment grounding conductor.

410.42 Equipment Grounding Conductor Attachment. Luminaires (fixtures) with exposed metal parts shall be provided with a means for connecting an equipment grounding conductor for such luminaires (fixtures).

410.43 Methods of Grounding. Luminaires (fixtures) and equipment shall be considered grounded where mechanically connected to an equipment grounding conductor as specified in 250.118 and sized in accordance with 250.122.

VI. Wiring of Luminaires (Fixtures)

410.50 Luminaire (Fixture) Wiring — General. Wiring on or within fixtures shall be neatly arranged and shall not be exposed to physical damage. Excess wiring shall be avoided. Conductors shall be arranged so that they are not subjected to temperatures above those for which they are rated.

410.51 Polarization of Luminaires (Fixtures). Luminaires (fixtures) shall be wired so that the screw shells of lampholders are connected to the same luminaire (fixture) or circuit conductor or terminal. The grounded conductor, where connected to a screw-shell lampholder, shall be connected to the screw shell.

410.52 Conductor Insulation. Luminaires (fixtures) shall be wired with conductors having insulation suitable for the environmental conditions, current, voltage, and temperature to which the conductors will be subjected.

FPN: For ampacity of luminaire (fixture) wire, maximum operating temperature, voltage limitations, minimum wire size, and so forth, see Article 402.

410.53 Pendant Conductors for Incandescent Filament Lamps.

(A) Support Pendant lampholders with permanently attached leads, where used for other than festoon wiring, shall be hung from separate stranded rubber-covered conductors that are soldered directly to the circuit conductors but supported independently thereof.

(B) Size Unless part of listed decorative lighting assemblies, pendant conductors shall not be smaller than 14 AWG for mogul-base or medium-base screw-shell lampholders or smaller than 18 AWG for intermediate or candelabra-base lampholders.

(C) Twisted or Cabled Pendant conductors longer than 900 mm (3 ft) shall be twisted together where not cabled in a listed assembly.

410.54 Protection of Conductors and Insulation.

(A) Properly Secured Conductors shall be secured in a manner that does not tend to cut or abrade the insulation.

(B) Protection Through Metal Conductor insulation shall be protected from abrasion where it passes through metal.

(C) Luminaire (Fixture) Stems Splices and taps shall not be located within luminaire (fixture) arms or stems.

(D) Splices and Taps No unnecessary splices or taps shall be made within or on a luminaire (fixture).

FPN: For approved means of making connections, see 110.14.

(E) Stranding Stranded conductors shall be used for wiring on luminaire (fixture) chains and on other movable or flexible parts.

(F) Tension Conductors shall be arranged so that the weight of the luminaire (fixture) or movable parts does not put tension on the conductors.

410.55 Cord-Connected Showcases. Individual showcases, other than fixed, shall be permitted to be connected by flexible cord to permanently installed receptacles, and groups of not more than six such showcases shall be permitted to be coupled together by flexible cord and separable locking-type connectors with one of the group connected by flexible cord to a permanently installed receptacle.

The installation shall comply with 410.55(A) through 410.55(E).

(A) Cord Requirements Flexible cord shall be of the hard-service type, having conductors not smaller than the branch-circuit conductors, having ampacity at least equal to the branch-circuit overcurrent device, and having an equipment grounding conductor.

FPN: See Table 250.122 for size of equipment grounding conductor.

(B) Receptacles, Connectors, and Attachment Plugs Receptacles, connectors, and attachment plugs shall be of a listed grounding type rated 15 or 20 amperes.

(C) Support Flexible cords shall be secured to the undersides of showcases such that all of the following conditions are ensured:

(1) The wiring is not exposed to mechanical damage.

(2) The separation between cases is not in excess of 50 mm (2 in.), or more than 300 mm (12 in.) between the first case and the supply receptacle.

(3) The free lead at the end of a group of showcases has a female fitting not extending beyond the case.

(D) No Other Equipment Equipment other than showcases shall not be electrically connected to showcases.

(E) Secondary Circuit(s) Where showcases are cord-connected, the secondary circuit(s) of each electric-discharge lighting ballast shall be limited to one showcase.

410.56 Cord-Connected Lampholders and Luminaires (Fixtures).

(A) Lampholders Where a metal lampholder is attached to a flexible cord, the inlet shall be equipped with an insulating bushing that, if threaded, is not smaller than metric designator 12 (trade size 3/ 8) pipe size. The cord hole shall be of a size appropriate for the cord, and all burrs and fins shall be removed in order to provide a smooth bearing surface for the cord.

Bushing having holes 7 mm (9/ 32 in.) in diameter shall be permitted for use with plain pendant cord and holes 11 mm (13/ 32 in.) in diameter with reinforced cord.

(B) Adjustable Luminaires (Fixtures) Luminaires (fixtures) that require adjusting or aiming after installation shall not be required to be equipped with an attachment plug or cord connector, provided the exposed cord is of the hard-usage or extra-hard-usage type and is not longer than that required for maximum adjustment. The cord shall not be subject to strain or physical damage.

(C) Electric-Discharge Luminaires (Fixtures)

(1) Cord-Connected Installation A listed luminaire (fixture) or a listed assembly shall be permitted to be cord connected if the following conditions apply:

(1) The luminaire (fixture) is located directly below the outlet or busway.

(2) The flexible cord meets all the following:

a. Is visible for its entire length outside the luminaire (fixture)

b. Is not subject to strain or physical damage

c. Is terminated in a grounding-type attachment plug cap or busway plug, or is a part of a listed assembly incorporating a manufactured wiring system connector in accordance with 604.6(C), or has a luminaire (fixture) assembly with a strain relief and canopy

(2) Provided with Mogul-Base, Screw-Shell Lampholders Electric-discharge luminaires (lighting fixtures) provided with mogul-base, screw-shell lampholders shall be permitted to be connected to branch circuits of 50 amperes or less by cords complying with 240.5. Receptacles and attachment plugs shall be permitted to be of a lower ampere rating than the branch circuit but not less than 125 percent of the luminaire (fixture) full-load current.

(3) Equipped with Flanged Surface Inlet Electric-discharge luminaires (lighting fixtures) equipped with a flanged surface inlet shall be permitted to be supplied by cord pendants equipped with cord connectors. Inlets and connectors shall be permitted to be of a lower ampere rating than the branch circuit but not less than 125 percent of the luminaire (fixture) load current.

410.57 Luminaires (Fixtures) as Raceways. Luminaires (fixtures) shall not be used as a raceway for circuit conductors unless listed and marked for use as a raceway.

410.58 Wiring Supplying Luminaires (Fixtures) Connected Together. Luminaires (fixtures) designed for end-to-end connection to form a continuous assembly, or luminaires (fixtures) connected together by recognized wiring methods, shall be permitted to contain the conductors of a 2-wire branch circuit, or one multiwire branch circuit, supplying the connected luminaires (fixtures) and need not be listed as a raceway. One additional 2-wire branch circuit separately supplying one or more of the connected luminaires (fixtures) shall also be permitted.
FPN: See Article 100 for the definition of Multiwire Branch Circuit.

410.59 Branch Circuit Conductors and Ballasts. Branch-circuit conductors within 75 mm (3 in.) of a ballast shall have an insulation temperature rating not lower than 90°C (194°F) unless supplying a luminaire (fixture) listed and marked as suitable for a different insulation temperature.

VII. Construction of Luminaires (Fixtures)

410.60 Combustible Shades and Enclosures. Adequate airspace shall be provided between lamps and shades or other enclosures of combustible material.

410.61 Luminaire (Fixture) Rating.
(A) Marking All luminaires (fixtures) shall be marked with the maximum lamp wattage or electrical rating, manufacturer's name, trademark, or other suitable means of identification. A luminaire (fixture) requiring supply wire rated higher than 60°C (140°F) shall be marked in letters not smaller than 6 mm (1/ 4 in.) high, prominently displayed on the luminaire (fixture) and shipping carton or equivalent.
(B) Electrical Rating The electrical rating shall include the voltage and frequency and shall indicate the current rating of the unit, including the ballast, transformer, or autotransformer.

410.62 Design and Material. Luminaires (fixtures) shall be constructed of metal, wood, or other material suitable for the application and shall be designed and assembled so as to secure requisite mechanical strength and rigidity. Wiring compartments, including their entrances, shall be designed and constructed to permit conductors to be drawn in and withdrawn without physical damage.

410.63 Nonmetallic Luminaires (Fixtures). When luminaire (fixture) wiring compartments are constructed from combustible material, armored or lead-covered conductors with suitable fittings shall be used or the wiring compartment shall be lined with metal.

410.64 Mechanical Strength.
(A) Tubing for Arms Tubing used for arms and stems where provided with cut threads shall not be less than 1.02 mm (0.040 in.) in thickness and, where provided with rolled (pressed) threads, shall not be less than 0.64 mm (0.025 in.) in thickness. Arms and other parts shall be fastened to prevent turning.
(B) Metal Canopies Metal canopies supporting lampholders, shades, and so forth exceeding 4 kg (8 lb), or incorporating attachment-plug receptacles, shall not be less than 0.51 mm (0.020 in.) in thickness. Other canopies shall not be less than 0.41 mm (0.016 in.) if made of steel and not less than 0.51 mm (0.020 in.) if of other metals.
(C) Canopy Switches Pull-type canopy switches shall not be inserted in the rims of metal canopies that are less than 0.64 mm (0.025 in.) in thickness, unless the rims are reinforced by the turning of a bead or the equivalent. Pull-type canopy switches, whether mounted in the rims or elsewhere in sheet metal canopies, shall not be located more than 90 mm (3 1/ 2 in.) from the center of the canopy. Double set-screws, double canopy rings, a screw ring, or equal method shall be used where the canopy supports a pull-type switch or pendant receptacle.
The thickness requirements in the preceding paragraph shall apply to measurements made on finished (formed) canopies.

410.65 Wiring Space. Bodies of luminaires (fixtures), including portable lamps, shall provide ample space for splices and taps and for the installation of devices, if any. Splice compartments shall be of nonabsorbent, noncombustible material.

410.66 Portable Lamps.
(A) General Portable lamps shall be wired with flexible cord recognized by 400.4 and an attachment plug of the polarized or grounding type. Where used with Edison-base lampholders, the grounded conductor shall be identified and attached to the screw shell and the identified blade of the attachment plug.
(B) Portable Handlamps In addition to the provisions of 410.66(A), portable handlamps shall comply with the following:
(1) Metal shell, paper-lined lampholders shall not be used.
(2) Handlamps shall be equipped with a handle of molded composition or other insulating material.
(3) Handlamps shall be equipped with a substantial guard attached to the lampholder or handle.
(4) Metallic guards shall be grounded by means of an equipment grounding conductor run with circuit conductors within the power-supply cord.
(5) Portable handlamps shall not be required to be grounded where supplied through an isolating transformer with an ungrounded secondary of not over 50 volts.

410.67 Cord Bushings. A bushing or the equivalent shall be provided where flexible cord enters the base or stem of a portable lamp. The bushing shall be of insulating material unless a jacketed type of cord is used.

410.68 Tests. All wiring shall be free from short circuits and grounds and shall be tested for these defects prior to being connected to the circuit.

410.69 Live Parts. Exposed live parts within porcelain luminaires (fixtures) shall be suitably recessed and located so as to make it improbable that wires come in contact with them. There shall be a spacing of at least 13 mm (1/ 2 in.) between live parts and the mounting plane of the luminaire (fixture).

VIII. Installation of Lampholders

410.70 Screw-Shell Type. Lampholders of the screw-shell type shall be installed for use as lampholders only. Where supplied by a circuit having a grounded conductor, the grounded conductor shall be connected to the screw shell.

410.71 Double-Pole Switched Lampholders. Where supplied by the ungrounded conductors of a circuit, the switching device of lampholders of the switched type shall simultaneously disconnect both conductors of the circuit.

410.72 Lampholders in Wet or Damp Locations. Lampholders installed in wet or damp locations shall be of the weatherproof type.

IX. Construction of Lampholders

410.80 Insulation. The outer metal shell and the cap shall be lined with insulating material that prevents the shell and cap from becoming a part of the circuit. The lining shall not extend beyond the metal shell more than 3 mm (1/ 8 in.) but shall prevent any current-carrying part of the lamp base from being exposed when a lamp is in the lampholding device.

410.81 Switched Lampholders. Switched lampholders shall be of such construction that the switching mechanism interrupts the electrical connection to the center contact. The switching mechanism shall also be permitted to interrupt the electrical connection to the screw shell if the connection to the center contact is simultaneously interrupted.

X. Lamps and Auxiliary Equipment

410.90 Bases, Incandescent Lamps. An incandescent lamp for general use on lighting branch circuits shall not be equipped with a medium base if rated over 300 watts, or with a mogul base if rated over 1500 watts. Special bases or other devices shall be used for over 1500 watts.

410.91 Electric-Discharge Lamp Auxiliary Equipment.
(A) Enclosures Auxiliary equipment for electric-discharge lamps shall be enclosed in noncombustible cases and treated as sources of heat.
(B) Switching Where supplied by the ungrounded conductors of a circuit, the switching device of auxiliary equipment shall simultaneously disconnect all conductors.

XI. Special Provisions for Flush and Recessed Luminaires (Fixtures)

410.100 General. Luminaires (fixtures) installed in recessed cavities in walls or ceilings shall comply with 410.101 through 410.113.

410.101 Temperature.
(A) Combustible Material Luminaires (fixtures) shall be installed so that adjacent combustible material will not be subjected to temperatures in excess of 90°C (194°F).
(B) Fire-Resistant Construction Where a luminaire (fixture) is recessed in fire-resistant material in a building of fire-resistant construction, a temperature higher than 90°C (194°F) but not higher than 150°C (302°F) shall be considered acceptable if the luminaire (fixture) is plainly marked that it is listed for that service.
(C) Recessed Incandescent Luminaires (Fixtures) Incandescent luminaires (fixtures) shall have thermal protection and shall be identified as thermally protected.
Exception No. 1: Thermal protection shall not be required in a recessed luminaire (fixture) identified for use and installed in poured concrete.

Exception No. 2: Thermal protection shall not be required in a recessed luminaire (fixture) whose design, construction, and thermal performance characteristics are equivalent to a thermally protected luminaire (fixture) and are identified as inherently protected.

410.102 Clearance and Installation.

(A) Clearance

(1) Non-Type IC A recessed luminaire (fixture) that is not identified for contact with insulation shall have all recessed parts spaced not less than 13 mm (1/ 2 in.) from combustible materials. The points of support and the trim finishing off the opening in the ceiling or wall surface shall be permitted to be in contact with combustible materials.

(2) Type IC A recessed luminaire (fixture) that is identified for contact with insulation, Type IC, shall be permitted to be in contact with combustible materials at recessed parts, points of support, and portions passing through or finishing off the opening in the building structure.

(B) Installation Thermal insulation shall not be installed above a recessed luminaire (fixture) or with 75 mm (3 in.) of the recessed luminaire's (fixture's) enclosure, wiring compartment, or ballast unless it is identified for contact with insulation, Type IC.

410.103 Wiring.

(A) General Conductors that have insulation suitable for the temperature encountered shall be used.

(B) Circuit Conductors Branch-circuit conductors that have an insulation suitable for the temperature encountered shall be permitted to terminate in the luminaire (fixture).

(C) Tap Conductors Tap conductors of a type suitable for the temperature encountered shall be permitted to run from the luminaire (fixture) terminal connection to an outlet box placed at least 300 mm (1 ft) from the luminaire (fixture). Such tap conductors shall be in suitable raceway or Type AC or MC cable of at least 450 mm (18 in.) but not more than 1.8 m (6 ft) in length.

XII. Construction of Flush and Recessed Luminaires (Fixtures)

410.110 Temperature. Luminaires (fixtures) shall be constructed such that adjacent combustible material is not subject to temperatures in excess of 90°C (194°F).

410.111 Lamp Wattage Marking. Incandescent lamp luminaires (fixtures) shall be marked to indicate the maximum allowable wattage of lamps. The markings shall be permanently installed, in letters at least 6 mm (1/ 4 in.) high, and shall be located where visible during relamping.

410.112 Solder Prohibited. No solder shall be used in the construction of a luminaire (fixture) box.

410.113 Lampholders. Lampholders of the screw-shell type shall be of porcelain or other suitable insulating materials. Where used, cements shall be of the high-heat type.

XIII. Special Provisions for Electric-Discharge Lighting Systems of 1000 Volts or Less

410.120 General.

(A) Open-Circuit Voltage of 1000 Volts or Less Equipment for use with electric-discharge lighting systems and designed for an open-circuit voltage of 1000 volts or less shall be of a type intended for such service.

(B) Considered as Energized The terminals of an electric-discharge lamp shall be considered as energized where any lamp terminal is connected to a circuit of over 300 volts.

(C) Transformers of the Oil-Filled Type Transformers of the oil-filled type shall not be used.

(D) Additional Requirements In addition to complying with the general requirements for luminaires (lighting fixtures), such equipment shall comply with Part XIII of this article.

(E) Thermal Protection — Fluorescent Luminaires (Fixtures)

(1) Integral Thermal Protection The ballast of a fluorescent luminaire (fixture) installed indoors shall have integral thermal protection. Replacement ballasts shall also have thermal protection integral with the ballast.

(2) Simple Reactance Ballasts A simple reactance ballast in a fluorescent luminaire (fixture) with straight tubular lamps shall not be required to be thermally protected.

(3) Exit Fixtures A ballast in a fluorescent exit luminaire (fixture) shall not have thermal protection.

(4) Egress Luminaires (Fixtures) A ballast in a fluorescent luminaire (fixture) that is used for egress lighting and energized only during a failure of the normal supply shall not have thermal protection.

F) High-Intensity Discharge Luminaires (Fixtures)

(1) Recessed Recessed high-intensity luminaires (fixtures) designed to be installed in wall or ceiling cavities shall have thermal protection and be identified as thermally protected.

(2) Inherently Protected Thermal protection shall not be required in a recessed high-intensity luminaire (fixture) whose design, construction, and thermal performance characteristics are equivalent to a thermally protected luminaire (fixture) and are identified as inherently protected.

(3) Installed in Poured Concrete Thermal protection shall not be required in a recessed high-intensity discharge luminaire (fixture) identified for use and installed in poured concrete.

(4) Recessed Remote Ballasts A recessed remote ballast for a high-intensity discharge luminaire (fixture) shall have thermal protection that is integral with the ballast and be identified as thermally protected.

(5) Metal Halide Lamp Containment Luminaires (fixtures) that use a metal halide lamp other than a thick-glass parabolic reflector lamp (PAR) shall be provided with a containment barrier that encloses the lamp, or shall be provided with a physical means that only allows the use of a lamp that is Type O.

FPN: See ANSI Standard C78.387, American National Standard for Electric Lamps — Metal Halide Lamps, Methods of Measuring Characteristics.

(G) Disconnecting Means In indoor locations, other than dwellings and associated accessory structures, fluorescent luminaires (fixtures) that utilize double-ended lamps and contain ballast(s) that can be serviced in place or ballasted luminaires that are supplied from multiwire branch circuits and contain ballast(s) that can be serviced in place shall have a disconnecting means either internal or external to each luminaire (fixture), to disconnect simultaneously from the source of supply all conductors of the ballast, including the grounded conductor if any. The line side terminals of the disconnecting means shall be guarded. The disconnecting means shall be located so as to be accessible to qualified persons before servicing or maintaining the ballast.

Exception No. 1: A disconnecting means shall not be required for luminaires (fixtures) installed in hazardous (classified) location(s).

Exception No. 2: A disconnecting means shall not be required for emergency illumination required in 700.16.

Exception No. 3: For cord-and-plug-connected luminaires, an accessible separable connector or an accessible plug and receptacle shall be permitted to serve as the disconnecting means.

Exception No. 4: A disconnecting means shall not be required in industrial establishments with restricted public access where conditions of maintenance and supervision ensure that only qualified persons service the installation by written procedures.

Exception No. 5: Where more than one luminaire is installed and supplied by other than a multiwire branch circuit, a disconnecting means shall not be required for every luminaire when the design of the installation includes locally accessible disconnects, such that the illuminated space cannot be left in total darkness.

410.121 Direct-Current Equipment. Luminaires (fixtures) installed on dc circuits shall be equipped with auxiliary equipment and resistors designed for dc operation. The luminaires (fixtures) shall be marked for dc operation.

410.122 Open-Circuit Voltage Exceeding 300 Volts. Equipment having an open-circuit voltage exceeding 300 volts shall not be installed in dwelling occupancies unless such equipment is designed so that there will be no exposed live parts when lamps are being inserted, are in place, or are being removed.

410.123 Luminaire (Fixture) Mounting.

(A) Exposed Ballasts Luminaires (fixtures) that have exposed ballasts or transformers shall be installed so that such ballasts or transformers will not be in contact with combustible material.

(B) Combustible Low-Density Cellulose Fiberboard Where a surface-mounted luminaire (fixture) containing a ballast is to be installed on combustible low-density cellulose fiberboard, it shall be listed for this condition or shall be spaced not less than 38 mm (1 1/ 2 in.) from the surface of the fiberboard. Where such luminaires (fixtures) are partially or wholly recessed, the provisions of 410.100 through 410.113 shall apply.

FPN: Combustible low-density cellulose fiberboard includes sheets, panels, and tiles that have a density of 320 kg/m 3 (20 lb/ft 3) or less and that are formed of bonded plant fiber material but does not include solid or laminated wood or fiberboard that has a density in excess of 320 kg/m 3 (20 lb/ft 3) or is a material that has been integrally treated with fire-retarding chemicals to the degree that the flame spread in any plane of the material will not exceed 25, determined in accordance with tests for surface burning characteristics of building materials. See ANSI/ASTM E84-1997, Test Method for Surface Burning Characteristics of Building Materials.

410.124 Equipment Not Integral with Luminaire (Fixture).

(A) Metal Cabinets Auxiliary equipment, including reactors, capacitors, resistors, and similar equipment, where not installed as part of a luminaire (lighting fixture) assembly, shall be enclosed in accessible, permanently installed metal cabinets.

(B) Separate Mounting Separately mounted ballasts that are intended for direct connection to a wiring system shall not be required to be separately enclosed.

(C) Wired Luminaire (Fixture) Sections Wired luminaire (fixture) sections are paired, with a ballast(s) supplying a lamp or lamps in both. For interconnection between paired units, it shall be permissible to use metric designator 12 (trade size 3/ 8) flexible metal conduit in lengths not exceeding 7.5 m (25 ft), in conformance with Article 348. Luminaire (fixture) wire operating at line voltage, supplying only the ballast(s) of one of the paired luminaires (fixtures), shall be permitted in the same raceway as the lamp supply wires of the paired luminaires (fixtures).

410.125 Autotransformers. An autotransformer that is used to raise the voltage to more than 300 volts, as part of a ballast for supplying lighting units, shall be supplied only by a grounded system.

410.126 Switches. Snap switches shall comply with 404.14.

XIV. Special Provisions for Electric-Discharge Lighting Systems of More Than 1000 Volts

410.130 General.

(A) Listing Electric-discharge lighting systems with an open-circuit voltage exceeding 1000 volts shall be listed and installed in conformance with that listing.

(B) Dwelling Occupancies Equipment that has an open-circuit voltage exceeding 1000 volts shall not be installed in or on dwelling occupancies.

(C) Live Parts The terminal of an electric-discharge lamp shall be considered as a live part.

(D) Additional Requirements In addition to complying with the general requirements for luminaires (lighting fixtures), such equipment shall comply with Part XIV of this article.

FPN: For signs and outline lighting, see Article 600.

410.131 Control.

(A) Disconnection Luminaires (fixtures) or lamp installation shall be controlled either singly or in groups by an externally operable switch or circuit breaker that opens all ungrounded primary conductors.

(B) Within Sight or Locked Type The switch or circuit breaker shall be located within sight from the luminaires (fixtures) or lamps, or it shall be permitted elsewhere if it is provided with a means for locking in the open position.

410.132 Lamp Terminals and Lampholders. Parts that must be removed for lamp replacement shall be hinged or held captive. Lamps or lampholders shall be designed so that there are no exposed live parts when lamps are being inserted or removed.

410.133 Transformers.

(A) Type Transformers shall be enclosed, identified for the use, and listed.

(B) Voltage The secondary-circuit voltage shall not exceed 15,000 volts, nominal, under any load condition. The voltage to ground of any output terminals of the secondary circuit shall not exceed 7500 volts, under any load conditions.

(C) Rating Transformers shall have a secondary short-circuit current rating of not more than 150 mA if the open-circuit voltage is over 7500 volts, and not more than 300 mA if the open-circuit voltage rating is 7500 volts or less.

(D) Secondary Connections Secondary circuit outputs shall not be connected in parallel or in series.

410.134 Transformer Locations.

(A) Accessible Transformers shall be accessible after installation.

(B) Secondary Conductors Transformers shall be installed as near to the lamps as practicable to keep the secondary conductors as short as possible.

(C) Adjacent to Combustible Materials Transformers shall be located so that adjacent combustible materials are not subjected to temperatures in excess of 90°C (194°F).

410.135 Exposure to Damage. Lamps shall not be located where normally exposed to physical damage.

410.136 Marking. Each luminaire (fixture) or each secondary circuit of tubing having an open-circuit voltage of over 1000 volts shall have a clearly legible marking in letters not less than 6 mm (1/ 4 in.) high reading ``Caution _____ volts.'' The voltage indicated shall be the rated open-circuit voltage.

410.137 Switches. Snap switches shall comply with 404.4.

XV. Lighting Track

410.140 Installation.

(A) Lighting Track Lighting track shall be permanently installed and permanently connected to a branch circuit. Only lighting track fittings shall be installed on lighting track. Lighting track fittings shall not be equipped with general-purpose receptacles.

Connected Load The connected load on lighting track shall not exceed the rating of the track. Lighting track shall be supplied by a branch circuit having a rating not more than that of the track.

(C) Locations Not Permitted Lighting track shall not be installed in the following locations:

(1) Where likely to be subjected to physical damage
(2) In wet or damp locations
(3) Where subject to corrosive vapors
(4) In storage battery rooms
(5) In hazardous (classified) locations
(6) Where concealed
(7) Where extended through walls or partitions
(8) Less than 1.5 m (5 ft) above the finished floor except where protected from physical damage or track operating at less than 30 volts rms open-circuit voltage
(9) Where prohibited by 410.10(D)

(D) Support Fittings identified for use on lighting track shall be designed specifically for the track on which they are to be installed. They shall be securely fastened to the track, shall maintain polarization and grounding, and shall be designed to be suspended directly from the track.

410.141 Heavy-Duty Lighting Track. Heavy-duty lighting track is lighting track identified for use exceeding 20 amperes. Each fitting attached to a heavy-duty lighting track shall have individual overcurrent protection.

410.142 Fastening. Lighting track shall be securely mounted so that each fastening is suitable for supporting the maximum weight of luminaires (fixtures) that can be installed. Unless identified for supports at greater intervals, a single section 1.2 m (4 ft) or shorter in length shall have two supports, and, where installed in a continuous row, each individual section of not more than 1.2 m (4 ft) in length shall have one additional support.

410.143 Construction Requirements.

(A) Construction The housing for the lighting track system shall be of substantial construction to maintain rigidity. The conductors shall be installed within the track housing, permitting insertion of a luminaire (fixture), and designed to prevent tampering and accidental contact with live parts. Components of lighting track systems of different voltages shall not be interchangeable. The track conductors shall be a minimum 12 AWG or equal and shall be copper. The track system ends shall be insulated and capped.

(B) Grounding Lighting track shall be grounded in accordance with Article 250, and the track sections shall be securely coupled to maintain continuity of the circuitry, polarization, and grounding throughout.

XVI. Decorative Lighting and Similar Accessories

410.150 Listing of Decorative Lighting. Decorative lighting and similar accessories used for holiday lighting and similar purposes, in accordance with 590.3(B), shall be listed.
Substantiation: This proposal is to move the definitions in Article 410 to Section 410.2 and renumber Article 410 to accommodate this change and to provide for future additional sections.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 18-43. This proposal addresses the concerns of the submitter.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-43 Log #3179 NEC-P18 **Final Action: Accept**
(410)

Submitter: Michael S. O'Boyle, Lightolier Division of the Genlyte Group, LLC
Recommendation: Add a new Article to read as follows:

ARTICLE 410 Luminaires (Lighting Fixtures), Lampholders, and Lamps

I. General

410.1 Scope. This article covers luminaires (lighting fixtures), lampholders, pendants, incandescent filament lamps, arc lamps, electric-discharge lamps, decorative lighting products, lighting accessories for temporary seasonal and holiday use, portable flexible lighting products, and the wiring and equipment forming part of such products and lighting installations.
410.2 Definitions
Closet Storage Space. The volume bounded by the sides and back closet walls and planes extending from the closet floor vertically to a height of 1.8 m (6 ft) or to the highest clothes-hanging rod and parallel to the walls at a horizontal distance of 600 mm (24 in.) from the sides and back of the closet walls, respectively, and continuing vertically to the closet ceiling parallel to the walls at a horizontal distance of 300 mm (12 in.) or the width of the shelf, whichever is greater; for a closet that permits access to both sides of a hanging rod, this space includes the volume below the highest rod extending 300 mm (12 in.) on either side of the rod on a plane horizontal to the floor extending the entire length of the rod.

(Existing Figure 410.8 Closet Storage Space. to be placed here)

Lighting Track. A manufactured assembly designed to support and energize luminaires (lighting fixtures) that are capable of being readily repositioned on the track. Its length can be altered by the addition or subtraction of sections of track.
410.3 Other Articles for Specific-Purpose Luminaires (Lighting Fixtures), Lampholders, and Lamps Luminaires (Lighting Fixtures), Lampholders, and Lamps shall comply with this article and also with the applicable provisions of other articles of this *Code*. The provisions for specific-purpose luminaires listed in Table 410.3 amend or supplement the provisions in this article and shall apply to Luminaires referred therein.

Table 410.3 Specific-Purpose Luminaires (Lighting Fixtures), Lampholders, and Lamps

Equipment	Article	Section
Lighting systems operating at 30 volts or less	411	
Arc lamps used on constant-current systems	490	
Equipment for use in hazardous(Classified) locations	500 through 517	
Arc lamps used in theaters		520.61
Arc lamps used in projection Machines		540.20

410. 5 Live Parts. Luminaires (fixtures), lampholders, and lamps shall have no live parts normally exposed to contact. Exposed accessible terminals in lampholders and switches shall not be installed in metal luminaire (fixture) canopies or in open bases of portable table or floor lamps.
Exception: Cleat-type lampholders located at least 2.5 m (8 ft) above the floor shall be permitted to have exposed terminals.

II. Luminaire (Fixture) Locations

410.10 Luminaires (Fixtures) in Specific Locations.

(A) Wet and Damp Locations. Luminaires (fixtures) installed in wet or damp locations shall be installed so that water cannot enter or accumulate in wiring compartments, lampholders, or other electrical parts. All luminaires (fixtures) installed in wet locations shall be marked, "Suitable for Wet Locations." All luminaires (fixtures) installed in damp locations shall be marked, "Suitable for Wet Locations" or "Suitable for Damp Locations."
(B) Corrosive Locations. Luminaires (fixtures) installed in corrosive locations shall be of a type suitable for such locations.
(C) In Ducts or Hoods. Luminaires (fixtures) shall be permitted to be installed in commercial cooking hoods where all of the following conditions are met:
(1) The luminaire (fixture) shall be identified for use within commercial cooking hoods and installed such that the temperature limits of the materials used are not exceeded.
(2) The luminaire (fixture) shall be constructed so that all exhaust vapors, grease, oil, or cooking vapors are excluded from the lamp and wiring compartment. Diffusers shall be resistant to thermal shock.
(3) Parts of the luminaire (fixture) exposed within the hood shall be corrosion resistant or protected against corrosion, and the surface shall be smooth so as not to collect deposits and to facilitate cleaning.
(4) Wiring methods and materials supplying the luminaire(s) [fixture(s)] shall not be exposed within the cooking hood.
FPN: See 110-1 for conductors and equipment exposed to deteriorating agents.
(D) Bathtub and Shower Areas. No parts of cord-connected luminaires (fixtures), chain-, cable-, or cord-suspended-luminaires (fixtures), lighting track, pendants, or ceiling-suspended (paddle) fans shall be located within a zone measured 900 mm (3 ft) horizontally and 2.5 m (8 ft) vertically from the top of the bathtub rim or shower stall threshold. This zone is all encompassing and includes the zone directly over the tub or shower stall. Luminaires (lighting fixtures) located in this zone shall be listed for damp locations, or listed for wet locations where subject to shower spray.
(E) Luminaires (Fixtures) in Indoor Sports, Mixed-Use, and All-Purpose Facilities. Luminaires (fixtures) subject to physical damage, using a mercury vapor or metal halide lamp, installed in playing and spectator seating areas of indoor sports, mixed-use, or all-purpose facilities shall be of the type that protects the lamp with a glass or plastic lens. Such luminaires (fixtures) shall be permitted to have an additional guard.
410.~~5.~~11 Luminaires (Fixtures) Near Combustible Material
Luminaires (fixtures) shall be constructed, installed, or equipped with shades or guards so that combustible material is not subjected to temperatures in excess of 90°C (194°F).
410.~~6~~ 12 Luminaires (Fixtures) Over Combustible Material
Lampholders installed over highly combustible material shall be of the unswitched type. Unless an individual switch is provided for each luminaire (fixture), lampholders shall be located at least 2.5 m (8 ft) above the floor or shall be located or guarded so that the lamps cannot be readily removed or damaged.
410.~~7~~ 14 Luminaires (Fixtures) in Show Windows
Chain-supported luminaires (fixtures) used in a show window shall be permitted to be externally wired. No other externally wired luminaires (fixtures) shall be used.
410.~~8~~ 16 Luminaires (Fixtures) in Clothes Closets
~~(A) Definition~~
~~Storage Space The volume bounded by the sides and back closet walls and planes extending from the closet floor vertically to a height of 1.8 m (6 ft) or to the highest clothes-hanging rod and parallel to the walls at a horizontal distance of 600 mm (24 in.) from the sides and back of the closet walls, respectively, and continuing vertically to the closet ceiling parallel to the walls at a horizontal distance of 300 mm (12 in.) or the width of the shelf, whichever is greater; for a closet that permits access to both sides of a hanging rod, this space includes the volume below the highest rod extending 300 mm (12 in.) on either side of the rod on a plane horizontal to the floor extending the entire length of the rod.~~
~~(B)~~ (A) Luminaire (Fixture) Types Permitted Listed luminaires (fixtures) of the following types shall be permitted to be installed in a closet:
(1) A surface-mounted or recessed incandescent luminaire (fixture) with a completely enclosed lamp
(2) A surface-mounted or recessed fluorescent luminaire (fixture)
~~(C)~~ (B) Luminaire (Fixture) Types Not Permitted Incandescent luminaires (fixtures) with open or partially enclosed lamps and pendant luminaires (fixtures) or lampholders shall not be permitted. (D) Location Luminaires (fixtures) in clothes closets shall be permitted to be installed as follows:
~~(D)~~ (C) Location Luminaires (fixtures) in clothes closets shall be permitted to be installed as follows:
(1) Surface-mounted incandescent luminaires (fixtures) installed on the wall above the door or on the ceiling, provided there is a minimum clearance of 300 mm (12 in.) between the luminaire (fixture) and the nearest point of a storage space

(2) Surface-mounted fluorescent luminaires (fixtures) installed on the wall above the door or on the ceiling, provided there is a minimum clearance of 150 mm (6 in.) between the luminaire (fixture) and the nearest point of a storage space

(3) Recessed incandescent luminaires (fixtures) with a completely enclosed lamp installed in the wall or the ceiling, provided there is a minimum clearance of 150 mm (6 in.) between the luminaire (fixture) and the nearest point of a storage space

(4) Recessed fluorescent luminaires (fixtures) installed in the wall or the ceiling, provided there is a minimum clearance of 150 mm (6 in.) between the luminaire (fixture) and the nearest point of a storage space

410.~~9~~ 18 Space for Cove Lighting

Coves shall have adequate space and shall be located so that lamps and equipment can be properly installed and maintained.

III. Provisions at Luminaire (Fixture) Outlet Boxes, Canopies, and Pans

410.~~10~~ 20 Space for Conductors

Canopies and outlet boxes taken together shall provide adequate space so that luminaire (fixture) conductors and their connecting devices can be properly installed.

410.~~11~~ 21 Temperature Limit of Conductors in Outlet Boxes

Luminaires (fixtures) shall be of such construction or installed so that the conductors in outlet boxes shall not be subjected to temperatures greater than that for which the conductors are rated.

Branch-circuit wiring, other than 2-wire or multiwire branch circuits supplying power to luminaires (fixtures) connected together, shall not be passed through an outlet box that is an integral part of a luminaire (fixture) unless the luminaire (fixture) is identified for through-wiring.

FPN:See 410.32 for wiring supplying power to fixtures connected together.

410.~~12~~ 22 Outlet Boxes to Be Covered

In a completed installation, each outlet box shall be provided with a cover unless covered by means of a luminaire (fixture) canopy, lampholder, receptacle, or similar device.

410.~~13~~ 23 Covering of Combustible Material at Outlet Boxes

Any combustible wall or ceiling finish exposed between the edge of a luminaire (fixture) canopy or pan and an outlet box shall be covered with noncombustible material.

410.~~14~~ 24 Connection of Electric-Discharge Luminaires (Lighting Fixtures)

(A) Independent of the Outlet Box Electric-discharge luminaires (lighting fixtures) supported independently of the outlet box shall be connected to the branch circuit through metal raceway, nonmetallic raceway, Type MC cable, Type AC cable, Type MI cable, nonmetallic sheathed cable, or by flexible cord as permitted in 410.30(B) or 410.30(C).

(B) Access to Boxes Electric-discharge luminaires (fixtures) surface mounted over concealed outlet, pull, or junction boxes and designed not to be supported solely by the outlet box shall be provided with suitable openings in the back of the luminaire (fixture) to provide access to the wiring in the box.

IV. Luminaire (Fixture) Supports

410.~~15~~ 30 Supports

(A) General Luminaires (fixtures) and lampholders shall be securely supported. A luminaire (fixture) that weighs more than 3 kg (6 lb) or exceeds 400 mm (16 in.) in any dimension shall not be supported by the screw shell of a lampholder.

(B) Metal or Nonmetallic Poles Supporting Luminaires (Lighting Fixtures) Metal or nonmetallic poles shall be permitted to be used to support luminaires (lighting fixtures) and as a raceway to enclose supply conductors, provided the following conditions are met:

(1) A pole shall have a handhole not less than 50 mm × 100 mm (2 in. × 4 in.) with a raintight cover to provide access to the supply terminations within the pole or pole base.

Exception No. 1: No handhole shall be required in a pole 2.5 m (8 ft) or less in height above grade where the supply wiring method continues without splice or pull point, and where the interior of the pole and any splices are accessible by removing the luminaire (fixture).

Exception No. 2: No handhole shall be required in a pole 6.0 m (20 ft) or less in height above grade that is provided with a hinged base.

(2) Where raceway risers or cable is not installed within the pole, a threaded fitting or nipple shall be brazed, welded, or attached to the pole opposite the handhole for the supply connection.

(3) A metal pole shall be provided with a grounding terminal as follows:

a. A pole with a handhole shall have the grounding terminal accessible from the handhole.

b. A pole with a hinged base shall have the grounding terminal accessible within the base.

Exception to (3): No grounding terminal shall be required in a pole 2.5 m (8 ft) or less in height above grade where the supply wiring method continues without splice or pull, and where the interior of the pole and any splices are accessible by removing the luminaire (fixture).

(4) A metal pole with a hinged base shall have the hinged base and pole bonded together.

(5) Metal raceways or other equipment grounding conductors shall be bonded to the metal pole with an equipment grounding conductor recognized by 250.118 and sized in accordance with 250.122.

(6) Conductors in vertical poles used as raceway shall be supported as provided in 300.19.

410.~~16~~ 36 Means of Support

(A) Outlet Boxes Outlet boxes or fittings installed as required by 314.23 and complying with the provisions of 314.27(A) and 314.27(B) shall be permitted to support luminaires (fixtures).

(B) Inspection Luminaires (fixtures) shall be installed such that the connections between the luminaire (fixture) conductors and the circuit conductors can be inspected without requiring the disconnection of any part of the wiring unless the luminaires (fixtures) are connected by attachment plugs and receptacles.

(C) Suspended Ceilings Framing members of suspended ceiling systems used to support luminaires (fixtures) shall be securely fastened to each other and shall be securely attached to the building structure at appropriate intervals. Luminaires (fixtures) shall be securely fastened to the ceiling framing member by mechanical means such as bolts, screws, or rivets. Listed clips identified for use with the type of ceiling framing member(s) and luminaire(s) [fixture(s)] shall also be permitted.

(D) Luminaire (Fixture) Studs Luminaire (fixture) studs that are not a part of outlet boxes, hickeys, tripods, and crowfeet shall be made of steel, malleable iron, or other material suitable for the application.

(E) Insulating Joints Insulating joints that are not designed to be mounted with screws or bolts shall have an exterior metal casing, insulated from both screw connections.

(F) Raceway Fittings Raceway fittings used to support a luminaire(s) [lighting fixture(s)] shall be capable of supporting the weight of the complete fixture assembly and lamp(s).

(G) Busways Luminaires (fixtures) shall be permitted to be connected to busways in accordance with 368.17(C).

(H) Trees Outdoor luminaires (lighting fixtures) and associated equipment shall be permitted to be supported by trees.

FPN No. 1: See 225.26 for restrictions for support of overhead conductors.

FPN No. 2: See 300.5(D) for protection of conductors.

V. Grounding

410.~~17~~ 40 General

Luminaires (fixtures) and lighting equipment shall be grounded as required in Article 250 and Part V of this article.

410.~~18~~ 42 Exposed Luminaire (Fixture) Parts

(A) Exposed Conductive Parts Exposed metal parts shall be grounded or insulated from ground and other conducting surfaces or be inaccessible to unqualified personnel. Lamp tie wires, mounting screws, clips, and decorative bands on glass spaced at least 38 mm (1 1/ 2 in.) from lamp terminals shall not be required to be grounded.

(B) Made of Insulating Material Luminaires (fixtures) directly wired or attached to outlets supplied by a wiring method that does not provide a ready means for grounding shall be made of insulating material and shall have no exposed conductive parts.

Exception No. 1: Replacement luminaires (fixtures) shall be permitted to connect an equipment grounding conductor from the outlet in compliance with 250.130(C). The luminaire (fixture) shall then be grounded in accordance with 410.18(A).

Exception No. 2: Where no equipment grounding conductor exists at the outlet, replacement luminaires (fixtures) that are GFCI protected shall not be required to be connected to an equipment grounding conductor.

410.~~20~~ 44 Equipment Grounding Conductor Attachment

Luminaires (fixtures) with exposed metal parts shall be provided with a means for connecting an equipment grounding conductor for such luminaires (fixtures).

410.~~21~~ 46 Methods of Grounding

Luminaires (fixtures) and equipment shall be considered grounded where mechanically connected to an equipment grounding conductor as specified in 250.118 and sized in accordance with 250.122.

VI. Wiring of Luminaires (Fixtures)

410.~~22~~ 48 Luminaire (Fixture) Wiring — General

Wiring on or within fixtures shall be neatly arranged and shall not be exposed to physical damage. Excess wiring shall be avoided. Conductors shall be arranged so that they are not subjected to temperatures above those for which they are rated.

410.~~23~~ 50 Polarization of Luminaires (Fixtures)

Luminaires (fixtures) shall be wired so that the screw shells of lampholders are connected to the same luminaire (fixture) or circuit conductor or terminal. The grounded conductor, where connected to a screw-shell lampholder, shall be connected to the screw shell.

410.~~24~~ 52 Conductor Insulation

Luminaires (fixtures) shall be wired with conductors having insulation suitable for the environmental conditions, current, voltage, and temperature to which the conductors will be subjected.

FPN: For ampacity of luminaire (fixture) wire, maximum operating temperature, voltage limitations, minimum wire size, and so forth, see Article 402.

410.~~27~~ 54 Pendant Conductors for Incandescent Filament Lamps

(A) Support Pendant lampholders with permanently attached leads, where used for other than festoon wiring, shall be hung from separate stranded rubber-covered conductors that are soldered directly to the circuit conductors but supported independently thereof.

(B) Size Unless part of listed decorative lighting assemblies, pendant conductors shall not be smaller than 14 AWG for mogul-base or medium-base screw-shell lampholders or smaller than 18 AWG for intermediate or candelabra-base lampholders.

(C) Twisted or Cabled Pendant conductors longer than 900 mm (3 ft) shall be twisted together where not cabled in a listed assembly.

410.~~28~~ 56 Protection of Conductors and Insulation

(A) Properly Secured. Conductors shall be secured in a manner that does not tend to cut or abrade the insulation.

(B) Protection Through Metal. Conductor insulation shall be protected from abrasion where it passes through metal.

(C) Luminaire (Fixture) Stems Splices and taps shall not be located within luminaire (fixture) arms or stems.

(D) Splices and Taps. No unnecessary splices or taps shall be made within or on a luminaire (fixture).

FPN: For approved means of making connections, see 110.14.

(E) Stranding. Stranded conductors shall be used for wiring on luminaire (fixture) chains and on other movable or flexible parts.

(F) Tension. Conductors shall be arranged so that the weight of the luminaire (fixture) or movable parts does not put tension on the conductors.

410.~~29~~ 59 Cord-Connected Showcases

Individual showcases, other than fixed, shall be permitted to be connected by flexible cord to permanently installed receptacles, and groups of not more than six such showcases shall be permitted to be coupled together by flexible cord and separable locking-type connectors with one of the group connected by flexible cord to a permanently installed receptacle.

The installation shall comply with 410.29(A) through 410.29(E).

(A) Cord Requirements. Flexible cord shall be of the hard-service type, having conductors not smaller than the branch-circuit conductors, having ampacity at least equal to the branch-circuit overcurrent device, and having an equipment grounding conductor.

FPN: See Table 250.122 for size of equipment grounding conductor.

(B) Receptacles, Connectors, and Attachment Plugs Receptacles, connectors, and attachment plugs shall be of a listed grounding type rated 15 or 20 amperes.

(C) Support Flexible cords shall be secured to the undersides of showcases such that all of the following conditions are ensured:

(1) The wiring is not exposed to mechanical damage.

(2) The separation between cases is not in excess of 50 mm (2 in.), or more than 300 mm (12 in.) between the first case and the supply receptacle.

(3) The free lead at the end of a group of showcases has a female fitting not extending beyond the case.

(D) No Other Equipment. Equipment other than showcases shall not be electrically connected to showcases.

(E) Secondary Circuit(s). Where showcases are cord-connected, the secondary circuit(s) of each electric-discharge lighting ballast shall be limited to one showcase.

410.~~30~~ 62 Cord-Connected Lampholders and Luminaires (Fixtures)

(A) Lampholders. Where a metal lampholder is attached to a flexible cord, the inlet shall be equipped with an insulating bushing that, if threaded, is not smaller than metric designator 12 (trade size 3/ 8) pipe size. The cord hole shall be of a size appropriate for the cord, and all burrs and fins shall be removed in order to provide a smooth bearing surface for the cord.
Bushing having holes 7 mm (9/ 32 in.) in diameter shall be permitted for use with plain pendant cord and holes 11 mm (13/ 32 in.) in diameter with reinforced cord.

(B) Adjustable Luminaires (Fixtures) Luminaires (fixtures) that require adjusting or aiming after installation shall not be required to be equipped with an attachment plug or cord connector, provided the exposed cord is of the hard-usage or extra-hard-usage type and is not longer than that required for maximum adjustment. The cord shall not be subject to strain or physical damage.

(C) Electric-Discharge Luminaires (Fixtures)

(1) Cord-Connected Installation. A listed luminaire (fixture) or a listed assembly shall be permitted to be cord connected if the following conditions apply:

(1) The luminaire (fixture) is located directly below the outlet or busway.

(2) The flexible cord meets all the following:

a. Is visible for its entire length outside the luminaire (fixture)

b. Is not subject to strain or physical damage

c. Is terminated in a grounding-type attachment plug cap or busway plug, or is a part of a listed assembly incorporating a manufactured wiring system connector in accordance with 604.6(C), or has a luminaire (fixture) assembly with a strain relief and canopy

(2) Provided with Mogul-Base, Screw-Shell Lampholders Electric-discharge luminaires (lighting fixtures) provided with mogul-base, screw-shell lampholders shall be permitted to be connected to branch circuits of 50 amperes or less by cords complying with 240.5. Receptacles and attachment plugs shall be permitted to be of a lower ampere rating than the branch circuit but not less than 125 percent of the luminaire (fixture) full-load current.

(3) Equipped with Flanged Surface Inlet Electric-discharge luminaires (lighting fixtures) equipped with a flanged surface inlet shall be permitted to be supplied by cord pendants equipped with cord connectors. Inlets and connectors shall be permitted to be of a lower ampere rating than the branch circuit but not less than 125 percent of the luminaire (fixture) load current.

410.~~31~~ 64 Luminaires (Fixtures) as Raceways

Luminaires (fixtures) shall not be used as a raceway for circuit conductors unless listed and marked for use as a raceway.

410.~~32~~ 65 Wiring Supplying Luminaires (Fixtures) Connected Together

Luminaires (fixtures) designed for end-to-end connection to form a continuous assembly, or luminaires (fixtures) connected together by recognized wiring methods, shall be permitted to contain the conductors of a 2-wire branch circuit, or one multiwire branch circuit, supplying the connected luminaires (fixtures) and need not be listed as a raceway. One additional 2-wire branch circuit separately supplying one or more of the connected luminaires (fixtures) shall also be permitted.

FPN: See Article 100 for the definition of Multiwire Branch Circuit.

410.~~33~~ 68 Branch Circuit Conductors and Ballasts

Branch-circuit conductors within 75 mm (3 in.) of a ballast shall have an insulation temperature rating not lower than 90°C (194°F) unless supplying a luminaire (fixture) listed and marked as suitable for a different insulation temperature.

VII. Construction of Luminaires (Fixtures)

410.~~34~~ 70 Combustible Shades and Enclosures

Adequate airspace shall be provided between lamps and shades or other enclosures of combustible material.

410.~~35~~ 74 Luminaire (Fixture) Rating

(A) Marking All luminaires (fixtures) shall be marked with the maximum lamp wattage or electrical rating, manufacturer's name, trademark, or other suitable means of identification. A luminaire (fixture) requiring supply wire rated higher than 60°C (140°F) shall be marked in letters not smaller than 6 mm (1/ 4 in.) high, prominently displayed on the luminaire (fixture) and shipping carton or equivalent.
